Welcome Notes

Dear Friends and Colleagues,

We are pleased to welcome you to the **International Conference: “Sustainable economic development and business management in the context of globalisation” (SEDBM 2018)**, which is jointly organized by *Academy of Finance* (Vietnam) and *University of Greenwich* (United Kingdom).

As a result of Academy of Finance and University of Greenwich’s close collaboration with international partners, the International Conference SEDBM 2018 brings together the world-leading experts in finance, accounting, audit, economic and business administration, serving as a point of convergence for researchers, practitioners and policy-makers to meet, share and exchange their ideas. The International Conference SEDBM 2018 will strive to offer not only plenty of networking opportunities, providing you with the opportunity to interact with the leading researchers from both academia and universities, but also an environment to engage in stimulating discussions about research topics and practices. We are especially honoured to have:

Professor **Alex Stojanovic** - *Head of the Department of Accounting and Finance, University of Greenwich, UK.*

Professor **Petros Ieromonachou** - *Head of Department for Systems Management and Strategy, University of Greenwich, UK.*

We are indebted to members of the Organizing Committee particularly, **Mr Jon Sibson** (*Pro Vice Chancellor of the Business School, University of Greenwich, UK*), **Professor Trong Co Nguyen** (*President of Academy of Finance, Vietnam*), for their support to make this International Conference a great success.

We wish you all an intellectually stimulating and productive conference!

On behalf of the Organizing Committee,

Assoc. Prof. Trong Co Nguyen

ACADEMY OF FINANCE

The Academy of Finance (AOF) is a public and research-oriented university, subordinated to the Ministry of Finance, Vietnam. The AOF was officially established under Decision No 120/2001/QĐ-TTg dated August 17th, 2001 of the Prime Minister by integrating the Hanoi University of Finance and Accounting (founded in 1963), the Finance Research Institution (founded in 1961) and the Financial Training Center (founded in 1995). The main site of the Academy of Finance is located in Hanoi.

The mission of Academy of Finance is to provide expertise in research and training of professional finance and accounting to the society, the mission has been defined for our 55-year history with outstanding achievements and contributions branded by our lecturers, researchers and students.

The AOF established self-evaluation council since 2006 according to regulations of MOET Vietnam. This council significantly helped improve the academic performance, and in April 2016, AOF was accredited by Center for Education Accreditation (CEA) – Association of Vietnam Universities and Colleges (AVUC). The accreditation result was published according to the Decision 10/QĐ-KĐCLGD dated February 20th, 2017 of AVUC ranking AOF in top 5 best universities in Vietnam.

The Academy of Finance offer a high quality of training and research through 14 faculties: Fundamental Sciences, Political theories, Public Finance, Tax and Customs, Corporate Finance, Banking and Insurance, International Finance, Accounting, Business administration, economic Information. Languages, Economics, Master and Doctoral training, Part-time training, two centers: Center for Languages and Informatics Training, Information Technology Center, 2 research institutes: Institute for International Finance Education (IIFE) and Institute of Economics and Finance and 13 support divisions.

AOF offers a rich training programs included ordinary undergraduate/graduate programs spread in 06 academic majors: Finance and Banking, Accounting and Auditing, Business Administration, Management Information, Economic and Financial English, Economics. The AOF also offer to international and vietnamese students with different choices partially/totally taught in English such as High Advanced Program or Dual Degree Programme (DDP - a Joint Training Programme between the Academy of Finance (Institute of International Finance Education) and the University of Greenwich (UK).

Throughout its history, AOF's qualified scientists and lecturers have been supporting more than 85,000 students including 5,000 masters and 300 doctors and additionally 500 international students for Laos and Cambodia in the last 55 years. Significantly, a large number of AOF's graduates are leaders of the Government, ministries, local authorities and businesses. The academy has also been recognized for conducting thousands of valuable research projects for the policy makers in economic development of the State. The rich tradition and custom makes AOF unique among the other universities and colleges in Vietnam and attracts thousands of learners to study at the academy annually.

The valuable contributions of AOF to the development of the State in training and doing research has been respected publicly, the academy has been recognized with national unique awards. Many AOF alumni are key people in the Government and Local Administrations.

UNIVERSITY OF GREENWICH

The University of Greenwich is a public and research-oriented university located in London, in the United Kingdom. It has three campuses in London and Kent, England. These are located at Greenwich, in the grounds of the Old Royal Naval College, and in Avery Hill and Medway. Previous names include Woolwich Polytechnic and Thames Polytechnic.

The university's range of subjects includes architecture, business, computing, mathematics, education, engineering, humanities, maritime studies, natural sciences, pharmacy and social sciences.

The university dates back to November 1891, when Woolwich Polytechnic, the second-oldest polytechnic in the United Kingdom, opened in Woolwich. In 1970, Woolwich Polytechnic merged with part of Hammersmith College of Art and Building to form Thames Polytechnic. In the following years, Dartford College (1976), Avery Hill College (1985), Garnett College (1987) and parts of Goldsmiths College and the City of London College (1988) were incorporated.

In 1992, Thames Polytechnic was granted university status by the UK government (together with various other polytechnics) and renamed University of Greenwich in 1993. In 2001, the university gave up its historic main campus in the Bathway Quarter in Woolwich, relocating to its current main campus in Greenwich, a UNESCO World Heritage site on the banks of the River Thames, and close to the financial centres of the City and Canary Wharf. The location is genuinely unique combining the advantages of such a beautiful and historic setting with being 15 minutes by light rail from the centre of London.

The campus is home to the Business School and the Faculty of Liberal Arts and Sciences. The campus also includes university's Greenwich Maritime Institute, a specialist maritime management, policy and history teaching and research institute.

The Business School at the University of Greenwich combines strengths in teaching and research with an emphasis on equipping our students with the practical knowledge and skills sought by employers. It offers a comprehensive range of high-quality undergraduate degrees through five departments: Accounting & Finance; International Business & Economics; Human Resources & Organisational Behaviour; Marketing, Events & Tourism; Systems Management & Strategy. Many of the programmes are accredited by key UK professional bodies and course content is constantly revised to reflect current business priorities and the demands of employers.

The campus has a large library at Stockwell Street in the centre of Greenwich which houses an extensive collection of books and journals, language labs and a 300-PC computing facility. Other facilities include specialist computer laboratories including one at Dreadnought centre, a TV studio and editing suites. The Stephen Lawrence Gallery at the Stockwell Street building, showcases the work of contemporary artists and is linked to the Department for Creative Arts.

ASSOCIATE PROFESSOR NGUYEN TRONG CO

PRESIDENT OF THE ACADEMY OF FINANCE

Assoc. Prof. Nguyen Trong Co is the President of the Academy of Finance. He has been working for the Academy of Finance since he was young and played different roles as Lecturer, Head of Financial Analysis Department, Deputy Head of Human Resources Department before becoming Vice President of the Academy of Finance. He was nominated as the President of Academy of Finance in 2014 and has been in that position so far.

He is the Editor of the Journal of Finance and Accounting Research and serves the Scientific Board of Finance Research Sector as Vice President and a member of *Scientific Board of Banking Research Sector*.

He was also nominated as honor member of FCPA Australia.

Assoc. Prof. Nguyen Trong Co is the author/coauthor of more than 21 valuable text books and supplementary materials such as “Financial Analysis”, Finance Publishing House, 2017, “Auditing management and Usage of mineral resources for sustainable development in Viet Nam”, Finance Publishing House, 2016 and etc.

He has researched actively with more than 20 research projects spread on different fields: Corporate Finance and public finance, and Technological Markets. In the Academy of Finance, he has published more than 70 articles in both local journals and international journals.

MR JON SIBSON

**PRO VICE CHANCELLOR OF THE BUSINESS SCHOOL IN THE UNIVERSITY OF GREENWICH
SEDBM 2018 CO-ORDINATOR**

Jon Sibson is the Pro Vice Chancellor of the Business School in the University of Greenwich. He joined the Business School from PricewaterhouseCoopers LLP (PwC), where he had been a partner since 1997.

He led the Government and Public Sector practice in the UK, and was a member of the global leadership team for this area of the business. Prior to this he led the Public Private Advisory practice in the UK for five years, after previously leading the equivalent business in South East Asia while based in Singapore.

Prior to joining PwC Jon was a senior civil servant, serving in the Home Office and also on secondment to the Cabinet Secretariat. In the Home Office he carried out a number of policy roles in the criminal justice area, and also worked in the areas of broadcasting policy and race relations. He also acted as Private Secretary to the Rt Hon Douglas Hurd. While in the Home Office he was a member of the local branch committee of the FDA.

KEYNOTE SPEAKERS

Professor Alex Stojanovic

Professor Alex Stojanovic is Head of the Department of Accounting & Finance. He was formerly a founding member and Director of Research at Bradley Financial, a City of London-based equity research/financial consulting agency.

Prof Stojanovic graduated with a BA Economics with honours from Belgrade University, and an MBA Finance and a PhD Finance from Cass Business School, London. In addition to his extensive undergraduate and postgraduate teaching experience, Prof Stojanovic has won praise as an executive education professional, most notably as a visiting Lecturer in Finance at the Cass Business School's Executive MBA programme.

Prof Stojanovic started his career in commercial banking with Komercijalna Banka Belgrade, and has considerable project management and consulting experience through his involvement in international banking projects, including work on International Payment Systems in association with the Bank of England and work on the Impact of the Euro on the UK Banking Industry in association with the Corporation of London.

Prof Stojanovic is also a Director of the Centre for Governance, Risk and Accountability which is active in the areas of corporate governance, corporate social responsibility, risk management, behavioural finance and banking regulation.

PROFESSOR PETROS IEROMONACHOU

Professor Petros Ieromonachou is the Head of Department for Systems Management and Strategy at the University of Greenwich Business School. He has written, managed and delivered various courses on transportation and logistics management.

He is a research active academic with wide ranging interests and experience - transportation policy and management, energy and sustainable development, strategic niche analysis, urban studies and smart cities

Previously, he worked at the Open University, and also served for several years as a visiting Research Fellow in the Design Group of the Faculty of Mathematics, Computing & Technology.

Professor Ieromonachou established 'Connected Cities', a multi-disciplinary research group which builds on a variety of theories and knowledge, including system dynamics, discrete choice analysis, neo-institutional theory, strategic niche management, social network theory and decision analysis.

The mission of this group is to bring together different expertise to explore the expanding urban challenges and opportunities to improve quality of life, competitiveness and sustainability of cities. He extended his network by establishing an international research forum between the University of Greenwich and collaborative partner Universities in China, and through organising an annual research workshop on 'Smart Urban Policy Futures'

ĐỀ DẪN HỘI THẢO QUỐC TẾ PHÁT TRIỂN KINH TẾ VÀ KINH DOANH BỀN VỮNG TRONG ĐIỀU KIỆN TOÀN CẦU HÓA (SEDBM2018)

Chúng ta đang sống trong những thập kỷ đầu của thế kỷ XXI với 3 đặc trưng nổi bật: (i) phát triển bền vững đã trở thành chiến lược phát triển của toàn thế giới; (ii) hội nhập và toàn cầu hóa và (iii) biến đổi khí hậu đã trở thành thách thức lớn nhất cho toàn nhân loại trong thế kỷ XXI. Phát triển kinh tế bền vững là mục tiêu hướng tới của nhiều quốc gia. Tính bền vững về kinh tế được thể hiện trên các khía cạnh: sự gia tăng quy mô kinh tế, tăng trưởng kinh tế, chuyển dịch cơ cấu kinh tế theo hướng tiến bộ và bình đẳng về cơ hội tham gia cũng như hưởng thụ thành quả của quá trình phát triển. Toàn cầu hóa không chỉ là một tiến trình kinh tế mà còn là sự phản ánh những khát vọng vươn xa, những mưu cầu hạnh phúc và chinh phục thử thách của loài người. Với trên 150 Hiệp định thương mại tự do (FTA) và khu vực, chiếm 58% tổng số Hiệp định của thế giới, châu Á đang đi đầu về hợp tác, hội nhập quốc tế. Bên cạnh đó sự phát triển kinh tế và công nghệ quá nhanh trong khi năng lực quản trị ở cả cấp độ toàn cầu và quốc gia chưa kịp thích ứng, các tiến bộ về công nghệ sinh học, trí tuệ nhân tạo, điện toán đám mây... đòi hỏi các quốc gia không chỉ đổi mới mà phải sáng tạo những mô hình kinh doanh hoàn toàn mới. Tác động của toàn cầu hóa và hội nhập quốc tế làm cho thế giới đương đại đang có những chuyển biến, tác động sâu sắc trên nhiều lĩnh vực của đời sống kinh tế - xã hội của nhân loại. Hiện nay, Việt Nam tham gia đàm phán và ký kết khoảng 17 Hiệp định thương mại tự do, song phương và đa phương. Việc tham gia các FTA đã tạo ra nhiều cơ hội nhưng cũng không ít các thách thức cho Việt Nam trong quá trình phát triển kinh tế - xã hội. Đề tận dụng cơ hội và vượt qua thách thức Đảng và chính phủ Việt Nam đã xác định rõ phát triển bền vững là mục tiêu bao trùm trong chiến lược phát triển kinh tế - xã hội đất nước, không chỉ là nhiệm vụ của một bộ, ngành, một lĩnh vực, địa phương, không chỉ là vấn đề kinh tế, chất lượng tăng trưởng mà bao gồm các vấn đề xã hội, môi trường, văn hóa, con người. Để đưa nền kinh tế phát triển thịnh vượng đi đôi với bền vững môi trường và hòa nhập xã hội trong thời gian tới, Việt Nam cần phải tiếp tục: đổi mới mô hình tăng trưởng kinh tế theo hướng chuyển nền kinh tế phát triển theo chiều rộng sang chiều sâu; nâng cao chất lượng, hiệu quả và sức cạnh tranh của nền kinh tế; phát triển nhanh, bền vững; sử dụng tốt các nguồn lực để thúc đẩy tăng trưởng kinh tế bền vững; tạo lập môi trường cạnh tranh bình đẳng; đổi mới và hoàn thiện hệ thống chính sách kinh tế, bảo vệ môi trường và đảm bảo công bằng xã hội; nâng cao chất lượng nguồn nhân lực; tăng cường hội nhập quốc tế; tận dụng cơ hội tốt cơ hội từ các FTA và cách mạng 4.0 mang lại...

Hội thảo SEDBM 2018 đã nhận được 163 bài viết và lựa chọn, biên tập được 135 bài viết để đăng trong Kỷ yếu Hội thảo. Các bài viết này đã được các nhà khoa học và Ban biên tập của Hội thảo phân biện và chọn lựa. Các bài viết tham gia Hội thảo SEDBM 2018 có chất lượng, đa dạng về chủ đề nghiên cứu, được thực hiện cả bằng tiếng Việt và tiếng Anh. Những bài viết được chọn tham dự Hội thảo đều có giá trị không chỉ đúng từ góc độ lý luận mà cả từ góc độ thực tiễn về phát triển kinh tế bền vững trong điều kiện toàn cầu hóa. Nội dung các bài viết công bố kết quả nghiên cứu được chia thành ba nhóm chính, cụ thể như sau:

- Về Kinh tế, quản trị kinh doanh: với chủ đề này, các bài nghiên cứu đã tập trung vào các nội dung như phát triển chuỗi giá trị, phát triển kinh tế xanh, thực hiện công bằng trong phân phối nguồn lực tài chính, xây dựng mô hình phát triển bền vững, năng suất lao động và khả năng cạnh tranh, chiến lược marketing;

- Về Tài chính: ở nội dung này, các bài nghiên cứu đã đề cập đến nhiều vấn đề như tái cấu trúc và phát triển bền vững tài chính công, các quyết định tài chính doanh nghiệp nhằm phát triển doanh nghiệp bền vững, thị trường chứng khoán, hệ thống pháp luật thuế, chuyển giá và tự do hoá tài chính;

- Về Kế toán kiểm toán: các bài nghiên cứu tập trung vào kế toán môi trường nhằm đảm bảo sự phát triển bền vững xã hội, xu hướng kế toán kiểm toán trong bối cảnh cuộc cách mạng công nghiệp 4.0, kế toán trách nhiệm xã hội, mức độ công bố thông tin trách nhiệm xã hội của doanh nghiệp.

Hội thảo SEDBM 2018 tập trung thảo luận về phát triển kinh tế và kinh doanh bền vững trong điều kiện toàn cầu hóa để nhìn nhận rõ cơ hội và thách thức. Học viện Tài chính và Ban Tổ chức Hội thảo trân trọng cảm ơn quý vị đại biểu, các vị khách quý và các nhà khoa học đến từ các trường đại học, viện nghiên cứu, các đơn vị trong nước và quốc tế đã nhiệt tình tham gia và đóng góp vào sự thành công của Hội thảo. Trân trọng cảm ơn sự quan tâm và phối hợp chặt chẽ trong công tác tổ chức của Ban Lãnh đạo trường đại học Greenwich – vương quốc Anh, các đơn vị, cơ quan Bộ/ngành có liên quan đã đóng góp vào sự thành công của Hội thảo lần này. Hội thảo sẽ là nơi để các nhà khoa học trong và ngoài nước trao đổi về học thuật cũng như kinh nghiệm nghiên cứu và giao lưu, hợp tác trong nghiên cứu khoa học, chuyển giao công nghệ.

Học viện Tài chính và Ban Tổ chức Hội thảo kính chúc quý vị đại biểu, quý nhà khoa học sức khỏe, hạnh phúc và thành công! Kính chúc Hội thảo thành công tốt đẹp!

BRAND COMMUNICATION AS SUSTAINABLE BUSINESS DEVELOPMENT SOLUTION FOR ORGANIC STARTUPS IN VIETNAM

Ngo Phuong Anh* - Nguyen Thu Huyen**

ABSTRACT: *This research represents the consequence of building brand communication in sustainable economic development for organic startup companies in Vietnam. The study first considered the impact of brand communication strategy and activities on sustainable development for businesses, therefore, startups. The objective of the study is to analyze and evaluate the effectiveness and importance of brand communication strategy on the sustainable development of three organic startup companies in Vietnam: Soya Garden, Biophap, and Organica, and finally provide some recommendations for other organic startup businesses in Vietnam.*

Keywords: *sustainable development, sustainable business development, organic, startup, brand communication, marketing activities*

1. INTRODUCTION

Recently, “startup” - a newly formed company developing innovative products or services has brought an energetic and creative trend to the enterprise community in Vietnam. They are potentially promising as a motivation for strong economic growth and a prosperous society. Startup entrepreneurship is crucial for the economy of Vietnam because of innovations, new jobs and dynamic competitions they bring into the business environment. Vietnam’s ministries are currently working on new supported policies, investment tools to assist startup companies. There are about 3,000 startup businesses in Vietnam by April 2017 according to Echelon Magazine, Singapore.

Joining the sustainable development, organic products are also creating the phenomenon in the market. Organic products startup companies are considered as the combination of two current leading revolutions. The appearance of organic startups cultivates environmentally-friendly production and consumption and helps the society gradually pursue sustainable development. Among 3000 startup entities in Vietnam, there are only less than 100 startups which are officially certificated as “organic” by United States Department of Agriculture and EU Organic farming.

The propitiousness brought by organic startup businesses is undeniable but these companies meet with difficulties of expressing their values to the society. A survey by Nielson Vietnam shows that 86% of Vietnamese are willing to pay higher prices for environmentally-socially-friendly products and clean brand names but 70% are inaccessible to organic products. Therefore, on approaching sustainable development, organic startups have to regulate their green planning and production along with the management of their brand communication.

2. IMPACT OF BRAND COMMUNICATION ON THE SUSTAINABLE DEVELOPMENT OF COMPANIES

2.1. About brand communication

2.1.1. Overview of brand

The most powerful brands are the most powerful assets. Developing brand equity is growing “the value of a brand, based on the extent to which it has high brand loyalty, name awareness, perceived quality, strong brand associations, and other assets such as patents, trademarks, and channel relationships” (Kotler, 2000, p. 470). Companies with strong brand equity can expect stable revenues as devoted consumers would go for a chosen brand rather than switch to a more profitable substitute.

Philip Kotler in his book *Principles of Marketing* defines brand as “a name, term, sign, symbol or design, or a combination of these, intended to identify the goods or services of one seller or group of sellers and to differentiate them from those of competitors” (Kotler, 2000, p. 469). However, to date, the understanding of the concept of a “brand” has expanded to a certain extent and stands for more meaning than just the classical interpretation proposed by Philip Kotler.

A brand has broader meanings than just a memorable logo or a name, which are extracted from its brand core which contains the main idea of the brand. The brand core is referred to the set of values that a company wants to be associated with or the soul of a company, a great story that a company wants to tell to its audience, a position that differentiates a brand from its competitors. Generally, the core of a brand is a company’s essence described in several words and usually reflects the corporate values as well. The meanings of a brand are presented by at a four-level structure in the *Principles of Marketing* book and are the following: Attributes, Benefits, Values, and Personality (Kotler 2000, p.469).

- Under the first level meanings goes the parameter, which is mentioned as “Attributes” and is referred to specifications an offered product possesses. As consumers are seeking not specifically for the “attributes” a company advertise its product with, but more of the benefits they can receive from it, a company must transfer these “attributes” into “functional and emotional benefits”.

- The third level of brand meaning comes the “Values”, which are the same as the corporate values such as “heritage, integrity, and nature”. At this level of brand meaning, the main task of a company is to propose the values that are corresponding to the values of its target audience.

- The last level of the brand meaning is “Personality”, which implies the ability of a brand to be presented as a person. When a person is willing to purchase a product, he or she is willing to obtain one that is same or similar to their personality.

All these complex levels of a brand prove that the perception of the brand as just a label or simply identification is improper. Additionally, these four levels are essential in brand building, each company can add more elements in order to differentiate themselves from their competitors and create more value for their consumers though. Nevertheless, it is important to understand the complexity of brand creation and its positioning on the market, meaning that a company should not choose one or two levels as an area of its focus, but rather perceive all its elements as a whole, building on the brand core and ending on its externalities.

Before building a brand, first and foremost, enterprises should be understood that a brand is one of the most important assets of a company, and its further progress depends on the constant communication of a brand essence, its integrity, value, and uniqueness.

2.1.2. About brand communication

Marketing communications are seen as brands' 'voice' (Keller 2009) and are therefore perceived as a crucial strategic tool for building brands (Keller 1993; Naik and Raman 2003). Academics stress out that marketing communications contribute to a brand building if they are based on unique brand identity (Aaker and Joachimsthaler 2000; de Chernatony 1999).

Brands vary in power they exercise in the marketplace - because, ultimately, their power resides in the minds of consumers (Chernatony, 2006; Chernatony and Dall'Olmio Riley, 1998b; Kapferer, 2008). The power of a brand can thus be understood in terms of its position in the minds of customers: which brands do buyers have a degree of awareness recall, and recognition. Nowadays, marketing communications are believed to contribute to building high customer-based brand equity (Vakratsas and Ambler, 1999; Yoo, Donthu, and Lee, 2000). Pelsmacker et al (2004) state that, successful brands have to be different, it should be innovated, the brand should have some added value attached with it and it should have a long - term integrated communication support for the customers. It means that building strong brand communication is one of the most important things that one company should do if they want to communicate with their target customers. And, indeed, through communication, companies can mainly provide knowledge for the customer about their brand, their company. Quality, customer services can also come under communications as well as availability, price, and so on.

Brand communication tools give more freedom and information to customers to interact with each other and the marketers. Consumers were no longer act like receivers of messages sent by marketing agencies and companies through conventional media forms: customers who previously used to receive messages suddenly became active communicator (Patti & Schultz, 2009). They are created more opportunities to received different information in different ways such as Advertising, Sale promotion, Public relations and publicity, Events, and experiences, Direct Marketing, Personal selling.

- Advertising - Advertising can be used to create a long-term image for a product or generate quick sales. It offers opportunities for amplified expressiveness and is also pervasive, able to reach geographically dispersed buyers efficiently (Kotler and Keller, 2007). Certain forms of advertising, such as TV, newspaper, radio, professional and technical magazines, and so on.

- Sales promotion – Sales promotion tools - coupons, contests, premiums, offer three key benefits: Communication - getting the attention that may lead the consumer to the product; Incentive - offering a concession or an inducement that gives value to the consumer; Invitation - including a distinct invitation to engage in the transaction. Sales promotion can be used for short-run effects such as dramatizing product offers and boosting sales. (Kotler and Keller, 2007)

- Public relations and publicity - According to Kotler and Keller (2007), the appeal of public relations and publicity is based on three qualities: High credibility - news stories and features are more authentic and credible than advertisements; Ability to catch buyers off guard - reaching prospects who prefer to avoid salespeople and advertisements; Dramatisation - the potential for dramatizing a company or product.

- Events and experiences - A well-chosen event or experience seen as highly relevant can get the consumer personally involved. Because events and experiences are live, consumers find them more actively engaging. Also, events are more of an indirect "soft sell." (Kotler and Keller, 2007)

- Direct marketing - All forms of direct marketing - direct mail, telemarketing, Internet marketing - share three characteristics: Customised – to appeal to the addressed individual; Up-to-date - can be prepared very quickly; Interactive - can be changed depending on the person's response.

- Personal selling - Personal selling is the most effective tool at later stages of the buying process, particularly in building up buyer preference, conviction, and action (Kotler and Keller, 2007).

2.2. Sustainable business development theory

2.2.1. Overview of sustainable development

The term, 'sustainable development', first appeared in the World Conservation Strategy composed by the United Nations Environment Programme (UNEP) and the International Union for the Conservation of Nature (IUCN) in 1980. Later in The Encyclopedia of the Environment (Eblen and Eblen, 1994), the description of 'conservation' concept, interpreted as 'the management of human use of the biosphere so that it may yield the greatest sustainable benefit to present generations while maintaining its potential to meet the needs and aspirations of future generations', emerged as an advanced terminology of 'sustainable development'.

In 1987, the UN's World Commission on Environment and Development delineated 'sustainable development' was the complex of action to alleviate poverty, safeguard the environment, and feed the world. The modern concept of sustainable development is derived mostly from the Brundtland Commission Report, *Our Common Future*, defined 'sustainable development' as 'development that meets the needs of the present without compromising the ability of future generations to meet their own needs (WCED, 1987). This definition has been widely published and is accepted as authoritative. Sustainable development consisting of a long-term, integrated approach that is organized for assisting human development goals while at the same time maintaining the capability of natural systems with the natural resources and ecosystem services upon which the economy and society depend. The sustainable development goals are to balance our economic, environmental and social needs, allowing prosperity for now and future generations.

This is demonstrated by The limits to growth (Meadows et al, 1972) posit that economies will not be sustainable if natural resources are excessively used and if society continues to rely upon phenomena that drove growth in the past. Sustainable Economic Development enables nations to develop mutual benefit of regions for reducing poverty and generating sustainable and equitable economic growth worldwide, strengthening the economic productivity, innovation, and competitiveness by investing in their fundamental assets of people and place. Sustainable Economic Development brings together leaders from government, business, professional institutions, community groups, non-governmental organizations, and the communications media in from nations all over the developed and developing world without compromising the ability of future generations and also nature and environment.

2.2.2. Sustainability revolution

Sustainable Economic Development recognizes a green market is emerging, policies and procedures are exclusively constructed to assist the market in general and individual green businesses, sustainable production and consumption and sustainable marketing in particular.

Sustainable production is based on 3 key sources of strength: the economic, the environmental and social ones. Production activities can be assigned as sustainable production provided that they are economically efficient for businesses while avoiding affecting the environment and human health, minimizing the amount of waste and use of natural resources, energy, toxic substances. Sustainable production supports sustainable consumption, especially since every producer is also a consumer and every consumer can selecting the products, promote the green ones and the cycle continues. Sustainable production considers consumers' wants, the company's requirements, consumers' long-term concern, environmental issues, and society's

long-run interests. The optimal decisions of businesses are following the societal marketing concept. The dimensional concept of societal marketing is composed of social welfare, individual welfare, company profits (Kaplan, 2014).

Philip Kotler's concept of societal marketing in a 1972 article "What Consumerism Means for Marketers" in the Harvard Business Review suggested that for the well-being of society, deficient products should be disposed of the market, pleasing and salutary products should undergo a product modification process before becoming desirable, by incorporating missing short-term benefits into salutary products and long-term benefits into pleasing products, and the ultimate goal of the businesses should be to develop desirable products rather than focusing on profit, which can be beneficial or detrimental for the consumers. Societal marketing developed into sustainable marketing. Sustainable marketing requires businesses to include social, ethical and ecological considerations in product and market planning.

2.3. The development of organic companies

In recent decades, along with the sustainability revolution and consumers' demanding of food safety and transparency, a new business model has been raising as the most noticeable trend to develop in the market which named "organic company". They are entities that provide foods and personal care products with no use of chemical preservatives, genetically modified organisms and pesticides. Organic companies apply the societal marketing concept in a view of raising awareness of the environment and human health, stimulating sales and creating a reputation. According to United States Department of Agriculture, "organic" is a labeling term that indicates that the food or other agricultural product has been produced through approved methods. These methods integrate cultural, biological, and mechanical practices that foster cycling of resources, promote ecological balance, and conserve biodiversity. Synthetic fertilizers, sewage sludge, irradiation, and genetic engineering may not be included in the process. All organic farms and food companies are inspected at least once a year and the standards for organic food are laid down in specific regulations.

2.4. Start - up companies

Startups as innovative companies are in the process of realizing business ideas to create a new kind of product, goods, or service or a new business model that no other companies have used.

2.4.1. Characteristics

- High growth potential – Startup business idea is based on shaky hypothesis, but the founders have clearly indicated the need on the market and if the execution works out as intended, the product or service has an impact on many potential customers. High growth is also potential is also related to quick implementation, meaning that the product or service can be launched quickly and brings massive traction at once.
- Scalability – Startup business model is build up so that the product or service can be offered in many different markets at once. There might be some customizations in the customer accusation model (e.g. customer support, languages, logistics, marketing activities), but in general, the global market can be tackled at the same time with the same core product or service.
- High risk – Startup idea is unique or different/better than the competitive solutions on the market in some cases. This makes the implementation uncertain and naturally quite risky. There are startup companies that are following the success stories of other companies (using the same business model, entering the same markets, having the similar product or service features). In this case, the traction takes longer but some risks connected with sales and marketing can be reduced as well.

- Lack of resources – Startup companies are always lacking the resources (mostly time and money) because their target market is large and the product development requires a lot of testing and redeployment. The key is to find a correct balance between the development and implementation. The ultimate goal is to reach the revenue phase as quickly and cost-efficient as possible.

2.4.2. Challenges of startup companies

- Prior research on challenges of startups addresses a number of common challenges among different startups (Shepherd et al., 2000). However, there are some common challenges, most of the challenges are unique, and the extent to which they affect startups differs. Some of the main common challenges are as follows:

- Financial challenges - Finance is an integral part of the startup process. Any startup would face financial issues and problems for several reasons and in different stages (Colombo & Piva, 2008; Tanha et al., 2011; Salamzadeh, 2015 a, b; Salamzadeh et al., 2015) because product development requires a lot of testing and redeployment.

- Human resources - Startups normally start with one founder and/or some cofounders. As time goes by, the founder needs more experts to develop other processes of the company. Then, he/she has to negotiate with people, make team and finally hire employees. This process is so critical to succeed and if the founder lacks enough knowledge of the field, the startup might fail due to human resource management issues (Salamzadeh, 2015 a,b; Salamzadeh, 2014).

- Support mechanisms - There are a number of support mechanisms that play a significant role in the life cycle of startups. These support mechanisms include angel investors, hatcheries, incubators, science and technology parks, accelerators, small business development centers, venture capitals, etc. Lack of access to such support mechanisms increases the risk of failure (Salamzadeh, 2015 a, b).

- Environmental elements - Last but not least is the effect of environmental elements. Many startups fail due to lack of attention to environmental elements, such as the existing trends, limitations in the markets, legal issues, etc. While a supportive environment facilitates the success of startups, a maleficent one could result in the failure (Boeker, 1988). The environment for a startup is even more difficult and critical than for an established firm (Bruton & Rubanik, 2002; Van Gelderen et. al., 2005).

3. BRAND COMMUNICATION ACTIVITIES OF ORGANIC START UP COMPANIES IN VIETNAM

3.1. Development of organic startup companies in Vietnam

In recent years, startup companies have received a lot of attention from the government and the private sector. In Vietnam, there is not yet an official legal document that standardizes the concept of startup. According to Echelon, Singapore - one of the largest online media startups in Southeast Asia, there were about 3,000 startup companies in Vietnam in April 2017, an increase of 67% compared to 2015.

Not except from the rest of the world, organic products and the increasing demand for them are also creating phenomenon in Vietnam. A report on the trend of organic food consumption in 2017 shows that 86% of Vietnamese consumers interviewed will choose local, natural and organic products when possible. However, Ministry of Agriculture declared that only 150 companies are received certifications by United States Department of Agriculture (United States Department of Agriculture) and US Department of Agriculture and the European Union (EU) for the organic products. However, the development of organic startup business cannot catch up with the rising number of demand.

3.2. Brand communication activities of notable organic start up companies in Vietnam

Organic agriculture is taking shape in Vietnam, numerous startups in this field desire to grow and satisfy the increasing demand. Although parts of consumers are interested in organic products, in fact, organic food does not have their place in the market. Their prices are twice as much due to the required advance technology and even consumers can not determine the difference between organic and normal products just by reading unreliable information on the label. Therefore, organic companies, especially startups need to improve brand communication to bring the real value and quality of organic products to society. Based on the list of companies certified as “organic” by United States Department of Agriculture (United States Department of Agriculture), we choose three Vietnamese organic food startup companies as a representative to examine brand communication activities and evaluate their effectiveness: Soya Garden, Organica, and Biophap.

3.2.1. Soya Garden

Soya Garden Joint Stock Company is one of the most popular startups in the domestic F&B market. Established in April 2016, the concept of Soya Garden is focused on developing products derived from organic non-GMO (genetically modified organism) soybean. Originating from pure organic soybeans, the core values of Soya Garden are modern culinary trends, appreciating and enhancing the beauty, health, and experience of the customers. After 2 years of implementation, up to now, Soya Garden has 13 stores. In December 2017, two founders of Soya Garden - Hoang Anh Tuan raised fund successfully on a startup reality show called Shark Tank Vietnam with a commitment of actually VND 20 billion and planned to open 70 stores in Southern cities of Vietnam. In the next five years, the brand desires to establish the habit of drinking soy milk and making this dessert become popular as coffee or tea.

At the beginning of the launch, Soya Garden had two main products: organic soymilk and bean curd (Singaporean soybean dessert). Soya Garden’s soy ingredients are certified organic by United States Department of Agriculture, non-genetically modified and the seeds are imported directly from Singapore. So far, Soya Garden has expanded to other product categories based on customers’ interests, such as tea, smoothie coffee, Japanese milk tea, vitamins, etc. Especially with the concept “Everything from soya”, all drinks used milk are cleverly replaced by soy milk. For the most natural taste experience, products are produced in a “just in time” process and used only for the day and produced no more than 5 hours ago. Product development team conducts regular research to build menus for every occasion in the year. 30-40% of core products will still be retained, other products will change according to trend or season.

3.2.2. Organica Investment Joint Stock Company

Organica Investment Joint Stock Company is an organic foods development and distribution system established with the goal of helping Vietnamese consumers to live a healthier life by consuming clean, organic and non-genetically modified foods. In 2015, after many efforts of self-development and production, Organica’s farm in Long Thanh, Dong Nai Province, Vietnam has been certified organic by the US Department of Agriculture and the European Union (EU), became the first organic tropical vegetable farm in Vietnam. After that, in 2017, Ba Vi Organica garden was appraised to meet the American and European organic standards. In addition to self-managed organic farms, Organica is also supporting and associating with farmers in many localities, especially remote communities, ethnic minorities and other vulnerable subjects in society to cultivate by organic and natural methods to reach a better life.

Organica has nearly 1,000 organic certified products including fresh foods (fruits, vegetables, meat, seafood), dairy products, dried foods, organic spices, organic cosmetics, home care products, personal

care products made from cotton. All products from this company either self-produced or imported are vouched by international agriculture organizations and institutions, namely Control Union Certification from United States Department of Agriculture for handling products, EU Organic farming for fresh fruits and vegetables, Japanese Agriculture Standards Certification and Australian Certificated Organic for dried products. Organica uses Trace verified, the only electronic traceability service in Vietnam, with the expectation of transparency and commitment to organic farming with consumers.

3.2.3. Biophap

Biophap was founded in 2015 by two French experts in organic agriculture and Tyna Giang - a young Vietnamese woman living abroad, willing to use her entrepreneurship to initiate, share and expand what she believes in the most, organic and sustainable agriculture. In 2016, Biophap has succeeded in initiating 5 farms of 50 ha and more than 300 biodiversity varieties, planting more than 23,642 trees while preserving ecosystem of Central Highlands, in other words, it means agroforestry. Biophap gets help from the Bahnar (an ethnic minority in Vietnam) in all of Biophap projects with local authority support. The first project of Biophap with the Bahnar is the production of more than a ton of turmeric powder, issued from organic agriculture, planted and harvested by hands.

Biophap is certified by three major labels, Agriculture Biologique (AB EU), United States Department of Agriculture (United States Department of Agriculture) - [ECO] EcoCert S.A. for turmeric crops and handlings and Japanese Agriculture Standard Japanese (JAS JP). The business has three main types of products: Fresh fruit including sideless lime, king mandarin, caracara orange, pink pomelo; Spices including turmeric powder, ginger powder, black pepper powder and Herbs (Goji berries, verain, jiaogulan, rosemary). By respecting the strictest standards of organic farming, Biophap use exclusively natural substances in our production. Biophap's products are 100% natural, nutritious and healthy because they plant their product by natural organic fertilizers. Besides, pesticides and herbicides are prohibited to use for the products.

3.3. Evaluation of brand communication activities

3.3.1. Soya Garden

Soya Garden's main customers are white-collar women, aged 22-23 years and aware of health issues. The company claimed that guests are willing to pay from VND 30,000 - VND 40,000 for a product from Soya's soy milk while a cup of fresh soy milk in a local market or processed soy milk only costs a quarter of Soya's price.

- Advertising

One of the most successful marketing methods used by Soya Garden is the appearance in Shark Tank season 1 on VTV3 to call for investment capital. After the show, the company received more than VND 20 billion and opened five new stores with large space and favorable location. Soya Garden has succeeded in attracting customers' attention from the day they showed up on nation channel to introduce their company and organic products. Many people start to find for Soya Garden's product information. The brand has become a topical issue and continuously appeared on articles. The result shows Soya Garden had taken full advantage of television to promote its brand. The Internet is used as a crucial marketing tool for companies, especially startup companies to introduce their brand and products. Soya Garden promotes marketing activities by creating their own website and fan page on Facebook. Besides, they created a Facebook fan page with a view to update stores' daily activities, promotion, survey and study about customers' interest.

Soya Garden would get feedbacks from customers easily to complete their services and products. Until now, Soya Garden has reached 47 771 followers. However, 47 771 followers is really not an impressive number within 2 years in the case of Soya. The reactions to their fan page are only in the range of 100 - 200 likes, which means that Soya Garden does not actually speed up this tool to promote their brand.

- Sale promotion

Soya Garden focuses on the development of sales promotion when launching new stores or in some special days such as International Day, Back to school,... Soya Garden has deployed many different promotion to attract customers such as buy 2 get 1 free, check-in to get free bean curd for 20 people, get free gift, free-shipping for the bill more than 100.000 VND,... Most of their sales promotion they choose are premiums in customer promotion tools and free services in trade promotion tools. This old tactic only works in short-term and can not make customers repurchase their products.

- Public Relations

Soya Garden manages to draw on investor relations due to the huge support of financial resources, human resources, and especially business experience, management skills from Nguyen Ngoc Thuy - their investor on Shark Tank show. Besides the launching of five new stores and significantly upgraded products, with the assistance of Egroup Group, directed by Nguyen Ngoc Thuy, Soya Garden recently signed a contract and became a strategic partner with Mr. Bean from Singapore - the world's leading chain of soybean franchises, which allows the company to gain market share in domestic and international markets

Commentation: In the Vietnamese market, organic soymilk is not a new product but Soya Garden has upgraded to make it more delicious and more attractive to the customers. In the consideration of their target customers and product positioning, they currently have no direct competitors but numerous indirect competitors with the same market segment and different products or vice versa. They understand clearly and strongly the importance of various kinds of tools for their brand communication activities. The most effective tools used is one of advertising's forms: television by appearing on a reality show of national broadcast. However, Soya Garden has almost no unique features to attract more customers. Their concept might be easily copied and considered as a flat idea among the competitive marketing world up to this day. Besides, Soya Garden has not clearly identified their competitors as their brand positioning is unspecific and lacking in market research. In spite of using several types of communication tools, they still do not have a significant breakthrough in brand-building.

3.3.2. Organica

Organica builds up the brand's journey based on their founder's story of building a safe-for-health food shop while the local markets in Vietnam usually provide foods with unknown origin or planted using chemical fertilizers, pesticides or genetically modified varieties. The company's aim is raising awareness of consumers about organic food and its positive impact on human's health and environment with the slogan "Think organic, buy Organica".

Organica's brand communication activities are based on social media and press relations. Facebook fan page and has been used by the company as a facility to show their products to the users, a tool of online trading and communication with customers. After more than 4 years, Organica's fan page has 30,000 subscribers and receives below 50 likes and 5 comments every post. Organica also holds weekly events named "Saturday - Think Away" and joins monthly Green Fair Market in Ho Chi Minh City to create clean foods shopping experiences for the residents. The nature of these activities is sale promotion. In fact, there

are only 20 - 30 people attending weekly events. Mrs. Pham Phuong Thao - Organica's founder frequently appeared on economic and agriculture newspapers with the story of businesswoman setting up her own chain of food - shops when she was pregnant. The difficulty when obtaining international organic agriculture certificates, convincing farmers to change the farming methods and managing distribution process of Mrs. Thao and Organica creates the reader's sympathy and motivation for startup business community.

Commentation: The message shown on Organica's visual design and slogan makes almost no remark for the target customers nor an expression of their value based on their task of bringing to Vietnamese families fresh and healthy foods. Organica's communication activities are mainly separate and incoherent instead of making a specific strategy planned for brand-building. The information on their social media channel, which is their most used communication tool, only draws the attention of people who have already concerned about organic products and healthy lifestyle while the brand's aim is spreading eco-lifestyle to the entire community. Although Organica's renown mainly owes to press agency, the content of articles about Organica remains unchanged and becomes unnoticeable through the years. Occasional events are part of an effort to help the company stimulate sales but it has the minor effect on building customer loyalty and improving brand communication, which is proved by the number of joining. In conclusion, Organica's brand is positioned in consumer's mind same as "local clean vegetables and meat shop" when they were newly formed.

3.3.3. Biophap

Biophap's development is based on core values: organic, creative and ethical. The slogan "glow organic, glow local" is demonstrated by the range of organic spices and herbs products which are specialties of Kon Tum Province, Vietnam and the company's effort to connect disadvantaged farmers and provide them organic farming training programmes to develop a sustainable lifestyle on their own land. From the beginning, Biophap has determined their primary target is the global consumer market. Besides, specializing in exporting, the company is also inclined to produce to meet the domestic consumption demand for organic products.

Biophap's main brand communication activities are community actions. The company has been involving the Bahnar (an ethnic minority in Vietnam) in all of Biophap projects with local authority support. DPE1, the first social project by Biophap was implemented with Bahnar minority people in Dak Phe town, Kon Ray district. The company has provided seeds, fertilizer and guided farmers to cultivate since 2015. The Bahnar families instead of gathering for wine as before started to have vegetables, rice and organic beans to improve their life; after that they has grown orange, lemon, grapefruit, turmeric, ginger, peanuts. Their first achievement was about one million tons of turmeric and ginger powder granted international certifications such as United States Department of Agriculture, JAS. Biophap has run the charitable programs in mid-autumn festivals donating supplies for the children in Dak Phe, Kon Tum Province. Biophap continues to participate in sport and cultural activities organized by provincial committee for the purpose of developing a dynamic youth community in the local. Moreover, Biophap purchases fresh products with high prices and deducts 10% of profits for farmers to develop more "organic" villages in Vietnam. This is demonstrated through commitment and inspection by the Fair For Life certification organization. In 2018, Biophap expanded the production area of 100 hectares with Chu Se pepper and neighboring model farms in Gia Lai Province.

In addition, Biophap is active in international conferences and events. The DPE1 project was the only one project in Vietnam to be ranked the first in the vote for 100 projects for climate change and global warming

from all around the world, held by the French Ministry of the Environment, Energy, and Sea in 2016. They participated in Meet Europe 2018 - conference held by European Chamber of commerce in Hanoi to promote the brand to international market, represented Vietnam joining in the world's leading event focusing on organic foods Biofach held in Germany and the Forum of Trade Promotion & Investment-Development Cooperation in Food Industry - FIC 2018 in China. Furthermore, Biophap's brand journey is widely spread thanks to press. After 10 years studying and working in Europe, Tyna Giang - Biophap's co-founder with the dream of "seeking eternal harmony between people and nature" decided to return to Vietnam to work in organic agriculture at the age of 33. The story has made an effect on improving communication with potential customers, distributors and investors. Apart from the startup story, Biophap regularly appears on large number of online newspaper owing to their updated achievement and participation in agriculture and commerce events.

Commentation: Biophap with the goal of building brand based on local, societal and environmental respect has performed good communication up to this time. Bio France's currently investing in high-tech processing, information systems, along with high-cost research and development and retraining from the initial time causes their limited budget for marketing so the brand is not popular among the country. Nevertheless, Biophap has created dedicated-for-the-society image for the local community and the organic agriculture world. The company specified their goal-image of brand, selected main tool of brand communication (community activities) and started to manage marketing plan from the beginning. The evidence is that the messages came from different channels are homogeneous regarding core values of the brand and Biophap becomes one of the most prestigious startup company in the region. Brand communication influences in the relationship of the company with their customers, distributors, local authorities and also helps the company raising more capital for production expanding. Two projects of Biophap had been agreed by Agribank with the borrowing of nearly USD 600,000 in spite of the company's unprofitable situation after 3 years of operation.

In conclusion, marketing and brand communication activities in three entities above have the same limits: ambiguous brand's image, lacking specific knowledge about marketing strategy, incoherent brand communication activities, ineffective advertising efforts. The above listed are result from the management's lack of awareness of the importance of brand communication since their first priority is product quality and product development.

4. RECOMMENDATIONS TO IMPROVE EFFECTIVENESS OF BRAND COMMUNICATION ACTIVITIES FOR ORGANIC STARTUP COMPANIES IN VIETNAM

As mentioned above, organic startup business has become a newly favored trend in Vietnam. Even though the demand for organic foods is rising everyday, the numbers of organic companies are unable to communicate with their potential customers. The problem is not just how to use brand communication effectively but how to set the orientation for brand-building in the long run because a company's further progress depends on brand - the most valued asset. The organic product market becomes increasingly dynamic as a result of high demand, which requires the involved companies to address themselves to differentiate from the rivals. The messages and value composed of the brand have to be unique, remarkable and meaningful. Carefully planned marketing and communication strategy based on core values are the foundation of effective activities of businesses, especially startup ones.

In order to utilize brand communication specific tools and activities, the following recommendations are made:

- Analyzing the market: the essential step for companies to make strategy planning for brand communication. The companies need to know what is happening in the food market they are about to enter and fully understand the pressures, issues, and requirements that impacts on consumers' attitudes and decisions. Moreover, they have to determine their strengths (especially their unique selling point among thousands of "organic" labeled products) and limits, opportunities to grow and obstacles. Typical methods to analyse the situation are PEST (Politics, Economics, Social, Technology) model and SWOT (Strengths, Weaknesses, Opportunities, Threats) model.

- Setting up goals: including short-term goals, long-term goals, which play as the guideline for through operation of the company. Specific targets in accordance with brand values, benefits of society and environment and suited to current state make it easier to focus on and follow, notably for organic startup companies, who are having a countless problem to deal with at the early stage of operating. Consequently, SMART method will help the companies guide their goal setting, which are: Specific (simple, sensible, significant); Measurable (meaningful, motivating); Achievable (agreed, attainable); Relevant (reasonable, realistic and results-based); Time-bound (time-based, time/cost limited, timely, time-sensitive).

- Identifying target customers and positioning: Choosing communication tools for getting messages from the brand across depends mostly on how the company identifies the group of target customers. Distinguishing between different groups of customers assists the positioning process and finding out what segments of consumers truly support business and whether they are going to become more than one-purchase customers. Regarding organic foods, customers can be at any age, in any class of society. In the conditions of Vietnamese domestic market, the young and middle-aged women tend to have a major concern about organic foods than other objects and may become potential customers of small and retail organic companies.

- Determining the content of the message: Marketing message is the very first communication between a company and a potential customer. It only takes 50 milliseconds for users to make a judgment about a brand and the products. Therefore, the basic requirements for organic foods startup companies are building a slogan for the business and specific message for each campaign. The message content should be clear, easy to understand, focus on their values and primary product category to build impressive brand's message. Besides, strong messages should comply with the goal of the advertising campaign and combine with appropriate brand communication tools to spread messages to target customers.

- Building the strategic plans: Business needs a strategic plan which allows the business to know what actions take priority and where to allocate their limited resources. In addition, a strategic plan supports the company in making changes to meet new needs and expectation by outlining which communication activities should be held by an organic startup business with an exact timetable and expected expenditure. All actions startup made will be fueled by the strategic plans or missions, especially when selecting brand communication tools to develop the ideas of the messages. Examination during the marketing campaigns and evaluation of brand communication must be conducted regularly. The periodic assessment of these activities helps the company improve the marketing performance and timely modify the unsuitable movements.

CONCLUSION

Organic startup companies in Vietnam have appeared to satisfy the demand for fresh and healthy food. In the early stages, they have started realizing the consequence of brand communication for their

marketing activities to find the ways to introduce the brand, and communicate with the customers efficiently via some kinds of brand communication tools such as Advertising, Sale Promotion, etc. However, most of the organic startups are facing many difficulties in taking advantages of these tools to get the messages across and reach the target customers. The reasons come from lack of knowledge brand communication tools and lack of skills to combine different types for the marketing plan. Thus, the study has drawn out some recommendations for organic startup businesses to hope that they would find out the best solutions to promote their own businesses.

To complete the research, we profoundly thank Ms. Nguyen Thi Van Anh (Academy of Finance) for her inspiration, trust, and guidance. Due to limited knowledge and resources, shortcomings are inevitable, our team would like to receive contributions from scientists as well as teachers to the research for further improvements.

VIETNAMESE ENTERPRISES INVOLVED IN THE GLOBAL VALUE CHAIN IN THE CONTEXT OF ATTRACTING NEW GENERATION FDI

Nhu Trong Bach* - Dao Duy Thuan**
- Mai Xuan Thai*** - Pham Thi Nga****

ABSTRACT: *In summary, attending global supply chain has been bringing more development opportunities for Vietnamese enterprises in particular and Vietnamese economy in general, as well as contributing to Vietnam's export growth which helps improve the balance of trade. However, the Viet Nam is known as a country having a low position in the global value chain. The reason is that Viet Nam has just conducted the manufacturing stages which bring one of the lowest value added in the supply chain such as assembly, handcrafting and so on. Therefore, the business connections between domestic investors and foreign investors are vague, and the spillover effect of technology and labor productivity from foreign partners to the domestic enterprises is limited. For the reasons mentioned above, there are the factors preventing the Viet Nam's development from the process of attracting new generation FDI.*

Keywords: *The global value chain, FDI, new generation FDI,...*

MENTIONED

Attending higher value added activities and enhancing the connection between domestic enterprises with foreign investors and international markets can help Viet Nam move up to higher position in the global value chain.

Engaging in the global supply chain has been bringing more beneficial for the development of Vietnamese companies in particular and Vietnam economy in general, as well as contributing to the export growth of Vietnam with more stable balance of trade.

The next is the benefits such as creating more favorable conditions which helps Viet Nam attract foreign direct investment (FDI) with higher value, more advanced technology, in order to improve the competitiveness of economy and institution in Viet Nam.

However, the position of Viet Nam is low in the global value chain nowadays. The cause of that is that Viet Nam has just conducted the manufacturing stages which bring one of the lowest value added in the supply chain such as assembly, handcrafting and so on.

Figures indicate that about 300 companies in Viet Nam is qualified to take part in the supply chain, but they only supply the spare parts, has not involved in producing main products yet.

*** Government office, Viet Nam

**** Trade Union University, Viet Nam

Moreover, business connections between domestic investors and foreign investors are faint, the spillover effect of technology and labor productivity from foreign partners to domestic enterprises is limited. Those are the factors which will prevent the Viet Nam's development from the process of attracting new generation FDI.

2. THE GLOBAL VALUE CHAIN AND ATTRACTING NEW GENERATION FDI IN VIET NAM

2.1. Global value chain

"The global value" started from the definition of "Value chain". Michael Porter initiated in the 1990s. According to him said that "value chain is a set of activities to put a product from the definition to the process of using, even after that. Value chain consisted of activities such as design, production, marketing, distribution, and after-sales service to final consumers. These activities can be performed the scope of a business or distributing to different companies". These value chain can be conducted in the range of a geographical area or spread across multiple countries and become global value chain – Global value chain.

Basing on the opinion of Michael Porter, two American researchers are Raphael Kaplinsky and Mike Morris was had a concept in 2002: "Global value chain is a production line of business in the form of globalization, in which many countries participate, mainly are companies take part in another processing from design, production to distribution and supporting consumers". In fact, Global value chain is only a new approach, more comprehensive about the division of international labor, mean that any companies can be involved in the production process of an export product, that is recorded as attending the global value chain. However, approaching the division of international labor according to global value chain will help enterprises are more know about their position in the international markets, in order to be able to actively select appropriate participatory steps to achieve higher profits. These activities may start from a company performed by their self or have a division of many companies in the scope of a geographical area or more. The idea of "Global value chain" is particular attention is paid to the enhancement of knowledge of the value chain in which activities are carried out by many enterprises in a broad geographic area. So, this is the reason why people call these chains is "Global value chain".

2.2. The position of Viet Nam enterprises in the global value chain.

Viet Nam economy is opening and integrating more deeply with the global economy. Since WTO accession to now, Viet Nam has signed many trade agreements, this accession brings more beneficial for Viet Nam as well as contributing to promoting foreign direct investment (FDI) which is investing more and more, with a purpose enhance the development of export goods in particular and the growth of Viet Nam economy in general.

Vietnam has successfully attracted investment from world leading corporations in many fields, for example:

- Samsung: Investing in over 20 billion dollars to build many factories which mainly produce the mobile phone, screen, and other products; a half number of Samsung's mobile-device produced in Viet Nam. The Sumsung's profit from exportation exceeded 50 billion USD per year, the figures accounted for 25%, compared with the total export **turnover** of Viet Nam. There are 130.000 employees who currently working in Sumsung, to reach the proportion of employee who take part in the research and application are

5% that those people will enjoy preferential policies for hi-tech investment, the Group is in the process of recruiting 6,500 people working in the field of research and application.

- Intel: Investing in over a billion dollars to build a plant specializing in assembly and testing micro-chip. This is Intel's largest plant in the whole world and creating jobs for more than 3,000 laborers and outsourced workers.
- LG: LG Group invests more than US \$ 4 billion in Vietnam, producing all kinds of products from home appliances, electronics to chemicals and cosmetics.

However, investors all agree that low labor, energy and preferential tax rates are the main reasons for investment in Vietnam, coupled with political stability and the need to diversify investment locations. Out of places other than China. Almost none of the enterprises considered that good experience or competitive local supply chains are the strength of Vietnam, this is the huge problem of "attraction strategy for new generation FDI". In fact, companies that operate in China, Thailand, or the Philippines have better skilled and better-supply chains. When labor cost significantly rise and tax exemption no longer exists, there will be more content needs to improve when planning development of more advanced skills and the local supply chain competitiveness needed to maintain and attract investors in an economy with higher incomes.

Indeed, many items with advanced technology, secrets, exclusive resource and high value-added products have great benefit which not belong to Viet Nam.

The figures of General Department of Customs recorded in 2007 shown that foreign direct investment capital (FDI) reached over US \$ 160 billion, contributes about 22-25% of total social investment and about 55% of industrial output, 70% of export turnover, 20% of GDP, 18% of budget revenue, direct job creation for about 3,7 million labors and millions of indirect workers... but the effect of FDI areas are not as expected. Vietnamese enterprises are limited when they involved in the global supply chain.

At this time, small and medium sized enterprises in Viet Nam still lack of the capacity to participate in the supply chain for foreign plants investing in the domestic market. Only 36% of Vietnamese enterprises integrate into the export network, while Malaysia and Thailand account for about 60%. Only 21% of Vietnamese SME are involved in the global supply chain. The share of Vietnamese SME in exports is much lower than that of other countries.

In which many foreign investors are strictly controlled from the stage of putting raw materials and components into all the products exported to the world market, we only enjoy the processing. Most of the exports of telephones and components belonged to the top two FDI enterprises, Samsung and Intel, but the components were mainly imported from the factories of the two groups investing in China. Although "set a record" on telephone exports, we only enjoy the assembly and assembly of that huge value chain

As a typical example of Textile and Garment industry, the activities of Vietnamese textiles is mainly outsourced to customers in the form of export processing. CMT accounted for the lowest of valua added. As many as 90% of Vietnam's garment enterprises are involved in this sector, outsourcing company for the famous brand and there are almost no direct distribution partners in the international market. Vietnam's contribution to finishing a jacket is only about 11%, for shirts is 25%, trousers is 15% and other products are regularly under 25%.

Therefore, the situation of Vietnamese garment is quite dependent on the source of imported fabrics, in which the import ratio is 80% total demand. These figures consist of China (50% of total value), South Korea (18%), Taiwan (15%), and CPTPP about 7%. Localization rate is about 50%. Accessories also have to import up to 70%.

The reason above shows that Vietnamese enterprises have started to be involved in the global value chain, but are still in the outsourcing stages or importing raw materials and components to produce with the main purpose is cheap labor. This is a stage with lowest value. To resolve these problems, Vietnamese enterprises should attempt to promote their advantages as well as engage in the production process with high grey matter to achieve greater value in the global value chain.

2.3. Attracting new generation FDI need more from their participation into the global supply chain of Vietnamese enterprises

The appearance of FDI enterprises are not only an important link, but also create a leverage to Viet Nam attend to the global value chain, especially are major contributions to exports and contrast. Further participation in global value chain is a tool to get noticed in the strategy to attract new generation FDI.

In the strategic orientation of attracting new generation FDI, Vietnam mainly focuses on attracting capital flows towards value-added production activities, introducing new technologies, research and development activities. It is particularly important to have a strong spillover effect to help local firms integrate into value-added chains as well as to catalyze the emergence of a new generation of domestic firms is stronger.

The main mark of “Attracting new generation FDI strategy” is the shift from attracting appropriate investors to ‘products’ in Vietnam to developing appropriate products (It means that business environment and appropriate investment conditions) for the type of investment that Vietnam needs in the future. As such, it is possible to maximize the spillover effects and added value of FDI.

Connecting FDI enterprises with domestic enterprises is still limited.

Figures indicate that about 300 companies in Viet Nam is qualified to take part in the supply chain, but they only supply the spare parts, not involved in producing main products. In which, only 2% are large enterprises, 2-5% are medium enterprises, the rest are small and micro enterprises.

Besides, the connection between the foreign and domestic enterprises are limited. The evidence has shown that the proportion of products bought by FDI enterprises from domestic processors only accounts for 26.6% of the total value of FDI inputs, while the rest is purchased from other FDI enterprises.

It is necessary to resolve to domestic enterprises can attend to the global supply chain, especially in the context of increasingly deep integration into the world and regional economies. Moreover, The Fourth Industrial Revolution is coming and it may ensure that every nation, every people, every community, organizations, businesses, each people of great opportunity to be able to reach their targets and develop even inverted in the world economic map. In contrast, The Fourth Industrial Revolution may be considered a terrible storm, especially for developing countries like Viet Nam, it is not the storm area which is a global storm, which eradicates many traditional trades and jobs that can push millions into unemployment, which upset many of the values that have been shaped by many. Last year, increasing the gap between rich and poor in each country as well as increasing the development gap between countries around the world.

Because of this, it is gradually changing the trend of FDI on the world and Vietnam is no exception. The increasing level of complication as well as the wide affection on global. They will continue in the context of trends about scarce resources, urbanization, combined with the development of technology with fast speed will open many opportunities for many countries access to global FDI flows. It also brings a lot of challenges if the enterprises of those countries do not participate in the global value chain.

3. SOME SOLUTIONS TO IMPROVE THE POSITION OF VIETNAMESE COMPANIES IN THE GLOBAL VALUE CHAIN TOWARDS ATTRACTING NEW GENERATION FDI.

Firstly, focus on developing supporting industries to help Vietnamese enterprises improve their competitiveness and participate in the global value chain.

The development of supporting industries (SI) is considered to be an effective solution to Vietnam's trade deficit as well as to attract international investment. Therefore, it is necessary to concentrate resources to improve the capacity of domestic manufacturing enterprises, helping enterprises to participate in the global supply chain.

In order to develop supporting industries, three factors must be taken into consideration: producing quality input resource; developing standards and technical regulations; and having supporting industrial clusters and complexes of assistive technologies. The construction of complex industrial support must be a priority ... even establish a trading floor for supporting industries.

Therefore, the government should develop appropriate policies to support the companies in the industrial zones / clusters to accelerate the growth strategy based on the supply to domestic customers and towards export. The development of supporting industrial zones / clusters has become a nucleus for the development of manufacturing industries, which requires large capital and skilled human resources to expand and develop production capacity, strengthen the ability to cooperate, associate with multinational corporations ...

Second, strengthen linkages between FDI enterprises and domestic enterprises

To do this, in addition to improving the quality of labor, narrowing the technological gap between domestic and FDI enterprises also needs to pay attention to geographic factors. Geographic distance also has an impact on this connection. The formation of separate industrial parks and export processing zones, separating FDI enterprises can help improve the efficiency of operations and export. However, it has made the positive spillover effects on the private sector in the country limited.

Therefore, when governments and local governments design their own industrial zones for FDI, they must also consider the connection with industrial parks for small and medium enterprises.

In addition, the promotion of investment from passive promotion to active promotion in some priority sectors is reviewing current incentive policies. Opening a few of service sectors is important in order to boost the competitiveness and growth of foreign investors, promulgate strategies and promote foreign investment. Government needs to breakthroughs more in attracting high-tech enterprises, we are not only interested in connecting FDI enterprises with domestic enterprises but also creating conditions and encouraging enterprises and corporations to set up the center of research and development (R & D) with the participation of engineers in the country. We need to be stronger and more committed to improving the quality of FDI, linking FDI and private firms in order to get more participation in the global value chain.

Thirdly, the attraction of new generation FDI is associated with the transfer of technology in a manner consistent with the 4.0 technology revolution

According to the National Center for Socio-Economic Information and Forecast, the Ministry of Planning and Investment says that technology innovation in Vietnam is not sustainable compared to neighboring countries, focusing on reducing costs rather than putting New products to dominate the market.

Vietnamese enterprises have a rapid change in productivity, however, the contribution of technological improvement is not much. This is true for both domestic and FDI firms. In general, in recent years, enterprises have actively raised the technology, however, FDI has not that exceeded compared to domestic enterprises. The rate of technology from modern countries (u & America) is low, while the rate of old technology from China is quite high, FDI is using more than domestic ones, the trend is declining.

Vietnam has many enterprises doing research and development (R & D), but the actual expenditure on R & D is not high. Spends primarily on R & D staff training, rather than buying patents. Technology transfer is mainly in the form of buying machinery and equipment with technology. FDI buy more. There is no difference between the size of the business. The channel is mainly transferred to other domestic companies.

In the context of the ongoing industrial revolution of the forthcoming 4.0, one of Vietnam's top priorities is to attract high-tech, modern, friendly projects. environment, energy efficiency, and materials. It is therefore necessary to take into account the attraction from high-tech countries which are the United States and EU, in order to create synergies for domestic firms. , creating opportunities for enterprises to participate more in the global value chain, and this has a direct impact on the attractiveness of FDI enterprises.

Fourthly, attracting new generation FDI with the targets which are investors from US and EU.

Apart from the strategic capital inflows from Korea, Japan and Singapore, Vietnam needs to attract more investors from Europe and America. The attraction of investment capital from the US and EU is expected to bring high technology, modern, good spread and high economic efficiency. Accordingly, the flow of investment from US and EU investors focuses on areas that have good technological diffusion and high technology content such as: renewable energy, information technology, education, health, services, finance, banking, transportation, and tourism.

SUSTAINABLE ECONOMIC IN PUBLIC FINANCE: CASE STUDY IN BAC GIANG PROVINCE

Nguyen Trong Co*

ABSTRACT: *Public service is a special type of service, which serves the common and essential needs of the society. The State is responsible for securing these services through direct or authorized provision by facilitating the delivery by non-state sector. In any cases, the State still plays the role of regulating, ensuring the supply and ensuring social equality in service access.*

On October 25, 2017, Resolution No. 19/NQ/TW, the sixth plenum of the XIIth National Party Congress, set the objective to “promote the provision of public non-business service delivery in accordance with the market mechanism, and boost the socialization of public services “; aiming to improve the quality of public service delivery, so that people will be more and more satisfied with the services they receive. Thus, the goal of this Resolution is to ensure the harmony between the three dimensions of development, ie. sustainable economic growth, prosperous, equal, stable and multicultural society, and sustained environment and natural resources.

The goal of developing public service delivery is towards sustainable development. Therefore, within this paper, the author examines sustainable development in the public service sector by answering three questions: first, the context of public service delivery; secondly, how to develop sustainably in the field of public service delivery; and thirdly, survey, analysis and practical application in public service delivery in Bac Giang province as a case study.

Keywords: *Public services, sustainable development of public service delivery*

1. INTRODUCTION TO THE CONTEXT OF PUBLIC SERVICE DELIVERY

Public service delivery policy is a collection of relevant decisions to set objectives, find solutions and select policy tools to facilitate public service delivery in accordance with the overall objective set to get Vietnam towards being rich, strong, democratic, fair, civilized.

Over the past years, the Government has issued many documents related to public service delivery policy, such as Decree No. 43/2006/ND-CP, dated April 25, 2006, “Regulation on autonomy and self-sufficiency in task delivery, organization of structure, payroll and finance of public service delivery units “; Decree No. 85/2012/ND-CP dated October 15, 2012, on the “Mechanism of operation, financial mechanism for public healthcare service units and the prices of medical examination and treatment services at public medical examination and treatment establishments”; Decree No. 16/2015/ND-CP dated February 14, 2015, with regulations on “Autonomy mechanism for public service delivery units”; Decree No. 54/2016/ND-CP dated June 14, 2016, with regulations on “autonomy mechanism of public science and technology organizations”; Decree No. 141/2016/ND-CP dated October 10, 2016, stipulating the autonomy mechanism of public service deliver units in the economic and other public service fields.

However, there has been delay in the promulgation of documents for detailing and guiding, especially at sectoral, industrial and local levels. Moreover, the objectives set for public service delivery have not been clear and thus evaluation with regards to policy reforms in public service delivery remains difficult. Many normative documents needed to create important conditions for the implementation of the autonomy mechanism for public service delivery units are still slow to be promulgated or amended or supplemented: for example documents guiding on the identification and approval of employment positions, the quota of state employees, labor contracts ... This has affected the operation mechanism of public service delivery units.

According to PAPI's research on the results of public service delivery that focused on measuring the effectiveness of the provision of four basic public services to the population, most of the provinces have improved their public service delivery. Six aspects measured in the research include *grassroots participation, publicity, transparency, accountability, public sector corruption control, public administration and public service supply*. Synthesized scores given for these indices from 2011 to 2017 are as following:

Figure 1: Average PAPI index score for the years 2011-2017

(Source: PAPI Report 2017)

In general, all provinces achieved remarkable improvements when comparing the results for 2017 with those of 2011; People were more satisfied with the accessibility and quality of the public health services and of the public primary education services in 2017. However, according to many people, the quality of public services was not as expected.

In 2017, no province/city got to the highest scoring group in all 6 content indices. Also, it is worth noting that there is a large gap between the provincial highest PAPI score (39.52 points) compared to the maximum expected score (60 points) on the PAPI synthetic score scale from 10-60 points. In addition, the gap between the highest scoring locality and the lowest one is still rather high (39.52 points versus 33.09 points). Thus, local authorities need to better fulfill their mission of serving the people in order to meet the higher expectations and ever increasing demands of the people.

Implementation of the autonomous solution among public service delivery units has still been limited. The organization of public service units has not been scientific, not reasonable, fragmented and scattered especially for many public service units which are small. There are still many non-business service delivery

units that have overlapping functions, tasks and area of activity; Many units still operate in areas of public service delivery that could be provided by civil society organizations and thus the involvement of state units is not necessary. The organization of public non-business units is conducted along industries, areas of expertise and administrative boundaries; There are cases where there are too many public service delivery units working in the same industries or areas of expertise in one geographical area. These cause waste in the use of facilities and human resources. The number of units operating with autonomy is still too low. The transformation of management mechanism into enterprise-like model has been slow.

Public service units have not been active and taken their initiative in the rearrangement, and streamlining of their apparatus. The number of staff has increased rapidly, especially in the fields of education and healthcare, but the quality of staff has not been high, leading to limited public satisfaction with public services. The staff structure has been unreasonable and inappropriate; the proportion of staff working in supporting positions is still high. The employment structure has thus been redundant in one way and lacking in the other: abundant in the number of people working in executive or supporting positions while short of professional staff.

According to government statistics on the number of civil servants nationwide: Total number of public servants under payroll in state agencies and organizations from central to district levels in the period 2011-2016 have been declining, especially in the period 2014-2016, with an average annual decrease of more than 4,000 and a continued decline in 2017.

In the period 2011-2016, the total number of people working in the public service units of ministries, sectors and localities has risen slightly.

Table 1: The number of state employees for the years 2011-2016

| The number of people working in non-business unit | 2011 | 2014 | 2015 | 2016 |
|---|-----------|-----------|-----------|-----------|
| | 1,971,577 | 2,062,204 | 2,087,912 | 2,093,313 |

(Source: Government statistics report)

Public service delivery units have not been granted the autonomy in recruiting and managing their employees from monitoring and evaluation to emulation and rewarding; in restructuring their staff along ranks, professional titles and qualifications to suit their functions, mandate, recruitment, human resource planning, training and retraining, and professional upgrading. Criteria for assessing the level of performance of an officer in each professional area have not been established. On the other hand, staff classification and assessment are still conducted in unprofessional ways swayed by informal connections and a lack of seriousness or only conducted for formality purpose and thus, quality assessment of state employees has not been substantial enough to form the basis for staff restructuring. The planning, use of state employees, and the training and upgrading of state employees have not been interlinked. These limitations have made it difficult to implement the autonomy mechanism among public service delivery agencies.

In addition, new recruitment has not been successful in attracting talented people. The quality of training of state employees at training institutions is rather poor. Labor productivity has been low. Salaries are low while wage increase has been modest. In many public service delivery units, the allowed number of employees is high while the amount of work delivered is small due to the contracted need for their services. Examples include units working in continuing education and vocational training. Such a situation has led to wastefulness in salary payment and in the use of facilities. The task of attracting talents to work in public service delivery units has been with modest success due to limits in mechanisms, wage payment and use of

human resource. Average income of state employees in public service delivery units has not been improved compared to other sectors in the society.

In terms of financial autonomy, public service delivery agencies granted with autonomy still have to comply with the ceiling fees set by the State, while the fee collection has not been sufficient to cover their operating expenses and not close to the specific cost requirements of each training area and have not met the quality and branding requirements of each public service delivery unit. It is stipulated that the service charges be calculated properly and adequately to cover all costs. Yet the public service delivery units are required to spend 40% of their revenues to create a source of finance for wage reform. The two-pronged pricing approach applied for public and non-public institutions has been maintained in the provision of services, leading to overloads among public service delivery units.

In addition, the allocation from state budget is still conducted on an average basis, based on inputs and not yet linked to results and performance. Management based on annual budget allocation and staffing, but not linked to outputs, has not encouraged units to improve the quality of public services. Many service delivery units have not clearly identified their revenue structure and the ability to self finance their regular expenditures as a basis for determining the exact level of budget support needed. The estimation of budget revenues and expenditures in many service delivery units has not reflected all revenue sources. In many cases, estimations have been made with revenues lower than the amounts actually collected in the previous year and expenditures higher than the amount settled in preceding years in order to maximize the support from the state budget while no legends and reasonable explanations are provided to justify the increase.

“According to the report of the Government, the renovation of the organizational system of public service delivery units has not been up to requirements. Organization of these units has remained cumbersome, scattered, petty and overlapping. In addition, state budget expenditures for public service delivery agencies are too large. Expenditures from the state budget made by public service delivery units are large, accounting for more than 50% of the total expenditures of these units (about VND 140,000 billion in 2017, with an increase of 2.2% compared to 2016)

Thus, the public service delivery sector in our country still needs to be refined and adjusted in many areas to ensure that the objectives and tasks set are met. In that context, the author has identified some key issues that need to be seriously considered and implemented towards the goal of sustainable development in the field of public service delivery as following:

2. SUSTAINABLE DEVELOPMENT IN PUBLIC SERVICES:

Firstly, to clearly distinguish among groups of units and types of public services for appropriate steps and roadmap;

First of all, it is necessary to reach a common understanding about the novel approach to be applied in the building of mechanism and policies for the delivery of public services based on classification of them into groups: essential services (fully state-funded); basic services (partly state-funded); other services / value added services (state-sponsored by cases). This is to develop appropriate policies and supervision procedures.

In which: essential services are basic and essential services for the people, needed to ensure the foundation for social development but private sector would not want to participate into the provision. Thus the State has full responsibility from initial investment in building infrastructure, financing and organizing the supply for the services to supervising although it is possible that the State authorize some non-state actors to take part in non-key areas.

Basic services and other services may be authorized to be provided by the non-state sector following different levels of socialization, so the State would only manage, intervene, supervise and regulate using market mechanism or improved institutional and management tools as well as provide direct financial support to disadvantaged people in accessing the services.

The author argues that classification of groups of service providers is a matter of urgency because without clearly classifying the types of public services according to their characteristics as mentioned above then the socialization would be confusing: situations might happen where the State has withdrawn from current role while the private sector would not want to take over or they would not be able to provide the services with better quality or where the State continues to subsidize the provision of services in which the private sector is willing to involve themselves and can do better.

Second, to remove subsidies through prices, and step by step gearing towards covering all costs:

In order for service delivery units to operate effectively and to develop, the service charges should be enough to cover all necessary operating costs and to be close to the specific cost requirements of each training sector as well the quality and branding requirements of each public service delivery unit. Therefore, the units need to step by step apply the principle of full cost accounting in the financial management of public service delivery while ensuring the principle of rational charging for services.

In particular, it is necessary to distinguish between the cost of services (the cost of the supply unit in the process of providing services) and the payment made by the people for using public services. Specifically:

- + The cost of public services must be based on the principle of “full cost”, whereby total costs must be determined on the basis of “correctness and adequacy” to cover all reasonable expenses to ensure the quality of services.

- + Service charge must be determined on the basis of service cost and some other conditions, following the principle where “increased cost does not always entail corresponding price increase (tuition fee, hospital fee).

Thirdly, the State provides direct support to special policy beneficiaries for use of public services.

Here, the state should develop a common approach for extending direct support to policy beneficiaries, disadvantaged groups and special beneficiaries in society instead of funding through service providers.

That is, state support should be made not through integrated subsidies in price but directly to the poor, ethnic minorities, families with outstanding revolutionary services, the vulnerable and risk-prone people. As social policies will not be integrated into service prices the providers would be able to account properly and fully for all costs and to re-invest to expand the scale and to modernize their services. Direct support for those who lack access to public services will directly benefit them, and thus address the inequalities created by the market during resource allocation. This new way of doing would also help addressing the problem where social policies are integrated into the financial settlement of public service delivery units to gain local benefits and push the burden onto the state shoulders.

Fourthly, to reform the expenditures made from the state budget for the public service deliver units:

To modify the method of state financing, from financing suppliers to giving support to service users in accordance with output products:

- To implement the mechanism of bidding for the provision of services between units (including public or non-public ones) such as bidding for research and bidding for training provision (instead of appointing and quota granting as current practice).

- Intensifying the implementation of the ordering mode, assigning tasks based on the system of economic-technical norms.

- The State shall use public service funding to provide output services according to the essential levels of the services (eg services such as primary education, preventive medicine, basic research, researches for the purpose of state management should be completely state financed);

- Partial state funding can be extended to the provision of basic services while no fund is available for premium services;

Fifthly, to promote the granting of autonomy and self-responsibility to public service delivery units

“To renovate the organization and operational mechanism of public service delivery units in the direction of enhancing the autonomy and self-responsibility over organizational structure, staffing, personnel and finance; to boost socialization of the public service sector, attracting other economic sectors’ involvement in this field”. This way, the reform is to essentially granting autonomy and self-responsibility to public service delivery units as a subject in the service market, accepting competition with other actors, making effective operation as the measuring ruler and constantly improving the quality of services and enhancing their responsibility to consumers. Such a reform also allows public service delivery units to have the autonomy in restructuring their organization, payroll, labor, financial management and cooperation with the non-state actors to maximize their benefits without being hampered by administrative decisions. The higher financially independent the unit become, the higher autonomy it enjoys in the implementation of its tasks, the organization of its structure, in deciding its personnel and allocation and use of financial resources.

Sixth, to establish a useful feedback mechanism and to encourage the involvement of social and professional associations to take part into public service delivery, to provide funding and to monitor and supervise the quality of public services.

The accreditation of public service delivery is thus now conducted by accepting market competition and by giving consumers the opportunity to select and screen products; by modernizing and improving the governance capacity of public service delivery units; by building the professional ethics of the service providers.

In addition, by accepting competition the services could also be cheaper. Furthermore, service providers would always find ways to improve their product quality to attract consumers, and thus new attitude and a sense of responsibility in service delivery to the people will develop. The modernization and enhancement of the governance of public service delivery units play an indirect role in accrediting the service quality right from the “input” standards, because unlike conventional goods of which the prices often show their value, the value of the services is not entirely expressed in price, but is also reflected in indirect indicators, such as the level and skills of the staff involved in the service process; the process of organizing and providing services; facilities and technical conditions; ethics and service style; satisfaction level of beneficiaries; trademark...

However, all those criteria can only be assessed and verified through a modern, professional, open and transparent governance system. Modern and professional management systems create a “filter” to recruit and employ competent and ethical staff, dismiss employees who do not meet the requirements; develop scientific standards and procedures for activities for all employees to abide by and to act responsibly; shape the professional ethics of employees which are reflected in their relationship with the product as well as with the service consumers. Working in any sector requires regulation by professional ethics and the provision of public service delivery is no exception. Furthermore, the lack of ethics in public service delivery will directly affect human life (such as in medicine), physical or mental injury (eg, education, culture, science and sports, etc.), creating immediate or long-term consequences for the society, because social services differ from conventional goods where production and consumption occur at the same time.

3. CASE STUDY IN BAC GIANG PROVINCE

3.1. Difficulties and limitations:

Decree 16 has taken effect since April 6, 2015 and replaced Decree No. 43/2006/ND-CP dated April 25, 2006 by the Government to regulate the autonomy and self-responsibility of public service units in their delivery of state mandate, their organizational structure, payroll and financial management. However, up to now, a number of issues have remained unsolved in the implementation of the decree among public service delivery units. Thus Decree 16 has not been able to play the role intended for it. Specific difficulties include the following:

Firstly, the perception of people and society on the renovation of operation of public service units is still limited and incomplete. There is still a dependant psychology for continued reliance on state subsidies; A large number of staff in management and internal administration are slow in their acquisition of better professional qualities and a new way of thinking. Many have remained bureaucratic and imperative, especially among the units providing monopolistic or less competitive services.

Secondly, the implementation of autonomy and self-responsibility of public service delivery units has been sluggish, with no breakthrough developments. The separation between state management functions and the provision of services between state administrative agencies and public service delivery has not been clear and effective due to slow and unsynchronized promulgation of mechanisms and policies to implement Decree No. 43 on granting of autonomy and self-responsibility to public service delivery units.

The results of the survey on the performance of the units beyond the tasks assigned by the state show that:

Figure 2: Survey results on the operation of public service delivery units in Bac Giang province beyond tasks assigned by the State

(Source: Elaborated by the author)

General situation of public service delivery units in Bac Giang province. Apart from the activities assigned by the State, 83% of the public service delivery units in Bac Giang province do not have any other activities. Only 17% of the public service delivery units have extra activities. Examples of those with extra activities include Bac Giang Center for Application of Science, Technology Advances. This center involved in some joint venture activities to produce a number of service products; the Informatics Center – Gazette also reported having activities to provide IT services to other agencies/units.

Besides, most answers received was negativeto the survey question: “to report about accounting preparation work to implement Decree 16/2015/ND-CP in your unit”. The units explained they had not fully grasped on the implementation of the Decree and thus had not made any changes in their accounting practice.

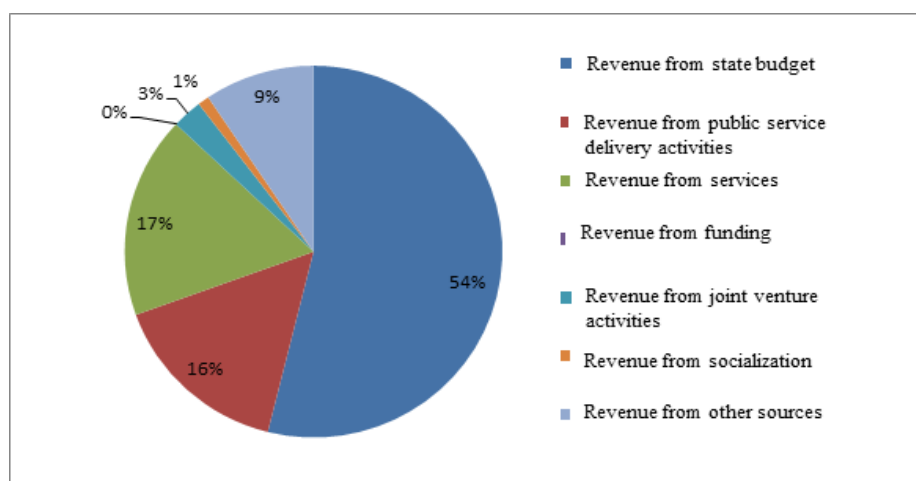

- The determination of budget allocation levels for implementation of the autonomous mechanism for professional agencies has mainly based on the payroll, and not linked to the efficiency of their work; The scope and extent to which saved funds could be used for welfare activities have not been clearly defined so there has not been uniform implementation among agencies.

- A number of units still have their own calculations while developing their budget for state funding and thus they have not included all revenue sources or have budgeted with a lower total revenue compared to the actual revenue generated in the preceding year and with higher expenditures so that to gain more support from the state budget, setting their estimated expenditures at higher level than that of the previous years, while attaching no legends and reasonable explanations for the proposed increase.

- Some units have inaccurately identified their revenue sources while the competent agencies have not yet verified and properly evaluated, and thus have classified these units to the wrong groups eligible for granting offinancial autonomy and self-responsibility.

- The implementation of the financial autonomy mechanism in some areas has been with slow reforms. The units have not taken the initiative in the effective mobilization and use of state and social resources for service development (service delivery units under the Department of Culture, Sports and Tourism, Agriculture and Rural Development such as Mushroom Breeding Center, Urban Drainage and Sewerage Center ...). More than 50% of public service delivery units are still 100% funded from the state budget (mainly in the fields of education, healthcare, justice, science and technology, culture, information and sports). Public service delivery units in this group mostly provide public services with little possibility of socialization.

Figure 3: Results of the survey on revenue structure of public service delivery units in Bac Giang province

(Source: Elaborated by the author)

Results of the survey on revenue structure of public service delivery units in Bac Giang province show that: The majority of public service delivery units in other sectors get revenue from the state budget. Of which: 54% is from state budget; The rest of revenue is generated from services, grants and joint ventures. Concretely, 17% of the revenue is from services, 16% from public service delivery activities, and 4% from other sources of revenue.

The main reason is that these units are tasked to serve the requirements of state and social management in the province. Particularly the tasks include: mobile film screening for political purpose (Bac Giang Film and Film Distribution Center); management and protection of the existant forests, maintenance of the area of protection natural forests and development of forest resources (Cam Son Protection Forest Management Board); State management of dykes (Bac Giang Irrigation Department); Judicial duties (legal aid centers), some medical centers, etc. Besides, the competitiveness of public units in the province is still low while the quality of public services has not met the needs of society. There are also areas which have been decentralized to local levels or attracted strong socialization but still are assumed by the State.

- Some public service delivery units have had a stable source of income, but they have made limited contribution to the state budget. These include colleges and training centers, district level general hospitals, and some vocational training centers. This is because the revenues generated have been used mostly to finance employment contracts and to form funds.

This is reflected in the results of the survey on the distribution of the funds saved in 2015 in some typical public service delivery units in Bac Giang province as following:

Figure 4: Results of the survey on distribution of savings in 2015 by public service delivery units in Bac Giang province

(Source: Elaborated by the author)

- There are some units which have large number of labor contracts but low income for employees due to decreasing revenues for objective reasons (professional colleges, vocational training courses which have seen their number of students fall), for historical reasons (some centers belong to the Department of Agriculture and Rural Development, Department of Culture, Sports and Tourism as a result of the process

of separation and merging) and for the lack of capacity or conditions to increase their revenues from public service delivery (a number of district centers, district health centers ...).

- There is a difference in the income of employees between revenue-generating public service delivery units and non revenue-generating public service delivery units. The difference is because of the difference in sectors of activity and assigned tasks (project management units and hospitals have higher revenue compared to other healthcare centers and education institutions in the same locality).

Thirdly, the determination of prices, fees and charges for services of most units have not been understood and conducted well.

Figure 5: Survey results on the determination of service prices at service delivery units in Bac Giang province

(Source: Elaborated by the author)

The results of the survey on the determination of service prices among public units in Bac Giang Province show that most of the questioned units have not conducted the pricing exercise for their services. One of the main reasons is that the concept of public service charges is relatively new to most educational public service delivery units. For example some accountants still wonder what direct costs, what indirect costs, and what fixed asset depreciation are and how to calculate, identify and recognize these costs? Currently those concepts have been developed for public services in healthcare while none have been available for services in other sectors. This conceptualization exercise, meanwhile, is of great importance to bring Decree 16/2015/ND-CP into life, because only after direct and indirect costs have been determined then we can proceed to determine the cost of public services, to serve as a basis for calculating the service costs, and the breakeven point of the service delivery unit. At present it is difficult to determine direct and indirect costs. Thus, this has posed a difficult problem for the service delivery units because only when the direct and indirect costs can be identified then it is possible to ascertain the break-even price and the break-even point. Moreover, the concept of cost, revenue and profit and the problem of determination of fixed asset depreciation in public service delivery units are also the factors that cause headaches to accounting departments in units in accessing this Decree.

Finally, many economic-technical norms and industrial standards have been out of date or non-existent, or have proved unreasonable and need addressing. The study and development of documents to stipulate the criteria for assessing the levels of completion and quality of non-business activities of the unit granted autonomy and self-responsibility have not yet been conducted. This has prevented payment to be made according to the level of work completion. Thus income payment in some units is still made on an equalized basis

3.2 Solutions for sustainable development in public service delivery in Bac Giang Province

3.2.1. To eliminate subsidies through price, and step by step to fully cover costs:

In public service delivery units, the public service prices stipulated in Decree 16/2015/ND-CP are calculated on the basis of each service, following the principle of properly and adequately accounting for all costs (including direct costs such as salary payment, allowances, contributions stipulated in the laws, expenses for materials, tools, machinery, energy costs, repair costs of fixed assets; depreciation of fixed assets, labor hire, ... and the cost of indirect management).

Public service delivery units in the province should pay attention to the implementation roadmap scheduled for each type of activities as follows:

(i) The transition into price application of public service delivery would take place in three phases:

Phase 1: Public service delivery units are only allowed to fully account for the wages of direct and indirect labor in the prices of their public service in accordance with the state-regulated pricing framework. This is a transitional phase in order to gradually adapt for both public service delivery units themselves and the society. At this stage it is necessary that:

+ For units of Group I: the implementation must be concurrent with the cease of state budget funding for regular expenditures, the transfer to cost coverage is conducted based on their operation results and the performance of assigned tasks.

+ For units of Group II: the prices determined must be paralleled with the quality of service provision. The stipulation is clear that payment rates applied for patients, pupils and students must be suitable to socio-economic conditions of the locality; compensating subsidies from the state budget are made available to cover the operational costs of the units.

Phase 2: Public service units are allowed to account for the full cost of salaries and management costs. Depending on the specific conditions of each locality, service charges could be gradually increased until management expenses are fully covered. The implementation should be carried out among the units of Group I first, before applied to the units of Group II once they meet all required conditions.

Phase 3: Public service units are allowed to account for the full cost of salaries, management costs and depreciation of fixed assets. The policy that allows full coverage of the costs of services should be implemented simultaneously with the cease of funding for investment from state budget to public service delivery units.

The process of determining public service delivery prices should be accompanied with policies to create conditions for poor people to access essential public services such as policies for expanding the objects for health insurance participation, loans given to students, scholarship grants for the poor, or excellent students, or policies to encourage enterprises and individuals to contribute to the establishment of social funds, charity funds and so on.

(ii) For service delivery activities carried out as ordered by the State, the ministries, branches and localities should set up the system of economic-technical norms and comprehensive unit prices to ensure that full costs could be compensated. These would be used as a basis for funding and financial settlement with the state budget.

(iii) For service activities such as drug testing, quality inspection, inspection of machinery and equipment ... which are currently implemented in accordance with the fees and charges set by the State, providers could introduce prices as dictated by the market.

3.2.2. To perfect and renovate the allocation and use of funds within each unit in the concentrated, focused, thrifty and highly effective direction.

A basic requirement for allocating and using funds in service delivery units is to be effective and economical. Resources are always limited while demand for use has no limit. Service delivery takes place within a large, diversified and complex range, leading to an ever increasing demand for expenditure while the capacity for revenue generation is limited and thus saving is also very important to obtain effectiveness in the allocation and use of financial resources. Thus, of prime concern for the units is to ensure the lowest cost while obtaining the highest effectiveness in the allocation and use of financial resources. To this end, the units must use several measures, concretely:

3.2.2.1. To identify the priority order for service investment

The determination of the order of priority for service investment may be based on the following specific criteria:

- (1) Services essential to the people
- (2) Services that can bring large revenues to the unit
- (3) Services that make the strength of the unit
- (4) Upon review and finalization of internal spending regulations

It can be said that the internal spending regulations for service delivery units reflect most clearly the grand lines for allocation, use and management of finance and assets of the unit. Many of the internal spending regulations in public service units were built in the spirit of financial autonomy as governed by Decree 43/2006/ND-CP of the Government and other guiding documents of the Ministry of Finance for implementing Decree 43. Thus the internal spending regulations of public service delivery units in the province might contain points no longer relevant under the new Decree No. 16/2015/ND-CP of the Government. Therefore, it is necessary to review, to improve and to renovate internal spending regulations in each public service delivery unit in the locality to ensure the allocation, use and management of finance and assets of the units in the spirit of financial autonomy as stipulated in Decree 16/2015/ND-CP of the Government. Generally, the internal spending regulations of service delivery units should be revised, supplemented and amended in accordance to the level of autonomy granted under Decree 16/2015/ND-CP and guiding documents for the implementation of Decree 16 of the Ministry of Finance.

3.2.2.2. To organize a system of information by data to reflect and make timely record of the expenditures by each spending item, expense group and line and to regularly organize the analysis, review, and evaluation for lesson learning to provide the basis for strengthening expenditure management.

(1) To improve financial management within each unit

Financial management in public service delivery units in general as well as financial management in production and business enterprises usually include such contents as:

- To participate in the evaluation and selection of investment plans for provision of public services by the units.
- To determine the capital demand, to organize the mobilization of capital sources needed for the operation of the units.
- To make good use of the existing capital, to closely manage the revenues and expenditures and ensure the solvency of the units.

- To conduct appropriate distribution of financial results, to make regular contributions to unit funds for proper use.

- To ensure regular inspection and monitoring of the operation of the unit and to conduct satisfactory financial analysis.

The units could, through the situation of daily monetary collection and spending, the implementation of financial indicators conduct regular inspection and monitoring of their own operation. On the other hand, periodic analysis of the financial situation of the unit is required. Financial analysis aims at assessing the strengths and weaknesses of the entity's financial situation and business performance, which can help the unit's leadership in assessing the overall performance of the unit, their strengths and weaknesses in operations such as payment capacity, rotation of stocks, capital, business performance, and thus the leadership can make good decisions on the professional and financial operation, can develop a proper financial plan to ensure that all assets, capital, and financial resources of the unit have been used in the most efficient way.

(2) To conduct satisfactory financial planning

The financial activities of the unit should be anticipated through financial planning. Proper financial planning provides a necessary tool to enable units to take initiative in providing timely solutions when market fluctuations occur. The process of implementing a financial plan also involves an appropriate financial decision-making process to achieve the goals of the units.

3.2.2.3. To actively determine the costs incurred for service provision to form a basis towards the establishment of the service price of the unit

Principles of determining costs

The calculation of costs incurred in service provision as a basis for determination of service prices of the units must strictly follow the key principles as below:

(1) The principle of adequately and properly accounting for costs

The principle stipulates that all costs are to be assembled and reflected properly to make a basis for the calculation of service charges. Any cost misaccounting would directly affect subsequent steps in the determination of service charges.

(2) the principle to ensure the affordability of service beneficiaries

We cannot include all the costs incurred during service delivery into setting service charges. The service beneficiaries will be the ones who make direct payment for the public services they receive. Thus the determination of the charges for service provision must also be based on the affordability of users. If the cost aggregation exceeds the affordability of the beneficiaries - customers (even though the service charges are just enough to cover the costs), it will also be contrary to the mandate of public service delivery units.

(3) the principle of maintenance of State regulation

By nature, public service is still non-materialistic public goods. Thus it will be difficult to ensure social well-being of the service delivery units if the market takes full control of the service provision. If service delivery units were allowed to determine the cost of establishing public service prices themselves and then to set the price of services provided not under the regulation, management and control of the State, then it may entail adverse impacts on the development goals of the whole nation, creating inequality and potential damages of national social well-being.

On the basis of these general principles, it is possible to elaborate principles for making expenditures on a number of key spending items for service supply of the units such as:

- Expenditures related to salary contracting:

There should be a change with regards to the principle of salary calculation to be based on position and responsibility combined with efficiency and productivity according to two basic salary systems: market wage (salary based on agreement between the workers and the employing units); and state-regulated wage (including state administrative salary and salary stipulated for state-owned enterprises). The choice of which salary system to be applied will depend on which group of service the personnel in question belong to among the four identified. Specifically:

+ For group 1: those with specific assigned tasks – possible application of the salary system in the state administrative area.

+ For group 2: those that provide services to meet social demands and those who provide support services (canteen services, dormitories ...) will have their salary based on the market mechanism (to be contracted under the agreement mechanism).

+ For group 3: those providing services as ordered by the State (orders for the implementation of projects and scientific researches) will have their salary following the wage scales of state enterprises.

+ For group 4: Non state budget funded service providers shall have their salary based on the negotiated market mechanism.

- Expenditure related to depreciation of fixed assets

The depreciation of fixed assets must be calculated based on the principle of properly and adequately accounting of assets and infrastructure on land, excluding land use rights depreciation. Only assets directly related to the delivery of public service delivery would have their depreciated value accounted for. For assets directly related to the process of supplying of two or more groups of public services, the provider unit shall have to elaborate appropriate allocation schemes and norms so as to ensure the correctness and adequacy in their calculation to provide a basis for determination of prices for each type of service provided.

3.2.3. To promote the granting of autonomy and self-responsibility to the public service delivery units

Firstly, the units need to rearrange their apparatus and reorganize to have streamlined and flexible structure. They should enhance thrift practice and waste combat. They also need to actively conduct market research, establish and conduct PR (Public Relations) activities to promote their brand and images to the society in general and to public service users in particular.

Secondly, the units need to develop a roadmap for deconcentration or decentralization extended to their training and research departments; to build and improve the quality of staff, to manage their facilities, equipment and finance. The units should also conduct periodical review, recalculation and reconstruction of their contractual norms for administrative expenses for the departments for electricity, telephone, stationery and equipment, to ensure savings, to fight waste and to enhance the sense of responsibility among individuals and groups in the unit.

Thirdly, the units also need to renew the mechanism of selection and management of laborers; the payment mechanism applied for their staff should be made upon on task completion and on a competitive basis.

The most important factor for the development of a unit is that it must have qualified staff. In order to have qualified human resources, the units need to change the selection mechanism and labor management mechanism. Concretely:

1) to publicize principles, criteria and procedure of recruitment. In particular, to pay attention to the evidences that reflect the potentials and development prospects of cadres and employees recruited; These evidences must be measured by clear quantitative indicators such as graduation grade averages, foreign language proficiency, academic credentials, academic degrees, years of experience, achievements in the specialized area and in doing research. ..

2) Labor recruitment must be based on the human resource development planning (each year, each stage of development of the functional division and the whole unit); Based on the position and attached responsibility.

3) Personnel management through quality work should not be administered rigidly such as through calculating the time present at work as this will create passivity, reduce productivity and effectiveness of the workers.

The provisions in the internal spending regulations of the unit must be publicized with regards to the rights and obligations to collectives and individuals assigned with tasks. Payments for staff should be divided into two separate sections, including:

1) Salaries and wages according to state regulations -this is to be based on the level of accomplishment of tasks and personal research results.

2) The level of additional income should not be paid in an equalizing manner. Instead, they should be made adequately different to be distinguishable, to be competitive and they should be based on a clear set of quantitative criteria such as academic titles, degree, wages, seniority, duties, positions, professional contributions....

However, a very important point of the mechanism to attract qualified human resources within and outside the country to work, and stay loyal to the agencies is to have clear regulations on working conditions both material and spiritual for workers.

In the coming time, the State should apply the pilot model where the head of the unit can decide the income level for cadres, civil servants and employees on the principle of position, quality of work assigned to ensure their staff can live by regular income so that they are ready to devote themselves to the unit and to the society.

3.2.4. To set up a useful feedback mechanism and to encourage social and professional organizations to engage in public service delivery, including sponsorship, inspection and monitoring, and supervision of public service delivery.

4. CONCLUSION

In short, sustainable development in the delivery of public services is urgently needed to meet the demands of the society at present and in the future. The essence of this orientation is to ensure the harmony between the three development areas: sustainable economic growth, social prosperity, equality, stability, diverse culture and healthy environment, sustainable resource management. Therefore, there is a need for innovation in three areas:

Firstly, on the management and development of public service delivery, there must be a roadmap suitable to the development level of the market economy, of state management and of international integration in each period.

Secondly, for the various public service delivery groups, there should be more specific socialization orientations or enhanced state responsibility and function restructuring and role.

Thirdly, there should be guidelines to gear the management of public service delivery units in the direction of modernization, professionalism and to ensure publicity and transparency.

On the basis of these innovations the quality and competitiveness of products should be improved; There is a need to ensure the humanity or humanist nature of the public service towards expansion and sustainable development.

In addition, it is hoped that the survey, analysis, research and evaluation works carried out in Bac Giang province will be of valuable use for public service units nationwide to learn and extract from the experiences for their own benefits./.

NEW GENERATION FACTORS AFFECTING THE GLOBAL FDI INFLOWS

Nguyen Trong Co* - Nhu Trong Bach**

ABSTRACT: *The decline in foreign direct investment (FDI), along with the drop in global value chains, coupled with the explosion of the Industrial Revolution 4.0, is a major concern for worldwide policy makers. These have been and will create new trends in the investment strategy of multinational companies, which has a great impact on the trend of FDI flow today. Understanding that will bring more opportunities for countries in the process of attracting FDI and investing abroad.*

Keywords: *FDI, new generation FDI, Industrial Revolution 4.0. global factors...*

1. QUESTION

In 2016, global FDI inflows amounted to \$ 1.75 trillion, with the Asia-Pacific region maintaining the leading position in FDI receipts. In the Asia-Pacific region, ASEAN countries accounted for 44% of total FDI projects recorded in 2016 (compared with 28% in 2003), of which the new Asian Tigers (Indonesia, Malaysia, Philippines, Thailand and Vietnam) accounted for 28% of the region's total recorded projects (compared with 22% in 2003). As measured by the proportion of FDI projects within ASEAN, the Asian Tigers have declined from 78% in 2003 to 63% in 2016.

According to UNCTAD, FDI inflows are undergoing a major shift, whereby investment from developed countries, from multinational corporations, is increasingly flowing into the industrialized countries rather than the developing countries like previous years. Meanwhile, emerging economies have also boosted offshore investments to reach new markets

According to a survey by the New York Times (USA) in 2014, the divestment of a number of US economic groups is taking place in the context of labor costs in the "world factories" such as China, India continuously increasing over the years. For example, wages in China and India have increased by 10 to 20 percent, while wages in the United States and the European region have not increased significantly during the same period. Therefore, the return to production in the US is a smart estimation in the long run.

It is recognized that international labor allocation and global economic developments have led to the shift of FDI flows as well as new trends in global investment cooperation.

Therefore, in the process of developing the new generation of investment and FDI attraction strategies for Vietnam in particular and countries in general, understanding the global trends and possible impacts of these trends (opportunities and challenges) is important, because they will provide a strategic context for strategy development and implementation in the coming years.

2. GLOBAL INVESTMENT TRENDS.

Mukhisa Kituyi, Secretary General of the United Nations Development Forum (UNCTAD), said that in the poorest countries, investment in production assets is a prerequisite for ensuring a sustainable economic development.

Meanwhile, in developed economies, the challenge is getting bigger as these economies face more geopolitical instability. According to data from the US Bureau of Economic Analysis, inflows of FDI into the US in the first quarter of 2018 have fallen sharply over the same period in 2017 and 2016.

In the first quarter of 2016, total net investment in the United States was \$146.5 billion. By 2017 and 2018, the figure fell sharply to \$ 89.7 billion and \$ 51.3 billion respectively. This shows a general decline in US attractiveness as a place to make long-term business commitments.

The UNCTAD report highlighted the sharp decline in FDI inflows globally. It is worth noting, however, that this decline is in contrast to other macroeconomic movements, where, in turn, the Gross Domestic Product (GDP) and trade index figures show the greatest improvement.

In 2017, the decline in FDI inflows on the global market is reflected in both traditional investment, namely M & A (using FDI to acquire or merge a business then develop it) and greenfield investment (capital to build a new business). In particular, greenfield investment, which is expected to boom in the future, saw a 14 percent drop, to \$ 720 billion

In general, the decline in FDI inflows is reflected in most regions of the world. However, the developed economies are the places where FDI inflows have fallen the most, losing a third of their value and falling to \$ 712 billion.

The cause of this situation, besides the absence of large M & A transnational investment projects and the tendency of corporate restructuring, is also the “disgrace” of economies which was previously considered as “investment paradise”. For example, the United States and the United Kingdom (with reductions of 40% and 92% respectively).

Political instability, which is typically the trade war between the United States and other “giants” of the world and the Brexit scenario, is thought to be the cause of this decline.

Meanwhile, FDI inflows to developing economies remained stable at \$ 671 billion, with the top three being China, Brazil and Singapore. This means that global FDI inflows in these economies have gradually grown in 2017, rising from 36% in 2016 to 47% in 2017.

However, looking at the overall picture of the past 10 years, the figure of \$ 671 billion is still very modest. In particular, the inflows of FDI into Africa have fallen sharply by 21% to \$ 42 billion in 2017, due to the fall in oil prices.

In recent years, there are quite a few reasons why FDI activity is not as active as before. The payback ratio of FDI projects has declined considerably in the last five years.

By 2017, margins on global FDI projects have dropped to 6.7% from 8.1% in 2012, although this figure is still higher than the average observed in developing economies. The economy is growing, but negative trends are being recorded in most regions.

In particular, the tendency of commodity price decreases in recent years is one of the reasons leading to the situation of FDI investors who “neglect” areas of economic activity that depend on production and manufacture, for example, Africa, Latin America and Asia.

3. GLOBAL FACTORS AFFECTING WORLDEWIDE FDI IN THE NEXT PERIOD: 2020 TO 2030

New trends such as the Industrial Revolution 4.0, new free trade agreements such as CPTTP, changes in international division of labor, etc. are gradually changing the flow of FDI globally, influencing the growth of the world economy in the years to come.

3.1. Industrial Revolution 4.0

This factor should be prioritized for top research, as its impact is extremely strong. There are positive factors that motivate development but it is also negative if you can not take advantage. Industrial Revolution (abbreviated as IR 4.0) is like a new wind, but at the speed of a super typhoon brings every nation, every community, organization, business, every people great opportunities that never existed before to rise, develop, even swap positions in the world economic map.

Many experts say that IR 4.0 will make the world economy grow at an exponential rate rather than linearly as it currently does, although this sentiment has not been proven yet but they have reasons for being such optimistic.

However, IR 4.0 is a terrible storm, especially for developing countries like Vietnam, not a regional storm but a global storm, eradicating many traditional industries and employment, It can drive millions of people to unemployment, overturning many of the values that have been shaped many years ago, widening the gap between rich and poor in each country, and increasing the development gap between countries in the world.

In essence, the origin of the term “4.0” is related to the fourth “wave of change” in modern industrial production following the lean production revolution of the 1970s, the phenomenon of outsourcing in 1990s and the development of automation in 2000s . In the center of the Industrial Revolution 4.0 was technology, including self-control robotics, simulation, vertical – horizontal system integration and cloud computing. These technologies are rapidly changing the organization and manufacturing industry. Most of these technologies are only 10 years old or have not yet existed, but when combined together, they can create conditions for businesses to quickly increase their productivity.

The first industrial revolution used water and steam energy to mechanize production. The second revolution took place through the application of electricity for mass production. The third revolution uses electronics and information technology to automate production. Now, the fourth revolution is emerging from the third revolution, which combines technologies together, blurring the boundaries between physics, digital and biology.

IR 4.0 will take place in 3 main areas: Digital, Physics and Biotechnology. The core elements of Digital in IR 4.0 will be artificial intelligence (AI), Internet of Things (IoT) and large data (Big Data). In the field of physics with new robots, 3D printers, self-driving vehicles, new materials (graphene, skyrmions ...) and nano technology

In the field of biotechnology, is the researches that create a leap in agriculture, fisheries, medicine, food processing, environmental protection, renewable energy, chemistry and materials. The technology platforms will incorporate and be applied in broad areas from different professions, combinations and dependencies will be stronger and deeper than ever.

IR 4.0 will impact almost all sectors, economies, ethnic groups, countries, and the breadth and depth of these changes anticipate the transformation of the whole production system and management.

The downside of IR 4.0 is that it can cause profound inequalities, which will break down many industries in every country, thus breaking the labor market when automation replaces manual labor in the economy. When robots replace human beings in many areas, millions of workers in the world may fall into unemployment, especially those working in insurance, real estate brokerage, financial advisory, carriage...

The economic uncertainty that arises from 4.0 will lead to social unrest and may lead to political instability.

Changes in the way we communicate on the Internet make information, including personal information, very fragile, placing people at risk for information security, resulting in unpredictable consequences. If Governments do not fully understand and fully prepare for IR 4.0, the risk of global instability is likely to exist.

IR 4.0 brings opportunities, and also challenges humanity. All countries including Vietnam can not stand outside this game.

IR 4.0 seems to be more equitable for later countries than for developed countries. The first IR with steam engine is not for countries with no metallurgical industry and pressure boiler, the second IR is not for countries without relatively developed mechanical and manufacturing industries. The fourth IR can give the later countries the opportunity to go off to join and breakthrough.

3.2. The new generation Free Trade Agreement (FTA)

In recent years, along with the development of production, the world trade activities reflected in trade needs, types of products, services, principles, trading standards ... also has a more and more advanced, transparent and comprehensive development, aiming at sustainable development. The concrete evidence is that the shift to a broader, higher level in free trade agreements, now called the new free trade agreement.

In this transitional context, the content of FTAs is expanded, not only by the liberalization of tangible products but also by service products and investments, removing market access conditions in service sector. This is seen as the next generation after the first generation of FTA. In this phase, the FTA not only expands the content of the agreement on products and services, but also expands on geographic space. Early FTAs promoted by neighboring countries in geo-space, entering the second phase, FTAs consisting of two or more members that may not be geographically close. It is possible to see in the new generation FTA the following specific characteristics:

First, the level of trade liberalization is high. Countries joining new generation FTAs are often negotiated to eliminate most of the tariff lines. That means when joining the new generation FTA, the openness of the economy is very high, the products of goods and services ... are basically freely circulated within the space of FTA member countries. .

Second, the range of commitments is broad, not only in terms of trade liberalization but also non-commercial content. New generation FTAs are comprehensive agreements, not limited to trade and investment such as traditional FTAs, but with broad market commitments in both trade in goods and services. private sector, intellectual property protection at high level and commitments on institutional market economy, state-owned enterprises, public procurement ... in order to create a transparent business environment and fair competition. The agreements also cover not only direct trade but trade related issues, such as procurement, environment, intellectual property, labor and trade.

Third, the commitments are high, but also flexible, allowing developing countries to adjust their policies according to their own development path. In the traditional FTAs, the roadmap for tax cuts usually lasts no more than 10 years, while in the new generation FTAs the process is generally accelerated.

Fourth, the supervisory mechanism of new generation FTAs has higher and tighter requirements in the implementation process.

Fifth, the new generation FTAs adopt a new legal mechanism in resolving disputes. New generation FTAs explicitly state dispute settlement by the state suing the state or investors suing state that the older generation FTAs do not.

Sixth, in the new generation FTAs, there are members with the highest level of economic development in the world. This is also different from traditional FTAs. For example, the ASEAN Free Trade Area (AFTA) includes developing countries. Even Vietnam - Korea FTA, FTA Vietnam - EAEU, although newly signed, are not FTAs with high commitments such as the CPTPP or the FTA by Transatlantic Trade and Investment Partnership (TTIP).

Highly developed members in next generation FTAs are the driving force for cooperation, which is the basis for deep and broad agreements and high level commitments within the FTA.

3.3. Group Development - focusing more on developing value-oriented production clusters.

Characterization of cluster development is not a new concept. A hundred years before Harvard's Michael Porter defined the cluster as "A group of companies and organizations that are geographically close together in a particular field, linked by similarities and complement each other". Alfred Marshall argues that businesses and craftsmen in an organic cluster often operate more efficiently than businesses and craftsmen in the same field of activity but in a more isolated position

Cluster development can take place in a variety of ways, from the "organic growth" of IT clusters in California and countries such as Ireland and Germany to the "more managed" approach in developing clusters in countries like India, Korea. Future cluster development trends will focus more on building productive ecosystems through more horizontal and vertical connections. In order to be more contextualized, grouping into clusters can be considered local focus of horizontal or vertical linkage enterprises engaged in similar business activities. Horizontal integration often arises from longer-term cooperative mechanisms that relate to interdependence and trust between businesses with the concentration of resources to achieve common goals. For example, businesses in a textile or footwear industry cluster are competing strongly with other firms but cooperate with one another for the same goal, such as how to increase productivity through automation.

On the other hand, vertical integration plays an important role in the up and down of the supply chain, which must be strong and effective to move a product or service profitably to the consumer market. Moreover, vertical integration is also the channels to convey experience, information, capital and market information in the value chain. This is one reason that affiliate programs are increasingly becoming the foundation of competency-based solutions. Normally, in the development of value-oriented production clusters, both horizontal and vertical alignment can be affected.

3.4. Connecting the global value chain to address and mitigate supply chain risk

The "global value chain" is derived from the concept of "value chain" initiated by Michael Porter in the 1990s. The "value chain" is a set of activities that take a product from concept to put it into use and afterwards. Value chains include activities such as design, production, marketing, distribution and after-sales services to final consumers. These activities can be done within a business or distributed between different businesses. This value chain can be implemented within a geographical area or spread across multiple countries and become a global value chain.

Based on this view of Michael Porter, in 2002 two American scientists, Raphael Kaplinsky and Mike Morris, introduced the concept: “The global value chain is a globalized production chain, in which many countries are involved, mainly those involved in the different stages of design, manufacturing, marketing, distribution and consumer support. “ In fact, the global value chain is only a new, more comprehensive approach to international division of labor, meaning that any business engaged in the production of an export product can be considered to be involved in the global value chain. If you look carefully at a European shirt, it is most likely designed in the fashion world of Paris, cloth made in China, accessories in India, and tailor made in Vietnam. . This is a simple example of a global value chain that combines the advantages of a business in each step to create a product that has the most advantages.

But access to international labor division in the global value chain will help businesses better understand their position in the world market, so that they can actively choose the appropriate stage of participation to achieve higher profits, resilience and risk mitigation from the global supply chain.

The trend of increasing complexity and global reach will continue in the context of continued major trends in resource scarcity, increased urbanization, and rapid technological development. It opens up opportunities for many countries to access global FDI inflows, but it also presents a number of challenges if their countries are not able to participate in the global value chain.

3.5. New forms of FDI investment and non-capital cross-border investment (NEM)

Historically, multinational corporations have been doing business, investing cross-border or through direct ownership overseas in their home country or through free trade. In the recent years, with the emergence of global value chains, this trend has been gradually changing and multinational corporations are increasingly turning to new FDI ways to get better effectiveness or accessing to foreign markets through less traditional forms of investment such as outsourcing, agricultural contracting, franchising, licensing and contract management.

Alternative forms of establishing such domestic presence, such as through FDI in the direction of efficient search or market search, are commonly referred to as the Cross-border non-capital investment (NEM) or New Investment Forms (NFI), the importance of these methods is increasingly recognized. For example, as Vietnam moves towards increased value added and integration with global value chains (GVC), NEM plays a pivotal role by allowing multinational corporations to coordinate the activities in the GVC while supporting local suppliers, thereby enhancing the linkages between the Vietnamese supplier and the GVC.

Non-capital investment methods and capital contributions are not mutually exclusive and often multinational corporations will participate in the host country market by non-contributory capital but may gradually decide later on investing more directly through foreign owned or joint ventures. Today, offshore investment takes two forms - one is through direct capital investment and the other is through trade contract mechanisms between foreign and domestic investors. In the second case, the “investment” of the foreign investor usually includes the supply of trademarks, intellectual property rights, business know-how, technology, skills and / or business processes. Hyatt’s brand and operating system, for example, is used to operate a locally-owned hotel in Nepal, a management contract or an outsourcing contract signed by Intel with Wipro, India for IT software or services, or Apple hired Inventec of Taiwan to manufacture some types of components through outsourcing contracts.

Given the rise and importance of this phenomenon for many developing countries, any discussion on foreign investment, private sector development and the relevant institutional and policy framework will not solely focus on direct FDI.

4. MEASURES TO ATTRACT NEW GENERATION FDI INTO VIETNAM IN LINE WITH THE TREND OF FDI IN THE WORLD TODAY

Firstly, addressing technology and transferring science and technology issues in line with the industrial revolution 4.0.

Experts from the International Finance Corporation (IFC) and the World Bank have made recommendations that Vietnam needs a new generation of FDI strategies, which focus on high technology, friendly environment and low energy consumption.

The results of the screening of industries that need to be prioritized for investment promotion and the most value-added FDI in the coming time include: Manufacturing, Logistics, Agriculture, travel, education - health. However, key sectors such as textiles, footwear, clothing, outsourced services, primary metal processing and minerals will continue to play an important role.

According to this group, investors in Vietnam are operating at level 4.0 but their institutional and business environment remains at the 2.0 level. Filling this gap is the main objective of the next-generation FDI attraction roadmap.

To address the challenges and grasp the opportunities of the Industrial Revolution 4.0, Vietnam must strive to build a business environment that fits the needs of businesses in the digital age. Instead of “catch-up efforts,” this re-launch process must provide superior investment environment and operational experiences with online digital solutions that compete with other competitors in the region. Secondly, establishing a new foreign investment management agency.

International experts recommend that Vietnam set up a new “Foreign Investment Agency” instead of the current Foreign Investment Agency. According to the IFC, the functions and duties of the Foreign Investment Agency are currently dispersed among many ministries. No organization in Vietnam has the capacity, personnel skills and key competence to carry out investment promotion in line with new generation FDI.

Thirdly, modernizing investment promotion, shifting from passive promotion to active promotion in some priority sectors; reviewing the entire investment incentive policy framework; opening up a number of important services to boost competitiveness and growth for foreign investment. Therefore, the Government should have a new policy framework in line with the objective of attracting from “pure profit” tax incentives, preferential policies are preferential to higher quality FDI projects.

Fourth, increasing the attraction of investment from the US and the EU

A noteworthy recommendation from the expert team developing Strategy and Strategic Orientation for Newly-Appointed FDI in the period 2018-2030 is that, despite attracting investment efficiently from Japan and Korea. It is necessary to attract more investors from Europe and the United States, to diversify FDI, and to make better use of the investment from this region for higher value-added activities, as well as increased technology transfer for the private sector.

In fact, when reviewing 30 years of FDI attraction, FDI from the United States and the EU to Vietnam is still limited. The question is, can Vietnam pull capital from these markets? The answer that has long been mentioned is that, at least from the statements of US and EU investors, that they always considered Vietnam an attractive investment destination, as well as from the Government messages. on strongly improving the investment environment.

PROMOTING THE RESTRUCTURING OF VIETNAMESE SECURITIES COMPANIES IN THE ORIENTATION OF SUSTAINABLE DEVELOPMENT

Nguyen Le Cuong* - Vu Thi Thuy Nga* - Luong Quang Hien

ABSTRACT: *In the process of restructuring the economy, the process of restructuring the securities market in Vietnam, including the securities company system has been focused to implement since 2013. Hitherto, the restructuring process of securities trading organizations in general, securities companies in Vietnam in particular has achieved many successes.*

The research aims to identify the key successes of the restructuring process of Vietnamese securities companies in the last period. Simultaneously, the research focuses on identifying and analyzing specific databases to determine the shortcomings and limitations of the restructuring process of securities companies in Vietnam.

On that basis, to propose effective and feasible solutions in two aspects, mainly for securities companies and for market management agencies and market surveillance agencies in order to strongly promote the restructuring process of Vietnamese securities companies, especially the quality and effectiveness of this process, to ensure the strong and sustainable growth and development of each company as well as Vietnamese securities company system and to contribute positively to the process of restructuring securities market and Vietnamese economy in the next period of time.

Keywords: *securities companies; restructuring; solution*

INTRODUCTION

The Vietnamese securities market has developed over an eighteen-year period of ups and downs. The market size has been gradually expanded with the appearance of a series of financial intermediaries, typically securities business organizations such as securities companies and investment fund management companies. The maturity of Vietnamese securities trading organizations is not only reflected in the growth of the number and capital size but also in the methods and quality of customer service providing, operational models, etc.

However, in consideration of real market in Vietnam, compared with other markets in the region which has similar conditions, it comes to a prominent conclusion that the system of securities trading organizations, every securities company, investment fund management company in Vietnam are still lack of effective management; the organizational process and the securities service provision are still scattered and dispersed. The restructuring of the economy in general and the securities market in particular is entering a decisive stage, therefore it is needed strong measures to promote, adjust and restructure the securities trading organizations, especially securities companies in Vietnam.

In the context of promoting sustainable growth and development, this writing focuses on analyzing the process of restructuring Vietnamese securities companies in the period from 2014 to the end of 2017 and provides

* Nguyen Le Cuong, Academy of Finance, Hanoi, Vietnam, Tel: +84989072196, E-mai address: cuonghvtc@gmail.com.

some recommendations to enhance the restructuring of securities companies in the coming time aiming at a stable and strong development of the securities company system and securities market in Vietnam.

RESTRUCTURING PROCESS OF SECURITIES COMPANIES IN VIETNAM OVER THE PERIOD 2014-2017 - THE REALITY

In the financial market and securities market, securities trading organization is an intermediary which performs the role as a bridge connecting and bringing capital from one or some parts of the economy having excess capital (idle capital) to other parts of the economy having capital's demand (lack of capital, need to mobilize capital).

From the decisive point of view: the restructuring of securities trading organizations in general and securities companies in particular is the process of identifying the current position, formulating strategies and tactics to improve the service providing of securities companies aiming at the best performance of their functions on financial market and securities market, contributing to the stable and healthy development of the system of securities trading organizations and the sustainable development of the financial market.

The main contents of the securities companies restructuring are: (1) Restructure the service providing activities of securities companies; (2) Adjust the resources structure to meet the business demands of securities companies; (3) Adjust and improve the trading efficiency of securities companies, and improve their financial capacity by taking reasonable and effective measures [5]

On 10th January 2012, the Minister of Finance issued a decision approving the scheme for restructuring securities companies and securities trading organizations in Vietnam. Therefore, the purpose, the principle and the viewpoint of the restructuring of securities companies is determined as:

+ Improve the operational quality, financial capacity, corporate governance and risk control capabilities of securities companies; on that basis, reduce the number of securities companies step by step.

+ Enhance the capability and effectiveness of management and supervision in securities companies' activities.

+ Open the financial service market according to the committed integration road map.

+ The restructuring of securities companies is carried out in accordance with the road map, with careful and steady steps, without disturbing the operation of the securities market as well as the socio-economic activities of the country, to ensure the legitimate interests of customers.

+ The securities companies will restructure according to the provisions of law, the road map of restructuring scheme, the management and supervision of the State management agencies.

+ Handle well the relationship among securities companies, banks and insurance firms in order to ensure risk management and use market operations to restructure through transparent capital contribution mechanism.

The scheme has identified that the immediate task of restructuring Vietnamese securities company system is to handle securities companies in unsafe financial situation, in the risk of stopping operations, or even bankruptcy; then to pay attention to implementing the solutions for stable and sustainable development, to raise the business efficiency, to ensure the financial safety of each organization as well as the system of securities companies and securities trading organizations on the basis of improving standards and contributing to the sustainable development of financial market and securities market in Vietnam.

Restructuring the number of operating securities companies in the market

One of the most encouraging results during the restructuring process of securities companies is that the financial factor of securities companies in Vietnamese market has been much more effective and stable.

Figure 1: below shows the changes in the number of normal operating securities companies in the market:

Figure 1: The number of Vietnamese securities companies in the period 2013-2017

Source: State Securities Commission

The number of operating securities companies in Vietnamese market has reached a peak of 105 at the end of 2011, then due to the adverse effects of the world market and Vietnamese market itself, especially based on the strategy, solutions and direct impact under the issuance of restructuring scheme of securities companies, particularly since the second half of 2014, the securities companies having a low level of financial safety, companies suffering prolonged losses, weak investment management capacity, weak corporate governance has become the target for handling. Therefore, the number of securities companies remaining normal operation in the market fell remarkably. It was only 89 at the end of 2014 then went down to 81 in 2015 and 76 in 2017.

Next comes to the business results of the Vietnamese securities companies. Their turnover of service provision decreased significantly in 2013 compared with 2012, but recovered strongly in 2014 to more than 10,500 billion VND, the total revenue in 2015 still remained at approximately 10,000 billion VND. In the past two years (2016-2017), the turnover of securities companies in Vietnam has grown dramatically, reaching over 13,256 billion VND and 19,425 billion VND respectively, equivalent to the increases of 38% and 102.2% respectively in comparison with the year 2015. More impressively, the average turnover of a normal operating securities company has increased by 43.3% and 119.22% compared with 2015.

Unit: Billion VND.

Figure 2: Total revenue and average revenue of a securities company

Source: Financial reports of securities companies and authors' aggregation

Based on the final results of the business activities which means the net profit after taxes of Vietnamese securities company system, the overall picture also brings a lot of positive signals, reflecting the actual results of the restructuring of securities trading organizations in general and securities companies in particular. The total net profit after taxes of securities companies saw a strong growth in 2014 compared with 2013, followed by a relative stability in the period 2015-2016 and then a strong breakthrough in 2017, as well as the positive evolution in the first half of 2018.

Unit: Billion VND.

Figure 3: Net profit after taxes and the average net profit after taxes of a securities company

Source: Financial reports of securities companies and authors' aggregation

As can be seen, the restructuring process of Vietnamese securities company system has achieved many notable successes, however, it still faces a number of shortcomings.

- **First of all**, there is a profound divergence between the best and the worst groups of securities companies. At first glance, there is a significant number of securities companies that had losses in 2016 and 2017. In 2016, there are 25 securities companies with negative net profit after taxes equivalent to an increase of 6 companies compared with 2015; up to 2017, the number of securities companies reporting losses reduced, but there still remained 14 companies, accounting for over 19% of total securities companies operating normally in the market.

- **Secondly**, in terms of securities service provision of securities companies in Vietnam, from Figure 4, we can see:

The contribution of main business activities in total turnover of Vietnamese securities company system has changed positively but not considerably. The two basic activities contributing to the business results of the securities company system are proprietary trading and non-core trading activities - other activities such as credit services, securities depository services, interest amount, etc. This reflects a heavy dependence of Vietnamese securities companies' revenues on market movements and trading movements in Vietnamese market - the market is still considered only as a frontier market with many wild fluctuations.

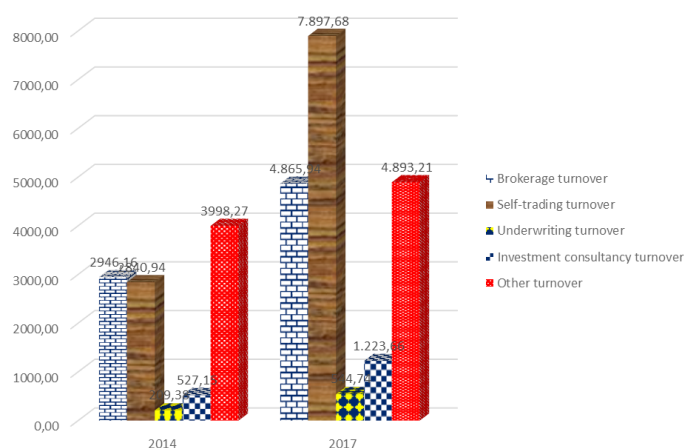

Figure 4: Turnover proportion of business activities of securities companies

Source: Financial reports of securities companies and authors' aggregation

- **Thirdly**, it is about the segmentation of the securities companies in the market. Making a comparison between the group of 20 companies having largest net profit after taxes and the one having smallest net profit after taxes at the end of 2017 and the end of 2014, through Figure 5 below, we can see the turnover proportion of the best and the worst securities company groups.

Under the correlated point of view, the business activities turnover of the group of 20 best companies at the end of 2014 was only 9.3 times higher than the group of 20 weakest ones; however, at the end of 2017, the turnover of best group was 62 times higher than that of weakest group. The profitability is similar. This reflects a clear fact that the level of segmentation in securities service provision market in Vietnam is more widening. The restructuring activities have not eliminated completely the weaknesses in the operation of Vietnamese securities company system yet.

Figure 5: The turnover proportion of the best and the worst securities company groups

Source: Financial reports of securities companies and authors' aggregation

- **Fourthly**, it is about the management and operation capacity of securities companies. Many securities companies, especially those came into operation during the period 2000-2007, it has come to realize the importance of corporate governance which helps gradually bring the company into right orbit relevant to the law and international practice.

The professionalism in corporate governance has been basically enhanced in some points: the organizational structure of the securities trading organizations has been improved; the management board

has obtained more knowledge of securities business management; an increasing number of companies has applied international practices into their corporate governance, etc.

Setting up an internal control mechanism is always one of the necessary conditions for the establishment and operation of securities companies. Securities companies and market regulators have paid more attention to the risk management as the key factor that determines the exist and sustainable development of the securities trading organizations in Vietnamese market in general, and securities companies and investment fund management companies in particular which needs to integrate more deeply into the regional and world markets.

However, the application of international practices in managing and operating securities companies and investment fund management companies is limited and inadequate. Senior staffs are still unstable under the fluctuations of the market so the strategic planning ability in the development of the securities trading organizations has not been seriously considered.

Most of securities companies in the market do not have a specialized strategic research department, which always appears in the modern corporate governance structure, especially for financial institutions operating in a volatile business environment like financial markets.

The majority of Vietnamese securities companies are carrying out many business activities, including those with high conflict of interest, high risk, depending on domestic and foreign market movements. Nevertheless, risk management has not been carefully considered and there is no specialized risk management department in the organizational structure of most companies.

There is no general orientation on the effective structure of the Board of Management, Executive departments and Business departments to apply popularly to the securities company system in the market. The presence of independent members in the Board of Management has not been regulated yet, not considered as an important factor in improving the quality of corporate governance.

One of the most obvious manifestations of Vietnamese securities companies' management capacity that has not really been noticed, is the number of securities companies listed on Ho Chi Minh City Stock Exchange, Hanoi Stock Exchange. Up to now, there are about 20 securities companies, just accounting for about 25% of the companies are normally operating, have their stocks listed on the two above stock exchanges, in which there are no new listed securities companies over the period 2015- 2017. This partly shows that the ability to access the listed standards, including regional and international standards of corporate governance have not been concerned and completed by Vietnamese securities companies [4].

RECOMMENDATIONS FOR PROMOTING THE RESTRUCTURING OF VIETNAMESE SECURITIES COMPANIES IN THE ORIENTATION OF SUSTAINABLE DEVELOPMENT

In order to promote the restructuring process of securities trading organizations in general, Vietnamese securities company system in particular for the growth, stable and healthy development in the coming time, first and foremost, in the period 2018-2022, the following main solutions should be considered:

For State management and market surveillance agencies

- **Firstly**, formulate a strategy to develop and restructure securities companies for the purpose of sustainable development.

The process of restructuring securities company system cannot be done in the short and temporary term. It is a long, persistent, even continuous process. It is not only the responsibility of each securities trading organization or its owners but also the responsibility of the State, management agencies, supervision

agencies, market organizing agencies investors customers and organizations supporting the activities of the securities companies.

Accordingly, the Government, the Ministry of Finance and the State Securities Commission should complete and focus on implementing the development strategy of securities market, including the development strategy of securities trading organizations as a basis for developing and implementing solutions that supports the development of securities companies in the market. Such development strategy can be used as an important indicator to guide the development strategy of each securities company.

State development strategies on securities company and securities market must clarify the guiding viewpoints of the State, the Ministry of Finance, the State Securities Commission on the development of the securities company system; clearly define the roadmap to complete organizational models of securities trading organizations in general and securities companies in particular; key operational model needs to be prioritized; the roadmap of implementing international standards and practices in corporate governance and risk management in securities companies; a roadmap for the development of securities services provided to clients by the securities companies must be done; etc. Strategies for the development of securities market and securities trading organizations need to be stable and have a vision of 20-30 years.

Simultaneously, it is necessary to determine the strategy of securities company development, in which clearly defining the long-term positions in the market is compulsory for securities companies in the process of applying for the establishment or reorganization.

- **Secondly**, focus on enhancing the evaluation criteria for securities trading organizations, securities companies in the market.

(1) Current criteria for assessing the securities trading organization are mainly aimed at the financial security standards. A comprehensive assessment of the performance of Vietnamese securities companies has recently been considered, step by step based on CAMELS model. Nonetheless, the actual effects of this process are not clear. The main reason is that standards based on the CAMELS model are still being used to warn the activities of securities companies in the market.

In the coming time, it is necessary to use CAMELS model as the main basis to evaluate, classify and take measures to deal with securities companies.

Those securities companies that do not achieve the evaluation standards or do not use CAMELS models are required to be temporarily suspended for a certain period of time (i.e. 6 months) so that the owners will have to take corrective measures. If the problem cannot be fixed, it must carry out the measure of dissolution or merger or integration with another securities trading organizations.

The merger and integration of securities companies has both gradually reduced the number of securities companies in the market and minimized the negative changes for the securities company system from issues related to trading accounts of customers and the relevant financial obligations; the consultancy contracts, the underwriting for securities issuers, the handling of technical and infrastructure system, and the laborers currently working at professional departments in the merged and integrated securities companies, etc. The integrated and merged activities of securities companies also contribute to minimizing the decline in trust of public investors and customers towards the operations of securities companies in comparison with the dissolution or bankruptcy activities and simultaneously help the merged and integrated securities companies concentrate on their resources, including human and financial resources to carry out securities trading activities.

(2) Put the number of securities companies in the market in a quantity suitable to the size of the Vietnamese securities market in terms of improving financial capacity, diversifying services together with professionalizing the process of providing securities services. The suitable number of securities companies in Vietnam to 2022 should be around 60 - 65 companies. The State should show the need of reducing the number of securities companies by making legal decisions; should continue not to grant license for the new establishment of securities companies but encourage the restructuring of the securities companies through the merged and integrated mechanism, including allowing investment fund management companies can be merged into qualified securities companies.

(3) Have a mechanism to encourage securities companies, especially small-scale ones with modest operation scale and market share to merge into large-scale securities companies (with total assets of more than 1,000 billion VND) or unify small-scale securities companies to continue providing services in the securities market. The incentive mechanisms may be exemption, reduction or deferment of corporate income tax for 2-3 years; reduction of securities investment tax for investors who open accounts and conduct securities transactions at the merged or newly incorporated companies after unification in a certain period, may be from 6- 12 months, etc.

- **Thirdly**, complete the legal model and the organization of services provision of the securities companies.

Regarding the legal model, formulating and finalizing securities companies in the model of joint-stock companies is a priority to be implemented. This will ensure the access and implementation of corporate governance in a modern governance model which is considered as a vital requirement for securities companies in the context of international integration and internationalization of the securities market.

Regarding the organization of service provision, in the current condition of the Vietnamese securities market and the next 5 to 10 years, we think that the partial multipurpose model or specialized trading model are the suitable ones for securities companies. The restructuring of trading activities of the securities companies in the coming time should focus on the following main contents:

The process of restructuring business operations should be done drastically on the basis of conformity with the business model, the operation capacity of the company and the provisions of the law. The time limit of special control towards securities companies is not over 6 months. When the deadline expires, if the business activities of securities companies still suffer losses, the supervisory board will notify the creditors and owners of the company so that they may consider the request for bankruptcy, dissolution or implementation of company merged and integrated measures according to the provisions of law.

Set up a special mechanism for securities companies to transform the operation model from securities service provision in which self-trading activities make up a large proportion to the investment bank model through abiding by the financial obligations without applying the process of dissolving the securities company and re-establishing the investment bank [3].

Strongly implement effective regulations on requesting securities companies to disclose information similar to a listing organization on the Stock Exchange. It should be considered as one of the basic “therapies” to improve the quality of securities company’s activities, enhance the company’s responsibility to customers as well as the stock market, thereby put pressure on the securities company itself to restructure its activities, that actively contributes to the process of restructuring the securities company system in the market. Take priority of operating license grant to new securities companies established under the model of joint-stock companies.

Enhance the conditions for the establishment and maintenance of securities companies. In the next 5-10 years, those conditions should be revised to reach the common ground of securities companies in the region. The legal capital to implement the main professional activities needs to increase 2 to 3 times compared with the current one. It is necessary to have a specific roadmap with a period of 1-2 years to enforce the compliance of new legal capital requirements on key business operations for all securities companies in the market.

At the same time, it should be applied to all securities companies with the appropriate roadmap of regulations on major shareholders and large capital contributors in existing securities companies operating in the market with at least one shareholder or large capital contributors are commercial banks, insurance companies or financial companies as regulated by the establishment of securities companies in accordance with current law. The securities companies that do not fully meet the standards of operation must be removed from the market through compulsory company dissolution or merged mechanism with other securities companies.

- **Thirdly**, empower and promote the role of self-regulatory organizations, especially the Association of Securities Dealers, in supporting membered companies in business activities in general, in enhancing the capacity to identify, prevent risks, and identify corporate restructuring plans in particular. To enhance the efficiency and effectiveness of the State Securities Commission's inspection and supervision activities in compliance with the law and the principles of business operation; the service provision of securities companies must be carried out regularly and continuously; to ensure the inter-connection between the State Securities Commission and the Stock Exchanges, the Depository Center and the Designated Bank for payment.

FOR EACH SECURITIES COMPANY

- **Firstly**, it is necessary to clearly define and focus on communication: the restructuring process of securities companies is the regular and periodic activities. Under the conditions of Vietnam, restructuring activities should be implemented every 2-3 years. Then, the owners, the management board of the company, the customers and investors who have related business activities with the securities company in restructuring process would approach that activity in a calm and objective way without negative evaluation of the company's normal operations during the restructuring phase. This will create a stable basis for the normal operation and development of the company even in the process of adjusting, restructuring, then maintain the general stability of the system.

In the course of operation and development, it is necessary to formulate and implement the development strategy of securities company, with the following main contents: (1) Determine the long-term (5 to 10 years) target position that the company needs to achieve in the securities services market; (2) Establish and implement policies for brand development, brand positioning, and enhancement of the company's reputation in the market; (3) Identify medium-term objectives (2 to 3 years) with corresponding implementation solutions that will gradually approach long-term objectives; (4) Determine the policy on human resources and talent attraction to serve the long-term goals of the company so that those who work or need to work in the company have the basis for evaluation, selection then making decision to participate in professional activities of the company, for the development of the company and the staff themselves; (5) Establish strategies for conducting business activities in the direction of expanding or focusing on work specialization, target markets, customers, etc.

- **Secondly**, securities companies should focus on implementing specialized models in a more focused manner, in the direction of specialization and professionalization of products and services such

as brokerage, securities investment consulting, financial analysis and consultancy, etc. These specialized orientations need to be cared by small scale securities companies (with total assets under 100 billion VND) with low market share. These companies should transform into specialized operation model, typically investment consultancy, financial consultancy, especially enterprise restructuring consultancy.

Review the operation of the securities company itself to apply the independent investment banking model in Vietnamese securities market in the direction of separating the brokerage from underwriting and self-trading. Investment banks carry out specialized securities underwriting in combination with self-trading as an investor in the market. To develop professional brokerage companies, conducting intensive brokerage activities with accompanying services. Initially, regulations on the investment banks should be specified in the Law on Securities with the main contents are: the model of organization; the main activities of the investment banks; the conditions for establishment and operation of an investment bank; the regulations on supervision and control of activities; the regulations on dissolution, bankruptcy of the investment banks, etc.

- **Thirdly**, each securities company should actively review the business situation and even re-recognize the objectives of establishment and operation of securities business of the company owners. The owners, the shareholders of the securities companies particularly those suffered from prolonged losses or inefficiency should actively seek partners to merge, sell the companies or voluntarily dissolved to avoid greater losses.

- **Fourthly**, focus on strengthening financial capacity of securities companies

Financial capacity, including the financial strength and capital structure, asset structure, efficiency of business performance of securities companies in Vietnam today is generally weak and unreasonable which needs to focus on improving. Accordingly, the financial security must be considered as the first priority, the borrowing activities, particularly the short-term borrowing activities of securities companies must be strictly controlled and maintained at a low level. In order to improve the financial capacity of the companies, the following measures need to be implemented:

- + Securities companies should focus on increasing the number of strategic investors as the foreign securities trading organizations or large domestic financial institutions through joint ventures and share sale to strategic investors to create the financial strength of the company. In this process, it must be recognized that Vietnamese securities services market is a potential market with an ever-expanding market scale, in the context that the economy still maintains a high economic growth rate, the number of potential customers of securities companies such as business agencies, investors are still growing rapidly. Those are the potentials that foreign securities trading institutions and domestic financial institutions do not underestimate.

- + Improve efficiency of doing business and providing securities services of securities companies, to boost the quality of financial capacity, contributing to the improvement of competitive ability of the company in the market. Focus on resources to achieve the core business performance, especially the strengths which have high market share. The focusing process of doing business basing on the strengths of the company can be achieved through transforming operational models; narrowing the ineffective operations which is not in line with the company's risk management capabilities.

- + On the basis of provisions of the law, internal capacity of the company, to apply the operational model with the reasonable number of professional operations and operational structure. If the securities company performs many business operations, there is a need to minimize excessive dependence on a particular business activity, especially those heavily influenced by market fluctuations. The proportion of

securities self-trading, financial services activities in total revenue of the securities companies with various business lines should remain below 60%.

- **Fifthly**, focus on strengthening corporate governance, risk management. Securities companies should formulate corporate governance policies according to the best practices. Formulate training strategies, attract high-quality human resources and highly qualified business executives to participate in the management and administration of the company.

Establish and operate an effective risk management system. This system must meet certain requirements:

- To be a specialized department in the organizational structure of securities companies directly under the General Director.

- Operate independently from other professional sections of the company. To be directly responsible to the General Director and Board of Management for risk management, supervising the professional sections.

- Have ability to identify and early warn the risks in all business aspects of the company.

- Have regular and close contact with the supervisory system of the Securities Exchanges, the State Securities Commission.

CONCLUSION

It can be confirmed that the process of restructuring securities companies in Vietnam has achieved certain successes. However, due to the shortcomings of the hot growth process at the beginning of the Vietnamese securities market, the process of restructuring Vietnam securities companies needs to be further strengthened with strategic, decisive and strong measures to build and complete securities company system for a healthy and stable development.

Such solutions must be synchronically and rhythmically applied among each securities company with management agencies, market surveillance agencies and organizations supporting the operations of securities companies. Therefore, the restructuring process of Vietnamese securities companies can achieve successes as expected, contributing to the development of financial market, securities market as well as the overall economy of Vietnam.

ENHANCING THE GLOBAL VALUE CHAIN OF VIETNAM AGRICULTURAL PRODUCTS

Vu Thi Dao*

ABSTRACT: Vietnam is one of the leading countries in terms of scale agricultural exports with many commodities such as rice, cashew, coffee, seafood ... However, 90% Vietnam's agricultural products is still exported in raw or applied simple process, product quality and export value lower than that of other countries. It makes the competitiveness and level of participation in the global value chain of Vietnam agricultural products low, especially high value-added phases. As a result, the growth in scale and quantity of Vietnam's export agricultural products does not bring corresponding income increases and faces many risks and losses in the market. Based on the research and analysis of the situation participating in global agricultural value chain of Vietnam products, the study also suggest the particular solutions to remove difficulties in the formation of the value chain and set up Vietnam agricultural value chain towards sustainability.

Keywords: Value Chain, Exporting Agricultural Products, Vietnam agricultural value chain

1. INTRODUCTION

1.1. The global value chain

The 'value chain' is defined by Kaplinsky and Morris (2001) as "the full range of activities which are required to bring a product or service from conception, through the intermediary phases of production, delivery to final consumers, and final disposal after use"¹. A value chain includes activities such as design, production, marketing, distribution, support and after-sales services, delivery to final consumers and final disposal after use. It is basically a descriptive construct that provides a framework for the generation of data for the entire range of activities within and across the various links in the chain.

The process of production and consumption goes through many phases in the value chain. Each of them contributes to the added value of the product. Generally, value added is created most in R&D and marketing phases, design and distribution stages contribute lower value added, the lowest stage is production (Fig. 1).

Figure. 1. The Value chain model

¹ Gereffi, G. and R. Kaplinsky, R. (eds), 2001 "The value of value chain"

Nowadays, along with the globalization process, there are rarely enterprises possible dominate the whole value chain. Enterprises rely on their strengths to enter the value chain by specializing in each stage. Looking at figure 1 above, we can see that the value created by enterprises in the production process, in the value chain is different. While companies that specialize in research, development, design, distribution, and marketing can create a great value, the values created by assemblers and producers create only much smaller and being the lowest value in the global value chain. This is also an explanation why companies in developed science and technology countries tend to place production and assembling products in developing countries in order to take the advantage of cheap human resources there (Fig. 2).

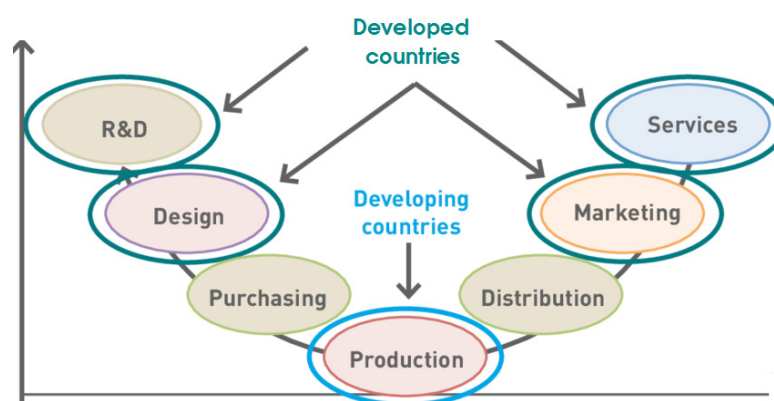

Figure 2. *The smiling curve: Value distribution along the global chain*

The global value chain is a value chain in which activities can be carried out by many firms and are occurred on a global scale. In the global value chain, each national economy is just a coordinated part and national borders are no longer principal limitations of the development of economic actors. Specific production processes are still being implemented in each country, and the difference is that they take place on by global connectivity and are governed by international rules and regulations. This is a new structural form of the modern world economy occurring the restructure of labor division between enterprises of different countries but within the territory of a country, then switch to the form of labor division in the chain, based on a global comparative advantage, is led by the process of liberalization of trade and investment through global operations of companies.

1.2. The characteristics of the agricultural global value chain

Basically, the formation and development of the agricultural global value chains is similar to other conventional commodity value chains. It means there are activities that will be allocated to where it creates the highest added value and works best in the global value chain. However, due to the very specific characteristics of agricultural commodity production from farming stage in the field to processing and consumption, the value chain of agricultural products has its own characteristics to be considered for successful and effective participation in these value chains. The specific characteristics of the global agricultural value chain are as follows:

- Characteristics of seasonality and impacting of weather.

As agricultural crops and livestock of agricultural productions are always seasonal, commodity agricultural products are also seasonal, making the value chain of agricultural products are often discontinuous and very fast change volume, quality for supplying to the market in each period. Demonstration: In the harvest

season, the volume of agro-products increases rapidly, the quality is high and the market demand is huge, leads to make up the price of goods on the market lower. Vice versa at the end of harvest, the volume of goods fell very fast with low quality, but its price is high. This characteristic makes the distribution of goods difficult and prices are not stable in the market. Actually, agricultural production is strongly influenced by climate, temperature, light and other resources such as land and water. Changing these factors in any direction will have a direct and big effect on the outcome of the production, which may be positive and may be negative, then make the value chain more unstable and fluctuate over time. Dependence on natural conditions will lead agricultural production is limited due to inadequate conditions and agricultural production was strong regionalization, mean concentrating in some areas, while other areas cannot grow. Therefore, more than any products of non-agricultural industries, the value chain of agricultural products is often high localization.

- Characteristics of processing, preservation and food safety.

Farm products are fresh commodities, easily damaged and expired, quickly decrease quality after harvesting, so transporting away is difficult if not processed, well preserved before shipping. It means the price of the production will increase if goods are under go processing, selection and preservation the right technical requirements. This characteristic causes difficulties for producers and restricts the expansion of the value chain, especially for products consumed under fresh conditions such as vegetables, flowers, animals slaughtered, milk, ... Therefore, the globalization of agricultural commodities has become very limited, developing global value chains of these products to many countries requires manufacturers and traders to have high technology, suitable for processing and preservation, then the price of consuming must increase more than the price of products at the place of production. The issue of food, beverages safety is also a major impediment to the development of the global value chain of agricultural products because these goods directly affect consumer's health and life. Governments often set up strict barriers on food hygiene and safety for imported agricultural products and do not allow importing poor quality order or too much toxic chemicals. These measures are justifiable and necessary, but adversely affect global agricultural trade and cause much risk to the agricultural producers.

- Characteristics of the organization of agricultural production

Due to the traditional and biological of crops and livestock, the organization of agricultural production (the supply of agricultural products) also has characteristics that are different from the production of non-agricultural goods. The biggest difference in the value chain of agricultural products compared to non-agricultural value chains is that the agricultural production process often involves a large number of farm households with very different production level, business sense and awareness of agricultural markets. This makes the value chain complicated and difficult to adjust to produce a large volume of quality homogeneous products, especially the ability to adjust the scale of production according to market signals for products produced in countries with large numbers of farmers such as China, India, Vietnam, Thailand and Indonesia. The large number of farmers in agricultural production requires appropriate forms of production organization in order to effectively attract farmers to produce the same quality products, models and launch the quantity of products according to the market demand, minimizing the disparity between supply and demand on the market for some agricultural products. This is the arduous problem of the global value chain of agricultural products and is a great challenge for producers, processors in the agricultural value chain in general and the global value chain of agricultural products in particular.

- Characteristics of participation in the agricultural value chain.

First of all, the production stage is characterized - which are constituted by two stages: cropping and processing. In fact, participation in the global value chain of agricultural products by developing

countries such as Vietnam is mainly carried out at the production stage, especially at farming. Participation in farming and cropping stage in the agricultural value chain are farmers and fishermen with a very different scale of production, depending on land, water resources and other conditions. Participation in processing includes many different forms, such as manual processing, mechanical processing, combine manual and automation.

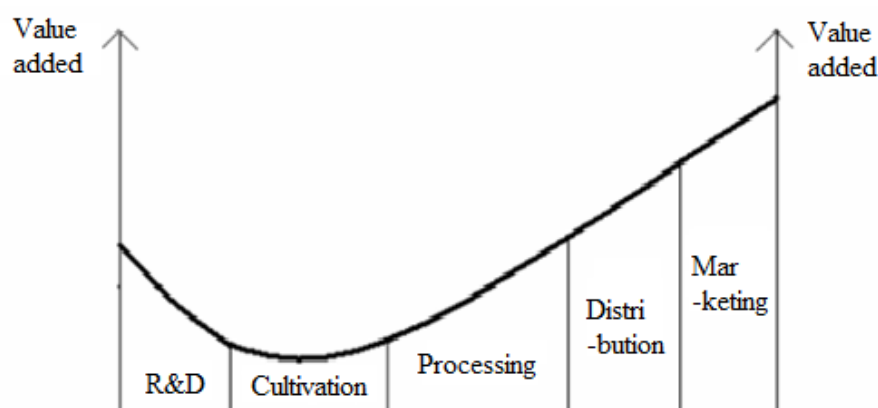

Figure 3. Typical model of the agricultural value added chain¹

In fact, participation in farming and cropping stage with the result that raw material products often receive a much lower value added than the processing stage, while participating in this phase takes many risk due to seasonality, weather conditions, climate, ... and always have high competitive pressure. This model has partly explained the reason that global business groups focus on distribution and marketing, researching breed and production processes then transferring them to slow and developing countries to crop. Therefore, it is not easy for Vietnamese enterprises to engage in high value-added activities in the global agricultural value chain in of the globalization today. Big brand importers usually hold almost all of these stages, and firms in a developing country want to join the chain, they face fierce competition.

2. THE SITUATION OF PARTICIPATING IN THE GLOBAL VALUE CHAIN OF VIETNAM'S AGRICULTURAL PRODUCTS.

2.1. Results of participating in the global value chain of some Vietnam's agricultural products.

Recently, Vietnam's agricultural sector has made great efforts to participate in the global agricultural product value chain, with many products gaining high export value such as coffee, pepper, seafood, fruit... At present, Vietnam's agricultural products have been exported to more than 100 countries in the world, exporting turnover of agricultural products increased over time. As of 2017, agricultural product export turnover reached over \$US 36 billion, accounting for more than 17% total export products². In terms of market share and ranking position in exporting countries, some agricultural products of Vietnam have a high market share and rank as: cashew kernel is 38.23% of total global cashew exports – the first rank in the world; pepper is 25.18% market share - the first rank; rice is 18.12% - the second rank; coffee is 8.23% - the second rank; natural rubber is 3.23% - the fourth rank³.

¹ According to Assoc. Prof. Dinh Van Thanh, Global Value Chain Identification for Agricultural Products, Proceedings of the State-level seminar, KX.01.16 / 06-10, Hanoi, 2009.

² Data from the General Statistics Office

³ According to the General Statistics Office: Statistical Yearbook 2014, Hanoi, 2015

At the International Support Group Plenary Meeting (ISG) about agriculture themed “Integrating Global Agricultural Value Chain: Promotion of Food Safety and Market Linkages” on the 11th of December 2017, Minister of Agriculture and Rural Development Nguyen Xuan Cuong said that over the past 30 years, the Vietnamese agricultural sector had recorded remarkable achievements, making it one of the world’s 15 biggest farm produce, forest product and seafood exporters. Vietnam’s farm produce, forest product and seafood exports hit US\$32 billion in 2016 and are expected to reach US\$35-36 billion this year, with 10 export items expected to yield more than US\$1 billion each. The agricultural sector has been reorganizing production in the direction of cooperation, linking closed value chain, associating production from raw materials to processing and selling products in the value chain, connected to the global consumption system. Increasing processing and product value have created more jobs and higher income for Vietnamese farmers.

Some of Vietnam’s agricultural products and some of separated value chains are involved in high value added stages in the global value chain. Vinacafe’s coffee chain, dragon fruit chain in Binh Thuan, and especially the chains of foreign invested enterprises such as Nescafe, Metro... have brought Vietnam-made agricultural products to the system of retailing abroad. Moreover, in terms of coffee consumption in the domestic market, the strong participation and growth over time is mainly due to the positive results of marketing strategies from big brands such as Highlands Coffee, Gloria Jean’s, The Coffee Bean, Tea Leaf, Trung Nguyen and Illy, etc. Although Vietnam has not built strong brands in the international market but some companies have initially reached the world market with Vietnamese coffee brand. In addition, more and more multinational corporations are tending to invest in the Vietnamese coffee sector, contributing to improve efficient participation of Vietnamese coffee in the global coffee value chain. These days more and more Vietnamese exporters are involved in sustainable coffee development programs.

Renovation and improvement of the institution and business environment have initially contributed to create the effect of participating in the global value chain of Vietnam’s products. Accession to the WTO and multilateral, bilateral economic integration have been continued to pave the way for Vietnamese agricultural products to enter the world market. The policies of agriculture, trade, science and technology have been promulgated and implemented, contributing to improve the productivity and quality of agricultural products, improving the value of processing and increasing the export turnover of agricultural products. The position of Vietnamese agricultural products in the global value chain has been one step higher than that of other countries.

2.2. The inadequacies of participating in the global value chain of Vietnam’s agricultural products.

According to experts, up to 85% - 90% of the Vietnam’s agricultural products are sold abroad under foreign brands . Therefore, low and restricted price are still the story of the Vietnamese goods when exported. That is not to mention other barriers such as anti-dumping, environment, technical barriers,... are considered “commercial tactic” are often used by importing countries in the “playground” of the World Trade Organization (WTO) that Vietnamese goods are not easy to overcome.

While Vietnam has become a major farm produce exporter, 90 percent of the country’s farm produce exports are unprocessed or semi-finished products that are in general inferior to products of the same kind from many other countries in terms of quality and value. This has seriously affected Vietnam’s participation in the global agricultural value chain.

Food safety is a hot issue for Vietnam’s agricultural production, according to a World Bank representative. A World Bank study on food safety risk management in Vietnam shows that exported foodstuffs are relatively well controlled, but management of domestically sold products remains poor, with unsafe food sales and consumption becoming a burden, leading to disease problems.

Many of the products sold on the world market are not branded, labeled, or have to use foreign brands. Meanwhile the supporting activities such as policies to attract investment is still inadequate; forecasting, warning signal market are still not meet the requirements. Moreover, the impact of changing climate usually happen, causing great risks to agricultural production, income, farmer life and rural economy.

The constraints, weaknesses of agricultural producers and exporters need to focus on improving, that is:

The capacity of participating actors in the global value chain is still limited. Fragile production makes it difficult to implement mechanization, low productivity, un-even quality. Most farm households lack being able to access to market, they often produce base on their experience and rely subjective calculations. Vietnam's agricultural products have only been involved: cultivation, collection, processing and exporting raw materials, which are the lowest added value in the agricultural value chain. At high value added stages such as R&D, processing, distribution (retail) and marketing, we have not been participated, or the level of participation is very low.

In the production stage, farmers suffer many disadvantages. Oxfam's survey in cooperation with the Institute of Policy and Strategy for Agriculture and Rural Development (IPSARD) in An Giang province shows that among the three actors of the export value chain (farmers, traders, enterprises), farmers have to pay the highest cost (63%), traders and exporters only spend the remaining 37% and the benefit is permuted. In the chain of production and export of rice, the most benefit belongs to the supply of fertilizer and plant protection drugs, followed by rice exporters, next to the purchasing enterprises to produce and traders. They only trade product but earn more than 70% profit and the benefit of farmers are often less than 30%. Especially, the coffee value chain which farmers only benefit about 10% of the total value added of the coffee product¹.

The stages of collection, processing and consuming of agricultural products are incomplete and unsustainable with many intermediate levels. Farmers mainly sell agricultural products to traders, whole-sellers. On the other hand, the collection and processing has not been carried out in accordance with the technical process, lead to its low quality and cheap price of agricultural products.

In terms of consumption (export and retail distribution), the construction and development of Vietnam's agricultural product brand is still limited. In addition, the maintenance, development and protection of Vietnamese agricultural product brand are facing many difficulties due to stealing brand or the registration of Vietnam's agricultural products of other enterprises in the foreign market. (eg, Trung Nguyen Coffee in some US states or Highland Coffee in China).

On the side of Vietnam Government, the thinking capacity of government management and business management under the chain model is still limited. Up to now, there are very few cadres to set up strategies, plans and policies on agricultural and commercial development, fully understand the global value chain and its necessities to participate. Vietnam's exporters of agricultural products are still mostly exporters at FOB prices, by looking for trade contracts and implementing deduction models (it means taking pre-paid, then buying and delivery of goods, then deciding price), exporting partners are not stable and almost no forward contracts. Therefore, Vietnam's agricultural products export nearly \$ 20 billion per year, even some of the world's leading export goods, but because of hundreds of export enterprises competing with each other then we still cannot control market and price.

¹ According to Prof. Vo Tong Xuan (2011): Researching and applying the value chain production and consumption of agricultural products, "Tia sang dien tu" Journal, June 22.

In addition, the World Bank research team recommended that the Vietnamese government avoid market interference with too much regulation, and focus on attracting more private businesses to production chains.

3. SOME SOLUTIONS TO IMPROVE THE EFFICIENCY OF PARTICIPATING IN THE GLOBAL VALUE CHAIN FOR VIETNAM'S AGRICULTURAL PRODUCTS.

3.1. For producers and exporters of agricultural products

When participating in the global value chain, enterprises must determine clearly needing to be involved from the beginning, from product development, not when they have a product on the market then back to find out order. Therefore, producers and exporters of agricultural products should carry out:

- To actively and proactively participate in the global value chain, selecting right priority stages to take comparative advantages, develop quickly, efficiently and sustainably export activities on the world market.

- To take advantage of joint-venture and association activities so as to increase the strength and economic efficiency of participating in the global value chain, quickly overcome the current small scattered and fragmented situation and lack of linkage between the clues (from producers to buyers, processors, exporters, retailers) in the chain.

- Focus on the selection of agricultural products that Vietnam has a comparative advantage and the world has a high demand to produce and export. In addition, rearranging production and processing facilities and setting up large production and processing establishments with modern equipment and technologies to create high added value products, enough capacity to compete in the international market, gradually reduce small and fragmented production firms, which have low productivity and quality, does not guarantee food safety.

- Participating in agricultural product associations. This is the unit that gathers and strengthens the linkages between agricultural business enterprises which have the potential of comprehensive advantages, promoting the construction and development of trademarks, in addition exploitation of geographical indications for agricultural export products.

- Ensuring food safety and hygiene is not only a solution but also an overall solution. We must abide by the International Food Safety Standards. Beside, concentrating more investment is needed for food safety.

- It is very important to the building of trademarks for Vietnam's agricultural products. Vietnam's agricultural products are always cheaper than agricultural products of other countries with similar products. In the last 15 years, we have succeeded in exporting some agricultural products (coffee, pepper, cashew, seafood, fruit ...) to European market. However, due to too focused on quantity, trademarks issues are not paid attention. In the immediate future, the association of agricultural and forest products of Vietnam should organize the introduction of their products to consumers in some localities in the countries whom Vietnam exported to create customer trust for agricultural products under Vietnam brand name. If we have good trademarks, Vietnam agricultural products can participate in the agricultural global chain.

3.2. For Government

Practical lessons from experience of many countries, in order to increase the added value of agricultural products, the Government plays an especially important role. From the situation of agricultural production and export, along with the current international economic integration process, the Government should focus on the following policies and efforts:

- To restructure production towards complete value chain-oriented cooperation and connectivity, link raw material production with processing and sales in compliance with value chain development. Step by step adjusting and changing the strategic orientation from the development of production and export of agricultural products in quantity and high speed to focus on quality, competitiveness and efficiency. In order to implement this guideline, besides encouraging investment and developing the processing industry, the Government should enhance and attach importance to the raising and growing agricultural products base on promoting comparative advantages and toward large-scale and modern productions. At the same time, construction and management of the production, processing and preserving export agricultural products abide by quality standards, food hygiene and safety, suitable to import markets.

- It is necessary to review and re-evaluate the scale and level of processing technology of all existing agricultural processing facilities. According, applying appropriate mechanisms of incentives and support will be provided for them to increase and expand investment, linkage and technology transfer towards establishing large-scale processing facilities. This will increase the processing capacity and the rate of deep processing then create quality products and meet the high demand of the world market.

- Proving good conditions to attract foreign direct investment for accessing capital and technology as well as to participate in a global distribution network for agricultural products. This is the shortest way to increase competitiveness and participate in the global value chain, thereby enhancing the added value of agricultural exports.

- To create a bridge for domestic and foreign enterprises to join in, share information, develop effective production and business linkages, low emission, develop green and sustainable agriculture. Create good conditions for producers and exporters of Vietnamese agricultural products to participate in non-production activities, to approach more closely with foreign consumers, especially to support information about market demand, trade promotion for agricultural products in key markets, open distribution facilities abroad.

- To develop both domestic and foreign markets, and distribution channels; ensure food hygiene and safety; gradually develop strong brands; negotiate to open and expand export markets; keep traditional markets stable; and look for and expand potential markets.

- To encourage the private sector to build investment and business plans compliant with the agricultural sector's restructuring strategy and the government's strategic development targets.

- To further improve institutions and policies, administrative reform and public services; mobilize resources from different sources; promote investment in the form of public-private partnerships in agricultural and rural infrastructure development in order to meet large scale commodity production demands.

CONCLUSION:

Globalization has given rise to a new era of international competition that is best understood by looking at the global organization of industries and how countries rise and fall within these industries. However, Globalization's benefits will continue to be unevenly distributed, with its gains going to those with more education, skills, wealth, and power. Therefore, if Vietnam is to effectively participate in the global agricultural value chain, its agricultural sector needs to restructure production towards complete value chain-oriented cooperation and connectivity, link raw material production with processing and sales, address food safety issues, and develop markets.

ACKNOWLEDGEMENTS:

This is my own independent research. The data used in the paper are clearly stated and published in accordance with the regulations. The results of my research are self-explanatory, analyzing honestly, objectively and in accordance with the reality of Vietnam.

COMPLETING PRINCIPLES AND EVALUATION METHOD F VIETNAMESE ACCOUNTING

Nguyen Dinh Do*

ABSTRACT: *The article mentions the process of taking form principles and evaluation method of Vietnam accounting; the formation of evaluation models in the world and Vietnam; General assessment about the situation of applying the evaluation models in Vietnam and offering the contents of completing the principles, evaluation methods of Vietnamese accounting to advance the international economic integration in adequate and equal about the accounting and auditing with the following basic contents: (i) The common problems consists of specifying the basic characteristics of accounting compared with other types of create accounting; about the use of value measurement in accounting; evaluation method of accounting objects; content and principles of evaluation method; the nature of the evaluation method; the expression of the evaluation method; types of evaluation used; evaluation models; (ii) Formation and application of logical value in the world and the application of logical value in Vietnam which consist of the accounting principles mentioned in the Accounting Law 2015 of Vietnam and the changes about aware of the evaluation principle of logical value.*

Keywords: *Accounting, principle of accounting, Evaluation method of accounting,*

One of the basic characteristics of accounting compared with professional accounting and statistical accounting is the use of value measurement to reflect, taking note accounting objects in the receipt, tackle, systematize and provide information for users. Evaluation is one of the methods of the accounting method system used to quantify accounting objects in order to serve for accounting records and financial reporting. The evaluation method is formed when the appearance of accounting.

The evaluation method is an accounting method that determines the value of evaluation objects under certain principles. The evaluation object is properties and liabilities. Expressions of the evaluation method are used prices and evaluation techniques. To determine the value of the accounting evaluation objects used different prices at different times (the time of formation and in the process of production and business operations as well as the process of using, approaching accounting objects). The evaluation of accounting objects is carried out at the main time such as the time of initial recognition; the time after the initial recognition and the time of financial reporting.

At the time of initial recognition, it needs calculating in order to determine the valuation of assets and liabilities as soon as it formed to accounting record.

After the initial recognition in the process of production and business operations as well as the process of using and approaching the value of the evaluation objects to be changed so the accountant should also use the prices and evaluation technical to identify and acknowledge the value of evaluation objects.

Time of making financial statement: At the end of the period when financial statements are made, the types of assets and liabilities are also determined at the basis of using the adapt prices (market price) that accountant charge to recognition and present in the financial statements.

¹ Academy of Finance, 58- Le Van Hien, Hanoi, Vietnam, The corresponding author: Phone number: 0913.208.691; Email: dodinhnguyenhvte@yahoo.com.vn

Accountant can use many different types of prices to charge of accounting objects, but actually includes the following basic (principal) prices: original price, market price and reasonable value

Original price is the price used to initially record the accounting objects at the time of formation

Market price is the price agreed upon by market participants when there are actual transactions of evaluation object or the same type of objects in existence.

A reasonable price is a price used by the parties to determine the value of evaluation objects on a voluntary basis and an understanding about the exchange of a par transaction.

One of the most important contents of the accounting objects evaluation method is the identification the “evaluation principle” of accountant. Evaluation principles are understood as the main prices used to charge the basic elements of a financial statement. Each accounting system of each country has the logical charge principle with socio-economic conditions and requirements, management level as well as the management mechanism of the national economy. In our country, along with the use in the process of forming and developing the principles and methods of charging of accountant that have been formed different charging models:

- Original price model (actual price)
- Market price model
- Reasonable valuation model

According to the original price model (actual price), the accountant use the original price to charge of accounting objects at all times: initial recognition, after initial recognition and financial statement.

According to the market price model, accounting objects are valued at original price and market price: the original price is used to charge of accounting objects at the time of initial recognition, the market price used to charge of accounting objects when making financial statements.

According to the reasonable valuation model, the accounting objects is valued on a voluntary basis and understanding about the value of accounting objects between the parties involved in the evaluation.

Evaluation method has the important meaningful in providing practical and effective information for using and offering decision of the objects using accounting information, including those objects have direct benefits and indirect benefits. Due to the evaluation method, the financial information as well as the results of production and business activities, the formation and use of cash flows is presented and provided for objects using the system of summarize economic targets, since then analysis in order to offer the reasonable decisions. Starting from the role, the effect of accounting information providing evaluation method should be ensured the following basic requirements:

- The evaluation must be reliable and reasonable. The accounting information provided through the evaluation must be reliable on the basis of objective and reliable evidence in accordance with accepted accounting principles.

- The evaluation must be consistent. The value of the charge objects may be determined by different evaluation methods. The consistence of evaluation method requires consistency in the use of a certain price among accounting periods for a category or group of evaluation object.

In this article, we will outline about the formation and development process as well as the changes and orientations to improve the evaluation method of Vietnam accounting in opening condition, international economic integration and market economy develop.

Research results show that. However, the reasonable valuation model, awareness, understanding and use are quite new and not mentioned much in the Vietnam accounting standards system. This is a model that is increasingly used more popular to replace and in common with other evaluation models that the evaluation method of Vietnam accounting is more and more perfect to satisfy the requirements of integration and development, advance approach and integration with the International Financial Reporting System (IFRS)

The first time, the concept of reasonable value was recognized by the International Accounting Standards Board (IASB): the reasonable value is the value that an asset is exchanged or a liability is paid on a voluntary way among the parties that have the knowledge of a normal transaction. In common with (IASB) the Financial Accounting Standards Board (FASB) also states: The reasonable value is the price that can be received when selling an asset or being able to pay to transfer a debt to pay for a normal transaction among participants in the market at the valuation date.

On a national scale, the reasonable value has been widely used in international accounting standards and financial statements. In 2010, in the draft about the International Financial Reporting Standard No.13 (IFRS 13) “Reasonable Value Measurement” was defined as the price used to charge some accounting objects. After the research and exchange process 2011, this standard has been announced, promulgated and become effective from 2013, under the concept of the reasonable value is mentioned as “the price level which an asset can be exchanged among parties in knowledge of a par transaction”.

In the system of the international financial statements, the reasonable value is used in the following situation:

- To determine the original price.

According to the International Accounting Standard Board’s accounting theory model, the reasonable value is not a measurement basis to determine the elements of financial statement, it is used only to determine the initial recognition value of types of assets and liabilities such as financial assets, financial instruments, ...

- To determine after initial recognition.

In this case, the reasonable value is used to determine the value of assets and liabilities such as real property, factory, machinery and equipment, financial instruments, etc.

- To determine the discount of the asset

According to the accounting standard regulations, the International Financial Statement 13 carries out the reasonable value. It depends on the case determined by one of the following three levels:

1. Reference data is the list price of the asset or liability that is identical on the market. It is the unit may income at the measurement date.

2. The reference data can be collect for assets or liabilities directly of market prices or other indirectly (based on market prices) of the list price level 1. If assets or liabilities are related to a specific term, the reference data level 2 must be reference data which can be collected all essential terms related to assets or liabilities.

3. Asset or liability reference data is not based on active market (no active market).

In Vietnam, the reasonable value have been mentioned in Vietnam accounting standards such as: the Vietnam Accounting Standard No.03 “Tangible fixed assets”; Vietnam Accounting Standard No.04 “Intangible Fixed Assets”; Vietnam Accounting Standard No.06 “Asset lease”; Vietnam Accounting Standard No.10 “The effects of changing in exchange rate”; Vietnam Accounting Standard No.11 “Business consolidate “ and Vietnam Accounting Standard No.14 “Turnover, other income”

The concept of the reasonable value is also mentioned in the Vietnam accounting standards:

Vietnam Accounting Standard No.03 “Tangible fixed assets”: The reasonable value is the value of assets that can be exchanged among acknowledge parties at par exchange .

Vietnam Accounting Standard No.06 “Asset lease”: The reasonable value is the asset value that can be exchanged or the debt value paid in a voluntary way among the acknowledge parties and ready at par exchange.

Vietnam Accounting Standard No.10 “The effects of changing in exchange rate”: The reasonable value is the asset value that can be exchanged or the debt value which paid in a voluntary way among the acknowledge parties at par exchange.

Vietnam Accounting Standard No.11 “Business consolidate”: The reasonable value is the asset value that can be exchanged or the debt value paid in a voluntary way among the acknowledge parties at par exchange.

According to Vietnam Accounting Standard No.14 “Turnover, Other Income”: The reasonable value is the asset value that can be exchanged or the debt value paid in a voluntary way among the acknowledge parties at par exchange.

According to the content of Vietnam Accounting Standards mentioned above that the reasonable value is mentioned in the relevant accounting standards to determine the asset value, which is a determination of the value when it is initial recognition with tangible fixed assets, intangible, turnover, other income and determine the cost business consolidate, as well as initial recognition and reporting of monetary items that have original in foreign currencies.

Although there are regulations about the reasonable value in each accounting standard and the method of determining the reasonable value while it is not legal and synchronous, but also the specific nature of each content. This is also one of the reasons why the widely application of the reasonable value limited, leading to process integration of the International Financial Reporting System (IFRS) is not timely and quickly

Looking back at the process of forming, applying and developing the evaluation method of Vietnam accountant, it has shown that the evaluation models on original prices and market prices have been applied, which carried out quite good for book-keeping and financial statement step by step gradually to the opening, international economic integration. We have also gradually approached the reasonable value model to reach a more perfect integration with the region and the world in the field of accounting control. Aware of the necessity and importance of the Vietnam reasonable value model, there have been positive changes in the field of accounting control under the trend of international integration, especially Article 1, Clause 6 the “Accounting Principles” and Article 3, Clause 7 “Accounting Standards and Accounting Professional ethic standards” of the Accounting Law in 2015 under Law No. 88/2015/QH13, November 20, 2015, namely:

- Clause 1, Article 6: The value of assets and liabilities are initially recognized. After initial recognition for types of assets or liabilities which the value changes frequently at market prices and their value can be reliably determined, they are recorded at the reasonable value at the end of making the financial statement.

- Clause 3, Article 7: The Ministry of Finance shall prescribe accounting standards and accounting professional ethic standards on the basis of international accounting standards which suited to specific conditions of Vietnam.

- Also in Clause 6, Article 3, “Explanation of Terms” of Accounting Law 2015: The reasonable value is the value determined with the market price, which may be obtained when selling an asset or transferring a liability at the time of determining the valuation.

Through the research of the reasonable value model in developed countries with market economy shows that Vietnam needs have research and step by step approach to the reasonable value model to charge the accounting objects in order to improve of the evaluation method of Vietnam accounting to adapt the need of developing the market economy in the opening trend, international integration in accounting and auditing and sustainable development.

To achieve the above targets, we need to determine the rout apply for the reasonable value so that suited to the specific conditions of Vietnam and routine, international accounting standards as well as the content regulations at Article 6 and Article 7 of Accounting Law 2015 with the following contents and solutions:

1. Step by step prescribe the use of the reasonable value to charge of accounting objects in order to ensure the consistency in awareness as well as the realities of charging the accounting objects (assets and liabilities).
2. Determine the concept of the reasonable value.

Nowadays, the concept of the reasonable value is mentioned widely in the related accounting standards and the Vietnam Accounting Law as well as in International Accounting Standards and International Financial Statements including the concepts that the IASB and FASB. To ensure carry out the requirements of Vietnam Accounting Law 2015 on accounting standards, the reasonable value is one that used to determine the value of assets and liabilities paid in certain situation with conditions for a transaction when selling a property or paying a liability, the conditions are:

- The transaction parties are knowledgeable about the the transaction objects.
- The parties are willing to make transaction at the reasonable exchange rates.
- The transaction are conducted in objective and normal.

In short: The reasonable value is the value when selling an asset or paying a liability among the transaction parties voluntarily and acknowledge at par exchange of the transaction carried.

We can see that the conditions to determine the reasonable value when there is a active market of the evaluation objects to be traded.

3. Formally legalize the use of the reasonable value and enforce regulations guiding the implementation of the contents fixed at Clause 1 Article 6 and Clause 3 Article 7 of Accounting Law 2015, including matters related to:

- Basis determine the reasonable value
- The accounting method the reasonable value
- Evaluate and record the reasonable value

We see that the current situation in Vietnam, the basis to determine the reasonable should be based on the market price and ensured suitable to the international accounting standards.

Whereas waiting for enforce “The Reasonable Value Measurement” the reasonable value accounting methods are implemented in accordance with guiding by the Ministry of Finance.

The assessment and recognition of the reasonable value should be done so that suitable to the regulations of the Accounting Law:

+ Assets and liabilities appreciated and recognized under the reasonable value at the end of the financial statement included:

- Financial instruments required by accounting standards must be recognized and appreciated of the reasonable value;

- The monetary items have original foreign currency appreciated in the actual exchange rates.
- The other assets or liabilities have the value change frequently under requirement of the accounting standards must be revalued at the reasonable value.

+ The revaluation of assets and liabilities in accordance with the reasonable value must be ensured that there is a real basis. There is no basis to determine the value reliably, the assets and liabilities are recognized at cost.

+ The Ministry of Finance specifies the types of assets and liabilities to be recognized and revalued according to the reasonable value, the accounting method of recognition and revaluation under the reasonable value.

4. The accounting standards promulgated “Measurement the reasonable value” in accordance with accounting standards, international financial statements No.13 and specific conditions of Vietnam. With the accounting standards issued in related to the reasonable value, it is necessary to supplement and adjust so that suit to the reasonable value model: Guiding the method of determining the reasonable value; the accounting method record and revaluation according to the reasonable value.

According to us, in accordance with the conditions of Vietnam as well as the regulations of the Accounting Law, the reasonable value method should be applied according to the market approach method, the valuation and recognition at the reasonable value should be applied with Article 28 of Accounting Law 2015. In the process of waiting for the issuance of the accounting standards “Measurement of the reasonable value”, we see that it should be used levels and situations to use for determining the reasonable value in accordance with regulations of the accounting standards and international financial statements No.13. In addition to the accounting standards have issued related to the reasonable value, it is necessary to adjust so that suitable to the reasonable value model.

5. The regulations of using the reasonable value so that suitable to the system of international accounting standards:

- a. Using the reasonable value to evaluate and initial recognize with assets in the situation:
 - When businesses do not have to spend money to buy or new production
 - Even if there is the cost of asset. In this case, it will be arised the difference between the reasonable value and the cost, the difference is recognized in the profit (loss) at the time of initial recognition.
 - The cost of business consolidate is determined on the basis of the reasonable value of the exchange property.
- b. Using the reasonable value to charge after initial recognition and make financial statement:
 - Financial assets and investment properties are recorded at the reasonable value at the time of making financial statements.
 - Assets are machinery and equipment, the factory is reevaluated according to the reasonable value
 - Assets and products are recognized at the reasonable value, less estimated costs to sale when harvesting.
- c. Dealing with the difference because of changes or fluctuations in the reasonable values:
 - Recognition is income, expenses including business results (profit, loss)
 - Recognition adjusts increase or decrease target of owners’ capital in the accounting balance sheet with assets held for sale.

EXPORT OF ENVIRONMENTAL GOODS: VIETNAM'S DETERMINANTS

Tran Trong Duc*

ABSTRACT: *Low- and middle-income nations including Vietnam need to have a balance between export expansion and protecting environment. Promoting trade in environmental goods as well as services is one of potential factors that contribute the growth of economy while reducing environmental degradation. This study will provide an insight about the exports of environmental products from Vietnam, the determinants impacting on the export performance and focus on the APEC list of environmental goods that is consisted of 54 commodities in 54 different 6 digit HS code. By using stochastic frontier gravity model for the panel data of top 20 partner countries and regions of Vietnam on environmental goods exports from 2001 to 2016, the estimated results illustrate that GDP of partners nations, participating in the ASEAN and exchange rate have positive impacts on the exports of Vietnam; however, population, distance from Vietnam to partners countries and tariffs have negative impacts on the exports. Additionally, the determinants of 'behind the border' is one of the most important constraints of the Vietnam's exports of environmental goods.*

Keywords: *Environmental goods, Vietnam, stochastic frontier gravity model, 'behind the border' constraints, 'beyond the border' constraints*

1. INTRODUCTION

Since 1986, Vietnam's government has applied Doi Moi policy as well as created the socialist-oriented market economy. The growth rate of Vietnam's exports has increased by 20 percent annually, except in 2009 due to the economic recession (Ministry of Industry and Trade, 2017), but the exports of environmental goods account for only a small proportion of the total of Vietnam's export. It is evident that there is an inverse correlation between export and the environment. The expansion of export will lead to the increase of manufacturing products and the promotion of economic growth; however, it further results in environmental degradation and climate change. There are numerous countries that have suffered from climate change, especially low- and middle-income nations. According to Jones and Olken (2010), the growth rates of developing nations will decrease by approximately from 5.7 to 2 percent if the temperature rises by about 1 degree Celsius. Therefore, low- and middle-income nations including Vietnam need to have a balance between export expansion and protecting environment. Promoting trade in environmental goods as well as services is one of potential factors that contribute the growth of economy while reducing environmental degradation. Statistics reveal that the total exports of low carbon goods increase from 231 to nearly 866 billion US dollars over the period between 2001 and 2011 (Brockman, 2014); and it is expected to reach 1900 billion US dollar in 2020 (Bucher and alii, 2014). This study will provide an insight about the exports of environmental products from Vietnam and the determinants impacting on the export performance. The structure of this paper is as follows: Section 2 provides an overview of environmental goods and Vietnam's exports of environmental goods; Section 3 provides the methodology and a literature review; Section 4 describes the results of the Stochastic frontier gravity model; and the final section will draw conclusions.

2. OVERVIEW OF ENVIRONMENTAL GOODS AND VIETNAM EXPORTS OF ENVIRONMENTAL GOODS

2.1. The definition of environmental goods

There are several differences in the definition of which products will be the environmental good or which services will be environmental services; therefore, the definition of not only environmental goods but also environmental services have become a controversial problem in some WTO negotiations. For instance, Hamwey (2003) suggests that the equipment and technology are used to solve environmental issues or the goods can help to improve positive impacts on the health of citizens and the environment (Katti, 2005). Furthermore, the Organization of Economic Cooperation and Development (OECD) and Eurostat (1999) contented that environment goods are the products that are used to ‘measure, prevent, limit, minimise or correct environmental damage’.

The classification of environmental products also plays an important role in a trade policy. In 1992, OECD is the first organization beginning to identify 164 environmental goods and services and it was divided into 3 categories at the HS nomenclature: ‘pollution management, cleaner technologies and products, and resource management’ (Sugathan, 2013). APEC further created the list of 109 environmental goods under 10 groups. The OECD’s list is better than that of APEC because the APEC’s list does not consist of cleaner technologies, goods and services (Chu & Ahsan 2014). However, the low- and middle-income nations do not well recognize the lists of both OECD and APEC (Nguyen & Kalirajan, 2016). In 2007, the Friend of Environmental Goods group created the friend-153 list combining both of the two above lists. Since that time, the WTO has used the ‘friend-153’ list in negotiations on environmental goods, and it is known as WTO 153 list. One issue of WTO 153 list is that this list is submitted by some members of WTO; therefore, does not imply consensus among all WTO members that these are indeed ‘low-carbon’ or even ‘environmental’ (Chu & Ahsan 2014). In 2007, a list of 43 climate friendly goods is also created by the World Bank (World Bank, 2008); and according to the informal submission between the USA and EU, the tariff rates on these goods will be reduced to zero from 2013 (Sugathan, 2013). In 2012, the list of 54 environmental products developing by following the commitments between 21 economies is endorsed by the Leaders of APEC. According to their commitments, by the end of 2015, tariff rates of 54 environmental goods will be declined to 5 percent or less, and these commitments further take into account the economic circumstance of members. Moreover, since 8 July 2014, 14 WTO members started the plurilateral negotiation on liberalizing trade of environmental commodities that is based on the 54 environmental goods on the APEC list (Atsuko, 2016). There are several critical reasons why APEC negotiations about the list of 54 environmental goods became successfully. Firstly, 21 economies of APEC just agreed a list of 54 commodities that are accepted by all economies, and they did not try to define which product will be the environmental good. Secondly, the resolution of these negotiations is not only a non- legally binding but also implementation voluntary; however, it is supported by the political commitment from the Leaders of APEC economies.

This research will focus on the APEC list of environmental goods that is consisted of 54 commodities in 54 different 6 digit HS code. According to the APEC (2012), 54 commodities can be divided into 4 groups of goods: The renewable energy (15 HS codes); Environmental Monitoring, Analysis and Assessment Equipment (17 HS codes); Environmental – protection (principally SHW, WWM and APC) (21 HS codes) and Environmentally Preferable Products (1 HS code).

2.2. Overview about Vietnam's exports of environmental goods

Vietnam has been rising in the exports of environmental goods since 2001. In 2001, the total export of environmental goods is only US\$ 33,825 thousand while total products exports of Vietnam is US\$ 15,029,200 thousand, accounts for just 0.23 percent of total exports of Vietnam (Table 1). However, it increases dramatically to US\$ 3,117 million in 2016 and occupies approximately 1.77 percent. The export value of environmental goods in Vietnam accounts for small percentage of total Vietnam export, and the value of environment goods exporting from Vietnam is lower than others countries in ASEAN. For instance, the exports of environmental goods in Malaysia and Thailand rose from under 2 billion US dollars in 2000 to more than 7 billion and 6 billion US dollars in 2012, respectively (Bucher and alii, 2014). The enterprises of Vietnam have the capacity to produce numerous environmental products such as micro-hydro and wind towers (Baumuler, 2010), but Vietnamese firms deal with several issues such as the small scale of production and low good quality that will lead to the exports of environmental goods contributing for only a small proportion of the total of Vietnam's export.

Table 1. *The contribution of the exports of environmental goods in Vietnam.*

Units: US Dollar thousand

| Year | Total exports of Vietnam | Total exports of environmental goods | Contribution of environmental goods to Vietnam's exports (%) |
|------|--------------------------|--------------------------------------|--|
| 2001 | 15,029,200 | 33,825 | 0.23 |
| 2002 | 16,706,100 | 60,082 | 0.40 |
| 2003 | 20,149,300 | 61,173 | 0.30 |
| 2004 | 26,485,000 | 127,255 | 0.48 |
| 2005 | 32,447,100 | 134,981 | 0.42 |
| 2006 | 39,826,200 | 280,941 | 0.71 |
| 2007 | 48,561,400 | 273,888 | 0.56 |
| 2008 | 62,685,100 | 337,237 | 0.54 |
| 2009 | 57,096,300 | 330,333 | 0.58 |
| 2010 | 72,236,700 | 429,067 | 0.59 |
| 2011 | 96,905,700 | 689,532 | 0.71 |
| 2012 | 114,529,200 | 900,927 | 0.79 |
| 2013 | 132,032,900 | 913,379 | 0.69 |
| 2014 | 150,217,100 | 1,429,321 | 0.95 |
| 2015 | 162,016,700 | 1,745,209 | 1.08 |
| 2016 | 176,580,800 | 3,117,391 | 1.77 |

Source: UN Comtrade

In Table 2, like developing nations in ASEAN such as Malaysia, Philippines, Thailand and Indonesia, Vietnam further has the comparative advantage in some environmental commodities, for example producing parts and components (HS854140, HS850239 and HS901580) (Atsuko, 2016). The total export value of HS854140 from Vietnam is about 2,214,223 thousand US dollars over the period of 16 years, and it occupies approximately 20.38 percent of total Vietnam export. HS 850300 also has played vital role in the Vietnam export value of environmental goods, with 799,564 thousand US dollars and contribute to 7.36 percent of export value of environmental goods. Additionally, the HS85 group (electric machinery) has only 11 commodities but the export value of this group accounts over 42 percent.

Table 2. *Top 15 commodities of environmental goods exporting from Vietnam between 2001 and 2016*

| Rank | HS Code | HS Code Description | Export value | Contribute to export value of environmental goods |
|------|---------|--|--------------|---|
| 1 | 854140 | Photosensitive semiconductor devices, incl. photovoltaic cells whether or not assembled in modules or made up into panels; light emitting diodes (excluding photovoltaic generators) | 2214223 | 20.38 |
| 2 | 850300 | Parts suitable for use solely or principally with electric motors and generators, electric generating sets and rotary converters, n.e.s | 799564 | 7.36 |
| 3 | 903180 | Instruments, appliances and machines for measuring or checking, not elsewhere specified in chapter 90 (excluding optical) | 721167 | 6.64 |
| 4 | 847989 | Machines and mechanical appliances, n.e.s | 687941 | 6.33 |
| 5 | 901380 | Liquid crystal devices, n.e.s. and other optical appliances and instruments not elsewhere specified in chapter 90 | 599814 | 5.52 |
| 6 | 850490 | Parts of electrical transformers and inductors, n.e.s | 579468 | 5.33 |
| 7 | 850164 | AC generators "alternators", of an output > 750 kVA | 432469 | 3.98 |
| 8 | 854390 | Parts of electrical machines and apparatus, having individual functions, n.e.s. in chapter 85 | 396049 | 3.65 |
| 9 | 901390 | Parts and accessories for liquid crystal devices "LCD", lasers and other appliances and instruments not elsewhere specified in chapter 90, n.e.s. | 392931 | 3.62 |
| 10 | 840290 | Parts of vapour generating boilers and superheated water boilers, n.e.s | 300413 | 2.77 |
| 11 | 903190 | Parts and accessories for instruments, appliances and machines for measuring and checking, n.e.s | 290089 | 2.67 |
| 12 | 847990 | Parts of machines and mechanical appliances, n.e.s | 277402 | 2.55 |
| 13 | 840420 | Condensers for steam or other vapour power units | 275282 | 2.53 |
| 14 | 903289 | Regulating or controlling instruments and apparatus (excluding hydraulic or pneumatic, manostats, thermostats, and taps, cocks and valves of heading 8481) | 269020 | 2.48 |
| 15 | 902680 | Instruments or apparatus for measuring or checking variables of liquids or gases, n.e.s | 239253 | 2.20 |

According to Figure 1, China, USA, Japan and Republic of Korea are the four largest markets of environmental goods from Vietnam and they contribute more than 55 percent of the total export. According to Brockman (2014), the USA and Western Europe concentrate on almost all the biggest markets of low carbon goods; and the growth rates of the markets of low carbon goods in the Asian and African low- and middle-income countries are highest, with approximately 9 percent in 2011. The USA has the largest market size in the world, with £ 629303 million and 368951 firms from 2009 to 2010; and it grew by 5 percent in 2011 (Bucher and alii, 2014). Therefore, these regions will be high potential for exporting environmental goods from Vietnam.

Figure. 1. Top 20 markets of environmental goods from Vietnam.

3. METHODOLOGY

3.1 Theoretical model

The gravity model that has been applied since 1962 is the most successful approach to estimate export potentials as well as export determinants, and it is based on Newton's law. This model hypothesizes that the GDP, population and distance between two nations have major impacts on trade. Tinbergen (1962) demonstrated that there is a positive relationship between exports of nations and their GDP; however, the relationship between the exports of nations and distance of two countries is negative. There are numerous studies providing theoretical legitimacy to improve the gravity model such as Anderson (1979) and Bergstrand (1989). With OLS estimation, the basic of gravity model of international trade is

$$\ln(EX_{ijt}) = \beta_0 + \beta_1 \ln(GDP_j) + \beta_2 \ln(POP_j) + \beta_3 \ln(1+T_j) + \beta_4 \ln(DIST_j) + \beta_5 (RER_j) + v_j$$

Nevertheless, there are several disadvantages of this basic model. The 'behind the border' constraints as well as 'implicit beyond the border' constraints are ignored such as the social and political institution of both home and trading partner nations (Kalirajan 2005). The bias further brings about the presence of heteroskedasticity (Silva & Tenreyro 2003).

The basic gravity model is improved by numerous studies. Egger (2008) and Sayavong (2015) confirm that panel data models which are linear in variables and non-linear in the trade expenses. In addition, Feenstra (2002) indicates that the difference of price between trading partner could be used in the gravity model. Kalirajan (2007) suggests that by using the Stochastic frontier gravity model, the effect of trade resisting factors can be measured. There are several benefits of the Stochastic frontier gravity model, and

the biggest advantage of this model is that although the studies do not have adequate information, country-specific impacts ‘behind the border’ as well as ‘beyond the border’ can be incorporated and measured. The form of stochastic gravity model can be written:

$$\ln(EX_{ijt}) = \beta_0 + \beta_1 \ln(GDP_j) + \beta_2 \ln(POP_j) + \beta_3 \ln(1 + T_{i,j}) + \beta_4 \ln(DIST_j) + \beta_5 \ln(RER_{i,j}) - u_{ij} + v_j$$

in which u_{ij} is only positively distributed, and v_j is normally distributed. The value of u can be between 0 and 1.

According to Kaliarajan (2008), there are three types of determinants that impact on export growth of countries, namely natural constraints, ‘behind the border’ constraints as well as ‘beyond the border’ constraints; therefore, Vietnam’s total export of environmental goods will depend on numerous factors. Firstly, the core determinants such as GDP, population of nations that import product from Vietnam and the distance from Vietnam to the importing countries will have significant impacts on Vietnam’s export. It is evident that the increase of GDP or population of the importing countries could generally bring about the growth of demand for environmental goods from Vietnam. Nevertheless, because of costs of transportation, there is an inverse correlation between the values of environmental goods exports and distances. For example, if the distance between Vietnam and an importing country becomes longer, it will lead to higher transport costs; thus, the value of export will be reduced. Secondly, ‘beyond the border’ factors will be separated into two groups, namely ‘explicit beyond the border’ factors and ‘implicit beyond the border’ factors. The ‘implicit beyond the border’ factors consist of infrastructure and institution of partner nations, and it could have negative impacts on the export country. Moreover, the ‘explicit beyond the border’ factors include tariff and exchange rate policies which also have inverse effects on the total export value of the export countries. The price of imported products could be increased due to the increase in tariff or the devaluation of domestic currency; as a result, the demand for imported goods in the importing countries will be decreased. Finally, the ‘behind the border’ factors relate to the limitations of infrastructure or institution of exporting countries such as transaction costs, the infrastructure of trade, port and custom procedures, licensing and bank procedures that could have negative impact on the export. For example, one of the major ‘behind the border’

According to Ahsan & Chu (2014) and Khan & Kalirajan (2011), the decomposition of export growth could be illustrated by the graph below:

Where

E_1 and E_2 demonstrate the actual export of host country in two periods.

PE_1 : the potential export frontier of host nation with removing the behind the border determinants over the period 1.

PE_2 : the potential export frontier of host nation with removing the behind the border determinants over the period 2.

E_1^* and E_1^{**} : the potential export of host nation in two periods by giving the constraint X_1

E_2^* : the potential export of host nation over period 2 by giving the constraint X_2

From the graph, the different of export value between two periods could be decomposed:

$$\begin{aligned} EG &= E_2 - E_1 = A + B + C \\ &= (E_1^* - E_1) + (E_1^{**} - E_1^*) + (E_2 - E_1^{**}) \\ &= (E_1^* - E_1) + (E_1^{**} - E_1^*) + (E_2^* - E_1^{**}) - (E_2^* - E_2) \\ &= [(E_1^* - E_1) - (E_2^* - E_2)] + (E_1^{**} - E_1^*) + (E_2^* - E_1^{**}) \\ &= [HB_1 - HB_2] \quad + \quad IBB \quad + \quad GCD. \quad (2) \end{aligned}$$

$EG = E_2 - E_1$: the export growth.

$HB_1 - HB_2$ illustrates the export growth because of the impact of behind the border export determinants;

IBB implies the export growth because of the impact of ‘implicit beyond the border’ determinants of partner nation;

GCD demonstrates the export growth because of the effect of core determinants (GDP and population) and ‘explicit beyond the border’ determinants (the exchange rate as well as tariff).

3.2 Empirical strategy

In this paper, the Stochastic frontier gravity model is:

$$\begin{aligned} \ln(EX_{ijt}) &= \alpha_0 + \alpha_1 \ln(GDP_{jt}) + \alpha_2 \ln(POP_{jt}) + \alpha_3 \ln(T_{jt}) + \alpha_4 \ln(DIST_{jt}) \\ &\quad + \alpha_5 \ln(EXR_{jt}) + \alpha_6 \ln(ASEAN_{ij}) - u_{ij} + v_{ij} \end{aligned}$$

where EX_{ijt} presents the value of Vietnam’s exports of environment goods to nation j ; GDP_j and POP_j describe the GDP as well as population of importing nation j ; T_{jt} illustrates the average import tariff of Vietnam’s environmental goods imposed by nation j ; $DIST_{ij}$ is the geographical distance from Ha Noi to the capital city of country j ; EXR_{ij} indicates the nominal exchange rate of the currency of country j and the EXR_{ij} is calculated by the US dollar; and $ASEAN$ is one dummy variable. The value will be equal to 1 if the importing country is the member ASEAN respectively; otherwise, its value is 0.

U_{ij} is only positively distributed. It is denoted that the value of u_{ij} will be 0 if there is not an importance in the influence of behind the border constraints as well as the actual exports and potential exports are not different; otherwise, it will have a positive value. If u_{ij} has the value greater than 0 and less than or equal to 1, there is an importance in the bias and nation specific determinants, and ‘they constrain actual exports from reaching potential exports’ (Kalirajan, 2008). V_{ij} denotes the doublesided error term and normally distributed.

With the maximum likelihood estimation, the production coefficients (from α_1 to α_7) constituting the coefficients of the potential gravity model could be estimated. γ demonstrates the ratio of the variation

because of the influence of ‘behind the border’ determinants to all of the variances of exports. The above model will be estimated by the software STATA 14.1 over the period between 2001 and 2016.

3.3. Data

This research uses the panel data of top 20 partner countries and regions of Vietnam on environmental goods exports from 2001 to 2016. The twenty nations and regions include China, USA, Japan, Korea, Netherlands, Thailand, Saudi Arabia, Hong Kong, Singapore, Australia, Mexico, Malaysia, India, France, Germany, Turkey, United Kingdom, Indonesia, Canada and Philippines. GDP, population and exchange rate are collected from the website of the World Bank. Distance is calculated from Hanoi to the capital of trading partners by Distance Calculator website. Tariff is the average of tariffs on low carbon goods and derived from the World Bank. The export value of environmental goods is calculated from the website of the United Nation Comtrade.

4. RESULTS

Table 3. *Estimates of stochastic frontier gravity model for the data from 2001 to 2016*

| Category | Coefficients | Standard errors of estimates | t statistic |
|------------------------|-----------------|------------------------------|-------------|
| LnGDP | 1.673759(***) | 0.19462 | 8.60 |
| LnPopulation | -0.4745993(***) | 0.1300401 | -3.65 |
| LnDistance | -1.413627(***) | 0.2088813 | -6.77 |
| LnEXR | 0.0145241(**) | 0.0577862 | 0.25 |
| LnTariff | -0.4923042(***) | 0.1750362 | -2.81 |
| ASEAN | 0.4738488(*) | 0.416219 | 1.73 |
| Constant | -15.29209(***) | 3.646351 | -4.19 |
| Gamma | 0.9688(***) | 0.1943736 | 9.55 |
| Log likelihood | | -666.45212 | |
| Number of observations | | 320 | |

Notes: Dependent variable: the logarithm of Vietnam's total exports of environment goods

*(***), (**), (*) illustrates the significance level at one, five and ten percent.*

In the above table, the value of gamma is 0.9688 and it has a significance level at 1 percent (p value is 0.000); thus, using stochastic frontier gravity model is valid in this research. The value of γ further illustrates that the determinants of ‘behind the border’ are one of the most important constraints of Vietnam exports of environmental goods; therefore, with the purpose of increasing the export of environmental goods, Vietnam needs to decline the numerous impacts of ‘behind the border’ factors. For instance, Vietnam can improve the trade infrastructure and the quality of economic institutions.

In Table 3, the coefficient of GDP (α_1) is positive with the 1 percent importance level; hence, the growth of GDP of the importing countries leads to the positive impact on Vietnam’s exports. However, GDP of importing countries has a decreasingly positive impact on the exports of environmental goods from Vietnam during estimated period. There are several causes for that. For instance, when GDP of the partner countries rises, they can produce more goods that replace the imported products from Vietnam; therefore, it could decrease imports from Vietnam.

However, the coefficient of population (α_2) is negative and the significance level is 1 percent. It indicates that as income of the partner countries increases, the low carbon goods that are their demand are

either not exported from Vietnam or the partner countries start to produce those environmental goods, and so their import from Vietnam is decreased. The distance from Vietnam to the partner countries is further major factor by indicating statistical significance level at 1 percent with a negative number.

Tariff is also a crucial factor in Vietnam exports of low carbon goods from 2001 to 2016. The coefficient has negative value with statistical importance of 1 percent. This means that if the partner countries apply higher tariff on the imported goods, then it will lead to the increase in the prices of those goods as well as the reduction of the demand for those products. However, the Vietnamese government is out of control over this determinant because it depends on policies of each partner nations and trade agreements.

The exchange rate was also a crucial factor in Vietnam exports of low carbon goods from 2001 to 2016. The coefficient has positive value with statistical importance of 5 percent. This demonstrates that the currency of the importing countries is appreciated, which results in the decrease of commodity prices importing from Vietnam; thus, the demand for environmental goods from Vietnam will increase.

The ASEAN is also the important dummy variable, and it has a positive impact on Vietnamese export over the period from 2001 to 2016 with statistical importance of 10 percent. Since 1995, Vietnam has participated in the Association of Southeast Asian Nations (ASEAN) and ASEAN Free Trade Area (AFTA); hence, the products exported from Vietnam receive benefits such as tariffs from 0 to below 5 percent (Petri, 2012). In addition, since 2010, six nations in ASEAN (Thailand, Malaysia, Indonesia, the Philippines, Singapore, and Brunei) eliminated tariffs, and Lao PDR, Myanmar and Cambodia have also reduced the intra-ASEAN tariffs by approximately 5.5 percent from 7.3 percent to 1.8 percent over the period between 2000 and 2013 (Yean, 2015); thus, it will promote the exports of low carbon goods from Vietnam to ASEAN which is the third largest export market of Vietnam (Ministry of Industry and Trade, 2015).

GROWTH DECOMPOSITION

The impact of determinants on export potential could be measured by estimating the equation (1). The table 4 could be calculated through several steps below:

(1) From data is collected, with the maximum likelihood estimation, the production coefficients over two periods (from α_1 to α_6) constituting the coefficients of the potential gravity model could be estimated.

(2) $E1^*$ is calculated by multiplying the value of each determinant affecting export over period 1 by the coefficients of the potential gravity model over period 1.

(3) $E1^{**}$ is calculated by multiplying the value of each determinant affecting export over period 1 by the coefficients of the potential gravity model over period 2.

(4) $E2^*$ is calculated by multiplying the value of each determinant affecting export over period 2 by the coefficients of the potential gravity model over period 2.

(5) E_1 and E_2 are the actual export over period 1 and 2 respectively.

From equation (2) and E_1 , E_2 , $E1^*$, $E1^{**}$ and $E2^*$, (HB1-HB2), IBB and GCD are obtained.

Table 4. *Export growth decomposition of Vietnam environmental goods export between 2001 and 2016*

| No | Countries | % Export growth due to the impact of | | |
|----|--------------------------|---|--|--|
| | | 'Behind the border' determinants [HB ₁ – HB ₂] | 'Implicit behind the border' determinants (IBB) | 'Explicit behind the border determinants' and Core Determinants (GCD) |
| 1 | China | -164.362 | 5.199 | 259.164 |
| 2 | United States of America | 87.600 | -8.612 | 21.012 |
| 3 | Japan | -214.782 | 243.807 | 70.975 |
| 4 | Korea, Republic of | 1.090 | 26.576 | 72.334 |
| 5 | Netherlands | 77.881 | 17.284 | 4.834 |
| 6 | Thailand | 28.169 | -314.588 | 386.419 |
| 7 | Saudi Arabia | 59.422 | 19.977 | 20.601 |
| 8 | Hong Kong, China | -355.951 | 292.642 | 163.309 |
| 9 | Singapore | 24.487 | -64.465 | 139.978 |
| 10 | Australia | -363.936 | 102.780 | 361.156 |
| 11 | Mexico | 23.327 | 21.162 | 55.511 |
| 12 | Malaysia | -107.805 | 48.588 | 159.217 |
| 13 | India | -43.177 | 44.054 | 99.123 |
| 14 | France | -594.764 | 568.560 | 126.204 |
| 15 | Germany | -178.622 | 211.197 | 67.426 |
| 16 | Turkey | -84.323 | 99.478 | 84.845 |
| 17 | United Kingdom | -100.060 | 167.435 | 32.624 |
| 18 | Indonesia | -681.244 | 211.233 | 570.011 |
| 19 | Canada | -306.947 | 171.220 | 235.728 |
| 20 | Philippines | -438.935 | 8.717 | 530.219 |

The results in the table 4 illustrate that there was a negative impact of 'behind the border' determinants from 60 percent nations on Vietnam environmental goods export during estimated period, meanwhile the reduce of 'implicit beyond the border' constraints of almost Vietnam's market except Thailand, Singapore and America leads to positive effect on exports of environmental goods in Vietnam. Interestingly, the decreasing of 'explicit behind the border determinants' and Core Determinants (GCD) has contributed significantly to Vietnam's export.

5. CONCLUSION

The exports of environmental goods bring various advantages to Vietnam's economy such as the growth of national income. By using stochastic frontier gravity model for the panel data of 20 countries from 2001 to 2016, the estimated results illustrate that GDP of partners nations, participating in the ASEAN and exchange rate have positive impacts on the exports of Vietnam; however, population, distance from Vietnam to partners countries and tariffs have negative impacts on the exports. The value of gamma with the significance at 1 percent level further illustrates that the determinants of 'behind the border' is one of the most important constraints of the Vietnam's exports of environmental goods; therefore, with a target to increase the export of environmental good, Vietnam will need to decline the number of impacts of 'behind the border' factors. The analysis also shows that the decreasing of 'explicit behind the border determinants' and core determinants has contributed significantly to Vietnam's export. With the purpose of increasing

the value of environmental exports, it is suggested that Vietnam should promote policies that can remove ‘behind the border’ constraints; for instance, the government can improve the trade infrastructure and the quality of economic institution. The government further should diversify the environmental goods basket. The limitation of this paper is that because of limited of data, this study cannot quantify the effect of ‘behind the border’ factors as well as ‘implicit beyond the border’ factors.

APPLICATION OF COST-OF-CAPITAL APPROACH FOR DETERMINATION OF OPTIMAL CAPITAL STRUCTURE IN NHON TRACH 2 PETROLEUM POWER JOINT STOCK COMPANY

Hoang Trung Duc* - Truong Thi Thuy**

ABSTRACT: Capital structure shows the indication of the scale and proportion of specific part of total capital in the business. The purpose of determination of optimal capital structure is reaching the maximization of businesses' value. Optimal capital structure is the particular level of capital structure which creates the balance between the risk and profit in the business resulting in the minimization of the cost of capital and maximization of firm value. In the limitation of this study, the author used the Cost-of-Capital (COC) Approach with the aim of construction of optimal capital structure for the business Nhon Trach 2 Petroleum Power Joint Stock Company. The purpose of this study is to lay the foundation for the reaching optimal capital structure for listed power joint stock companies in the Vietnam security market.

Keyword: Business, Optimal capital structure

1. INTRODUCTION

Power sector is the fields playing essential role in the development of social economics in every nation. Vietnam power sector have been changed significantly for nearly decade. In the strategy of the construction of competitive power market, Vietnam government has been promulgated the planned legislative document for the orientation of development of power sector. From that purpose, 16 listed power companies in Vietnam security market has been operated in order to gaint that target.

Capital structure is the indication of scale and particular part of total capital in the business. The purpose of researching capital strucutre is to make the right decision for the determinantion of optimal strucutre which gaining the maximization of firm value. In this study, the author use Cost-of-Capital Approach for the determination of optimal capital strucutre for the Nhon Trach 2 petroleum power joint stock companies.

2. COST-OF-CAPITAL APPROACH

The cost-of-capital (COC) Approach is the optimal capital strucutre approach which is performed in the following steps

Step 1: Estimation of the cost of debt in each debt ratio: The cost of debt in each debt ratio is constructed based on the credit rating system.

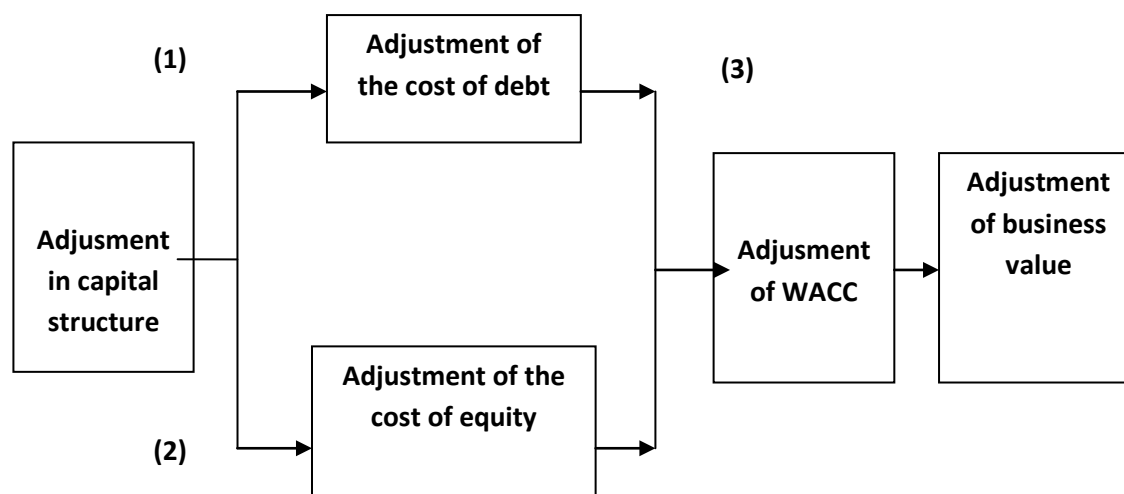

Step 2: Estimation of the cost of equity in each debt ratio: The cost of equity in each debt ration is constructed by the estimation of beta when fully funded by equity (b_U). Then, this task is followed by the estimation of the beta when debt was used (b_L). The application of CAPM model for the estimation of cost of equity at each debt ration is performed.

* Academy of Finance, Corresponding author. Tel.: 0346 313.125, E-mail address: hoangtrungduc.ulis@gmail.com

** Academy of Finance, Tel: 0913275598, E-Mail: truongthithuy@hvtc.edu.vn.

Step 3: Estimation of the average cost of capital used for each debt ratio for the determination of the optimal debt ratio. This formula is used for the estimation of average cost of capital used in each debt ratio. Hence, the optimal debt ratio is the minimal average cost of capital

This approach is demonstrated in the following model

Graph 1.1: Demonstration of COC Approach

3. APPLICATION OF COC METHOD FOR THE DETERMINATION OF OPTIMAL CAPITAL STRUCTURE IN NHON TRACH 2 PETROLEUM JOINT STOCK COMPANY – (NT2)

Step 1: Determination of elements/factors in the model

- **Determination of Risk-free rate (Rf):** Risk-free rate is determined by rate of 10-year Government bond issued by National Treasury in 2017. Risk-free interest rate is 5.38% per year.

- **Determination of Equity Risk Premium (ERP):** Equity Risk Premium is determined by the differential parts between the rate of return of the market portfolio and the risk-free market. ERP is the basic foundation for the decision of the cost of equity and weighted average cost of capital. ERP reflects the degree to which risk is offset by the fact that investments in equity assets have a higher level of risk than investment in non-riskier assets such as government bonds. If the level of risk compensation is not large enough to meet the expectations of investors, investment decisions will not be made. The author collects data on the risk premium from Prof. Aswath Damodaran's calculations. The results show that the ERP of Vietnam in 2017 is 10.27%.

- **Determining the capital structure of Nhon Trach Thermal Power Joint Stock Company at market price:** The structure of capital at market price reflects the level and proportion of each source of capital (debt, equity) according to market value. For the determination of the capital structure at market prices, the market value of debt is determined based on book value and market value of equity determined by the number of shares held. at the end of 2017 multiplied by the closing price of that stock at the end of 2017.

Table 1.1: Capital structure of NT2 by market value in 2017

| Capital structure | The volume of stock in circulation | Closing price of NT2 at the end of the year (VND) | Market Value (Trillion dong) | Propotion |
|-------------------|------------------------------------|---|------------------------------|-----------|
| Short-term Debt | | | 1.066.152 | .. |
| Long-term Debt | | | 2.631.620 | .. |
| Total Debt (D) | | | 4.763.924 | 34,55% |
| Equity (E) | 287.876.000 | 31,39 | 9.026.428 | 65,45% |
| Total Capital | | | 13.790.352 | .. |
| D/E | | | 0,5277 | 52,77% |

(Source: Author's estimatios from financial statements of JSCs)

- **Determination of enterprise income tax rate:** The enterprise income tax rate applicable to T2 is 20%.

- **Determine the beta coefficient of the stock NT2:** The beta coefficient of the stock NT2 collected by the author (source) is 0.47. Beta without financial leverage is determined by the following formula:
 $b_U = b_L / \{ [1 + (1 - T_c)] * D/E \} = 0,47 / \{ [1 + (1 - 20\%)] * 52,77\% \} = 0,33$

* **Step 2: Determine the cost of equity using the different capital structures**

- **Leverage factor leverage (b_L):** determined by the following formula: $b_L = b_U * [1 + (1 - T_c) * D/E]$

- **Cost of equity (R_e):** determined according to the following formula under CAPM asset pricing model: $R_e = R_f + b_L * (R_m - R_f) = R_f + b_L * ERP$.

Table 1.2: Cost of Equity at the level of capital structure

| Debt ratio | Total capital | Debt | Equity | D/E | b_L | R_e |
|---------------|---------------|--------------|--------------|--------------|-------------|---------------|
| 0% | 13.790.352 | - | 13.790.352 | 0 | 0,33 | 9,51% |
| 10% | 13.790.352 | 1.379.035,2 | 12.411.316,8 | 0,11 | 0,36 | 9,88% |

*** Step 3: Determine the cost of debt at different levels of capital structure**

To determine the cost of debt use at different levels of capital structure, the author collected data on rankings to determine the bankruptcy risk premium of Professor Aswath Damodaran. The rating is based on the solvency of non-financial corporations with a market capitalization of more than \$ 5 billion and less than \$ 5 billion. Table 1.3 describes the bankruptcy risk rating of Prof. Aswath Damodaran.

Table 1.3: Bankruptcy Risk Rating Chart of Professor Aswath Damodaran

| Market capital > \$5 billion | | | | Market capital < \$5 billion | | | |
|-------------------------------|----------|-----------|-----------|-------------------------------|-----------|-----------|-----------|
| If interest coverage ratio is | | | | If interest coverage ratio is | | | |
| > | ≤ to | Rating is | Spread is | greater than | ≤ to | Rating is | Spread is |
| 8.5 | 100000 | AAA | 0.40% | 12.5 | 100000 | AAA | 0.40% |
| 6.5 | 8.499999 | AA | 0.70% | 9.5 | 12.499999 | AA | 0.70% |
| 5.5 | 6.499999 | A+ | 0.90% | 7.5 | 9.499999 | A+ | 0.90% |

The author of this rating system for Nhon Trach Thermal Power Joint Stock Company - NT2 will be suitable for market capitalization of less than US \$ 5 billion. The solvency ratio is measured by taking pre-tax profit and interest divided by the amount of interest payable. Pretax profit and interest of NT2 in 2017 is 853,439 million dong; The average lending rate in Vietnam in 2017 is 6.25% [29]. The cost of using debt at different levels of capital structure is shown in the following table:

Table 1.4: Cost of debt use at different levels of capital structure

| Debt ratio | Total capital | Debt | Amount of loan interest | Interst coverage ratio | Credit rating | ERP | Rf | Rd | Rdt |
|---------------|-------------------|--------------------|-------------------------|------------------------|---------------|--------------|-------|--------|--------|
| 0% | 13.790.352 | - | | | | | | | |

***Step 4: Determination of optimal capital structure**

WACC in particular capital structure was indicated in Table 1.5 in the following demonstration

Table 1.5: Optimal capital structure of NT2 Petroleum Electricity Joint Stock Company

| Debt ratio | Equity ratio | Rdt | Re | WACC |
|------------|--------------|--------------|--------------|--------------|
| 0% | 100% | | 9,51% | 9,51% |
| 10% | 90% | 4,86% | 9,88% | 9,38% |
| 15% | 85% | 5,10% | 10,11% | 9,36% |
| 20% | 80% | 5,26% | 10,35% | 9,33% |
| 25% | 75% | 6,50% | 10,62% | 9,59% |
| 30% | 70% | 6,90% | 10,95% | 9,74% |
| 34,55% | 65,45% | 7,50% | 11,28% | 9,97% |
| 35% | 65% | 7,50% | 11,29% | 9,96% |
| 40% | 60% | 8,30% | 11,72% | 10,35% |
| 45% | 55% | 8,30% | 9,85% | 9,15% |
| 50% | 50% | 9,10% | 12,86% | 10,98% |
| 55% | 45% | 9,10% | 13,60% | 11,13% |
| 60% | 40% | 9,10% | 14,54% | 11,28% |
| 65% | 35% | 9,10% | 15,71% | 11,41% |
| 70% | 30% | 9,90% | 17,32% | 12,13% |
| 75% | 25% | 9,90% | 19,57% | 12,32% |
| 80% | 20% | 9,90% | 22,92% | 12,50% |
| 85% | 15% | 10,70% | 28,49% | 13,37% |
| 90% | 10% | 10,70% | 39,69% | 13,60% |
| 95% | 5% | 10,70% | 73,21% | 13,83% |
| 100% | 0% | | - | - |

(Source: Author's estimatios from financial statements of JSCs)

The target capital structure is the level of capital structure that results in the lowest average cost of capital (WACC). By setting the level of target capital structure for Nhon Trach 2 Petroleum Electricity Joint Stock Company with the debt ratio ranging from 0% to 100%, the analysis shows that the WACC has fluctuated from 9,15% to 13.83%. The lowest average cost is 9.15%, corresponding to the capital structure ratio of 45% for debt and 55% for equity. Thus, with the current funding structure (34.55% of debt, 65.34% of equity), the WACC of 9.97% is not the level of the target capital structure. Thus, through the formulation of target capital structure for NT2, it has been recommended that T2 be adjusted to 45% of debt and 55% of equity to minimize cost of capital and maximize cost. corporate governance.

RESEARCHING ON THE TRANSFER PRICING PHENOMENON AT THE COMPANIES IN THE BACKGROUND OF GLOBALIZATION.

Nguyen Duc Dung* - Ha Thi Phuong Dung**

ABSTRACT: *At present, in the background of globalization, Vietnam is becoming more integration in the regional economy and the world, along with the open door policy, absorbing the investment. Investment capital flow in the process of globalization has contributed to develop the economy of Vietnam, however, along with the active contribution to the economy, the process of economy globalization has appeared with anxious problems, caused the negative effects to the economy such as the story of transfer pricing, tax evasion, making the situation of false loss, real profit. Problem for Vietnam is to attract the capital source taking full advantage of globalization, but it is still sure about the budget revenue source to make a steady economic development. The article is to research the theory base relevant to transfer pricing, transfer pricing situation of companies on the basis of international integration from then towards the relevant solution to restrict the movement of prices in Vietnamese companies that is sure for a steady developed economy.*

Keywords: *Globalization, Transfer pricing, Decree No 20.*

1. MAIN TEXT

1.1. Introduction

In the process of economy globalization, the opportunity to increase the direct investment capital amount of foreign investment joint stock companies in Vietnam in the next time as considering in middle term and long term will have a strong and active impact on the strength of Vietnamese Economy. Making a lot of preferential tax policies aimed to attract the investment capital especially in the foreign investment capital will make the tax policies of Vietnam become more complicated, arising with a lot of gaps for the companies to take full advantage of tax evasion. In order to compete with many countries in area, Vietnamese Government has the preferential tax policies in the popular forms including: Tax exempt restricted, tax rate reduction, remission of taxes with the profits used for reinvestment, it is allowed to transfer loss, reduce tax on the profits transferred to the foreign countries. Policies of preferential tax is able to make the tax policies become deformed, complicated, less efficient, arising with many gaps for the companies to take full advantage of tax evasion and tax avoidance in many sophisticated practices. In the recent time, operation of transfer pricing in Vietnam has been taken place extremely complicated in many different forms, sophisticated and it is more difficult to find out. Many types of enterprises, not only the foreign direct investment enterprises, but also the domestic enterprises, even the State Enterprise also takes part in the transfer pricing operation

* ** School of Accounting - Auditing - National Economics University, 207 Giai Phong Road, Hanoi, Vietnam.

1.2. General summary of transfer pricing operation

“Transfer pricing” is the term used in the cross border transactions, transactions between companies in a group. Transfer pricing has reflected the price setup in the transactions on delivering assets and service between the associated companies. These transactions are also regarded as the controlled transactions to distinguish with non-controlled transactions are the transactions between independent companies in the free market

In the international researches, there are two directions to research the object of transfer pricing. According to Li (2005), price transferring can be used for goods and services transferred between the units or profit center inside a company, or used for goods and services transferred between the relevant companies in different countries. However, in general, transfer pricing is a term used to represent for the value of transactions between the subsidiary companies operated in different nations. In other words, delivery price is defined as the price calculated for tangible and intangible assets of company, goods, service, materials, know-how, and technology for the branches or subsidiary companies

According to Pearce David W. (1999), making the delivery price is “Price Fixing System for the transaction between subsidiary companies of multi-national company in which transaction has the delivery price is not dependent on the market element. Fixed price is to impact on the tax rate and a multi national company must pay on the global scope”.

Andrew Lymer and Jonh Hasseldine (2002) in their own research have also made the definitions on transfer pricing. According to that, transfer pricing is to carry out the price policies for goods, service and assets transferred between the members in the cross border group not according to the market price aimed to minimize the tax amount of multi national company in the global

Most of authors as said above have admitted that opinion of price transferring is an activity must take place between the subsidiary companies in different nations in a group

With regards to the Vietnamese opinions of price transferring, Pham Hung Tien (2012), in his own article considered that: “ Transfer pricing is described in general as defining by currencies for a kind of goods or such product, however, only including the commodities that parties have transacted not purchasing from the external party (or the third party), means the commodities exchanged between the member units in scope of a company together – still called the entity of associated relationship”.

Similar to the opinion as mentioned above, Nguyen Van Phung (2012) also provided the definition: “Transfer pricing is understood as a pre-arranged action and performed by the business entity which has an associated relationship to change the price level in the transacting relationship of purchasing and selling, exchanging goods, services, capital, assets (or any subject of transaction) with a difference in market price”.

Therefore, although there is a lot of definition on price transferring, but in general price transferring is understood as a technique, a pre-arranged operation of company, group, business entities have the associated relationship to change the price level in the relationship of purchasing and selling, exchanging goods, service, capital, assets. Price level in this internal relationship has a difference compared with the market price. Purpose of price transferring is used to maximize the business strategy, maximize the profit of a group with economic link relationship (Group, corporation, subsidiary company in group, branch of companies or group of companies with associated relationship) on the basis of minimizing the tax payable. According to Lin and partners (1993) due to transfer pricing, the government has reduced the revenue for budget from the relevant tax collecting activities to the business income tax, importing tax, and contractor tax. Transfer pricing is to differentiate the result of business operation and financial situation of companies. In order to

evaluate and audit the financial statement of government must recognize and adjust the influences due to price transferring. This can be less efficient and especially in high expenses in developing countries due to lack of skills and experiences

1.3. Transfer pricing situation in Vietnamese Enterprises

Some skills in taking full advantage of transferring professions caused the influence to the obligation of State tax payable of Enterprises can be listed:

- Transfer pricing by means of investment capital contribution: Taking advantage of clear policies on investment attraction of Vietnam in the direction to develop the comparative advantage of natural resources such as land and labour, multi-national companies have implemented to transfer pricing to seek profits. In addition that, multinational companies have also grasped on the restriction of Vietnam about the financial resources and ability to evaluate the value of fixed assets, foreign investors will invest in Vietnam by means of capital contribution with the chain of machine, specific equipment are evaluated much higher than real value to carry out a transfer pricing. Controlled raise of capital contribution value will bring some economic benefits such as: foreign investors are able to transfer a part of economic benefits back to their own by means of fixed assets depreciation and profit division in the proportion to contribute capital caused the damages to the State and Joint Venture Party of Vietnam. Raising the value of capital contribution is to have a capital gearing higher than the Joint Venture Party of Vietnam will lead to increase the opportunity to hold the control right and manage the enterprise, transfer pricing execution caused to the interminable loss will make a lot of Vietnamese Companies which have not full of finance potential to continue the activities of production and business must resell the foreign investment contributing capital and of joint venture to become a 100% foreign direct investment enterprise

Transferring the intangible assets from a foreign direct investment capital enterprise in Vietnam has been carried out in the popular forms: joint venture capital contribution, asset transfer is to formulate the fixed assets of enterprises, purchasing or renting the assets to operate the production, processing work. In principles, transferring profession of goods or tangible assets must be agreed by both parties of business partnership. In case, it has not been approved by either of the parties and such asset must be verified by the competent authority. However, in fact, definition on the price of capital contributing assets is not simple and performed rightly according to the specification. According to the official verification announced widely has shown that many foreign partners had an intention to count the price higher than real value of machine, equipment imported by them in Vietnam to contribute the joint venture capital. According to Nguyen Thi Lan (2016), the result of verification in 2003 performed by SGS Swiss International Verification Company to carry out among 13 foreign direct investment capital enterprises for verification, including 7 enterprises hold the percentage of 53.48% declared to increase the capital value in the joint venture compared with the real value more than USD 10 million

Vietnam has also made the regulations on controlling the transfer pricing more strictly. On 24th February 2017, the Government has promulgated the Decree No 20/2017/NĐ-CP on the tax asset management for enterprises with associated transaction (Decree No 20) aimed to intensify preventing the loss of tax revenue for the FDI Enterprises. New decree is compiled on the basis of BEPS action program, this problem is able to cause difficulties to observe the action program of BEPS as applied in the developed countries, which have the level of tax management; regulations on tax are quite clear and explicit. In Vietnam, local data base is still existed with a lot of weakness and shortcoming; tax payer will lack the basis for reference as

defining the price in associated transaction pursuant to the guidance of new decree. Therefore, feasibility in complying with this decree is necessary to consider

- Transfer pricing is relevant to the tax types of enterprise

In 2015, by means of Sabeco Audit, the State Audit has found out legal gaps in here and proposal to collect more approximately VND 2,500 billion of special consumption tax amount. In particular, this enterprise has sold through many grades in system at low value to avoid tax. According to the regulation in clause 6 of Special Consumption Tax Law on goods manufactured in domestic, special consumption tax price is the selling price of production basis. However, in fact, Saigon Beer-Alcohol-Beverage Joint Stock Corporation has established a commercial basis is Subsidiary Company (100% capital or holding the majority of distributing shares). These companies have purchased all products of manufactured factory as well as a subsidiary company in the similar parent company with the commercial basis. After that subsidiary company will continue selling to the distributor or independent wholesale agency to distribute in the market; Therefore, Sabeco has established a chain of subsidiary companies and sold beer to those subsidiary companies before distributing to the consumer and making a list of special consumption tax rate based on the sale price at the first manufactured location. Enterprises have made a lot of intermediate level to distribute, if considering in nature, this is the symbol of transfer pricing due to decrease the sum of special consumption tax payment

- Raising the input material price imported from Parent Company or a member company in Corporation

A problem relevant to the transfer profession again is to raise the price of input materials imported from parent company or a member company in group for many purposes. That is parent company will be entitled to get high interest rate as selling the materials and carrying out the profit transfer from subsidiary company in Vietnam to the parent company or an associated company in the similar foreign group. This is a quite typical case relevant to the enterprise producing the articles of beer, alcohol, soft drinks because materials relevant to the production of goods are usually not existed in Vietnam, mainly imported from parent company. Typically is the case of Vietnam Coca-Cola Company by means of importing the flavourings, mash liquor từ from parent company in the United States or associated company to manufacture the beverage. Value of materials holding the percentage of 70-85% in total expenses of this company while the average percentage is less than 40%

- Raising the service price due to the parent company in foreign country will provide for the subsidiary company in Vietnam at the price is much higher than market price

Reality in Vietnam, operations of providing and transferring the services between subsidiary company in Vietnam and parent company and Member Company in group in foreign country are carried out quite popularly. Providing among the parent company with the internal group's companies, among the company in the internal group with one another that is very difficult to realize the real value arisen or how the price is. In the past years, a lot of multi-national companies have taken full advantage of this characteristic in operation of verifying the services for tax evasion like Vietnam will pay the service fees or companies associated with foreign countries at very high price or supply to the associated companies in foreign countries the services at lower price than market price or even free of charge. For example as the case that Interfood- International Food Processing Company (with 100% capital of Trade Ocean Holding Sdn.Bhd in Malaysia) is to provide the automobile in foreign countries in 2003 at the value equal to 50% of automobile value. However, transfer professional definition of foreign direct investment capital enterprise properly or

not that is very difficult to determine due to the difference in labor efficiency, income, labor specialization in the management level, law of countries

- Increasing the advertisement costs, sale cost is higher than market price

Advertisement, sale cost,... as well as items of cost that foreign companies operating in Vietnam often take full advantage of promoting higher for the purpose of transfer price or holding the market. In fact, it showed that many joint venture companies of FDI have made a list of loss originated from increase remarkably on advertising and marketing costs. However, money spent for advertisement is of joint venture and advertising product of parent company. This problem according the calculation of the General Bureau of Tax, most of companies have been in excess of controlled level of 10% total expenses on advertisement, promotion. Therefore, Ministry of Finance warned many times about the situation warning about the fact not few multinational companies for the purpose of holding the market of Vietnam, so they have increased the task of promotion, advertisement to attract the customers caused to the unhealthy competition between the foreign direct investment enterprises and domestic enterprises

1.4. Recommendation relevant to the operation of transfer pricing in order to develop a stable economy

Controlling the transfer pricing, preventing the loss of tax revenue for the enterprises is a mathematical exercise for many years that management authorities of Vietnam are having a headache, especially in the global management process at present. Integration has contributed to develop the economy, but it is necessary to manage for a stably developed economy. Therefore, it is necessary to have the methods of restricting the transfer pricing issues of current enterprises

- Firstly, strengthening the State control on transfer pricing activities

Strengthening the State control on transfer pricing activities will contribute to improve the strength and the State management efficiency in the integrated times. Transfer pricing activities taken place in the countries in all over the world with international trading and investment relationship, and this tendency is becoming variety and complicated in many forms in Vietnam. Strengthening the State control on transfer pricing activities has contributed to increase the State Budget Revenue, increased the expenditure sources for social economic development from the State Budget, validity on guideline and regulation on preventing the transfer pricing, minimizing the inequality between the enterprises which observed the law and enterprises which did not observe the law, minimizing the information to provide for contacting on assets, profit... of enterprise for society

- Secondly, researching to promulgate the law on transfer pricing prevention

Vietnam has to research on creating a basis for promulgating the regulations on control and handling the influences of transfer pricing activities to the economy. At present, many countries in the world had a law on transfer pricing prevention and had a national council on managing the transfer pricing prevention to prevent the acts of transfer pricing such as France, Japan, Canada, India. American Government has always the best effort to complete the legal system, modify and supplement the regulations to serve for the control task and transfer pricing. Regulations on transfer price have become an important part of American Tax Law since the First World War time. From then to now, law on transfer pricing prevention in the United States is always completed according to the period of time

For the transfer pricing activities of domestic enterprises, State management authorities of Vietnam are also have to pay an attention to the influence of other tax types except for business income tax such as natural resource tax, value added tax, export-import tax, special consumption tax... Transfer pricing issue is not only taken place in the foreign direct investment capital enterprise

- Thirdly, tax authority at levels has to strengthen on inspection to find out the transfer pricing activities

Inspection on the transfer pricing activities is necessary to regard as one of focus duties of Tax Branch. Focusing on inspection, checking the transfer price for the enterprises which have some knowledge according to Nguyen Huu Anh and co-workers (2016)

- Enterprises have been lost for many continuous years after the period of newly establishment or business results are always balanced that caused the Enterprise not to pay for income tax. In addition, these enterprises have still extended the investment, extended the operation of production and business though lost results

- Enterprises arisen professionally with the relevant parties have been transferred from the associated enterprises in countries which have low tax rate, tax heavens

- Enterprises have their own profit ratio much smaller than other enterprises in a group, competitors

- Profit fluctuation of enterprises is not dependent on economy or almost unremarkable tax rate from this year to other year

- Transfer pricing activities are often executed with intangible assets. Intangible assets are often difficult to define correctly on value led to the transfer pricing activities

Fourthly, building the data base on price for transactions

Through the survey with the functional offices such as tax office, customs office or State Audit, problems for controlling the transfer pricing activities that is lacking the data base on price of goods transacted. According to Nguyen Huu Anh and co-workers (2016), good data base has an active influence to control the transfer pricing activities. Data base is to provide the information on comparable market price, creating a condition for evaluating the transactions with the associated party as enumerated. As evaluating a profession of internal purchase and sale, competent authorities have difficulties to find out the price for reference to compare. Problem is more complicated on types of goods such as automobile; the remained transfer price is dependent on the options of customer, accessories in attachment to the automobile caused the definition on transfer is complicated if there is not sufficient data

For the data base on price is accuracy, the State has to update frequently, continuously and supplemented from many sources of different trustworthy information. Therefore, the State authorities such as General Department of Tax have to provide the regular budget for the activities of updating data to restrict efficiently the action of transfer pricing of Enterprises

1.5. In conclusion

International integration is an inevitable tendency and all countries have been being towarded. However, along with integration, many problems are arisen in which of transfer pricing phenomenon. This article as said above is to generalize on transfer pricing and problems of transfer pricing influence to the stable development of economy. Process of global integration will create a condition for the economy to develop, however it is necessary to control strictly the associated transactions to avoid the loss of budget revenue. The author has searched in general about the situation of transfer pricing matter and put in the recommendations to control the transfer pricing activities of enterprises in Vietnam.

FORECASTING MODEL OF VIETNAMESE CONSUMERS' PURCHASE BEHAVIOR OF DOMESTIC PRODUCTS

Luu Tien Dung* - Nguyen Thi Kiem Hiep**

ABSTRACT: *The study of the determinants of consumer purchase decisions of domestic goods is necessary in the context of Vietnam's international integration in order to help domestic firms improve their competitiveness. This study aims to analyze factors influencing Vietnamese consumers' purchase decision of domestic products based on Binary Logistic regression model. This study uses survey data gathered from 240 consumers in Vietnam in 2018. Research results show that (i) Perceived price, (ii) Perceived quality, and (iii) Consumer ethnocentrism has significant influences on the consumer purchase decision of domestic products in Vietnam.*

Keywords: *Binary logistic model; consumer ethnocentrism; domestic products; perceived price; perceived quality; purchase decision.*

1. INTRODUCTION

International trade activity is becoming a central part of the world economy, and it is recognized that there is a greater necessity to gauge consumers' attitudes and behavior toward both domestic and foreign manufactured products. Vietnam's economy continues its' deep integration process with the continued signing of the Comprehensive and Progressive Partnership Trans-Pacific Partnership, the world's largest free-trade area with a combined market of 600 million people, together with the previously signed linkage mechanism, promises to continue to increase growth opportunities for many economic sectors. At the same time, competitive pressure on the domestic market will also increase strongly to firms. The relaxation of trade policies has provided consumers with more foreign manufactured product choices than ever before. Consequently, their attitudes toward products originating from foreign countries have been of interest to domestic business and consumer behavior researchers for decades. It is important to understand both the theoretical and practical aspects of the factors that govern the behavior of consumer purchasing decision.

Consumer behavior and consumer purchase behavior of domestic goods have received significant attention from researchers (Knight, 1999; Watson & Wright, 2000; Lu Wang & Xiong Chen, 2004; Nguyen, Nguyen, & Barrett, 2008). Previous studies used a microeconomic theory approach, behavioral economics theory to explain consumers' domestic purchasing behavior and test for multiple product groups. However, there is no full research model in all cases, and many studies, rather than the use of dependent variables, are the real decisions of consumers make using other variables such as a willingness to buy or intention to buy. Thus, the predictability power of these research models is not really significant.

The present study aims to determine factors affecting Vietnamese consumers' purchase decision of domestic products based on binary logistic regression model. The structure of the article consists of five parts: (i) Introduction, (ii) Review of literature, (iii) Research methodology, (iv) Results and discussions, and (v) Conclusions.

2. REVIEW OF LITERATURE

Kotler and Armstrong (2009) argue that consumers' decision-making processes were influenced by factors such as cultural factors, social factors, personal factors, and psychological factors. Consumer behavior patterns are used to describe the relationship between the three factors, including the stimulus, black box consciousness, and responses responding to consumer stimuli that affect purchasing decisions of consumers. The Theory of Reasoned Action (TRA) was developed by Fishbein and Ajzen (1975) shows that the intention of an individual's behavior to be influenced by two factors, including behavioral attitude, and subjective norm. These two factors directly affect the behavioral intent and then affect the actual behavior of an individual. Theory of Planned Behavior (TPB) states that the intention of an individual is influenced by three factors: behavioral attitudes, subjective norms, and perceived behavior control. Perceived Behavioral Control (PBC) refers to the ease or difficulty of performing a behavior and whether or not the behavior is controlled (Ajzen, 1991). This extension involves explanations for when people intend to perform an activity that is impeded by their lack of confidence or lack of the right to conduct behavior (Ajzen, 1991).

There are many previous kinds of research have identified the factors that explain the domestic goods purchase behavior of consumers. Key elements proposed in the previous studies include consumer ethnocentrism, perceived price, and perceived quality of domestic products.

Consumers ethnocentrism

Ethnocentrism' refers to the tendency of individuals to see their cultural group as proving the norms for acceptable behaviors and preferences. Highly ethnocentric individuals are intolerant and judgmental with respect to cultures different from their own (Luque-Martinez, Ibanez-Zapata, & Barrio-Garcia, 2000). The tendency of consumers to be ethnocentric represents their beliefs about the appropriateness and moral legitimacy of purchasing foreign products (Shimp & Sharma, 1987). Ethnocentric consumers prefer domestic goods because they believe that products from their own country are the best (Klein, Ettenson, & Morris, 1998). Moreover, a concern for morality leads consumers to purchase domestic products, even though the quality is poorer than that of imports (Wall & Heslop, 1986). Consumer ethnocentrism may play a significant role when people believe that their personal or national well-being is under threat from imports (Sharma, Shimp, & Shin, 1995; Shimp & Sharma, 1987). The more important a consumer places on whether or not a product is made in his/her home country, the higher his/her ethnocentric tendency (Huddleston, Good, & Stoel, 2001). Sharma, Shimp, and Shin (1995) show the effect of consumer preference leads to a preference for domestic goods, low prices for foreign goods and unwillingness to buy foreign goods while always favoring domestic goods. According to Netemeyer, Durvasula, and Lichtenstein (1991), the level of consumer preference indicates the degree of influence of buyers' beliefs, attitudes and behavior toward domestic products. In a study that examined the relationship between consumer ethnocentrism and evaluations of foreign sourced products. Lantz and Loeb (1996) found that highly ethnocentric consumers have more favorable attitudes toward products from culturally similar countries. The higher the purchasing power, the higher the domestic buying behavior (Shimp & Sharma, 1987; Watson & Wright, 2000; Lu Wang & Xiong Chen, 2004; Nguyen, Nguyen, & Barrett, 2008; Zafer Erdogan & Cevahir Uz Kurt, 2010).

In addition, individuals with high levels of consumer ethnocentrism would have more favorable attitudes toward products from culturally similar countries in comparison to products from culturally dissimilar countries, they support a higher perception of price and quality and thereby promote consumers' purchasing decisions of domestic goods.

Hypothesis H1: Consumers' ethnocentrism has a positive impact on consumer purchasing decision of domestic products in Vietnam.

Perceived price

According to Zeithaml (1988), the price is what the consumer must give up to own the goods. Diehl, Kornish, and Lynch (2003) argues that consumers are price sensitive because they tend to look for lower-priced products and they want satisfaction through price comparisons between different products. Zeithaml (1988) distinguished prices into two categories: objective price is the actual price of the product or service and price is perceived by the consumer. Price perception is a comparison between the actual objective price and the price at which consumers refer to, reflecting the buyer's subjective feelings or feelings about the price objective. That product or service (Agarwal, Wang, Xu, & Poo, 2007). On the consumer side, they often do not remember or know the actual price of the product, but instead feel the price, suitability based on the perceived usefulness of the merchandise (Agarwal, Wang, Xu, & Poo, 2007). This approach refers to the suitability of the price of the product or service that the user perceives. When consumers feel positive about price stability, and compare it to the usefulness they receive, they will shape their buying intentions and behavior (Winit & Gregory, 2009; Prasad, 2014).

Hypothesis 2: The perceived price of domestic products has a positive influence on consumer purchasing decision in Vietnam.

Perceived quality

Consumers' intention to purchase domestic will be influenced by perceived quality. In the literature, quality perception is treated as a multi-dimensional concept, including appearance, color and design, durability, fashion, functionality, prestige, reliability, technical advancement, value for money, and workmanship (Darling & Arnold, 1988; Darling & Wood, 1990; Klein, Ettenson, & Morris, 1998; Scott, Powers, & Swan, 1997; Watson & Wright, 2000). One of the solution consumers form perceptions about a brand is based upon the quality (Dooley & Fryxell, 1999). A positive perception of quality is the source of the consumer's purchase decision (Aaker, 1991). Quality perception influences consumers' buying intentions (Dodds, Monroe, & Grewal, 1991; Cham, Lim, & Cheng, 2017).

Hypothesis H3: The perceived quality of domestic products has a positive influence consumer purchasing decision in Vietnam.

3. RESEARCH METHODOLOGY

Binary Logistic Model was used to estimate parameters. There are 14 items in measure three independent variables of the research model (see Table 3). All items are measured by 5-point Likert scales, which were 5 – strongly agree, 4 – agree, 3 – not sure, 2 – disagree and 1 – strongly disagree. We adopted previously validated measures with additional testing of reliability for indicator scale in this study.

The logit model is generally specified as follows:

$$\ln \left[\frac{p=1}{p=0} \right] = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 \quad (1)$$

Where:

$P(Y=1) = P0$: Probability of consumers' purchasing decision of domestic products.

$P(Y=0) = 1 - P0$: Probability of consumers' non-purchasing decision of domestic products.

X_i : Independent variables (i : from 1 - 3); Ln : Log of e ($e = 2.714$).

β is a scalar parameter to be estimated in equation (1).

Odds ratio (O_0):

$$O_0 = \frac{P0}{1-P0} = \frac{P(\text{Purchaser})}{P(\text{Non-Purchaser})}$$

Replace O_0 into the function (1):

$$\text{Ln}O_0 = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 \quad (2)$$

The log of the Odds ratio is a linear function with independent variables X_i (Cox, 1970).

Agresti (2007) indicated the prediction function of the binary logit model:

$$E(Y/X_i) = \frac{e^{\text{LnOdds}}}{1 + e^{\text{LnOdds}}}$$

$E(Y/X_i)$: Probability of $Y = 1$, when X equal X_i ($i = 1,2,3$)

$$\text{LnOdds} = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 \quad (2)$$

$$E(Y/X_i) = \frac{e^{\beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3}}{1 + e^{\beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3}}$$

According to Hair, Black, Babin, and Anderson (2010), the sample size used in the exploratory factor analysis was determined by the minimum ($\text{min} = 50$) and the number of variables included in the model. The proportion of samples compared to an analytical variable was 5/1 or 10/1, which included 14 observations and therefore the sample size is at least $50 + 8 * 3 = 74$ observations. Green (1991) suggesting that in the regression model the minimum sample size was determined by the empirical formula $50 + 8 * \text{independent variables in the model}$. This study has three independent variables so the sample size is at least $50 + 8 * 3 = 74$ observations.

The sample for the study was drawn from 240 consumers in Ho Chi Minh City represent different geographic, cultural, and commercial backgrounds. Demographic characteristics of the final sample are provided in Table 1 and Table 2. The research required that we examine a product category in which a domestic alternative was available. Apparel products were chosen as the domestic product category in this study.

The result of the survey showed that 155 cases (64.65 percent) purchased domestic products while 85 cases (35.35 percent) did not purchase.

The chi-square test showed that the demographic factors did not have a statistically significant relationship with the consumer purchasing decision on domestic products (Asymp. Sig. > .05 for all variables) (See Table 1).

Table 1. Chi-square test result (all cases)

| | Characteristics | Asymp. Sig. |
|-------------------|--|-------------|
| Gender | Male= 55.2%; Female= 44.2% | 0.136 |
| Family with child | Yes = 62.2%; Others= 37.5% | 0.099 |
| Education | High school or higher = 62.1%; Others = 37.9% | 0.316 |
| Income | Under 5 million VND = 37.9%; 5-7 million VND = 28.9%; 8-10 million VND = 17.7%; Above 10 million VND = 15.5% | 0.073 |

| | | |
|--------------------------------------|---|-------|
| Willing to Pay for domestic products | 0%= 10%; Less than 5= 18.8%; Less than 6-10%= 36.3%; Less than 11-15%= 17.9%; Less than 16-20% = 6.3%; Less than 20% and more = 10.8% | 0.072 |
| Consumption for domestic products | Less than 500 thousand VND/ month= 52%; 500–1 million VND/ month = 20.8%; Above 1 Million VND/ month= 27.1% | 0.129 |

The T-test results show that there is a statistically significant difference in consumer purchasing decisions. Consumers choose domestic products who have a higher perceived price, perceived quality, and consumer ethnocentrism than non-domestic consumers (see Table 2).

Table 2. T-test result

| | | Purchase decision of domestic products | | Levene’s test | T-test |
|-----------------------------|----------|--|-----------------|---------------|-----------------|
| | | Mean | Mean Difference | Sig. | Sig. (2-tailed) |
| (PP) Perceived price | Other | 2.7 | | 0.144 | .000 |
| | Domestic | 3.5 | 0.82 | | |
| (PQ) Perceived quality | Other | 2.8 | | 0.683 | .000 |
| | Domestic | 3.4 | 0.68 | | |
| (CE) Consumer ethnocentrism | Other | 2.5 | | 0.464 | .000 |
| | Domestic | 3.2 | 0.68 | | |

4. RESULTS AND DISCUSSIONS

For reliability and validity of indicators in the model, as can be seen from Table 3, the lowest Cronbach’s alpha value is 0.878, exceeding the cut value of 0.60 recommended (Hair, Black, Babin & Anderson, 2010). The value of Kaiser-Mayer-Olkin (KMO) was 0.816 (between 0.5 and 1.0) which means that data is significant for conducting a factor analysis. All loadings of variables are higher than the 0.50. According to Hair, Black, Babin, and Anderson (2010), loadings ± 0.50 or greater are considered practically significant.

Table 3: Results of factor analysis and reliability tests

| Code | Items | Factor Loadings |
|--|---|-----------------|
| Perceived price; Cronbach’s alpha = 0.884 | | |
| PP1 | The price of domestic products is more acceptable than foreign manufactured products. | 0.614 |
| PP2 | Compared to the quality, the price of domestic products is cheaper. | 0.723 |
| PP3 | The amount of money to buy domestic products is perfectly suited to me personally. | 0.720 |
| PP4 | The amount of money to buy domestic products compared with foreign manufactured products is reasonable. | 0.512 |
| Perceived quality; Cronbach’s alpha = 0.878 | | |
| PQ1 | Seam strength is not inferior to foreign manufactured products. | 0.702 |
| PQ2 | The fabric is not inferior to foreign manufactured products. | 0.696 |
| PQ3 | Brand prestige is not inferior to foreign manufactured products. | 0.683 |

| | | |
|---|--|-------|
| PQ4 | Production techniques are not inferior to foreign manufactured products. | 0.745 |
| Consumers ethnocentrism; Cronbach's alpha = 0.888 | | |
| CE1 | Foreign manufactured products are a bad behavior of Vietnamese people. | 0.518 |
| CE2 | Vietnamese had better buying goods made in Vietnam. | 0.516 |
| CE3 | Buying foreign manufactured products is contributing to the loss of some Vietnamese workers. | 0.620 |
| CE4 | Buying foreign manufactured products will help other countries get rich. | 0.833 |
| CE5 | Foreign manufactured products cause harm to the domestic firms. | 0.831 |
| CE6 | It should only buy foreign manufactured products when it cannot be produced domestically. | 0.566 |

Table 4 shows maximum likelihood estimates of the binary logistic regression model, all of three estimated coefficients have expected signs and significant at the 5% level or higher level. The Nagelkerke R² is 0.801, an upper bound R² for binary-choice models. The likelihood ratio test is significant at the 1-percent level, indicating the model has good explanatory power.

Table 4. Maximum Likelihood Estimates, Goodness-of-Fit Measures, and Change in Probability for significant Coefficients

| | Beta | Wald | Sig. | Exp (B) | Change in Probability for significant Coefficients (P0 = 10%) |
|-----------------------------|---------|--------|------|---------|---|
| (CE) Consumer ethnocentrism | 1.860 | 16.569 | .000 | 6.423 | 41.64 |
| (PQ) Perceived quality | 1.871 | 9.688 | .002 | 6.497 | 41.92 |
| (PP) Perceived price | 6.070 | 41.908 | .000 | 432.521 | 97.96 |
| Constant | -29.272 | 47.174 | .000 | .000 | |
| Omnibus test | | | | | |
| Chi-Square | 209.795 | | | | |
| Significance | 0.000 | | | | |
| Nagelkerke R Square | 0.801 | | | | |
| Correct prediction | 93.3% | | | | |

The probabilities presented in table 4 show the effects of changes in the individual explanatory variables on the likelihood of consumer purchasing decision, assuming that all other explanatory variables are set to zero. The likelihood of the consumer purchasing decision increases by 41.64 percent if consumers get one more unit in their ethnocentrism. The likelihood of the consumer purchasing decision increases by 41.92 percent if consumers have one more unit in their perceived quality of domestic products. If consumers have one more unit in their perceived price of domestic products, there is an 97.96 percent increase in the likelihood of purchasing decision.

The model of domestic product purchasing of Vietnamese consumer could be written as below:

LogOdds = -29.272 + 6.070*Perceived price + 1.871*Perceived quality + 1.860* Consumer ethnocentrism (3).

$$E(Y/X_i) = \frac{e^{(-29.272 + 6.070\text{Perceivedprice} + 1.871\text{perceivedquality} + 1.860\text{consumerethnocentrism})}}{1 + e^{(-29.272 + 6.070\text{Perceivedprice} + 1.871\text{perceivedquality} + 1.860\text{consumerethnocentrism})}} \quad (4)$$

Table 5. Forecasting Model of Vietnamese consumer purchase behavior of domestic products

| Order | Variables | β (beta) | Xi | |
|------------------------|------------------------|----------|------------|-------------|
| | | | Min | Max |
| 1 | Perceived price | 6.070 | 1 | 5 |
| 2 | Perceived quality | 1.871 | 1 | 5 |
| 3 | Consumer ethnocentrism | 1.860 | 1 | 5 |
| 4 | Constant | -29.272 | - | - |
| LogOdds | | | -19.471 | 19.73 |
| e ^{LogOdds} | | | 3.6073E-09 | 360099931.1 |
| 1+e ^{LogOdds} | | | 1 | 360099932.1 |
| P(Y/X _i) | | | 3.6073E-09 | 100 |

5. CONCLUSIONS

The study uses the Binary logistic econometric model to explain the factors affecting the Vietnamese consumers' domestic purchasing decision based on the data set of 240 consumers in Vietnam. Research results show that consumers' domestic purchasing decision was significant influences by (i) perception of price, (ii) perception of quality, and (iii) consumer ethnocentrism. This study provides valuable implications for business in domestic market in the context of Vietnam's international integration. Domestic firms must recognize the significant relationship between consumers' perceived price, perceived quality of domestic products, and consumer ethnocentrism with their purchasing decision. Positive perceptions of quality and price are important for the long-term success of a brand. Therefore, it is recommended that domestic firms need to employ aggressive strategies to improve consumer perception of their brands in terms of quality and price appeal among those who have higher interest in domestic products.

VIETNAMESE ENTERPRISES IN THE PROCESS OF INTEGRATION: CHALLENGES TO MERGERS AND ACQUISITIONS FROM FOREIGN INVESTMENT

Bach Thi Thanh Ha*

ABSTRACT: *In Vietnam, mergers and acquisitions (M&A) is gradually becoming more known for its dealings with DaLan's toothpaste sold to PG, KinhDo bought Unilever's Walls, Pacific Airlines sold its stake to Qantas, Dai-ichi Insurance acquired BaoMinh CMG ... In recent years, the value of M&A in Vietnam has grown from about \$ 30 million in 2002 to \$ 6.5 billion in 2017. Statistics from the Mergers and Acquisitions Institute (IMAA) show that the growth of the M&A market in Vietnam is remarkable but the market size is only moderate in Southeast Asia. In 2017, Vietnam's market is mainly small transactions with the size of 3-4 million USD and accounted for over 90% of the number of transactions. In particular, 70% of the large M&A deals in 2017 are domestic acquisitions of foreign investors, forming FDI companies. The article will analyze the results and limitations of M&A activity over the past time and propose some solutions for Vietnamese enterprises in the process of integration face with challenges to mergers and acquisitions from foreign investment.*

Keywords: *M&A, mergers, foreign investors, corporate value, corporate restructuring*

1. THE BASICS OF M&A

“ $1 + 1 = 3$ ”, the formula shows that this is a particularly important trigger for an M&A transaction. Behind the acquisition of business is to increase the value of many times more than the shareholders rather than simply the total value of the two companies stand alone. The essence of M&A is to give the business a new edge and gradually increase the value of the business while diversifying the product and brand strategy.

Mergers occur when two companies (usually of the same size) agree to establish a new business without maintaining the ownership and operation of the component companies. Acquisitions are activities through which businesses seek economic profit by scale, efficiency and ability to dominate the market (Scott, 2013). A deal can also be called a merger when both parties agree to join together for the benefit of both companies. But when the buyer does not want to be acquired, it is considered a buy and sell transaction. A transaction that is considered to be a trader or merger depends on whether it is held in a friendly manner between the parties or forced to take over.

In Vietnam, the Enterprise Law of 2014 does not have the concept of buying and selling businesses, the concept of merger and merger is defined in Article 194 and Article 195. Accordingly, the merger is two or several companies. A merged company can merge into a new company (incorporated company), and terminate the existence of merged companies. Mergers are one or several companies (incorporated companies) that can be merged into another company by transferring all assets, rights, obligations and benefits to the merging company, and terminate the existence of the merging company.

* Faculty of Business Finance, Academy of Finance, Vietnam.

There are three types of combinations when merged:

+ *Horizontal integration*: Conducted between enterprises in the same business. For example, Taisho Pharmaceutical purchased a 24.5% stake in HauGiang Pharmaceutical JSC. In the banking sector due to the need to increase chartered capital, a series of M&A deals have been launched such as mergers between SCB, DeNhat and DaiTin bank; merger of TienPhong Bank and Doji; Habubank - SHB; PVcombank - Western Bank; MHB into BIDV; MDB into Maritime Bank; Southern Bank merges into Sacombank ...

+ *Vertical combination*: A combination of enterprises in the same product line, but different in terms of production status. Over time, many vertical M&A deals are taking place because strategic managers are aware that a complete, closed product or service chain will enhance competitiveness, product quality and outputs of enterprises. Especially in the retail, food, beverage, entertainment, consumer goods industries. For example, in 2016, large M&A deals in retail and consumer goods such as Masan Group sold 25% of Masan Consumer Holdings and 33.3% of Masan Brewery to Singha Asian Holdings (Thailand) with a total value of \$ 1.1 billion.

+ *Combined by inter-branch mode*: To be conducted between two companies not operating in the same business field. Most prominent is Masan Group's acquisition of dominant shares in other businesses in the industry to expand business areas such as Bien Hoa Coffee Joint Stock Company, Pocono Vietnam - French food production company, International Agricultural Nutrition Joint Stock Company (Anco), Vinh Hao Mineral Water Joint Stock Company...

2. M&A SITUATION IN VIETNAM:

- M & A activity is fast and strong in both quantity and scale with increasing value.

According to IMMA statistics (2018), in 2005 there were 18 M&A cases with a total value of \$ 61 million; in 2006 with 38 cases, total value of 299 million USD; For the first time in 2007, it reached over \$ 1 billion (with 113 cases worth \$ 1.753 billion)... In 2017, M&A value reached approximately \$ 6.5 billion, breaking the record \$ 5.8 billion in 2016. Major deals in 2017 such as ThaiBev Group purchased 53.59% of charter capital of Sabeco worth about US \$ 4.8 billion, SCG Group has acquired 100% stake, equivalent to \$ 156 million) from existing shareholders of Vietnam Construction Materials Company or CJ Group grabbing 71.6% of CauTre Company... contributed to make Vietnam in the top 15 M&A market on the world rankings. As of April 2018, capital contribution and share purchases reached \$ 2.263 billion, up 167% over the same period in 2017, reaching \$ 1.36 billion.

- M&A activities take place in many fields:

+ *The sector of finance - banking and consumer goods is the leading sector involved in M & A deals.*

To meet the remaining target of 15 - 17 strong commercial banks from 33 banks, especially small and medium banks, are urgently seeking partners to merge. Many commercial banks have sold capital to foreign investors such as Vietcombank, which sells 7.73% of charter capital to GIC Special Investments, Singapore's national investment fund. In August, 2016, IFC, a member of the World Bank Group, became a shareholder of TienPhong Bank (TPBank) when it bought a 4.99% stake worth VND403.1 billion (about \$ 18.3 million). Not only TPBank, IFC is also an investor in ABBank (owns 10% of shares) and VietinBank (8.03% of shares). At Eximbank, the largest shareholder is Sumitomo Mitsui Banking Corporation - SMBC (Japan) bought over 185 million shares, owns 15%.

Meanwhile, consumer goods, with a market of nearly 95 million people, young population, are also attracted by many investors. These deals may include the transfer of companies that own long-established

local brands or a market share with a number of categories. Some major M&A deals such as Central Group (Thailand) bought Big C Vietnam for \$ 1.14 billion. TTC Holdings (Thailand) with \$ 711 million has bought 19 supermarket chains of Metro Vietnam...

+ Business fields: Takara Belmont Group (Japan) has merged Asian Handicraft Trade Service (NAC) - owner of Kanac Hair Salon - holding 97% share. With Takara Belmont, the company that built and developed the Lebel-branded hair cosmetics, is holding the second-largest market share in Japan, owning NAC is considered the shortest way to enter the cosmetic industry hair in Vietnam, because NAC now has a distribution network with about 60 agents, more than 35,000 hairdressers in the country.

Through buying shares to acquire the local in-house businesses such as The NawaPlastic Industries (Saraburi) Co. Ltd of SCG Group (Thailand) has spent more than VND 2,329.5 billion to buy nearly 24.14 million shares of BinhMinh Plastics Joint Stock Company. At present, SCG has 23 companies in Vietnam, many of them formerly wholly-owned enterprises.

Secondly, M&A has great value with foreign elements.

According to IMAA statistics, Vietnamese business deals are usually in the range of \$ 2-5 million, with some \$ 10-30 million. In terms of value, big deals have foreign elements. Foreigners accounted for 66% of M&A transactions (2016), rising to 77% (2017).

According to the Department of Foreign Investment, Ministry of Planning and Investment, in the first quarter of 2018, the total registered capital of new, increased and contributed capital to buy shares of foreign investors in Vietnam continues stable growth. In particular, the form of investment through M&A companies available in the country of foreign investors is increasing. In particular, 70% of the large M&A deals in 2017 are domestic acquisitions of foreign investors, forming FDI companies.

3. THE CAUSE OF THE MERGER AND ACQUISITION ACTIVITIES OF ENTERPRISES HAS TAKEN PLACE IN RECENT TIMES:

First, due to the impact of the economic downturn, the business activities of enterprises are greatly affected.

Only a few years ago, Vietnam's GDP growth rate averaged over 6% a year. Along with the economic growth of the previous period, many companies have been operating in highly competitive sectors such as auditing, finance, securities,... already exists. However, after the global economic recession has strongly influenced Vietnam, causing many businesses in these fields to fall into difficulties. Therefore, businesses will tend to associate with each other to co-exist and develop.

Second, since 2015, Vietnam has negotiated four free trade agreements, along with policies such as the ownership ratio of foreign investors, or new regulations allowing foreign investors. Besides buying houses in Vietnam, making the business more motivation to accelerate M&A. The ambition of foreign investors to do M&A is not only to Vietnam but also to take advantage of the investment opportunities in ASEAN's 600 million people market. One of the reasons why Vietnam's M&A market is attractive to foreign investors is due to its young population size, stable economic growth and equitization of SOEs.

Third, due to improve business efficiency in the context of increasingly intense competition: there is a fact that the majority of Vietnamese enterprises are smaller than foreign ones; weaker on market experience, financial ability; Lack of human resources capable of corporate governance. Meanwhile, the need to compete requires cutting costs in the business, increasing the company's position in the market, reaching new markets, expanding global, reaching new potential customers, acquire and develop new technologies ... In this unbalanced competition, the linkages in general and through M&A activities in particular of Vietnamese enterprises play a vital role and this is also the way create motivation for domestic enterprises.

4. LIMITS ON THE DEVELOPMENT OF M&A ACTIVITIES IN VIETNAM

M&A is an indispensable trend, but not all M&A deals are successful. According to statistics, two-thirds of the deal is due to:

Firstly, the legal corridor for M&A is incomplete:

M&A activities in Vietnam do not yet have a complete regulatory framework but only scattered in different laws and legal documents such as the Enterprise Law 2014, the Investment Law 2005, Competition Law 2004 and Securities Law 2006 ... However, these regulations are still largely confined to determining the form of M&A activity while M&A is a financial trade requiring. There should be clear guidelines on M&A procedures as well as the establishment of a market mechanism for offering, buying, providing information on prices. This is one of the reasons why the success rate of M&A transactions is not high. Many businesses are choosing to become strategic partners, instead of officially embarking on the process to implement M&A.

Secondly, enterprises lack experience in M&A.

M&A activity in Vietnam in recent years is characterized by the buyer held from the beginning to the end; the paperwork is written by the buyer, the seller is not aware of self-planning. Many businesses do not really understand M&A and may become subject to acquisition. At present, Vietnamese companies do not really understand the nature of M&A activity; most of them think that successful M&A activities are linked to whether the agreement is reached at a reasonable price. The M&A results are dependent on the efforts of all members throughout the operation since M&A was signed.

Third, the difficulty in valuing enterprises due to lack of information.

The biggest obstacle to M&A success is because the buyer has a lot of difficulties in evaluating their partners due to lack of information. Partner evaluations can first be based on the evaluation of financial indicators through the analysis of the seller's financial statements, followed by the quantification of the intangible value of the business as a person factor, vision, goals... However, information on financial statements of some Vietnamese enterprises in the past time is not transparent; the number of violations is still high.

5. SOME SOLUTIONS TO DEVELOP M&A ACTIVITIES IN VIETNAM.

Firstly, there is a need to develop strong enforcement mechanisms for information provision.

One of the reasons for the illicit acquisitions, the lack of transparency from stock market transactions, and the M&A deal was due to the slightest sanctions. According to the current regulations, the fine for disclosure of information of major shareholders when trading on the stock market is only VND 40 million/time or the listed companies may delay reporting. It is these things that have made decisions of businesses, shareholders or regulators to regulate M&A activities with time lags.

Second, improve the legal framework for M&A procedures.

It is necessary to stipulate in more detail the contents related to enterprise valuation, settlement of financial issues, shares, stocks, labourers, taxes, fees ... of enterprises in the process and after when M&A.

Thirdly, it is necessary to set up a specialized agency for M&A management.

At present, there are no specialized agencies of the State managing M&A activities. Only part-time agencies are included in government agencies from the Ministry of Finance, the Ministry of Industry and Trade and the Ministry of Planning and Investment. ... Therefore, the control of M&A in our country is not really effective and quality. When companies find themselves are often passive acquisitions without consulting from the state management agencies.

Fourthly, it is necessary to improve the quality of the consulting and valuation organizations.

The M&A market is a special market for goods traded on the market. Therefore, in order to effectively operate the M&A market, it is necessary to have the participation and consultation of many experts who have experience in fields such as law and finance. The team of experts in brokerage and consulting for M&A activities.

Fifthly, enterprises participating in M & A should actively develop detailed plans.

Based on a study by PA Consulting Group and Edinburgh Management School, based on 85 M&A deals worth £ 50 million each, the companies have detailed plans for mergers and acquisitions. There will be short-term stock prices that are about 4.5% higher than companies without prior preparation [5]. These plans should have clear organizational objectives such as: personnel, systems, management... The plans should focus on the suitability of systems, structures and work processes between mergations for business.

Sixth, it is necessary to maintain stable basic macro indicators.

In order to attract large investors in the world, as well as strong domestic firms implementing M&A process, the State needs to maintain GDP growth, stabilize macro economy and control inflation as well. Commitments on exchange rate stability.

6. CONCLUSION

In the globalization, M&A activity in Vietnam is not long but exciting and promises to boom in the future. Vietnam is stepping up the equalization of state-owned enterprises and the opening of a room for foreign investors is attractive to investors in M&A activities. For M&A development, there is a need for comprehensive solutions to attract large investors to join the market, focusing on solutions such as: (i) supplementing, specifying legal regulations on the responsibilities of when M&A deals with the rights of employees and shareholders and minimizes the risk of M&A leading to monopoly; (ii) M&A businesses should be facilitated to provide complete, accurate and timely information for the transaction; (iii) Encourage the development of professional consulting firms for M&A activities./.

APPLY THE OECD PRINCIPLES OF CORPORATE GOVERNANCE TO SUSTAINABLE DEVELOPMENT OF VIETNAMESE ENTERPRISES IN THE CONTEXT OF GLOBALIZATION

Nguyen Thi Ha*

ABSTRACT: *This article explains and describes the Organization of Economic Cooperation and Development (OECD) Principles of Corporate Governance, on the basis of which the principles of corporate governance That is in the Vietnam business over time. From that, we propose some solutions in order to more effectively apply the principles to help the sustainable development of Vietnamese enterprises, especially in the context of globalization.*

Keywords: *Organization for Economic Co-operation and Development (OECD), Principles of Corporate Governance, Sustainable Development, Vietnamese Enterprises, Globalization*

1. INTRODUCTION

Integration and globalization have been and will be the right steps of the Party and State of Vietnam, the trend is indispensable and increasingly attract the attention of many people. Globalization takes place in all areas: economic, social, political ... In which economic globalization is in place and of great importance, can bring about great effects. to other areas. In the trend of economic globalization, the role of enterprises is undeniable. Globalization brings opportunities but also challenges us. How not to be left behind, how to integrate into the international community on all sides without dissolving? All require an effort, dare face to actively change the whole nation. To integrate and globally economic success, businesses are constantly learning, innovating, renewing themselves to rise. One of the important tasks of enterprises is to promote the role of corporate governance in order to develop enterprises in the context of international economic integration and globalization.

The Organization for Economic Co-operation and Development (OECD) consists of the member countries of the United States, Britain, Austria, Belgium, Canada, Denmark, France, Germany, Italy, the Netherlands, Norway, Sweden, etc. These countries have joined the organization and have promoted policies to achieve sustainable economic growth, job creation, At the same time, maintaining financial stability in the member countries will contribute to the overall growth of the world economy, contributing to healthy economic growth in member countries as well as in non-member countries. Must be a member of the OECD in the process of economic development, contributing to the expansion of international trade on the basis of multilateral cooperation, equality and compliance. and with international law. The OECD has developed a set of corporate governance principles based on practical business development experience in these countries. This Code of conduct has become an international standard for policy makers, investors, corporations and other stakeholders all over the world. The Code sets out the fundamental issues of business

* Academy of Finance, 58 Le Van Hien, Bac Tu Liem, 1000 Hanoi, Vietnam, Corresponding author. Tel.: +84987858870, E-mail address: honghanhim1977@gmail.com

governance, providing specific legal and regulatory guidance for both OECD and non-OECD countries; It focuses on governance issues arising from the separation of ownership and governance. The Code is a flexible tool that sets standards that are not binding, good examples, and implementation guidelines that can be tailor-made to suit the specific circumstances of each national and regional. The Code also covers a wide range of issues from the company's decision-making process to issues of the business environment, anti-corruption or ethical business issues.

2. PRINCIPLES AND APPLICATION OF PRINCIPLES

First, the principle of protecting the rights of shareholders: According to the OECD, the fundamental rights of shareholders include the right to: 1) secure the means of registration of ownership; 2) To be given priority to buy new shares offered for sale in proportion to the number of ordinary shares of each shareholder in the company, to transfer the shares; 3) Access relevant and important information about the company in a timely and regular manner; 4) To participate and vote at the General Meeting of Shareholders; 5) Electing and dismissing members of the Board of Directors; 6) Earn profit of the company; when the company is dissolved or bankrupt, it will receive the remaining part of the assets corresponding to the number of shares in the company.

Currently Vietnamese enterprises operate under a common enterprise law, the Enterprise Law of 2014. Over 28 years of establishment and development, starting with the Company Law in 1990, until the Law on Enterprises in 1999, the Law Enterprise in 2005 and now is the Enterprise Law of 2014. The rights of shareholders are also gradually appreciated and protected better, in which minority shareholders have been noticed. The law also regulates how to facilitate shareholders to exercise their right to sue the manager with simpler procedures and procedures. So far after more than four years of business rule 2014, the minority shareholder index has surpassed 38, ranking 122nd in international rankings, as follows:

Table 1: - Rating criteria for protecting shareholders' rights -

| <i>1.1.1. Numerical order</i> | <i>1.1.2. Criterias</i> | <i>1.1.3. ratings</i> |
|-------------------------------|---|-----------------------|
| <i>1.1.4. 1</i> | <i>1.1.5. The highest shareholder righ</i> | <i>1.1.6. 7/10</i> |
| <i>1.1.7. 2</i> | <i>1.1.8. The easiest way to file a lawsuit against a company manager</i> | <i>1.1.9. 1/10</i> |
| <i>1.1.10. 3</i> | <i>1.1.11. The responsibility of the manager, members of the Board of Directors</i> | <i>1.1.12. 3/10</i> |

Source: Phan Hoang Ngoc, Ministry of Justice "Protecting shareholders' interests, meeting international practices and standards on corporate governance"

Enterprise Law 2014 has more advanced provisions than previous corporate laws to protect the rights of shareholders, namely: (i) has stipulated that a joint stock company will choose one of two models Corporate governance is a single-entity model (General Assembly of Shareholders, Board of Directors, Director / General Director) and multi-board model (General Assembly of Shareholders, Board of Directors, Supervisory Board and Director, General Manager) instead of just a multi-board model as before. (ii) provide a regulation allowing the company to appoint one or more representatives, emphasizing the role of the chairman and the director or general director of the company if the company there are many representatives; The company decides on the number of representatives. (iii) the reduction of the voting rate by the decision of the General Meeting of Shareholders shall be reduced to 51% for the ordinary decision and 65% for the "special" decision (Clause 1 and Clause 2 of Article 144 of the Law on Enterprises 2014). Previously, under

the 2005 Enterprise Law, the rates were 65% and 75%. Thus, the reduction of voting power in the Law aims to express the purpose of protecting small shareholders in advance of major shareholders, which makes it easier for minority shareholders to exercise the right to conduct the GMS. Article 160 of the Enterprise Law of 2014 provides more detailed information on the obligations of managers of companies (including board members, directors or general directors and other managers) to ensure the rights and interests of the shareholders and the company on the principle of exercising the rights and obligations assigned in accordance with the provisions of the Law.

Second, the principle of equal treatment of shareholders: According to the OECD, the corporate governance framework should ensure equitable treatment for all shareholders, including minority shareholders and foreign shareholders. Every shareholder should have the opportunity to make an effective complaint when their rights are violated. The equality of treatment between shareholders is reflected in such aspects as: All shares of the same type and the same issue have the same rights. Investors should be provided with sufficient information about the rights associated with all issuances and types of stocks. Any change in voting rights must be approved by the shareholders owning the type of shares affected adversely by such change. Minority shareholders must be protected from acts of abuse directly or indirectly by or for the benefit of controlling shareholders and they should have effective means of complaint. The custody organizations designated to represent shareholders must vote in the manner agreed with the shareholders they represent. Obstacles to foreign voting should be removed. The procedures and procedures of the General Assembly of Shareholders must ensure equal treatment with all shareholders. Company procedures must not cause difficulties or unnecessary expenses when voting. Prohibition of insider trading and abuse of personal interests. Members of the Board of Directors and senior executives must disclose to the Board of Directors that they have a significant interest in any transaction or matter that directly affects the company, whether directly, indirectly or on behalf of a third party.

When investors have decided to invest in a company, it shows they trust the good things the company will bring to them. Therefore, it is necessary to adhere to the principle, whether major shareholders or small shareholders or minority shareholders, domestic shareholders or foreign shareholders to be treated equally. When shareholders notice signs of infringement, they have the right to sue. However, this measure requires the country to develop a strict legal system. This issue in Vietnam has also been implemented but needs to be improved. In Vietnam the phenomenon of insider trading and underground transactions still occur. This violates the principle of equal treatment of shareholders.

Third, the principle of promoting the role of stakeholders: According to the OECD, corporate governance frameworks must recognize the rights of stakeholders as defined by law or contractual relations and to encourage Encourage active cooperation between the company and stakeholders in creating assets, employment and financial stability for the business. This principle is concretized as follows: The rights of the interested parties as defined by law or under the bilateral agreements must be respected. Where the interests of the parties concerned are protected by law, the interested parties must have the opportunity to make effective complaints when their interests are infringed. It is necessary to develop mechanisms to improve the efficiency of workers' participation. When involved stakeholders participate in corporate governance, they must have access to relevant, adequate and reliable information in a timely and regular manner. Interested parties, including employees and their representative organizations, should be free to communicate their concerns about unlawful or unethical practices to the Council. Governance and this is not allowed to affect their rights. Corporate governance frameworks need to be supported by an effective bankruptcy framework and effective enforcement of the creditor's rights.

In Viet Nam, this principle has also been specified in laws including business law, bankruptcy law, labor law, etc. Related parties such as creditors, suppliers, customers, employees should be promote the role. Bankruptcy Laws in Vietnam regulate the procedure for resolving assets when declaring bankruptcy, including the priority of secured creditors. Employee benefits are also highlighted in the labor law and in the internal regulations of the enterprise. Many companies have sold shares to employees at preferential prices; Set up a fair compensation and reward system for employees. This has the effect of encouraging the employees to work hard, creating conditions for them to develop and improve their lives. In addition, there is a priority to sell shares to customers, suppliers.

Fourth, the principle of publicity and transparency: The corporate governance framework must ensure timely and accurate disclosure of information on all matters of concern to the company, including its financial position, operating situation, ownership and corporate governance. This principle is specified by the OECD as follows: Information disclosure must include, but is not limited to, important information about: financial results and operations of the company; The company's goals; Ownership of majority shares and voting rights; The remuneration policy for members of the Board of Directors and senior management including the qualification, selection process, positions held in other companies and whether they are considered by the Board of Directors. independent or not; Transactions with related parties; Predictable risk factors; Issues related to workers and other stakeholders; The structure and policy of governance, namely the content of any governance rule or policy and the process of implementing it. Information must be prepared and disclosed in accordance with the high quality standards for disclosure of accounting, financial and non-financial information. Annual audits must be conducted by an independent, qualified and high quality auditor to provide independent and objective evaluation to the Board of Directors and shareholders, ensuring that The financial statements have honestly shown the financial position and performance of the company in all aspects. The independent auditor is responsible to the shareholders and is responsible for conducting a professional audit of the company. Information dissemination channels should facilitate equal, timely and cost-effective access to information for users. Corporate governance frameworks must be complemented by measures to promote the development of analytical or advisory services provided by securities analysts, brokers, credit ratings, and so on. granted. Analysis and advice related to this investor's decision must not be affected by material conflicts of interest that may affect the integrity of the analyst's opinion or advice.

In Vietnam, the issue of supplementary disclosure requirements for timely and adequate disclosure of a shareholding company has been amended in accordance with Article 171 of the Enterprise Law of 2014 to be consistent with international practices with respect to Request for publicizing the contents of the charter of the enterprise, list of members of the Board of Directors, Director / General Director, members of the Board of Supervisors, foreign shareholders and major shareholders. Current contents of Article 171 are amended as follows: (i) For financial statements, the shareholding company must submit its annual financial statements approved by the General Meeting of Shareholders to the competent State body; (ii) For publication on the website (if any), the company should disclose the following information: company charter; curriculum vitae and professional experience of members of the board of directors, supervisor, director or general director of the company; Annual financial statements approved by the General Meeting of Shareholders; Report on the annual performance of the Board of Directors and the Board of Supervisors; (iii) In respect of foreign individuals, the Law requires that a joint stock company which is not a listed company must notify the business registration office of the locality of its head office no later than three

days(03) Having information or changing information on the full name, nationality, passport number, permanent address, number of shares and type of share of the shareholder being a foreign individual; Name, business code, head office address, number of shares and types of shares and name, nationality, passport number, permanent address of authorized representative of foreign institutional shareholder. Public joint stock companies shall publicize and publicize information in accordance with the law on securities. Joint-stock companies where the State holds more than 50% of the charter capital shall announce and disclose information according to regulations on periodical disclosure in Article 108 and extraordinary disclosure under Article 109 of this Law.

Apart from the new major issues or the basic regulations as mentioned above, the Law has also amended and supplemented the regulations on capital of joint-stock companies in the direction of specific and clear regulations, and unify the concepts of equity capital; To clearly define the responsibilities of the Managing Board in requesting shareholders to fully pay the shares they have registered for purchase upon the establishment of enterprises within 90 days after being granted the enterprise registration certificates.

Fifth, the principle of responsibility of the Board of Managements (BOMs):

The corporate governance framework should ensure the strategic direction of the company, effectively supervise the management of the Board and the responsibilities of the Board for the company and its shareholders. The operational structure of BOMs in each country can be modeled on a two-tiered basis, ie, the separation of managerial functions (in which managerial staff includes the entire board of directors) and control functions (in which the supervisory board including members of the Board. The second model is the one-level management board consisting of executive and non-executive board members. It is the Board's responsibility to monitor the effectiveness of the management, to prevent conflicts of interest, to deal fairly with the interests of stakeholders; The Board of Directors plays a key role in setting the company's ethical standards, not just by its actions but by appointing and overseeing its key executives and management. Generally monitoring written systems is designed to ensure that the company always adheres to the relevant laws; The Board of Directors has the duty to operate in the best interest of the shareholders. (This Principle specifies two main elements of the Board of Trustees' mandate, namely: Responsibility of the Board requires that the Board of Directors function with integrity, diligence, and diligence. Loyalty is key because it reinforces performance, other principles in this Code); When decisions of the Board may affect different groups of shareholders in different ways, the Board of Directors should treat all shareholders equally.

The Board of Directors must perform key functions including: reviewing and strategic orientation of the company, basic operations plans, risk policies, budgets and annual business plans; set operational goals, monitor performance of company objectives and activities; overseeing major capital investment, acquiring and divesting activities; Effectively monitor corporate governance practices and make changes as necessary; Select, remunerate, monitor and replace key managers when necessary and monitor the successor selection plan; Associate the remuneration of senior management and the Board with the long-term interests of the company and its shareholders; Ensure the seriousness and transparency of the nomination process and elect the Board; Monitor and handle potential conflicts of interest between the Board of Directors, the Board of Directors and the shareholders, including misuse of company assets and misuse of related party transactions; Ensure the integrity of the company's accounting and financial reporting system, including the independent audit report, and ensure that appropriate control systems are in place, especially management systems, risk management, financial and operational control, compliance with applicable laws and standards; Monitor the process of information disclosure and communication; The Board of Directors

must be able to give independent, objective judgment on company matters; The Board of Directors must consider appointing a sufficient number of non-executive directors to give independent judgment on issues where potential conflicts of interest exist. For example, ensure the integrity of financial and non-financial statements, review third-party transactions, nominate members of the Board of Directors and key executives and remuneration to the Board; When committees of the Board of Directors are established, the authority, composition and operational procedures of the committees must be clearly defined and publicly announced by the Board; Members of the Board must commit to perform their responsibilities effectively; To fulfill their responsibilities, Board members must have access to accurate, relevant and timely information.

In Vietnam, the Law on Enterprises stipulates in detail the rights and obligations of the Board of Directors. The rules are generally in line with international practice. The regulations clearly define the responsibilities of the board of management and the board of directors. The value of the investment or liquidation of assets is determined by the board of management, and the value of the asset is determined by the board of directors (BODs). BOMs's decisions must be approved and that is a decision based on the company's common good without any shareholder group consensus. However, there is still a phenomenon of overlapping management, misconduct, a clear separation of responsibilities between the BOMs and BODs.

3. SOME COMMENTS ON CONDITIONS APPLYING THE PRINCIPLE

First, ensure the basis for an effective corporate governance framework: The corporate governance framework should promote transparency and efficiency of the market, in accordance with the law, and clearly define the responsibilities of the supervisory, regulatory and enforcement authorities. Every business is a cell of the national economy, wanting to do business effectively must first be ensured in a healthy business environment. However, in Vietnam this problem needs to be re-examined. The market of Vietnam is not really perfect, integrity. In addition, the incentive mechanisms for the development of enterprises by the framework of the business environment created for the market participants are unclear, encouraged by type of business or encouraged by the field of activity enterprise. Each country adopting this set of rules needs to be familiar with the characteristics of its own regulatory environment. In addition, the development of legal framework to help businesses operate in accordance with the standards is good, but the mechanism also needs to be renovated to suit the reality. Companies operating in a stable, stable legal environment will be an important driving force for their business to be effective and ensure a sustainable development.

Second, the unpoliticization of economic relations: economic relations let it arise naturally according to the objective process. The state should not be too tightly controlled. Chinese economists argue that the politicization of economic relations often results in bad outcomes, if not the ultimate outcome of the developmental impetus.

Third, continue to innovate to improve the business environment: The business environment includes all external conditions that affect the operation of the business. Any business that operates in a certain business environment. Consider the impact of the business environment and continue to improve it.

Fourth, promote the propaganda and education: It is necessary to strengthen the dissemination, dissemination and education of social values and status, challenges and risks for business and business. human resources, ethical standards and business culture; views and changes in the thinking of the Party and the State on the role, position, importance and objective necessity of the development of economic sectors with socialist orientation.

MANAGING LOAN PORTFOLIO BY THE ECONOMETRIC MODELS: A THEORETICAL ANALYSIS

Phung Thu Ha*

ABSTRACT: *Loan portfolio management plays important role in risk controlling system of commercial banks. The crucial idea of this paper is to examine theoretically two econometric models which can be used for loan portfolio management. These two models are credit portfolio view model and evaluation model of a commercial bank loan portfolio. The first model, credit portfolio model, provide a method to analyse the relationship between loan portfolio management and macroeconomic factors, then explain how economic cycles can affect the result of loan portfolio management in commercial bank. Another model give us a tool to assess the loan portfolio management of a commercial bank step by step, and we can understand clearly how loan portfolio management can impact on bank's profit, liquidity and credit risk management. These models can be suggestion for Vietnamese commercial banks to improve their credit risk management effectively and build the critical strategies to assure the soundness of their loan portfolio.*

Keywords: *loan portfolio, loan portfolio management, credit risk.*

1. INTRODUCTION

The principal business activity for most commercial banks is lending. And the biggest asset of most commercial banks is also loan portfolio. Loan portfolio is the prevail source of revenue. Thence, it can be the main impact threatening the safety and soundness of a bank. Whether due to lax credit standards, poor portfolio risk management, or weakness in the economy, loan portfolio problems have historically been the major cause of bank losses and failures.

Following the Business Dictionary (2014), a loan portfolio is defined as the total of all loans belonged to a bank or a financial institution on any chosen day. IACPM (2005) affirmed loan portfolio management is the process by which the manager can manage and control the inherent risk in the credit process. Wise Geek (2014) considers credit portfolio management as the process of creating a list of investments based upon credit relationships and managing the risks involved with these investments. Therefore, loan portfolio management includes assessing the risk of each loan and then investigating the total amount of risks for all loans. The main objective of managing portfolio is to reduce the amount of loans default.

The lifeblood of each lending institution is its loan portfolio, and the success of the institution depends on how well that portfolio is managed. The quantitative modeling of the loan portfolio is rather recent in fact. Several models were created, including at the same time the applications of property developed for the internal custom by the financial institutions, and the applications intended for the sale or for the distribution (Hickman and Koyluoglu, 1999).

Loan portfolio objectives build the assessment system with detailed, clear and measurable target for the portfolio. In this paper, the author wants to introduce some effective models which can suggest Vietnamese commercial banks applying to gain some loan portfolio objectives as below:

* Academy of Finance, Corresponding author. Tel.: +84 981 911 399, E-mail address: phungthuha91@gmail.com.

- To grant loans on a sound and collectible basis.
- To invest the bank's funds profitably for the benefit of shareholders and the protection of depositors.
- To serve the legitimate credit needs of their communities.

2. THE MODELS FOR LOAN PORTFOLIO MANAGEMENT

2.1. Credit Portfolio View of McKinsey

Credit Portfolio View is a model with multiple factors which is used to feign the common conditional distribution of the default probability and migration for various groups of estimation and in different industries (Crouhy et al., 2000). Loan portfolio is a part of credit portfolio and accounts for the main structure of credit portfolio, therefore, we can use this model to assess and analyze the loan portfolio of a bank or financial institution.

Wilson (1997) developed this model when he worked in McKinsey. This author brought out a hypothesis that macroeconomic factors like the level of the long-term interest rate, the GDP growth speed, the global unemployment rate, the exchange rate, the public expenditures, the savings have a connection with the probability of defect and migration.

Credit Portfolio View is built on the infrequent observation which shows that the default probability, as well as the probability of migration, relates to economic cycles. When the economic crisis happens, then the cycles of credit are also lesser. If the economy is expanding with higher GDP growth rate and lower unemployment rate then the cycles of credit become stronger. By way of explanation, the cycles of credit is impacted by the trend of economic cycles. Because the macroeconomic factors widely affect the condition of the economy, Credit Portfolio View gives us a methodology to connect these macroeconomic factors to the probability of default and migration.

Provided that the data are available, this methodology can be applied in every country, in the different sectors and in the diverse classes of borrowers of the obligors who react differently within the economic cycle. The way that a model Credit Portfolio View works is as follows (Smithson, 2003):

- Simulate the state of the economy.
- Adjust the rate of default to the state of the simulation of the economy.
- Attribute a probability of default for every debtor on the basis of the simulations of the state of the economy.
- The value of the individual transactions attributed to the debtors according to the probability of defect is determined on the basis of the simulations of the state of the economy.
- Calculate the loss of the portfolio by adding the results for all the transactions.
- Repeat all the stages quoted above certain number of times to map finally the distribution of the losses.

Following Credit Portfolio View model of McKinsey, the historic rates of default for the various industries are described according to the macroeconomic variables specified by the user of the model:

$$\text{(Probability of default} = f(\text{GDP, Unemployment rate, ... Exchange rate})$$

According to McKinsey approach, the rates of defect are directed by a sensibility in a sand of the factors of the systematic risk, or the particular factors to the company. The main characteristics of model from McKinsey are described following the unit of analysis segmented towards industries and on countries as below:

- The data by default is an empirical estimation of the rates of default according to the macroeconomic variables;
- The structure of correlation is obtained from the correlations banding the chosen macroeconomic variables and the estimated factors of sensibility;
- The engine of the risk is the adjustment of the ARMA model (Autoregressive Moving Average model) with the evolution of the macroeconomic factors. The shocks are undergone by the system determine the standard deviation of the average of the rates of defect concerning the level of the segment;

- The distribution of the rates of defect is logistic (Normal distribution);
- The horizon is the maturity of the marginal default rate year by year.

2.2. The evaluation model of a commercial bank loan portfolio

The model for evaluating the commercial bank loan portfolio is developed by Irena (2008). The goal of this model is gathering useful information on the structure of bank loan portfolio. The research indicates that the structure of bank's loan portfolio can be reflected by dividing it on three main sectors of bank's activity as corporate banking, business banking and personal banking. While analyzing and evaluating the element of loan portfolio, we need to understand that every part of banking operation has a different level of risk, profitability and influence on bank's liquidity. To assess a loan portfolio, the most purposeful way would be to divide it into three main segments or sub-portfolios, each of them could have its own groups, subgroups depending on the kind of borrower, loan purpose, collateral, currency, term and other criteria. This approach allows distinguishing the most risky areas of activity, for the evaluation of which maximum attention should be paid, also the groups of customers which are most attractive and profitable for the bank. There are three stages to make the evaluation of a commercial bank loan portfolio as following:

The first stage is classifying loans into 3 main parts – sub-portfolios: (i) large-scale projects financing sub-portfolio includes borrowings of large enterprises or groups of them, financial intermediaries, local and central government; (ii) business financing sub-portfolio includes borrowings to small and medium size enterprises and farmers; (iii) individual financing sub-portfolio includes borrowings of private person: consumer loans, mortgages, credit card overdrafts and etc.

The second stage is evaluating individual loans and sub-portfolios based on criteria of credit risk, profitability and liquidity. The measurement to assess the individual loan depends on the sub-portfolio of the loan. With the loans in large-scale projects financing sub-portfolio, the evaluation of them is made in great deal, with much attention towards the assessment of credit risk, liquidity and profitability. The evaluation of loans in business financing sub-portfolio is slightly simplified and it is made automatically by evaluation system requiring less attendance of experts. For loans in private person financing sub-portfolio, the evaluation of them is only focused on the credit risk, excluding the mortgage loans which will be assessed by the liquidity.

In this stage, banks will establish rating groups. For loan rating structure, banks should choose the system with 8 ratings: acceptable (small) risk loans belong to the first three ratings; other next three ratings for average (average doubtful) risk loans and non-performing loans in the last two ratings. In valuation of separate aspects of the loans for both legal and private persons, every factor is assigned to one of 8 groups (ratings), and the final score depends on the weight of the factors. Risk rating 1 indicates that the risk is minimal, and, correspondingly, risk rating 8 indicates the maximal credit risk. Next, for loan liquidity rating, the following factors are used: (i) assessing the term of the loan; (ii) calculating collateral as a loan amount to collateralized property times security coefficient ratio. Then, loan profitability rating is established based on what income (fees and commission) bank earns from granting a loan and what income is received from the customer in granting other than credit banking services.

The third stage is creating final loan rating (FLR). The credit risk rating is the main factor impacting on the final loan rating and the loss regarding loan repayment can be reduced by only adequate liquidity. Loan profitability in case of default loan would not be this important as when granting loan with high interest rate, bank would get just bigger interest which the customer would pay, but in case of default it can lose the principle. Based on these principles, at first credit risk (CR) and liquidity (L) group is established, then the relation of this group with profitability (P) is used to derive the final rating of the loan based on the following formula:

$$\text{FLR} = (0.8 * ((0.7 * \text{CR}) + (0.3 * \text{L}))) + (0.2 * \text{P})$$

Regarding to these assessment principles, when at first credit risk and liquidity are two fundamental aspects of assessment distinguished, after that the adequate assessment of factors is carried out by evaluating the influence of profitability. Then more detailed information is derived.

The fourth stage is comparing loan portfolio indicators with the overall country banking system tendencies. Assessment of correlation with country’s economic indicators helps to determine if bank’s loan portfolio growth and changes in certain indicators correspond with the rates and tendencies of development of the economy in the country. Final structure of the evaluation model of loan portfolio of a commercial bank is presented in Figure below:

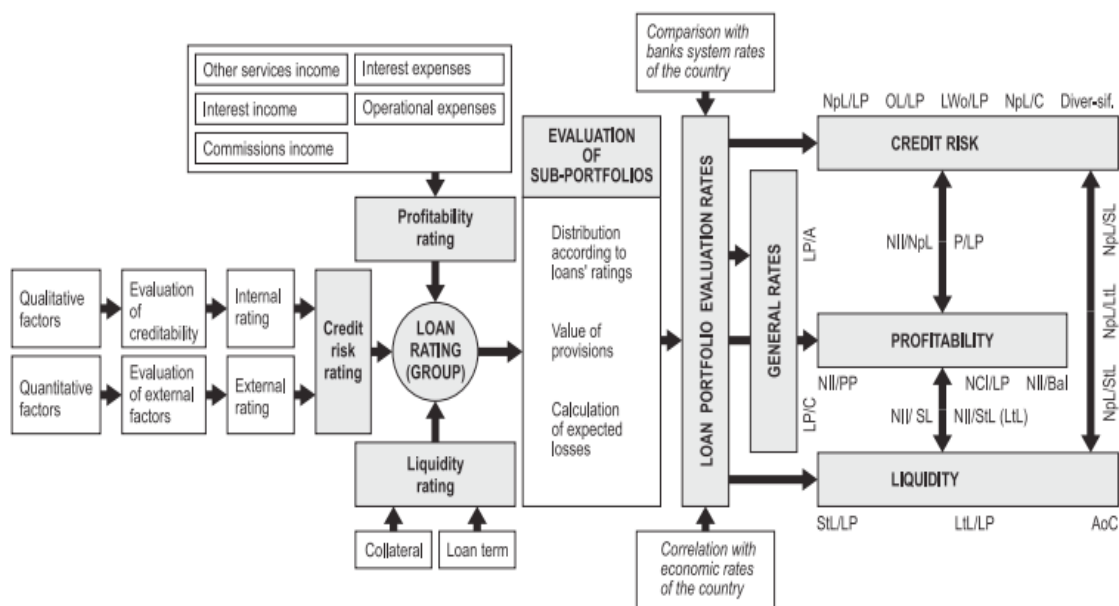

Figure: the structure of the evaluation model of a commercial bank loan portfolio

Source: Irena (2008)

The final stage is showing the current status of loan portfolio after evaluating and conducting suggestions towards the loan portfolio management or improving the evaluation system of loan portfolio. Besides, banks need to build common databases or improve their own databases with longer period of time and in accordance with the expansion of their operation and the growth of loan portfolio. More detailed loan evaluation models could be used.

3. CONCLUSION

This paper presents a theoretical approach’s concerning the model of management of loan portfolio by the Credit Portfolio View model and the evaluation model of a commercial bank loan portfolio.

With the Credit Portfolio View model proposes a methodology which links macroeconomics factors to default and migration probabilities. The calibration of this model necessitates reliable default data for each country, and possibly for each industry sector within each country. The probability of failure depends in this model of macroeconomic factors such as unemployment, the rate of increase GDP, the interest rate long-term.

For the evaluation model of a commercial bank loan portfolio, with the purpose of getting more comprehensive results of loan portfolio evaluation, loans that form a loan portfolio should be distributed into sub-portfolios according to activity segments of a bank: large-scale projects, corporate and private clients. Such approach to loan portfolio enables banks not just properly distribute resources with a purpose to get a maximum profit, but also designate appropriate consideration while evaluating risk of individual loans or sub-portfolios. The attention was paid to credit risk evaluation of loan or loan portfolio mostly in research studies. The following methods and models of individual loan credit risk evaluation are established: actuary, scoring, credit margin, option, credit equivalent position and

repayment level models and heuristic, empirical – statistical and causative models. It has been identified that the banks of transition economy countries are able to use only actuary and scoring models and will not be able to embrace the advantages of other models due to lack of available data.

SOME CONSIDERATIONS INTO VIETNAM ON THE ROAD TO SUSTAINABLE DEVELOPMENT

Nguyen Ho Phi Ha* - Vu Thi Phuong**

ABSTRACT: Sustainable development is the target that mankind is trying to achieve. It is also a concern worldwide and it has also become a strategic aim to realize of our Party and government. There is a fact that when economy grows, it reveals some bad effects. For example, natural resources and unrecyclable natural resources are scarcer, more damaged natural environment gets more damaged, ecosystem balance is damaged. As a result, there are a lot of natural disasters. Economic growth is not in pace with social development. When economy grows, there is still no advancement in culture, morality. Economic development causes bigger gap between the rich and the poor, which leads to social unrest. The question is how to grow sustainably to settle 3 major factors: economy, society and environment. In this research, authors focus on the situation of resource allocation, industry structure, industry relationship, and effects on production, income and gas disposals in Vietnam. Besides, some recommendations for future sustainable development are given in this research.

Key Words: structure, resource allocation, growth, sustainable development.

SOME FACTS OF ECONOMIC GROWTH IN VIETNAM RECENTLY

Vietnam has got higher GDP than other countries in ASEAN for many years, on average about 6.1% in the period 2005- 2016.

(Source: National Statistics Department)

Moreover, there has been a significant change in economic structure over for recent years, labor in agriculture decreased from 55% to 44% (on average 1.3% each year)

* Academy of Finance.

| Criteria | Unit | 2005 | 2010 | 2015 | 2017 |
|---------------------------------|----------|------------|------------|------------|------------|
| GDP by sectors | % | 100 | 100 | 100 | 100 |
| Agriculture | % | 19,3 | 21 | 18,9 | 17 |
| Industry- Construction | % | 38,1 | 36,7 | 37 | 37,1 |
| Service | % | 42,6 | 42,2 | 44,2 | 45,8 |
| GDP by business entities | % | 100 | 100 | 100 | 100 |
| Private owned | % | 47,2 | 49,1 | 48 | 46,4 |
| Corporate | % | 6,6 | 4,6 | 4,5 | 4,2 |
| Private business | % | 8,5 | 7,9 | 8,8 | 9,6 |
| Individuals | % | 32,1 | 36,7 | 34,8 | 32,6 |
| State owned | % | 37,6 | 33,6 | 31,9 | 31,8 |
| FDI companies | % | 15,2 | 17,3 | 20,1 | 21,8 |

Since 2008, with GDP per capita approximately 1.050 USD, Vietnam has been grouped as medium low- income developing country, no longer in low- income developing countries group. Today, GDP per capita of Vietnam is 2.385 USD.

Results of sustainable development:

-Thanks to sustainable development, Vietnam has reached relatively high economic growth, social well- being has improved and social equality is boosted.

Sustainability index is higher and higher in 2017, Vietnam ranked 68th out of 157 countries (much higher than other countries in ASEAN) in terms of sustainable development. Economic growth has maintained relatively high (the year after is higher than the previous year) For example, GDP growth rate in 2012, 2013, 2014, 2015, 2017 was 5.3%, 5.4%, 6.0%, 6.7%, 6.8% respectively. Only in 2016 it decreased to 6.2%. Sustainable development also ensures the economic development together with social equality and environmental protection.

-Fast and sustainable economic growth has brought some achievements ahead to depth and breadth, especially the depth, which is a big contribution to improve effectiveness and competitiveness.

Growth rates in many fields are increasing, so is the labor force productivity with 4.01% per year in the period 2006 to 2016 and it has tended to increase higher and higher. The contribution of capital and labor to GDP has decreased but contribution of synthesized factors such as Technology, management or labor quality to GDP has increased. Economic sector structure has positively changed, percentage of industry and service in GDP has gone up. FDI business has become more important in development and investment, economic growth, government revenue, export, and job creation.

-Infrastructure investment is put emphasis on, a lot of important infrastructure works are being in use. This has painted a new image of the country and helped to promote economy and society, helped Vietnam join international business and ensured national security and defense.

Focus on developing transportation systems, especially road systems, high way, airport, sea port etc has stimulated commerce, investment and relationship between regions as well as improved competitiveness of the country. Electricity systems have been paid more attention to meet the increasing demand for the electricity of the industry. A lot of electricity stations are being built or completed. Urban structures are also developed, for example, Hanoi, Ho Chi Minh city, to make urban picture more modern and civilized.

- Social advancement and equality has reached important results and has been paid more attention in each step and each policy.

People have enjoyed more equality and have been more accessible to resources, utilizers and development chances. Gap in Income Index just increased to 0.016% from 2006 to 2016. On the other hand, activities of eradicating hunger and alleviating poverty has got positive results. Mental and material

life of people are more improved. Conditions of food, accommodation were upgraded. Poor household rate decreased from 15,5% in 2006 to 5.8% in 2016. Unemployment rate maintained under 3%. Social welfare systems were broadened comprehensively and diversified, which is more suitable with economic growth and resource exploitation and equalization. This also ensures basic demand for services of the people.

-Resource management and environmental protection and adaptation to climate changes are more focused and reveal positive results.

Social awareness has been raised of resource management and efficient exploitation as well as environmental protection, prevention from natural disasters and adaptation to climate changes. There have been many measures to protect environment, punish businesses causing pollution. More and more unrecyclable wastes are collected. Many programs to increase environmental quality are given to reduce environment pollution, especially land and water pollution. Many activities are aimed to protect nature, biology diversification, and forest development. Forest coverage increased to 41% in 2016. Management, exploitation and usage of land, water, and mineral resources are more effective and more suitable with market mechanism. There is a significant decrease in ask- give mechanism in land and resource management. Natural disaster ability is improved.

Shortcomings:

However, macro limitations exist such as high rate of deficit, public debt, thereby having a lot of risks.

-Economy doesn't grow as fast and stably as its potential, aims and other developing countries. Quality, growth efficiency and low competitiveness lead to a drop of the economy.

Economic model is based heavily on capital, unskilled worker, resource exploitation. The model has not transferred into the model basing on management, technology, innovation, and creativeness. Capital and labor contributed 70% to GDP, other factors only 30%.

Investment efficiency is low and has no signal of big changes. From capital efficiency by ICOR by 3 sectors from 2010 to 2016, State sector has least efficient capital exploitation, 5.1 dong in investment for 1 dong value added. Next is FDI sector with 3.5 dong investment for 1 dong value added, most effectively is Private sector with 2.6 dongs for 1 dong value added. Efficiency for state sector is the least but it gets highest capital invested (over 39%). Therefore, it makes ICOR low(3.5%)

The weakest point is management model, especially in resource allocation. Although state companies are least effective, they get generous programs of investments. Whereas, private businesses get less capital. Among private businesses, household business comprises 30% in GDP, co-operative society 7%, private business 8%. Therefore, low ICOR also shows that this private size is too small, even households which do not need much capital can give value added.

Table 2: ICOR by economic sectors

- Low stable and sustainable macro economy

Many factors cause unrest in macro economy such as savings unbalance, lengthy investment, trade deficit, high inflation, government deficit, increasing public debt. In many times, it is due to unstable money market, high interest rate, changes in exchange rate, irregular ups and downs of securities and real estate market, stagnant production, increase in the number of dissolution businesses.

Economic restructuring has not carried out crucially and in a synchronized way, which has not created a big change to stimulate sustainable economic growth.

Sector structure has changed slowly to industry and service. From 2010 to 2016, percentage of agriculture and forestry, sea food industry in GDP decreased from 18.38% to 16.32%, higher than some countries in the areas and the world on average.

Investment restructuring, especially public investment exists lots of limitations and low efficiency. Proportion of social investment has decreased slowly and until now still high (31%- 33% GDP). Proportion of investment in state sector has also remained the same situation (about 38%), proportion of investment in private sector increased only under 1% from 38.1% to 39% during the period 2006- 2016.

-Low and slowly improved productivity of labor has weakened efficiency of input factors and growth quality, competitiveness of the economy.

Labor productivity of Vietnamese human force is low and worse than other countries in the area. Therefore, keeping pace with development of others in the area as well as becoming a high- income country is becoming more and more difficult.

Labor productivity in 2016, basing on current price, was estimated 84,5mil/ labor (about 3.853USD/ labor), much lower than other countries in the area. According to price comparison in 2010, labor productivity in Vietnam increased on average 4.01%/ year during period from 2010- 2016, lower than GDP growth rate. According to International Labor Association, rate of increase in labor productivity in Vietnam was 4.3%/ year during the period 2010- 2016 and estimated to be 5.31%/ year during the period 2017- 2021. This is a relatively high figure but still lower than China (7.59%/ year and 6.07%/ year), medium- high income countries in Asian Pacific community (6.68%/year and 5.72%/year). This rate shows an absolute gap on labor productivity between Vietnam and other countries. As a result, it is necessary to have a breakthrough on labor productivity to reduce the gap with other countries.

-Social inequality and rich and poor gap tend to increase, social classification and wealth polarization take place in many regions, parts, urban and countryside, social classes. Poverty alleviation is not sustainable, poverty rate in the multi-approach is still high, welfare systems are not completed, comprehensive enough to ensure safety, stability of the people, citizens' quality is low.

Economic growth recently has not been comprehensive enough, has not reduced inequality, gap between the rich and the poor. A proportion of population are left behind the development and the poor's income rate is lower than the rest. Difference in income leads to inequality of well-being and consumption as well as education, healthcare etc.

Many social programs, especially social welfare programs, have not placed to social aids and have not covered all people. Many subsidized programs are given unsuitably, which makes people reliant on the government. This causes negative effects. Moreover, population quality is not high. Human development index is still low in comparison with the world (115/ 188)

-Natural resources are running out, ecosystem environment is polluting and effects of climate changes are becoming more and more serious. Energy security is not ensured.

Fast economic growth as the first priority puts a pressure on natural resources degradation and air, land and water environment. Environment quality has decreased, waste disposal, environmental pollution and food hygiene are big concerns everywhere. This can threaten life safety now and in the future.

On the whole, despite the relatively high economic growth, growth quality is not really good. Environment factors are missed. Sector and inter sector structure is giving disadvantages to sustainable development, causing unrest to macro economy and environmental pollution.

Recommendations:

1. Suitable policies for sustainable development

+ uniformly policies not only for different political system sectors such as State business, FDI business, non-state business and households but also for business in the same political systems.

+ suitable allocation policy of capital, high- quality labor for agriculture, forestry, seafood to ahead to green agriculture.

+ identify the aim clearly, sustainable development or development at all cost.

2. Labor force development, especially high-quality labor force

In the times of 4.0, it is vital to develop labor force, especially high- quality labor force.

(i) carry out uniformed ways to stimulate labor training, focus on skilled labor, especially in IT field.

(ii) motivate international cooperation in high quality labor training,

(iii) develop labor market. Complete labor laws and measures to settle labor matters, enable for laborer to transfer between regions.

3. Social sustainable development, ensure social security and advancement as well as social equality.

Continue stimulating sustainable poverty alleviation, focus on poverty in groups: ethnic groups, disabled, women, and children. Improve livelihood for the poor and give good conditions for the poor, poor households, women, ethnic people etc. Reduce inequality and motivate socialization.

4. Continue economic restructuring, improve labor productivity, economic effectiveness, fast and sustainable development in economic sectors.

Economic growth needs combination between renewal, technological modernization, skill improvement and effective use of labor force. Besides, it is necessary to push economic restructuring, from the low value added to high value added sectors.

Diversifying channels of raising capital for the economy, especially investment for infrastructure development. Motivate attraction of capital in private sector in and out of the country. However, it should be careful to choose the correct source to improve the investment quality, especially from foreign investment.

5. Be aware of environment protection, manage, exploit and use effectively natural resources, be ready to fight natural disasters and climate changes.

Try to reduce environmental pollution, air pollution, land, water in urban area, living area, trade village, industrial zones. Make a plan of management, exploitation, suitable and sustainable use of natural resources. Control and restrict exports of raw materials. Ensure national security of energy. Meet the demand for social development, diversifying energy sources. Encourage green production and consumption.

COST ACCOUNTING – AN IMPORTANT TOOL IN RISK MANAGEMENT AND SUSTAINABLE DEVELOPMENT FOR ENTERPRISES

Tran Thi Ngoc Han - Nguyen Tuan Anh*

ABSTRACT: *Vietnamese economy has been constantly integrating into the world economy. The integration process has created opportunities but also poses many difficulties and challenges. To survive and develop, Vietnamese enterprises need to improve and innovate their thinking and management methods in order to make efficient use of economic resources, maximize value for customers, increasing competitiveness. Enterprises also need to exploit effective management tools for risk management and sustainable development. One of the key management tools is cost management accounting. How does cost management accounting play a role in risk management and promoting sustainable development for enterprises? This article presents the role and relationship between cost management accounting with risk management and corporate sustainability.*

Keywords: *Cost management accounting, risk management, sustainable development*

Globalization with the development of knowledge economy is an inevitable trend. This trend has a strong impact on the business of all enterprises: the broader market, the more intense competitive pressure, especially more frequent and complex risks. This not only forces enterprises to shift from traditional management and business thinking to a new one in a new business environment but also requires them to exploit effective management tools for risk management and sustainable development. One of the key management tools is cost management accounting. How does cost management accounting play a role in risk management and promoting sustainable development for enterprises?

Cost Management Accounting is an administrative or cost accounting department that collects, processes and provides cost information for internal management purposes. It plays an important supporting role in the planning, controlling and decision-making of executives.

The object of cost management accounting is cost and its movement according to occurred space and time in activities, departments, also called the cost flow.

The goal of cost management accounting is:

- Providing accurate, flexible, timely and detailed information on cost, cost of goods sold, selling price and profit of the charged object to the internal administration requirements.
- Contributing to enhance the efficiency of resource use and cost control, improve the efficiency of operations including governance.
- Providing cost information, which is the basis for enterprises to plan and control their plans and strategies, as well as to improve the effectiveness of their decisions.

* Academy of Finance, Hanoi, Vietnam. Corresponding author. Tel.: +84969998916. E-mail address: ngochan249@gmail.com

- Maximizing the benefits to customers, shareholders, owners and related parties, which is an important premise for sustainable economic development of enterprises

1. COST MANAGEMENT ACCOUNTING HELPS ENTERPRISES MANAGE RISK

Indeed, business risk is most commonly understood as the occurrence of adverse events, making it difficult for enterprises in the process of achieving business goals that causes them to suffer losses, to cost more for resources in the course of their development.

Business risk always exists in enterprises' life and they must always find ways to manage risk. The purpose of risk management is to help enterprises utilizing their resources as well as organizing their operations more securely, safely and effectively. It also helps executives make the right decisions and helps enterprises achieve their goals, missions and business strategies.

Risks are objective and subjective but are often the result of management decisions. On the other hand, the basic characteristic of risk is to cause losses or damage to the enterprise in the form of costs. Therefore, the role and requirement of using tools to support managerial cost-related decisions becomes essential in the enterprise risk management process.

Business risk management processes include:

- Risk identification: Identify the list of risks that may occur in the operation of the enterprise to sort and classify risks.
- Risk analysis and measurement: Analyze the risks, assess the extent of the damage caused by the risk as well as the probability of occurrence of the risk to find a way to deal with or find solutions to prevent, eliminate, limit, mitigation losses, costs.
- Risk control: Activities that involve avoiding, preventing, mitigating the severity of costs.
- Risk financing: The activity that provides the means to compensate for losses, damages, costs, or establish funds for various programs to reduce losses.

Risk management undertaken by the manager during the implementation of the management functions for the unit's activities. Three main the management functions are planning function; controlling function (including organizational performance and evaluation) and decision making function.

There are two main types of activities that the manager must affect and manage risk. First, the activities in the value chain, the supply chain of the enterprise. Second, the administrative activities of the administrator. Thus cost management accounting will help the manager to control risk, improve the efficiency of both types of activities.

First, cost management accounting plays an important role in risk management, enhancing the efficiency of activities or parts of the value chain and supply chain.

A value chain is all the activities a company performs when it creates a product from its inception, until it is sold in the market as well as after-sales services referring to that product. Activities in the value chain include: R & D activities; Design activities; Purchasing activities (supply); Production activities; Marketing; Distribution activities and Customer service.

Supply chain is seen as a complement to, or extension of, the value chain. Supply Chain is a collection of methods used in an integrated and efficient way for suppliers, manufacturers, transport companies, warehouses and stores to distribute manufactured goods to the local area at the right time and with the right quality, with the aim of minimizing system overhead while satisfying customer requirements.

Value chain and supply chain all involve an enterprise and its activities. When considering the business from a value creation perspective, one refers to the value chain of the business, and when it comes to satisfying customer needs, it is called the supply chain. Value chains are designed to create value in the production of products and supply chains to create value in distribution. Value chain and supply chain are closely related. Because it is a dialectical relationship that coexists and develops in parallel between production and distribution, between corporate interests, partner interests, and customer interests. Value chains focus on internal issues within an organization in value creation while supply chains focus on the organization's relationship to the external environment in the supply chain. At the organizational unit level, the value chain is wider than the supply chain as the value chain includes both supply and distribution. At the level of suppliers and customers, the supply chain as an extension of the value chain (called value chain extension) as it relates to the operation of a group of enterprises cooperate with each other (business conglomerate model) through customers and suppliers. At this point, the business is only a key link between suppliers and customers.

Value chain and supply chain management must take into account all elements of the chain, its impacts on costs and its role in the production and distribution of products in line with customer needs. , from the supplier to the manufacturing facilities, warehouses and distribution centers to retailers and stores. The goal of value chain and supply chain management is to achieve system-wide performance based on the value the customer receives. The total cost of the entire system from research, design, transportation, production, distribution, inventory to materials, inventories in production and finished products should be minimized. In other words, the goal of every value chain and supply chain is to minimize costs, maximize the value generated for the whole system, not just at one stage or another. On the other hand, the cost or value created does not only relate to the responsibility of a CEO but also at various levels from strategy, tactics to performance.

The researching object of cost management accounting is information about costs, which existence and movement in space and time are always associated with each stage, each part of the value chain, the supply chain of the enterprise. The purpose of the research and reflect the cost associated with the value chain and supply chain of enterprises is to understand the causes of cost, understand the cost structure, the process of advocacy (cost flow) as well as the responsibility of the manager in the cost control process. From that research, cost management accounting can help managers identify, analyze, and measure risks and errors that may arise in each stage, component or step causing cost damage to the business. This helps enterprises find effective ways to save costs, increase value for each stage of the chain, for the product, for the customer as well as to eliminate the activities, stages, parts do not add value, causing risk to the business.

Second, cost management accounting plays an important role in risk management, enhancing managerial efficiency of management.

Administrative activity is a special activity that is carried out simultaneously with all other activities within the unit. However, the effectiveness of the activities, the internal cause of the risk to the enterprise, has a great deal of governance.

The management of the manager creates the development orientation for the organization on the basis of setting common goals and directing all efforts of individuals and resources to achieve that common goal. Management activities help organizations adapt to changing environmental conditions, capture and make better use of opportunities, and reduce the negative impact of risk, create added value, ensure sustainable development for the organization.

In a unit, managers control the risk and cost. Cost management has helped managers in managing risk and cost associated with implementing each management function for value chain and supply chain operations

Cost management accounting helps manage risk in the planning of operations

Planning is the process of identifying objectives, tasks as well as solutions and resources that an organization can use to achieve its goals.

The planning process includes five stages:

Stage 1: Environmental Analysis;

Stage 2: Define goals;

Stage 3: Develop options;

Stage 4: Evaluate and select the best options;

Stage 5: Decide the plan.

Whether it is a strategic, tactical or operational plan, the first stage of planning is to analyze the internal and external environment to assess opportunities and risks, from which it is possible to identify the target accurately, feasibly as well as the appropriate solutions to achieve the target. In the process of environmental analysis, the business must take into account the risks and interest in risk management in each activity, department, step, as well as associate the risk management with the responsibilities of administrative level. Thus, through the first stage of the planning process, the manager has actively responded to the uncertainty or change, i.e. responding to the risks. The more easily the environment changes, the higher the role of planning. Planning helps enterprises orienting, linking and unifying all activities, all parts of the system to achieve management objectives, business strategies set as well as create basis for allocation and use available resources in the best way and to achieve the purpose of risk management. Environmental analysis is the primary responsibility of the manager and related departments, but cost management must fully understand the environment in terms of both opportunity and risk, to be a precaution for the next stage of the planning process. In addition, in analyzing the effects of factors, cost management accounting is responsible for providing information that assesses the effect of these factors in the past and future that affect the activities and objectives of the business in terms of economic and financial aspects by identifying the types of costs that may have arisen as well as forecasting the nature and extent to which these factors influence the cost. Particularly, factors can quantify financial risks such as the economic environment and the constituents of interest rates, inflation, taxation, monetary policy and exchange rates or factor of customers, suppliers, competitors, all resources, functional parts in the enterprise.

In the second stage of the planning process, cost management accounting helps to establish long-term, short-term financial goals for the organization and for each department and activity. These are the indicators of cost, cost of production, selling price, planned and standard profit. To set up these indicators, cost management accounting must analyze past cost information, future cost estimates and opportunity costs. In the process of establishing such targets, the enterprise must take into account the response to uncertainties, changes in the internal or external environment, and establish the basis for the inspection and adjustment of practical activities in a flexible and timely manner. This process also serves as a basis for preventing, controlling and remedying risks arising later in the course of organizing the implementation of activities.

In the third stage of the planning process, cost management accounting helps businesses to develop cost plans, profitability of each business plan, plan to provide resources for each option, based on which the organization can exploit and use its resources proactively and effectively. This is the basis for unification and coordination between departments and the basis for the unit to organize activities in a safe and stable manner in order to minimize risks arising in the course of operation.

In the fourth and fifth stages of the planning process, cost management accounting provides the relevant cost information for evaluating and selecting the best business alternative that have the greatest impact on the target, to the efficient use of resources. In the process of analyzing relevant information, the accountant not only has in fact selected the most valuable, accurate, relevant and timely information on the decision request, but also restricts and removes information that is related to the costs of misrepresentation or misrepresentation, which results in the risk for the decision of the administrator.

The final result of the planning is that the manager must the budgets including the master budget and the detailed budgets for each department, activity, product. The budgets should use cost information that includes the cost or provision funds to finance for any risks arising unexpectedly out of plan or standard cost. If there is no cost information, there is no budget, unable to allocate for development plan as well as no tool available for the evaluation of the result, the level of the strategic target completion, evaluation of the administrator's responsibility. Therefore, if there is no cost information, it is unable to evaluate the efficiency of risk management

Cost management accounting helps manage risk in the organization of the implementation of activities

Implementation is the coordination of activities, best links the organizational factors, human factors and resources to implement the plans and targets set. When executing a plan, managers need cost information on a regular, ongoing basis to capture the effectiveness of using resources for departmental activities. From this, the level of implementation of the plan will be evaluated, which is the basis for the subsequent examination and evaluation. Information about operating expenses allows them to assess the shortcomings of different parts, periods and situations, assessing the extent of the damage caused by the risk as well as the possibility of risk as the basis for timely remedies to select and redistribute resources in an optimal way, seeking modern technological solutions or more closely align internal and external units, enabling businesses to stop, eliminate, limit or minimize the risk of losses. In addition, managers need information about the cost of performance of each department, individual to assess the responsibility of the administrator in the process of controlling costs and risks in detail and clarity, which is the basis for the evaluation of emulation and reward to encourage and motivate labourers to work with high efficiency and minimize risks caused by labourers.

Cost management accounting helps manage risk in controlling

Control is the process of monitoring, measuring, evaluating and adjusting activities to ensure the implementation of the plan and objectives set. Control is a tool for managers to detect errors, risks, find causes, and take corrective measures to make operations more efficient, reduce errors, or risks that can arise, helping to achieve better goals, and increasing the responsibility of executives. So controlling the value chain or supply chain and controlling risk is always done simultaneously and for the same purpose, not just at certain stages but a continuous process of time, space and at every stage of the management cycle.

Cost management accounting helps to manage the risk in the control before the operation and control in the stage of implementation. The information provided by the cost accounting manager will help the

manager know which activity, which part is the risk factor, the cost (source of risk), the risk structure, risk-affected subject (finance, human resources, productivity, branding), risk exposure, cost and maximum acceptable level of exposure to achieve the goal. It also helps administrators evaluate the effectiveness of current operating procedures as well as provide operational improvement options to prevent the resulting risks that affect performance. On the other hand, because risks and costs both lead to the consumptions of input resources, the cost information about each detailed activity or department of the product, helps the manager evaluate the economy and effectiveness of the product in the process of mobilizing and utilizing resources and introducing design improvement measures to prevent risks that may result in waste of resources. Departments (where resources are consumed) are the places where risks and costs arise, so the cost information of the departments will help the manager assess the performance and responsibilities of such departments in the process of using resources as well as proposing risk control measures for each resource and activity. In these stages, if there are risks to be financed, the management should take timely risk financing measures to prevent and overcome the consequences and damage caused by the risks.

Control is both a feedback system on the results of the activities of the risks and also a predictive feedback system. The resultant feedback system is setting standards, measuring performance, measuring risk and adjusting deviations and risks in the process. In order to make the adjustment, managers must put in place a program for correcting and implementing this program to reach the desired goal. The predictive feedback system will monitor the input of the system and the implementation process to confirm whether those inputs and processes ensure that the system is performing the right plan and goal or not? Are there any risks? This system allows the feedback to regulate the operation and control of the risk is made before the output or the result of the system is affected. To maximize efficient use of resources and prevent the risk of giving rise to costs, risks need to be controlled by both control the final outcome and control forecast in all phases of the implementation of activities in the value chain and supply chain and at all levels of governance and in the enterprise.

The risk management in the implementation process depends very much on the management model and cost management accounting model of the enterprise. Each different management model and cost management model will have different risk and cost management features and methods. This will affect the efficiency of resource utilization, cost control, profit measurement, and competitiveness of the business.

Cost management accounting helps manage risk in decision making

In the process of doing business, managers often face changes from the environment on both sides of the opportunities created for the unit but also contains many hidden risks. So managers need to be careful to make the right business decisions. Decisions can vary in terms of time, content, scope, but they all have common characteristics that they go through all stages of the corporate governance cycle and are all related to costs. Costs are partly due to the company's failure to control the risk of loss, waste that affects the effectiveness of the decision. Therefore, to make the right decisions, limit the risks, managers must definitely consider and evaluate the information on the cost involved in the decision. In particular, managers must regularly review the decisions made and make the necessary adjustments in accordance with the change of environment. Hence, in order to prevent risks in the decision making process, managers must design an effective cost management accounting information system to ensure that information is provided regularly, continuously, accurately, in detail, fully, flexibly and promptly, and in accordance with management situations and decisions. Cost management accounting with the

object, content and methodology it uses will serve as a cost information provider, resulting in meeting the above requirements of the administrator through the system of management reports. In order to make the right decision in the budget planning process, cost management accounting will provide budgeted reports on production, sales, budgeted reports on cost such as direct materials, direct labors, overhead, selling and administrative expenses, inventories, contribution margin report using the C-V-P analysis... These reports are intended to provide prospective information for the selection of managerial alternatives, decisions, strategies ... On the other hand, cost management accounting information helps the manager make strategic decisions by answering questions like: Who is our most important customer, and how can we compete and bring value to them? Are we providing good quality products and services at low cost by managing costs? Are there alternative products on the market, and how are they different from ours in terms of price and quality? Since resources are not infinite, what is our most important ability? Technology, production or marketing? How can we leverage these resources for new strategic initiatives? Do we have funds to implement the strategy, or must we mobilize from support? What resources do we need to implement the strategy? What is the source of your competitive advantage - for example, cost, productivity, or product features? The cost accounting accounting process supporting information for making strategic business decisions also helps managers to identify risks, analyze and measure risks as well as to find out the measures to control the risks.

The cost management reports on the assessment of the implementation of the plan such as reports on costs, sales, profits of each type of product, service, department, area; Report on the volume and cost of goods purchased and sold in the period according to customers; The detailed report on the volume of products finished and sold; Report on the situation of labor use and labor productivity; The report analyzes the factors influencing the implementation of production and financial plans in the period... These reports are intended to provide information (past information) to the manager to assess the actual performance of the planned budgets from which the manager proposes decides to improve the activities, helps to achieve the objectives set and limits the risks arising during the implementation.

Cost reporting is always important information for executives' optimal decision making in business production planning, resource control, cost control, accurately assess the responsibilities of the management units, prevent risks, timely correct errors, risks before, during and after the process of production and business activities, help enterprises meet the strategic objectives set out.

On the other hand, one of the risks of the business comes from competitors. Competitive information is as meaningful as a sign and alerting the managers about the changes of risks in the market. So in order to win the competition the business must find an advantage in which the management and cost savings have to be more effective for products and services with more and better quality, differentiated products, especially, having a competitive price in accordance with customers is a way to create competitive advantage and reduce risk in the most active way for the business.

Thus, cost management accounting is very important for minimizing risk, improving the efficiency of management activities. In contrast, effective management will reduce the cost of operating activities, increase profitability, help save costs on resources, minimize waste, risk, and help businesses achieve their goals. Cost management accounting is a mirror that helps managers re-evaluate their own perceptions, attitudes, responsibilities, and managerial skills, and they are very important factors that affecting the quality of risk management from the internal perspective of the business.

2. COST MANAGEMENT ACCOUNTING CONTRIBUTES TO PROMOTING THE SUSTAINABLE DEVELOPMENT OF ENTERPRISES

Nowadays, sustainable development is the path of exclusivity, and the life and soul of enterprises in the socio-economic development in the new period. To sustainably grow businesses in the pursuit of profit, must be environmentally friendly and socially responsible.

Sustainable development is the current development but does not affect future generations. In order to achieve this, in the implementation of business strategies, enterprises must consider this as their objective and concretize it into specific plans and targets suitable to their business conditions as well as achieving them to the global standard. Thus, the introduction of management accounting in general and cost management in particular becomes an effective tool for corporate executives in the process of sustainable development is essential for the following reasons:

Cost management accounting contributes to the maximization of the benefits to customers, shareholders, owners and other stakeholders involved in the value chain and supply chain of the business. In the process, cost management has helped businesses demonstrate their social responsibility to create a common prosperity for the whole society.

Indeed, the purpose of managing an organization is to balance the interests of the individual, the business and the community. Modern management theories on the sustainable development of today's business point out that every management tool of the enterprise aimed at maximizing value for customers is the most important goal. The customer is the one who decides the existence and development of an organization, must maximize value for them to maximize value for shareholders and other stakeholders. A company can only succeed if it creates a reason for customers to choose it rather than its competitors. Value for the customer is the focus of management strategies, of sustainable development. The values that are offered to customers tend to fall into three broad categories: *Customer friendliness* means understanding and responding to customer needs better than others or *Excellence in Performance*: the reason customers choose the company is because the company offers products and services faster, more convenient and at a lower cost than other competitors or *Product Leader*: the reason customers choose the company is because the company offers higher quality products than other competitors. But regardless of the business strategy to provide value to customers through the process of providing products and services to customers. Cost management accounting therefore plays an important role in decisions about products offered to customers, such as form, quality and structure, cost, cost of finished products and cost of goods sold of all kinds of products. For example, the tastes of customers influence the cost of product design; The form and quality of products affect the production costs of products; Time, delivery processes affect the costs associated with sales and after-sales services. A good cost accounting system must track the costs associated with a range of activities that are important to the client and advise management on solutions that address the highest satisfaction of their needs, creating added value for them. From there, on the one hand it creates added value for the organization, its members as well as its stakeholders, for the whole society. On the other hand, it helps enterprises to cope with the risks that may arise in the fields and activities related to customers and help them improve themselves, win the competition and that is the premise to develop sustainably.

Cost management accounting helps businesses to grow sustainably by finding solutions to efficiently use resources, increasing profits for businesses but not wasting resources and compromising the environment. Because resources are always limited, improving the efficiency of resources use and not affecting the resources of the next generation has become an important goal of the enterprise in the

process of sustainable development. Cost management accounting information helps managers achieve this goal. Indeed, the costs incurred are due to the use of resources. Cost management always monitors, reflects, controls costs associated with the process of mobilizing and utilizing resources for stages, departments engaging in the operation of the value chain and supply chain of the business, thereby helping businesses evaluate the economy, efficiency, effectiveness of mobilizing resources, as well as evaluation of the efficiency of responsibilities of the governance system in this process. Cost management accounting helps businesses minimize the cost of mobilizing resources to achieve their goals while still ensuring the quality of output. Resources are exploited, mobilized, distributed and used in a thrifty manner, bought at the correct price, in a timely manner, in right quality and quantity, in line with the plan and budgets. Cost management accounting through the application of modern cost management accounting models helps businesses maximize the benefits of using resources by reducing costs or improving productivity, helps businesses maximize profits, achieve goals at the lowest cost. The process of using resources efficiently so as not to waste social resources is also the process of finding solutions to technology innovation and management innovation to constantly improve themselves, improve the stature of the business, to protect and environmentally friendly and ensure the responsibility of business to society.

Currently, interest in sustainability tends to increase. Government regulations in many countries require companies to develop and report on their sustainable development initiatives. So managers often use cost management accounting as a tool, leverage business, help businesses maximize the benefits of customers, shareholders and other objects, help businesses win in the competition and sustainable development. Cost management accounting not only looks at cost information, results in the present but also reflects the future hidden value that will be generated by the business in a long and harmonious way in all finance, social, and environmental aspects.

POLICIES TO PROMOTE LOGISTICS IN MARINE ECONOMIC DEVELOPMENT OF QUANG NINH PROVINCE

Luong Quang Hien* - Nguyen Trong Tuan**

ABSTRACT: *Quang Ninh is a province in the northeast of Vietnam. This province has many advantages to develop marine economy. Over the past few years, the Party and State as well as Quang Ninh Province have taken many measures to promote socio-economic development of Quang Ninh, in which measures to promote the logistics industry have contributed to significantly increase marine economy of Quang Ninh Province in the economy of the province. The policies of the central government and Quang Ninh Province in recent years have contributed to make the logistics of Quang Ninh ranked in the leading group in the country. The competitiveness index of Quang Ninh Province has been increasingly improved, in the top cities and provinces of the country in recent years. The growth of logistics industry in the province has been improved; the quality of logistics services has gradually met the demands of the economy, the logistics increases its ratio in service sectors of the province. However, beside the achievements, the logistics industry of Quang Ninh Province has not brought its potentials into full play in maritime economic development. One of the reasons for this situation is that the policies for the logistics service sector are still inadequate; they could not to promote the logistics industry to flourish. In the coming time, besides the general policies of Quang Ninh Province, it is necessary to have appropriate and synchronous policies to promote the growth of logistics industry and to boost the marine economy of Quang Ninh Province, contributing to the implementation of the national marine economic targets.*

Key words: logistics, marine economy, Quang Ninh, policies, national targets...

Quang Ninh is located in the northeast of Vietnam. With a strategic economic and political position, with national borders and territorial waters are bordered by China, bordered by the Tonkin Gulf and the provinces of Bac Giang, Hai Duong, Lang Son and Hai Phong, Quang Ninh Province thus becomes a service center for economic development of the North, linking the economic centers of Southeast Asia and Asia-Pacific.

With a land area of over 6,000 km², 9/14 district-level administrative units have the sea (the highest in the country), population of 1.9 million with 22 ethnic groups, over 250 km of coastal roads, more than two thousand small islands, four thousand hectares of tidal flats, twenty thousand hectares of ponds and bays, two island districts. Quang Ninh is the center of the country's coal resources, rich in minerals. The system of seaports, airports, waterfronts, canals and rivers facilitates the development of sea transport.

Being a province with favorable natural conditions, socio-economic conditions in industrialization and modernization, socio-economic development in general and marine economy in particular, especially the

** *People's Police Academy, Co Nhue 2 Ward, Bac Tu Liem District, Hanoi Nguyen Trong Tuan, Tel.: +84985 848 288/nguyentrongtuan.hvcsnd@gmail.com.*

service sector for the development of marine economy, Quang Ninh has experienced a high growth rate over the whole country. The economic structure in the province is moving towards progress, the value added of all economic sectors increased. Particularly, economic sectors and fields that promote the advantages of coastal areas such as seaports, sea tourism, shipbuilding, fishing and aquaculture have made remarkable progress. The port system has been developed quite reasonably, upgraded towards industrialization and modernization; increasingly meets the requirements of international integration. Sea tourism has made important progress, initially forming and connecting tourist centers in the province of different forms such as ecotourism island sea tourism, spiritual tourism and historical sites, tourism sports border tourism for shopping goods and services... tourism quality has been improved. The potentials of tourism, the natural wonders of the world Halong Bay are exploited strongly with higher effectiveness. The transport infrastructure has been improved; many key projects have been put into operation, facilitating the trade of goods and services, enhancing the competitiveness of the province. Shipbuilding industry in recent years has made significant progress. The brand name of the shipbuilding industry is affirmed not only domestically but also regionally and internationally. The shipbuilding establishments are expanding, from small transport ships, so far the Quang Ninh shipbuilding industry has built large vessels of high tonnage and high quality meeting international standards. The fishing and aquaculture outputs are constantly increasing. The seafood export market is increasingly expanding with increasing quality standards, in line with new international standards. Annual coal output is high, with annual average of over 4 million tons. The output of oil and gas has increased in recent years.

However, besides the achievements, logistics in the development of marine economy in Quang Ninh has many limitations. The efficiency of production and business has not reached the optimal results in scale and quality of exploitation. Competitiveness of marine economic sectors and fields is low. The policies of attracting investment in marine economic sectors are limited. The level of exploitation technologies is backward, state management over the exploitation and use of marine resources reveals weaknesses, causing loss and waste of logistics resources for marine economic development. The cooperation with other localities and international integration are limited, the advantages of the province in the development of marine economy have not been exploited.

The course of international integration brings to Vietnam (including Quang Ninh) many opportunities and challenges in logistics development to develop the marine economy. The issue is how to promote advantages, seize the favorable international integration conditions of Quang Ninh to develop strong marine economic services to make Quang Ninh Province the center of logistics services of the whole country, contributing to achieve the goal of turning Vietnam into a “rich-from-the-sea” and a “strong-sea” nation, successfully implementing the renovation, industrialization and modernization of the country.

In the past time, the Party and State have adopted policies to develop the economy - society in general, develop the logistics industry in particular. The document of the 12th National Congress of the Communist Party of Vietnam has clearly stated: “Speeding up the development of service industries, striving to reach the average speed of 6.6 - 7.1% per year ... Increasing the connection between modes of transport, encouraging the development of multimodal transport and logistics” Document of the 12th National Congress, p.286, 287

Commercial Law, 2005 defines logistic services as follows “Logistics are commercial activities whereby a trader organizes one or more tasks including receiving, transporting, warehousing, storing, customs clearance, other paperwork, customer consultation, packing, marking, delivery or other services related to the goods as agreed with customers for remuneration. Logistics service is transcribed in Vietnamese as lô-gi-stíc.” - Article 233, Commercial Law, 2005

The Customs Law amends the provisions on the State management over customs of goods exported, imported, in transit and transport means on exit, entry or in transit of organizations and individuals in the country and abroad within customs territory; on the organization and operation of Customs. For example, Article 41 of the Customs Law stipulates the responsibilities of enterprises dealing in ports, warehouses and storing yards in customs supervision as follows:

1. To arrange locations for installation of technical means and equipment Customs for inspection at the request of the customs office.

2. To connect the enterprise's goods management information system with the e-customs clearance system of the customs office to manage the goods being subject to customs supervision, putting them into stores and take them out of the port areas, warehouses and storing yards.

3. To fully observe the regime of management, statistics and keeping of documents, books and data of goods put into stores, taken out of port areas, warehouses and storing yards according to the provisions of law and present, provide to the customs office upon request.

4. To supply information and coordinate with the customs office in monitoring, inspecting and supervising goods in and out of the port areas, warehouses and storing yards.

5. To preserve, rearrange and preserve the status quo of goods in port areas, warehouses and storing yards according to the supervision and management requirements of the customs office.

6. It is allowed to transport goods out of and into port areas, warehouses and storing yards upon documents of the customs office.

7. To perform the decisions of the competent agencies on handling of infringing goods.

Civil Law 2005: Article 518 through Article 526 stipulates the service contracts, which clearly stipulates the rights and obligations of the parties to the service contracts. For the service provider, Article 522 of the Civil Law defines the obligations of the service provider as follows: "The service provider has the following obligations:

1. To perform the right tasks, quantity, duration, location and other agreements.

2. Not to assign another person to perform the tasks without the consent of the service hirer.

3. To preserve and hand over to the service hirer the documents and means assigned after the completion of the tasks.

4. To promptly notify the service hirer of incomplete information, documents and/or poor- quality means to complete the tasks.

5. To keep secret information obtained during the performance of the tasks if so agreed upon or provided for by law.

6. To compensate for damage to the service hirer if damaging, losing documents, means or disclosing confidential information."

Decree No. 160/2016/ND-CP, dated 29/11/2016 on conditions for sea transport business, shipping agency services and towage services; This Decree will come into force on July 01, 2017 and will replace Decree No. 30/2014/ND-CP dated April 14, 2014 of the Government on conditions for sea transport service business and sea transport supporting services.

Regarding the shipping business conditions, the Decree clearly stipulates the conditions on organizational structure, human resources, finance, ships and crew members for Vietnamese enterprises engaged in international shipping business and domestic transportation business, conditions for foreign organizations participating in domestic transportation by vessels flying the Vietnamese flag. This Decree stipulates the conditions for foreign

organizations to participate in domestic transportation by boats flying the Vietnamese flag, which is a new point. Foreign organizations engaged in domestic transport (cabotage) by Vietnam-flagged vessels must set up joint-venture enterprises according to regulations, of which the foreign investors' capital contribution ratio does not exceed 49% of the charter capital of the enterprises. Foreign crew members working on board must not exceed one third of the crew, the captain or vice captain must be a Vietnamese citizen...

Regarding the conditions for dealing in ship agency services, The Decree still prescribes that if foreign-invested enterprises providing ship agency services, capital percentage of foreign investors must not exceed 49% of the charter capital of the enterprises. The decree stipulates that employees of the ship agency must be Vietnamese and that competent authorities should issue professional certificates of ship agency.

Regarding the conditions for towage service business in Vietnam, In the case of foreign invested enterprises providing towage service, capital percentage of foreign investors must not exceed 49% of the charter capital of the enterprises. The enterprises must have at least one towing ship and crew members must be Vietnamese. This Decree specifies the conditions permitting foreign organizations to use foreign-flagged vessels for seagoing vessel towage services in Vietnam when towing ships bearing Vietnamese nationality fail to meet conditions as prescribed. The Decree also regulates the conditions for maritime safety and security and environmental protection. Crew members must have professional certificates, must sign a towage contract and a foreign organization must have an authorized branch or representative office or a Vietnamese towing enterprise in Vietnam.

Conditions of business, investment in logistics services are the basis for the relevant state management agencies to manage more effectively in the industry. Logistics services - the sector managed by many state agencies; this will create more favorable conditions for the development of the important services, bringing more value to the economy in general and commerce in particular.

Decision No. 175/QĐ-TTg dated January 27, 2011 by the Prime Minister on "Approving the overall strategy for development of service sector in Vietnam up to 2020", orientations and targets of development for the sector in the coming period are defined as: Service sector growth is higher than growth rate of production and GDP growth rate; Focusing resources, promoting the development of service areas with potentials and advantages; Improving the quality of products and services and the competitiveness of service enterprises; Promoting the exploitation of the potentials and advantages of each service sector, strengthening the cooperation between the service sectors... Decision No. 175 considered the logistics service as a service sector of potentials and advantages that needs to develop strongly, the "infrastructure" service sector needs to focus on key development. Logistics services are considered as a key factor promoting the development of the production, distribution systems in other service sectors and the circulation of goods in the country and import and export. Orient to form a 3PL package; develop electronic logistics (e-logistics) along with efficient and friendly e-commerce and supply chain management. In line with the definition of service sector development targets, specific development targets are also identified. The growth rate of the service sector in the period 2011-2015 will be 7.8-8.5%/year, with the scale of 41-42% of GDP of the whole economy; In the period 2016-2020, the service sector growth rate will reach 8.0-8.5%/year with the scale of about 42-43% of GDP of the whole economy. In which the growth rate of logistics market reached 20-25% per year. The total value of the logistics services market is forecast to account for 10% of GDP by 2020. The outsourcing rate for logistics is 40% by 2020.

Decision No. 448/QĐ-TTg dated March 25, 2011 on the approval of the Customs Development Strategy until 2020. Among the strategic contents of Decision 448 are summarized as follows: Firstly, regarding

institutional structure, Decision 448 is divided into 3 phases; a) From now to 2012: To review and evaluate the implementation of the provisions of law on Customs procedures, inspection and supervision as well as tax on export and import goods in the past time b) From 2013 to 2015: To review and evaluate the implementation of the Customs Law in the past time and other relevant laws; c) From 2016 to 2020: To review and adjust the system of legal documents on customs and other relevant law in line with international commitments to which Vietnam is a party. Secondly, the customs profession is composed of: customs procedures, customs inspection and supervision; Tax Administration; Customs control. Thirdly, organizational structure and human resources, Decision 448 sets out the organizational structure and human resource development. Fourthly, regarding facilities, technical equipment; Information technology and customs statistics: Facilities, technical equipment: information technology and customs statistics; To implement the statistics on new import and export goods in the national statistical indicator system. Fifthly, regarding other issues: To promote the information and propaganda for officials and employees in the customs sector, organizations, individuals and the business community on policies, laws, procedures customs; programs and plans on customs reform and modernization; to take advantage of the coordination and support of organizations and individuals in customs law enforcement. To develop and implement consistent quality management system models. To research, develop and implement the Customs - Enterprise partnership program. To promote bilateral and multilateral cooperation, effectively implement the financial management mechanism.

Decision No. 2190/QĐ-TTg dated December 24, 2009 approving the planning on Vietnam's seaport system up to 2020, with orientations to 2030 with a view to developing a comprehensive seaport system to develop rationally and synchronously between seaports, aiming to quickly integrate our country and to be competitive in seaport activities with other countries in the region and in the world. The content of the planning is expressed in many aspects: According to the territory, according to the size of functions and tasks, according to the function and scale of development of each port group, according to the direction of improving the flow... Decision 2190 also estimated the demand for port development investment capital by 2020 at 360-440 trillion dong, of which funds for port public infrastructure is about 70-100 trillion dong; The charge for the sea port infrastructure is about 290-340 trillion dong. Decision No. 2190/QĐ-TTg dated December 24, 2009 approving the master plan of Vietnam's seaport system up to 2020, with orientation to 2030, Hon Gai port - Quang Ninh is planned in port group of the North (Group 1). Being a national general port, regional focal point (Type I), including Cai Lan - the major wharf area, mainly for general cargo, containers for ships of 50,000 DWT or 3,000 TEU; Specialized wharves are satellites for major ports such as Hon Gai passenger wharf, cement wharves, coal wharves and specialized wharves for economic zones and industrial parks. Prime Minister's Decision No. 2190 has created legal basis on scale, capital and infrastructure for seaport operations in particular and logistics services in general to develop strongly in the country and Quang Ninh Province.

Decision No. 35/2009/QĐ-TTg dated March 3, 2009 by the Prime Minister, approving the readjustment of the transport development strategy till 2020 with a vision to 2030. With a view: "To develop modern and high-quality transport with reasonable and safe costs, limit environmental pollution and save energy; To apply advanced transportation technology, especially multi-modal transportation and logistics. "Decision 35 by the Prime Minister has set the direction of transport development to 2020 with a diverse system of roads, railways, domestic waterways, sea, air, rural transportation, shipbuilding industry, automobile industry, construction motorcycles, railway industry and aviation industry. Vision to 2030: "The port system satisfies the demand for imported and exported goods and the domestic market, in which, Van Phong international

transshipment port has entered the effective exploitation period, the port is the international gateway in the key economic areas associated with the system of goods distribution centers and interconnected traffic systems shall ensure the formation of a modern and efficient logistics infrastructure network on a par with the countries in the region". In order to realize the above-mentioned orientations, the Prime Minister's Decision 35 sets forth solutions for implementation, including solutions and policies on transport. Logistic services are mentioned as follows: "Develop diversified types of transport and transportation supporting services; ensure quality, fast, safe, convenient requirements while saving social costs. Develop multimodal transportation and logistics services in goods transportation."

Notice No. 108-TB/TW dated 01/10/2012 regarding the Project of socio-economic development in a fast and sustainable manner and firmly maintaining national defense and security as well as piloting two special economic administrative units Van Don, Mong Cai. Van Don Special Economic-Administrative Zone Project identifies key occupations in sectors (tourism-service, industry and agriculture) and is stratified according to each stage of development. Phase 1 (2018-2022) focuses on the following areas: casinos for entertainment, seaport service, aviation; international trade centers; innovative technology, start-up center. Phase 2 (2023-2026) includes: theme parks; fishery, seafood processing, logistic services; education and training; Financial services; health, healthcare.... Phase 3 (2027-2030) will focus on: biotechnology, green technology, high-tech agriculture.

Conclusion by the Prime Minister on December 22, 2016 at the meeting with Quang Ninh Province: "To promote the link for development, Quang Ninh should strive to become a logistics center, service center to effectively serve economic development of the whole region." Conclusion by the Prime Minister agreed to deploy investment in the construction of high-grade service and tourism complexes in the province to achieve the goal of turning Quang Ninh Province into a service economy in the next time. The Prime Minister agreed on the policy of adjusting Van Don airport to become an international airport. The Ministry of Transport and the People's Committee of Quang Ninh Province will be assigned to accelerate the investment and soon put Van Don Airport into operation and use. The Prime Minister suggested Quang Ninh to continue to exploit and make the most of the advantages of border gate and border economy, trade with China both in terms of quota and non-quota categories; To fully exploit the existing cooperation mechanisms for socio-economic development.

Decision No. 1012/QĐ-TTg dated July 3, 2015 by the Prime Minister promulgating the approval of the planning on development of the national logistics center system up to 2020 with orientations to 2030 "With the aim to: Develop a network of logistics centers to meet the needs of domestic production and circulation and import and export. To effectively exploit the logistics market of Vietnam, focus on outsourced logistics services, integrated and synchronous logistics, organization and operation under the 3rd party logistics model (3PL). To promote the production and business development through minimizing costs and adding value to the goods and services of businesses. Step by step to deploy the 4th party logistics (4PL) and 5th party logistics (5PL) models on the basis of developing e-commerce and supply chain management in modern, effective and professional manner. By 2020, the growth rate of logistics services will be around 24% -25%/year, the contribution to GDP of the whole economy will be 10%, the ratio of outsourced logistics will be about 40%, minimizing the logistics cost of the whole economy over GDP of about 20%. By 2030, these indicators are 34% - 35%/year, 15%, 65%/year and 15% - 17%/year, respectively. Planning options in all three economic corridors, Quang Ninh are in the option of logistics development network: Hanoi - Lang Son economic corridor connected to shallow ports, seaports (Hai Phong, Hon Gai, Cai Lan; The economic

corridor of Hanoi - Lao Cai connected to shallow ports, seaports (Hai Phong, Hon Gai, Cai Lan), airports, railway stations, industrial parks and border gates (in Lao Cai, Ha Giang); Northwestern economic corridor connected to shallow ports, seaports (Hai Phong, Hon Gai, Cai Lan), airports, railway stations, bus stations, industrial parks, border gates (in Son La, Dien Bien, Lai Chau).

In the planning of logistics centers in the whole country until 2020, the orientation to 2030 is the Logistics Centers on the East-Northeastern coastal economic corridor with the area of 20 ha (Phase 1) and increased to 40 ha (Phase 2).

Decision No. 200/QĐ-TTg dated 14/02/2017 by the Prime Minister approving the action plan to improve competitiveness and develop logistics services by 2025. From the government's perspective, Logistics is an important service sector in the overall economy of the country, playing the role of supporting, linking and promoting the socio-economic development of the country as well as of the localities; Developing logistic services into a high added value service sector; Developing a healthy logistics market; Maximizing the advantages of strategic geographic location, making Vietnam become a major logistics hub in the region; Focusing on enhancing the competitiveness of logistics service providers; The State has the role of supporting and creating favorable environment for enhancing competitiveness and developing logistics services in Vietnam. The goal is to contribute 8% - 10% of total GDP of the whole country in 2025, service growth rate of 15% -20%, Logistic outsourcing rate is 50-60%, logistics costs are reduced to 16% -20% of GDP, ranked by the National Logistics Performance Index (LPI) reached 50th upwards. In order to achieve the above targets, Resolution 200 sets out 6 main tasks: Improving legal policies on logistics; Improving logistics infrastructure; Improving business capacity and service quality; Developing logistics services market; Training, raising awareness and quality of human resources; Other duties.

Official Letter No. 10414/VPCP-KTTH dated October 02, 2017 by the Prime Minister on solutions to develop logistics services. In Official Letter 10414, the Prime Minister assigned the Ministry of Industry and Trade to focus on urging and implementing the tasks and solutions to develop logistics services approved in the Action Plan for Enhancing Competitiveness and Development Vietnam logistics services up to 2025 promulgated together with Decision No. 200/QĐ-TTg dated February 14, 2017 by the Prime Minister.

Decision No. 2072/QĐ-TTg dated December 22, 2017 on "Approving the adjusted master plan on development of the shallow port system in Vietnam up to 2020 and orientations to 2030". With the target: "To step by step form and develop the shallow port system in order to meet the demand for transportation of exported and imported goods and increase the clearance capacity goods of seaports; To organize the transportation of containers in a reasonable way to reduce transport costs and goods store time at the seaports, ensure goods safety; It contributes to the reduction of traffic jams, especially in big cities and areas with large seaports. To develop the port system shall become the focal point for the organization of transport, transshipment and distribution of goods, combined with the provision of logistics services."

Planning contents with coastal economic zone: To develop shallow ports mainly serving goods of Hai Phong, Quang Ninh, Thai Binh, Nam Dinh, Ha Nam and Ninh Binh. The location is able to favorably connect to domestic waterway transport, river transport in the sea, railway transport with Hai Phong and Quang Ninh seaports; By 2020, the total area will be 50 - 70 hectares and the clearance capacity is of about 80,000 - 200,000 TEUs/year. By 2030, the total area is of 80-100 hectares, the clearance capacity is of about 500,000 - 850,000 TEU/year. Hanoi - Lao Cai Economic Corridor: Priority is given to locations that can be easily connected with domestic rail transport, waterway transport to Hai Phong and Quang Ninh seaports; By 2020, the total area will be 30-40 hectares and the clearance capacity of about 120,000 - 300,000 TEUs/

year; By 2030, the total area is 60 - 70 hectares, clearance capacity is around 500,000 - 830,000 TEU/year. Hanoi - Lang Son Economic Corridor: Priority is given to locations that can be easily connected with domestic railway and waterway transportation to Hai Phong and Quang Ninh seaports, locations linked to land border gates, international railway; By 2020, the total area will be 30-40 hectares and capacity of about 100,000 - 270,000 TEUs/year; By 2030, the total area of 60-70 hectares; clearance capacity will be around 400,000 - 720,000 TEU/year.

Decree No. 140/2007/ND-CP dated September 5, 2007, detailing the conditions for running business in logistics services and limiting the liability of traders providing logistics services. Accordingly, traders providing logistic services under the provisions of Clause 1, Article 4 of Decree No. 140/2007/ND-CP must satisfy the following conditions: lawful business in accordance with Vietnamese law; Having sufficient means, equipment and tools to ensure safety and technical standards and having staffs to meet the requirements. Decree No. 140/2007/ND-CP also stipulates that foreign traders engaged in logistic services and business conditions for traders dealing in logistic services related to transport, business conditions for traders involved in other related logistics services. Decree 140 also deals with regulations on business transportation services for traders, the responsibility of traders in logistics services.

Decision No. 2622/QĐ-TTg by the Prime Minister dated December 31, 2013 approving the master plan for socio-economic development of Quang Ninh Province up to 2020 with a vision to 2030. By 2020, Quang Ninh will become a modern service and industrial province. By 2030, services will account for 51% of the province's economic structure. Decision 2622 by the Prime Minister has created favorable conditions for the logistics industry in Quang Ninh Province with the opportunity to develop, with the orientation to develop infrastructure and transport infrastructure of Quang Ninh as follows: Road construction investment of arterial roads: the road connecting Ha Long to Hanoi - Hai Phong Expressway (also known as Ha Long - Hai Phong Road); Ha Long - Van Don - Mong Cai Expressway; upgrading National Highway 18; building Noi Bai - Ha Long Expressway; upgrading National Highway 4B, building Van Tien bridge linking Van Don with Tien Yen, Lang Son, Cao Bang and Yunnan - China. Railways: In the period up to 2020, priority should be given to investing in Hanoi - Cai Lan railway route, preparing conditions for the construction of Ha Long - Mong Cai, Uong Bi - Lach Huyen and Lang Son - Mui Chua routes up to 2030. Ports: To step up the development of seaport services in Cai Lan port, to transform Cam Pha port into a general port and develop deep water ports in Hon Net and Con Ong areas; To develop Tien Phong port to effectively connect to Lach Huyen - Hai Phong port, to develop Hon Gai port into an international tourist port. To invest in Van Don airport in the coming time as planned and to extend by 2030.

Resolution No. 02-NQ/TU, dated February 05, 2016 by the Provincial Party Executive Committee "On developing services in Quang Ninh Province in the period 2016-2020, orientation to 2030". Accordingly, "to strive to 2020, Quang Ninh Province has service – industry economic structure; Service becomes the most important economic sector, accounting for the largest share of the province's GRDP structure." To achieve the above target, Resolution 02 sets out many key tasks and solutions, which identify potential service sectors that need to be strongly developed. Resolution No. 02 states "To develop transport services, focusing on sea port services: To develop Quang Ninh into a service center for seaports, sea transport and modern logistic services." To develop the service into a leading economic area, including the modern logistics industry, Quang Ninh provincial Party Committee set up the Steering Committee led by the Secretary of the Provincial Party Committee; steering committees of districts, towns and cities in the province, the chairman of each committee is responsible for implementation of the Resolution. This

shows that the Party committees and authorities at all levels in Quang Ninh Province are very drastic in directing and implementing the service development targets in general, developing the logistics industry in the province in particular.

Decision No. 1588/QĐ-UBND of the People's Committee of Quang Ninh Province on "Approving the construction planning of Quang Ninh Province up to 2030, vision to 2050 and beyond 2050". By 2030, Quang Ninh will become a modern industrial and service province, including logistics services. Vision to 2050, Quang Ninh will become the center of tourism - international services. As such, Decision 1588 sets a target for service sector in general, logistics industry in particular of Quang Ninh province clearly; logistics will be one of the services to make Quang Ninh become a service center of the world in the coming time. Decision 1588 also mentions the spatial development direction of the sub-regions, whereby Ha Long is considered as the development center of the region; The service sector (including logistics) is one of the sectors considered the focus of development.

Resolution No 32/2016/NQ-HĐND dated November 17, 2016 of Quang Ninh Provincial People's Council approving the development plan of commerce sector of Quang Ninh Province by 2025 with a vision to 2030. With the view of developing the commerce sector to become an important economic sector of the province, providing significant support for production and consumption, especially for the tourism and services sectors. Resolution No. 32/2016/NQ-HĐND dated November 17, 2016 of the People's Council of Quang Ninh Province outlines plans for the development of commercial infrastructure systems, including warehouses, yards, logistics centers, duty-free shops. For logistics centers, ICD shallow ports, Resolution 32 states: "To efficiently exploit logistics centers in Cai Lan (Ha Long) and in Mong Cai; to maintain and expand the operation of ICD Km3 + 4 Mong Cai port; To form new logistics centers in industrial parks, economic zones, seaports and airports in service of the transshipment of imported and exported goods and industrial production". Particularly for the 2 priority investment projects: warehouse system, logistics center, commerce and service centers in Bac Luan 2 bridge area, Hai Hoa Ward (Mong Cai) with the capital of 10,000 billion dong and the warehouse system, logistics center in the area of Hoanh Mo, Dong Van (Binh Lieu) border gate with the capital of 500 billion dong.

Plan No. 14/KH-UBND dated July 28, 2017 by the People's Committee of Quang Ninh Province, on improving the competitiveness and development of logistics services in the province up to 2025 for the purposes of: Defining Logistics as an important service sector in the overall structure of socio-economic development, playing a supporting role, linking and promoting socio-economic development, contributing to enhancing the competitiveness of the provincial; Developing logistics services in the province into a service sector with high added value, linking logistics services with the development of goods production, import and export and domestic commerce together with developing transportation and information technology infrastructure; 2. Developing the logistics service market in the province, creating equal opportunities for enterprises of all economic sectors, encouraging domestic and foreign investment capital in accordance with Vietnamese law and treaties to which Vietnam is a party; suitable with outstanding potentials, competitive advantages of the province, ensuring the target of fast and sustainable economic development; 3. Promoting to the advantages of the strategic geographic position of the province: Mong Cai international border gate (Mong Cai city) and two national border gates, namely Hoanh Mo (Binh Lieu District) and Bac Phong Sinh (Hai Ha District) in the border area, adjacent to a market with a large population, dynamic economic development of Guangxi (China). In particular, Quang Ninh is at the heart of two economic corridors Kunming - Lao Cai - Hanoi - Hai Phong - Quang Ninh; Nanning - Pingxiang -

Lang Son - Hanoi - Hai Phong - Quang Ninh and the Tonkin Gulf economic belt to Quang Ninh to become a logistics center, service center for the economic development of the whole region; 4. Concentrating on raising the competitiveness of logistics service providers and developing logistics service providers in terms of quantity, scale and qualifications of human resources and high competitiveness in domestic and international markets; 5. Implementing the State's policies and laws on logistics services in the province to ensure the level of development of logistics services in the course of international economic integration.

The plan also sets the development goals for 2020, with the contributing proportion of logistics services to the service sector of the province is 16-18%, reaching 6.0-7.0% of the province's GRDP; By 2025, the contributing proportion of the logistics industry will be from 18-20% in the service sector of the province is from 8.0-10% of the province's GRDP; At the same time, forming logistics centers in the province with the standard of providing 3PL, 4PL and 5PL services in Ha Long City, Van Don, Cam Pha, Quang Yen Town, Mong Cai international border gate, Bac Phong Sinh border gate (Hai Ha District), Hoanh Mo border gate (Binh Lieu District).

The socio-economic policy of the Party and State has set the target that Quang Ninh Province will become a service-industrial economy, a service center of the whole country; the service center of the region and the world. This is because of the long-term and macro-economic goals, which help Quang Ninh develop strong service sectors, including logistics services. The general policies in the socio-economic development of the country has contributed to the institutionalization of logistics development policy across the country, thereby creating conditions for the logistics industry in the marine economy in Quang Ninh Province. Especially there are breakthrough policies to promote the development of logistics services. Legal environment and competitive environment for logistics service providers to thrive. The Government has specific regulations on the conditions for trading in logistics services, so that enterprises operating and using logistics services have clear legal basis. The policies have set the goal of developing a logistics service center in the whole country. For Quang Ninh Province, the central and provincial decisions have set the goal of building logistic centers, shallow ports and airports until 2020 with the orientation of 2030. The policy of building logistics infrastructure has facilitated the development of logistics industry. The investment cost for infrastructure construction has been increased, especially for transportation and communications infrastructure, and to enhance connectivity between Quang Ninh and northern provinces, cities, and business centers of the country. The targets of logistics growth are to increase the proportion of logistics in GDP in the whole country as well as Quang Ninh Province, encouraging businesses to provide logistics services to improve the quality of services to meet the needs of the business and production enterprises. The policy mechanism has put forward general solutions to develop the service sector in general and logistics in particular. Solutions focus on improving the quality of logistics services, infrastructure and system development.

However, the system of legal documents regulating the business of logistics services is still limited. There are no strategic, synchronous and inter-sectoral plans to develop logistics services nationwide in general and in Quang Ninh Province in particular. Logistic activities involve many different sectors, but there are no specific regulations on the authority of each agency. This, on the one hand, leads to overlapping conflicts between competent authorities and on the other hand increases costs for businesses. The law governing logistics remains inadequate. Commercial Law stipulates that logistics activities are commercial activities, the main task is to provide services for goods transportation and organization of transportation, but when transporting, the law on transportation must be complied with. However, at present, the law does

not specify regulations on NVOCC (NVOCC - Non-Vessel Operating Common Carrier). The licensing for local government to private companies is carried out extensively without considering the financial capacity and facilities of the applicants for permission to operate. The regulations on fast-forwarding services are now considered as postal services, not considered as a kind of logistics service and also subject to regulations and circulars on post and telecommunication. This is very unreasonable. The legal regulations on import-export procedures remain inadequate with too many administrative procedures, making it difficult for logistics service providers to carry out their activities.

Main causes

Awareness of Logistic in Vietnam in general, Quang Ninh Province in particular is still limited. The counseling of the specialized agencies in charge of logistics for the Party and State has not promoted optimal efficiency. Management capacity of logistics agencies is limited. The staff managing, planning policies for the development of logistics services have not met the requirements. The management agencies of the logistics industry have not been established in a separate way, and logistics is considered in transport or import and export, so macroeconomic management is lacking a focal point to connect and build the logistics sector in the initial phase. Provisions of law have not promoted active participation in the development of domestic logistics services from logistics enterprises with foreign elements. (According to current regulations, foreign-invested logistics service enterprises are only associate members, not official members).

The main solution enhances the role of logistics in marine economic development in Quang Ninh Province

The awareness of the state management agencies, the logistics policy-making agencies, enterprises and laborers about the role of logistics in socio-economic development in general and marine economy in particular should be advanced. Since then, solutions to promote the role of logistics in the development of marine economy in Quang Ninh Province should be well implemented. The role of government and party consultancy agencies on logistics development policies at both the macro and micro level needs to be strengthened. The quality of consultancy on the role of logistics in the development of marine economy needs to be improved. The training of managers, logistics policy planning in the long term should meet the requirements of practice. Central and local logistics management agencies should be established to unify the management of logistics. Mechanisms and policies should be adopted to encourage the cooperation between domestic enterprises and foreign enterprises on the development of logistics services.

CONCLUSION

Quang Ninh is a province in the economic development triangle of the Northern Delta, with many advantages for economic development in general and marine economy in particular. In order to promote the marine economy in Quang Ninh Province to develop more strongly, in the coming time, Quang Ninh Province should have synchronous solutions to strongly promote logistics services in the province, in which, create breakthrough mechanisms and policies to promote the development of logistics and contribute to the development of the marine economy of Quang Ninh Province, thus turning Quang Ninh into a service center of the country and then becoming an international service center.

GDP GROWTH AND SUSTAINABLE DEVELOPMENT IN LESS-DEVELOPED COUNTRIES

Nguyen Van Hieu*

Abstract: *The GDP growth target set in less-developed countries has a major impact on the exploitation and allocation of national resources (often referred to as public resources). Over the last several decades, natural resources exploitation and FDI have been an important way to achieve high GDP growth rates of governments in less-developed. Each time GDP growth slows, governments immediately think of ways to push it higher. GDP growth has long been used as the single most important economic indicator of a country's overall development performance. However, its limitations are rarely addressed in detail. This article re-discusses the economic nature of the GDP indicator and the implications of pursuing GDP-based growth policies look from the side of less-developed countries.*

1. GDP IS AS RELIABLE AS WE USUALLY THINK?

At the World Economic Forum (WEF) in Davos in January 2016, Joseph Stiglitz, the owner of the 2001 Nobel economics, stressed the importance of finding a new measure to measure the achievements of nations instead of GDP.

In fact, the world's leading experts have long pointed out that GDP is a bad indicator, reflecting incorrectly, even misleading the performance of an economy in terms of prosperity and progress.

An OECD report (2004-2005) pointed out that “[if] ever there was a controversial icon from the statistics world, GDP is it. It measures income, but not equality, it measures growth, but not destruction, and it ignores values like social cohesion and the environment. Yet, governments, businesses and probably most people swear by it” (OECD Observer 2004-2005)¹.

Similarly, The Economics (4/2016) argues that GDP is increasingly becoming a bad instrument for measuring prosperity and is no longer a reliable measure of productivity. Unfortunately this fact has not been noticed by governments for many reasons. Adequate recognition of the limitations of GDP growth, however, is necessary.

There are at least five dimensions where GDP shows helplessness and misleading to sustainable development:

- *First*, GDP only reflects the value of goods and services that are monetized (traded on the market) but not reflecting non-monetary economic activities.

There is a lot of real economic activity going on but it is not measured and reflected in GDP. These are non-monetary, non-market economy activities such as housework, self-sufficiency in remote and isolated

* Assoc. Prof. UEB – Hanoi National University, Vietnam

¹ As cited from Lorenzo Fioramonti (2015), We Can't Eat GDP: Global Trends on Alternative Indicators, syndicated from global-trends.info, Aug 22, 2015

areas and other economic activities occurring in the “informal” economy. The greater the proportion of people living on the available natural resources, the greater the economic value omitted from the GDP. Thus, low per capita GDP does not necessarily mean poverty as a whole. This explanation for the rapid growth rate of GDP in newly developing countries in the early stage when the self-sufficient activities and natural resources are increasingly marketed and employed in the economy. The roads, beaches, scenic spots etc. previously used for free now being privatized and doing business make GDP increase. If a natural habitat is exploited to do business, it also makes GDP increase. Thus, the growth of GDP in these cases reflects only the fact that a certain source of wealth that has not previously been measured in GDP is now included.

Second, GDP does not recognize many modern-high-tech achievements of the economy. In some cases, the progress of technology has been reflected as the negative effects.

GDP came into being in the 30s of the last century when most economies consisted of only farms, production lines and mass markets. However, social production has fundamentally changed from a manufacturing to a servicing economy and is now a knowledge-based economy. People are no longer focused on the production of material goods but instead are more spirit, culture, knowledge based products and services.

The advancement of knowledge and technology has brought about a more qualified and comfortable life as new technologies replace traditional industries and products. GDP has been unable to reflect this progress of society.

Face book, Zalo, Viber or other similar software have brought tremendous benefit because people can use it for free to make global calls. This progress has reduced the international telephone sales of telecom operators by nearly zero. In this case, GDP has fallen in number while progress, prosperity, and well-beings have increased.

Similarly, the development of technological advances such as Uber, Craft, digital music, YouTube ... and other internet based-products has reduced rather than increased GDP by way of current measurement. GDP is not only helpless but also misleading the development of society.

Third, GDP measures everything that is produced without distinguishing good or bad, costs or benefits, productive or destructive activities, and sustainable or unsustainable ones. As a result, GDP grows faster if there are more undesirable activities.

GDP is calculated on the basis of the aggregation of everything produced by an economy over a given period of time, regardless of whether it is positive or negative for society. That implies dangerous distortions if GDP growth is considered a single indicator of progress and quality. It is possible to cite cases in which the GDP indicator fails:

- *Corruption can make GDP increase*. Imagine a construction project finalized with a value of 10 \$million of which one \$million were embezzled. The illegal money then used to buy houses, land, goods... of some people. Without the corruption, the value used to calculate GDP is only 10 \$million. With the corruption, it would be 11 \$million. GDP has grown artificially by the corruption.

- *Wasteful spending also contribute to GDP growth undesirably*: Unnecessary projects will contribute to GDP growth in the years it conducted. It bubbles growth achievement in the short run but left a long consequence for many generations as resources have been withdrawn elsewhere in the economy or borrowed from future ineffectively.

The rise of “ghost towns” with thousand of expensive villas but left unused for decades is a extremely waste of resources but contributes to GDP growth during the construction period. It’s virtually undesirable growth.

- *Fraud, low efficiency, poor quality can increase GDP*: A road worth \$millions is built in accordance with quality requirements can be used for 10 years. However, because of poor quality, it only existed for 5 years and then have to constructed again. Thus, in 10 years, the value that counts in GDP of roads has doubled.

An unstable water supply system will entail millions of households building reservoirs, installing pumps, etc. That will also increase GDP unexpectedly.

- *Destroying the environment, exploiting exhaustedly resources result in increase of GDP*: One of the common characteristics of less-developing countries is that the environment is ruined and polluted, natural resources are exhausted. Ironically, in terms of GDP, it is an achievement.

As analyzed, when resources are in their original state, they are not reflected in GDP and are generally not reflected in the national account. However, when exploited, it also contributes to GDP growth. Increasing GDP by exploiting natural resources can be as much as like an increase in income by the sale of property of a business. It makes current income increase but reduces future capitals and erodes long-term benefits. In many cases, it will leave unpredictable consequences for future generations in term of environment. In overall, the loss may out weightthe gain.

Indonesia gives a good example of a paid forover natural resource extractions. In the 70s of last century, Indonesia achieved a spectacular growth rate of over 7% annually thanks to the exploitation of rare mineral resources and primary forest. As a result, agricultural production is severely affected by soil erosion, floods and ecological pollutions. Many scholars believe that it is the rob of the future to finance the present generation. Taking into account the costs, it was realized that real rate was less than half the nominal growth rate.

One of the consequences of environmental pollution is the spread out of disease. Both public and private hospitals are required more; drugs and medical equipment production and imports increase etc.. As a result, revenue and income of the health service and related industries increase but not necessary go in line with the improvements of healthcare in overall.

If the GDP of the health service sector increases derived from the requirement of upgrading the quality of health care services, it is a good indicator. But if it raises to solve the environmental pollutions arising from massive economic development, it is a negative indicator. Environmental damage is added to GDP once, then the remediation of the damage is added to GDP again. This is a paradox because it must be other whilesubtracted from real growth.

- *Moral hazards, family relationship break, social valuedeteriorations can also increase GDP*.

The immediate consequence of this phenomenon is the rise of the prison systems, re-education camps, security forces accompanywith huge expenses. All will be included in GDP. The breakdown of family relationships and social value that leads to illegal actions, disputes, divorces, outlaws, etc., In turn, it requires a lot of relatedactivities such as legal supports, judicial services, property trading etc.. All are included in GDP as normal activities. However, they are not merits of society.

Fourth, GDP is a short-term indicator, sometimes achieved by sacrificing long-term benefits, which is not a sustainable growth target.

GDP measures the value of goods and services produced during the current period, including the borrowings of the future. The principle of borrowing is:the investmenthas to generate money sufficient to cover both capital and interest paid. Unfortunately, not all loans guarantee this. Most of the current loans are used to repay old debts or used to finance low efficient projects. Debt seems to be an easy one to satisfy GDP growth target for the current year but leave more and more debt to the nation and future generations.

Excessive credit growth is essentially an increase in borrowings, including the borrowing of both current and future generations. In a normal economy, if other conditions do not change, credit growth can only be sustainable if it is equal to economic growth. Higher credit growth can only be achieved by increasing domestic or foreign borrowings or by issuing money. Both measures can lead to negative long-term consequences.

The exhaustion of non-renewable resources is another example that has been analyzed above to increase the current GDP. However, it is an unsustainable development because either it impinges on preserved values or obtain by sacrificed future generations.

- *Fifth*: GDP conceals resources for developed countries but exaggerates benefits for less developed countries.

Unlike the GNP, gross domestic product (GDP) is the value of goods and services produced domestically (even by foreign firms) but does not include the income generated by domestic firms in other countries.

Developed countries are often capital-exporting ones - net investments or loans to less developed countries. So they produce more in other countries than other countries produce in them. GNP of developed countries is larger than GDP reported. The real GDP growth rate conceals part of the economic strength of the developed world. While in the less developing countries, the picture is contrast. They are net recipients of investment or debt financings. The value of the products and services that other countries produced in their country is much larger than that of their productions in other countries (even zero). Given that situation, the GDP of under developing countries seems to have included in what actually does not belong to them. They achieved spectacular growth rate or GDP but unrealistic prosperity. In almost cases, benefits of FDI or ODA financing belong to investment countries but not much to the receiving ones. This is especially true in the context of global integration as today. Making money by exploiting natural resources, cheap labor... in the less developed part of the world and spending in developed paradise is a common trend of the major economies.

The World Bank recently announced that the 10 fastest-growing countries in the world are backward, underdeveloped, or primitive economies. Four of which in the Southeast Asia are: Laos, Cambodia, Myanmar and Philippines. However, growing faster does not mean higher quality of life in that countries. If GNP is used to measure instead of GDP, the picture of growth in that countries may be very different.

2. WHAT INDICATORS CAN REPLACE GDP TO BETTER REFLECT THE GROWTH PICTURE?

Kuznets, the Russian-born economist and father of GDP indicator, tried to warn about the limitations of the GDP: "The welfare of a nation," can "scarcely be inferred from a measurement of national income as defined"¹. In 1962, writing on *The New Republic*, he argued that accountants should pay attention to the distinction between quantity and quality of growth, between cost and return, between short and long term. Refers to growth, it must be specific growth what and what is the goal.

Clearly, the birth of the GDP index well understood the incompleteness of this indicator and has warned the world. It is very users that have not been understood or ignored its weaknesses for a variety of reasons (including political issues).

However, academics and policymakers have different directions in finding alternative or complementary indicators that better reflect growth associated with social progress and quality of life.

¹ Quoted from Clifford Cobb, Ted Halstead, and Jonathan Rowe (1995).

Pioneering in this area is the attempt by James Tobin and William Nordhaus in the 1970s to propose the use of an alternative measure of economic welfare. This is defined by taking GDP plus non-monetary contributions from individuals or households and subtracting unwanted costs such as security and defense etc.. However, this is quite a simple adjustment. A more complex indicator was proposed by academics in the early 1990s and more widely accepted as the Genuine Progress Indicator (GPI). The GPI encompasses a wide range of factors, both positive and negative, such as the value of leisure, public services, non-monetary contributions (parental care, housewife...); the economic impact of inequalities, crime, insecurity (accidents, unemployment, theft...); the breakdown of the family background, the economic loss due to exhaustion of natural resources, pollution and long-term environmental disasters; expenses for national security and defense... After calculating the GPI, it was found that from the 1950s to 1970s, real GDP growth was close to real growth (GPI). However, since the late 1970s, the world's GDP has grown at the expense of the loss of social, economic and ecological welfare. Real growth (GPI) is not as great as nominal growth (GDP) and it is increasingly trending away from nominal growth. The GPI shows a more realistic picture of growth of the world. Regarding the identification of the GPI, the most difficult part is to identify factors related to natural resources, environment and society. So, the need for the valuation of natural resources came into being. One of the indicators proposed by the World Bank is the Adjusted Net Savings (ANS). This index refers to the value of non-renewable resources that have been exploited, damages caused by pollutions, net to human capital (such as training & education) and the amount of capital that has not been consumed for the current period. The results show that, over the last 50 years, natural environmental damage has virtually eliminated all of the gains achieved.

Other indicators similar to the GPI are also proposed by some countries such as the ISEW (Index of Sustainable Economic Welfare), SNBI (Sustainable Net Benefit Index). These indicators are based on the notion that add in anything not yet reflected in GDP and subtract unwanted damages or values such as activities causing negative impacts on the environment, community life and society. They can be controversial, but at least they reflect more faithfully the picture of socio-economic development than the picture expressed by GDP.

3. IMPLICATIONS FOR LESS-DEVELOPED COUNTRIES

GDP has become a very popular indicator for decades in almost every country in the world. For many countries, it is almost universally recognized as a synthetic indicator that accurately reflects the desired economic growth without a doubt of its credibility. However, GDP is not reliable as thought not only because its inherent defects in reflecting well beings of a society but also it exaggerate benefits of less-developing countries.

As early as 1991, when the United States moved from the GNP system to GDP, scholars of the United States themselves said: With the old system (GNP), the earnings of multinational companies belong to the owner countries. With the new system (GDP), this value is assigned to the host countries - where factories or mines located - although it does not belong to them. This change in national accounting has led to the growth of poorer countries and has also contributed to the explosive growth of the world. It conceals the fact that northern hemispheres are taking away most of the natural resources of the southern states but still claim that the fruits belong to the southern.

For decades, less-developing countries such as Vietnam, Laos, Cambodia... have grown at impressive rate in term of GDP. Contribution to the rate is the boom of foreign investment from developed countries.

However, it must be acknowledged that much of the achievements of the foreign investment sector are largely not belong to the hosts. There is also no doubt about the consequences of the depletion of natural resources, ecological environment disasters, water and air pollutions and other negative value originated from the massive growth of economy. In addition, increase of public debt and foreign debts leading to the risk of losing control; unsustainable credit growth leading to bad debts widely are common phenomena of the less-developing countries. Clearly, the price of GDP growth is not small. Taking account fully negative factors, it is unlikely they have actually grown at all. Thus, some recommendations may be useful:

Firstly, taking GDP growth rate as a guideline for economic activities, be aware fully the nature with advantages and disadvantages of GDP in planning, designing, evaluating and analyzing economic goals. Do not try to achieve GDP growth at all costs.

Secondly, instead of using only GDP as the sole indicator, annual and periodic GNP should be calculated. With above analyzes, GNP is the indicator that reflects more accurately for less-developing countries. GNP itself is not perfect but at least it removes artificial factors that come from other than domestic resources.

Thirdly, in the long run, it is necessary to calculate the negative components of GDP, analyzing and evaluating these factors as a basis for calculating the GPI or equivalent indicators to reflect the real picture of growth. It will be a new national accounting measure for analysis, planning and evaluation for sustainable development.

The transition will certainly not be easy, and may even be subject to strong opposition from local institutions. However, if not change, a single GDP growth rate indicator may mislead many of countries in pursuing sustainable development goals.

FACTOR AFFECTING THE DEVELOPMENT OF THE SCIENCE AND TECHNOLOGY MARKET

Nguyen Manh Thieu - Nguyen Ha Linh*

ABSTRACT: *Effective public finance management is one of the most importance requirements of any government for socio-economic development. Especially, in the context of increasing difficulty on budget collection, growing needs on budget spending, recurrent budget overspending, etc., the restructuring public finance to ensure the socio-economic objectives funded by public finance, and then to have the impact on the entire state management activities and public services delivery is an urgent requirement of the country's finance. The overview of experience in managing and using budget in some countries will give some lessons learned that are applicable in accordance with the current situation in Vietnam.*

Keywords: *Public finance restructuring, lessons learned from other countries*

1. PUBLIC FINANCE RESTRUCTURING:

“Public finance is a field associated with the collection and spending activities of the State, reflecting economic relations in the form of value in the process of establishing and using State monetary funds to serve the implementation of inherent functions of the State for society (not for profit purpose)”.

The public finance management entities include:

- **Firstly, general finance of the State:** The management entity is the State. .

The general finance comprises: State budget, State credit, State reserve.

All parts of general finance operate in association with the State, the establishment and use of monetary funds of the State. The State budget plays the most important stage in the operation of public finance.

+ In terms of legislation, the State Budget is highly legally in association with the political power of the State, and when passed by the National Assembly, it is considered as an effective legal document.

+ In terms of planning, the State budget is the major and basic finance plan of the Government.

+ In terms of tool, the State budget is a financial tool of the State that has a powerful impact on the macro economy. The State budget is structured by two parts: collection and spending.

+ The main collection of the State budget is tax. This collection is compulsory and generates financial resource in large scale for the State. The main spending of the State budget shall be allocated to development investment and recurrent expenditures. The State budget must keep balance in order to achieve high efficiency in the operation of public finance and the sustainable development of the national economy.

The State credit is a form of credit used by the State to mobilize capital for the State budget to deal with the requirements of balancing the State budget and development investment. The State credit is carried out by the State in two aspects: on the one hand, it is to mobilize and attract financial resources

* Học viện tài chính,, 58 – Le van Hien, Hanoi, Vietnam

Corresponding: Phone number: 0904.135.354; Email: thieu70@gmail.com

domestically and internationally through the issuance of valuable papers of the State and borrowing; on the other hand, the State uses mobilized financial resources for lending and investing in economic development according to policies, programs and projects that have already planned. All credit relations of the State shall be based on the principle of repayment, definite term and profitable; voluntary and compulsory, in which the voluntary nature is major.

The State reserve is formed from the financial resources of the State budget. The State reserve demonstrates an amount of money in the reserve for use in cases where the economy and the market have fluctuations or risks that affect the development of the whole economy or for the reserve of recurrent expenditures in the fiscal year that the State is unable to foreseen.

- **Secondly, Finance of the State administrative units:** the management entities are the State administrative units.

Based on legal regulations, the administrative system of Vietnam includes: the system of legislative bodies, the system of executive bodies and the system of judicial bodies, operating from central to local and grassroots levels. These are budgeting units that their expenditures are covered by the State budget.

On the basis of the estimates of the State administrative units approved by the competent agencies, the State budget shall allocate funds according to the approved estimates to maintain the operation and development of the State administrative apparatus.

- **Thirdly, Finance of the public non-business units.** The management entities are public non-business units.

The public non-business units operate in many socio-cultural-economic fields and provide public services for public and private sectors. In the market economy, the requirement on the quality of public services and effectiveness of the public non-business units are an objectively indispensable matter. Therefore, in addition to the State budget expenditures for public non-business units, these units also generate income from providing public services. The income from public services contributes to reduce the non-business expenditures of the State budget.

The public non-business units include: based on the level self-financing for investment and recurrent spending, the public non-business units are divided into 4 types: (i) public non-business units totally self-financing for recurrent spending and investment; (ii) public non-business units totally self-financing for recurrent spending; (iii) public non-business units partially self-financing for recurrent spending; (iv) public non-business units financed by the State for recurrent spending.

On a broad scale, public finance restructuring is a reform of the State collection and spending, so all State management activities and public services delivery are affected.

Therefore, public finance restructuring can be understood as the organization of management, renovation, supplementation on the State collection-spending, and control of policy for income generation; strengthening the management and effective use of investment funds originating from the State budget to ensure the fulfillment of socio-economic objectives financed by the public finance, thereby affecting the whole State management activities and public services delivery in all fields.

The trend in recent years have shown that many countries, including Vietnam, are facing certain fiscal risks, especially from the medium and long-term perspective. This is a prolonged budget deficit and a continuously increase in public debt. The experience of many countries around the world has show that the delay in fiscal consolidation and restructuring the State budget can cause many negative consequences for the economy.

Therefore, to successfully restructure the State budget, many countries have made comprehensive and timely solutions to synchronously resolve all issues related to the public finance.

2. PUBLIC FINANCE RESTRUCTURING IN OTHER COUNTRIES:

2.1. Experience about restructuring the State finance:

2.1.1. Management of State budget spending by outputs.

With this method, the construction and allocation of budget estimates must have a close link between the budget estimates that are expected to be allocated and the implementation of objectives, thereby achieving an output. This management method requires the changes in legal framework, institutional, the way to construct and administer the budget plan as well as the management culture towards ensuring accountability for the performance. The typical examples are:

(1) Experience of French Republic:

The Law on State Budget dated 01/08/2001 (LOF - Loi Organique Relative aux Lois de Finances) has been taken effect from 2006, is considered to be an important milestone in the history of France as it results in profound changes in the whole public finance structure as well as the operation of the State system from political institutions to administrative management. The Law on State Budget introduces new regulations on building and complying with the State budget that move from the management method by inputs to budget management by outputs.

Before 2006, the State budget of France was built basing mainly on the level of collection and spending but did not answer the question: what are expected outputs/results that the allocated budget aim to achieve? Whether the outputs/results are achieved or not?

The new Law on State budget stipulates that budget estimates shall focus on expected objectives, relation between budget collection and spending, and the effectiveness of Government policies. The basic contents related to management and administration of the State budget are reflected in the law as follows:

- Regarding management method: moving from input-based budget management to output-based management, defining responsibilities and ensuring proactivity in operation of the State units at all levels.
- Regarding information: ensuring transparency of budget information by enhancing and standardizing the Parliament's rights to monitor and evaluate, as well as improving information quality of the Court of Auditors, assigning the right to verify and certify the budget settlement to the Court of Auditors.
- Regarding management tools: improving the tools of management and provision of information through revising the State budget appendix, reforming accounting, issuing public accounting standards.
- Regarding structure of budget spending: instead of focusing on listing and describing the State budget expenditures according to the nature of expenditures (spending items), it lists by the purposes of expenditures and will allocate in package – budget by program.
- Regarding budgeting: instead of focusing on listing and describing the State budget expenditures by the natures as in the input-based budget management, the budgeting in the output-based budget management prioritizes to review strategies, objectives, outputs of using budget along with indicators serving the measurement and evaluation.

The strategies, objectives, indicators and expected results will be identified for each program and presented in the commitment for Project Annual Performance (PAP – Project Annuel de Performance), built

for each program, including following contents: (i) describe the implementation strategy of the program; (ii) introduce objectives; (iii) introduce indicators for measurement and evaluation of results; (iv) explain the basis, purpose of use of each allocated amount. The commitment is a mandatory explanation document attached to the annual estimate.

Next, identifying the right prioritized objectives is seen as an important step to improve the effectiveness of budget use, so without it, the budget will be spread out in use with the lack of consistency and clarity, leading to difficulty in achieving expected results.

The prioritized objectives must be evaluated by specific indicators, which clearly indicate expected results of program activities by using the budget. Indicators should be consistent with the selected objectives, useful, sustainable and verifiable.

When budgeting, the strategies, prioritized objectives and indicators are identified by the Ministers with the assistance of person who is responsible for the program. Within the scope of each ministry and sector, the role of coordinating the process of budgeting is assigned to the Director General of the Department of Finance. At the Government level, this role is undertaken by the Minister of Finance under the direction of the Prime Minister. Finally, strategies, objectives and indicators are approved by the Parliament. With this process, the Government and Parliaments can clearly select strategic objectives and expected results. The selection of objectives and expected results is based on studying and analyzing results of the previous year as reflected in the Annual Budget Report.

(2) Experience of New Zealand:

In 1988, the Government of New Zealand began implementing a financial management reform program aiming at improving efficiency and accountability of public sector. To implement this reform program, New Zealand enacted the 1988 State Sector Act and 1989 Public Finance Act.

The State Sector Act stipulates the framework for new relationships between Chief Executive Officers and their Ministers, gives CEOs some new powers such as: hiring or firing employees, deciding salary level according to the labour productivity.

The basic content of the Public Finance Act is the budget management must be based on goods and services provided by ministries and sectors, but not on the resources that the Government allocates to them. Accordingly, ministries and sectors sign contracts with the Government (or with certain third party) about providing goods and services, and they will receive a budget from the Government. Ministries and sectors are free in using the allocated budget to fulfill the contracts that they have signed.

The process of output-based budgeting includes the following steps: (1) Drafting the budget of ministries and sectors that identifies and prioritize outputs; (2) Guiding on procedures and limits the macro budget ceiling; (3) making budget estimates for units that are in line with the budget ceiling limit; (4) synthesizing budget for each ministry and sector by bottom-up method; (5) budget approval.

When guiding the procedures for budgeting, the Government should thoroughly study and analyze the following points: expected outputs are reflected in the draft of the ministries, sectors, and the appropriateness of the outputs; the costs that are needed to achieve the expected outputs must be estimated. When estimating costs, it should refer to the operation reports of previous year which are considered as a reference but not a basis for determining the next year's budget.

Policy orientation of the State:

- Budgeting in spending units: budgeting is started from spending units at the lowest after having the procedure guidance and budget ceiling limit. Units make budget estimates for both recurrent and investment

expenditures. After that, the budget estimates will be aggregated bottom-up by each ministry and sector. When budgeting, the spending units are based on following factors:

+ Demand of people: the expected outputs for planning year may not be based on the outputs of reporting year, but they must meet the needs of people and aim to achieve expected outcomes. Choosing the right outputs is the responsibility of the ministers.

+ Estimation of fixed and variable costs: when developing budget estimates, fixed and variable costs must be identified. In which, fixed costs (office rent, general management costs, etc.) are unlikely to change according to expected outputs, while variable costs (salaries, operating costs) are closely related to the outputs.

+ Inputs: units commit to provide expected outputs at a defined cost, this does not mean that they are required to use the same inputs. They are free to choose the most effective inputs, for example, they will decide a certain proportion between spending for purchasing assets and wage payment, or they will decide the change between these two items by themselves.

Spending units shall set performance goals such as: cost savings, they can maintain outputs in terms of quantity and quality with the requirement of reducing delivery time and unchanged costs.

(3) Experience of Korea:

Since 1998, the Korea Government has stepped up the process of reforming the public sector, establishing more market-oriented institutions and management strategies to improve the efficiency and transparency. The core issue is to implement the results-based budget spending management mechanism. The purpose of this mechanism is not to manage input costs, but to manage the outputs of budget spending. The most prominent point is to build the apparatus and mechanism for assessing the effectiveness of budget spending, performance of the Government bodies.

Regarding the operation plan: The State units should concretize their tasks, powers on the basis of establishing strategic objectives in medium term; it is necessary to concretize strategic objectives into specific results each year, accompanied by indicators for assessing outcomes and measures as well as method of measuring results.

Regarding performance evaluation:

The system of monitoring, analyzing and evaluating the situation of spending, performance results of the Government bodies are strengthened.

The State Audit and Inspectorate are strengthened and enhanced their responsibility not only to ensure the transparency and honesty in financial reports, but also to more actively participate in the evaluation of performance, spending and particularly achieved results of the Government body before, during and after each activity ends.

The Center for Public Investment Management coordinates with the Korea Development Institute to perform the evaluation of programs, projects under the mechanism:

- Selecting programs and projects that implement the output-based budget management mechanism, classifying into certain groups.

- Setting up groups for monitoring, managing and analyzing, evaluating the implementation of programs and projects. These groups are responsible for monitoring, analyzing and evaluating the programs, project; making analytical reports to submit to the Ministry of Planning and Budget for inclusion in the budget report to the National Assembly. The working mechanism of these groups is as follows:

+ Studying and defining the basic issues of programs, projects: objectives, expected results, economic and technical issues, implementation time, implementation schedule, reporting regime, etc. Discussing with the National Assembly, the Audit Committee and the State Inspectorate on these matters.

+ Posting the budget estimates and operation programs of agencies on the internet, receiving comments of experts and citizens on goods and services to be provided. The Department of Budget Management and the groups will discuss and include in the budget estimates submitting to the National Assembly for approval.

2.1.2. Budget management according to spending plan in medium term

This is a tool to link policies, plans and budget in a medium term (3-5 years) at the central level.

This tool aims to 6 specific objectives such as: to strengthen financial discipline by estimating more substantial balance for macroeconomic; to integrate policies with different priorities into the budget to ensure the relevance; to allocate resources between different sectors and between units in the same sector; to make budget estimates in longer term for each sector by making the vision of 3-5 years; to promote the effectiveness of performance and to increase the quality along with decline of cost; to emphasize the accountability for public expenditures.

- Typically, Norway has set up a budget management model based on the performance results that aims to a serious implementation and high financial discipline related to the macroeconomic model. Based on the organizational structure of the Government bodies, Norway has adopted a performance-based budget management model and a budget management model for medium-term spending plan into the process of State budget management, and reflected in the accounting system of the public sector with 6 main tasks.

Establishing objectives for public organizations that are measurable; using the top down budgeting process; decentralizing the implementation of budget of each unit; decentralizing the human resource management and management policy of human resource's quantity and quality, etc.

2.2. Experience about financial restructuring of the public non-business units:

Experience of China on the implementation of financial autonomy in public non-business sector

China has been moved from the traditional planning economy to the market economy, so the public non-business sector in China also has some characteristics and establishment, development process that are same with Vietnam. The lesson learned from China in the process of renewing financial policies in this sector has many similarities with Vietnam needed to study, sum-up and apply.

Regarding identifying the scope of public finance and public spending:

China has identified: along with the economic growth, the need on public finance also increases to cover social public costs representing the general welfare in long term of the society such as: technical science, education, health, social insurance, etc., but it should change the traditional method of "financing by government". In general, these social public costs should take public finance (State budget) as a key channel, and also be based on the principle of "benefit recipients will be responsible".

The operation scope of the Government finance (State finance) includes areas that the State participates through financial distribution to meet public requirements of the society; while non-public matters should be coordinated and provided by the market. The public needs are defined by three things:

- Jobs that is only done by the organization and implementation of the Government.

- Jobs that private sector and companies do not want to do but are essential for the survival and development of society.

- Jobs that only the Government is able to harmonize effectively the benefits of stakeholders.

Determining the scope of fund for public non-business units:

Non-business units such as culture, education, scientific research, health, etc., are all for meeting public needs and are divided into groups:

- Units for public interests: for example: basic education, basic scientific research, library, birth plan, public toilets, etc., are services to meet public needs. The State finance should ensure operational funds for these units.

- Units for semi-public interests: for example: college education, professional education, broadcasting, healthcare, etc., provide service for both public needs and personal needs. The operational funds of these units are from public expenditures of the Government but the recipients of services should bear a share of costs, so public finance can support a part of costs.

- Units for profits: for example: scientific development research, specialized sports, artistic performance team, theater, etc. Services provided by these units are not the public needs so they should follow the market mechanism.

Allocating fund in package for public non-business units:

During the process of renewing financial management of public non-business units, China implements the mechanism of allocating annual budget in package for administrative agencies and public non-business units. Based on the nature, tasks and financial condition of administrative and public non-business units to divide into 4 categories:

- Full budget in package: identify total budget allocated to public non-business units, not subsidize in case of overspending, keep surplus to use

- Budget in package by items: only give budget in package for one or a number of items.

- Budget in package by quota: identify budget of the year, identify the spending level for one or a number of items, give budget in package according to identified quota, not subsidize for overspending, keep surplus to use.

- Budget in package to offset difference: identify the amount of collection, spending to identify the level of subsidy, or the amount to send to higher level before providing budget to units; not subsidize in case of overspending (or deficient collection), keep surplus to use.

Evaluating the efficiency of public spending:

The evaluation of the efficiency of public spending is applied by 3 methods:

- Analysis of price – efficiency: is a method that analyzes and compares the price with expected efficiency of different options to choose an optimal option for public spending. This method is suitable for evaluating expenditures that bring tangible economic results that can be measured in monetary terms.

- The method of selecting the lowest cost: this method takes the amount of costs required to achieve certain socio-economic efficiency as a standard for evaluating the efficiency of public spending. With the same results, the lower cost the higher efficiency and vice versa. This method applies to public expenditures that can not be evaluated by the monetary term as socio-economic measurement, but only calculate price (operation cost) as standard for the selection.

- The financial analysis method for evaluating public spending often applies two contents:

+ Comparative analysis method: is to compare between two or more indicators to identify the difference, e.g. compare actual spending with estimates of the same period, compare the data of this period with previous period. When applying this method to assess the efficiency of spending, it must ensure the comparable consistency in terms of contents, calculation methods, measurement units, statistical methods of comparison index.

+Ratio analysis method: is to conduct analysis of relevant data among financial indicators (spending structure, spending speed, etc.), by analyzing the ratio change between relevant financial indicators and combining correlative factors (products, performance, etc.) affecting the ratio change to analyze the spending efficiency of units. This method can be used in conjunction with the comparison method (this period with previous period, this unit with the same other units, etc.) to evaluate the performance of the unit.

3. LESSONS LEARNED FOR VIETNAM:

3.1. Lessons learned about restructuring General finance of the State:

The management methods of some countries indicate that:

Output-based budget management and budget management by spending plan in medium term are new management methods that are being applied by many countries, including developed countries with rich budget and developing countries. This comes from the fact that each country's development requirements are always higher than budget resources so it requires budget must be used efficiently, transparently and publicly.

Output-based budget management is to address above requirements, by quantifying the efficiency of budget use through specific outputs that all citizens can assess.

Budget management by spending plan in medium term is a mechanism that allocates public resources between sectors and activities of a sector within a budget ceiling limit.

In other words, budget management by spending plan in medium term allocates limited public finance to be appropriate with policies and strategic priorities in a multi-year fiscal space, taking into account opportunity cost of decisions. The advantage of this tool is that the plan is always supplemented and updated annually, making the plan lively and more feasible.

For Vietnam, these are new methods. In order to measure the management efficiency of budget by outputs, according to experts, in the coming time, Vietnam needs a completed legal framework with information technology infrastructure, qualified management staff to access new methods. In the context that Vietnam is familiar with the application of traditional budget management method based on input, the budget is limited but is still used in spread and inefficient way.

In the immediate future, it is necessary to promote the budget allocation in package and the empowerment of autonomy and self-responsibility for payroll, costs and products, services for units using the State budget; to seriously review and evaluate implementation results; to gradually study the pilot application of output-based budget management in some ministries and sectors when eligible.

The combination use of above methods allows to address the relationship between limited budget and high requirements on outputs, expressing by programs, projects and within the medium-term framework to increase the efficiency in the State budget spending management.

Based on the above remarks, the author proposes a number of solutions to restructure the general finance of the State that should be implemented in the coming time as follows:

Firstly, strengthening the management of budget cycle. Better management of budget cycle to help agencies, units in linking operation plan with financial plan, thereby, they will have timely and enough financial resources to actively implement their tasks. There is a need of renewing activities in budgeting, complying and settling budget to be scientific and more appropriate with actual situation. In particular, it is necessary to continue to renew the bases and procedures for budgeting, completing procedures and mechanism of budget compliance as well as to renew the budget settlement method. Especially, it should change the input-based budget allocation to output-based budget allocation.

Secondly, completing regimes and norms of spending. Reasonable norms help agencies, units to calculate more accurately the necessary financial resources as well as to have scientific basis for spending and saving. It is necessary to continue to improve specific spending norms – especially in the administrative field, on the basis of objectivity and more closely with practice, towards giving the activeness for agencies, units and encouraging saving.

Thirdly, strengthening the financial autonomy of administrative and non-business units by linking spending with the improvement of management mechanisms in these units. Giving payrolls and administrative costs in package to administrative agencies and the financial autonomy to public non-business units should be completed and scaled up in the future.

Fourthly, expanding and completing the budget audit, contributing to improve the discipline of public finance, to detect and prevent wastefulness and corruption. Strengthening both internal audit and State audit agencies, making auditing become a regular activity in agencies and units using state budget. Auditing activities must contribute to evaluate the economic efficiency in the use of State financial resources, to promptly detect and prevent wastefulness, corruption, thereby to improve the financial discipline in agencies, units.

Fifthly, strengthening the effective use of budget, and spending a sufficient amount for salary payment on the basis of wage reform in association with performance results. The most important requirement in wage reform is to develop a payroll system and reasonable mechanism for increasing salary that encourages employees.

Well implementing above reforms in the field of public finance will have direct impact to the operation of the State administrative apparatus, increasing the autonomy of units in finance; creating financial regimes to encourage the effective spending, aiming to outputs and budget saving, thereby to increase income of employees. These are incentives for the State bodies/units to renew their organization, operational method and improve capacity of human resources contributing to the more effective performance of the State apparatus.

3.2. Lessons learned about financial restructuring in public non-business units:

By studying the implementation of financial autonomy in public non-business units in other countries, there are a number of lessons learned for public non-business units in Vietnam in completing the financial autonomy mechanism in the coming time:

Firstly, the autonomy must synchronously consist of factors having organic relation with the operation of the unit. If the autonomy is not assigned, it leads to that these factors limit each other and do no work well.

The empowerment of autonomy in implementing task must be in associated with the autonomy in personnel administration, and in accordance with the financial autonomy of units under the principles:

- Ensuring efficiency: this is the most important principle in implementing the financial autonomy. Efficiency is reflected in two fields including economic and social efficiency. When making a decision or

policy, it should consider these two contents at the same time.

- Ensuring consistency: the consistency in management by law is a principle that can not be ignored in public finance management. This principle ensures the fairness, equality, efficiency, limiting negatives, especially subjective negatives when making decisions on spending.

Secondly, developing criteria for assessing the performance of each unit, criteria on completing tasks of social services delivery in terms of quality and satisfaction of citizens; and paying additional incomes to officers, civil servants, public employees and employees on the basis of properly assessing the contribution of each person and each division. Developing the performance-based evaluation system is a requirement in all public non-business units.

Thirdly, completing regimes and norms of spending. Reasonable and practical norms of spending help agencies, units to calculate more accurately the necessary financial resources as well as to have scientific basis in using funds in a thrifty and reasonable way, creating the activeness for them, encouraging saving.

Fourthly, step by step moving from the assignment of budget estimates to public non-business units to the method of order, assigning the task of public services delivery on the basis of economic-technical norms and quality standards of each service. Clarifying joint venture activities of public non-business units, addressing the situation of public-private confusion.

Fifthly, strengthening inspection, monitoring of units that are autonomy to evaluate the economy and efficiency in the use of the State financial resources. Promptly detecting and preventing wasteful acts, corruption to improve financial discipline in units.

In the context of integration and globalization, the renewal and perfection of the socialist-oriented market economy institution is important. With this requirement, the objective of renewing the public finance is one of the six major contents in the overall program of national administrative reform in 2011-2020. The above experiences and lessons learned are not only applicable but also can be used as references for other localities in perfecting the financial autonomy mechanism in public non-business units, meeting the objective requirements of the economic development process.

4. CONCLUSION:

In summary, public finance restructuring is a prerequisite to improve the efficiency of State budget spending in a comprehensive plan, gradually reducing the size of recurrent expenditures, reducing budget deficits with a strong commitment; reforming the tax policy system to establish a tax system with an appropriate and sustainable structure. In addition to learn from experience of other countries, it is necessary to understand the current socio-economic situation, the current social needs to reasonably apply solutions to get the highest results.

THE IMPACT OF FACTORS ON PUBLIC HEALTHCARE ENTITIES'S REVENUE IN BAC GIANG PROVINCE VIA PANEL DATA REGRESSION

Ngo Thanh Hoang* - Cu Thu Thuy** - Hy Thi Hai Yen*** - Ngo Thi Thuy Quyen****

ABSTRACT: *The process of autonomy has become increasingly demanding that public non – business units in general and public healthcare units in particular need to change their mode of operation in order to take initiative in the sources, gradually separated from the state budget. In order to have appropriate modalities that increase the revenues of health care, the research and analysis of the impact of endogenous & exogenous factors is essential. The paper presents a theoretical framework for performance characteristics, the structure of public healthcare units' revenue sources, and the factors affecting on revenue sources in public healthcare units. In addition, by the survey data in the experimental research of 15 hospitals in Bac Giang province from 2010 to 2016 to assess the impact of factors, this paper introduces the regression models used in this field. The results of the study show that the bed occupancy, the number of visits, the number of doctors, the number of nurses, and the per capita income were 85.1% the fluctuations in the total revenue of public healthcare entities in Bac Giang province. The process of model estimation and testing is also summarized for best effect in using the model. The implementation process will be a useful guide in the data processing and planning of financial resources mobilization to meet the financial autonomy requirements of public healthcare units in Bac Giang province.*

Keywords: *financial autonomy, public healthcare units, Bac Giang province*

1. INTRODUCTION

Autonomy of public non – business units in Vietnam has been a main issue. It has had a great impact on more than 30,000 public non – business units in all sectors and nearly 4,000 Public healthcare units in Vietnam. Most recently, the Central Resolution No. 19 dated 25 October 2017 has once again emphasized the reform of the organizational and management system, the improvement of the quality and effectiveness of these public non – business units.

Otherwise, state budget expenditure for these entities has been decreasing, along with the renewal of the mode of allocation – instead of allocating directly to the public non – business units, the State gives directly to the public service users. It has created many opportunities but also a big challenge came along the way for these units -- leading them to change their operation in order to take initiative in financial resources, and to maintain and develop revenue sources.

Particularly, in the healthcare sector in Bac Giang, there are more than 32 public healthcare units, 10 of which are district health centers which are fully funded by the State budget, the rest (2/3 out of total) are self-funded units that cover part of regular operating expenses. Among the units that self-funded are part of

**** Public Accounting Department, Public Finance Faculty, Academy of Finance, Hanoi, Vietnam Corresponding author: Hy Thị Hải Yến. Tel.: +84947692228. E-mail address: hyhaiyen@hvtc.edu.vn

their regular activities, the trend of 17 hospitals's revenue structure is rapidly reducing the sources of State budget and increasing the sources of Public healthcare services. Specifically:

- When the wage cost is not yet included in the price of medical examination and treatment services, the revenue structure shall include:

+ The state budget allocated for regular expenditures accounts for 18.72%.

+ Healthcare revenue accounted for 81.28%.

- When the price of medical examination and treatment is based on the wage cost (applicable to health insurance card holders from May 2017), the revenue structure shall include:

+The State budget allocated to recurrent expenditure decreased to 2.9%.

+ Healthcare revenue accounted for 97.1%.

From this situation, it can be seen that healthcare revenue at the public healthcare units in Bac Giang province in particular, and in Vietnam in general is the main financial source of units. Revenues from health care more or less reflect the level of effectiveness in operation and success in implementing the financial autonomy mechanism of Public healthcare units. However, these sources can not be mobilized effectively, because it depends on many factors. Thus, the study of the impact of internal and external factors on the healthcare revenue of Public healthcare units is important in planning the development policies, especially in the context of a strong financial autonomy. The assessment of the direction and magnitude of the impact of factors on public healthcare units' revenues are the basis for enabling units to take advantage of positive factors, for the ultimate goal is to ensure financial resources of these units, and to control activities to improve the quality of Public healthcare services as well as improve operational efficiency.

To assess objectively and positively the impacts of factors on Public healthcare units' revenue in Vietnam -- in Bac Giang province specifically, the authors present the basic framework and data analysis through regression models based on sample data of 15 public hospitals in Bac Giang province from year 2010 to 2016.

2. OVERVIEW OF RESEARCH ISSUES

When referring to previous studies, the authors have studied many articles, research topics, revolve around finance in the field of Public healthcare's financial. Each study aimed to improve the efficiency and quality of Public healthcare services. For the purposes of this article, the authors propose some case studies which are most closely related to these contents, namely:

Jay PAN , Gordon G. LIU , Chen GAO [4]. This paper evaluates the effect of regulatory reform separating the operational control and regulatory oversight of public hospitals in China. Using city-level data and a Difference in Differences (DID) model, this paper estimates the changes in healthcare supply in response to the regulatory reform. Based on the DID estimates, in Weifang between 2006 and 2008, the reform led to a 39.3% increase in the number of doctors per 10,000 residents and 40.1% increase in the number of health workers per 10,000 residents. Similarly, in Suzhou between 2005 and 2008 the reform led to increases of 60.5%, 30.8% and 36.6% for hospital beds, doctors and health workers per 10,000 people, respectively. Moreover, the magnitude of this impact appears to increase over time. Furthermore, the effect of the reform is consistent regardless of whether the separation reform takes place inside or outside the government. These findings led us to conclude that the government should focus only on the regulation of healthcare markets, while leaving hospital operation to the free market.

Zhang Xing, Tatsuo Oyama [5]. Local Public Hospitals (LPH) in Japan were established to secure equal accessibility and to improve quality for the health care system by providing policy-based medical services.

Difficulties faced by the LPHs challenged the equal accessibility of the health care system and the improvement of their financial situation. We tried to investigate the impact of LPH burden on the health care system and attempted to repair the problems confronting LPHs in order to attain the higher health care quality based upon the technology innovation. Panel data regression is used to analyze the effect of proportion of LPH beds and an indicator of LPH burden on hospital personnel numbers and also on estimated national medical expenditure (ENME) using the data from 2005 to 2010 for 47 prefectures in Japan. Hospital personnel, a major supply-side indicator, increased more in prefectures shouldering smaller burden of LPH beds. Prefectural ENME, an important demand-side indicator composing of medical expenditure based on the location of medical facilities, tends to decrease with increasing prefectural LPH burden. The results indicate that patients in the prefectures carrying more LPH burden tend to seek health care in the prefectures bearing less LPH burden during the research period. These imbalances substantially increase after the LPH reform.

PhD. Nguyen Truong Giang [9]. This subject has been a relatively comprehensive study of state budget expenditure management in the field of healthcare, achieved the following outstanding results: Research and clarification of the nature of public goods of the medical activities; Assess the characteristics and specific conditions of medical activities in the market economy. It clarifies the nature of the problem why the State should have policies to manage and intervene, and not float to the market. At the same time, the dissertation has also studied the health insurance fund, which is an intermediary financial institution - a very important tool for the State to intervene in the field of health financing with aim to mobilize all resources for development of medical care, ensuring the requirements of raising the quality of preventive medicine, medical examination and treatment for the people.

Ministry of Health [10]. A comprehensive approach to research, including the reform of the operational mechanism and financial mechanism for public healthcare units. In the renovation of the financial mechanism, the project focused on analyzing the financial autonomy mechanism linked to wages and prices of health services.

Than Thi Thu Hien [11]. The thesis presents theoretical and practical basis for some financial management models including: (i) private hospital model, (ii) fully autonomous hospital model finance; (iii) partially autonomous public finance model; (iii) public hospital model fully funded by the State budget. The thesis has clarified that the increase in financial autonomy to nearly 100% over the two years (2012-2014) is from healthcare revenue sources, of which the highest increase in hospital fees (58, 5% for 2 years). In terms of solutions, the thesis has raised a group of solutions to increase revenue: tight control to ensure accuracy and science from the stage of estimation of revenue and expenditure; expanding the scale of medical examination and treatment; applying information technology in medical examination and treatment; reforming administrative procedures in medical examination and treatment; and well implemented regulations transparent publicity, especially in the development of internal expenditure regulations.

3. THEORETICAL BASIS

3.1. Activities and revenues in public healthcare units

In public healthcare units, activities in these units are divided into two main areas of activity:

- First, according to their assigned functions and tasks, activities are the provision of public non-business services using the State budget; services and products ordered by competent state agencies from the State budget; and medical examination and treatment activities for medical insurance card holders according to the provisions of law on medical insurance.

- Secondly, the required business and service activities are social services and non-state services. Including:

- + Medical examination and treatment services such as medical examination on request (including medical examination and treatment for medical insurance card holders on holidays); room service on request; High quality medical services and techniques to meet the diverse needs of the people.

- + Other public services in the field of healthcare due to the request of organizations and individuals.

- + Other auxiliary services associated with activities of public non-business units such as pharmacy, laundry, food, drink, room service for family members, patient transportation and related services and the like.

Based on the above mentioned, the revenue of public healthcare units includes:

- Revenues from the provision of public services, including state budget orders, assigned to provide public services at full cost,

- Sources of fees in accordance with the law on charges and fees that may be left for regular expenditures in service of the collection of charges and fees according to regulations;

- Income from other activities (if any), including: dividends from joint ventures; interest on bank deposits; and other revenue sources as prescribed by law.

For these three groups of revenues, revenues from the provision of public healthcare services are significant, and this is most likely to be influenced by internal and external factors.

3.2. The impact of factors on public healthcare units's revenue

There are many factors influencing the revenue of public healthcare units, such as the policy of the State for healthcare development, the prestige of public healthcare units, the level of socio-economic development and income of the people; the scale and diversification of health care, the relationship of public healthcare units to economic establishments, hospitals and international organizations. However, in order to quantify the effect of these factors on the health care revenue of these units, the authors analyzed in terms the two groups of basic factors:

- *Endogenous factors, which include: operational scale, quantity & quality of human resources in public healthcare units*

First, the operation scale of a Public healthcare unit is one of the major factors affecting the unit's revenue. By taking advantage of the scale, it is easy to see that maintaining the same rates for medical services, increasing the capacity of hospital beds and increasing the number of medical appointments would increase the financial resources of the unit. However, the increase in the scale of operations is limited by the existing facilities of public healthcare units.

Secondly, if the operation scale of the unit is a direct and easy-to-see factor for the rapid growth of revenue, the quantity and quality of human resources are factors that influence the sustainable development of revenues in the unit and all activities of the unit. A large number of physicians and nurses with a high quality and level of expertise will be the root element to attract patients who are using healthcare services. Thus, it indirectly increase the healthcare revenue for the unit.

- *Group of exogenous factors: socio-economic conditions and people's income in the area where public healthcare units are operating*

The level of socio-economic development affects the mobilization of financial resources for investment in healthcare. Economic development such as the increasing in production, economic restructuring, job creation, reduction of poverty rate and increasing of income and increasing of people's living standards

... are some of the major influencing factors what carried out the policy “The entire society to care for the cause of healthcare” as well as the implementation of socialization of healthcare.

With the developed economy, people with high income and low rate of poor households will create a good premise to mobilize the whole society to contribute resources for healthcare development, thereby increasing healthcare revenue for the units. In contrast, the underdeveloped economy with low income people and the high rate of poor households, the mobilization of investment in health is limited.

4. REGRESSION MODEL ANALYSES FOR HEALTHCARE REVENUE

4.1. Data

The data used in this study were collected and processed from survey questionnaires, financial reports and other materials from 15 public hospitals in Bac Giang province from 2010 to 2016. The data is a *panel data of 105 observations*.

4.2. Research models

Based on the economic theory of public finance and the results of previous empirical research, as well as the characteristics of Public healthcare units in Bac Giang province, the variables used in the model are as follows:

- Dependent variable is the healthcare revenue of a public healthcare unit.
- Group of internal factors including:

Indicators showing the operation scale of public healthcare units. This study used the capacity of using beds (denoted as X2) and the number of medical examinations (denoted by X3) what representing on the operation scale of public healthcare units.

Indicators on human resources and quality of human resources: research on the number of doctors (denoted as X4) and number of nurses (denoted as X5). It is the largest human resource in the public hospital which indicated for human resources.

- Group of external factors: The average quarterly income of the population is used as the external factor (denoted as X6). With units which located in areas with high population, the higher the average income of population in the area, the total revenue of the units will tend to increase. In addition, if there is a large percentage of poor households, it will be a huge challenge to implement autonomy mechanism in this area.

A theoretical econometric model can be characterized as follows:

$$Y_{it} = \beta_1 + \beta_2 X2_{it} + \dots + \beta_k Xk_{it} + u_{it} \quad (t = 1, 2, \dots, T; i = 1, 2, \dots, N)$$

where

Y_{it} Y_{it} is the dependent variable represents the healthcare revenue of the i th at time t .

Xk_{it} Xk_{it} is the k th explanatory variable of the i th at time t .

u_{it} u_{it} is the random error of the model for the i th at time t .

β_k β_k is the regression coefficient of the k th explanatory variable in the model.

Because the data is collected and processed in the form of an equilibrium table, it is possible to choose from the table data model. Commonly used methods are: (1) Pooled OLS model; (2) Fixed-effects regression model (FEM); (3) Random-effects regression model (REM). [1-3]

4.3. Experimental results

In order to ensure the corresponding value and maintain the relationship between the variables in the model, the study applies the logarithm function to the variables. The descriptive statistics are shown in Table 1. The variability coefficients of the variables in the study pattern are small, showing no significant variation in the elements of Public healthcare units. Statistics describing research variables also provide information that includes mean, maximum, minimum, and standard deviation of variables in the model.

Table 1: Results of descriptive statistics of metric variables

| variable | N | mean | sd | min | max | cv |
|----------|-----|----------|----------|----------|----------|----------|

To avoid spurious regression in the regression model, all variables considered in the model must stationary variables. The Levin-Lin-Chu (LLC, 2002) and Harris-Tzavalis (1999)'s standards are used in research to test the stationary of the variables in the model to the data panel. Test results of both methods with a significance level of 5%, all the data series in the sample were stationary.

Inspection on the phenomenon of multicollinearity in the model, we tested the variance inflation factor of the independent variables in the model. The coefficients of VIF were low (mean value 2.99), the model does not have multicollinearity.

The research examines the FEM, REM, and Pooled OLS models to find which is the most suitable. The Hausman test was used to select between REM and FEM models. The test with p-value = 0.0111 is less than the significance level of 0.05, giving the conclusion that FEM is more appropriate.

Carrying out the heteroscedasticity and contemporaneous correlation with the FEM model, the result was a study model with both of these defects.

To overcome the defect of the FEM model, this study uses the generalized least square estimation method for panel-data models by using GLS. The model regression results using the modified variance parameter variance were shown in column (1) of Table 2. The study using the corrected Driscoll-Kraay estimation number (Driscoll and Kraay-1998). The regression results of the model by this method are shown in column (2) of table 4. The third method applied is the error correcting method for multi-unit table data but the time is small Panel-corrected standard error (PCSE). The regression results for this model are shown in column (3) of table 2.

Table 2: Estimated results of the model

| VARIABLES | (1) lnY | (2) lnY | (3) lnY |
|------------------|----------------------|----------------------|----------------------|
| lnX2 | 0.429** (0.207) | 0.435* (0.222) | 0.435** (0.193) |

Source: By the authors calculated on STATA 14 software

Results of the model estimation had a p-value = 0 which was significantly smaller than the 5% significance level, so the model was statistically significant with the sample. Three methodologies used to conclude that the regression model is consistent and the multiple coefficient of determination is 0.851. This shows that about 85.1 percent of the variation in the total revenue of public healthcare units in Bac Giang province is explained by the bed occupancy, the number of visits, the number of doctors, the number of nurses and the average per capita income of the population.

All factors in the regression model were statistically significant at either 1% or 5% significance level in all three methods. The value of these coefficients is also almost no difference. The sign of regression coefficients is positive showing the same fluctuations of internal and external factors for total revenues of public healthcare units in Bac Giang province.

5. CONCLUSION

By analyzing the internal and external factors affecting the revenues of Public healthcare units in Bac Giang province, it is possible to draw some necessary and sufficient conditions to increase the financial resources for Public healthcare units. Specifically:

- Regarding the necessary conditions:

Public healthcare units need to invest in the development of human resources, professional qualifications and facilities so as to improve the quality of health services, increase the number of patients to medical examination and treatment, thereby increasing the capacity of using beds.

- On the sufficient condition:

Public healthcare units should take advantage of the geographical location and make use of their prestige and trademark to attract patients, especially in the areas where the socio-economic development to increase competitiveness and maximize revenue.

This is also one of the key solutions for Public healthcare units to successfully implement the process of autonomy and self-management because of the important content of this process, namely the financial autonomy process.

SOCIAL RESPONSIBILITY ACCOUNTING – ESSENTIAL DEVELOPMENT IN VIETNAMESE ACCOUNTING FIELD TO ACHIEVE TO ACHIEVE SUSTAINABLE DEVELOPMENT

Ngo Thi Thu Hong* - Le Thi Yen Oanh**

ABSTRACT: *Social responsibility accounting is a part of corporate accounting. It processes to collect, measure, analyze and provide accounting information related to social responsibility activities of the entities. This information is used by both internal and external users to make their own decisions. Furthermore, social responsibility accounting is an important factor effecting the achievement on sustainable development. It maintains the good relationship between entities and the society, thus improving the results of social activities. Therefore, social accounting should be applied in Vietnamese entities.*

Keywords: *Social responsibility accounting; sustainable development.*

1. INTRODUCTION

Currently, the development of social responsibility accounting mainly focuses on management purposes. It provides necessary information resource for executives to make decisions and achieve sustainable development. The content of social responsibility accounting includes environmental accounting, social cost management accounting and social income management accounting. In addition, how to apply balanced scorecard to assess social responsibility of the corporate and report it are also basic contents of social accounting. Normally, researchers, managers and consultants use indicators that reflect the combined effectiveness and connection of economic, environmental and social aspects of the entities to assess their social responsibility.

There are opinions that it is impossible to identify these indicators by using current knowledge and experience. In fact, many enterprises and international organizations such as GRI and ISO provided indicators reflecting the separate effectiveness of each aspect of the business. They also proposed orientation to build an indicator system that can reflect the connected effectiveness of all aspect depending on the actual conditions of the entities. Regarding the application of balanced scorecard in corporate social responsibility assessments, the extension and adjustment of the scorecard are proposed by some researchers, in order to manage and monitor the implementation of the corporate social responsibility strategy. This is called the Sustainability Balanced Scorecard. There are two basic ways to use the balanced scorecard in order to plan vision, targets and strategy for corporate social responsibility as follows:

- Adding objectives, measurements, social and environmental criteria in four aspects including finance, customer, internal business and researches, experience and development. They should be added in a relationship that is relevant to the vision and strategy for sustainable development of organizations.

- Creating the social and environmental aspects as the fifth aspect associated with the above four ones: Finance; customer; internal business; researches, experience and development (Capron and Quairel, 2006).

*,** Academy of Finance, Ha noi, Viet Nam; ngothuhonghn@gmail.com.

Currently, the International Financial Reporting Standards is applied in many nations. This is the framework for preparing and presenting financial statements. According to the Conceptual Framework for Financial Reporting, primary users of financial statements are existing and potential investors, lenders and other creditors. Other parties, such as regulators and the public, are also users of the financial reports. The Framework, at the same time, describes the objectives of the financial statement is to provide financial information about the reporting entity. This includes financial position, business operation and changes in financial situation of the business. The useful information provided to users, in a broad interpretation, can refer to the involvement of social and environmental aspect. This change in the framework would lead to the discussion of responsibilities of executives, including the protection of the entity's economic resources from negative effects such as changes in price, technology and the community behavior.

However, it has been suggested that accountants should not engage in reporting corporate social responsibility or environmental issues (Milne, 2007) and the involvement of accounting professionals is considered as "antithetical to any long run solutions to such crises" (Mauders, 1996, p.1). At the same time, however, IFAC has expressed that "For professional accountants in business, sustainability is an issue which has a far-reaching effect on business behavior" (IFAC, 2006a, page 5). Thus, it is clear that business experts and accounting professionals are engaged in innovative approaches related to sustainable development and corporate social responsibility.

The organization of social accounting in entities would definitely create favorable conditions and advantages for them. These conditions may be the competitive improvement, brand awareness enhancement in the market. Social accounting also provides documentation and data on the costs that should be included in the product and socially responsibly business processes. If the enterprise has a good attitude and behavior towards the society, the enterprise position in the domestic market and global market will increase significantly, thus hastening the international intergration processes of the enterprise. Therefore, the business can access to global market easily. The good organization of social accounting in the corporate will satisfy and strengthen stakeholders' trust.

2. DEFINITION OF SOCIAL RESPONSIBILITY ACCOUNTING, SOCIAL RESPONSIBILITY

Recently, social responsibility has been a considerable issue worldwide. The corporate responsibility towards social and environmental issues have been considered and analyzed. Then, accounting has to change in relevant with corporate social responsibility. Accounting, at the moment, is not only the process of recording then reporting financial information, but also the management tool towards social and environmental issues in the enterprise. Therefore, social responsibility accounting is extremely essential for entities to fulfill the information demand on social responsibility in business operation.

So far, social responsibility accounting has appeared in many nations. This new research area appeared around the late 1960s and early 1970s. Then the development of social accounting has contributed not only to the development of general accounting, but also to the solutions for social issues. In recent years, researching on social and environmental issues has become popular. Thus, social responsibility accounting in businesses is an increasingly interesting area for parties. The social role of accounting in improving social justice and contributing to the economy, the society and the environment is widely recognized in many countries around the world.

Then, social responsibility accounting have emerged since the early 20th century, but it is now popular in many developed countries such as the United States, Japan, Germany, South Korea, Australia, Singapore, etc. In Vietnam, this is still a new subject.

There are many definitions of social responsibility accounting. They are approached in different views, some definitions which are generally accepted as follows:

According to Mathews (1993, p. 64), social and environmental accounting has been defined as “voluntary disclosures of information, both qualitative and quantitative made by organizations to inform or influence a range of audiences. The quantitative disclosures may be in financial or non-financial terms”. He also noted that social accounting is concerned with the organization’s interaction with community, environment, employees and customers. All these issues would be reflected in social accounting reports.

Social accounting has been defined by Gray et al. (1987, p. ix) as “the process of communicating the social and environmental effects of organizations’ economic actions to particular interest groups within society and to society at large. As such it involves extending the accountability of organizations (particularly companies), beyond the traditional role of providing a financial account to the owners of capital, in particular, shareholders. Such an extension is predicated upon the assumption that companies do have wider responsibilities than simply to make money for their shareholders”

Anderson (1977) considered social accounting as a management tool supporting to set up social targets by fully consideration on business’s needs and the community’s needs.

Rob Gray and his partners examined UK company annual reports over a period from 1979 to 1991, their data showed “a rise in both the proportions of companies disclosing and the range of that disclosure” related to corporate social responsibilities. However, the authors also pointed out that the number of pages in annual social reports was still smaller in comparison with other reports before making conclusion that “social and environmental performance is still a relatively low priority for companies.” (Rob Gray, Reza Kouhy and Simon Lavers, 1995).

According to O’Dwyer (2006, p. 233), social accounting likes a group of individuals with “commitment to stakeholder accountability and democracy”. This is “a mechanism aimed at enhancing corporate accountability and transparency to a wide range of external stakeholders, addressing the social, environmental and ethical concerns and values of individuals upon whom a business has a non-economic impact” (O’Dwyer, 2006, p. 220). Therefore, social accounting is an important element of social responsibility.

To sum up, social responsibility accounting is the science of observing, measuring, calculating, recording, processing and analyzing information about corporate social responsibility, such as: environmental protection, community contribution, responsibility to ensure the interests of shareholders and employees in the enterprise. Social responsibility accounting is a supporting tool for executives to set social targets and organizational goals because executives can fully consider the business needs by using social related information.

The term “Social responsibility accounting” derived from the fact that an enterprise must carry out its social responsibility with respect to the protection of the environment and the employment of its employees.

Also, the term “corporate social responsibility” was mentioned in H.R. Bowen’s book named “Social Responsibility of the Businessman” (1953). The author wrote this book to propagandize and call on managers not to impact negatively the rights and interests of others.

The term “social responsibility” has been defined in a number of different ways. There is an opinion that “social responsibility implies bringing corporate behavior up to a level where it is congruent with the prevailing social norms, values, and expectations of performance” (Prakash Sethi, 1975). According to this

opinion, the enterprise takes responsible to not only its shareholders and employees, but also the society by paying taxes.

In addition, there is other perspective about corporate social responsibility that “it must embody the economic, legal, ethical, and discretionary categories of business performance” (Archie B Carrol, 1979). The author illustrated that enterprises use social resources, exploit natural resources for their operation. And during their operational processes, they cause negative effects on the natural environment. Therefore, businesses must have social responsibility for the surrounded environment, communities, workers, etc.

Recently, in Vietnam, the most popular definition of corporate social responsibility has been used as follows: “Corporate Social Responsibility is the commitment of businesses to contribute to sustainable economic development, through activities to improve the living standard of workers and their family members, the community and the whole society. In a way, this benefits both the business as well as the society.”

The above perspectives about social responsibility accounting may not be exactly the same. Most of the opinions emphasize the main function of the business to the society, this is the connection between financial efficiency and social effectiveness, social responsibility. Social accounting is concerned with corporate social responsibility, the environment, the community, employees, and the need for a social accounting accounting system.

It is clear that social accounting is a part of corporate accounting. It relates to social and environmental information about business activities within the enterprise for. Social responsibility accountants collect, process, analyze and provide these social information for internal and external users to make their own decisions.

Social accounting is a part of corporate accounting and it connects to others accounting sectors. Unlike traditional accounting, social accounting is concerned with the social impact of corporate activities. Social accounting has two basic functions. They are internal management and external reporting. Thus, social accounting has a significant influence on the decision of the external users of information such as customers, investors, regulators, local people, etc.

Social accounting generates many benefits for both organizations and the society. Its huge contribution to environmental protection and human rights would lead to the achievement of sustainable economic development.

3. FUNCTIONS OF SOCIAL RESPONSIBILITY RESPONSIBILITY ACCOUNTING.

Benefits to the corporate itself:

Firstly, social responsibility accounting can fulfill the incompleteness of traditional accounting. With the economic growth, traditional accounting experiences limitations, especially environmental issues. Traditional accounting does not clearly distinguish environmental factors and provides information about environmental damage of the enterprise. In addition, information about environmental costs is often hidden in general cost accounts. Therefore, managers cannot fully understand information on environmental costs. Moreover, the use of general cost accounts to record environmental costs often leads to confusion because these costs are allocated back to the production costs. This allocation can lead to inaccurate allocate amount of some environmental costs. When implementing social accounting, it will help businesses overcome these incompleteness.

Secondly, business competitiveness can be improved. By applying social responsibility accounting, executives will be able to approach fully accurately information, thus improving business performance.

As a result, executives can create trust with stakeholders and avoid risks, such as penalties, compensation. Moreover, if social responsibility accounting is well organized in the corporate, managers can efficiently use of input resources to avoid wastage. For example, the wastage in using raw materials, energy and labor. Consequently, the business competitiveness will improve thank to the deduction of the production cost. Useful social accounting information would definitely support managers in making business decisions, such as reducing production costs, increasing productivity, investing in machinery and equipment for clean production. This will give the company a competitive advantage in terms of higher sales, improve brand awareness, strengthen the relationships between the business and the community, reduce legal issues and improve corporate value in the market.

Benefits to stakeholders:

Stakeholders include investors, creditors, employees, regulators, the surrounded community, etc.

Good attitude and behavior towards the society and the environment will then create great benefits for the development of enterprise. Hence, the enterprise position in the domestic market and global market will increase significantly, thus hastening the international intergration processes of the enterprise. The good organization of social accounting in the corporate will satisfy and strengthen stakeholders' trust.

Implementing social accounting will contribute to the decrease in the unemployment rate. The reason for this positive impact is that enterprises generate jobs, ensure living standard for citizens and take part in solving social issues. Charities, fundings for community improvement purposes contribute to eliminate poverty and narrow the gap between social classes.

Social accounting records assets and liabilities related to the environment, and society.

4. ACTUAL FACT OF SOCIAL RESPONSIBILITY AND SOCIAL RESPONSIBILITY ACCOUNTING ACCOUNTING IN VIETNAM.

To achieve the sustainable development in Vietnam, the Vietnamese government has introduced many policies related to all fields including economy, society and environment. The government also issued policies to regulate the implementation of international commitments on sustainable development that Vietnam signed as a party. In these policies, the government clarified the viewpoint of sustainable development. The social economic development strategy for the period 2011-2020 emphasize "rapid development must associate with sustainable development. Sustainability is a mandatory requirement of the strategy throughout the period". It is clear that sustainable development has now become the key point of view of the Communist Party and the Vietnamese government recently.

The Vietnamese government has recently signed international conventions related to sustainable development, such as the Montreal Protocol on ozone depleting substances, the Vienna Convention on the Protection of the Ozone Layer, the United Nations Convention on the Law of the Sea; the United Nations Framework Convention on Climate Change, the Convention on Biological Diversity (1994), and so on.

Solutions to cope up with social issues such as poverty, overpopulation, poor health care, low education and unemployment have showed positive results. Social welfare focuses on ensuring the basic living standard needs, and supporting the production process of farmers, especially in the situation of high inflation and frequent natural disasters. The goal of universal primary education following national standard was achieved in 2000. In addition, the poverty rate dropped sharply. Furthermore, the gap between genders in Vietnam is small in comparison with other countries that have the same level of development and national income.

Vietnamese government, at the same time, cares about the combination of economic growth and social development. In particular, politicians have focused on poverty elimination and social welfare policies. Social progress and social justice for human rights are also considered as key targets of policies. Living standards have showed positive progress years after years.

However, there are many environmental issues in Vietnam currently. Actually, there are many attributable causes leading to these issues, but the root causes is rapid economic development pressure and over-population in the situation of resource scarcity. In addition, Vietnam is in the process of industrialization and modernization. This process had great contribution to the economic growth, however, at the same time it also causes bad results on the environment, affecting human life. In fact, images and information about the environmental pollution are showed frequently on Vietnamese media channels. Normally, the economic development and environmental preservation are reversed patterns. In other words, great economic development always comes along with great exploitation of natural resources. Also, industrial waste causes a significant level of pollution which directly affects the sustainable development of the environment. Therefore, there is a desperate need of harmonization between economic development and environmental protection. Regarding pollution, things that can affect human health and damage the environment are considered to be environmentally pollution factors. Environmental pollution can be divided into categories: water pollution; air pollution; soil pollution; noise pollution; visibility pollution; light pollution and thermal pollution.

The current Vietnamese environmental pollution status is bad. The main cause of this situation is industrial waste from production activities and the low awareness of environmental protection. Pollution ratios are extremely higher than permitted standards, especially in big cities like Hanoi and Ho Chi Minh City. This pollution, then, is the main cause of climate changes which impact negatively on agricultural productivity, increases water shortage and diseases, contribute to the unbalance of biology, etc. Therefore, developing and applying environmental management solutions are really in need.

It is the matter of fact that not only small businesses, but also many big corporations in Vietnam have not yet considered the importance of environmental protection. They do not have strict policies to regulate the management and treatment towards production waste. This contributes to low assessment of international environmental organizations, thus reducing the attraction of foreign investors into Vietnamese corporations as well as poor brand and social image of the businesses worldwide.

Regarding the green economy launched by the United Nations in 2010, Vietnamese government needs to plan a new development process in order to ensure the environmentally economic growth. The government should take actions and introduce more legal regulations to limit overexploitation of natural resources and minimize environmental damage activities. Actually, in Vietnam, there are many the policies related to environmental protection. The environmental regulators, agencies, authorities have been gradually improved. Funding for environmental protection has increased each year. The government also introduced the Environmental Protection Law in 1993, and the latest revision was in 2005. In addition, there are other legal documents on environmental protection have been issued (33 documents, 22 ordinances related to environmental protection).

In fact, social responsibility accounting is a new term in Vietnam today. The Ministry of Finance and related agencies have not yet issued guidances on social accounting, environmental accounting and sustainable accounting. Similarly, there is no official data on social responsibility accounting in enterprises.

As one of the management tools, environmental accounting is a part of social accounting, which contributes to control pollution activities and ameliorate the ecological environment. So far, the Vietnamese government has not issued and given detail guidances on environmental accounting for enterprises. In this article, we would like to give an overview about Vietnamese environmental accounting. The regulations on environment accounting in Vietnam are very vague and there is a few guidances related to it. These guidances only focuses on some contents of financial accounting related to liabilities such as environmental protection tax, the provision for the cost of environmental restoration. Even if there is a provision on the liability, the recognition and measurement are not fully reviewed. Accountants only record the amount on accounts and ledgers, such as account Environmental Protection Tax (code 33381), account Other payable expenses (code 3524) for the restoration costs. Then they report it on the financial statements as in items “Taxes and liabilities to the government”; “Long-term provisions”.

In Vietnam, almost manufacturing enterprises does not implement environmental accounting, especially exploitation companies, chemical companies, construction material manufacturing companies. In fact, environmental costs are increasing and are being considered by executives, such as depreciation of waste treatment facilities, salaries of workers collecting waste, water supply and drainage costs, industrial waste costs, compensation costs, incident recovery costs, etc. However, there are no separate accounts for monitoring and recording environmental costs and environmental benefits. Many environmental costs are reflected in administrative expense account (code 627) and manufacturing overhead expense account (code 627). Due to general reflection, it is difficult for executives to detect the size and nature of environmental costs.

It is clear that social responsibility accounting is new term to Vietnamese businesses, and the application of environmental accounting in Vietnamese businesses is extremely necessary. This is due to the fact that business activities are related to the surrounding environment such as natural environment and the society. Social accounting plays an important role in the sustainable development of enterprises in particular as well as the economy in general. Applying social accounting would definitely give necessary support for managers to fully understand the business situation before setting future plans.

In conclusion, it can be seen that social responsibility accounting is an urgent need to provide social information about business operations for users. Regarding internal users, with the support of this social information, executives can be able to make the most optimal decisions. This absolutely contributes to sustainable development.

USING SWOT MODEL TO ANALYSE STARTUP DEVELOPMENT IN THE CONTEXT OF INDUSTRY 4.0: THE CASE OF VIETNAM

Vu Van Hung* - Luong Quang Hien** - Ho Kim Huong***

ABSTRACT: Industry 4.0 has created many opportunities and challenges for startup in order to improve business efficiency, promote the start-up process strongly in Vietnam recently. The paper focuses on the strengths, weaknesses, opportunities and challenges for Vietnamese start-up in the context of Industry 4.0 by using SWOT model. As a result, it finds some important reasons to explain why Vietnam start-up is not really effective. The reasons are an unsuitable start-up ecosystem, the lack of legal system, the weakness of startup's competitiveness, the lack of capital and innovative ideas and the misuse of strengths of Industry 4.0... In that context, the government needs to build a suitable startup ecosystem, create a stable macroeconomic environment, support startups so that they can access to capital easily. And the government has mechanisms and policies to help startup enterprises to enhance innovation in the direction of developing digital technology.

Keywords: Industry 4.0, Startup, Startup enterprises (Startups)

1. INTRODUCTION

Industry 4.0 has been formed on the basis of Industry 3.0. Digital technology with computer hardware, software and network becomes more and more complex, more connective. So this transforms our society and global economy. It is a trend that combines real and virtual systems, Internet of Thing (IoT) and Internet of System (IoS). In Revolution 4.0, "smart products" are attached sensors which show tell machinery what they need to be operated. Smart devices work together over a wireless network or through the cloud based storage. Industry 4.0's characteristic is that the initial investment may not be large, but the profit is high, this will be good for startups because they usually do not have much capital. This will be one of the major advantages for startups in the future. In Vietnam, promoting start-ups is considered a main in developing economy and it is also the means to implement three strategic breakthroughs, they are: institutions, infrastructure and human resources. We have more and more programs, seminars, workshops about start-up. Many policies, laws and incentive programs have been built and issued. Promoting start-up in Vietnam is contributing to the prosperity of the economy, the progress of society. The paper will focus on evaluating the current status of Vietnamese start-up, using the SWOT analysis model to assess the strengths, weaknesses, opportunities and challenges, in order to give solutions to accelerate the growth of start-up more powerfully and effectively in the context of Industry 4.0.

2. THEORETICAL FRAMEWORK AND METHODS

Startup is the process of creating different value on the basis of investing time and effort, assessing the social, psychological and financial risks to bring satisfaction to the individuals (Bowen và Hirisch, 1986). A startup is a young company that is just beginning to develop. Startups are usually small and initially financed and operated by a handful of founders or one individual. These companies offer a product or service that is not currently being offered elsewhere in the market, or that the founders believe is being offered in an inferior manner (Amy Fontinelle, 2017). A startup is a company working to solve a problem where the solution is not obvious and success is not guaranteed (Neil Blumenthal, 2013). And startup is early stage in the life cycle of an enterprise where the entrepreneur moves from the idea stage to securing financing, laying down the basis structure of the business, and initiating operations or trading (Businessdictionary). Over the past few years, the term “start-up” has appeared more and more in the mass media, on policy forums or academic forums. Now, when we talk about startups, they are aimed at “startups” - Enterprises are expected to develop strongly by technology or breakthrough by innovation. However, starting a business is the act of starting a career and the most common way is to set up a business in a certain field.

To assess the current status of Vietnam’s start-up in the context of Industry 4.0 and find out solutions to promote start-up in Vietnam, the paper uses the group of basic research methods as descriptive statistics method, synthetic analytical method, comparative method and SWOT analysis model:

- Descriptive statistics method are used to collect, summarize, and present data of Vietnam’s start-up in the context of Industry 4.0 and give some solutions for the development of Vietnam’s start-up. During the research process, the paper used data systems from some sources: annual statistical yearbook of the General Statistics Office, Report of ministries, papers on retail model...

- Synthetic analytical method used in theoretical research and complete this paper. Results from the collection of information are used to analyze, evaluate the advantages, limitations of the current status of Vietnam’s start-up in the context of Industry 4.0. Based on these results, the paper proposes solutions to develop Vietnam’s start-up.

- Comparative method is used to look at the advantages and disadvantages of the current status of Vietnam’s start-up in the context of Industry 4.0. This method is also used to clarify the changes in space and time, the conditions as well as the characteristics, advantages of the current status of Vietnam’s start-up in the context of Industry 4.0.

- SWOT analysis model, this method is used to synthesize elements from the inside and outside elements of the research object. The SWOT model is an useful tool which helps us analyse the current status of Vietnamese start-up, the strengths of Vietnam’s start-up, its weaknesses, the opportunities and the challenges that Vietnam has to face in the context of Industry 4.0. This will be a useful analysis to assess the current status of the start-up in Vietnam. This result is the basis for solutions to develop start-up in Vietnam in the context of the Industry 4.0

3. RESULTS AND DISCUSSION

3.1. The current status of Vietnamese startup

3.1.1. The number of startup enterprises (startups)

Since 2000, Vietnamese startups has gone through three stages. Successful startups in the first stage: Vatgia, Socbay... In the first stage, Vietnam’s startup did not attract much attention. Because startup’s

communications have not developed and leaders in the field have not proved the potential for success. At present, Vietnam’s startups is in the third stage. Many Vietnamese startups have reached out to international playgrounds and gained some success. In the 2017, report of business registration of the Ministry of Planning and Investment, there are 14,451 new startups were established with the capital 152.558 trillions VND, up 3.9% in volume and 35% in registered capital compared to the same period last year. In Vietnam, 2016 has been identified as the year for startups. Form 2017 to 2020, this period is considered the golden age for start-up with the establishment of startup enterprises. The main form is self-employed individuals (households).

Source: Vietnam Chamber of Commerce and Industry (VCCI)

However, Vietnam’s start-up is facing a lack of unification within the development network and the connection to startup sources in and out of the community. Besides, Vietnamese startups are racing to keep up with the latest trends in the world instead of focusing on finding out and analyzing the current status of Vietnamese startups. It is difficult for the startups to find out the best development orientation.

3.1.2. Start-up Sectors

Industry 4.0 has a significant impact on the business sector of startups. Now the number of startups in technology sector is much higher than startups in other sectors. Many Vietnamese startups are also choosing to be “Tech Startup” bussiness. Because technology startups do not need too much capital if they are compared to other sectors and it’s easy to learn from previous models in the world. There is a diversification in startup sectors. Some sectors have increased dominantly: real estate (86.2%); arts, entertainment (59.3%); warehouse transportation (39.3%); employment services (35.5%) and high-tech industries are also growing as science and technology, design consultancy services (35.4%); information and communication (11.7%).

Figure 2. Growth rate of startup business sector in 2015

Source: National Business Registration Portal, 2015

3.1.3. Owner of startup enterprises

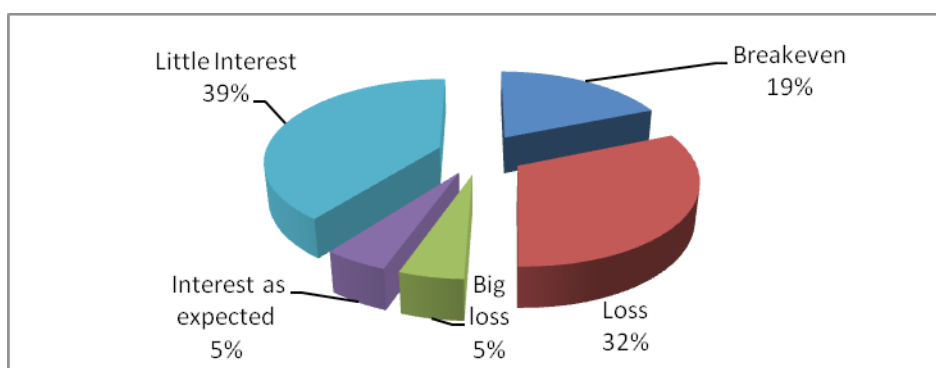

Owner of startup enterprises are often young (about 30 years old), accounting for 72% of startup enterprises. Most of them have tertiary degrees, accounting for 84%. They are private enterprises (occupied 73%). According to General Statistics Office (GSO), the number of non-agricultural private units was 4,671,339 in 2014 and 4,754,826 in 2015 (increase of 135,293 units compared to 2014). Meanwhile, the number of individual enterprises establishments, which are mainly in the Mekong Delta, Red River Delta, South East in the agricultural sector only increased 2,275 times in 2015. The purpose of starting a business is to be financial independent (59%), self-employed (41%) and passionate about new things (31%) (National Business Registration Portal, 2015).

3.1.4. Business efficiency of startups

The characteristic of startups is in the early stages of development. 86% of startups are in the beginning period, only 8% of startups are in the expansion period. About the size of the labor force in small start-up enterprises: 63% have less than 10 employees, 30% have form 10 to 49 employees, and only 7% have more than 50 employees (VCCI survey, 2016). Few of start-up businesses take part in import-export activities, most of them serve in domestic market.

In term of efficiency, the recent statistics reflect an unpleasant situation that most of Vietnamese startups were failed. Only 3% Vietnamese startups are successful, it means that one of their criteria are met: valued at \$ 10 millions or more; revenues from \$ 2 millions; has more than 100 employees; at good prices to sale (VCCI survey, 2016). According to VCCI survey results, owner of successful startups: 78% are employed or owners failed in the previous two companies, 45% of them studied or worked abroad companies before they return to home. The average startup time is 5.7 years to success and it will take longer to become a company which has hundreds of millions dollars, 100% of them are learned and localized from similar abroad models that were successful.

Figure 3. Business activities efficiency of startup enterprises in 2016

Source: Vietnam Chamber of Commerce and Industry (VCCI)

The figure shows that the number of newly established enterprises is equal to the number of dissolved enterprises in Vietnam. In 2013, the number of new enterprises increased 10.1% and the number of dissolved enterprises increased 11.9% (compared to 2012). In 2014, the number of new enterprises decreased 2.7% while the number of dissolved enterprises increased 11.7%, compared to 2013 (VCCI survey, 2016). This number is a warning about the way of operating of Vietnam Startups. Many startups are tending to copy the products, services and business models which are available in the market. This contraries completely

to the conclusions about the intimate relationship between start-up and creativity that has been confirmed by many research.

3.2. SWOT analysis of Vietnam start-up in the context of Industry 4.0

3.2.1. Strengths

Firstly, the stable macroeconomic environment has had a positive impact on the development of the entrepreneurial movement in the context of Industry 4.0. Vietnam's macroeconomic environment is considered to be stable. This will be a factor to nurture the expectations and determination to start a business for people. This helps startup enterprises secure their investment in start-up. Government is ensuring macro stability actively through the development and effective implementation of macroeconomic policies. According to the World Economic Forum in 2016, Vietnam is considered a stable macroeconomy and Vietnam's National Competitiveness Index is 4.7 (Le Duy Binh, 2017). In 2017, the legal corridor to support innovative entrepreneurship has also been improved when Congress adopts Technology Transfer Law, Small and Medium Enterprise Support Law. In this laws, there are many new regulations that support creative start-up. The number of venture capital funds and individual investors is higher.

Secondly, the start-up movement received strong support from the Government, ministries and social organizations. At present, the start-up movement is developing strongly and spreading to individuals in communities in Vietnam. At the Young Entrepreneurship Forum in 2017, Vietnam is the top position in Start up Spirit Index in the world. A survey of Startup Spirit was carried out in 45 countries with 50,861 respondents was sponsored by the Amway Group, Technische Universitat Munchen (TUM) and GfK market research firm. According to this report, Vietnam is the second about Positive startup attitude. This will be a strength for Vietnamese start-up.

Thirdly, Vietnam is being considered as a potential market for enterprises, especially technology startups. The world is witness the transformation of businesses in digitalizing enterprises. In developed countries such as Singapore, more than 60% of total payment transactions are without cash. As reported by the Ministry of Planning and Investment, in 2017, Vietnam has nearly 210 websites with operation related to e-commerce. E-commerce turnover in 2017 reached about 2.08 billions USD with 20% growth rate per year. The revenue of Vietnam's online advertising market in 2017 is about 76 millions USD, 36% of the total online advertising revenue were made through mobile phones. Specially, Vietnam has a very high rate of using smart phones, it is at over 80% in big cities and over 60% in rural areas. This is the initial basis for enterprises to take advantages and give solutions to encourage people increasing the demand for products. These figures show that digital consumption is driving business to transform digital models. This is a great opportunity for startups if they know how to fill the market gap for development in the context of Industry 4.0.

3.2.2. Weakness

Firstly, the legal system and administrative barriers. Government Resolution No.19 and Government Resolution No.35 are stepping up reforms in Vietnam's business environment. Reforms in many sectors continue to take place. However, the moves are slow and do not meet the startup's expectations. There are still many buracratic administrative procedures, hidden fees in the regulations, complicated procedures that make business environment unfavorable for startups. In addition, there are still many barriers in terms of business conditions, licenses, withdrawing capital... This makes investors reluctant to invest in Vietnam. According to statistics in 2016, the total investment in startups in Southeast Asia is about 1.5 billions USD. However, this figure in Vietnam is less than 100 million USD. 80% of the money is invested in Indonesia

and Singapore because of their supporting startup policies and attracting capital policies (Luu Gia Binh, 2017). In the next time, it is necessary to construct a suitable legal barrier and start-up ecosystem to support startups in the new context.

Secondly, the start-up education system. Start-up education is not focused properly. The two major constraints of the current education system are: Start-up education in universities has not paid much attention; training programs on start-up are not unrealistic, lack of practicality. Many students do not have opportunities to meet successful entrepreneurs when the students were in school to learn and share. Therefore, they can not find the right path for themselves.

Thirdly, the start-up's weakness

- The biggest barrier is English language. Many potential foreign investors have difficulty in communicating and understanding products and services of startup. Vietnam Startups are losing their opportunities to foreign startups due to poor English ability, inconfidence in communicating in foreign languages. In the context of regional and world integration, Industry 4.0 links nations closer together, this lack of basic skills is reduce the chances of accessing foreign investors and thus, reducing their competitiveness.

- Start-up enterprises are lack and weak about basic knowledge and legal knowledge. This is a hindrance to the success of startups. They are not good at financial knowledge while investors need a realistic business potential to make decisions on their investment. They are not good at legal knowledge so they are entangled in many issues such as lack of consideration of the type of company when established, no protection of intellectual property.

- Most of startups are in need of capital. The number of startups is increasing while the fund is dwindling. Besides, the investors also expect startup's development to a certain level and then put capital into so Start-up enterprises have to compete aggressively for capital.

- Enterprises have difficulty in branding. Many startups have new products, good quality, meet the need of consumers but they still have to close. Because the cost of marketing (television, radio, newspapers, radio, etc.) is very expensive. In addition, time and place restrictions affect negatively the choice of target customers, gather feedback, in-store survey.

3.2.3. Opportunities for Vietnam startups

In the context of Industry 4.0, Vietnam has achieved initial success in start-up and has a younger and more active star-tup generation. In addition to the advantage of technology boom, market opening, open management thinking, this startup generation also has the advantage of market when Vietnam opened widely into the world economy through a series of trade agreement from Asia to Europe. And they have more opportunities when the Internet, Smartphone booms in with the development of e-commerce. There are many successful startups such as Flappy Bird, Foody.vn, Haravan, Fibo... This has made Vietnam a bright spot in the technology start-up movement. Vietnam is a potential market for digital startup businesses. As reported by Vibiz, up to 2017, Vietnam has nearly 210 websites with content related to e-commerce. E-commerce retail sales in 2017 reached about 2.08 billions USD with the growth rate about 20% per year. The report also said that the revenue of Vietnam's online advertising market in 2017 is about \$ 76 million, in which 36% of online advertising market revenue is generated via mobile phones. These figures show that digital consumption is driving the business to convert digital models. This is also a great opportunity for startups if you know how to grasp the market needs to grow. Thus, the main opportunity of startups is

to grasp the market's need to deploy the business plan. Vietnam has a very high penetration rate of smart phones, 80% in big cities and over 60% in rural areas. However, this is only the initial basic, the important thing is that businesses need to take this advantage, offer solutions to encourage people to increase the demand for their products.

3.2.4. Challenges for Vietnam startups

According to the general assessment, the startup is still facing many difficulties. Because most of startups are often young, the financial resources are not many, the staff are not professional. Therefore, startups businesses are confused in the knowledge of administrative procedures, legal ... So Vietnamese market has very favorable opportunities for startups, but it is also difficult to orient, share practical experience from successful domestic and foreign startup companies. In other words, encouraging start-up spirit needs for more specific guidance and support such as: Offer ideas or projects to support capital, navigate young people to do and enable them to try their best. Thus, in the context of Industry 4.0, the biggest challenge for Vietnam to encourage startups is establishing a start-up ecosystem. At present, among these institutions, the government has a great influence on the development of start-up ecosystem.

Over the past 10 years, the Vietnamese government has made an effort to upgrade the the start-up ecosystem. For example, the launching of R & D form of public and private organizations, such as the National Science and Technology Development Fund (NAFOSTED) or the National Technological Innovation Fund (NATIF). This contributes to form of new businesses that might be applied research results. However, the development of the start-up ecosystem in Vietnam is still facing many difficulties. Firstly, the legal acts still refer mainly to enterprises in general, while regulations for startups (especially creative start-up) are quite poor absent. For example, venture capital funds - a new investment form in Vietnam do not have specific legal regulations. In addition, the legal mechanisms for recognizing the monetary value of intangible assets in a capital contribution, the mortgage loans or the protection of intellectual property rights for startups should be more specific.

Another sector which the government needs to pay attention to developing a startup ecosystem is start-up's finance. Most of start-up businesses have difficulty in accessing loan because the procedure is too complicated or they do not know bank's requirement clearly. According to the VCCI and USAID provincial survey on enterprise's competitiveness index conducted during the last 11 years shows that accessing to capital is always a top problem for startups. According to the results of the PCI survey in 2015, 35% of new startups which established within 3 years have loans from banks, while this figure for enterprises with the establishment time of more than 3 years is 53%. At the same time, the role of local governments for promoting start-up ecosystems also needs to be improved. At present, many local authorities do not have policies to improve the business environment to create favorable conditions for small and medium enterprises. Therefore, in order to build a good start-up ecosystem, local authorities must also take part and have detailed solutions with experts and the entrepreneurial community.

4. SOME SOLUTIONS TO ACCELERATE VIETNAM'S START-UP IN THE CONTEXT OF INDUSTRY 4.0

First, promote Industry 4.0 and increase the access to science and technology of startups.

This Industry is characterized by a combination of technologies that blur the boundaries between physics, digitization and biology. This is a trend that combines real and virtual systems, Internet of Thing (IoT) and Internet connection systems (IoS). Industry 4.0 is not only about the machines, intelligent systems and connection, but also it has a much broader scope. At the same time, there are waves of further

breakthroughs in different areas from gene sequence coding to nanotechnology, from renewable energy to quantum computing. Industrial 4.0 is the fusion of these technologies and their interaction in the fields of physics, digital and biology.

Second, focus on start-up education.

Human resource quality is one of the key elements of startups. Therefore, we need to focus to the start-up programs in tertiary education. Training programs should be consistent with the startup content, ensure the specificity and system. It should provides students with the knowledge of corporate governance and other soft skills to develop their startup ideas after graduation. Universities and training institutions need to re-evaluate the effectiveness of current curricula related to startups, including assessments based on student's feedback. Schools should organize events that invite business leaders, experts to talk to students, or even invite them to participate directly in teaching students, instruct students to participate their projects.

Third, build an suitable ecosystem and supportive start-up institutions.

The start-ups ecosystem includes the participation of various stakeholders and institutions. It implements three functional groups: (i) start-up functions (such as newly established startups), (ii) support functions (eg, government, universities, research institutes, expert advisors); and (iii) investment functions (via venture capital funds, angel investors, business promotion organizations). The interaction between stakeholders in the start-up ecosystem is extremely important to the development of startups. In these institutions, the government has a great influence on the development of start-up ecosystem. The government needs to review add regulations for startups support. We need display venture capital funds and have specific legal regulations for the fund to operate effectively. We need to enact the Law on Small Business Support, legal mechanisms for recognizing the monetary value of intangible assets in the capital contribution to establish the company, the mortgage loans or to protect intellectual property rights. It should be more specific regulation for start-up businesses.

Fourth, improve the financial accessibility of start-up enterprises, improve competitive power of start-up enterprises.

Establish channels to provide financial funds for start-ups such as loans from families, commercial banks, private equity or through angel investment funds and venture capital funds. Create mechanisms for start-up enterprises to prove easily the conditions to access these investment funds. In addition, the government should focus to financing of start-ups. Most of startups find difficulty in accessing bank credit due to complicated procedures or lack of collater which was required by the bank. Therefore, it is necessary to review the procedure of bank loan, make it easier for startups to access business capital.

Fifth, maintain a stable macroeconomic environment, guarantee the business freedom for startups.

A stable macroeconomic environment will nurture the expectations and determination of the people to start a business. This requires the government to formulate and implement effective macroeconomic policies that can manage the economy in a tactful and careful manner to help the economy not to fall into instability. It is difficult to imagine that the enthusiasm of the people, of young people will remain in an economy with high inflation rate, the bank interest rate is higher than the average profit, high rate public debt, unstable exchange rate and high budget deficits. The stability of the macroeconomy makes startups believe in the long-term future and be reluctant bet bigger in that future.

TRANSFER PRICING CONTROL AND THE PROBLEMS POSED IN THE FUTURE

Nguyen Thi Thuong Huyen*- Mai Thi Van Anh**

ABSTRACT: *Click here and insert your abstract text. Please provide an abstract of 150 to 250 words*

In today's globalized world, transfer pricing is a common practice that has negative impacts on all economies regardless of size and level of development, and becomes problematic for every country in the world in state management of the tax domain. A few decades ago, in Vietnam "transfer pricing" was still a new concept, now it is a popular activity not only for FDI enterprises but also in the domestic enterprises (or This is also called domestic transfer pricing). The purpose of the transfer pricing is to minimize the obligation to pay taxes within the enterprises, businesses to maximize profits based on preferential policies or tax differences between regions and countries. The progression of international integration promotes the rapid development of nations, but also presents new challenges, especially the fight against budget deficits. Transfer pricing is not only a form of large budget deficits but also distorts the business environment, creating inequitable competition among economic actors and containing many other risks.

Keywords: *transfer pricing; state management; tax policy; budget deficits.*

1. ABSTRACT

In today's globalized world, transfer pricing is a common practice that has negative impacts on all economies regardless of size and level of development, and becomes problematic for every country in the world in state management of the tax domain. A few decades ago, in Vietnam "transfer pricing" was still a new concept, now it is a popular activity not only for FDI enterprises but also in the domestic enterprises (or This is also called domestic transfer pricing). The purpose of the transfer pricing is to minimize the obligation to pay taxes within the enterprises, businesses to maximize profits based on preferential policies or tax differences between regions and countries. The progression of international integration promotes the rapid development of nations, but also presents new challenges, especially the fight against budget deficits. Transfer pricing is not only a form of large budget deficits but also distorts the business environment, creating inequitable competition among economic actors and containing many other risks. To minimize taxes, companies will transfer prices in the following forms:

- Transfer the price into the value of investment assets, in other words unifying the price of assets contributing capital above the market price in order to reduce the obligation to pay taxes in the future;
- Transfer price hidden in income: There are transactions which don't apply the market price in order to reduce tax obligations;
- Multidimensional transfer pricing: This is the type of which companies that deal with transactions which are not at market price to artificially illimate each other's finances and tax losses.

* Academy of Finance, Bac Tu Liem Dist., Hanoi, 100000, Vietnam

** General Department of Customs, Cau Giay Dist, Hanoi, 100000, Vietnam

- Transfer pricing through other forms of trade: This is the most common form of transfer pricing that requires effective measures to increase revenue for the budget avoiding tax losses due to transfer pricing.

Vietnam has made great efforts to develop and promulgate a number of policies and guidelines to establish and gradually complete the legal framework for anti-price transfer, anti-state budget revenue loss, conduct certain legal basis for the operation of the tax department in the fight against transfer pricing by enterprises. However, the legal framework on anti-price transfer in Vietnam is still lack of synchronous, unopposed holes, low effectiveness. The practice of transfer pricing law is ineffective, the validity is not high. To minimize the impact of transfer pricing that has been occurring and to ensure the commitment of the Government of Vietnam to an open, healthy, transparent and fair business environment for the success of every business. and to avoid losing State resources, it is necessary to clarify the role of the State management agencies in the control and anti-price transfer.

In the context of international economic integration, with the difference in tax rates and preferential tariffs among countries, the issue of transfer pricing avoids tax not only in Vietnam but also in many countries. In the world, including developed countries, this is a hot issue and is being discussed at many international conferences such as the G8, the G20, the International Tax Forum ... for decades.

According to international practice, price transfer is understood as the implementation of price policy for goods and services transferred among group members across the border not at market prices in order to minimize the payable tax amount. , maximizing the profitability of multinational companies across the globe. To do this, multinationals often take advantage of differences in tax policies between countries / territories and take advantage of tax incentives of countries / regions and regions to build and enforce a policy of internal transaction prices within the corporation. Accordingly, transfer prices among members within a corporation can be set at a high or low (relative to market price) to transfer profits to the place where they wish to pay taxes (usually where the tax is low level or where they are entitled to tax incentives).

Price transferring only makes sense for transactions made between affiliated entities (affiliates). The basis for determining the linkage between entities is the control, management, operation or capital contribution. These are the determinants of affect, the harmony of the interests of the subject. On this basis, affiliates can be formed in the same country or in different countries. Therefore, in principle, the transfer does not only take place in international transactions but also in domestic transactions. In practice, however, price transfer is often focused on international transactions due to differences in tax policy among nations. For countries where tax incentives are available, domestic parties may benefit from preferential treatment and exemption by transferring income from non-preferential business to the associated party. Preferential treatment or transfer of income from the less privileged enterprise to the related enterprise is entitled to higher incentives. Thus, although most countries now only regulate transfer pricing for international transactions, a few countries (China, Vietnam, India) apply the transfer pricing rules with both domestic transactions to ensure equality in the performance of tax obligations, equality of interests and create a healthy competitive environment.

In Vietnam, transfer pricing of affiliated companies is a potential risk to the domestic economy when it leads to unequal competition and causes tax losses to the state budget. Determining the reasonable transfer price (transfer price) in order to resolve the conflict of interests between the enterprise and the tax authority in determining the amount of enterprise income tax to be paid annually. The determination of the transfer price also aims to clarify the taxation rights of a country or territory with income streams arising in the course of business of affiliated companies. Restrictions on transfer pricing require a separate legal framework. The

tax administration policy of transfer pricing should complement legal documents that provide the basis for proper regulation of transfer pricing in line with international practices.

1. LEGAL FRAMEWORK ON TRANSFER PRICING

The Ministry of Finance has internalized international regulations and practices such as the Organization for Economic Co-operation and Transparency (OECD), proposed erosion control and profit transfer (BEPS), The GATT Customs Valuation Agreement, ... in the legal framework on anti-price transfer in the Decrees and Circulars guiding the implementation, particularly:

In addition to the circular issued in previous years, the year 2017 marked a major turning point in the regulation on determining the market price in related transaction (GDLK) in Vietnam. The Government has assigned the Ministry of Finance to present tax reform programs and to update current tax regulations, taking into account action plans against erosion of the tax base and the transfer of profits abroad (“BEPS”) as recommended by the Organization for Economic Co-operation and Development (OECD). Since July 2013, the OECD has enacted 15 action plans to combat erosion of tax bases and offshore profit transfers (“BEPS”), validated by G20 nations, to identify and limit positive taxation and modernization of the international tax system. In particular, Action Plan 13, issued on 5 October 2015, provides a three-tiered approach to developing related transaction pricing records, along with an implementation plan which aim to suggest Tax authorities in countries around the world in the management of enterprises carrying out related transaction. Many countries have adopted or are willing to apply changes in the international tax system based on OECD recommendations.

In that context, on February 24, 2017, the Government issued Decree 20/2017 / ND-CP regulating tax administration for enterprises with related transaction (“Decree 20”) and Circular 41/2017 / TT-BTC (“Circular 41”) guiding the implementation of a number of articles of Decree 20 effective from 1 May 2017. This is the first time in more than 10 years that the management of transfer pricing has been upgraded from Circular level to Decree level, reflecting the Government of Vietnam’s interest, as well as the demand for the coordination of all line ministries in the management of transfer pricing.

Decree 20 considered BEPS action programs, including Action 4 - Eliminate erosion of tax base by deducting interest and other financial payments; Action No. 8 - Ensure the transfer price allocation matching the value created - Intangible assets; Action 9 - Ensure distribution of transfer prices in line with value created - Risk and capital; Action 10 - Ensure distribution of transfer price in line with value created - High risk transactions; and act No. 13 - Revising the valuation records of the related transaction price.

On the other hand, these documents provide for “anti-price” measures to be taken by the tax administration to adjust rates or rate of return for cases through inspections. Detect unreasonable price or profit margins in business transactions between affiliated or predetermined companies. The approach to the problem of transfer pricing has made certain changes, moving from a tendency “against” transfer pricing to the propensity accepted as objective phenomena of integration issues of international economic and change. The term “measure against price transfer” to “measures to determine market prices in transactions between affiliated enterprises”. Along with the integration of the international economy, the management of related transaction policies is increasingly improved and modified to suit the business practices of business and management practices of the Government. With the trend to apply the mechanism of self-assessment and self-payment of taxes, the valuation related transaction have shifted from management measures of the tax administration to the obligations of self-declaration and self-determination of the taxpayer. Taxpayers

involved in joint transactions shall themselves determine market prices and declare and adjust taxable incomes at market prices when finalizing enterprise income tax.

In other words, the legal framework for associated transactions is now more specific, transparent, detailed and complete, and more in line with international norms, as well as clear responsibilities, the compliance obligations of businesses related to transfer prices change significantly, stipulates regulations on coordination between the authorities concerned with the tax authorities in the fight against transfer pricing, especially the coordination of diplomatic missions of Vietnam abroad.

3. DATABASE FOR TRANSFER PRICING CONTROL

Agency Tax administration has been gradually building a database of business does not arise affiliation (now independent) to service inspection transfer prices for industries with high risk which can abuse the transfer pricing, avoid corporate income tax (CIT) such as garment, footwear, beverage production, fish feed production, electronic components production ... In addition, the tax authorities are also researching the trial The commercial database of some international organizations such as Beure van Dijk, Thomson Reuter. After the end of the trial, the review, evaluation and proposal for a commercial database will be considered on the basis of the cost and efficiency of this commercial databases. In addition, the customs data system seems to be more complete, for example, the GTT02 tariff data system, which regularly publishes the risk management list attached to the price as the basis for reference, reject the declared value of the business which is not accurate. The regulations on coordination of data supply and information between related agencies and the customs law also fully regulate the function of buying information, investigation ...

From these advantages, in the period from the year 2015-2017 was initially obtained positive results, in particular¹:

As of December 31, 2017, about 600,000 enterprises are operating. Of which, 4,720 businesses have related transactions.

- In terms of turnover, the number of enterprises with turnover threshold > VND 2,000 billion is 240 (accounting for 5.08%); Turnover from VND 1,000 - 2,000 billion was 233 enterprises (accounted for 4.94%); from VND500 - 1,000 billion, 303 enterprises (accounting for 6.42%); from VND110 - 500 billion are 1,179 enterprises (accounting for 24.98%); From 0 to 100 billion dong, there are 2,339 enterprises (accounting for 49.56%), from 0-5 billion dong (908 enterprises) (accounting for 19.24%) (about 5 enterprises accounted for 0,11% has negative turnover, this might be the system error or incorrect declaration by the enterprise).

- On the results of production, the number of business with profits equal 0 is 210 businesses (representing 4.45%); the number of profitable business is 2,809 businesses (representing 59.5%) and the number of enterprises suffering losses is 1,684 (representing 35.7%).

- In 2015, the inspection and examination of 4,751 enterprises have suffered losses, signs of transfer of prices and enterprises engaged in related transactions, reducing losses of 10,050.17 billion; Collection, retrieval and fines of VND 1,062.74 billion; Deduction is VND 302.91 billion; the tax amount paid to the state budget is VND 887.74 billion.

- In 2016, the tax authorities inspected 84,472 businesses, found 329 enterprises have related transactions, tax authorities at all levels have collected, retrieved and fined 607.52 billion, reducing losses VND 5.612,21 billion, retrospective collection of VND 17,164 billion.

¹ Source: General Department of Taxation

- In 2017, the tax authorities at all levels have conducted inspection and examination of 734 enterprises has related transaction activities; collection, retrieval and fine of VND 2.270,58 billion; a loss of VND 7.416,54 billion; increased taxable income of VND 4.134,73 billion.¹ The tax audit is expected to be stronger in the coming years, aiming to achieve fiscal targets to reduce the budget deficit to acceptable levels (3.5% of GDP by 2020 according to the National Financial Plan approved by the National Assembly under Resolution No. 25/2016/QH14).

- The application of price determination method to adjust associated transaction prices for enterprises is as follows: 13 enterprises applying the comparison method of independent transaction prices; 45 enterprises applied the resale price method; 06 enterprises apply cost plus method; 40 enterprises applied the profit comparison method; 02 enterprises applied two methods (each applied a different method), 20 enterprises applied the integrated measure.

However, the results are not satisfactory in comparison with the difficulties in the future. The question that always comes to the tax administration is how can we effectively combat the transfer of prices of foreign invested enterprises in Vietnam while their operations increasingly sophisticated. The most recent example is a series of companies like Coca Cola, Grab, The state budget lost hundreds of billions of VND. According to statistics, in December 2017, about 50% of FDI enterprises declared losses, many of which suffered losses in consecutive years. Nearly 60% of 3,500 FDI enterprises in Ho Chi Minh City. In Lam Dong, there are 104/111 FDI enterprises and 50% of FDI enterprises in Binh Duong province regularly declare losses, report losses through many periods or the rate of return on revenue is extremely low. However, these companies have been continuously expanding their production scale, promoting advertising and developing markets, in particular²:

Grab: From 2015 up to now, Grab reported financial losses, in which, Grab has legal capital more than 20 billion VND but accumulated losses of nearly 1000 billion VND.

Coca Cola to March 12/2017 has reported losses of more than VND 4,000 billion, surpassing the 3,500 billion VND charter capital where Coca-Cola has invested in Vietnam. According to statistics from the Tax Department of Ho Chi Minh City, Coca revenue within 3 years from 2014-2017 had increased from VND 2,500 billion turnover to over VND 3,000 billion.

Metro Cash & Carry after over 10 years of operation in Vietnam, has been collected nearly VND 600 billion...

Hualon Corporation Vietnam. This is a 100% foreign invested company from Malaysia, Taiwan - British Virgin Island specializing in producing yarns and weaving fabrics. During nearly 20 years of operation in Vietnam, Hualon continuously reported losses. By the end of 2010, the company's accumulated losses reached over VND1 trillion and Hualon had never paid corporate income tax. Despite the losses, the company is still expanding production. Through inspection, the General Department of Taxation has forced the company to reduce all losses. In which, cut loss of the hole of the stage of the 2006-2009 to VND 621,1 billion, move the loss of the period prior 2006 to the 2006-2009 period and continue to move the loss of VND 335,2 billion to the 2010 period. As a result, Hualon has a large profit and total retained earnings of VND78.1 billion. After inspecting in 2014, the General Department of Taxation requested Metro to adjust losses, deductions and tax arrears totaling VND 507 billion³.

¹ Statistics, General Department of Customs, [https://www.customs.gov.vn/Lists/ThongKeHaiQuan/ViewDetails.aspx?ID=1038&Category=Phân tích định kỳ&Group=Phân tích](https://www.customs.gov.vn/Lists/ThongKeHaiQuan/ViewDetails.aspx?ID=1038&Category=Phân%20tích%20định%20kỳ&Group=Phân%20tích)

The transfer of prices of FDI enterprises is expressed in the form of raising the input price such as the value of investment in equipment, materials, tools and tools and reduce the output price, of FDI enterprises in consecutive losses; Create “unreal value” for fixed assets, increase the depreciation rate into expenses, distorting total FDI when disbursing. Acts of transfer pricing and focus on industries that Vietnam has advantages compared to other countries in the region and the world that the industry uses more labor, such as textiles, footwear, manufacturing electronic components...in particular, textile and garment industry is 404 enterprises (accounting for 8.56%), electronics manufacturing sector is 211 enterprises (4.47%), plastic products industry is 210 enterprises (4.45%), footwear industry is 146 enterprises (accounting for 3.09%) ...¹

The way of doing business of FDI enterprises makes the market capital goods and domestic consumption market subject to high prices unreasonable. On the other hand, high import prices due to price transfer have eliminated the price advantage from import activities, making the price of artificially high, as a result the prices of many goods and services in Vietnam are much higher than those of other countries in the region, limiting the competitiveness of Vietnamese enterprises and foreign enterprises in the region, creating an unfair competition market between businesses. Because of the advantage of abundant investment capital, multinational companies easily take over the local companies through aggressive advertising and promotional campaigns leading to market manipulation. Domestic companies do not have enough financial resources to compete, so they gradually weaken and can go bankrupt, change their industries and products, while multinational companies gradually manipulate the domestic market, take the advantage of monopoly pricing.

The inevitable consequence of price transfer to the macro economy receiving investment is that the macroeconomic policy-making process is in trouble, and the domestic industry is slow to develop, especially causing damage to domestic consumer, the economy of the receiving country gradually depends on and is dominated by other countries.

Consequently, the transfer pricing of FDI enterprises creates many negative impacts on the national investment market such as reducing tax obligations on the State, changing the structure of trade transactions, false misleading capital cost in the distribution of benefits, creating the ability to dominate, win market share as well as takeover partner at the lowest cost.

4. CAUSES

First, the legal framework against transfer pricing in Vietnam is not complete. At the level of legal documents, regulations on transfer pricing and anti-price transfer is not really complete and clear. At the law level, only Clause e of Article 37 of the Law on Tax Administration stipulates that a relevant content can be used as the basis for combating price transfer. In addition, the provisions on transfer pricing have just stopped at the circular level and recently the decree level, thus it doesn't have high legal effect, causing difficulties for the implementation process. There are no clear regulations on state budget expenditures for anti-price transfer (expenses for buying information, investigating costs, verification ...); there is no coordination mechanism between relevant agencies (police, economic counselors) to help the tax division collect information for anti-price transfer activities; no specialized agency transfer pricing at the central level in order to direct the work smoothly transfer pricing at the national level and the direct handling of information issues at the international level; there is no tax investigation function, the current coordination mechanism does not allow this agency to conduct investigations and deal with complex and wide-ranging violations involving partner outside of Vietnamese territory.

¹ Assessment Report of the General Department of Taxation in 2016

Second, the database system has not built up a data system adequate information on taxpayers in general and in service activities in transfer pricing in specific, and there are no diversified and up-to-date sources of information from state management agencies and other sources of information, there are no specialized unit is equipped with the knowledge and capacity to investigate and collect information for tax inspection activities in general, and against the transfer pricing in particular at the national level, and directly address information issues at the international level.

Currently, the authorities (such as the tax authorities, financial agency pricing, statistics, auditing agencies, customs) hardly built up a database of transactions between independent companies and affiliated companies. Therefore, when evaluating an internal sale transaction, functional agencies find it difficult to find reference prices to compare and impose real transactions, especially difficult when dealing with oversea affiliates and services with specific nature.

There are not enough data information of independent auditors as the basis for determining the market price, specifically:

From the perspective of the taxpayer, in the implementation process and problems encountered great difficulty in finding comparable data information by the information publicly available is very limited. The size of the stock market in Vietnam is small, the number of listed companies on the stock exchange is not much, so it is often necessary to use the commercial database at a very high cost. This sometimes causes the cost of compliance to exceed the financial capacity of the business, especially the microenterprise.

From the perspective of the tax administration, in fact, during the inspection of transfer prices in enterprises, the tax agency use the internal database of the tax department (the data of the independent enterprises shall report according to the prescribed regime and send it to the tax office) to use as a basis for fixing the taxable income of the enterprise. When conducting the inspection, the inspection team wants to publicly disclose the enterprise name and business results data as evidence and on the basis of convincing the enterprise, but it must stipulate the responsibility of the tax agency to keep confidential information of taxpayers in accordance with the Law on Tax Administration. Commercial databases (purchased from companies with trading functions) have not yet purchased and there is no survey on these database sources. From the perspective of customs, although the database system is complete, however, when comparing the price data declared by the enterprise with the price database collected by the customs authorities, there is still a big difference, enterprises with associate transactions often report higher import prices of 10-15%¹ compared to normal trading enterprises, often listed as risky and need to manage.

Meanwhile, the full database and reliable with very positive influence to control the state of transfer pricing activities. The development of the current block chain facilitates the storage of large data as a basis for referencing and controlling the value of transfer in the market.

Third, there is not enough qualified human resources and facilities; tot yet established a good inspection department on transfer pricing; not regularly update knowledge and professional skills, foreign language and computer skills for tax officials and related industries such as customs and finance; inspection, post-inspection and price consultations have not been concentrated and promoted, especially with enterprises showing signs of transfer of prices, such as foreign enterprises with many member companies; Enterprises are enjoying many tax incentives; enterprises have a large capital structure and export and import activities make up a high proportion; enterprises have been restructured and able to take advantage of transfer pricing to avoid tax ...

¹ Source: General Department of Customs

Fourthly, coordination among state management agencies has not been paid due attention due to lack of specific regulations on coordinating responsibilities of each agency. Especially, when the tax office does not have the function of investigating taxes, the current coordination mechanism does not allow this agency to conduct investigations and deal with complex and wide-ranging violations which related to partners outside the territory of Vietnam.

5. THE PROBLEMS OF TRANSFER PRICING CONTROL IN THE NEW SITUATION

First, the need to complete the legal framework.

Although the Ministry of Finance is drafting a law amending the tax laws, including the Enterprise Law, Value Added Tax Law, Special Consumption Tax Law, Natural Resource Tax Law and Tax Administration Law (amended plans to add a new chapter on e-transactions to improve the regulations on tax administration for enterprises with associated transactions to prevent transfer pricing, (ii) There are specific legal regulations on State budget expenditures for activities of examining, inspecting and controlling transfer pricing; Improve regulations on coordination between the authorities concerned with the tax authorities in the control of transfer pricing, particularly the coordination of the diplomatic missions of Vietnam abroad.

However, in the long run, it is necessary to develop a separate law on transfer pricing, which should specify the contents of the tax investigation, which may in the short term only assign the right to investigate the tax authority at the General Department level, when the tax officials trained and fostered to meet the requirements of the investigating function may extend the investigation authority to the provincial tax authority. The assignment of the right to investigate not only helps the tax authorities have good conditions for transfer pricing control but also facilitates the effective administration of taxation in general. This is the most important legal basis for anti-transfer pricing, not only has implications for the management of enterprise income tax, but also related to the management of value-added tax, special consumption tax, ... and amendment of legislation such as: Investment Law, Commercial Law, Competition Law, Civil Law, Foreign Trade Control Law ... Currently, there are many countries in the world have laws on transfer pricing and the national council on managing transfer pricing to prevent transfer pricing behavior. In Southeast Asia, a number of countries have developed and implemented the Anti-Transfer Law for many years (Malaysia, Thailand, Indonesia ...)¹.

Secondly, it is necessary to have budget to build a database in order to effectively combat the transfer pricing. A database is a very important factor in whether or not a successful anti-price transferring investigation. Therefore, every tax office must build, update, exchange, collect, buy information ... to get a database of transfer prices in full and updated. In general, every country has to invest financially, time and human resources satisfactorily for the task of building a database that attracts foreign investment by what is the right of the nations.

In recent times, many countries have signed several agreements with bilateral or multilateral exchange of information on the implementation of the tax liability of a taxpayer in the country of residence. This information will allow countries to obtain official data on transaction prices as a basis for taxation in countries around the world. Official data from countries and from transfer pricing controllers will be compared, screened, analyzed and processed to be officially recognized as official databases in order to measure for identifying transactions between bonded parties is transfer pricing. This database is updated continuously with the cycle of every sixth month to ensure the aptness of the market. This facility may,

¹ Experience of some ASEAN countries

in some cases, be an open source data source for any referral without regard to the business secrets of the controlled entities or collected to form a database. Therefore, the data that is open source for reference may be average values processed without specificity to ensure the confidentiality of the data sources provided except to the extent that they are used to adjust for specific cases involved.

For Vietnam, it is necessary to design a database structure for transfer pricing control of enterprises, specifically: Financial report data; Data on the transaction price of the goods or services, including intangible goods and specific services such as copyright; securities, interests, transfer of land use rights; Other relevant data such as: Attachment to associated transaction information, publicly disclosed data, indictment, investigation information, press information ... In addition, the requirements for an enterprise data transfer pricing control database must be adequate, accurate, convenient, speedy, flexible, timely, and easy to extract in common forms such as Excel file, Word file.... Organizing the collection of information for the enterprise's information on transfer pricing (functions, apparatus, procedures, financial mechanism, coordination mechanism in collecting information). At the same time, manage and exploit information database to control the transfer pricing of enterprises (regulations, methods in the confidentiality of information, data, in the exploitation of information and data and in the handling of violations against database extraction).

Therefore, in the future, it is necessary to intensify and expand international cooperation with foreign tax administration agencies in order to exchange and collect necessary information for evaluating transactions with foreign affiliates.

Thirdly, to have a team of expertise with in depth experience, we need to learn from the experiences of other countries, actively participate in the programs of action of international organizations.

Rather than being a place for transnational firms to transact, Vietnam should actively participate in the BEPS Action Program; attend economic forums on anti-price transfer and tax fraud prevention to coordinate information exchange with tax authorities in countries around the world. In line with the legal framework on transfer pricing in a transparent, consistent international practice, it is necessary to promote propaganda to raise awareness of taxpayers in compliance with tax law.

Due to the phenomenon of transfer pricing has been relatively widespread and increasingly sophisticated and harder to detect, the tax department needs to prepare additional force tax officers whom in capable of professional, using foreign language and informatics work of tax administration for transfer pricing activities at all levels; provide more trainings for this team on transfer pricing management skills, including practical exercises linked to reality, opening specialized training courses, equipping them with knowledge on sectoral economics, skill training informatics, foreign languages; organizing conferences and seminars for tax departments to exchange experiences in tax administration for transfer activities; organizing the survey, learning experiences of inspecting and examining transfer prices in countries that have gained a lot of success in tax administration for transfer activities. Advanced the automated information system in tax declaration. The information system on taxpayers should be supplemented with important supporting information and application development in order to serve the risk analysis and inspection of transfer prices. In addition to the separate database of the tax department, the tax authorities coordinate with the concerned agencies to build a common database, which allows enterprises to access and collect information for the construction of the transfer pricing document, provided to the tax office upon request. The economic management agencies of Vietnam, particularly the tax and customs agencies need to exchange experience with other countries. It is important to coordinate with the regulators to take action against the transfer pricing actions that MNCs cause to adversely affect the economies of other countries.

Fourth, the need to understand the business results of the enterprise.

Urgently review the FDI, the economic group of multi-national enterprises, multi-field to identify the focal business is the associated parties, as a basis for planning, identify the necessary to conduct tests and inspections synchronized, focused, according to the content of key thematic requirements of transfer pricing, sorting FDI to research the basic criteria, such as: Profits, business losses, state budget remittances, preferential policies being enjoyed, capital size, land area being occupied, labor force, investment situation ... Prioritize pre-reviews for businesses that have suffered losses for years or no revenue; enterprises have losses but continue to invest in expanding business scale; carry out performance analysis and compare with domestic enterprises of the same size and position to work out the proposal and propose to be included in the inspection and examination.

Fifth, there should be multi-dimensional information, support from various sources to improve the legal system.

Regulators such as the Ministry of Planning and Investment, the Ministry of Industry and Trade, the Ministry of Justice and business associations to identify inadequate legal and tax regulations on market management, penalties for administrative violations, etc., to indicate obstacles and difficulties of anti-price transfer work that need to be corrected in the long run; at the same time, concrete measures within the framework of the current law can be implemented immediately, the examination and inspection of transfer pricing, clarify of the coordination between the administrators State management in relevant areas in price transfer control. On the basis of the Double Taxation Avoidance Agreements and tax evasion prevention assistance signed with other countries, it is necessary to develop a process of coordination and assistance to deal with taxation, foreign affairs, Planning and Investing in Investigation of Transfer Pricing, Dispute Resolution, Price Fraud ...

Vietnam is calling for foreign investment; many foreign companies have opened branches operating in our country. In contrast, many Vietnamese businesses have opened branches overseas. These companies choose transfer pricing based on which is a matter of concern, because they not only affect the interests of enterprises, but also affect the national interest. Through the experience of some ASEAN countries to draw useful lessons when applying into practice the legal framework, soon build anti-transfer pricing law and business environment in Vietnam in the management and anti-price transfer. At the same time, application of practical experience, OECD methodologies are accepted such as the method of comparing free market prices, the method based on the selling price, the cost plus cost method, method of profit distribution, method of profit from trading. It is necessary to have measures and remedies strong enough to handle acts of transferring or evading taxes. The law of the countries in other region provides for strong measures and remedies for transfer pricing, such as Singapore, which stipulates that the overall penalty for tax violations is between 100% and 400% of the tax pay; Indonesia applies a penalty of 2% to 48% per month on the amount of tax paid due to fraudulent transfer; Malaysia specifies that the level of taxation varies between 100-300% of the tax found fraudulent, and discloses the identity of the transferees.

Sixth, a transfer pricing dispute resolution mechanism should be established.

The pricing control process is, of course, likely to lead to conflicts because it interferes with the process of creating the interests of state actors transferable (income) or related entity (loss of income). Such conflicts often arise from the decision to deal with the transfer pricing applicable to the transferor of the competent state authority. So when there is a dispute about the transfer, the plaintiff will be the subject of the transfer and the defendant will be the state management of the transfer.

The resolution of transfer pricing disputes by administrative mechanism and the mechanism by court proceedings. In some countries, separate tax court is set dedicated to reviewing tax cases. According to legal practice in Vietnam, in this case, proceedings under the jurisdiction of administrative courts. However, tax cases, especially those involving transfer pricing, are complex issues which require professionalism not only in law. In addition, taxes are a duty prescribed by the constitution, so that acts that do not comply with constitutional provisions are considered unconstitutional. Therefore, the adjudication of transfer cases is also based on the importance of the level of the infringement.

Seventh, the valuation method (APA) should be applied.

In order to limit transfer pricing and appropriation of funds, many countries have already implemented a prior agreement mechanism on price-fixing (APA) An effective measure for anti-transfer pricing management besides inspections. This is an agreement between tax authorities and taxpayers on the method of determining the transaction price, just trading enterprises under the agreed price, the tax department will be detected immediately.

APA is usually defined before the transaction between affiliates and is a form of three to five years commitment of the investor to the price as a basis for determination of tax obligations and the tax authority performs the role of the supervisor of the implementation of this commitment. APA has many benefits for enterprises as they will be more secure in terms of market price determination. There are two commonly used APAs, APA unilateral and APA bilateral. APA unilaterally is an agreement between the tax authorities and the business, providing assurance that the tax authorities will not inspect transactions that apply the methodology specified in the APA.

The bilateral APA is an agreement between tax authorities in different countries to fight price shifting because of global price movements, not just in one country. The bilateral APA will ensure that both parties pay the tax as both the tax authorities in the two countries agree to the agreed price in advance of the APA. However, bilateral APAs can only be applied to transactions between affiliated parties to taxpayers, tax authorities of countries and territories where Vietnam has signed the Avoidance of Double Taxation Agreement. There is another type of APA multilaterally between tax authorities and between many taxpayers. Multilateral APAs are complex but increasingly popular. If the APA is implemented, the tax office reduces the pressure of inspection and may use the data in the APA to conduct anti-transfer tariff inspection.

CONCLUSION

Over the past twenty years when the problems associated transaction was first mentioned, and more than ten years when the first text on the management of the transfer was made, today the construction corridor, the legal basis on transfer pricing has been raised to a new height as well as more in line with practical requirements as well as deeper integration with international practices. However, the new regulation also creates a heavy burden of compliance for businesses. In addition, restrictions on the management of transfer pricing and the implementation of other measures to manage transfer prices now result in a lack of transparency and less favorable business environment for businesses. To minimize the impact of transfer pricing activities have been taking place and ensure the commitment of the Government of Vietnam on an open business environment, healthy, transparent and fair for the success of every business and avoiding the loss of state resources, it is necessary to clarify the role of the State management agencies in the control and anti-price transfer and to develop a modern tax administration system. , effective, transparent, necessary to have the coordination and effective implementation of solutions from the enterprise.

On the other hand, with the rapid development of the “shared economy” and the Industrial Revolution 4.0, which directly affects the mode of production and distribution between economic entities, the price transfer is remain complex, sophisticate and incessant increase not only in FDI enterprises, but also in domestic enterprises posed no small challenge to the state management of transfer pricing. Therefore, the anti-price transfer must be studied and reviewed in a systematic and rigorous manner, thereby resulting in a more efficient and quality organization, thereby contributing to control strictly the transfer price of the enterprises, to combat the loss of state budget. The problems in the process of transfer pricing should be clarified from the legal issues to the objectives, content, scope, methodology and implementation to ensure effectiveness and efficiency.

Therefore, anti-price transfer work needs to be discussed and implemented in a formal, systematic manner, fully in line with its nature in order to improve the rule of law, strengthen the role of State management agencies leading to the state management of transfer pricing still many inadequacies and limitations.

GREEN FDI AND SUSTAINABLE ECONOMIC DEVELOPMENT IN VIETNAM

Bui Thanh Huyen*

ABSTRACT: *After 30 years, foreign direct investment (FDI) has made significant contributions to the Vietnamese economy and become a critical source of funding for economic development. However, there has been increasing awareness of the drawbacks of FDI which does not always contribute to advancing sustainable economic development in host and home countries. Therefore, like many other countries, Vietnam is facing the difficult problem of how to attract and utilize efficiently FDI inflows while minimizing the negative impact of this investment. In efforts to achieve the sustainable development goals, the concept of “green FDI” and the role of FDI in promoting the transition to a sustainable economy have been concerned over the world. There are many questions about green FDI and its implications, opportunities and challenges that Vietnam faces in attracting FDI and moving towards sustainable development. The paper clarifies those issues and makes some recommendations to support Vietnam to efficiently and effectively attract and use green FDI in line with sustainable development objectives.*

Keywords: *FDI, green FDI, sustainable development, Vietnam*

The actual and potential role of FDI in achieving the transition to a low-carbon and sustainable world

1. INTRODUCTION

Over the last 30 years since the Foreign Investment Law was passed in 1987, the foreign direct investment (FDI) inflows into Vietnam has tended to rise over time, increasingly asserting an important role in achieving the objectives of real economic development in Vietnam. From a poor country, Vietnam has become a middle income country in the region, as well as one of the most attractive destinations for foreign capital. In the 12 months of 2017, the total registered capital of foreign investors reached US\$ 35.88 billion, presenting an increase of 44.4% over the same period of 2016.

According to data released by the Ministry of Planning and Investment, by the end of 2017, the country has 2,591 new projects licensed with a total registered capital of US\$ 21.27 billion, an increase of 42.3% over the same period of 2016. There are 1,188 projects registered to adjust investment capital with the total registered capital increased approximately US\$ 8.41 billion, up 49.2% over the same period of 2016 and 5,002 capital contribution, share purchase of the first with a total capital contribution of US\$ 6.19 billion, up 45.1% over the same period of 2016.

The statistics show that FDI continues to be significantly poured into Vietnam following efforts to improve the investment environment of the government of Vietnam as well as the opportunities created by Vietnam’s participation in Free Trade Agreements (FTAs), including the Vietnam-Korea FTA, the Vietnam-EU FTA, the Trans-Pacific Partnership Agreement (since March 1818) and the Comprehensive Partnership Agreement Transpacific Progress - CPTPP) ...

* Academy of Finance, Viet Nam, Academy of Finance, Viet Nam. Tel: +84916019556. Email: huyenbui.1410@gmail.com.

However, in parallel with the fact that FDI projects have been increasingly implemented with the huge amount of capital in Vietnam, the issue of sustainable development is still concerned by the authorities and public opinion. FDI is one form of international finance flow that has played increasingly critical role in financing development, but also imposed significant social and environmental impacts, both potentially positive and negative. Therefore, efforts to clarify contributions of FDI, as well as to manage its activities and impacts, and to leverage it are essential contributors in the transition to a sustainable economy.

2. FUNDAMENTAL ISSUES OF FOREIGN DIRECT INVESTMENT (FDI)

2.1. Foreign direct investment (FDI) and the role of FDI in Vietnamese economic development

According to the OECD, FDI refers to an investment made by an individual or multinational enterprise of one country with the objective of establishing a lasting interest (ownership or controlling interest) in an enterprise located in another country. Generally, FDI includes a parent company's establishment of a foreign affiliate or one company's takeover of another company in a foreign country. It is a long-term investment with high stability, bringing both positive and negative impacts on Vietnamese economy.

In terms of benefits, *firstly*, FDI contributes significantly to capital needed for the socio – economic development. *Secondly*, FDI also contributes to economic restructuring. Over the years, FDI has played an important role in the growth of the economy in general and of the industry in particular, with the emergence of a range of factories and industrial zones. By the end of year 2017, foreign investors have invested in 19 out of 21 sectors in the national economic classification system, of which the processing and manufacturing industry sector accounts for the highest proportion with US \$ 186.1 billion, accounting for 58.4% of total investment.

Forthly, FDI contributes significantly to upgrading the export-import turnover, as that foreign investment might help boost export activities, thus increasing export value. According to statistics by the General Department of Customs, the value of goods exported by FDI enterprises in the first nine months of 2017 totalled US\$ 109.1 billion, leading to a sharp increase of 21.4% compared to the same period last year, and accounting for 70.7% of total export turnover of the country. FDI businesses have played an increasingly important role in the export of goods in Vietnam; and in particular, the groups of processed and assembled goods, including telephones of all kinds and accessories, computers, electronic products and components, textiles etc., have made a substantial contribution to the growth of export turnover. In 2017, the export – import outcomes of foreign invested enterprises accounted for 65.5% of the total export - import turnover of the country, and reached 278.56 billion, rising by 23% compared to last year. Specifically, exports of FDI enterprises reached US\$ 152.19 billion, up 22.9% over last year; while imports reached US\$ 126.37 billion, up 23.4%. Hence, trade surplus of FDI enterprises increased by 20.4% to US\$ 25.82 billion.

Forthly, FDI inflows promote innovation and technology transfer. Together with the capital investment in the fields of industry and services, FDI also contributes to promoting the transfer of advanced technologies into Vietnam, as well as developing some important economic sectors such as telecommunications, oil and gas exploitation, chemicals, electronic engineering, information technology, automobiles and motorcycles... Thanks to FDI, businesses have created many quality products to meet domestic and export demand, contributing to restricting imports, thus helping to improve the trade balance. In addition, FDI also brings about competitive pressures, which in turn could encourage and motivate local firms to innovate and upgrade their production facilities and efficiency. The presence of large corporations such as Intel, Samsung, Canon, Toyota, Honda ... with high and new technology projects open opportunities to improve the quality of FDI flows, thereby meeting the needs of industrialization - modernization and sustainable

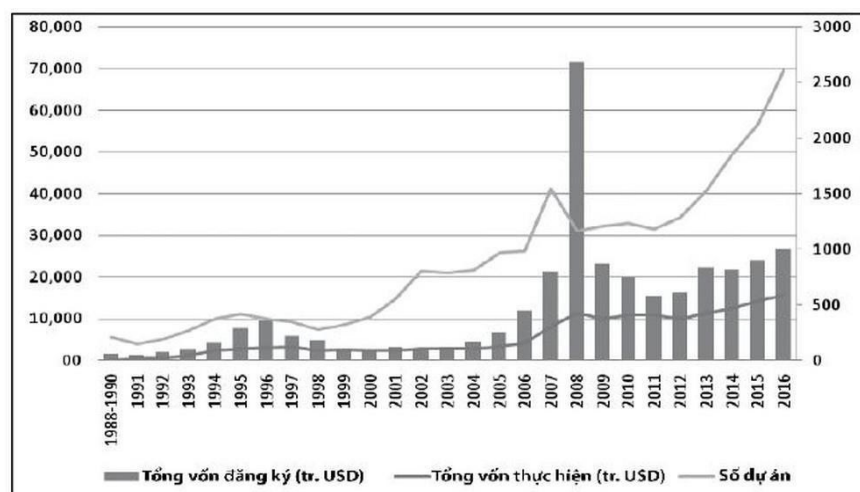

development in Vietnam. *Fifthly*, FDI helps to create more jobs, increase labor productivity, and enhance the quality of human resources.

Apart from the above positive effects, FDI inflows also have adverse effect on the environment, natural resources and society. As mentioned above, FDI can create millions of jobs with increasing incomes for labor force, and introduce new technologies, new industries, high quality services and advanced business management methods. However, there have been disputes between employers and workers regarding low wages which did not rise correspondingly with labor intensity and increased price index (inflation index), poor labor conditions, unsecured workplace safety, increasing working hours in excess of the law, even some owners of FDI enterprises have disrespectful behaviors to workers.

In addition, serious violations of the law on environmental protection related to FDI enterprises cannot be ignored. Typically, in 2016, a large number of fish died on a large scale along the coast of Central Vietnam, causing the public opinion and concern towards Formosa, a steel joint venture project worth over USD 10 billion in the Vung Ang economic zone (Ha Tinh province). The environmental incident associated with mass fish death at the coastal area of four provinces in Central Vietnam was identified to be caused by Formosa company, which during the trial operation of the plant complex had committed violations and incident, leading to the discharge of wastewater containing phenol, cyanide toxins that had not been treated to the standard into the environment. An earlier case was Tung Kuang, which did not strictly enforce environmental regulations and was listed in the “blacklist” of environmental pollution in Hai Duong province for three consecutive years. In early 2010, the government of Hai Duong province revoked the permit for discharge and suspend the production activities of Tung Kuang after the company’s discharge of the untreated waste water was caught by the Environmental Police Department.

2.2. FDI Attraction in Vietnam

Having advantages in geographical location, natural resources, low cost labor and political stability, Vietnam is regarded as one of the most attractive emerging markets for investors. Vietnam has been attracting an increasingly greater volume of foreign direct investment (FDI)

Nguồn: Tổng cục Thống kê

Source: General Statistics Office

Figure 1: Foreign Direct Investment in Vietnam over the period 1988 – 2016

As shown in Figure 1, FDI inflows into Vietnam are fluctuating, but total FDI inflows tend to increase over time. This could be explained by improved investment climate of Vietnam, with low-wage labor force, favorable economic conditions, and good legal system.

Generally, in the 12 months of 2017, the total registered capital of foreign investors reached US\$ 35.88 billion, increased by 44.4% over the same period of 2016. (In the first quarter of 2018, the total registered capital of foreign investors was \$ 5.8 billion, equivalent to 75.2% of the same period of 2017.) *According to investment field:*

In 2017, foreign investors have invested in 19 industry sectors, of which the manufacturing and manufacturing sector is attracting much attention of foreign investors with a total capital of US\$ 15.87 billion, accounting for 44.2% of the total registered capital in the 12 months of 2017. Power production and distribution sector ranked second with total investment of US\$ 8.37 billion, accounting for 23.3% of total investment registration. The third largest was real estate business with the registered capital of US\$ 3.05 billion, accounting for 8.5% of total registered capital.

According to investment partner:

During the 12 months of 2017, 115 countries and territories have investment projects in Vietnam. Japan ranked first with its total investment of 9.11 billion USD, accounting for 25.4% of total investment; South Korea ranked second with its registered capital of 8.49 billion US dollars, accounting for 23.7% of total investment in Vietnam; Singapore ranked third with its registered capital of \$ 5.3 billion, accounting for 14.8% of total investment.

According to investment area:

In 2017, foreign investors have invested in 59 provinces and cities, of which Ho Chi Minh City is the most attracted foreign investment capital with a total registered capital of 6.5 billion USD, accounting for 18, 1% of total investment. Bac Ninh ranked second with a total registered capital of USD 3.4 billion, accounting for 9.5% of total investment. Thanh Hoa ranked third with a total registered capital of 3.17 billion USD, accounting for 8.8% of total investment.

3. SUSTAINABLE ECONOMIC DEVELOPMENT IN VIETNAM

3.1. FDI and Sustainable Economic Development

Sustainable development involves economic growth (fast and efficient), social justice and environmental protection. To achieve this, all socio-economic constituents, governments, local authorities, social organizations, etc., must work together to reconcile three key areas: economics – society - environment.

FDI also needs to be directed towards sustainable economic growth by meeting the following requirements:

Regarding economic benefits, once a foreign investment project is implemented, it must ensure benefits for both the investing country and recipient country. For investing countries, they invest abroad to reap economic benefits such as abundant labor and cheaper raw materials, therefore generating profits in the investment process. For recipient countries, they must ensure high and stable economic growth, develop environmentally friendly production, develop agriculture and rural areas sustainably, and develop clean industry.

In terms of social benefits, the synchronous implementation of measures aims to achieve targets, such as progress and social justice, poverty alleviation, unemployment reduction, higher income, improved education quality, professional qualifications, health care...

In addition, there is a need for actions to be taken to mitigate the negative impacts of FDI, particularly on the environment, including environmental protection, treatment and remediation of pollution, recovery and improvement of the quality of the environment, preventing deforestation as well as over-exploitation of natural resources.

FDI involves more than just a capital investment. It can be not only an effective way to transfer needed capital and modern technology or advanced management across borders, but also an important channel for promoting particular innovation and investment that is needed for environmentally sound economic growth and development. Regarding the behavior of multinational enterprises, the implications of FDI are controversial, as FDI does not always bring beneficial effect to host countries in terms of environmental, social or economic outcomes.

With respect to the potential environmental impacts, FDI have contributed significantly to increased economic activities which would have accelerated environmental degradation, such as greenhouse gas emissions, loss of biodiversity, deforestation, resource depletion, and other environmental problems. Traditionally, companies in developed countries move their operations (as well as shift the pollution) to developing countries in order to take comparative advantage of less stringent environmental regulations and sufficient labor force. In other words, some companies' decisions to invest overseas are driven by the desire to reduce the costs of environmental regulatory compliance. Less developed countries frequently receive a bulk of investment flows into the natural resource based sectors. Moreover, the local government may intentionally reduce environmental standards in order to attract more foreign investment, so that developing countries have become multinational corporations "Pollution Havens". Although such foreign investment has boosted the rapid growth of host countries' economy, it has led to excessive levels of pollution and environmental degradation, which has been driven by "trade-induced" environmental pollution.

However, there has been considerable debate about whether FDI does not necessarily deteriorate the environment of host countries. FDI may play a significant positive role in spreading green technology and dealing with environmental challenges. Investment of the MNCs can bring more environmental friendly production standards and less polluting technologies, which results in a positive influence on host countries' environmental protection. For example, greenfield investment in renewable energies can promote the use of such alternatives by consumers and other MNCs, conservation projects,... FDI investments involve the transfer of technology that can be important in helping firms manage, reduce or avoid adverse environmental impacts. Though foreign firms tend to comply with less intense regulations in the host country, these firms may appear to be more energy efficient and environmentally friendly than local firms.

3.2. Green FDI

The environmental impacts of FDI (both potentially positive and negative) have given rise to an interest in the concept of "green FDI". Green FDI can be referred to as FDI that advances progress on goals regarding environmental protection and addressing the climate change challenges, and evades negative effects on the environment. However, there is no clear agreement about what "green FDI" actually should be. Such definitional challenges raise concerns about true environmental integrity of supposedly green firms or projects.

While FDI has potentially contributed to, and affected the wide range of sustainable development goals, the concept of "green FDI" has emerged and more attention has been paid to those investments that contribute, more specifically, to environmental and climate change related objectives.

A definition of “green FDI” is crucial for policymakers and others to assess whether FDI is contributing to environmental goals, and to develop strategies for green financial flows. Based on the definition, project developers, potential investors, consumers, governments and other stakeholders can identify more effortlessly and efficiently the environmental soundness of an investment. There is an absence of a single widely adopted definition of “green FDI”.

According to UNCTAD (2008), green FDI includes foreign investment that complies with higher environmental standards than required under the host country’s law, or goes into production of environmental goods and services. In UNCTAD World Investment Report 2010, low carbon FDI is described as “the transfer of technologies, practices or products by MNEs to host countries – through equity (FDI) and non-equity forms of participation – such that their own and related operations, as well as use of their products and services, generate significantly lower GHG emissions than would otherwise prevail in the industry under business-as-usual (BAU) circumstances”. For instance, following sector-based approach, low-carbon FDI can be determined as including greenfield investment in renewable energy, recycling activities and low-carbon technology manufacturing.

The OECD defines “green FDI” as comprising all investment in “green infrastructure and greening of existing infrastructure”; “sustainable management of natural resources and related services (e.g. fisheries, forests, wildlife and nature-based tourism, soil productivity, water security and minerals)”; and “activities within the environmental goods and services sector, and across green value chains”.

Moreover, development banks and other financial institutions also define what they see as green investment in their policies used for assessing whether a particular project is eligible for support and govern project-level effects.

The lack of data gives rise to challenges for identifying whether FDI has contributed to promoting or undermining sustainable development objectives, thus possibly hindering relevant policy responses and strategies. The integrity of green projects can be impaired by the lack of harmonization of “green FDI” definition which may make it costly for comparison across institutions and markets and for cross-border green investment. In other words, the lack of a consistent understanding of green FDI can impede support for green investment, and also lead to higher costs associated with development of environmentally sustainable FDI projects.

Sustainable development in a global context, along with significant contribution of MNCs, has led to green FDI as a key investment trend. It is suggested that developing countries in general and Vietnam in particular should have tailored policies to attract effectively those FDI flows.

3.3. Some solutions to attracting green FDI and advancing sustainable development in Vietnam

Vietnam faces challenges of both seeking to attract foreign capital and making certain that the investment generates environmental benefits (or, at least, does not harm the environment). A country’s relatively weak environmental standards or loose enforcement of environmental laws can be seen as selling points making that country a favorable investment destination for some foreign investors, but leading to adverse environmental impacts. On the other hand, some evidence shows that FDI may also be a major channel of transferring modern, cleaner technologies into the host country, improving environmental performance, and reducing carbon emissions. Therefore, these two objectives are potentially competing.

Numerous evidences support that raising stringency of environmental regulation will not impede the entrance of FDI, but on the contrary, may attract FDI of high cleanliness, thus contributing to developing

countries to achieve green development. Strict environmental regulation has not only prompted the government to adjust the structure of foreign investment and improve the environment threshold of foreign investment, but also given priority to introduce FDI that is beneficial to environmental protection and technology upgrading, crowding out the FDI in pollution intensive industry.

In the attempt to attract and capture all the socio – economic and environmental benefits from green FDI, the government has strived to use various approaches, including granting an appropriate combination of fiscal and regulatory incentives, lowering barriers to investment, and targeting investment in specific sectors and activities.

It is crucial for investment promotion policies to more efficiently contributing to attracting green FDI in particular and advancing sustainable, inclusive economic growth in general. Although there are still some challenges relating to business opportunities for green FDI as well as to the measures utilized to attract such investment, Vietnam can take steps to develop policies and structures so as to achieve better alignment between investment promotion and sustainable development strategies.

In line with the “Sustainable Development Orientation” and “Industrial Cleaner Production Strategy to 2020,” the new strategy on FDI needs to be formulated in four broad directions, including High quality and effectiveness ; Sustainable development, Low carbon economy; Having a commitment on technology transfer suitable to each sector or project; Highly skilled workers.

The State has set up orientations for attracting FDI into the sectors in the direction of sustainable development, encouraging with the highest preferential policies for environmentally sound projects, such as renewable energy, wind, solar power, green buildings and energy saving, energy – efficient transport, less polluting industry, quality services, developing new production and business methods which are more economical and effective. In fact, a number of large countries have been carrying out many projects to exploit natural resources, to relocate to Vietnam the environmentally unfriendly and carbon-intensive industries, and transfer backward technology; hence if not alert, negative consequences can be unforeseen. Therefore, the necessary measures for this issue include the active selection of FDI projects by state agencies and local authorities, who cannot easily and arbitrarily believe in the “pie” drawn by some investors, but must consider on the basis of long-term interests of the country.

Specifically, when evaluating industrial projects, it is necessary to require investors to comply with environmental standards, to have adequate investment in waste treatment systems and to be equipped with the most advanced technology to reduce greenhouse gas emissions. Energy is a major contributor to the greenhouse effect and climate change, Vietnam has consumed power/ energy with a high annual growth rate of 14-15%. To achieve the goals of the National Target Program for Energy Efficiency and Conservation regarding improving energy efficiency and reducing greenhouse gas emissions for large energy consuming industries, when licensing FDI projects, there should be rigorous requirement for technology to reduce carbon emissions and enhance energy efficiency. Existing plants need to have a commitment to adoption of new low-carbon technologies. Reduce carbon emissions. Buildings constructed by foreign investors must be environmentally friendly and green buildings, with new technologies and energy saving. In addition, there is a need for stronger incentives for sustainable energy projects which help meet current needs without jeopardizing future generations, such as alternative renewable energy produced from waste sources, solar power, wind power. Because the capital invested in these projects is quite high, the cost exceeds the current commercial electricity prices, so the initial support of the state is essential and through the competitive mechanism as well as transparent bidding new energy sources can be quickly developed.

The reality of technology transfer in FDI shows that, thanks to acquiring knowledge and adapting technology to the country's development situation, together with learning management and business experience and training staff, several economic sectors in our country have developed, reaching the advanced level in the region, approaching the international level. Typically, the telecommunication industry, based on the good cooperation with Telstra (Australia), has a competitive mechanism with the emergence of many enterprises such as Viettel and other suppliers, thus leading to exceptional progress in technology and market. In the coming period, commitments on technology transfer should be paid more attention during the evaluation of FDI projects, although investment capital remains an important target in attracting FDI. In the process of industrialization and internal development of the economy, technology must be prioritized.

Previously, Vietnam has advantages in terms of abundant labour force with low wages, favorable natural conditions, such as land for industrial development. But if we continue to follow the old policy that is targeting FDI projects using cheap labor, occupying much land and exploiting many resources, it is not suitable with the purpose and orientation of development in the new era and unsustainable. Therefore, in order to meet the requirements of sustainability in development investment, the direction of attracting FDI in the coming time is to focus on the quality of FDI in a more selective way: technological selection, selective high value added projects, low fuel projects and environmentally friendly projects; attracting infrastructure projects and projects using high technologies and clean technologies and capable of creating competitive products; minimizing the licensing of projects likely to cause serious environmental pollution or projects not compatible with the development planning of Vietnam.

For example, iron and steel projects that are easy to pollute the environment require very close monitoring and evaluation of investment. Vietnam government should restrict foreign investment in projects that are likely to generate environmental risks, such as unsustainable forestry activities, harmful fishing practices, heavily greenhouse gas emitting activities and the trade and production of goods forbidden by international environmental agreements. In the field of textiles, most of the investors in textile dyeing projects in Vietnam come from Taiwan, China and Korea, and these are not high-tech markets. , especially in the field of textiles. Therefore, the monitoring of imported equipment and technologies in textile and garment production projects needs to be focused to limit backward technology transfer and energy consumption to Vietnam. At the same time, environmental monitoring plans should be introduced, especially the construction of concentrated waste water treatment plants in textile and garment factories. Projects that do not use cheap labour, with the commitment to training human resources will also be given priority.

Besides, priority should be given to FDI business partners from developed countries with high environmental standards, where there is strict regulation on environmental work. These enterprises, in addition to their ability to use clean technologies, often adopt better environmental management practices, and also can create a strong link between FDI and host economies, especially through the transfer of knowledge and clean technology to local subcontractors.

The State needs to improve the legal system on environmental protection in line with the high standards and environmental norms of the world, perfect mechanisms and policies on FDI management in order to control against environmental pollution and improve the living conditions of people. Regulators should provide sufficient legal information to FDI enterprises, advise enterprises on environmental law enforcement, and encourage enterprises to be more environmentally friendly.

CONCLUSION

In general, FDI is a critical source of finance, particularly for developing countries, but in principle, it is not mandatory for a country. Therefore, along with the improvement of the investment climate, it is equally important for the government and local authorities to select partners and projects in line with the country's sustainable development orientation.

The implementation of commitments to open market, the implementation of the "national treatment" principle in international agreements does not lose the sovereignty of the country. The government of host country has the right to choose projects and investment partners actively, refuse to license FDI projects that do not meet labor standards and benefit the workers, and are not suitable for community benefits, polluting the environment, exploiting natural resources for export rather than for processing to increase the value of products. In the case of projects where the benefits for socio-economic development are not significant, even instead of that, those projects can pollute the environment and lead to resource exhaustion, it is best not to attract such investment.

More than ever, it is necessary to put FDI attraction together with the sustainable development goals of Vietnam. Without strict control, it will lead to concerns, boycotts in attracting this important resource. The State must have a strategy of attracting FDI towards sustainable development, which means that appreciating the increase of FDI capital every year while attaching importance to the quality of FDI projects in line with the socio-economic development orientations of the country in each period.

COMPARISON OF THE PERFORMANCE OF STATE-CONTROLLED AND PRIVATE-CONTROLLED ENTERPRISES - EVIDENCE FROM THE ELECTRICITY INDUSTRY IN VIETNAM

Vu Duc Kien*

ABSTRACT: *Over the past decades, privatization of state-owned companies has become a global trend as a way to fortify the performance of these enterprises and ensure the sustainable economic development of countries. This study aims to examine the impact of ownership structure on business performance. The study uses a sample of 51 companies in electricity industry listed on Vietnam's stock market in 2017. The author uses multi-linear regression to evaluate the effect of the structure ownership on the performance of enterprises. The study shows that state-controlled enterprises have a lower performance than private-controlled firms. The results of the study are consistent with previous studies on the relationship between ownership structure and performance of enterprises in the world.*

Keywords: *Ownership structure, performance of enterprises, state-controlled enterprises, private-controlled enterprises.*

1. INTRODUCTION

For many countries in the world, state-owned enterprises (SOEs) are seen as a driver of economic growth. However, with the rapid development of the market economy, the role of the state tends to shift in the direction of issuing policies to regulate the economy rather than directly involving in the operation of enterprises. Over the past decades, the privatization of SOEs has become a global trend. The privatization of SOEs takes many forms, and varies from country to country. For example, in the airline industry, the New Zealand government sold only a portion of its shares at Auckland and Wellington International Airport to private corporations and retained a number of minority shares (Shipley, 1998). But in the UK it is different. In 1987, the British government sold the entire seven major airports to the British Airport Authority (BAA plc), a 100% privately-owned company (Wearden, 2008).

The motivation for ownership restructuring through privatization is varied. In the 1980s and 1990s, in developed economies, as governments divest their SOEs, their goals are often to improve these firms' performance by improving operating efficiency, reducing their own intervention and increase revenue by facilitating competition in monopolistic areas (Vickers and Yarrow 1988). Much of the earlier empirical evidence about the economic impacts of privatization on the performance of the firms has been based on data from developed countries, according to reviews of Megginson and Netter (2001) and Estrin et al. (2009). Although most of the results of these studies have shown that private firms are more efficient than state-controlled enterprises, recent studies have shown evidence to the contrary (Mühlenkamp, 2015).

In transition economies like Vietnam, the process of equitisation and divestment of state-owned enterprises have been strongly taking place, but there are not many in-depth studies evaluating the impact of this process on performance of the business. Therefore, the objective of this research is to contribute to

* Faculty of Corporate finance - Academy of finance.

the rationale for research on the ownership structure and performance of firms, and to provide empirical evidence regarding the effectiveness of divestment of state capital in enterprises in Vietnam.

The paper is presented as follows: Section 2 presents an overview of the studies that have been conducted. Section 3 presents the research method and the research data employed. Section 4 presents the findings and discussion. Section 5 is the conclusion and limitations of the study.

2. LITERATURE REVIEW

Boardman and Vining (1989) were among the first researchers studying the relationship between state ownership, private ownership and business performance. His research was performed on 500 manufacturing conglomerates from 29 different countries with data collected in 1983. There are 409 privately-owned companies and 23 mixed-ownership companies (both public and private hold shares) and 57 SOEs. Research has shown that there are differences in the performance of state-owned companies, mixed-ownership companies with private companies. State-owned companies and mixed-ownership companies are less efficient than private companies.

The research by Frydman, Gray, Hessel, and Rapaczynski (1999) delves into the relationship between ownership structure and the performance of firms. The study was conducted in transitional economies of Central Europe. Research indicates that the privatization process has different effects on the performance of the business depending on the owners. In particular, if the enterprises were taken over by outsiders, operating efficiency will greatly increase. In the case of effective privatization, revenue efficiency is very clear, but there is no equivalent effect on cost reduction.

The study of Oum, Adler, Yu (2006) used data from airline companies in Asia-Pacific, Europe and North America from 2001 to 2003 to study the relationship between ownership forms with performance. This study has provided clear evidence that the government-controlled airline companies will operate significantly less efficiently than private-owned companies. However, the study also showed there is no solid evidence to suggest that airlines, which are 100% owned by state-owned conglomerates, perform less well than private airlines. From this point of view, the study suggests that public-private partnerships in which the private investors merely hold minority interests should not be applied in reality. Instead, the research team supports that private investors take control of and operate the airline firms in order to improve operating efficiency.

However, contrary to the conclusions of earlier studies, in 2015, Mühlenkamp's (2015) study pointed out that in case of other factors fixed, there is no evidence to support the argument that private companies have better productivity and production costs than SOEs.

It can be seen that in the world there have been many studies to assess the level of public ownership affecting the performance of enterprises. While most studies have shown less effective performance in SOEs than private companies, recent studies have shown contradictory findings.

3. RESEARCH METHOD AND DATA

To examine the relationship between ownership structure and business performance, the author used the similar model as employed by Boardman and Vining (1989), Padachi (2006). This model considers the linear relationship between firms' performance (measured by Return on asset - ROA, and Return on equity - ROE) with dependent variables including ownership structure (Own = 1 if the state holds the majority of number of shares (over 50%), Own = 0 when the private investors hold more than 50% of total number of

shares), and various that reflect economies of scale and firms' size e.i. total asset (Asset), Revenue (Rev) (Boardman and Vining, 1989). In addition, in order to reflect the impact of working capital management on performance, the author adds another dependent variable, current asset turnover (Cat) (Padachi, 2006).

Research model:

Model 1:

$$ROA_i = \beta_0 + \beta_1 Own_i + \beta_2 \ln Asset_i + \beta_3 \ln Rev_i + \beta_4 Cat_i + \varepsilon_i$$

Model 2:

$$ROE_i = \beta_0 + \beta_1 Own_i + \beta_2 \ln Asset_i + \beta_3 \ln Rev_i + \beta_4 Cat_i + \varepsilon_i$$

Where:

ROA: Return on asset, calculated by Net income divided by average total asset

ROE: Return on equity, calculated by Net income divided by average shareholders' equity

Own: The dummy variable represents the ownership structure. This variable will receive a value of 1 if the state holds more than 50% of the shares, Own receives a value of 0 if the private investors hold more than 50% of the shares.

lnAsset: is the natural logarithm of the company's total assets

lnRev: is the natural logarithm of the company's total revenue

Cat: is current asset turnover. Cat is equal to sales divided by average current assets.

This study uses the data of 52 listed companies in electricity industry in Vietnam in 2017 to examine the relationship between ownership structure and performance. Data is collected from Stockbiz.vn website of Stockbiz investment limited company. Stockbiz uses Industry Classification Benchmark (ICB), an industry classification taxonomy introduced by Dow Jones and FTSE, to classify companies listed on stock exchanges. This will make the data set of the study highly consistent with previous studies in the world. Companies that temporarily cease to operate do not disclose information resulting in missing data will be discarded. After compiling the data, the dataset consists of 51 companies.

For the estimation of the model, the author utilizes the ordinary least squares (OLS) method.

Figure 1. Descriptive statistics

| Variable | Obs | Mean | Std. Dev. | Min | Max |
|----------|-----|----------|-----------|----------|----------|
| ROA | 51 | .1040569 | .0810867 | .0029 | .3881 |
| ROE | 51 | .1909373 | .1021657 | .0031 | .418 |
| Own | 51 | .4509804 | .5025426 | 0 | 1 |
| lnAsset | 51 | 7.136563 | 1.625393 | 4.33951 | 11.30502 |
| lnRev | 51 | 6.109573 | 1.834538 | 1.888584 | 10.54289 |
| Cat | 51 | 2.520392 | 1.642455 | .07 | 6.78 |

Figure 1 shows the descriptive statistics for the main variables used in this study. Return on total assets is on average 10.40%. The highest and lowest ROA are 38.81% and 0.29% respectively. Return on equity is on average 19.09% with the range of value from 0.31% to 41.8%. As can be seen, the gaps of profitability among firms are quite large.

Mean of ownership structure variable of 0.45 indicates that the number of private-controlled enterprises is larger than government-controlled firms in sample. On average, total asset of an electricity enterprise is approximately 1257 billion dong, and total revenue is about 450 billion dong. These large figures might be because that the amount of capital necessary to build up the power plants, hydroelectric dams is vast. That is reason why the size of electricity firms is very big. Current asset turnover is 2.52 on average. This indicates that in 2017, on average, electricity enterprises take 145 days to turnover their current asset.

4. FINDINGS AND DISCUSSION

Correlation analysis

Figure 2. Correlation matrix

| | ROA | ROE | Own | lnAsset | lnRev | Cat |
|---------|-----------------|-----------------|----------------|----------------|---------------|---------------|
| ROA | 1.0000 | | | | | |
| ROE | 0.7587* | 1.0000 | | | | |
| Own | -0.1894 | -0.3361* | 1.0000 | | | |
| lnAsset | -0.3542* | -0.2738 | 0.1819 | 1.0000 | | |
| lnRev | -0.1404 | -0.0938 | 0.3238* | 0.8693* | 1.0000 | |
| Cat | -0.1768 | 0.0930 | -0.0002 | 0.0255 | 0.2217 | 1.0000 |

It can be seen from the figure 2, with a significance level of 5%, the variables lnRev and Own; lnRev and lnAsset are highly correlated (Koop, 2013). In order to be able to confirm if there is a collinearity phenomenon, the author will perform the test for collinearity after estimating the regression model.

Figures 4 and 5 in the appendix show the regression results and tests for multicollinearity and heteroskedasticity. These results are summarized in the table below.

Figure 3. Regressions of profitability on independent variables

| Independent variables | Model 1: ROA | Model 2: ROE |
|-------------------------|------------------------|------------------------|
| Own | -0.05621 (0.010)*** | -0.09467 (0.001)*** |
| lnAsset | -0.06890 (0.000) | -0.06564 (0.000) |
| lnRev | -0.05598 (0.000) | 0.05495 (0.001) |
| Cat | -0.02086 (0.001) | -0.00617 (0.459) |
| R ² | 0.4521 | 0.3406 |
| R ² adjusted | | 0.2833 |

The first regression result shows that the R² coefficient of 0.4521 indicates that the independent variables explain 45.21% of the value of the dependent variable - ROA. In particular, with a 1% significance level, the ownership structure affects the return on asset of enterprises. The regression coefficient of Own

variable of approximately -0.05621 indicates that, on average, state-controlled companies would have a lower return on asset by about 5,621% than the private-controlled firms. The results also show that, with a statistically significant 1%, the size of the company's assets, revenue, and current asset turnover affect the profitability of its assets.

The second regression result presents that the adjusted R^2 coefficient equals to 0.3406 indicating that the independent variables accounts for 34.06% of the value of the dependent variable - ROE. In particular, with a 1% significance level, the ownership structure affects the profitability of equity of enterprises. The regression coefficient of the Own variable is approximately -0.09467, indicating that the state-controlled companies would have a lower return on equity ratio by about 9.467% than private-controlled firms. The results also show that, with a statistically significant 1%, the size of the firm's assets and turnover affects the company's return on equity. With a statistically significant 5%, the working capital turnover has an impact on the profitability of the company's equity.

To sum up, in terms of both models, ownership structure has statistically significant impact on firms' performance. The private-controlled enterprises show better operational efficiency than government-controlled firms. These results are consistent with the results of previous studies by Boardman and Vining (1989), Oum, Adler, Yu (2006).

5. CONCLUSION

The results provide evidence that the state-controlled enterprises will operate less efficiently than private-controlled enterprises. This confirms the results of previous studies that there is a significant difference in performance between state-controlled enterprises and the private-controlled enterprises, providing more empirical evidence of this relationship. It also confirms that the equitisation and divestment of SOEs in Vietnam is one of the most effective restructuring solutions to improve the performance of these enterprises, toward a sustainable development of the economy.

Limitations of the study: Due to time constraints, data sets used for research are limited in only one industry and in year 2017. Besides, there are many companies in the industry in recent years have not disclosed financial statements, this may affect the results of research. In order to obtain a more comprehensive assessment of the performance of state-controlled enterprises in Vietnam, it is necessary to extend the research to other sectors for comparison, with more research data in order to provide more accurate results.

APPENDICES

Figure 4. Estimation of regression model between return on asset and independent variables under the OLS method

RISKS IN CAPITAL CONTRIBUTION AND SHARE PURCHASE OF VIETNAM COMMERCIAL BANKS-FROM THE MANAGEMENT PERSPECTIVES

La Thi Lam*

ABSTRACT: *Capital contribution and share purchase are equally important activities of commercial banks in Vietnam, especially in the increasing trend of business diversification and financial liberalization in the banking industry. However, the reality of the past time shows that this activity implies many risks that threatening the safety of banking operations as well as national financial security as: The capital contribution and shares purchase activities of commercial banks may lead to the Phenomenon of cross-ownership which causing unsafety in the operation of the system and national financial security; Dispersing resources and reducing the capital adequacy ratio of commercial banks; The risk of equity investment loss, especially from the activities that commercial banks do not hold the right to decide, dominant... Therefore, in addition to careful consideration in the selection of investment projects of the commercial bank itself, improvement of the regulatory framework as well as strengthening the supervisory role of the State Bank (SBV) for capital contribution and share purchase are exceedingly essential, in an effort to ensure operational safety for commercial banks in in the second phase of the restructuring of credit institutions (CIs)*

Keywords: *Commercial banks; The State Bank of Vietnam; Capital contribution and share purchase; Operational safety; Legislation.*

LEGISLATION ON CAPITAL CONTRIBUTION AND SHARE PURCHASE.

Firstly: Regarding the form of capital contribution and share purchase

Based on the level of contribution and purchase, contribution activities include:

The contribution to establish or acquire a subsidiary.

In Article 103 of the 2010 Law on Credit Institutions, commercial banks are allowed to contribute capital and purchase shares of the enterprises which is operating in the fields of insurance, securities, overseas national currency exchange, foreign exchange, gold, factoring, credit card issuance, consumer credit, payment intermediary services, credit information or other fields. In this form, a bank contributes with a large proportion, owning more than 50% of charter capital or voting shares of the contributed enterprise. With such a high contribution, the commercial bank shall have a strong influence to the operation of subsidiary.

The contribution in the form of commercial investment and association.

Apart from the establishment of a subsidiary, the equity contribution of a credit institution also includes associate activities (Credit institution who owns over 11% to 50% of charter capital or voting shares of the contributed enterprise, but in many cases not holding control) and commercial investment activities (CIs owns less than 11% of charter capital or voting shares of the contributed enterprises).

* Add: Academy of Finance, No.58 Le Van Hien St., Duc Thang Wrd., Bac Tu Liem Dist., Hanoi, Vietnam; City and Postcode: Hanoi, (+084); Country: Vietnam. Corresponding author. Tel.: +84.982063708. E-mail address: lamnhbh70@gmail.com

Secondly: Regarding funding sources for capital contribution and share purchase

Under Clause 1, Article 103 of the 2010 Law on Credit Institutions, commercial banks are allowed to use their charter capital and reserves only to contribute capital and purchase shares in the establishment or acquisition of subsidiaries or associated companies. In addition, Decree No. 60/2015/NĐ-CP amending and supplementing several articles of Decree No. 58/2012/NĐ-CP on guiding the implementation of certain articles of the Law on Securities provides that from September 1, 2015, businesses are allowed to offer shares to a creditor in order to swap for the debts. Thus, in the spirit of this decree, commercial banks may be allowed to swap debt into equity shares in businesses.

Thirdly: Regulations on safety limits in capital contribution and share purchase of commercial banks.

- Regarding the level of contribution: Article 129, the 2010 Law on Credit Institutions stipulates the limitation of contribution as follows: *(1) Level of capital contribution and share purchase of a commercial bank and its subsidiaries, associated companies into a business operating in the field of insurance, securities, overseas national currency exchange, foreign exchange, gold, factoring, credit card issuance, consumer credit, payment intermediary services, credit information and other fields must not exceed 11% of charter capital of the contributed enterprise; (2) Total capital contribution, share purchase of a commercial bank to enterprises, including its subsidiaries and associated companies shall not exceed 40% of its charter capital and reserves.*

- Regarding the subject of capital contribution, it must be excluded according to the provisions of Clause 5, Article 129 of the Law on Credit Institutions: *Credit institutions shall not be allowed to contribute capital or purchase shares of other enterprises or credit institutions which are their own shareholders or contributors.*

POTENTIAL RISKS FROM CAPITAL CONTRIBUTION AND SHARE PURCHASE ACTIVITIES OF COMMERCIAL BANKS

The capital contribution and shares purchase activities of commercial banks may lead to the phenomenon of cross-ownership which causing unsafety in the operation of the system and national financial security.

It can be said that the lack of tight management in equity investment is one of the long-term causes leading to the cross-ownership and unsafe operation of commercial banks in the past time. The potential risks that commercial banks have to face such as the possibility of indirectly manipulated through its subsidiaries, associated companies, or credit granting through the subsidiaries, associated companies, and dodging the law on the purpose of cross lending in the banking system which may causes deviations in credit quality assessment. In fact, over the past few years, many commercial banks have entrusted investment capital to an associated company where the major shareholder of the bank is also the shareholder of the company and from that trust fund, this associated company shall grant credit to securities companies [2]

Dispersing resources and reducing the capital adequacy ratio of commercial banks

According to legal regulations, commercial banks shall use charter capital and reserves only to contribute capital and purchase shares in the establishment or acquisition of subsidiaries or associated companies. As stipulated in Circular No. 36/2014/TT-NHNN on safe operation of credit institutions, the contributions to other credit institutions and subsidiaries will be directly eliminated from Tier 1 capital when calculating the capital adequacy ratio. For that reason, capital contribution and share purchase will disperse one's resources as well as reduce the capital adequacy ratio and the level of assurance for the bank's liabilities, especially in the context of more stringent safety regulations shall be applied under Basel

2. Recently, many commercial banks have been carrying out acquisition deals of financial companies to expand consumer lending operation. Therefore, commercial banks should carefully consider the efficiency brought about by this activity in comply with the capital adequacy ratio as prescribed by the SBV.

The risk of equity investment loss, especially from the activities that commercial banks do not hold the right to decide, dominant.

Like other businesses, commercial banks have to accept the principle of “takes the gain, bears the loss” but the level of risk will be very high for activities that commercial banks are not in the driver’s seat such as in association and commercial investment activities. This is considered to be the most complex and risky activities today in ensuring the safe operation of the banking system. By holding shares that they do not have control rights, the risk level that commercial banks have to bear totally depends on the performance of the contributed enterprises. Especially when commercial banks invest in enterprises. Especially when commercial banks invest in unlisted companies which aren’t in the field of finance and banking (commercial investment).

On the other hand, allowing to convert debt into equity also implies a lot of risk for commercial banks, due to the poor performance of the contributed companies as well as the limited management ability of the bank resulted from insufficient understanding of the sector in which the contributed enterprises operate [1].

MITIGATING SOLUTIONS FOR RISKS FROM CAPITAL CONTRIBUTION AND SHARE PURCHASE

Given the increasing trend of operational diversification and financial liberalization in the banking sector, it’s nessesary for Vietnamese commercial banks to carry out the capital contribution and share purchase activities. On the one hand, it’s for profitability but on the other hand, it contributes to the diversification of operations, risk dispersion and increases the competitiveness of the bank. However, in order to further improve operational efficiency as well as minimize risks, ensure operational safety and financial security, the management of capital contribution and share purchase should be improved in the following ways:

To improve the regulatory framework for capital contribution and share purchase activities of credit institutions.

Currently, the Law on Credit Institutions No. 47/2010-QH12, Circular 36/2014 / TT-NHNN has provided regulations relating to capital contribution and share purchase activities of credit institutions. However, in order to tighten management over the potential risks arising from capital contribution and share purchase, provide the basis for the SBV to play the role of regulator as well as provide specific regulations for commercial banks in regulating their activities, the regulatory system should be finalized and further specified for each form of capital contribution and share purchase.

In the form of subsidiaries, commercial banks contribute more than 50%, even 100% ownership and have the controlling interest. Although in this case, commercial banks hold control and dominance, so they can be more proactive in risk management, but the use of equity in establishment or acquisition of companies operating in risky areas will disperse the bank’s resources, not to mention the relationship between holding bank and subsidiaries might lead to the lack of transparency in compliance with the current regulations. Therefore, the regulations should specify the conditions for credit institutions to contribute capital and purchase shares to establish or acquire a subsidiary such as Financial capacity (the level of charter capital, non-performing loan, business performance, etc); Management capacity (management and executive apparatus of the banks and its subsidiaries); The feasibility of the plan (the proposal to set up a subsidiary should be proven feasible and effective).

In the form of associated companies, the CIs has a high level of ownership, owning from 11% to 50% of the charter capital or voting share of the contributed enterprise, but in many cases has no controlling interest, so it's not fully active in risk management and/or make important decisions in controlling and managing risks. Affiliation will make ownership relationships becomes more complex and credit institutions may be indirectly manipulated through associated companies that pose additional risk to the bank. Ownership becomes more complex, credit institutions may be manipulated indirectly through affiliates that pose increased risk to the bank. However, according to Circular 36, the regulation on risk limitation for this activity is not tight enough, similar as for the subsidiary. In the guideline for calculating the capital adequacy ratio in Circular 36 as well as Circular No. 41, the capital contribution to the associated company is not directly excluded from the Tier 1 capital when calculating the capital adequacy ratio (CAR) of the credit institution. Therefore, the SBV should issue legal documents to provide more stringent and rigorous conditions compare to the establishment of CIs' subsidiary in terms of management capacity, financial capacity as well as operational experience of the CIs.

In the form of commercial investment, the credit institution owns a small percentage of share capital (owning 11% or less of charter capital or voting share of the contributed enterprise). These are capital contributions and share purchase in enterprises operating outside the banking and finance sector, implied many risks such as liquidity risk, loss, conflict of interest...etc. Especially when investing in unlisted companies, while the current regulations almost do not mention except for the limitation of total equity contribution. Therefore, in the near future, the State Bank should regulate the commercial investment of credit institutions by strict regulations. Credit institution that wish to invest in a external sector belong to the above group must have a good financial result in the preceding period, such as a profitable business, return on equity (ROE) and on assets (ROA) must be at the recommended threshold; bad debts is cotrolled within the safety limits according to the current regulations of the SBV; debt classification and risk provisioning has been fully implemented as prescribed, the actual value of the charter capital is not lower than the legal capital, etc. Credit institutions that wish to invest in a external sector must prepare a commercial investment plan and a capital withdrawal plan in case of necessary, including an assessment of the effectiveness of the commercial investment plan as well as the assessment of the return of capital. On the other hand, in order to avoid widespread investment, the SBV should stipulate the field of a contributed enterprise of the credit institutions, such fields must be relvant and well supported for the operations of the CIs.

The conversion of debt into equity in enterprises also needs to have specific guidance from the State Bank such as: The debt criteria for being allowed to convert into equity; debt standard is converted into capital contribution; The safety limits must be ensured for credit institutions; The feasibility of the rehabilitation plan of the contributed enterprises; The field of the contributed enterprises...etc.

Strengthening the management, inspection and supervision of capital contribution and share purchase activities of commercial banks.

With the role of the regulator, the SBV should strengthen the supervision of capital contribution and share purchase a ctivities of CIs on the following contents:

- It is necessary to carefully evaluate before making a written approval for the capital contribution and share purchase activity of credit institutions. On the basis of assessing the level of satisfaction of legal conditions and completing the dossier, The SBV shall comply with the order and procedures for approval of capital contribution and share purchase activities under the current regulations.

- To perfect the regulatory framework, inspection and supervision methods in order to improve the management efficiency of commercial banks in general and capital contribution and share purchase activities in particular. Timely detecting the signs of risk from violating regulations on operational safety for capital contribution and share purchase by commercial banks, such as ensuring the capital adequacy ratio, complying with contribution limitation in accordance with the current law ...

- Determined on sanctioned treatment with the CIs who violating regulations on operational safety for capital contribution and share purchase activities.

SUSTAINABLE BRANDING FROM THE CUSTOMERS' VIEW

Nguyen Son Lam*

ABSTRACT: Most of the experts or the marketing scholars have got to know the concept of brand from their own knowledge as well as the tangible elements within the business. This study which referenced the 30 researches inbound and outbound, and all the concepts of the brand (from 2004 to year 2017) strengthens the idea, the points of view of the values from the professional scholars in order to present a definition of the brand from the customers' thinking. The study uses the knowledges of the behavioral psychology, activities to explain the customers' thinking in the process of building the brand. On the database, the study reports the roles of the brand of the commodity in the field of the consumers' behavioral psychology, activities in their knowledge process. The concepts of brands formed from the customers' acknowledgement will help the businesses steadily develop the brands of commodities and business fitted with the customers – the first important factor according to the marketing attitudes.

Keywords: Brand, Trademarks, Corporate/business, Customer, Psychological

1. INTRODUCTION

There are different perspectives on branding, and there are opposing views. Experts and marketers in Vietnam and in the world have not agreed on the concept of brand approach. The approach from the enterprise (from the inside out) is a popular view (typically, authors Ton That Nguyen Thiem (2006), Chu Van Nguyen (2009), ...) Most of these authors define A brand is a collection of elements of a product (common is the name, term, image, ...). The approach from the customer (from outside) has very few authors, such as Do Hoai Linh (2011), Ha Thi Ngoc Oanh, Tran Thi Thu Hien (2012). In this approach, the authors define the brand as the result of the customer's cognitive process; brand is the image, the customer's feelings when they think about the product.

Some studies are confusing, even identifying two categories of brands and trademarks into one. The authors only refer to the product brand without researching, making the point of corporate brand.

In business practice, businesses need a brand concept that is consistent with the marketing concept for consistency in branding and sustainability. This paper proposes a brand concept (both for the product and for the enterprise) from the perception of the customer on the basis of psychological phenomena. This brand concept is completely consistent with the core view of marketing 'customers come first'.

2. TEMPORARY ATTITUDES TOWARDS BRANDING

Most of the researches of brands are from the corner of business. There are many misunderstandings of the brands and trademarks, some even suppose that brands are trademarks.

* Academy of Finance, 58 Le Van Hien, Ha Noi, 100000, Viet Nam.

Brand and trademark are categorized into one

In many researches, there are no differences between brands and trademarks. Brands are considered trademarks and trademarks are considered brands. Brand is another word for trademark in the term of marketing. Some authors thought that brand is translated from the word “trademark” in English including two parts ‘trade’ and ‘mark’. Trade is (brand), mark is a symbol (effect).

According to the Center for Technology and Commerce Information - Ministry of Industry and Trade (2009), Ministry Level of Industry and Trade’ study coded: 121.09 RD, “Protect and develop the Vietnamese commodity brands in the world market”, “Trademark is understood as a trademark after it has been commercialized.” In this sense, the brand is a new development of the brand, after being commercialized and developed in the market.

Some authors identify the brand with the elements of the brand. Le Dang Lang (2010) states that “the brand is the whole of many elements that are made up and registered for protection”. Ha Thi Ngoc Oanh and Tran Thi Thu Hien (2012): “Trade names, brands over time can become brands.” Trade names, industrial designs, symbols, etc. are tangible elements defined and protected by law. These factors, in accordance with the Intellectual Property Law, are elements of the trademark.

In line with this view, the authors of the book named “Management for commodity brand”: Theory and Practice, Statistics Publishing House (2015) use the term “brand” instead of the term “brand”. According to the author of the book, the nature of these two concepts is one, with the term “Brand” in the field of marketing. The authors have found that the nature of a brand is the result of all the effects of the business to the customer but is not clearly distinguishable from the trademark concept, so it was mistaken.

Brand is a trademark that adds a number of elements

Some authors identify brands and trademarks are of a different nature. Brand is a category that is broader than the trademark, and both categories come from a number of factors, such as the name, logo, ...

According to Chu Van Nguyen (2009), the brand is a combination of several other factors, growing up in the market and becoming a brand. The elements that add to the trademark to become a brand name are the trade name, business logo, business slogan, business style, etc. According to this author, this is just a pure arithmetic addition. .

Nguyen Thi Luyen (2008) said that appearance, brand and trademark appear similar, but the brand is created by the market, the brand is created by the manufacturer. Brand include not only the trademarks but also the intellectual property, the image of the goods, the image of the business in the mind of the customer, the style of business, the style of service of the business. , ...

A brand is a particular type of trademark

According to Tang Van Ben and the authors (2005): “A trademark can only be considered a brand if it communicates the value of the benefits that target customers are seeking and therefore it is wanted and desired. Authors are right to realize that a brand must be associated with certain target audiences. A successful brand must build trust in the customer, it must convey the values and benefits in accordance with the wishes of customers.

This concept recognizes brands and trademarks as different but does not distinguish clearly these two categories. Brands formed from the trademark, on the basis of the original trademark.

Business’s viewpoint towards branding

Jack Trout, Steve Rivkin (2004) argues that the brand is the seller’s commitment to the buyer for the quality and value of the product. Brands are validated by their effectiveness, for a long time and by customer satisfaction. Along with this view there are articles by Tran Minh Dao and Pham Van Tuan (2011).

Ton That Nguyen Thiem (2006) said that the brand is the collection of all names, shapes, symbols. These elements are created by the business and branded to validate a product of a business and to distinguish it from a competitor's product. Using this point of view, there are authors: Nguyen Vinh Thanh, Hoang Van Hoan (2006), Bui Van Quang (2008), Tran Ngoc Son (2009), Phan Thi Thanh Xuan (2009), Nguyen Thi Minh Anh (2010), Tran Trung Vinh (2012).

Nguyen Quoc Thinh, Nguyen Thanh Trung (2009), also asserted that the brand is the set of signs of the product to distinguish it from the competitor's product but added to the depiction of these signs to the customers' mind. The authors have found the target of the brand is the impact, retention into the memory of the customer.

Some researchers cite the American Marketing Association (AMA) brand concept: "A brand is a name, a word, a symbol, a logo, a graphic, a design, or a set of elements in order to identify and distinguish the goods or services of a seller or group of sellers with the goods and services of competitors." In practice, this organization does not introduce the concept of a brand, but rather the concept of trademark. Actually these researchers translated the trademark in English into "brand". The AMA trademark concept is stated on the basis of the trademark definition of the Trademark Act, 1946, 15 U.S.C, article 1127 (United States). This law defines: A trademark is any word, designation, symbol, term, or any combination (between them), used by a trader to identify, indicate the source of the goods and distinguish them with the merchandise of other trader. (any word, name, symbol, or device, or any combination (thereof) that is used by a person in commerce to identify and distinguish his goods manufactured or sold by others and to indicate the source of goods, whether known or unknown (Trademark Act of 1946, 15 USC sec.1127).

Brand perception comes from the customer's perception

Some authors view the brand from the perspective of customer perception of the impact of business. Typically, the concept of the brand stated in the two articles is very valuable.

Do Hoai Linh (2011), in his article affirmed the brand is the perception of customers about all elements of the business.

Ha Thi Ngoc Oanh, Tran Thi Thu Hien (2012) both agreed, brand name is the image, the emotions that customers get when they think about a company or product. These images, emotions appear immediately when the customer thinks of the product, that company, that these images exist in the memory of the customer.

Gordon R. Foxall and the authors (2013), introduced two approaches to brand concept. The first is the customer-oriented approach, the second is the enterprise-wide approach. Customer orientation is orientation from outside, oriented from the perspective of business is the orientation from the inside. At present, these two perspectives persist in the studies of authors around the world. The article further suggests a view that coordinated access from both directions.

Johann Fuller and other authors. (2013), suggested that consumers are the basis for branding. Customers are also positive in conveying the message of the brand to others. According to the authors, the internet environment facilitates the development of a strong corporate brand in today's society.

Michael G. Walsh (2013) asserts that the brand exists in the business and that the brand is governed by the law, the object of intellectual property. In business, customers are the center of all activities of the business. So, a good brand is a brand having the elements that customers demand, desire.

3. METHODOLOGY

Sustainable brand development should eliminate false positives and correct the deficiencies, and propose the views appropriate to the business activities in the market.

Brands and trademarks are two different categories, so considering brand as trademark is not appropriate. Confusing these two concepts will not be able to form the brand, not mention to the development of sustainable brand.

Most researchers do not mention the corporate brand. Branding product brands and branding corporate brand are all important. Brand development needs to proceed from small to small scale to larger scale and ultimately to enterprise scale. Corporate brand is formed by the synthesis of all activities of the business, by the success of the collection of product brands. Branding of each product should be done in the overall brand development strategy of the business.

Developing your brand from your thoughts, from within the enterprise, will create brands that are affordable to your customers. In business today, all activities of the business are aimed at satisfying the needs of customers. To develop a sustainable brand needs to come from the customer and to satisfy the customer needs. To do this, branding must understand the psychology of customers, brand owners must have good knowledge of business management psychology. Consensusing with the view of Do Hoai Linh (2011), Gordon R. Foxall et al. (2013), Johann Fuller et al. (2013), ... the author develops the brand concept from Customer's requirements and aim to satisfy the needs and expectations of customers.

4. MAIN FINDINGS

The three aspects of human psychological life are cognitive, emotional and action. Recognition, emotion, trust are psychological phenomena that represent the three aspects of human psychological life. These psychological activities carry out the process of receiving and dealing with human impacts. Through product and many factors, businesses impact on customers. By the psychological process, customers receive the impact of products, businesses. These effects form and embellish the brand of the product or business in the mind of the customer. Tang Van Ben&his authors (2005) share the same view that branding must be targeted and convey value to the target audience.

Customer perception is the first psychological process, which is the basis for all other high-level psychological activity of the customer. In contrast, other psychological activities affect the cognitive process. The result is the quality of all activities, the psychological process is enhanced. Perception is the basis of branding as stated by Do Hoai Linh (2011), but the author does not mention other psychological phenomena of customers in the process of branding in their mind.

Emotions are formed on the basis of the aggregation of feeling. Feeling is the result of the effects of the product, the business to the customer. Emotions are the results of total emotion for a long time. Emotions can be positive or negative corresponding to the good or bad nature of a product or business. Ha Thi Ngoc Oanh, Tran Thi Thu Hien (2012), has identified brands as images and emotions that customers have when they think of a company or product but not fully mentored psychological process that the customer gets through the process of branding.

Trust is a positive action formed by the emotional clarity of the customer. Frequent emotions of customers for products and businesses will affirm confidence, create trust and deepen into the mind of customers.

Many authors have mentioned the components of the brand, such as Ton That Nguyen Thiem (2006), Nguyen Quoc Thinh (2009), ... but the factors were inadequate. The authors systematize the components of the brand into three groups: attributes, images and benefits. Properties are the characteristics of the product such as color, design, weight, height, composition, standards, ... attributes of the business can be: the time of establishment, activity; production scale and business scale; capital, human resources, organizational structure, management ... The image of products and enterprises are related in the customer's mind about the contexts, characters, related events or representative of the product or enterprise. The factors are usually: character of representatives, image of advertisement; style of target customers; logo, ... Benefits include the elements: personalization, character abstraction, value of use; human, social and community values of the product or enterprise; ability to meet the needs of the higher levels of products, enterprises.

The brand name comes when the product is created and commercialized in the market, the corporate brand name has existed since the enterprise was established. It could be good or bad brands, not even good ones.

Based on the analysis of the status of brand claims, the study of customer psychological phenomena in the process of perception, the author of the article proposed the definition of brand: "Brand is the recognition, the emotional, trust of customers about the attributes, images, benefits of products, enterprises; is formed by the complete process of customer perception of all factors that are being affected by the product, the enterprise.

5. CONCLUSION

The contribution of this article is to propose a brand definition based on the psychological evolution of the customer in the process of receiving the impacts from the business. The psychological process of the customer in the process of receiving the impact to form the brand is the recognition, feelings and trust. Here are three typical psychological phenomena of the three aspects of human psychological life. Businesses that perceive these psychological phenomena of brand awareness will have a strong foundation in branding, as well as sustainable brand development. The brand definition of this article has also systematized the customer perceptions about the brand of the business, namely the attributes, images, benefits of products and businesses. These factors are also the elements constituting the brand from the viewpoint of the author of the article. These factors will guide the business in designing brand to ensure the conditions and requirements for the brand to develop sustainably.

The article analyzes the situation of some articles but is not intended to criticize. Through the analysis of published researches, the author has found valuable arguments to reinforce one's own perception and had many bases for developing definitions in the direction of approach from the customers' view. The author hopes that the paper's proposal is reasonable to contribute to creating a good platform for businesses to develop sustainable brands.

STRENGTHENING COOPERATION BETWEEN BANKS AND FINTECH COMPANIES FOR DEVELOPMENT OF THE FINTECH ECOSYSTEM FOR VIETNAM

Pham Van Lien* - Tran Thi Lan Huong**

ABSTRACT: *The continuous growth of financial technology companies (Fintech) in Vietnam and in the world is a vivid expression of the ongoing industrial revolution in the field of finance - banking, creating new values for the user and society. Banks and Fintech companies make two important components of Fintech ecosystem, both of which are heading towards cooperation in the provision of financial services so as to take advantages of each other. The article shows the trend of cooperation between banks and Fintech companies in the context of the 4th Industrial Revolution, the achievements, limitations and development orientation of Fintech ecosystem in Vietnam.*

Keywords: *Fintech, Fintech Ecosystem, Cooperation, Bank, Vietnam*

1. Introduction

Financial Technology – Fintech - is an area in which many companies take advantage of the technological innovation to provide diversified financial solutions/services which are efficient, convenient and of lower cost than traditional financial services provided by financial institutions.

Main customers of Fintech companies are banks, insurance companies, traditional financial institutions, consumers and newly started businesses (start-ups).

According to the 2016 report of SparkLabs Global Ventures on the operation of Fintech companies all over the world, Fintech companies are offering services in many different areas such as banking technology, payments, corporate finance, personal finance, digital currencies, services to replace services the core of the finance-banking (alternative cores) and so on. Their products/technological services could be as diverse as electronic wallet, technology ledger dispersion (DLT) on blockchain platform, online commerce B2C, mPOS, etc. In Vietnam, the link between banks and Fintech companies is now of prime concern in the development of the Fintech ecosystem.

2. Theories on the relationship between banks and Fintech – Fintech Ecosystem

Fintech is the term used to describe the use of technology in the provision of the financial services. Fintech companies are usually newly established businesses with new business models and new products to compete with core banking, insurance or payment services (ASIC, 2016).

According to Cemal Karakas and Carla Stamegna (2017), Fintech stands for financial technology, is a broad term used primarily to refer to those companies that use technology-based systems in some way to provide financial services directly or trying to make the financial system more efficient. Initially, this term refers to the technology used to support the activities of financial, trade and consuming

** Hong Duc University, Thanh Hoa, Vietnam

institutions. Today, the interpretation of Fintech has expanded to include any technological innovations in the financial sector, including innovation in finance education and training, retail banking, investment or improvement in the area. Fintech has also become synonymous with the emerging financial service industry of the 21st century to refer to a variety of services and products such as non-cash payment, loan, doing business, consultancy, capital mobilization, digital currencies and possibly many more in the coming years.

A symbiotic and stable ecosystem will promote the development of Fintech. Fintech role has become more important through the combination of the five elements of Fintech as suggested by Lee (2016) as following:

First, Fintech startups: These companies are located at the center of the ecosystem exerting significant impact on the financial services, boasting low operating costs while targeting numerous niche markets to offer more services to individual customers than conventional financial institutions.

Second, technology developers: technology developers provide technical platforms to create a favorable environment for Fintech startups to apply technology to improve services...

Third, the policy makers: policy makers have created a favorable legal environment for Fintech. The regulations create favorable conditions for Fintech startups to provide financial services which are less expensive and more accessible to customers compared with conventional services.

Four, financial customers: including individuals and organizations which help Fintech generate their revenues. Besides revenue from the institutional client group, individual customers and small and medium-sized enterprises have also brought Fintech gain considerable revenue and helped Fintech grow.

Fifth, conventional financial institutions: They are conventional banks, insurance companies, securities firms and venture investors. These organizations are the main driving force in the Fintech ecosystem. The business model of these traditional financial institutions is being reassessed and strategies have been developed to capture the innovation of Fintech.

Table 1: Ecosystem Fintech

(Source: In Lee, 2016, *Fintech: Ecosystem, business models, investment decisions, and challenges*, Available online at www.sciencedirect.com)

Of the 05 elements above in the Fintech ecosystem, Fintech companies and traditional financial

institutions (banks) are currently two predominant players in Vietnam. Strengthening the coordination between Fintech - innovative and banks - traditional is a platform that needs attention, in order to develop Fintech ecosystem in Vietnam.

3. METHODOLOGY AND THE RESEARCH PROCESS

The authors used qualitative research methods to analyze the relationship between banks and Fintech, to show the benefits in strengthening the cooperation between banks and Fintech to develop Fintech ecosystem in Vietnam. The authors focus on the results of the most recent studies from 2015 to date on the academic journals in Economics, Finance and Banking, Accounting - Audit in Vietnam and around the world. Based on these findings, the authors evaluate the strengths and weaknesses of traditional banks and Fintech companies, showing the increased cooperation between the two parties makes the principle key to success, creating added value in the digital technology era. In addition, to assess the status of the cooperation between banks and Fintech companies in Vietnam as well as the development of the Fintech ecosystem, we have used the survey results recently published in 2017 by the Basel Committee on Banking Supervision (BCBS). The survey has shown that this relationship has been mutually and continuously promoted by participating sides while Fintech companies have been involved in most of the banking services. The authors also conducted surveys with banks (state and non-state including the commercial joint-stock bank of Industry and Trade of Vietnam, Military Commercial Joint Stock Bank, the Commercial joint-stock bank of Technology, Vietcombank) and studied the legal framework, the provisions of the State Bank of Vietnam related to the cooperation between banks and Fintech companies. From the analysis of the benefits of the partnership between the two parties, the authors have also pointed out the remained problems and obstacles before coming up with key directions for boosting cooperation as well as developing Fintech ecosystem in Vietnam,

4. EXCHANGES BETWEEN FINTECH AND BANKS IN VIETNAM

4.1. Trend for cooperation between Fintech companies and banks

In the banking sector, the rapid development of Fintech companies over the past years, particularly in the fields of payment and loan, has been an issue that attracts the attention of many banks. However, Fintech companies and banks have distinctive advantages that can be exploited by each other.

| Fintech companies | | Banks | |
|--------------------------|---|-------------------|---|
| <i>On products</i> | Fintech companies are capable of launching, within a very short time, new products which are highly applicable and customer-friendly. | <i>On capital</i> | Banks possess enormous capital sources which could make a solid basis for investment into technologies to facilitate new projects, products and services. |

| | | | |
|-------------------------|--|---------------------------|--|
| On innovation | <p>Fintech Companies boast outstanding innovative characteristics which are not restrained by legal barriers as in the banks' case. Continuous application of the latest technology, especially technology in automation, artificial intelligence, social network data analysis ... to bring better experience, and better products than those provided by conventional banks.</p> | On prestige | <p>Banks possess prestige thanks to their solid financial strength, existing network and system. They are able to control risks and ensure security for customer transactions.</p> |
| On risk appetite | <p>Fintech take risks in a wide range, at higher level and even take ventures, so they easily reach to with customers who have not been made customers of conventional banks and bank subprime customers.</p> | On experience | <p>For years, banks have dominated the financial arena. Thus banks are experts in the field of finance and financial management.</p> |
| On database | <p>These companies also do better than banks in capturing the core values of customers from big data in order to provide better and faster services.</p> | On professionalism | <p>Banks boast professional staff, with extensive knowledge in the field of banking and finance.</p> |

Table 2: Analysis of the advantages of banks and Fintech companies

(Source: Mbank, 2017. The trend of cooperation between banks and fintech inn the context of the 4th industrial revolution)

Obviously, the strengths of Fintech companies are the weaknesses of banks and vice versa. As such, both sides are looking to cooperate in deployment of financial services in order to capitalize on the advantages of the partners. This partnership now makes a dominant trend worldwide in many different forms but, but gearing towards a common goal of bringing the best financial services and experience to customers.

On a broader scale, the symbiotic and complimentary relationship in which both sides supplement the deficient parts in each other with their own strengths should be nurtured for a country to maintain and develop a modern finance-banking system with innovative products and financial services to meet the ever higher expectations of customers.

Witnessing the rise of FinTech companies in recent years, banks have come to be aware of the advantages and challenges they have compared with FinTech companies. For banks, FinTech companies are both competitors, but also partners which could help to make finance-banking services more accessible, especially among customers living in remote areas with no access to traditional financial services.

Meanwhile, startups in the area of financial technology have the advantage of innovation, creativity and the ability to apply technology in a flexible and efficient way, especially with the application of digital platforms such as blockchain technology (block strings), cloud computing (cloud), artificial intelligence, robo-advisors and etc ...

To survive and develop, FinTech companies need support to access to capital, networks, customer information sources, as well as support and counseling on banking legal framework. Therefore, this mutually beneficial cooperation will give customers the service experience which is modern, convenient, and inexpensive while also generating substantial profits for both banks and FinTech companies.

4.2. Cooperation is the critical key

According to the bank report Vision 2020 composed by the International Auditing Company Deloitte, collaboration would give the key to success for Fintech companies and the banks in the digital era. The report points out the key factors to ensure successful cooperation between banks and FinTech companies to provide innovative financial products and services, while enhancing customers' experience.

First, the prospect to market enlargement (Scalability): Cooperation with banks can help reduce the time to market new solutions by leveraging the existing network of banks. In addition, the potential "exclusive" agreement potential between banks and FinTech companies must be customized so as not to exceed the limits of innovation and creativity.

Second, the product life cycle: The cooperation between banks and FinTech companies can influence the existing financial products; reaching out to existing customers, especially those who are less knowledgeable about technology.

Third, the confidence of the customer: This is a factor to be placed at the center of the model. Customer trust in the banks has been built up over decades thanks to responsible risk management and legal experience. Banks need to be selective so as to find a suitable Fintech company to cooperate with. Besides, both sides must work together to identify the limitations of the system or legal barriers within the bank's activities that should be addressed.

Fourth, the vision: FinTech companies need to develop visions towards creating innovative solutions for the financial service ecosystem. Meanwhile, banks must realize its role as an active partner in cooperative relationship with FinTech companies.

Fifth, self-built or acquired: The question led to the rapid formation of models of collaboration to utilize technology to provide products and services to quickly meet market demands and more sophisticated taste of customers.

Thus, in the current banking and finance context of Vietnam today, the "hand shake" between banks and FinTech companies is the inevitable. There have been good signals showing that banks in Vietnam has taken the initiative in looking for suitable partners among FinTech companies.

Valuable experience in the finance-banking area of banks and the capacity for creativity of FinTech companies will create resonating combinations which ensure sustainability and innovation. This will help satisfy the increasing demands of clients in the provision of financial products and services which are innovative, convenient and low cost. In other words, the cooperation between banks and FinTech companies will be the complementary for each other, helping to create value for users and the society, and to promote the dynamic development of the market in the future.

4.3. Fintech and banks in Vietnam

In the context of global economic integration, Vietnam should shape a suitable ecosystem to facilitate the development of Fintech companies and to promote the growth of the economy in general and financial services of Vietnam in particular, gearing towards strengthening the financial integration in the region and into the world.

According to assessments of foreign experts, Fintech companies and finance-banking institutions in Vietnam possess many favorable conditions with potentials for development in the field of Fintech. Vietnam has a young population with high demand for connection. 2016 statistics shows that more than 50% of the Vietnamese population use the Internet regularly. 34 million people own a smart phone. The number of users of banking services has not been high. Those who use banking service have currently focused only on withdrawals from your account. Thus, Vietnam is still a very attractive market for new financial service companies.

Over the years, the State Bank of Vietnam (SBV) took the initiative to approach and to enable Fintech companies to join the market. Since 2008, the central bank has licensed many companies which are not banks to offer payment service. Moving in the same direction, there has been a relatively established trend where banks cooperate with Fintech companies in recent years. A typical case is the cooperation between VietinBank and the Opportunity Network Company (ON): the two has recently signed a cooperation agreement to provide digital platform for connecting corporate clients of VietinBank with over 15,000 businesses in 113 countries which are members of ON, creating opportunities for domestic enterprises to effectively expand their market with foreign partners.

Meanwhile, the Military Commercial Joint Stock Bank (MB) has developed a digital banking model based on collaboration with its strategic partner Viettel. Vietcombank has cooperated with and the M_ Service Company to facilitate payment transfers ... Recently, electronic payment and online shopping have become increasingly popular. Thus, some banks are eyeing to grow their market share among the young, trendy, dynamic, technology loving customers. VIB Bank has partnered with FinTech Weezi to launch MyVIB Keyboard products, an application to transfer money through social networking.

Similarly, Techcombank has, jointly with FinTech Fastacash, introduced F@st Mobile, the platform to transfer money quickly through Facebook and Google+. Thus, choosing a suitable Fintech company to match its development strategy has helped banks achieve its objectives, as well as maximizing the benefits as a result of resonated relationship between banking and Fintech.

Currently payment is still one of the areas paid with strong attention by Fintech companies because technological application in this area has brought many benefits to consumers. Most recently, according to a survey published in 2017 by the Basel Committee on Banking Supervision (BCBS), Fintech companies have gotten involved in most of the services of banks from credit, deposit to payment and investment management, but the majority are still service-related payments, guarantee deposit which has accounted for about 41% while 27% is on supplementary services to financial services; 18% in loan making, depositing and capital raising; 9% in investment management services and 5% in other services.

In general, most of the Fintech products available in Vietnam is still very primitive while banks still account for the major market share of the financial services. Fintech cooperation is still limited, mainly focusing on provision of simple payment services, and has not touched upon more advanced services, as well as services in receiving feedbacks, and sharing information about customers.

It is noteworthy that Fintech and banking in Vietnam have not developed as expected by the market due to the lack of adequate and synchronized legal framework. Fintech companies are facing many problems, including the fact that the users are still shy away from online financial transactions since they do not understand what role the technology company play and what they would do to their bank accounts. Online financial activities carried out have remained less than 5% of total online time of internet users in Vietnam

5. CONCLUSIONS AND RECOMMENDATIONS FOR VIETNAM

With the huge potential of Fintech in Vietnam regarding the size of the population and comparative advantage in human resources in the field of information technology, in order to maximize the benefits that Fintech can bring into the Vietnamese finance and banking markets in particular and into economic growth in general, and to create a harmonious development between the banking sector and Fintech, and to encourage and promote innovation, the cooperation of many stakeholders is recommended. In particular:

On the side of the State: The State needs (1) to complete the legal framework, towards building a pilot (if necessary) legal framework to develop a “level playing field” in the future for Fintech companies and commercial banks, through which to encourage mutually beneficial “cooperation - competition” between the two players; (2) to improve financial market infrastructure, enhancing interoperability between different market infrastructure systems; (3) to mobilize the technical support and assistance of international organizations such as the ADB, the WBG ... and bilateral cooperation with management counterparts of foreign countries to conduct exchanges and experience sharings in Fintech management; (4) concerned ministries such as the Ministry of Science and Technology, Ministry of Finance, Ministry of Justice, State Bank and so on should promote coordination in improving the legal framework for consistent and unified supervision, so as to create a favorable business environment for Fintech development with a view to promoting a dynamic, sustainable and stable banking system in Vietnam while protecting consumers’ rights.

On the side of Fintech companies: they need (1) to conduct thorough research to understand and master the technology innovative, creative before applied in Vietnam, making sure to avoid risks and to master the technologies with potentials for innovations before applying them into the Vietnamese environment to avoid risks and to ensure highest benefits to the society; (2) to diversify and to enhance the quality of financial products and services, focusing on the convenience, ease of use, while ensuring the safety and security. The reliability of transaction security should be ensured to create confidence in the use of financial services; (3) to promote the demands of users (by improving financial awareness of the people, strengthening the confidence of consumers while using the services, protecting the consumers ...in line of the implementation of the National Strategy on financial universalization in the near future.

On the side of banks: they should (1) continue to build and improve the legal framework for the financial services provided in association with Fintech companies; (2) make the most of the provisions of the State Bank Steering Committee on the financial technology sector in promoting the development of Fintech in banking; (3) strengthen coordination, linkage to Fintech companies in the creation and provision of financial services, to reinforce confidence of service users capitalizing on the banks’ existing reputation.

On the side of universities and training institutions: Human resources make a key factor, and with decisive role, in building the ecosystem Fintech of all nations in the face of technological development. Therefore, Vietnamese management bodies should pay attention to the nursery of talents through attraction, training and support given to technology professionals /talented people who are knowledgeable about digital technology and the finance-banking sector. This could be done based on experiences learnt from the management models of some countries in the region such as Singapore, Hong Kong, Indonesia, Australia ...

MISSTATEMENTS PREDICTION ON FINANCIAL STATEMENTS OF LISTED REAL ESTATE COMPANIES ON THE VIETNAM STOCK MARKET

Vu Thi Phuong Lien - Cu Thu Thuy - Duyen Nguyen T.M*

ABSTRACT: *Financial information needed faithful representation, which is one of the inevitable requirements to ensure sustainable development goals in business operations of enterprise. This research is carried out to predict misstatements on financial statements of listed real estate companies on Vietnam stock market by analyzing financial ratios. The study is based on Positive Accounting theory as well as F-SCORE model. The research data included 56 listed real estate companies on Vietnam stock market during the period from 2010 to 2017. Random Effects Logistic Regression model (Logit REM) is used to estimate this model. The results indicate that three variables consisting of changes in receivables (CHREC), changes in inventory (CHINV), the percentage of assets with average liquidity (SOFTASSETS) in F-SCORE model and two additional variables including accounts receivable to total assets (RECTA), gross profit to total assets (GPTA) affect the possibility of misstatements on financial statements. After being eliminated insignificant variables, the model has ability of 60.59% of accuracy prediction relating to the companies with misstatements on financial statements, 71.02% relating to the companies with no misstatements on financial statements and 66.29% relating to the whole sample. Financial statement users (especially investors, auditors and inspectors, etc.) could use the results of the study to predict the possibility of misstatements on the financial statements as well as to define the range of financial ratios in which frauds and errors frequently appear, thus helping define key elements in examination and evaluation.*

Keywords: *Misstatements prediction, F-SCORE, Listed real-estate companies, financial ratios*

1. INTRODUCTION

Financial information needed faithful representation, which is one of the inevitable requirements to ensure sustainable development goals in business operations of enterprise. Financial information on financial statements should be presented faithful and objectively to meet the demands of financial statement users in making economic decisions. (IASB, *Conceptual Framework for Financial Reporting, 2010*). However, financial information on financial statements do not always meet all the requirements of the qualitative characteristics of Conceptual Framework for Financial Reporting. The terms such as “polished”, “inflated”, “manipulated” are increasingly familiar to information users and they are hot topics in both global financial markets and Vietnam’s financial market. For instance, the world has witnessed the big scandals related to frauds on financial statements such as Health South, Enron, Olympus, Toshiba and WorldCom, etc. In Vietnam, a series of scandals of listed companies have revealed fraud behaviors such as Truong Thanh Furniture Corporation (TTF), Hung Vuong Corporation (HVG), Vietnam Japan Medical Equipment (JVC) and KLF international

* Academy of Finance – Tel: +84989789820, Email: vuphuonglien@hvtc.edu.vn

investment company (KLF), etc. According to statistics on Vietstock, the recent announced profits of many businesses in 2017 “evaporated” or increased several times after audit in comparison with their early reports, causing bad effects to investors. Facing the fact that frauds and accounting tips are increasingly sophisticated, financial statement users (auditors, inspectors, borrowers, lenders, banks, suppliers, etc.) need to be equipped with more tools and techniques which help them to predict and define range of frauds in order to minimize risks, ensure the reliability of information represented on financial statements.

There has been a remarkable return in real estate industry after a long period of stagnation (from 2009 to 2013) in recent years. More than 80% of stocks of real estate companies increase value that contributes substantially to the growth of the stock market, reaching 1000 points. The characteristics of the real estate business require large amounts of capital, at least two latest years of operation as a joint stock company, at least 5% of the return on equity (ROE), at least two latest years of profitable operation, no overdue debts over one year, no accumulated loss up to the year of listing registration and so on. (*Source: Decree 58/2012 / Decree - Government, 2012*). However, listed real estate companies in Vietnam often have limited financial capacity, low equity, long-term business cycles and long-term capital returns. As a result, financial information on their financial statements could be represented intentionally unfaithfully by information providers.

This study aims at predicting the probability of misstatement and the applicability of empirical study to listed real estate companies on Vietnamese Stock Market. Literatures include studies using statistical techniques to identify frauds and errors on financial statements such as those of Persons (1995), Beneish (1999), Dechow et al. (2011), Normah Omar et al. (2015), Sri Astui (2015), etc. In Vietnam, there are many studies contributing greatly to identifying and detecting the misstatements on financial statements of Vietnamese enterprises such as researches by T. T. G. Tan et al. (2014), D. N. Hung et al. (2017), T. M. Dung et al. (2017). Relying on Positive Accounting theory, Fraud Triangle theory and previous researches, this research predicts misstatement on financial statement by analysing financial ratios. This study applies the F-SCORE model (*Dechow et al., 2011*) to assess and predict the probability misstatements on financial statements of listed real estate companies on Vietnamese stock market. Additionally, we expand and develop forecasting models and Logit model to analyse the ability of existing frauds and errors through the sample consisting of 56-listed real estate companies in eight years (from 2010 to 2017).

2. LITERATURE REVIEW

Misstatement is a difference between the values, classification, representation or disclosure of an item on a financial statement and its values, classification, representation or disclosure in accordance with the requirements of Conceptual Framework for Financial Reporting. Misstatement are likely to be caused by frauds or intentional errors. In order to distinguish between frauds and errors, it is necessary to consider causes. There have been many previous researches of misstatement or fraud.

Fraud Triangle theory (Donald R. Cressey, 1953) analyzed frauds in terms of asset misappropriation and corruption through the survey of 200 cases relating to economic crimes, which suggests three factors causing frauds including: incentive/pressure, opportunity and rationalization. Fraud triangle is one of the models used for studying and evaluating the risk of frauds occurring in many different activities, including auditing. It provides a valid framework for many foreign and local studies on embezzlement behaviors such as those of T. T. G. Tan et al. (2014); D.N. Hung et al. (2017); H.T.T. Huyen (2016), Normah Omar et al. (2015); Ines Amara et al. (2013); P. Ravisankar et al. (2010); Sri Astui (2015).

Fraud Scale theory (Albrecht et al., 1980) shows that pressure and opportunity are two of three factors leading to fraud behavior. However, Albrecht used a third factor of personal integrity instead of rationalization. According to Albrecht, the risk of fraud is higher when pressure and opportunity are high, personal integrity is low. In contrast, the risk of fraud is lower when opportunity and pressure are low, personal integrity is high.

Many researchers combined fraud theories with Positive accounting Theory to explain and predict regular accounting practices in order to find answer to the questions: “Why do the reporters do that?” or “What motivates them to do that?” **Positive accounting theory** was early study by Ray Ball and Phillip Brown in “An Empirical Evaluation of Accounting Income Numbers” in 1968. Watts & Zimmerman later purified it in the popular book named “Positive Accounting Theory” which was published in 1986. It helps researchers to explain things which have never appeared or have been difficultly observed in finance and accounting through the analysis of motives and objectives of managers in the selection of accounting regimes. Positive Accounting theory bases on empirical studies with data and events that occur in reality to test hypotheses that the researcher observes and poses, which implements statistical or econometric methods for the purpose of hypothesis testing and forecasting.

The research of **Messod D. Beneish** (1999) relied on Positive Accounting theory to classify firms, which involved in income adjustment. M-SCORE model has helped auditors and investors identify fraudulent possibility effectively and assess the reliability of accounting profits. Beneish (1999) used samples of 74 companies that manipulate earnings and 2332 companies on COMPUSTAT non-manipulators in the period from 1982 to 1992 with weighted exogenous sample maximum likelihood probit model (*WESML Probit model*) to estimate the model.

The result of the study showed the M-SCORE model:

$$M - Score = -4.84 + 0.92DRSI + 0.528GMI + 0.404AQI + 0.892SGI + 0.115DEPI \\ - 0.172SGAI + 4.679TATA - 0.327LVGI$$

M-SCORE of a company exceeding -2.22 indicates signal of behaviours that affected profit (*Brickell, 2011, Roxas, 2011*).

Base on the research conducted by Beneish (1999) as well as the foundation of Positive accounting theory, Dechow et al. (2011) developed a database of widely available financial frauds, promoting the study of profit fraud, analysing the financial characteristics of fraudulent companies, and developing a model for predicting misstatements. The results of the study revealed that F-Score can be used as an indicator or a signal of the possibility of frauds. The results obtained three models:

F-score I:

$$MISSTATEMENT = -7.893 + 0.790Rsstacc + 2.518 Chrec + 1.191Chinv \\ + 1.979 Softassets + 0.171Chcs - 0.932Chroa + 1.092Issue + e$$

F-score II:

$$+2.011Softassets + 0.159Chcs - 1.029Chroa + 0.983Issue - 0.150Chaemp \\ + 0.419Leasedum + \varepsilon$$

F-score III:

$$MISSTATEMENT = -7.966 + 0.909Rsstacc + 1.731Chrec + 1.447Chinv$$

$$+2.265Softassets + 0.160Chcs - 1.455Chroa + 0.653Issue - 0.121Chaemp \\ + 0.345Leasedum + 0.082Ret_t + 0.098Ret_{t-1} + \varepsilon$$

The rate of accuracy of F-score I was 65.59%, that of the F-score II was 64.97% and the F-score III has the rate of 62.98%. The researchers then added more variables and formulas to these models in order to improve the possibility of prediction as well as the outcomes of the model.

Some researchers also use financial ratios relating to financial leverage, liquidity, profitability, asset structure, etc., (Persons (1995), Spathis (2002), Spathis et al. (2002), Dalnial et al. (2014), Efstathios Kirkos et al. (2007), etc.). However, these studies have not yet met the needs of every users. Therefore, this research used the F-SCORE model based on the researches of Beneish (1999) and Dechow et al. (2011) to build and develop a model of research.

3. RESEARCH METHODOLOGY

Based on *Accounting Positive Theory* with other fraud theories, this research used F-SCORE model to build and develop a model for listed real estate companies on Vietnam stock market from 2010 to 2017.

3.1. Hypothetical construction

Accrual Accounting (RSSTACC)

Early work by Healy et al. (1985), total accrual includes Discretionary Accruals (DA) and Non-Discretionary Accruals (NDA). According to Beneish's research (1997), total accrual accounting divided by total assets is useful ratio to identify the violation of the firm in Generally Accepted Accounting Principles (GAAP), which is also the conclusion in Dechow et al.'s research (2011).

$$WC = (Current\ Assets - Cash\ and\ Cash\ Equivalent - Short - term\ Investment)$$

$$NCO = (Total\ Assets - Current\ Assets - Long - term\ Investment) - (Liabilities$$

$$FIN = (Short - term\ Investment + Long - term\ Investment) - (Long - term\ Debt \\ + Debt\ in\ Current\ Liabilities + Preferred\ Stock)$$

Hypothesis: Accrual accounting has a positive relation with misstatements on financial statements.

Change in inventory (CHINV)

The value of inventory is dependent on the business manager's choices through the provisions and the methods of calculating inventories, which then affects costs of goods sold and profits in the period. Some researchers such as Summers and Sweeney (1998), Spathis et al. (2002), Skousen and Wright (2006), Efstathios Kirkos et al. (2007) agreed that fraud is manipulated on inventories, such as inventories that are higher than cost or market value, or incorrect value.

$$CHINV = \Delta Inventories / Average\ Total\ Assets$$

Hypothesis: Inventories have a positive relation with misstatement on financial statements.

Change in receivables (CHREC)

According to study of D. N. Hung et al. (2017), many companies can fully manipulate the debt age of customers to adjust the provisions to change the profit. Among the tools for manipulating fraud on financial statements, accounts receivable and bad debt are useful tools due to their subjective nature (Summers and Sweeney, 1998). Researchers such as Loebbecke et al. (1989), Persons (1995), Beneish (1999), Wetzel et

al. (2001), Dechow et al. (2011), Aghghleh (2016), Dalninal et al. (2014), Tarjo and Nurul Herawati (2015) shared the same idea that the majority of cheating related to accounts receivable and inventory accounts.

$$CHREC = \Delta \text{Accounts Receivable} / \text{Average Total Assets}$$

Hypothesis: The change of accounts receivable has a positive effect on misstatement on financial statements.

The percentage of assets with average liquidity (SOFTASSETS)

SOFTASSETS measure the percentage of “soft” assets on the balance sheet (defined as the percentage of assets that are neither cash nor property, plant, and equipment (PP&E)).

The research of Barton and Simko (2002) shows that companies with high net assets would be more easily to adjust profit in short time (Dechow et al., 2011, N. Hung et al., 2017). When firms with higher SOFTASSET on the balance sheet, which have more discretionary power to change assumptions to achieve short-term returns (Dechow et al., 2011). Mohamed et al., 2016).

$$SOFTASSETS = (\text{Total Assets} - \text{Property, Plant and Equipment} - \text{Cash and Cash Equivalent}) / (\text{Total Assets})$$

Hypothesis: The percentage of assets with average liquidity has a positive effect on misstatement on financial statements.

Change in cash sales (CHCS)

Change in cash sales is a useful tool to evaluate the efficiency of the firms and identify the financial statement whether there is a fraud or not (Dechow et al., 1996; Beneish, 1999; Dechow, 2011). Enterprises will try to stimulate demand by loosening the policy of selling businesses, such as changes in limits, payment terms, and discount rates. These operations will help to increase capital in the short - term period, create a growing illusion of business and will inevitably lead to risks later. (D. N. Hung et al., 2017)

$$CHCS = \text{Sales} - \Delta \text{Accounts Receivable}$$

Hypothesis: The change in sales revenue in cash has a positive effect on misstatements on financial statements.

Change rate of return on assets (CHROA)

Managers appear to prefer to show growth in earnings (Dechow et al., 2011). The development of ROA is the driving force for managers to adjust the financial statements when performance actually does not meet expectations (Summers & Sweeney, 1998). In addition, Summers & Sweeney (1998) also pointed out that there is a significant difference in ROA between fraud and non-fraud businesses. Spathis (2002), Efstathios Kirkos et al. (2007), T.T.G. Tan (2014) again demonstrated this conclusion in your research.

$$CHROA = \left(\frac{\text{Earnings}_t}{\text{Average Total assets}_t} \right) - \left(\frac{\text{Earnings}_{t-1}}{\text{Average Total Assets}_{t-1}} \right)$$

Hypothesis: The change rate of return on assets have negative and affect misstatement on financial statements.

Issue additional shares (ISSUE)

A firm “zealously” issued more shares demonstrates that problems of cash flow need to be offset by additional financing. Although the firm has already done well in the pecking order theory, the money is not enough for its operations and has to issue more shares to raise money. According to Dechow et al. (2011),

one incentive for misstating earnings is to maintain a high stock price. The managers who misstate their financial statements are particularly concerned with a high stock price.

ISSUE = 1 (if the enterprise issues share in the year)

ISSUE = 0 (if the enterprise does not issue share in the year)

Hypothesis: Issuing additional shares has a positive effect on misstatement on financial statements.

Gross profit to total assets (GPTA)

Gross profit to total assets (GPTA) shows the efficiency when using inputs for manufacturing process. This is one of the most important targets for the investor to evaluate and make decisions. Firms, which do not prospect well, will have more incentives to manipulate earnings (Beneish, 1999). Moreover, this is accepted by Spathis (2002), Summers and Sweeney (1998), Hawariah Dalniala et al. (2014), Kreudfelt & Wallace (1986)'s researches.

$$GPTA = \frac{\text{Sales} - \text{Cost of goods sold}}{\text{Total Assets}}$$

Hypothesis: Gross profit to total assets has a negative impact on misstatement on financial statements.

Accounts receivable to total assets (RECTA)

Accounts receivables are known as "vulnerable" assets with frauds such as the employee appropriates or defalcates. According to Persons (1995), fraud firms having Current assets include inventories and accounts receivable (e.g Feroz, Park & Pastena, 1991; Spathis, 2002; Spathis et al., 2002)

$$RECTA = (\text{Accounts Receivable})/(\text{Total Assets})$$

Hypothesis: Accounts receivable to total assets has a positive effect on misstatement on financial statements

3.2. Reasearch Model

Based on the hypothesis and F-SCORE model, we offer some prediction models in misstatement on financial statement.

$$\text{Misstate} = \beta_1 + \beta_2 \text{RSSTACC} + \beta_3 \text{CHREC} + \beta_4 \text{CHINV} + \beta_5 \text{SOFTASSETS} + \beta_6 \text{CHCS} \\ + \beta_7 \text{CHROA} + \beta_8 \text{ISSUE} + \varepsilon$$

Developing F-SCORE model by adding 2 more elements evaluating the financial stability of the firm: accounts receivable to total assets (RECTA) and gross profit to total assets (GPTA). For real estate firms, financial stability is very important, so this research choose RECTA and GPTA with the expectation that it will increase the probability of fraud on the financial statements for real estate companies listed on Vietnam stock market.

$$\text{Misstate} = \beta_1 + \beta_2 \text{RSSTACC} + \beta_3 \text{CHREC} + \beta_4 \text{CHINV} + \beta_5 \text{SOFTASSETS} + \beta_6 \text{CHCS} \\ + \beta_7 \text{CHROA} + \beta_8 \text{ISSUE} + \beta_9 \text{RECTA} + \beta_{10} \text{GPTA} + \varepsilon$$

3.3. Model Estimation Method

Misstaterments on financial statements occur when a firm omits the data or is premeditated to make inaccurate financial statements. Dependent variables considered dummy variables (misstatement and no misstatement), which is binary variables to classify financial statements.

$$Misstate = \begin{cases} 1 & \text{The firm has misstatement on the financial statements} \\ 0 & \text{The firm has no misstatement on the financial statements} \end{cases}$$

The firms having misstatement on financial statement are the enterprises with a change in the profit after tax before and after audit of 5% or more. The change in profit after tax before and after audits, which calculated as follows:

$$Change\ in\ profit\ after\ tax = \left| \frac{Profit\ before\ audit - Profit\ after\ audit}{Profit\ after\ audit} \right| \times 100$$

When a firm makes a financial statement, it assumes that a vector of explanatory variables will characterize the firm: $X_i = (X_{2i}, X_{3i}, \dots, X_{ki})$. The investors as well as economic entity will pay attention to probability of Misstatement, which calculated as follow:

$$P(Misstate = 1 | X = X_i) \text{ (probability of Misstatement).}$$

Today, there are varieties of methods used to estimate the model with binary variables such as linear probability model (LPM), Logit model, Probit model, Tobit model, etc... The research used Logit model because of high applicability. In Logit model (Maddala, 1984), P_i is calculated:

$$P_i = P(Misstate = 1 | X = X_i) = \frac{1}{1 + e^{-Misstate_i}} = \frac{e^{Misstate_i}}{1 + e^{Misstate_i}} \quad (1)$$

Logit model is not studied the direct effect of independent variables on dependent variable Misstate but considers the impact of dependent variables on probability of Misstatement, which is equal “1” or mathematical expectation of Misstate.

$$\text{Odds ratio (OR): } OR = \frac{P_i}{1 - P_i} = e^{Misstate_i}$$

OR shows how many times the probability of Misstate = 1 (probability of misstatement) is compared with as the probability of Misstate = 0 (no probability of misstatement).

Transforming the formulas (1):

$$L_i = \ln\left(\frac{P_i}{1 - P_i}\right) = \beta_1 + \beta_2 RSSTACC_i + \beta_3 CHREC_i + \beta_4 CHINV_i + \beta_5 SOFTASSETS_i + \beta_6 CHCS_i + \beta_7 CHROA_i + \beta_8 ISSUE_i + \varepsilon_i \quad (2)$$

We use (2) to estimate $\ln\left(\frac{P_i}{1 - P_i}\right)$ (called by Log – Odds).

Sample survey data is panel data including 448 observations, 56 firms and 8 moments, so will use the Logit model. The regression models with the panel data are Population Averaged (PA), Fixed Effects Model (FEM) and Random Effects Model (REM). The Logit PA, Logit FEM and Logit REM methods will be applicable.

4. EMPIRICAL RESULTS

4.1. Initial collection and processing

The research has collected the consolidated financial statements after auditing and the unaudited consolidated financial statements or the unaudited fourth quarterly reports of real estate companies listed on HOSE, HNX, UPCOM, OTC, provided by Stoxplus - the leading enterprise in financial information and business information in Vietnam. From the sample we collected, this research removed the data samples

that were too different and did not have enough information about the audited financial statements or lack of information on the profit on the unaudited financial statements from 2010 to 2017. The final table used in the study includes 56 real estate companies listed on the Vietnam stock market in the period 2010 - 2017.

The research team classifies data into two groups. Group 1 has *Misstate* = 1 and group 2 has *Misstate* = 0. The total number of observations of group 1 includes 203 financial statements have misstatements and 245 financial statements do not have misstatements.

From a sample of 56 companies and 8 periods (from 2010 to 2017), this research calculated the descriptive statistics parameters of the variables. The table 1 shows that percentage of misstatement on financial statement of real estate companies listed on the stock market of Vietnam in the period from 2010 to 2017 at 45.31%. The average of SOFTASSET of companies at 89.68%, no companies with less than 45% shares, it shows that companies focus on investment on SOFTASSET. However, over-investment in this type of property will be a waste or perhaps a sign of a delay in the distribution.

Table 1: Results of Descriptive Statistics of Metric Variables

| variable | N | mean | sd | min | max | cv |
|------------|-----|-----------|----------|-----------|----------|----------|
| misstate | 448 | .453125 | .4983544 | 0 | 1 | 1.099817 |
| rsstacc | 448 | .0515702 | .1702705 | -.53126 | 1.54973 | 3.301723 |
| chrec | 448 | .0102058 | .1016034 | -.91104 | 1.09806 | 9.955448 |

The results of the correlation analysis in Table 2 shows that the dependent variables were negatively correlated with RSSTACC, CHREC, CHCS, CHROA, ISSUE, GPTA and positively correlated with CHINV, SOFTASSETS and RECTA.

Examination of multi-collinearity in the research model, the research tested the variance inflation factor of the independent variables in the model. The table 3 shows the average coefficients of VIF is 1.31 < 2.0, so the model does not have multi-collinearity.

Table 3: The result of the variance inflation factor (VIF)

To avoid spurious regression in the regression model, all variables must be stationary variables. The research use the standard of two researchers Levin- Lin – Chu (LLC, 2002) and Harris-Tzavalis (1999) to test the stationary of the variables in the model with panel data. The results of both methods show that all variables with significance level of 5%, all the data series in the sample were stationary.

4.2. Estimate and test model

Firstly, the research examines three FEM, REM, Pooled OLS models to find which the most suitable model is.

This research used the Hausman test for to evaluate the suitability between FEM and REM. The Hausman test P-value estimation result of model 1, model 2 are significantly higher than the 5% significance level, therefore the REM model is more appropriate than the FEM model.

Then, the research uses Breusch-Pagan test to select between REM and Pooled OLS models. The Breusch- Pagan's p-value regression results of 2 models are zero, so the REM model is appropriate

Results of the F-SCORE model estimation using all three methods were statistically significant with the sample. Table 4 is the result of F-SCORE model estimation by FEM Logit, Logit REM and Logit PA. There are two variables: CHINV and SOFTASSETS are statistically significant at 1% for all three estimation methods, the RSSTACC variable is significant at 5% with the Logit PA method.

Table 4: Regression result for model 1

(Source: By the authors calculated on STATA 14 software)

The regression with expanded F-SCORE model by the Logit REM model, therefore the Logit REM model is consistent. The result, there are five variables CHREC, CHINV, SOFTASSETS, RECTA, GPTA affect the possibility of misstatements on the financial statements of enterprises. Eliminating non-significant variables out of the model and continue the estimation using the REM Logit model as shown in Table 5.

Model 3:

$$\ln[P(\text{Misstate} = 1)/(1 - P(\text{Misstate} = 1))] = \beta_1 + \beta_2\text{CHREC} + \beta_3\text{CHINV} + \beta_4\text{SOFTASSETS} + \beta_5\text{RECTA} + \beta_6\text{GPTA} + \varepsilon$$

The results of Table 5 shows that the model of 5 variables (*SOFTASSETS*, *CHINV*, *CHREC*, *RECTA*, *GPTA*) are statistically significant in the forecast misstatement on the financial statements for real estate companies listed on the stock market of Vietnam. All of 5 variables is statistically significant at 5%. The results show that CHINV, SOFTASSETS, RECTA have a positive impact and CHREC, GPTA has a negative impact on the probability of misstatements on the financial statements.

4.3. Analyse the results

The results in table 6 shows that F-SCORE model can predict misstatements on financial statement for listed real estate companies in Vietnam, the model can classify precisely 60.04% for the whole sample. After adding

some factors to the model to evaluate the firm's financial stability (RECTA, GPTA), the extension model's ability to classify precisely is 64.73%. After eliminating all insignificant variables, the accuracy of the model is 66.29% in which 60.59% with enterprises committed misstatement and 71.02% with non-misstatement companies. With five-variable model, error violation for type I & II is 29.98% & 39.41% respectively.

Table 6: Forecast results of models

| Classified | Model 1 | | | Model 2 | | | Model 3 | | |
|------------------------|---------|-----|-------|---------|-----|-------|---------|-----|-------|
| | 1 | 0 | Total | 1 | 0 | Total | 1 | 0 | Total |

| Correct classification | 60.04% | | | 64.73% | | | 66.29% | | |

(Source: By the authors calculated by excel)

Discussion

The research shows that the F-SCORE model can apply to the listed real estate companies on Vietnam stock market. Among 7 variables in F-SCORE model, there are 3 variables RSSTACC, CHINV and SOFTASSETS that affect the probability of misstatement on financial statement, in which RSSTACC and SOFTASSETS has the same result with D. N. Hung et al. (2017)'s research.

The results of extension model including RECTA and GPTA show that there are 5 variables (CHINV, CHREC, SOFTASSETS, RECTA, GPTA) have impacts on misstatements on financial statement. The results of the five-variable model after being eliminated all the insignificant variables and being estimated by Logit REM model, all variables had correlation with misstatements and statistically significant at 1% and 5% in which 4 variables have the desirable correlation. While the results of the five-variable model of misstatement firms on financial statement is 60.59% and 71.02% for non-misstatement firms and for whole samples is 66.29%. The predicted rate is close to the predicted misstatement rate of Dechow et al. - the first to propose F-SCORE.

5. LIMITATION

Although the research model provides effective tool in forecasting misstatements on financial statement for listed real estate Vietnamese companies in stock market, but it has some limitations. Firstly, the size of our sample consists of 56 companies with 448 observations in 8 years from 2010-2017 is not large enough to make conclusion to all listed real estate companies in Vietnamese stock market and it does not able to develop a logistic indicator for firms in this industry. Secondly, this research has just stopped at research for real estate companies but not for all businesses in other areas. Consequently, following studies can extend the research for other industries and for unlisted companies.

The research is just a perspective on misstatement on financial statement in the sample consist of 56 listed real estate companies on Vietnam stock market from 2010-2017. Therefore, financial statement's users should use M-SCORE, Z-SCORE models or other forecasting tools to evaluate and have a bird's view of misstatements on financial statement.

6. RECOMMENDATIONS & SUGGESTIONS

With the sample of 56 listed real estate firms on Vietnam stock market from 2010-2017, this research shows that misstatements have correlation with 5 factors: ratio of accounts receivable to total assets, change in inventory, change in cash sales, the ratio of gross profit and the percentage of assets with average liquidity. The research also confirms that the five-variable model, it can classify precisely 60.59% for misstatement companies and 71.02% for non-misstatement firms and 66.29% for the whole sample. It is possible to apply the research model to detect misstatements on financial statement for listed real estate Vietnamese companies in stock market.

In these days, misstatements are increasingly sophisticated and harder to identify and control financial statement users (*especially investors, auditors and inspectors, etc.*) should be equipped with forecasting tools to predict misstatement in order to help them to be more cautious when making economic decisions. In practice, many misstatements are hidden and hard to detect but financial statement users can use this model of research to detect key elements, targets or items on financial statement that are predicted likely to have misstatements.

The auditors and inspector when conducting audits or investigations of listed companies on financial statement, they should focus on examining areas such as the ratio of accounts receivable to total assets, the ratio of gross profit, the percentage of assets with average liquidity of the enterprise. At the same time, they should also focus on Change in inventories and Change in cash sales and compare them with previous years or with those of other enterprises in the same industry.

The managers and shareholders, they should pay more attention to the accounting policies related to preparation and representation of financial information on financial statements, carry out supervision in accounting work, the recording of revenue and costs of goods sold in the period, re-evaluate the receivables, inventories and assets with average liquidity in the enterprise.

The investors, institutions, prior to making economic decisions, they should not rely solely on auditor's opinion in the audit report but also use forecasting tools such as F-SCORE model to re-evaluate the reliability of the information represent on the financial statement.

THE CHALLENGES FACED BY DEVELOPING COUNTRIES REGARDING TRANSFER PRICING REGULATION - A CASE STUDY OF VIETNAM

Tran Thi Phuong Lien* - Doan Huong Quynh** - Pham Thi Van Anh***

Abstract: *There is little room for doubt that transfer pricing has become one of the most controversial issue of international taxation. The dual objectives of maintaining the attractive investment climate and protecting the national tax revenue along with inherent difficulties of scarce resources and low capacity place much more challenges on transfer pricing legislation of developing countries, including Vietnam. They need to apply strict regulation to manage transfer pricing of multinational enterprises while still ensuring that foreign direct investments into these countries are not adversely affected (Silberztein, 2010). The paper offers a broad and complete interdisciplinary vision, not only from policy makers, tax authorities but enterprises and consultant firms such as Big 4 towards the change in current transfer pricing regulation. Besides giving comments on new law in Vietnam, we foresee the change in transfer pricing regime of developing countries in future.*

Key words: *Transfer pricing, developing countries, multinational enterprises (MNEs), foreign direct investment (FDI).*

Methodology: The paper is conducted as a qualitative case study. The collection of data is the combination of primary data through the interview and secondary data in both international and domestic transfer pricing regulations, related sources including books, journals, reports and databases.

1. INTRODUCTION

International decentralisation comes along with the integration national economics through the support of technology development has reinforced the establishment and operation of enterprises across the borders, which is referred as multinational enterprises (MNEs). As getting involved with tax rules of different jurisdictions, the development of MNEs has brought about the rising sophisticated taxation problems for both taxpayers and tax administration, including transfer pricing. Since defined as ‘an international tax planning strategy’ (Baistrocchi and Roxan, 2012), transfer price allows MNEs to avoid double taxation but ‘is also open to tax abuse’ through profit shifting (PwC, 2009). The transfer pricing malpractices, as a result, bring about unfairly competitiveness economic environment, national revenue lose and social poverty, which is more severe in developing countries. Recent years, MNEs, through the development of FDI, have to the economy of emerging countries. However, the integrated structure of MNEs along with more complicated transfer pricing method has become a bigger challenge for tax authorities. The fact requires governments to set up an efficient transfer pricing regime with the highest prior aim of protection national tax base, but not make an adverse impact on MNEs’ operation.

Vietnam is a transitional country with a dynamic market economy. Stable politics background and potential domestic resources attract more and more investment from foreign companies to set up affiliates. According to the Frontier Markets Sentiment Index conducted by Frontier Strategy Group in 2014, Vietnam

*, **, *** Academy of Finance

stands third rank in top 20 frontier markets that major European and American multinational companies are most interested in. As the matter of fact, Vietnam has several remarkable steps in establishing and implementing transfer pricing legislation, which basically leans on the OECD Guidelines and adopts to arm's length principle. According to a senior tax advisor at OECD Secretariat, Vietnam, along with Colombia, Ghana, Kenya are considered as highest priority nations to receive country-focused assistance in global strategies to develop transfer pricing schemes in developing countries. Integration gives emerging nations like Vietnam the chance to approach and study international practical guidelines as well as experiences in solving transfer pricing abuse from other countries. Also, the study of transfer pricing regulation in Vietnam can be reviewed as experience for other emerging nations in areas and over the world.

Rather discussing regulation with a negative view of transfer pricing as tax evasion, the paper offers a more objective and fair view of transfer pricing - as a principle tax tool. Challenges posed to transfer pricing policy are not only investigated from the perspective of authorities in executive and management, but also from the perspective of implementation and compliance of enterprises. This is considered as the core value and highlight of this paper.

The paper is structured in four main sections. The next part gives a brief overview of transfer pricing, followed by an analysis of the challenges faced by developing countries. The following section analyses the development of MNE along with the current situation of transfer pricing in Vietnam. Finally, we discuss the changes in Vietnamese policy currently and give comment on trend in development of transfer pricing policy in future.

2. TRANSFER PRICING – TWO SIDES OF A COIN

Transfer pricing is the setting of the price for physical goods and services, intangible properties between controlled or associated enterprise (Novikovas, 2011). Enterprises, according to Article 9 of the The Organisation for Economic Co-operation and Development (OECD) Model Tax Convention, are associated when: i) A firm engaged in managing, control or capital contributions to other enterprises directly or indirectly or; ii) The two enterprises have the same persons participating directly or indirectly in the management, control or capital. Since management factors, operating or capital contribution should be considered as determinants of associated links, such affiliated companies can be formed in the same country or maybe in many different countries. It comes to the fact that transfer pricing is not only taking place in international transactions but also in domestic transactions.

On one hand, transfer pricing is 'a part of the management control system' (Cools, 2003) and a legal tax toolset enables corporations to allocate capital in an optimal way (Adams and Coombes, 2011). Indeed, the term transfer pricing is originally explained to be 'neutral' and does not necessarily imply tax evasion (OECD, 1979). The role of transfer pricing is globally seen since intra-group transactions involved in the transfer of goods, services and intangibles within MNEs are recorded to constitute about two third of international trade (World Bank, 2011). Many developing countries do not have large treaty networks because they have not implemented administrative procedures for taxpayers to access treaty protections, leaving investors to bear the risk of potential double tax. The risk of double taxation decreases the attractiveness of the developing country as an investment location. Therefore, a proper transfer pricing method is important to protect investors from double taxation risk.

On the other hand, the integrated structure and closed connections allow MNEs to abuse their own preferential 'transfer prices' illegally. The greatest motivation of MNEs to use transfer pricing is to reduce

the overall corporate tax burden, through that, increase profits and maximise corporate value. A cross of theoretical studies (Horst, 1971; Halperin and Srinidhi, 1987; Eden, 1998; Swenson, 2001) have pointed out that MNEs utilize corporate tax differentials, shifting taxable income from associated entities in high tax jurisdictions where it is generated to related-parties in relatively lower tax countries, to minimize global tax bills and, through that, increase profits and maximize corporation value. Besides, tax reliefs offered by national governments when corporations make a loss is another motivation for MNEs to use transfer pricing malpractices. In some domestic tax law, including Vietnam, previous year loss can be carried forward to current year, even for a certain number of following years. MNEs may make use of losses brought by aggressive transfer pricing to enjoy more tax benefits (United Nations, 2013).

In conclusion, the differential and interest conflicts in taxing rights among countries where MNEs operate make transfer pricing become a controversial issue in international taxation issue for both taxpayers and tax authorities. Therefore, it is vital to recognize transfer pricing with both legal and illegal sides and apply efficient legal regime to ensure enterprises adopt legal transfer pricing methodologies that are considered acceptable according to international standards.

3. THE CHALLENGES FACED BY DEVELOPING COUNTRIES

Emerging nations face several challenges in coping with transfer pricing, includes:

First, the relatively disadvantage compared to developed countries

With the aim to attract more foreign investment in domestic market to develop national natural resource, developing countries usually offer financial inducements such as slash taxes and royalty rates to compete with developed countries (PwC, 2013). Therefore, MNEs are found to have more tendency of manipulating transfer pricing in developing than developed countries (Plasschaert, 1985; Borkowski, 1997). Market imperfection in information interchange in developing countries facilitates the income shifting by means of transfer pricing manoeuvres. Some empirical evidences have showed that aggressive transfer pricing practices become invisible in public eye and make it more difficult for tax authorities to detect. The problem is especially intense with high technology MNEs with great innovation and complicated structure, which recently expand their operations in many developing countries (Lall, 1979; Eden, 2003).

In terms of developing countries, they are stated to be more vulnerable to transfer pricing abuse compared to rich countries. While depending more than two third of income tax revenue on corporate income tax, developing nations face greater chance of tax revenue loss due to aggressive transfer pricing. Oxfam (2000) estimated the number of tax revenue developing countries lost each year due to transfer mispricing was about US\$50 billion. During the period from 2005 to 2007, the capital flowed from non-European Union nations to European Union and the US through transfer pricing abuse exceeded US\$1 trillion, which caused a tax revenue loss of US\$121.8 billion per year (Christian Aid, 2009). Transfer mispricing is directly harmful to fiscal base, economic climate and one of the reasons for poverty alleviation. While developed nations run a more sophisticated tax system to curb transfer mispricing, developing countries are at a relatively disadvantage. Since MNEs under stress of stronger enforcements in developed countries, they may prefer to increase their tax costs there and to reduce tax cost in developing countries through transfer profits from developing countries to rich countries (United Nations, 2013).

Second, the lack of resources and capacity

Low administrative capacity is also considered as one of the biggest challenges to developing countries (PwC, 2011). With little doubt, transfer pricing, especially in terms of transfer mispricing, still, is a new

aspect towards almost emerging countries. The awareness of transfer mispricing and related consequence is still limited, not only with society but also with tax authorities. Tax authorities have not adequate experience to monitor, detect and resolve transfer pricing manipulation. Moreover, the scare of fund in public sector also gives a tricky question for developing countries when seeking to a costlier and more sophisticated transfer pricing regime. As the aim of transfer pricing regulation is to protect domestic fiscal base, then there is tough consideration towards the benefits of collecting more tax from MNEs and spent cost.

Third, the lack of comparable data

Certain difficulties in determine comparable data comes from both internal and external factors. Lall (1979) specified the initial internal barrier to the comparable data collection is that different departments or ministries separately collect data of different aspects of an associated enterprise trade. For example, when tax departments are in charge of taxable profits, import and export prices are under control of customs and other related exchange dealings are managed by central banks. The lack of constant and comprehensive information interchange may lead to the difficulties in gathering data. Meanwhile, little transitional nations are observed to have a specific unit to cope with MNEs' operation or transfer mispricing. Besides, the actual small size of transitional economy is the second internal factors make it hard to find public companies in market. Inadequate available comparable transactions between an independent firm and an associated enterprise raise difficulties for tax experts in transfer prices assessment.

Regarding external factors, since MNEs have cross-border operations, the need of data collected from outsidess source is essential. To support the judgement of proper comparable data, tax authorities need data of operations of MNEs as a whole, including the profitability of the whole group, cost data and undertaken risk. However, in fact, developing countries hardly can collect information from parent and other local sub-units to challenge the price involved. In almost cases, tax authorities in developing will passively depend on information supplied by corporations, which is obviously supportive to firms' side (Lall, 1979). The challenge becomes more intense by the abuse of tax heaven where MNEs hide 'tax dogging' transactions.

4. THE DEVELOPMENT OF MNES AND TRANSFER PRICING STATUS IN VIETNAM

MNEs, through the development of FDI, have expanded their operations these years in Vietnam. According to The Ministry of Planning and Investment, by October 2017, there has been more than 15,000 FDI projects with total registered capital of \$218.8 billion. By 2018, Vietnam has attracted more than 24,000 FDI projects. These projects contribute nearly 20% of the national budget and appropriate 20% of the GDP.

During their investment and operation process, several MNEs are observed and suspected to abuse transfer pricing. According to the Ministry of Planning and Investment, even both number and scope of MNEs increase, the level of mobilization in national budget of MNEs is still low, even relatively decreases. According to a report of General Department of Taxation, there have been increasing numbers of loss-making corporations are inspected to get involved in transfer mispricing from 2012 onwards (from 44% in 2012 to 51% in 2015 and 50% in 2016). These MNEs reported constant losses but was still observed to expand their production and trading. Besides, the amount of reported loss deductions and additional taxes, penalties arose from tax authorities' inspection has been increased during the period from 2012 to 2016. The investigation of large MNEs such as CocaCola, Metro Cash & Carry, Big C, Keangnam for their transfer mispricing activities are some telling examples.

The Corporate Finance Department also pointed out a noteworthy new trend, which is the reverse in revenue transfer from abroad to Vietnam by some MNEs for preferential treatment of corporate income tax

rate and tax exemptions. This is confirmed by the average rate of equity (ROE) of MNEs in some sectors such as electronic components, telecommunications and software the past few years, has always maintained a high level of over 30%.

It can be concluded that MNEs play an increasingly important role in economy, bringing both incentives as well as negative effects when aggressive transfer pricing is applied. The imperfect economic, political and regulatory environment in developing countries boosts the susceptibility to detrimental effects of transfer pricing abuse. Therefore, the dual objective of maintaining attractive investment climate and protecting tax revenue and domestic economic environment required more consideration in setting transfer pricing rules.

5. COMMENTS ON CURRENT TRANSFER PRICING REGULATION IN VIETNAM

Following the introduction of the Base erosion and profit shifting (BEPS) Action Plan to control transfer pricing, developed countries such as the G20 together with the OECD as well as developing countries have applied and implemented the plan in developing the national policy. In June 2004, Vietnam became the 100th member of the BEPS Forum and had detail plans to implement BEPS Action.

On 24 February 2017, Vietnam Government has issued Decree No. 20/2017/ND-CP on tax administration for enterprises engaged in transfer pricing. This Decree takes effect from 01 May 2017 and regulations stated in this Decree shall replace ones in the Circular No. 66/2010/TT-BTC dated 22 April 2010 issued by Ministry of Finance to guide the determination of market prices in business transactions between associated parties. In general, Decree No. 20/2017/ND-CP has updated new guidelines of the OECD and BEPS action.

Some of changes in Decree No. 20/2017/ND-CP are discussed below:

Firstly, transfer pricing regulation scope

Compared to Circular No. 66/2010/TT-BTC, Decree No. 20/2017/ND-CP has reduced the number of regulated entities from 13 to 10 groups. In particular, the Decree limits the scope of transactions that are considered to be associated by reducing the threshold of capital participation (from 20% to 25%). It also stipulates the application of safe harbours from transfer pricing documentation. Article 11 states specific cases whereas enterprises are exempted from preparing the transfer pricing documentation. It supports independent entities, which unintentionally was classified as related parties under the past regulation. The change could be seen as a big practical change in terms of administrative reform, which releases the administration burden for both taxpayers and tax authorities.

Besides, it is necessary to note that Decree No. 20/2017/ND-CP also limits transfer pricing regulation scope in the geographic aspects. Accordingly, a taxpayer shall be exempted from the transfer pricing documentation requirements only if it is engaged in a related-party transaction with an entity that must pay corporate income tax within the territory of Vietnam. In the world, when some countries include specific domestic transfer pricing in place, such as the UK; almost countries' regulations such as the US, Japan, Columbia, Australia, transfer pricing rules only adjust on international aspects. The wide scope allows regulations approach a wider range of enterprises, but it also raises administration costs for tax authorities. In fact, the UK Her Majesty's Revenue and Customs (HMRC) has stated that the UK-to-UK transactions rule has low efficiency in practice as the tax risk in this field is low (PwC, 2013). In addition, the corresponding adjustment mechanism would self-regulate relief on the counter side of a domestic transaction to preserve overall tax bills in one country (OECD, 2010). Therefore, it is recommended developing countries, including Vietnam, focus only on the international transfer transaction in their legislation.

Secondly, the application of substance-over-form principle

Before Decree 20/2017/NĐ-CP was issued, transfer pricing rules in Vietnam incorporated the arm's length principle as their foundation, in line with the OECD guidelines. It is supposed Decree 20's biggest impact is the introduction of the substance-over-form principle. Substance-over-form is the principle by which tax authorities look past the legal forms of transactions and operating structures, and instead consider and analyze their economic substance.

The principle, indeed, has been applied by enterprises as an accounting principle to ensure the preparation and presentation of financial statement reflect the nature of the transaction rather than the form. It is the first time this principle has been applied in tax policy. This change not only reflects the uniformity of legal documents in many different fields, but also shows a common point recognized in most countries in the world when considering associated transactions (Shira, 2018). The principle is based on data about and practical reality of transactions between related parties to compare with independent transactions in the same or similar conditions, and without reliance on forms of transactions expressed in contracts or arrangements between related parties.

As a result, enterprises, rather than focus on "makeup" internal document of associated transactions, would be required to prepare and maintain internal databases (including associated transactions and independent transactions) as well as external data that publicly released, if any, or data available on transactions with similar conditions in Vietnam or in the region to prove the setting of transfer prices legally.

Thirdly, documentation

Transfer pricing contemporaneous documentation is designed to document taxpayers' relationships and transactions with related parties, as well as their global transfer pricing policies and the allocation of profits among all members/entities within a corporate group. Taxpayers meeting specific thresholds must, in accordance with Decree No. 20/2017/ND-CP, prepare, and then maintain transfer pricing contemporaneous documentation, which encompasses a Local File, and one or more of the Master File and Country-by-Country Report (CbCR). This helps solving the challenges with database shortages, particularly enables the tax authorities to have more data to evaluate and compare transactions of multinational corporations before considering the transfer prices of associated transactions.

However, the Decree also increases the pressure of providing information from enterprises in terms of both information volume and timing. While in other countries such as Japan, the US, Australia, the ultimate parent company only have to make a transnational profit report and publish it to the tax authorities of the host country, under Vietnamese decree, foreign entities must submit the report to the tax authorities in Vietnam if requested. Although Decree 20/2017/ND-CP states several exemptions, this, still, is considered to be too tight. There are cases ultimate parent company is not regulated to prepare global records under local tax jurisdiction, however must provide them under Vietnamese regulation. For instance, under Japanese regulations, only corporations have a total revenue of 100 billion Yen or more (the previous year) must submit a global profile. In this case, there are many small and medium Japanese family businesses investing in Vietnam whereas the ultimate parent companies are not required but the subsidiaries located in Vietnam must provide a master file and country by country report. This entails a significant increase in the cost of compliance in the recipient country.

Meanwhile, filing deadline is also a pressure for MNEs. Decree No. 20/2017/ND-CP requires enterprises to prepare contemporaneous documentation before submission deadline of annual corporate income tax declarations, which reduced preparation time from 30 to 15 working days compared to Circular

66/2010/TT-BTC. In fact, it cost most corporations much to pay for external consulting firms to prepare for transfer pricing contemporaneous documentation. Therefore, a consideration towards simplicity and reliefs in procedure and documentation are in need.

6. CONCLUSION

The dual objective to maintain an attractive investment environment as well as to protect tax revenues and domestic economic environment poses a dilemma in applying transfer pricing policy in developing countries, including Vietnam. Changes in current policy initially had positive effects, making Vietnamese transfer pricing regulations up to date and in line with practical requirements and international guidelines. Still, analysts argue that the regulatory framework is not rigorous enough to combat the increasingly complex transfer pricing methods. The fact requires policymakers to constantly criticize and apply appropriate changes to manage transfer pricing more effectively. We suppose the trend of the change to be more prescriptive and stricter with more penalties applied, following patterns of earlier stage of legislation development in some developed countries, namely the UK and the US. It is necessary to admit that the changes initially and ultimately motivated and managed by the tax authorities, or tax policy makers in specific. It is them who need to ensure transfer pricing rules are robust and suitably applied to reach national objectives. Besides, the further researches are opened towards the roles of related entities including international organizations, MNEs, tax inspectors, consultant firms and public in change process.

MODULARITY IN PLATFORM COMPETITION WITHIN BUSINESS ECOSYSTEM

Yong Lin*

ABSTRACT: *This paper explores how established modularity logic in the product area can be applied to platform competition to approach competitive advantages in the context of business ecosystem, and how modularity facilitates network effects in platform competition. The research adopts a case study approach. The results show that established product modularity logic can be applied to the context of a business ecosystem, which is beyond its classical implementation within the firm boundary. The results indicated that product/service modularity should be aligned with business ecosystem modularity to facilitate network effects in platform competition. A two-layer (product/service and organization) modular architecture of business ecosystems is developed. Modularity applied to the context of a business ecosystem can achieve competitive advantages via product/service varieties offering to end-consumers, in the same way as product modularity does through product variety. Meanwhile, organizational diversity can also be applied to mitigate uncertainties. Platform owners and product/service developers/providers (complementors) should consider applying modular logic to product/service design and development, and work together to nurture and develop the business ecosystem. This research extends modularity research from the firm level to a business ecosystem context, and develops a two-layer modular architecture of platform competition in the business ecosystem.*

Keywords: *Modularity; Platform; Business ecosystem*

1. INTRODUCTION

Platform has become one of the essential factors contributing to the success of many industries (Cusumano, 2010), particularly high-tech industries, and winning platform competition brings companies more competitive advantages. The platform can be regarded as comprising the building blocks (which can be products, services, or technologies) acting as the foundation on which partners can develop complementary products, services, and technologies (Gawer, 2011). A successful platform strategy enables the effective development not only of new products but also new services, and it also shapes business models and even transforms entire industries (Basole and Karla, 2011). Moreover, platform competition emphasizes the role of network effects (Gawer and Cusumano, 2014), which prescribe rapid expansion of a network of platform users and complementary services (applications) to capture entire markets. The network of platform owners, users and those complementors (who provide the complementary products, services, and technologies) is called a *business ecosystem* (Moore, 1996) the future is now; that today's great enterprises no longer compete for product superiority or even industry dominance. What matters now, and from now

* Petros Ieromonachou, Li Zhou, Business School, University of Greenwich, London, UK.

on, is total system leadership. Make no mistake - business rivalries have never been more intense. But the playing field is raised, the speed and stakes multiply geometrically, and the strategic options have never been more diverse. Grasping the complex, hidden patterns in today's competitive terrain, Moore envisions a future characterized by organized chaos. As the old powers wait and wonder, vast new fortunes flourish where entrepreneurs jostle to integrate technologies and cultivate utterly new markets of unimaginable richness. Inviting readers to approach their own businesses with equal boldness, Moore introduces biological ecology as a metaphor for strategic thinking about business coevolution and radically new cooperative/competitive relationships. From his vantage point at the hot centers of global economic competition, Moore provides a topographical map to competitive systems, enabling readers to position their own companies within interlocking business networks, to identify the development stage of their system, and to pursue the strategy most likely to prevail and ultimately dominate the whole. But a business model for one's own firm is simply not enough. Leaders must build strong communities of shared meaning, yielding a special resiliency, flexibility, and resistance to catastrophe.”, "ISBN": "978-0-88730-809-3", "shortTitle": "The Death of Competition", "language": "en", "author": [{"family": "Moore", "given": "James F."}], "issued": {"date-parts": [[1996]]}], "schema": "https://github.com/citation-style-language/schema/raw/master/csl-citation.json" .

For one thing, product/service, and their variety and quality based on the platform, are the key reasons why users will stick with a particular platform, and this correspondingly increases its value. It is well known that modularity contributes much to product variety (Lau et al., 2007) "container-title": "International Journal of Production Economics", "page": "1-20", "volume": "105", "issue": "1", "source": "ScienceDirect", "abstract": "Recent theories propose that modular product design is a key enabler for product success in global competition. Recent research has explored the impact of modular products on competitive manufacturing capabilities, including price, product quality, customer service, flexibility and delivery. However, there is limited empirical research that simultaneously examines their relationships with performance. This paper aims to fill this gap through quantitative research into Hong Kong's manufacturing industry. Results indicate that product modularity influences the capabilities of delivery, flexibility and customer service, and the capabilities of delivery and flexibility positively relate to product performance. These findings show that modular product design cannot improve each capability simultaneously, as existing literature suggests. Multiple trade-offs and future research are specified in this study.", "DOI": "10.1016/j.ijpe.2006.02.002", "ISSN": "0925-5273", "shortTitle": "The impacts of product modularity on competitive capabilities and performance", "journalAbbreviation": "International Journal of Production Economics", "author": [{"family": "Lau", "given": "Antonio K.W."}, {"family": "Yam", "given": "Richard C. M."}, {"family": "Tang", "given": "Esther"}], "issued": {"date-parts": [[2007, 1]]}], {"id": "959", "uris": ["http://zotero.org/users/2456320/items/JC5SVQPK"], "uri": "http://zotero.org/users/2456320/items/JC5SVQPK", "itemData": {"id": "959", "type": "article-journal"}, "title": "Managing modularity of product architectures: toward an integrated theory", "container-title": "IEEE Transactions on Engineering Management", "page": "204-218", "volume": "50", "issue": "2", "source": "IEEE Xplore", "abstract": "The management of innovation through modular product architecture strategies is gaining increasing importance for firms, both in practice and theory. Modularity refers to a new product development strategy in which interfaces shared among components in a given product architecture are specified and standardized to allow for greater substitutability of components across product families. It is argued that the degree of modularity inherent in product architectures depends on the constituent components and interfaces. This paper introduces a mathematical model, termed the modularization function, for analyzing the degree of modularity in a given product architecture. It takes into account the following variables: components; degree of coupling; and substitutability of new-to-the-firm components. The application of the

modularization function is illustrated with two elevator systems from Schindler-traction and hydraulic. The comparative analysis of the elevators captures the sensitivity and dynamics of product architecture modularity created by three types of components (standard, neutral, and unique, and it has been highlighted that service modularity via a platform approach is also helpful to develop and deliver new services cost efficiently and more flexibly (Voss and Hsuan, 2009). This research aims to understand how modularity is applied into platform competition and how it influences network effects.

For another, the *business ecosystem* consists of the platform owner (which is normally regarded as the focal company) and all partners and users (Moore, 1996) the future is now; that today's great enterprises no longer compete for product superiority or even industry dominance. What matters now, and from now on, is total system leadership. Make no mistake - business rivalries have never been more intense. But the playing field is raised, the speed and stakes multiply geometrically, and the strategic options have never been more diverse. Grasping the complex, hidden patterns in today's competitive terrain, Moore envisions a future characterized by organized chaos. As the old powers wait and wonder, vast new fortunes flourish where entrepreneurs jostle to integrate technologies and cultivate utterly new markets of unimaginable richness. Inviting readers to approach their own businesses with equal boldness, Moore introduces biological ecology as a metaphor for strategic thinking about business coevolution and radically new cooperative/competitive relationships. From his vantage point at the hot centers of global economic competition, Moore provides a topographical map to competitive systems, enabling readers to position their own companies within interlocking business networks, to identify the development stage of their system, and to pursue the strategy most likely to prevail and ultimately dominate the whole. But a business model for one's own firm is simply not enough. Leaders must build strong communities of shared meaning, yielding a special resiliency, flexibility, and resistance to catastrophe." "ISBN": "978-0-88730-809-3", "shortTitle": "The Death of Competition", "language": "en", "author": [{"family": "Moore", "given": "James F."}], "issued": {"date-parts": [[1996]]}, "schema": "https://github.com/citation-style-language/schema/raw/master/csl-citation.json". Those partners who provide complementary applications/services are also defined as complementors (Gawer and Cusumano, 2014). With an increasing number of users and complementors, the business ecosystem becomes a much more complex network. As a result, the traditional firm competing with another firm has transferred to a business ecosystem competing with another business ecosystem (Rong et al., 2013). In order to reach the objectives of platform competition, it is necessary to have a better understanding of the operations of a business ecosystem. While modular thinking is very helpful to understand a complex system and organization (Langlois, 2002), this research adopts modularity to investigate the organizational structure (actors and their roles) of a business ecosystem, and to explore how modularity at organization level contributes to network effects in platform competition.

This research contributes to the understanding of modularity in platform competition, and it brings insights to practitioners as well as theoretical contributions to operations management in services. The paper is structured as follows: firstly, the current literature will be reviewed to build the conceptual research framework; secondly, the research methodology will be defined and discussed; and finally, the research results will be summarized and discussed, with several research propositions proposed at the end.

2. LITERATURE REVIEW

2.1 Platform competition and network effects

Platform competition is usually regarded as happening in a two-sided market with a seller side and a buyer side, and the platform owner needs to consider how to get both sides on board to achieve the network

effects (Cennamo and Santalo, 2013) it prescribes rapidly expanding a network of platform users and complementary applications to capture entire markets. We challenge the unconditional logic of a winner-take-all (WTA). This means that the more users (seller and buyer) who adopt the platform, the more valuable the platform is to both the users and the owner. The actors on these two sides together with other stakeholders actually constitute a *business ecosystem*. As indicated above, nowadays business competition is more like one business ecosystem competing with another business ecosystem (Rong and Shi, 2014), rather than one company competing with another company. Hence, this research will bring the research focus from the firm level to the business ecosystem level. Then this research will focus mainly on the industry platform, rather than the internal platform.

2.2 Business ecosystem theory

During the last two decades, more and more firms have realized that their businesses are operating in a network context rather than an individual firm context (Jackson, 2010) 2010; Newman et al., 2006). Such a network can be defined as a *business ecosystem* consisting of interlinked organizations and individuals (Moore, 1993, 1996) the future is now; that today's great enterprises no longer compete for product superiority or even industry dominance. What matters now, and from now on, is total system leadership. Make no mistake - business rivalries have never been more intense. But the playing field is raised, the speed and stakes multiply geometrically, and the strategic options have never been more diverse. Grasping the complex, hidden patterns in today's competitive terrain, Moore envisions a future characterized by organized chaos. As the old powers wait and wonder, vast new fortunes flourish where entrepreneurs jostle to integrate technologies and cultivate utterly new markets of unimaginable richness. Inviting readers to approach their own businesses with equal boldness, Moore introduces biological ecology as a metaphor for strategic thinking about business coevolution and radically new cooperative/competitive relationships. From his vantage point at the hot centers of global economic competition, Moore provides a topographical map to competitive systems, enabling readers to position their own companies within interlocking business networks, to identify the development stage of their system, and to pursue the strategy most likely to prevail and ultimately dominate the whole. But a business model for one's own firm is simply not enough. Leaders must build strong communities of shared meaning, yielding a special resiliency, flexibility, and resistance to catastrophe.”,”ISBN”.”978-0-88730-809-3”,”shortTitle”.”The Death of Competition”,”language”.”en”,”author”:[{“family”.”Moore”,”given”.”James F.”}],”issued”:{“date-parts”:[["1996"]]}},” schema”.”https://github.com/citation-style-language/schema/raw/master/csl-citation.json”}. Within the business ecosystem, they are not just interconnected with each other, they depend on each other and have a shared fate (Iansiti and Levien, 2004a, 2004b). That means that they actually co-evolve with each other to develop mutual benefits, and *co-evolution* is one of the essential characteristics of a business ecosystem (Moore, 1996) the future is now; that today's great enterprises no longer compete for product superiority or even industry dominance. What matters now, and from now on, is total system leadership. Make no mistake - business rivalries have never been more intense. But the playing field is raised, the speed and stakes multiply geometrically, and the strategic options have never been more diverse. Grasping the complex, hidden patterns in today's competitive terrain, Moore envisions a future characterized by organized chaos. As the old powers wait and wonder, vast new fortunes flourish where entrepreneurs jostle to integrate technologies and cultivate utterly new markets of unimaginable richness. Inviting readers to approach their own businesses with equal boldness, Moore introduces biological ecology as a metaphor for strategic thinking about business coevolution and radically new cooperative/competitive relationships. From his vantage point at the hot centers of global

economic competition, Moore provides a topographical map to competitive systems, enabling readers to position their own companies within interlocking business networks, to identify the development stage of their system, and to pursue the strategy most likely to prevail and ultimately dominate the whole. But a business model for one's own firm is simply not enough. Leaders must build strong communities of shared meaning, yielding a special resiliency, flexibility, and resistance to catastrophe." , "ISBN": "978-0-88730-809-3", "shortTitle": "The Death of Competition", "language": "en", "author": [{"family": "Moore", "given": "James F."}], "issued": {"date-parts": [{"1996"}]}}, "schema": "https://github.com/citation-style-language/schema/raw/master/csl-citation.json" .

The actors in a business ecosystem include suppliers, lead producers (manufacturers), competitors, and other stakeholders (Moore, 1993). The main research theme of a business ecosystem is a focus on the focal company in the ecosystem (Iansiti and Levien, 2004b). From this original definition, the many actors (including suppliers, lead producers, competitors, and other stakeholders) existing in a business ecosystem have been listed. However, this has not shown very much of the inter-relationships among those actors (Rong and Shi, 2014). In order to better nurture a business ecosystem, it is important to have a good understanding of the actors' different roles and functions in the business ecosystem.

2.4 Modularity theory

Modularity is a general design principle for managing complex systems (Campagnolo and Camuffo, 2010), and it is typically defined as a continuum describing the degree to which a system's components may be separated and recombined (Schilling, 2000).

1) *Product modularity*

Product systems are deemed "modular" for example, when they can be decomposed into a number of components that may be mixed and matched in a variety of configurations (Schilling, 2000). The components are able to connect, interact, or exchange resources (such as energy or data) in various ways, by adhering to a standardized interface. Unlike a tightly integrated product in which each component is designed to work specifically (and often exclusively) with other particular components in a tightly coupled system, modular products are systems of components that are "loosely coupled" (Orton and Weick, 1990). It has been proven that product modularity positively and directly influences each aspect of competitive performance (Pil and Cohen, 2006).

2) *Service modularity*

While its application to services has not been explored in depth, modularity has proven to be important and crucial to service design and innovation (Voss and Hsuan, 2009). There is some literature exploring the application of modularity in services. It is believed from this research that modular service design and process are helpful in improving efficiency and productivity, and also valuable in achieving mass customization (Rajahonka et al., 2013).

3) *Modularity in business ecosystems*

Organizational systems are said to become increasingly modular when they begin to substitute loosely coupled forms for tightly integrated, hierarchical structures, and this leads to the achievement of greater flexibility in scope and scale (Schilling and Steensma, 2001). As firms in a given industry begin to substitute loose coupling with organizational components that lie outside of the firm boundaries for activities that were once conducted in-house, the entire production system (which may encompass many firms) becomes increasingly modular (Karim, 2006). This phenomenon has sometimes been termed as modular production

network (Sturgeon, 2002). From the perspective of organizational design, it then becomes very important and necessary to shift the focus from the individual firm to a business ecosystem scope (Baldwin, 2012) and they engage in production and trade. But individual corporations are no longer adequate to serve as the primary unit of analysis. Over the years, systems of distributed innovation – so-called business ecosystems – have become increasingly prevalent in many industries (Adner & Kapoor, 2010; Iansiti & Levien, 2004; von Hippel, 1988).

2.5 Research gap and conceptual research framework

From the current literature, it is obvious that there is plenty of research on product/service modularity and platform at firm level, and also in different fields. However, there is still a lack of knowledge on business ecosystem context. This paper aims to understand how modularity is applied and contributes to platform competition within the context of the business ecosystem. The research question developed in the introduction section is further defined in this research as:

RQ1: How do modularity contribute to platform competition for competitive advantages?

RQ2: How do modularity facilitate the network effects of platform competition?

3. METHODOLOGY

The case study method was adopted in this research to reflect the contemporary (Yin, 2013) and complex nature of the defined research questions. In order to enhance the research results and produce robust conclusions, multiple case studies were conducted. Three cases were selected according to criteria following criteria including each individual case should be successful in platform competition, with a range of products/services that have been built around the platform, and where a business ecosystem has been nurtured and is now running very healthily.

Data collection: Data were mainly collected through semi-structured interviews to gain managerial insights from the interviewed managers. Only the platform owner company in the business ecosystem was involved in the data collection. In each case, two middle-level managers and one manager at the top level were interviewed, each for 1.5-2 hours. However, in order to ensure data validity, multiple sources of evidence were used to meet the data quality criteria. The sources used include company annual reports, secondary documentation, archival records, and field visits. All data collected were cross-verified with each other to ensure the accuracy of the data.

Data analysis: The data collected were analyzed through a pattern-matching strategy to test whether the empirical data match the pre-defined elements. This logic also ensured the construct validity of this research.

4. FINDINGS AND DISCUSSION

The case study findings lead to the discussion of five research propositions.

4.1 Modular architecture of a business ecosystem

The research results show that a business ecosystem is a complex system including a huge number of actors and inter-dependent relationships. Regarding platform competition, there is always a platform owner (such as Tencent, Xiaoju Keji, and JD.com) in the business ecosystem. The platform owners are a keystone (Iansiti and Levien, 2004a, 2004b) actor in the business ecosystem, and what is most important for them is to develop an innovative platform for the co-evolution of all partners in the networked complex system. Because of its complex nature, operational strategies and the necessary tools and mechanisms are essential for the nurturing and sustainable evolution of the business ecosystem.

Following the modularity theory, we propose that the modular architecture of a business ecosystem consists of two layers, including product/service and organization. The *organization layer* shows the organizational structure of a complex business ecosystem with a variety of actors (organizational modules), including users, suppliers, partners, complementors, and platform owner. The *product/service layer* presents the various service offerings (service modules) provided via the platform. The services could be developed by either the platform owner, complementors, or other partners. Both services and the business ecosystem can be designed and organized with a modular logic, which on the one hand could offer sufficient service variety to customers, and on the other could also mitigate the uncertainties in the system.

These results lead to the first research proposition:

PI: A business ecosystem implies a modular architecture with two layers, including product/services and organization. The modular architecture of a business ecosystem is a mapping of the relationship between product/service layer and organization layer.

4.2 Three types of modules at different layers in a business ecosystem

According to modularity theory, those modules at different layers in the modular architecture could be regarded as physical elements of a business ecosystem. This is just the same as different modular components deployed in a complex product architecture, and each physical element normally reflects a specific function in the product. The results of this research show that those modules could be categorized into three types of functional modules reflecting actors' roles and functions at different layers in the architecture of the business ecosystem.

These three types of module at different layers are evolutionary module, developmental module, and fundamental module. Different types of modules act in different roles and reflect different functions in the service and organization architecture layers. For example, in WeChat's business ecosystem, if talking about the organization layer, Tencent is obviously an *evolutional module*, which always leads to the evolution of the business ecosystem through innovating the platform as with QQ and WeChat, or initiating new ideas for future development. The complementor, for example DiDi Dache, is more like a developmental module, which develops new services or apps based on the WeChat platform. The *developmental module* plays a role of enhancing and facilitating the evolution of the business ecosystem. An important feature of developmental modules is their reusability. Suppliers of hardware and accessories, mobile network operators, and OEMs (original equipment manufacturers) are more like a *fundamental module* providing basic services to the whole business ecosystem to ensure its continuity.

In the service layer, the evolution module is the one that could lead to opening up new businesses and starting a new business ecosystem. For example, the friend-adding service originally was part of the QQ platform. However, this service was then further developed into a new service like "Shake" or "People Nearby" by using location-based technologies. This led to the creation of a new app, WeChat, with those new service features, a new platform, and also a new business ecosystem based on the WeChat platform. The evolutionary module is extremely important when new technology is introduced into the market, acting in the role of changing the whole industry. In terms of the developmental module, those service modules are developed around the evolutionary service module, and also act to support and facilitate the evolutionary service module. Fundamental modules, like the payment service module in the WeChat platform, have fundamental support functions to other services such as online shopping and ticket booking.

The research results lead to another research proposition here:

P2: At different layers, there are three types of module, including the fundamental module, developmental module, and evolutionary module. Different types of module have different function roles in the business ecosystem.

4.3 Align service modularity with organization modularity

From the research results, it is obvious that services are designed either by the platform owner or complementors, which means a clear inter-relationship between service module and organization module. This reflection in the modular architecture shows the complexity of the business ecosystem, and also different platform strategies.

For one thing, the complexity of the business ecosystem, a reflection of the inter-relationship between service module and organization module, could have many forms: one-to-one, one-to-many, many-to-one, and many-to-many. One-to-one means one company delivering one service in the business ecosystem: for example, in the WeChat business ecosystem, only DiDi Dache provides a taxi-calling service to users on that platform. One-to-many means one company actually delivers several services: for instance, JD.com not only provides online shopping services, but also logistics services. Many-to-one refers to a situation like the many restaurants that have seat-booking services for users on the WeChat platform. Many-to-many means that different merchants offer different services to users on the platform.

Another aspect is that different platforms could have different platform strategies, namely open and closed platform strategies. This leads to different choices of forms of relationship in the modular architecture, as discussed above.

With a closed platform strategy, the platform owner normally develops various services by itself, especially evolutionary services. For example, the platform strategy of JD.com is more like a closed strategy. JD.com regards itself as a technology-driven company, so it has invested a large amount in developing its e-commerce platform to enhance its online shopping services. Meanwhile, different business units have developed a range of services around this e-commerce platform. However, there is almost no complementor in the business ecosystem or complementary services developed by other partners to this platform, since the platform is open neither to other partners nor to developers. Hence in JD.com's business ecosystem, there are more one-to-one and one-to-many forms reflecting the relationships between service and organization layers. For an open platform strategy like WeChat (although it is not a fully open platform), the platform owner actually welcomes several complementors being involved in its platform, such as DiDi Dache was involved to provide taxi services. As a result, there are several different forms of reflections between service and organization layers.

Based on these research results, we emphasize the alignment between services and organization layers and develop the following research proposition:

P3: Service modularity should align with business ecosystem modularity (organizational modularity) to ensure the efficiency of platform competition. Different platforms will lead to different forms of the reflection between service and organization layers in the modular architecture of the business ecosystem.

4.4 Product/Service modularity and platform competition

When considering platform competition, the results highlight the importance of service modularity in the business ecosystem. A business ecosystem can be treated as a two-sided market with users and partners/complementors. A successful platform owner always tries hard to bring users and complementor on board

the platform. With more users and partners/complementors, the value of the platform will increase and it will correspondingly attract more users and partner/complementors, which are network effects.

This kind of effort will be largely decided by the platform strategy (open or closed) adopted by the platform owner. An open platform strategy really pulls both sides on board, but there is much more focus on the user side in a closed platform strategy. For example, JD.com and DiDi Dache are relatively closed platforms, and the platform strategy for them is to accumulate users quickly around their platform. That is the reason why they all undertake lots of promotions to attract customers at a very early stage of their business.

In order to attract users and complementors, high product/service variety is needed to meet their demands and satisfy their expectations. One strategy to achieve this is to adopt modularity in product/service design and organization design. In a business ecosystem, the platform (evolutional module), product/services (key and support product/service), and sellers/buyers can all be categories in three types of module, as indicated in research proposition *P2*. By increasing the product/service variety via modularity logic, more customers will be attracted to using those services and binding themselves to the platform. This obviously will increase the value of the platform, and then it will attract more customers and more complementors to develop products/services to satisfy customers. The results in this research lead to the conclusion that modularity can facilitate network effects in a two-sided market.

Overall, the results suggest that established product modularity thinking can be applied to services. This evidence supports our fourth research proposition:

P4: Product/Service modularity and organization modularity will facilitate the network effects within platform competition. Different platform strategies will lead to different focuses of the platform owner on the two-sided market.

4.5 Nurturing the business ecosystem with modular logic

A preliminary research result of our study is that modular logic not only works in the product/service area, but in the organization level, namely at the business ecosystem level, rather than only at the firm level.

The results show that when companies adopt a platform strategy to compete and try to gain competitive advantages, they will put much effort into promoting their platforms to attract users and partners/complementors. On the one hand, this inspires the development of new products/services around the platform, which leads to higher product/service variety in the business ecosystem. On the other, with an increasing number of complementors and other partners, it increases the diversity of the organization modules in a business ecosystem. Meanwhile, with more products/services offered and more complementors involved, this means that it also facilitates the network effects that platform competition pursues.

For a product/service design, if modular logic is being applied in the development and design process, it is believed that the product could better satisfy customer demand with a high variety of product/service choices. Nurturing the business ecosystem with modular logic does not only mean that the organization of the business ecosystem is modularized, that modularity should also be applied to product design, technology design, service design, process design, and also platform design. From this point of view, the modularity of the business ecosystem will reduce the complexity of such a huge network structure, and also it will be much more efficient in response to uncertainties in the real business world, in particular uncertainty issues concerning technology, application, and market (Rong et al., 2013).

Overall, we conclude here that companies should adopt modular logic from the beginning in service design and organization design, especially in nurturing a new business ecosystem.

P5: Nurturing a business ecosystem with modular logic may mitigate the complexity of the business ecosystem, and also it can tackle the uncertainties in the business ecosystem within a context of dynamic economics.

5. CONCLUSION AND IMPLICATIONS

This paper has clarified two layers of modular architecture and three categories of modules in a business ecosystem. It has not only extended the research on modularity to the business ecosystem context, it also enhances current research on the business ecosystem with an understanding of the structural elements of a business ecosystem.

5.1 Theoretical implications

This paper contributes to the operations management literature by extending the previous established product modularity thinking into the emerging topics of platform competition, and in particular by considering all these topics within the context of a business ecosystem, which is beyond the traditional company boundary. In this way, we contribute to the further development of the school of modularity and provide insights for academic and practitioners on how both product/service modularity and business ecosystem modularity (organizational modularity) are contributing to platform competition and network effects.

This is a research addressing the modularity of the business ecosystem and also has developed three propositions for the future research agenda. Since the boundary of the business ecosystem is too complex and hard to identify, it is necessary to simplify the business ecosystem and capture its core construct. As a result, we have proposed a modular architecture of a business ecosystem with two layers, including product/service and organization.

In terms of multiple-level analyses, we have found that previous studies only focus on a single level. For example, Adner and Kapoor (2010) and downstream complements that are bundled by the firm's customers. We hypothesize that the effects of external innovation challenges depend not only on their magnitude, but also on their location in the ecosystem relative to the focal firm. We identify a key asymmetry that results from the location of challenges relative to a focal firm—greater upstream innovation challenges in components enhance the benefits that accrue to technology leaders, while greater downstream innovation challenges in complements erode these benefits. We further propose that the effectiveness of vertical integration as a strategy to manage ecosystem interdependence increases over the course of the technology life cycle. We explore these arguments in the context of the global semiconductor lithography equipment industry from its emergence in 1962 to 2005 across nine distinct technology generations. We find strong empirical support for our framework. Copyright © 2009 John Wiley & Sons, Ltd., "DOI": "10.1002/smj.821", "ISSN": "1097-0266", "shortTitle": "Value creation in innovation ecosystems", "journalAbbreviation": "Strat. Mgmt. J.", "language": "en", "author": [{"family": "Adner", "given": "Ron"}, {"family": "Kapoor", "given": "Rahul"}], "issued": {"date-parts": [{"2010", 3, 1}]}, "schema": "https://github.com/citation-style-language/schema/raw/master/csl-citation.json" have proposed a structure to present a business/innovation ecosystem by introducing the connection between supplier, focal firm, customers, and complementors. However, there is still a lack of a systematic perspective and it is not sufficient to catch the nature of a business ecosystem. It partly focuses on the organizational architecture of the business ecosystem, but fails to address the product/service and how those three levels interact. Hence, it is necessary to conduct a multiple-level analysis of the business ecosystem by linking the products/services and organization into its architecture.

Besides multiple-level analyses, we also classified three types of module, which apply at each level, and this will comprehensively reflect various actors and activities at each individual layer in the architecture of a business ecosystem.

5.2 Practical implications

This research provides a number of managerial implications, with suggestions for companies aiming to pursue competitive advantages through platform competition regarding how they can approach this objective in a manner that is consistent with the established modular logic, which has broadly applied in the product area.

Moreover, the study suggests to managers how different types of service module can be a source of competitive advantages in platform competition within the context of a business ecosystem. We also suggest that service modularity should align with business ecosystem modularity (organizational modularity) to attain competitive advantages for all partners and customer in the entire business ecosystem.

Furthermore, this research provides insights to managers with suggestions of using both service-dominant logic and modular logic to nurture the business ecosystem, and to facilitate network effects in platform competition.

5.3 Limitations and directions for future research

An important limitation of this work stems from the single case study. Historical data analysis provides more insight into when and how a business ecosystem evolves to reach success; however, multiple case studies can provide more comparative findings to make the research results more robust. Moreover, this study did not conduct quantitative analysis, in particular on network effects and performance measurement, so quantitative research may be helpful to develop and test more specific research propositions.

The proposed architecture framework could be adopted as a multiple-level analysis tool for future research on business ecosystem related issues, and the propositions developed could be verified and refined in future research, in particular with empirical case studies.

In the future, it is necessary to link those different layer analyses and explore how those modules operate in each layer, and further exploring the cross-layer interactive effects. Future research also could test the results of this study to determine whether different industry backgrounds would have different results.

HANDLING BAD DEBT OF COMMERCIAL BANKING SYSTEMS FOR FOSTERING SUSTAINABLE DEVELOPMENT OF NATIONAL FINANCE

Nguyen Thuy Linh*

ABSTRACT: *Dealing with bad debts to minimize credit risk is a matter of concerns of Vietnamese credit institutions in order to develop a sustainable national financial system. Vietnamese credit institutions are currently undergoing a major restructuring process in the context of globalization. In that context, the legal corridor regulating the operation of commercial banks are gradually being improved, the business has stabilized and liquidity has been maintained. The bad debt ratio is controlled, tightened and the lending interest rate is reduced, helping businesses recover their production and business, supporting economic growth and ensuring social security. However, the treatment of bad debt still encountered many obstacles. The article is based on the statistics and consolidated reports of the State Bank of Vietnam, the annual reports of commercial banks and credit institutions to analyze the bad debt situation and bad debt policy of banks, identify some remaining constraints and then propose some solutions to deal with bad debts of the bank towards the sustainable development of the national financial system.*

Keywords: *Bad debt; Credit risk; VAMC; Restructuring; sustainable development; Commercial banks*

Credit activity is the basic activity which generate the main source of income of commercial banks. However, the problem that commercial banks are facing is bad debt and credit risk. Bad debt leads to credit risk and causes financial loss, which reduces the market value of bank capital and results in business losses and even bankruptcy. In the effort to strengthen the banking business to foster sustainable development of the national financial system, efforts to deal with bad debts, reduce credit risks, and enhance the credit risk management capacity are what banks put high priority. The article analyzes the bad debt situation and the bank's bad debt treatment during the period from 2011 to present. Based on the analysis of the bad debt situation, the article provides insights on the limited features of bad debt management, and then suggests solutions to reduce bad debt in the process of credit institution restructuring towards the sustainable development of the banking sector in particular, and the national finance in general.

1.1. CURRENT SITUATION OF BAD DEBT AND BAD DEBT MANAGEMENT OF COMMERCIAL BANKS

Bad debt has been negatively impacting capital flow into the economy and the safety and business efficiency of the banks themselves. The bad debt of the banking sector in the recent period reflects partly the real situation of Vietnam economy as well as the effects of international market. Despite the positive results in dealing with bad debt, these are still big challenges to solve.

The year 2011 marked the first time that the State Bank of Vietnam (SBV) actively announced bad debt ratio of banks in the context of Vietnam's economy and the banking system facing difficulties and challenges

* Academy of Finance, Hanoi, Vietnam, Nguyen Thuy Linh. Tel.: +84972579839. E-mail address: linh.nguyenthuy.nhbh@gmail.com

caused by the impact of the global financial crisis and internal shortcomings in the economy. Accordingly, bad debts of the entire banking system at that time stood at 3.6-3.8% of total outstanding loans. The figure, up to the end of 2012, according to the State Bank of Vietnam (SBV) is 4.08%, although according to the independent rating agencies, the actual figure is much higher. Together with efforts to restructure credit institutions towards sustainable development, the establishment of Vietnam Asset Management Company (VAMC) in 2013 has contributed to the transfer of bad debts. There was a downward trend during 2014-2017 and decrease to lower than 3% from 2016.

During 2017 - 2018, together with the thorough efforts to deal with bad debts of the SBV and credit institutions, the issuance of Resolution 42/2017 / QH14 on piloting bad debts of credit institutions has achieved certain achievements. This is the first time that the banking sector has its own resolution on Bad debts, even though it is only a pilot, with time limitation and scope of dealing with bad debts. Resolution 42/2017 / QH14 supports Credit institutions accelerate the process of dealing with bad debts, improves credit risk management capacity, and enhances credit flow in the economy. As a result, after the seizure of Saigon One Tower to deal with 7,000 billion VND of bad debts (August 2017). By 2018, VAMC has processed approximately 5,000 billion VND bad debt. Moreover, a large number of credit institutions also seize the security assets, and at the same time auction many security assets. The total bad debts in the whole system at the end of March 2018 was 2.18%, whereas the figure for 2016 is 2.46%. From 2012 to the end of March, 2018, the system of credit institutions has processed 753.5 trillion of bad debt. Regarding the data on bad debt resolution, according to Resolution 42, by the end of March, 2018, the whole system processed 100.5 trillion VND, of which bad debt disposed by credit institutions was 454.1 thousand billion VND (accounted for 60.3%), the remaining debt (including selling to VAMC and other organizations and individuals) accounted for 39.7%. The results of dealing with bad debt have made important contribution to the improvement of credit and economic growth¹.

1.2. LIMITATIONS IN THE PROCESS OF DEALING WITH BAD DEBTS:

• *Firstly, the volume of bad debt sold to VAMC does not reflect amount of bad debt actually processed.* The bad debt ratio has declined significantly recently due to the key role of VAMC. However, the nature of debt selling through VAMC is only a form of “accounting tips” to remove bad debt from the balance sheet, or in other words, transferring bad debt from on balance sheet to off balance sheet. After five years, if VAMC can not solve the bad debts, these bad debt will return to commercial banks. After selling debt to VAMC, the bank will receive certain bonds issued by VAMC based on the debt purchase value equal to 100% of the book value. Annually, banks that sell debt will have to set aside 20% of their bonds, with a coupon rate of 0%. Thus, instead of a “bad debt” the bank will get back a “VAMC bonds”. This bond has a term of 5 years and when maturity, the value of the bond is defaulted to 0. Obviously, this process is not a financing bargain, the process of collecting debts will be authorized to the bank. When a debt is settled, the bank will receive 85% of the proceeds from the bad debt settlement, while the remaining 15% belongs to VAMC. Although selling debt to VAMC, each year, the bank still has to set up a risk reserve of 20% for VAMC bonds. This means that the profit of the bank will fall sharply, even eroding the charter capital.

According to recent statistics, from its foundation to May 31st, 2018, VAMC has only handled 90,648 billion VND of bad debts, including debt sales, sales of collateral, and debt repurchase on the total debt of 309,710 billion bought from credit institutions. As such, bad debts are only really solved if VAMC can get the debts, otherwise, a bad debt ratio does not reflect the better situation of the banking industry.

Secondly, the law on dealing with security assets to recover debts still has many inadequacies: Resolution 42 opened the door to seize the guarantee property in the absence of debtor cooperation, but the Resolution had not given the creditor the right to dispose absolutely, the law was still in favor of protecting the borrowers. Therefore, the difficulties still hang on the heads of the bankers, so they need the support from relevant authorities, such as the court, to speed up the progress and the amount of bad debt recovery. There are also many cases where the family mortgage their house to borrow capital to do business but the business was losing, unable to repay the loan, causing the house was indebted to the bank. At this point, if the assets are decisive assets, the bank will be condemned for pushing people into being homeless. Therefore, it is difficult to deal with these cases in a sensible manner.

The time of collecting debt and disposing secured assets through court is not effective (processing time is about 400 days, but in fact approximately 2 years, cost accounts for about 29% of the value of debt collection, the lawsuit index of Vietnam only reached 6.5 / 18). The civil procedure law does not permit the application of simplified procedures in the settlement of disputes over the obligation to deliver security assets of the securer and the right to handle security assets of the securee. On the other hand, the Land Law only allows credit institutions to receive security assets being land use rights and assets attached to land, restricting rights to purchase and sell debts secured by land use rights, adjacent to land of other entities other than credit institutions;

The current law allows for the purchase and sale of debt and assets secured by market value, but there are no specific provisions on debt selling lower than the book value. These shortcomings hamper the creation and development of the bad debt trading market, not protect the legitimate creditor of the credit institution / VAMC. In addition, tax law and fees related to the handling of bad debts, security assets still have unreasonable regulations affecting the legitimate creditors of credit institutions. The above mentioned legal obstacles are mostly related to the provisions of the Laws. In order to deal with these shortcomings, difficulties and problems, legal documents of high legal value should be promulgated. Although the Ministry of Finance has issued Document No. 4606 / BTC-TCT dated April 20, 2018 on thoroughly grasping the implementation of Resolution 42 of the National Assembly, the content of the document has not provided detailed guidance on tax payment when dealing with security assets of bad debt. Therefore, many cases of sale of property security has been completed but the buyer can not get the property because the tax has not been paid yet. In addition, in some cases, the law lacks of the jurisdiction to regulate the client's obligations in dealing with collateral. Some typical examples are the customer agrees to hand over assets to the bank but do not willingly. For example, the security property is the car, the car is given to the bank but the car keys are not. In particular, there are customers who have authorized the bank to sell assets and when the bank sells the property back, the customer does not deliver the property to the buyer.

- *Thirdly, the speed of bad debts processing is still slow*

Although statistics show that bad debts of the whole system have fallen from 11.5% at the end of 2016 to 9.5% by the end of 2017, with the prudent assessment of some upcoming bad debts, on balance sheet bad debt and bad debt sold to VAMC, but not yet processed, the bad debt of the whole system is still at 8.61 %, equivalent to about 566 trillion VND. In addition, in order to achieve the target of controlling the bad debt of the banking system at less than 3% by 2020, the system needs to handle around VND 130 trillion of bad debt per year. Thus, it can be seen that the current speed of bad debt processing, which falls to about 78 trillion VND in 2017, is still slower than the expected pace of treatment.

On the other hand, despite the measures taken, Bad debt still exists in the economy because many “debtors” – enterprises -are still in debts. Moreover, at present, the treatment of bad debts of some banks

mainly relies on debt selling to VAMC, there is not a vibrant market for bad debt trading. Because of the “clot” bad debt has not been “dissolved”, the bank has no conditions to reduce interest rates, reduce the cost of loans to support the business community

- *Fourthly, not having a competitive debt trading market.*

VAMC is currently playing a key role in dealing with bad debt. However, the purchase of debt by “real cash” is only for applicable debts, due to the limited chartered capital, VAMC’s chartered capital was only 500 billion VND, and by 2018 increased to 5,000 billion VND. The new mechanism has allowed banks to hold property rights, but the problem is how to sell that property, whether it is sold and who will buy it? The market is still waiting to see how the story of selling collateral to collect debts. This result relates to the real estate market. The positive factors are the real estate market is moving well, which is good for the sale of collateral and bad debt collection of banks in the future. But bad debt management is not efficient because there is no debt trading market, this is a problem to be solved in the next period. Organizing the debt trading market has become an essential issue to ensure the effectiveness of the process of dealing with bad debt in the context of the restructuring of credit institutions. In order to create a market for bad debts, and to attract a large number of domestic and foreign investors who are interested in bad debts of credit institutions, the most important thing is the price of goods and legal framework to ensure transparency and convenience in transactions. If these conditions are met, the debt trading under the market mechanism will be self-formed.

1.3. PROPOSING MEASURES TO HANDLE BAD DEBTS OF THE BANK TOWARDS THE SUSTAINABLE DEVELOPMENT OF THE NATIONAL FINANCE

First of all, developing a debt trading market Many countries experience that debt trading is one of the best ways to deal with bad debt to get out of crisis. The dealing with bad debt will stabilize domestic finance and improve the competitiveness of financial institutions. Many managers argue that if there is no debt trading market, the National Debt Management and Asset Management Company will become a monopoly. The monopoly will lead to a series of issues of transparency, group interests, performance, negativity, etc. The development of the debt trading market is a positive solution since bad debt is also a “commodity. Forming a bad debt trading market which is a way to create a social infrastructure to cope with a future debt crisis. To develop the debt trading market, there are two levels of market, primary and secondary: primary market deals with direct transaction between a credit institution and debt settlement organizations; The trading among investors is on the secondary market. These are two different categories and the policy mechanisms to promote each market is also different. The treatment of bad debt in Vietnam should combine the model of dealing with bad debt concentration and developing the debt trading market in order to socialize demand in the bad debt investment of Vietnam. The state also needs a “stick and carrot” mechanism to develop the primary debt trading market. If there is no sanction by the State Bank to force credit institutions to take more responsibility in dealing with bad debt, they will still gradually process bad debt and it will take 7-10 years to complete. For example, the State Bank of Vietnam (SBV) can stipulate that after a specific period, if commercial banks are not able to reduce their bad debt ratios, they will not be allowed to expand their operations and be required 100% provisioning. In fact, there are countries requiring 150-250% provisioning of bad debts. Recently, SBV has also made certain moves such as not allowing commercial banks to pay dividends if they do not make enough provisions.

In Vietnam, in order for the debt trading market to develop, it is necessary to form debt and asset trading companies. Then, there must be a legal system, a macro-policy mechanism that creates a corridor for a smoothly functioning market.

Secondly, the key to dealing with bad debt is to handle the collateral.

The resolution of the National Assembly on the handling of bad debts will help to handle collateral faster and more convenient. This allows the lender (Credit Institutions) to seize the collateral when the borrowers fails to pay debts; After the seizure of the collateral, the credit institution sold the collateral at market price, which may be lower than the book value; The credit institutions shall transfer the assets to the buyer; make priority payment for debt obligations; When disputes are brought to court, they will be dealt with according to the simplified procedure to shorten the process and proceedings in court, helping the Credit Institutions to handle the collateral quickly.

At the same time, the development of a competitive debt trading market needs to be taken into account in the coming period since the market for debt in Vietnam is still limited, the subjects of the market is restricted in accordance with the law. The seizure and sale of security assets meet many legal obstacles, the rights and responsibilities of debt buyers and sellers are not clearly defined.

Thirdly, it is necessary to take drastic measures to determine the real number of scale and structure of bad debts, because from this data, it is possible to apply specific solutions for each Credit institutions. For each bank, it is necessary to improve financial capacity such as: owner's capital, asset quality. Commercial banks, especially small banks, need to rush to implement the plan to increase equity.

In addition to finalizing bad debt with the risk reserve fund, asset sales, banks can transfer their debt to debt trading companies. In order to improve the quality of the loan, the bank needs to strictly follow the lending process, perform well the inspection and supervision of the loan in accordance with the regulations.

Fourthly, to enhance the efficiency and effectiveness of banking inspection and supervision so that credit institutions can comply with banking regulations, especially regulations on credit extension, loan classification, using of risk provisions and credit security regulations.

In fact, commercial banks have built a risk management system but only at the initial step. To have a sound and reliable risk management system, it takes time to comply with Basel 2 risk management principles, which require relatively high costs.

The SBV should develop criteria to assess the risk management policies and procedures developed by commercial banks in accordance with the size and complexity of each commercial bank. step by step standardizes processes to identify, measure and control risks.

Fifthly, strictly handle the act of concealing bad debts.

Banking business is based on credibility and trust, the morality of banking profession is not only necessary but also compulsory. However, due to many reasons, some bankers have cooped up with clients to hide the truth, cheat, deliberately violate regulations of the SBV and commercial banks. Although there is no data published, but in the total bad debt, there is a large proportion arising from the violations of professional ethics.

At the same time, The SBV need to amend and supplement the classification of debts, the provision for credit risk as well as to intensify the inspection and examination in cases of granting credit, debt classification, setting up and use of reserve funds in contravention of regulations.

CONCLUSION

The banking sector has been struggling to restructure credit institutions associated with dealing with bad debts to ensure the safety, health and sustainability of credit institutions to restrain the inflation, to reform the growth model, to develop the economy in line with the national policies.

In the process, in addition to the limitations, bad debt management has achieved certain results. Currently, bad debt ratio has been maintained under 3%, ensuring the safe and sound operation of credit institutions, initially achieving the set objectives and tasks. Nevertheless, the restructuring and handling of bad debts still face many difficulties and challenges in order to implement the roadmap, requiring the determination of the commercial banks, the State Bank, ministries and local authorities. In addition, it is necessary to focus on developing a consistent policy mechanism, legal system, enhancing transparency, enhancing the management and administration capacity of credit institutions in line with the international practice in order to ensure the safety, health and sustainable development of credit institutions.

IMPROVING HUMAN RESOURCES IN ACCOUNTING AND AUDITING FIELD DURING GLOBAL INTEGRATION PROCESS TO ACHIEVE SUSTAINABLE DEVELOPMENT

Tran Hai Long* - Ngo Thi Thu Huong**

ABSTRACT: *Vietnamese economy has experienced a rapid growth since the Government implemented economic administrative reform. At the same time, Vietnamese economy has engaged in global integration process. One remarkable milestone of this process is that Vietnam officially became a member of the World Trade Organization. This contributed to a new economic and social situation, thus requiring skilled human resources in general, and an advanced level of labor force working in accounting and auditing field in particular. As regards sustainable development during globalization, accounting and auditing working area faces opportunities and challenges. In this article, we will address solutions to promote the development and innovation in training accounting and auditing to generate skilled labor force for sustainable development.*

Key word: *improving human resources; sustainable development*

The Vietnamese government issued the “Strategic Orientation for Sustainable Development in Vietnam” (Vietnam’s Agenda 21) in order to achieve the sustainable development as mentioned in the Resolution of the National Party Congress on 17th August, 2004. The “Strategic Orientation” points out challenges that Vietnam is facing, then the Government sets out guidance, policies, legal instruments and priority areas that need to be implemented. Based on current plan, there are 19 priority areas that need to be improved. One of these is training human resources for sustainable development. The labor market policy system has been supplemented in three directions, including support for training and retraining, job placement and labor migration.

Human resources in accounting and auditing field during global integration process

According to data provided from the Ministry of Finance, independent audit has appeared in Vietnam since 1991 and has increasingly played an important role in the economy. In fact, there were only 2 independent auditing firms with 15 employees in 1991, then these number rose to over 160 firms with more than 7,000 employees. The rapid growth of Vietnam economy requires an advanced level of auditors to be able confirm reliable and transparent financial statements. This is a labor force that plays the important role in ensuring a strong economy that is attractive to foreign investment, especially the stabilization of Vietnam stock market which is full of potential as well as risks. However, the auditing industry in Vietnam is still a young industry, hence the number of advanced level auditors who have international experience to meet the requirements of integration is limited. In addition, Vietnam is experiencing “brain drain” caused by retired auditors or international certificate holders working and residing abroad.

* Thuongmai University, Hanoi, VietNam.

** Banking Academy, HaNoi, VietNam

In addition, it is undeniable that the average quality of Vietnam human resources is still low. In fact, the auditing certificate issued by the Vietnamese Ministry of Finance has not been widely recognized. The number of international accounting and auditing certificate holders is not great enough to be interested by foreign investors. The most restrictive of labor force in accounting and auditing area in Vietnam is in terms of standard perception. Like many countries, applying IAS and IFRS in the specific situation of each country is not easy. It will take great effort to complete Vietnamese accounting standards, or to apply IAS and IFRS into practice.

In the context of global integration, the Association of Chartered Certified Accountants (ACCA), the first international accounting professional organization in Vietnam, has gradually asserted its position and meet the demand for skilled employees currently. Along with the Ministry of Finance, ACCA has played an important role in supporting Vietnamese employees working in accounting and auditing field to access and use accounting standards in line with international practices, thus gradually improving the quality of labor resources. So far, ACCA has trained around 5,000 ACCA learners, and more than 1,000 learners have attained this certification. In addition, there are 2,000 people holding accounting or auditing certificates issued by Ministry of Finance. However, this figure does not really meet the requirements for labor resources of the current economy. As Vietnam becomes a member of the WTO, and integrates TPP and AEC, this is the best opportunity for the local workforce, especially for holders of international certifications such as CAT, CPA, ACCA, ICAEW ... In addition, there are a lot of enterprises, private companies, joint stock companies and foreign invested enterprises in Vietnam searching for a huge number of skilled employees in accounting and auditing field.

Furthermore, after joining the WTO, TPP and AEC, Vietnam will fully open its financial services, especially accounting and auditing services for foreign parties. According to the international commitments, Vietnam will open the auditing and financial accounting sector, with the goal of fully open by 2020. Given the fact that the AEC is a free service market, it allows freedom of movement of professional workers and recognizes of practice certificates ... then this will be a great challenge for Vietnam workforce. Thus it requires efforts to be responsive and competitive. Integration process leads to the fact that the financial market, especially accounting, insurance and securities services, will attract a lot of foreign investors. They have high demand for transparent and reliable financial information. Therefore, the explosion in the field of audit is inevitable. Local auditing firms have to improve their quality and competitiveness in order to keep their market share ahead of international competition, especially in terms of integration. In the early stage after joining the WTO, this competitive pressure is not so great for Vietnamese auditing and tax consulting firms, because Vietnam has differential customs, habits and language. Vietnamese auditing firms can be assured of many traditional clients such as state-owned enterprises, small and medium-sized local companies. This is due to the fact that these companies may not be familiar with auditing services produced by foreign auditing firms or foreign accounting services. Upon accession to the WTO, Vietnam has paid attention to and applied international accounting and auditing standards as well as introduced legal provisions on accounting and taxation in line with international practices in Vietnam. Today, in order to globally integrate and to develop sustainably, Vietnam has to pay attention to international accounting standards and international audit standards. Thus, local firms have to improve their skills, quality, thus improving accounting and auditing services. This is the only way to enhance their competitiveness in the market, and to ensure their market share in this field.

Currently, to survive and develop sustainably, enterprises must have accurate and timely information for making decisions on production and business activities. To be competitive with competitors, businesses

must have a strong accounting system to provide reliable, timely information for decision making. Global integration has brought many difficulties to Vietnamese economy, however, the economy has gradually transformed thanks to legal system improvement. Thus, organizations are ready to join and take challenge in a competitive environment... in the trend of globalization and economic integration in the world. Therefore, developing human resources in accounting and auditing in Vietnam is a matter of concern now.

THE DEMAND FOR HUMAN RESOURCES IN ACCOUNTING AND AUDITING FIELD IN THE CONTEXT OF TPP AND AEC INTEGRATION.

It is forecast that Vietnamese economy will experience rapid growth from 2016 to 2020. The social demand for human resources in accounting and auditing field is enormous. This demand may develop in two directions:

- Labor force meets the requirements of small and medium enterprises. This sector has showed rapid development recently, and generated most of the employment needs for accounting workforce. The demand of these businesses for skilled employees is not high.

- Large enterprises, financial institutions, state agencies and foreign invested enterprises are directly under pressure of international economic integration process. Therefore, the requirements for the quality of labor force for accounting and auditing area is very high. Employees must have a high level of expertise, proficiency, and good use of the Vietnamese accounting and auditing system; they also need to be able to understand and apply international practices in finance, accounting and auditing; and be fluent in foreign languages and computer skills in communication and in professional...

To improve the quality of workforce in accounting and auditing field to meet international standard, innovation in training is really necessary.

Vietnamese economy has gradually transformed itself thanks to legal system improvement, thus enabling organizations to join and take challenge in a competitive environment. Hence, innovating accounting and auditing training in universities, academies and research colleges is a necessity. Globalization, international economic integration and trade liberalization are emerging issues of the world economy. In that movement, in the area of accounting and auditing, Vietnamese government has issued accounting standards and auditing standards in accordance with international accounting practices. The issuance of this standard system is the foundation for accounting and auditing practices to follow the general principles of the market, facilitate data transparency and create a healthy investment environment. In addition, accounting and auditing sector is allowed for full competition according to Vietnamese commitment. This raised the need to innovate the training of accounting and auditing in universities and colleges.

THE REALITY ABOUT ACCOUNTING AND AUDITING TRAINING IN VIETNAM.

The training of accounting and auditing at universities and institutes has not only had a great influence on the quality of training labor and services provided in the market, but also affects the quality of accounting and auditing services. The training is reflected in the following aspects: training programs and methods; the system of modules in the training program; homework system, syllabus and quality of lecturers. The practice of accounting and auditing training in Vietnam has many issues to consider as follow:

- Firstly, accounting and auditing training at almost universities and academies now follows the form of credit. This form is suitable for hard-working students; self-study reduces cramming knowledge of the teacher, promote the creativity of the learner. However, this method of training in many universities and academies is not really compliance with the nature of training credit. The facilities are

not guaranteed, the place for students to self-study such as library, computer room, reference materials ... do not meet the training in the form of credit. In addition, the volume of lecture hours in the class decreases compared to the the time of self-study increased, however, in Vietnam, the sense of self-study is still low. Inadequate facilities, curriculum and library systems are not enough for students to self-study. Also, learners do not have the right to choose teachers according to their knowledge of their ability as well as the credit training that many universities in the world has applied. Moreover, the specialized knowledge are limited to the extent that each school has developed. Therefore, the ability to change careers in the future is limited.

- Secondly, as regards the learning materials, most of the accounting and auditing learning materials are compiled accordance with guiding circulars despite the issuance of accounting and auditing standards. Circulars are only practical guidance, which limits the students' ability to understand the nature of accounting and to develop their knowledge. It should be noted that the international standards for financial statements is always changing. Therefore, understanding the nature of norms and applying them to Vietnamese conditions is very necessary.

- Thirdly, the training program does not take into account the integration issue. This feature is indicated by the name and content of the modules according to the curriculum, the duration of the modules. This affects the continuation of pursuing international certificates such as CPA, ACCA, ICAEW...

TRAINING PROGRAM IN DEVELOPED COUNTRIES

In order to meet the requirements of integration in accounting and auditing training for sustainable development, the consideration of common practices in training at professional associations should also be taken into consideration.

Currently, in many countries, bachelor programs are not included in the bachelor's degree in auditing. The audit knowledge is only required components in the training process. Students after graduation, should experience related jobs before taking certificates. However, in Vietnam, many universities and institutes open specialized auditing while the actual experience of students is not available. Moreover, there is no similarity in degrees in foreign and domestic universities. The design of a foreign undergraduate program complements the modules that learners can learn to take CPA exams organized by professional associations. Example of this design is the training program of the University of Illinois (USA). Thus, the ability of students to adapt after training is large. This issue calls for the development of training programs that are interested international certifications such as CPA, ACCA, ICAEW. The program is designed in the form of credit training, which divides the knowledge into optional and compulsory modules. Apart from the knowledge of accounting and auditing, there are also knowledge of law, finance, taxation, business administration and other optional knowledge. Open training is an indispensable trend for training programs in the current period. It can be seen that the design of the program is always combined with the knowledge management, so that students can understand the role of accounting in management control. At the same time, it is possible to develop audit perspectives, in which awareness of corporate governance is indispensable. In addition, there are modules having a complementary knowledge of social, natural sciences, art... This seems to be new in Vietnam. The difference in basic education knowledge, in addition to math subjects, also includes English language skills with writing and communication skills (US Program). The knowledge of business subjects includes accounting subjects so that students of other business majors can approach the same problem.

ORIENTATION ON TRAINING IN THE CONTEXT OF TPP AND AEC INTEGRATION.

The above issues show that there are differences in university training in accounting and auditing of our country in comparison with developed countries in the world. The article discusses a few issues:

Firstly, it is necessary to improve the level, capacity and experience of accountants, auditors and those working in the field of accounting and auditing. Solutions to improve the capacity, qualifications and experience for accountants and auditors in the current conditions includes:

Developing a standard training program to ensure uniformity, there must be a close association between compulsory and voluntary training, domestic training combined with overseas training. At the same time, the implementation of training must be in accordance with the program has been developed and the actual requirements set out in accordance with current conditions of Vietnam. Training must always be in the trend of integration with high quality requirements.

The training program must meet 3 requirements, including:

- + Improvement of professional qualifications and practicing skills;
- + Close combination the training of professional knowledge in both domestic and international standard;
- + Improvement in the level and culture of behavior in professional as well as modern and professional manner.

Organizing examinations and raise the professional qualifications of accountants, organize the assessment of accountants' quality on a regular basis, ensuring strict and objective. Develop strict recruitment and conduct recruitment in accordance with regulations to attract talented people and use the right talent.

Developing and immediately applying the standards and titles to the accountant, organizing the assessment process on a regular basis and promoting into place appropriate positions to encourage and facilitate the accountants to develop themselves.

The Ministry of Finance must closely coordinate with universities in order to enhance professional training in accounting and auditing. Universities that have training in the accounting profession must develop an appropriate curriculum that ensures that graduates are able to use the knowledge they have acquired in their professional work. Especially, in the current period, credit training has been implemented by the Ministry of Education and Training. The advantages of this training are that students can broaden their knowledge according to their interests, promote self-control, independence, creativity and initiative in learning. In addition to the core knowledge of the discipline, the supplementary knowledge with the optional system can help students become more specialized in the fields of financial accounting and management accounting. When moving to a credit-based curriculum, the development of curriculum frameworks should also refer to developed countries so that the recognition of qualifications and transfer of higher education courses is more favorable. The content of the program should be in the direction of reducing class time and increasing the self-study hours and practice, so that students can be self-reliant in researching and improving their practical ability. Thus, they can continue to improve the quality and develop their accounting knowledge.

Training in the form of credit must be strictly academic credit. Learners can select lecturers. Learners can select modules included in the curriculum. At the same time, the modules taught in universities must be consistent, compatible with each other. The development of the curriculum should refer to the advanced curriculum of developed countries in order to recognize the degree, transfer of higher education or transition to higher education. The content of the program should be in the direction of reducing attendance hours, increasing self-study hours, practice so that students can self-study and improve their self-study ability and creative capacity.

Secondly, the procedures, methods, professional standards and ethics must be developed, issued and strictly managed.

Accounting companies need to develop and complete regulations on binding and enhancing the inspection and control of accounting activities. Each accounting firm needs to develop a separate regulation to suit its specific characteristics. The regulation should be closely linked with individual and collective responsibility in implementing the process, method as well as professional standards and ethics. At the same time, rewards and incentives as well as penalties should be used regularly.

Thirdly, the Government must have strict quality control policies towards accounting services. It is necessary to develop the Regulation on the control of accounting quality and the quality of accounting services for enterprises to control themselves as well as for State management agencies to inspect and supervise the implementation of the Regulation. There must be strict and punitive treatment of errors committed by accounting service providers such as errors in accounting procedures, accounting standards, changing accounting information affecting the interests of the Government and other subjects, violating the principles of professional ethics. The results of the control and treatment must be publicized and ensure transparency and timeliness. Therefore, the quality control activities of accounting services can be effectively implemented and put into practice and create favorable conditions for customers to select the best service provider for themselves.

Forthly, the Government must improve the legal framework to facilitate the legal environment for enterprises and individuals providing accounting services to promote their capabilities, improve the quality of services. The legal framework also needs to ensure that businesses and individuals operating in the field of accounting services are equal on the law as other enterprises in the economy. In addition, the Accounting Law should be put into practice as soon as possible.

Fifthly, the capacity and quality of activities of professional organizations and associations should be improved, so that accountants have the conditions and training environment to improve their professional capacity and professional experience.

- Increasing in training and organizing the assessment examinations for accountants and chief accountants to provide an advanced skilled labor force for enterprises, accounting service firms...

- Improving the process and content of accounting examinations to ensure the supply of workforce to the market and the quality of accountants.

- Expansion of recruiting sources of accountants: normally, only employees who have degrees in finance, accounting, auditing and banking are recruited. The expansion of recruitment sources, as well as allowing candidates in accounting contests in the current integration trend should refer to appropriate rules.

- Expand training in accounting and auditing in universities. In fact, almost universities and colleges in Vietnam are involved in accounting training, but the quality of graduation in many institutions is low. Therefore, there should be solutions in the direction of reducing accounting and auditing training in universities ranking at low level in this field. At the same time, increase training in experienced and prestigious universities.

To develop the human resources working in accounting and auditing area, below issues should be improved:

- Improve the learning materials, the quality of lecturers, the quality of training process. In particular, it is necessary to change the basic accounting textbook, in which accounting standards are the basis for the learner

to understand the problem, not the current circulars. Thus, the textbooks should not be changed a lot when the circulars change. In the contrary, the tasks need to be linked to the practice works. Important factors in improving the quality of human resources training include training program, curriculum and materials.

- Training professional ethics in universities and colleges, including ethical standards of accounting professionals and ethical standards of audit professionals. Combining theoretical and practical teaching in the direction of suggesting fundamental theoretical issues on professional ethics, emphasizing the professional ethics of accounting and auditing.

- Applying of modern technology, methods and professional standards to raise the quality of services. Formulating and perfecting professional procedures, standards, methods, forms, records, etc.

- Recruiting experts and persons with accounting or auditing experiences into the agencies managing or supervising the practice of accounting and auditing and the agencies issuing the standards of accounting and auditing.

- Sending Vietnamese officers to study abroad and financial support them by the State budget to encourage overseas study. Also, encouraging domestic training institutions to expand international cooperation. At the same time, expanding the training in Vietnam with foreign resources (capital, technology, lecturers ...) to quickly generate advanced level of skilled human resources with international qualifications in the short term. Furthermore, building the international advanced training programs in Vietnam.

Sixthly, English should be the language of instruction in accounting in long term. In fact, in many universities in Southeast Asia (Thailand, Malaysia, Myanmar), English is used in teaching. Thus, graduates can improve their competitiveness in comparison with accountants abroad. Currently, some institutions in Vietnam run this kind of program in accounting and finance and banking major. However, this program is not popular to learners.

Seventhly, teamwork skills should be practiced during lectures in class. In fact, accounting and auditing works require a lot of teamwork activities, thus teamwork skills are really necessary.

In conclusion: Developing and innovating the accounting and auditing training is an urgent requirement to improve the quality of accounting and auditing human resources in the future. Thus, accounting and auditing services in Vietnam can be able to compete with other abroad competitors during integration process. Moreover, quality human resources are important factor to achieve sustainable development. To improve and develop the quality of accounting and auditing human resources in Vietnam, all the above contents must be synchronously implemented, in which the quality of accounting training institutions is key solution.

EVALUATION OF SUSTAINABLE SEAFOOD EXPORT DEVELOPMENT IN VIETNAM

Anh Le Thi Mai*

ABSTRACT: Sustainable export development is becoming a global trend as well as a target of many countries in the world. It is development that satisfies the needs of the present without compromising the capacity of future generations, guaranteeing the balance between economic growth, care for the environment and social well-being. Vietnam's seafood export industry is not out of the trend. However, in the past few years, Vietnam's seafood export industry has faced many shortcomings such as poor growth quality, non-assurance of technical standards, excessive use of seafood resources, environmental pollution, ecological imbalance. Therefore, the development of Vietnam's seafood export industry in a sustainable manner is absolutely urgent. Based on the method of collecting secondary information and data, the article will analyze and evaluate the current situation of Vietnam's seafood export according to the criteria of sustainable development.

Keywords: export, seafood, sustainable

1. INTRODUCTION

With the rapid growth, Vietnam's seafood export industry has contributed positively to the restructuring of agricultural and rural economy, contributing effectively to hunger elimination and poverty reduction and employment for millions of employees, to improve the living standard of the population community, and also to contribute importantly to the national security and defense in the sea areas of the country. However, development of Vietnam's seafood export has not been sustainable in recent years. The quality of export growth has not been high, contained many risk factors, the export has not shown the trend of industrialization and modernization. The seafood export has caused over-exploitation of the natural resources, environmental pollution and ecological imbalances. The seafood export raises a number of social issues such as inequalities in the distribution of export benefits. On the basis of the criteria for the sustainable seafood export development, the article analyzes and evaluate the current status of Vietnam's seafood export.

2. LITERATURE REVIEW

Fresh seafood has a limited shelf life which creates constraints for export and it is estimated by Riialand (2014) that the value of fresh seafood depreciates by one fourth after two days and after four days the value is diminished to almost zero. It is therefore of priority to get to market, from harvest to consumption, as fast as possible. The Food and Agriculture Organization (FAO) of the United Nations (2017) means that post-harvest handling, processing and transportation of seafood require particular care in order to ensure food quality and safety. The post-harvest value chain of seafood must meet particular requirements to retain the nutritional value, preserve the benefits of the rich composition and avoid fish-borne illnesses. This becomes of special importance with regards to export of seafood when the distance from harvest location to

* Department of International finance, Academy of Finance Number 58, Le Van Hien street, Duc Thang precinct, Bac Tu Liem district, Hanoi, Vietnam. AnhLeThiMai. Tel.: +84948648799. E-mail address: maianhtcqt@gmail.com

consumption location is longer which often is the case in seafood export. Several studies indicate that there are large variations between different nations with regards fresh seafood value chain configuration and exploitation of market opportunities (Trondsen, 2012). There are nations in the world that are prominent with regards to export of fresh seafood, among these countries are for example Norway (Cantillon, 2010). This creates interest to investigate how these countries influence the activities, actors and resources as well as the opportunities, constrains and performances of industrial networks of fresh seafood export with the result of great value creation.

3. ANALYTICAL FRAMEWORK FOR SUSTAINABLE SEAFOOD EXPORT DEVELOPMENT

Based on the theory of sustainable development for the seafood export industry, the sustainable seafood export is maintaining the high and stable export growth rate, the quality of export growth has been increasingly improved, contributing to economic growth and stability, social stability and environmental protection.

According to this definition, sustainable seafood export is a harmonious combination of the said contents. The first is to maintain a high and stable growth rate of seafood export, ensure the quality of growth is improved. The second is to ensure the requirement for harmony between the aspects of sustainable development: economic, social and environmental affairs.

Sustainable seafood export must be a harmonious combination between the objectives of export growth, social stability and environmental improvement. However, in different stages of development, the assurance of harmony between aspects of sustainable development is different. In the early stages of industrialization, the period of capital accumulation, the growth of seafood export must be based on natural resources, fishing or processing technologies that can cause pollution. This is a model for the development of seafood export on a broad scale. In the later stages of industrialization (when the economy moves from an in – width growth model to an in-depth growth model), growth in seafood export is based on the exploitation of advantages for institutional competitiveness, the quality of work and technology, taking account into employment, the improvement of people's lives and the protection of the ecological environment. Thus, the level of trade-offs between economic growth, export growth and improvement of people's living standards, social stability and ecological environment protection varies between countries, based on the policies of development of countries in certain periods. Sustainable seafood export must be based on an in-depth growth model, the exploitation of competitive advantages due to institutional factors, quality of work and technology.

Another issue should be taken into consideration when researching sustainable seafood export is that the sustainability of seafood export must be considered in a long term. The high growth rate of seafood export in the short term on the basis of exploiting the available comparative advantage factors despite the high economic efficiency (gaining a lot of foreign currencies) is not a sustainable export if seafood export is made in the raw form with low added value, exhausting natural resources and polluting the environment, benefiting only an part of export.

4. EVALUATION OF VIETNAM'S SEAFOOD EXPORT DEVELOPMENT ACCORDING TO SUSTAINABLE CRITERIA

4.1. Growth rate of seafood export

Vietnam's seafood exports have made great strides in the past 10 years. Seafood export turnover has seen strong growth year by year with an average growth rate of 15.6% per year. This growth has made Vietnam one of the five largest seafood exporters in the world, playing the leading role in supplying global fisheries resources.

At present, seafood exporters have got the best out of domestic raw materials for export processing that has created many jobs for laborers. However, the unstable source of raw materials, especially the increasingly exhausted resources has caused businesses to import more raw materials from other countries as a solution for export processing, holding firm the market and maintaining production and profits and increasing export sales.

Fig.1. Vietnam's seafood exports in the 2010 - 2017 period

Source: Vietnam Customs

The country exported seafood volumes worth USD 8316 million USD in 2017, jumping 18 percent year-on-year to its highest all-time level, according to latest data from Vietnam Customs. The figure is much higher than a previous target of USD 7048 million USD for 2017 set by Vietnam in December 2016.

Up to now, Vietnamese seafood has been consumed in more than 164 markets in 5 continents. Consumption market is increasingly expanding and gets increasingly important position in the major markets. Top 10 biggest importers of Vietnamese seafood are US, EU, Japan, China, Korea, ASEAN, Australia, Brazil, Mexico and Russia. Among these countries, the United States and Japan are the two leading markets for Vietnamese seafood consumption.

4.2. Quality of seafood export growth

_ Quality of export growth seen from the perspective of export restructuring

Vietnam's exported seafood structure in the past 20 years has had a relatively positive movement such as increase in proportion of processed exports, decrease in export of raw materials, diversified markets, increasing role of the private sector and FDI. However, the restructuring of Vietnam's seafood export has not clearly shown the tendency of industrialization and modernization. Vietnam has only taken advantage of the comparative advantages available to develop the seafood export but not exploited the competitive advantage to develop the seafood export with high technology content and large added value.

_ Value added of seafood exports

Although Vietnam's seafood export growth rate is very high, its value added only accounts for a small proportion in total export turnover. Vietnam's seafood export is mainly based on resource-intensive processing and labor-intensive low-tech processing. Unless competitiveness is improved for Vietnam to engage in higher value-added production phases, the ability to grow rapidly and consistently will be limited.

_ Competitiveness of export seafood

In the context of increasing requirements of seafood importing countries in the world on product quality, Vietnam's seafood exports have been paid more attention to product quality. Especially after the occurrence

of many seafood shipments from Vietnam which were strictly controlled by the authorities of Japan, EU ..., the food safety and hygiene has been more concerned by many businesses. The quality of Vietnamese seafood has been gradually improved, but still low compared to other countries such as China, Thailand and the Philippines. There are some shipments of seafood receiving warnings about food safety and hygiene and product quality during aquaculture and after harvest is not good as well. The abuse of chemicals, antibiotics in production and in preservation of post-harvest seafood is also general. The cause of this situation is that seafood after harvesting is usually collected by the dealers first and then transferred to the processing plant; therefore, the transport and storage take so much of time without proper storage technique

_ The ability to participate in the global value chain

The involvement of Vietnamese enterprises in the global value chain is not deep enough to get the best out of the fisheries sector's advantages. Among stages of input supply, exploitation, aquaculture, purchasing and processing for export, processing can be considered as the strongest stage of Vietnamese seafood in regard of opportunity to participate in the global value chain. At present, however, the processing enterprises are mainly operating in Vietnam, only few enterprises have invested overseas to make use of available materials in such host countries. In spite of the fact that it has made a name for itself in many export markets, the trade promotion of Vietnam is still weak. Distribution network is mainly through importers acting as intermediaries, which makes the presence of Vietnamese exporters' brand in the world market relatively faint. Meanwhile, distribution is the stage potential to bring more value to the seafood value chain.

4.3. Contribution of seafood exports to economic growth and macroeconomic stability

_ Contribution to GDP growth:

According to the General Statistics Office, in 2016 GDP of fishery accounted for 19.97% of total GDP of agriculture, forestry and fishery and 3.07% of total GDP. In 2016, fishery's GDP increased by 2.8% compared to that in 2015, contributing 0.09% percentage point to the economic growth of agriculture, forestry and fishery in particular and the whole country in general. (This is the lowest growth rate of this industry in the past five years due to the difficulties and challenges in weather, disease, price and market of the product). On average, in the period 2011-2016, fishery GDP growth is 4.64% / year, contributing 0.21% to economic growth in agriculture, forestry and fishery in particular and the economy in general (Fig.2).

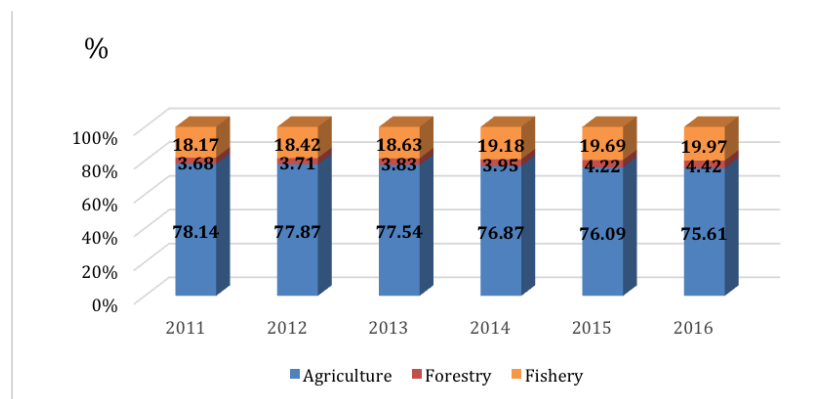

Fig.2. Contribution of seafood export to GDP growth.

Source: Vietnam General Department of Fisheries

_ Contribution to macroeconomic stability:

In addition to balancing the balance of payments, exports of seafood also helps to increase foreign currency reserves. However, export activity has a high potential for economic instability. *Firstly*, due to the high economic opening level, Vietnamese seafood export is heavily dependent on the world economy. Therefore, if the competitiveness is not promoted, fluctuations of the world market will have a great impact on the export turnover of seafood. *Secondly*, the employment in the seafood is not so attractive, hence, the risk of job loss and reduction of incomes of laborers in the seafood in the context of large market fluctuations is very high.

4.4. Seafood export and environmental issues

_ Seafood export in relation to the maintenance and improvement of biodiversity resources

Vietnam has already had some research institutions in universities (Hanoi University of agriculture, Nha Trang University, Can Tho University) with deep expertise in research, development and aquaculture breeding. However, aquaculture breeding is now mostly carried out by private breeding facilities that are relatively fragmented and spontaneous. In addition, boosting fishery exports in width has disrupted the coastal ecosystem due to the expansion of cultivation areas. The use of destructive fishing methods such as explosives and small mesh have resulted in the loss of juvenile fishes and other marine organisms.

_ Seafood export in relation to pollution and environmental improvement

Although the seafood has adopted the model of community link in the production chain (vertical link) with high feasibility whose the core is the processing enterprises achieving considerable successes such as: Model AGIFISH Pure Pangasius Production Association in An Giang; model of ecological shrimp farming in Ca Mau; Link mode of MSC standard implementation in clam farming, the model of shrimp and catfish farming in Ben Tre. However, the strong development in the quantity and production and processing scale of aquatic products has adversely impacted on the environment and the livelihoods of people living in fishery processing establishments. The more, the production grows spontaneously and lacks of depth, the more pressure on the issue of environmental pollution is increasing, that requires more responsibilities for environmental protection of manufacturers, managers.

In addition, the recent over-exploitation of fisheries has caused rapidly degraded marine ecosystems, significantly declining seafood resources, many depleted coastal areas and heavily polluted sea water in many areas.

_ Seafood export with the ability to meet environmental regulations and standards

Many enterprises have applied new production methods, invested in technology innovations, saved input materials and changed fishing and aquaculture methods in order to exploit more effectively aquatic biodiversity resources, while reducing the risks of environmental pollution in the country. However, satisfying the environmental requirements for export seafood is still a challenge for the enterprises in our country. Cause is due to limited awareness, processing technology which is slow to change, lack of information on the rules of importing countries, the status of violations of environmental and hygiene requirements are still quite popular. In particular, the lack of a master planning for the seafood industry, indiscriminate aquaculture and fishing households, etc. have directly threatened the quality of the environment and poses the risks of exhaustion of aquatic resources, leading to unsustainable development.

4.5. Seafood export and impacts on social issues

_Seafood export to employment and income

The characteristics of seafood production require a lot of labor forces, therefore, the expansion of seafood export has created more jobs for workers. On average, the seafood industry receives and creates jobs for about 300,000 workers (of which nearly 70% are in processing and service sectors). In the frozen processing area, female workers account for 83%. It is forecasted that by 2020, the coastal population will increase by about 30.4 million people, of which the labor force in the seafood sector is about 19 million people. This will be an important force in the future development of the seafood sector.

_Seafood export with quality and qualification of labor

Because the quality of exported seafood is improving slowly, the growth of seafood export is mainly based on cheap labor, thus the level of improvement is still slow. In many seafood processing plants, more than 60% of workers do not have technical expertise. Private processing establishments in the private sector of the seafood processing sector account for about 80% of the labor force without training, but only short-term training courses run by training establishments or enterprises.

CONCLUSION

Sustainable seafood export development not only solves the economic problems in order to develop the Vietnamese economy in the direction of marine economy but also contributes to maintaining the security and the sovereignty over islands of the country. Therefore, sustainable seafood export development plays a very important role for Vietnam. Although the export sector has grown tremendously over the past few years, the challenges of quality, growth, environment and social security are being addressed. In order to develop seafood export in the sustainable way, the solutions must be synchronously implemented by the State, enterprises and associations.

THE IMPACT OF FIRM GROWTH ON PROFITABILITY: EVIDENCE FROM VIETNAMESE LISTED COMPANIES

Dang Phuong Mai^{*}, Pham Thi Thanh Hoa^{**},
Vu Van Ninh^{***}, Bui Ha Linh^{****}, Dao Manh Huy^{*****}

ABSTRACT: *This paper investigates the impact of firm growth on profitability in Vietnamese listed companies during the period of 2009-2015. The sample consists of a balanced panel data of 234 companies from various sectors listed on the Vietnamese stock market. Analysis results show that firm growth has a positive impact on profitability. However, other independent variables firm size, leverage, liquidity and economy status are negatively associated with the performance in our sample firms. These findings may reveal that Vietnamese listed companies should particularly focus on sales growth to maximize their rate of return.*

Keywords: *Profitability, firm growth, Vietnamese listed companies.*

1. INTRODUCTION

Growth is an ambiguous phenomena and it can be measured and interpreted in a variety of different ways. For an economic planner it is efficient utilization of resources (Miles and Snow, 1978), while a welfare economist views it as equitable distribution of gains apart from efficient utilization of resouces. In the context of the firm, it can be defined as an increase in the sales of company, expansion of business through acquisition or merger, growth of the profits, product development, and diversification and also an increase in the number of employees of the firm. Thus, growth is viewed differently from different perspectives.

The relationship between firm growth and profitability are important issue for industry practitioners as well as academic researchers (Goddard et al.,2006). Firm excutives generally face the dilemma between pursuing growth and profitability. If companies are obsessed with short-term profit-oriented performance, they will settle for past successes and thus be unable to respond to market conditions, thereby falling into a success trap. On the other hand, if they are devoted to innovation only in the long term, they will fall into a failure trap, jeopardizing corporate survival (Seungkyu Yoo and Jaejun Kim, 2015).

The global financial crisis led to the collapse of large companies in the world and it also impacts on the Vietnamese firms. While large companies find it easier to survive in a long term downturn, as they are enjoyed relatively high bargain power, financing ability, and research and development capability, the small and medium sized Vietnamese firms are vulnerable in all those respects. Thus, these firms are more likely to favor a profitability-oriented management strategy. A profit-driven strategy in a relatively stable economic environment can help generate free cash flow and lower the probability of bankruptcy. Moreover,

^{*} Academy of Finance, Vietnam, Corresponding author. Tel: +84915198086, E-mail address: dangphuongmai@gmail.com

^{**},^{***},^{****} Academy of Finance, Vietnam

^{*****} University of Labour and Social Affairs, Vietnam

it can improve the growth potential of a firm as investment activities, the expansion of R&D, foster high profitability. However, in a long term macro-economic downturn, it is difficult to use a profitability-focused strategy as a means to improve business resilience. In such a context, the focus of management strategy should switch from profitability to growth. However, the very poor level R&D investment awareness among Vietnamese firms is a considerable barrier.

Thus, the study aims to identify the impact of firm growth on profitability of Vietnamese firms listed on the Stock Exchange in the context of effects of the economic downturn (2009-2015). The findings of this study may provide some insights to management in steering the corporate growth strategies of firms.

The rest of this paper is organised as follows: section 2 reviews the prior literatures and develops the hypothesis. Section 3 presents the data and methodology, while Section 4 shows the empirical findings and discussion. Finally, conclusions of this study are presented in Section 5.

2. LITERATURE REVIEW

The relationship between firm growth and profitability is first mentioned in the the U-shaped long-term cost function defined by Viner (1932). According to this theory, fixed costs are reduced in accordance with an increased production scale, while average costs are reduced according to the U-shaped long-term cost function. Such a situation is referred to as “economies of scale” in economics. However, when the firm’s size increases further, “diseconomies of scale” occur due to an increase in management costs; thus, the average cost increases accordingly. Similarly as above argument, The Kaldor Verdoorn Law in economics (Kaldor, 1966; Verdoorn, 1949) claims that firm growth contributes to an increase in firm size, larger firms could benefit from an economy of scale and in turn enhanced profits. That is, growth can help increase profitability.

Incontrast, Gibrat (1931) emphasized in the law of proportionate effect (LPE) that the firm growth rate and firm size are independent of each other, the reason being that changes in the market demand and uncertain external factors have the same effect on the growth of all companies.

According to evolutionary economists, companies make an investment based on their current financial performance rather than the present value of the expected future profits. Some companies gain a competitive advantage and high profitability by reducing production costs or by practicing efficient business processes. On the other hand, companies that do neither, lose market share and are eliminated Alchian (1950). According to this theory, current corporate performance can be regarded as a source for future growth.

On the other hand, from the resource-based perspective, firm growth does not increase future profitability. This theory is demonstrated by Penrose (1995). The author pointed out that firm growth is achieved not because of the characteristics of the company itself, but because of the “economy of growth” inherent in the company’s growth process. Although “economy of growth” temporarily provides companies with an incentive to grow, companies that have grown rapidly are burdened with high operating costs compared to those that grow slowly. As the result, there is an inverse relationship between current firm growth and future profitability. Similar as the argument of Penrose, the managerial theory proposed by Marris (1963) conclude that the expansion of firm size and rising profits contradict each other. Marris assumed that firm growth is achieved exclusively through product diversification, and the related empirical analysis indicated that product diversification that is not relevant to the core product of the company reduces its profitability. Consequently, increasing the firm size can decrease its profitability.

Empirical studies have proven the inconsistency in the relationship between growth and profitability. Markman and Gartner (2002) found no significant relationship between growth and profitability. Along the

similar lines, Gschwandtner (2005) declare that there is no remarkable relationship between growth trend and the differential profitability for American companies. Roper (1999) indicates that high profitability is not persistent above average growth rates for Irish companies. Moreover, Sexton et al (2000) show that a very weak relationship between sales growth and profits, whereas Capon et al. (1990) reported that firm growth is related to high financial performance, but it was significant in only some industries.

On the other hand, Robson and Bennett (2000) in their research on small and medium-sized British firms, observe a positive relationship between sales growth and profitability. Cox et al. (2002) reported a positive relation between sales growth rate and profit growth rate in the survey on 672 registered member of the Institute of the Entrepreneur of the Year. Bottazzi et al. (2008) also investigate a sample of Italian manufacturing firms, and observe that the correlation between the profitability ratio and firm sales growth is positive but barely significant.

In an opposite manner, Mueller (1977), in his empirical analysis, suggested that the firm's profitability can converge to a certain level because of market competition. Mueller argued that market entry and exit are completely free, and accordingly, any excess profit will rapidly disappear and converge to a long-term average. Coad (2010) states a negative relationship between growth and profitability, using sales growth and employment growth as an indicator for firm growth. Markman and Gartner (2002) examines their relationship with the profit growth. Accordingly, there is negative relationship between both firm growth measures and profitability.

The relationship between growth and profit rates is even more complicated when the inter-relationship is examined and time lags of the two variables are considered. Goddard *et al.* (2004) proved that the current growth rate for a given corporate size has a statistically significant negative effect on the profit rate in the next period. Coad (2007) claimed a quite small significant effect of current profitability on the firm growth but a positive effect of current growth rate on the next quarter's profit rate. Nakano and Kim (2011) identified that the current rate of returns acts as a positive factor for the future growth rate of firm size, while the current growth rate of firm size has a negative effect on future rate of returns.

3 DATA AND METHODOLOGY

3.1 Data collection

The data is compiled from balance sheets and annual financial statements of nonfinancial companies listed in Vietnamese Stock Market from the year 2009 to 2015. We excluded financial sector including banking, investment banking, securities, and insurance due to the differences in terms of sales activities, financial structure, or accounting policies with other sectors. Our study only covers the period from 2009 to 2015. However, to measure the firm growth for 2009, the data from 2008 was also needed. After screening firms with missing data, the final sample consists 243 firms with 1701 observations.

3.2 Data analysis

We used a package of STATA software version 13 to estimate the regression equations. First off, bivariate relations among variables were explored via examining correlation. Next, we used ordinary least square (OLS) to examine the effect of leverage to business performance. Then, Hausman's test was employed to discover which models are more suitable for the data set between Fixed Effects Model (FEM) and Random Effects Model (REM). The result suggests that FEM is suitable for the character of data in this research. The research also examined some necessary test for regressive assumption to ensure the result of

regression is blue such as autocorrelation, multicollinearity and heteroskedasticity. Finally, to validate our research results, the robust option was performed to recalculate standard errors in case the models violate regressive assumptions.

3.3. Variables

Dependent variable

Previous researches often used the basic earning power ratio, return on assets, or return on equity to measure the profitability of a company. In this study, we used both ratio return on assets (ROA) and return on equity (ROE) as the dependent variables to identify the profitability of companies.

Independent variable

Prior studies on firm growth have shown that sales growth is the most popular measure. Fitzsimmons, Steffens, and Douglas (2005) find that more than 60% of their 82 reviewed articles use sales growth as their measure of firm growth. In this study, we also used sales growth (SG) indicate for firm growth. To calculate the sales growth of a particular year, we measured the growth rate from the previous year to the current year, expressed as a percentage. We did this for the seven years from 2009 to 2015.

Control variables

Control variables include firm size (LTA), Leverage (LEV), Asset structure (TANG), Liquidity (LIQ), and economy status (ECO). The relationship between these variables and the profitability are explained in many previous studies. The variable economy status (ECO) is introduced in the model as a control variable for the purpose of assessing the impact of macroeconomic factors on business performance. Due to the period of study from 2009 to 2015, there are many fluctuations in Vietnamese economy. Especially, in the period of 2011-2014, Vietnamese companies faced the difficulties of the economy, such as: high interest rate, high inflation in 2011, tighten monetary policy. ECO variable is considered as a dummy variable with a definite value for the crisis period from 2011 to 2014, and 0 value for the remaining years.

Table 1: Variable and measured scale description

| N | Variables | Scales |
|---|---------------------|--|
| 1 | ROA _{i,t} | Return on asset _{i,t} = Net profit _{i,t} /Total Assets _{i,t} |
| 2 | ROE _{i,t} | Return on equity _{i,t} = Net profit _{i,t} /Total Equity _{i,t} |
| 2 | SG _{i,t} | Sales Growth _{i,t} = (Total sales _{i,t} - Total sales _{i,t-1})/ Total sales _{i,t-1} |
| 3 | LEV _{i,t} | Financial leverage of firms _{i,t} = Total liabilities _{i,t} / Total assets _{i,t} |
| 4 | LTA _{i,t} | Firm size _{i,t} = Ln(Total Assets _{i,t}) |
| 5 | TANG _{i,t} | Asset structure _{i,t} = Fix assets _{i,t} / Total assets _{i,t} |
| 6 | LIQ _{i,t} | Liquidity _{i,t} = Current Assets _{i,t} / Short term debt _{i,t} |
| 7 | ECO _{i,t} | The dummy variable |

3.4. Research Model

In respond to the research objective, this study tests empirically the following multiple regression models:

$$ROA_{i,t} = \beta_0 + \beta_1 SG_{i,t} + \beta_2 LTA_{i,t} + \beta_3 LEV_{i,t} + \beta_4 TANG_{i,t} + \beta_5 LIQ_{i,t} + \beta_5 ECO_{i,t} + \varepsilon_{i,t} \quad (1)$$

$$ROE_{i,t} = \beta_0 + \beta_1 SG_{i,t} + \beta_2 LTA_{i,t} + \beta_3 LEV_{i,t} + \beta_4 TANG_{i,t} + \beta_5 LIQ_{i,t} + \beta_5 ECO_{i,t} + \varepsilon_{i,t} \quad (2)$$

Where β_0 is the constant term, $\varepsilon_{i,t}$ is the error term.

4. RESEARCH RESULTS

4.1 Descriptive statistics on the variables

Table 2: Descriptive statistics

| Variable | N | Mean | SD | Min | Max |
|----------|------|----------|----------|-----------|----------|
| ROE | 1701 | .130452 | .143796 | -.9696568 | 1.594448 |
| ROA | 1701 | .061251 | .0738744 | -.3522118 | .721911 |
| SG | 1701 | .1491079 | .3113461 | -.687058 | 3.454186 |
| LTA | 1701 | 1.744378 | .1585253 | .5813698 | 2.099593 |
| LEV | 1701 | .5385813 | .1989267 | .0002812 | .9261392 |
| TANG | 1701 | .2468029 | .2004581 | .000046 | .9764187 |
| LIQ | 1701 | 10.25359 | 137.0891 | .1155694 | 3382.61 |
| ECO | 1701 | .5714286 | .4950172 | 0 | 1 |

(Resource: Author's evaluation)

Table 2 illustrates the descriptive statistics of the full sample. The table shows that the average return on asset and average return on equity of the companies is approximate of 6.12% and 13.04% respectively in the period from 2009 to 2015. The companies had an average sales growth is 14.9%. Furthermore, the average liabilities on total asset ratio is 0.53, which means that on average, the debt of a company is little greater than its shareholders' equity. However, the debt level is very high in some enterprise with the maximum of 0,92. The average fix assets ratio is 24.6%. The average current ratio of 10.2, which means that an average company had current assets which can pay off the current liabilities almost ten times. The dummy variable indicates the impact of macroeconomic factor on the performance of the business. It can be deduced that in over half of the research period (from 2009 to 2015), companies are faced with the fluctuations of the economy. The effect of inflation, interest rates and economic crisis have a strong impact on the performance of enterprises.

Table 3: Correlation matrix

| | ROE | ROA | SG | LTA | LEV | TANG | LIQ | ECO |
|------|---------|---------|---------|---------|---------|---------|--------|-------|
| ROE | 1.000 | | | | | | | |
| ROA | 0.8577* | 1.000 | | | | | | |
| | 0.0000 | | | | | | | |
| SG | 0.2709* | 0.2103* | 1.000 | | | | | |
| | 0.0000 | 0.0000 | | | | | | |
| LTA | 0.0208 | 0.0000 | 0.0564* | 1.000 | | | | |
| | 0.3904 | 0.9990 | 0.0200 | | | | | |
| LEV | 0.0943* | 0.4137* | 0.0995* | 0.1743* | 1.0000 | | | |
| | 0.0001 | 0.0000 | 0.0000 | 0.0000 | | | | |
| TANG | 0.0392 | 0.0075 | 0.1029* | 0.0705* | 0.0240 | 1.0000 | | |
| | 0.1064 | 0.7572 | 0.0000 | 0.0036 | 0.3228 | | | |
| LIQ | 0.0205 | 0.0483* | 0.0339 | 0.0325 | 0.1523* | 0.0783* | 1.000 | |
| | 0.3977 | 0.0463 | 0.1628 | 0.1810 | 0.0000 | 0.0012 | | |
| ECO | 0.1981* | 0.1604* | 0.2181* | 0.0328 | 0.0162 | 0.0439 | 0.0049 | 1.000 |
| | 0.0000 | 0.0000 | 0.0000 | 0.1770 | 0.5050 | 0.0702 | 0.8405 | |

(Resource: Author's evaluation)

Table 3 shows the correlation results between profitability of companies and independent variables which are included in empirical model 1 and model 2. The correlation results display that sales growth are positively correlated to both dependent variables including return on asset and return on equity.

The result also shows the high correlation between the independent variables. However, the variance inflation factor (VIF) is 1.05; therefore, the possibility of multicollinearity is very low.

4.2 Regression models

For the sample of our research, the fixed effects method is more appropriate than the random effects in both model 1 and model 2. This assumption was also formally tested. Breusch-Pagan Lagrange multiplier test is based on verification and selection an appropriate model between Ordinary Least Squares (OLS) or random model. The test result suggests rejection of the null hypothesis with on all levels of reliability, what implies that random model is more appropriate. Further, Hausman test helps us in making decision about better model between fixed and random. Main point is about whether the errors are correlated with regression. The null hypothesis presupposes that they are not, what goes in favour of random model, but if results are opposite, more appropriate is fixed model. The result of Hausman's test indicates rejection of the null hypothesis at all levels of significance, and fixed effects is better model than random effects. As the result, we have concluded that the fixed effects method should be applied in this case.

Modified Wald statistic test and Wooldridge test is used in this study to check the groupwise heteroscedasticity and autocorrelation. The result shows that the data is characterized by heteroscedasticity. We use robust option in Stata software to utilize this model and mitigate the effect of heteroskedasticity.

Table 4: Regression models: The impact of sales growth on return on asset

| Variables | FEM Coefficient (t statistic) | REM Coefficient (t statistic) | ROBUST Coefficient (t statistic) |
|---------------------------|--|-------------------------------------|--|
| SG | 0.0533*** (12.35) | 0.0520*** (12.28) | 0.0533*** (6.39) |
| LTA | -0.203*** (-3.80) | 0.0137 (0.75) | -0.203* (-2.45) |
| LEV | -0.206*** (-13.07) | -0.196*** (-17.25) | -0.206*** (-6.67) |
| TANG | -0.0291* (-2.03) | -0.00991 (-0.92) | -0.0291 (-1.50) |
| LIQ | -0.0000121 (-0.38) | -0.0000511** (-2.76) | -0.0000121*** (-5.42) |

| N | 1701 | 1701 | 1701 |
| R ² adjust (%) | 0.2361 | 0.2248 | 0.2361 |
| Hausman | Prob>chi2 (= 33.17) = 0.0000 | | |
| | t statistics in parentheses * p<0.05, ** p<0.01, *** p<0.001 | | |

The results of model conclude that the regression model is consistent (p-value (F) = 0 is significantly lower than the significance level of 0.05) (The F statistic is highly significant). The coefficient of determination of the model R² = 0.2361.

There is a significant positive impact of sales growth (SG) on return on assets (ROA) (0.0533; $p < 0,01$). This means that a company with high growth has higher return on assets. This empirical result could be explained by the phenomenon of dynamic increasing returns. In other words, companies reduce production costs and improve productivity based on the experience gained through high growth. Thus they increase the gap between themselves and their competitors and boost their profitability.

Firm size and profitability show a significant negative relationship. This implies that larger firm size is associated with decreasing profitability. The leverage ratio has a strong negative effect on the profitability. This indicates that the debt ratio increases financial costs and thus acts as an element inhibiting profitability. The state of economy also impacts negative on profitability. This means that the firm faced many difficulties in the downturn period, thus their profitability was reduced.

Table 5: Regression models: The impact of sales growth on return on equity

| Variables | FEM Coefficient (t statistic) | REM Coefficient (t statistic) | ROBUST Coefficient (t statistic) |
|---------------------------------|--|--|---|
| SG | 0.121*** (12.05) | 0.115*** (11.79) | 0.121*** (6.25) |
| LTA | -0.548*** (-4.41) | 0.00261 (0.07) | -0.548** (-3.17) |
| LEV | -0.234*** (-6.41) | -0.158*** (-6.56) | -0.234*** (-3.78) |
| TANG | -0.0229 (-0.69) | 0.0184 (0.80) | -0.0229 (-0.55) |
| LIQ | -0.0000327 (-0.44) | -0.0000418 (-1.10) | -0.0000327*** (-6.62) |
| ECO | -0.0342*** (-5.97) | -0.0404*** (-7.19) | -0.0342*** (-5.62) |
| _cons | 1.220*** (5.76) | 0.213*** (3.42) | 1.220*** (4.09) |
| N | 1701 | 1701 | 1701 |
| R² adjust (%) | 0.1785 | 0.1598 | 0.1785 |
| Hausman | Prob>chi2 (= 49.73) = 0.0000 | | |
| | t statistics in parentheses * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$ | | |

Table 5 show the impact of sales growth and other independent variables on return on equity, the regression model is consistent (p -value (F) = 0 is significantly lower than the significance level of 0.05). The coefficient of determination of the model $R^2 = 0.1785$.

The regression result shows a significant positive impact of sales growth on return on equity (0.121; $p < 0,01$). Similar to the impact on return on asset, companies with high sale grow are more likely to achieve higher return on equity.

The regression result also indicate that except the asset structure, remaining variables have significant negative effect on return on equity.

5. CONCLUSION

The impact of firm growth on profitability is an important concern in corporate governance. Even though theoretical perspectives indicate the relationship between firm growth and profitability but the

direction of the causality between both variables remains unclear defined in the empirical researches. In this paper, multiple regression method is employed to estimate the impact of firm growth on profitability for the 243 Vietnamese listed companies during the period 2009-2015.

The study reveals that sales growth has a strong positive effect on profitability, which is measured by return on asset and return on equity. The reason is that Vietnamese firms focus on the profitability driven management strategy rather than growth. This implies that growth has positive effect on current profits. Growing firms will have accumulated experience of implementing projects and increasing productivity, and the gap in competitiveness between firms will thus result in increased profitability. Furthermore, the result indicate that firm size, leverage, liquidity and economic status have a negative impact on the profitability of companies. The evidence presented here may contribute the perspective that firm growth does play its role in generating higher profitability for a firm. However, some limitations of this paper should be commented, as follows: the dataset used in this analysis are not sufficient to generalise the results over the all Vietnamese firms; different profit ratios and growth variables may be used to confirm these findings; time lags are not mentioned.

BUSINESS MODEL SUSTAINABLE DEVELOPMENT

Bui Thi Yen Minh* - Vu Viet Dung** - Khuat Khang*** - Nguyen Tien Dung****

ABSTRACT: *In Vietnam, we are in the midst of a transition from a hot, large-scale to stable and sustainable growth. In this context, the agricultural and food sectors receive special attention from many investors, organizations and the whole society due to the practicality of market demand and stability in the long run. Along with the natural resources and conditions, Vietnam has all the necessary elements to develop these two areas. However, failing to fully evaluate the changing factors of the day will increase the risk for participating organizations. Environment, climate change, human perceptions, international norms, technical barriers ... will be issues that we need to assess comprehensively to make the right decisions and actions for each stage.*

The aim of the article is analysis business model sustainable development and proposal for sustainable development for small and medium enterprises in agricultural sector.

Keywords: *business model, sustainable development, small and medium agricultural enterprises.*

1. INTRODUCTION

Vietnam is facing the pressure of industrialization with the growth models applied to make the role of agriculture with the economy in many periods of decline, neglect. But in the face of the new demands of socio-economic development, agriculture is gradually gaining ground and therefore needs to be placed in the right place in the growth model with the introduction of supportive policies. , more rational social resource allocation for the task of reforming the growth model, enhancing the added value and sustainable development of the economy and the agricultural sector according to the Resolution of the XIth National Party Congress (2011).

Countries that are out of underdevelopment and moving to middle-income countries, if they continue to grow broadly, they will fall into “growth traps” or “middle income traps.”

In Vietnam, we are in the midst of a transition from a hot, large-scale to stable and sustainable growth. In this context, the agricultural and food sectors receive special attention from many investors, organizations and the whole society due to the practicality of market demand and stability in the long run. Along with the natural resources and conditions, Vietnam has all the necessary elements to develop these two areas.

However, failing to fully evaluate the changing factors of the day will increase the risk for participating organizations. Environment, climate change, human perceptions, international norms, technical barriers ... will be issues that we need to assess comprehensively to make the right decisions and actions. for each stage

2. PRINCIPLE OF SUSTAINABLE DEVELOPMENT

Sustainable development is development that satisfies the needs of the present without compromising the capacity of future generations, guaranteeing the balance between economic growth, care for the environment and social well-being. There are three elements of sustainable development: Economic development, Environmental responsibility, Social progress.

Main factor in sustainable development for production

Natural resources: Rational exploitation of resources. Limit the use of natural resources, switch to using recycled materials, alternative sources of energy

Capital Sustainable development needs large scale of capital and diversified capital structure. Use import investment namely: Foreign direct investment (FDI), Foreign indirect investment (FII), International commercial credit (ICC), Official development Assistance (ODA)

Labor Worker are well-trained and well-equipped with modern knowledge. Sustainable development requires good human resources. For developed countries, workers are trained and equipped with modern knowledge. In contrast, developing countries have abundant human resources but do not know how to exploit them, and their quality is low, so they need to be trained to serve the sustainable development.

Technology (most important) :Using Clean - technology, high-tech and technology are the advantages of Sustainable development. Developing Countries often import science and technology from developed Countries.

Sustainable development is a characteristics of Knowledge Based Economic.

Knowledge Based Economic: is the economy which is directly based on the production, distribution and use of knowledge and information.

Social progress

- Knowledge Based Economic is capable of opening up new industries and services using advanced technology and high labor productivity. Therefore, it can create a lot of products to better meet the needs of people. In addition, the knowledge economy has created many jobs, contributing to increasing incomes and improving the lives of people. This is the basis for political

Environmental responsibility

- KBE use clean-technology, high-technology, to help protect environment, consume less raw material.

Economic development

- In the KBE, information technology development has shortened the distance between producers and consumers through a diversified information system that improves productivity. The economic growth rate is relatively fast and sustainable.

- Maintaining a relatively fast, long-term economic growth rate due to the use of input factor which are invisible resources and less tangible resources.

3. BUSINESS MODEL SUSTAINABLE DEVELOPMENT

A business model is a clear, concise way of picturing how a business operates. The management team should be able to describe the business model in a few sentences. All companies strive to provide value to their customers. The stronger this value proposition, particularly when compared to that of competitors,

the more likely it is large numbers of customers will purchase from the company. The business model is a means of translating the value proposition into the potential for rapid revenue growth and profitability.

Sustainable development is development that satisfies the needs of the present without compromising the capacity of future generations, guaranteeing the balance between economic growth, care for the environment and social well-being.

There are three elements of sustainable development

- Economic development
- Environmental responsibility
- Social progress.

A knowledge-based economy is the most important factor in Sustainable development

A knowledge-based economy (KBE) is the economy which is directly based on the production, distribution and use of knowledge and information.

Economic development

In the KBE, information technology development has shortened the distance between producers and consumers through a diversified information system that improves productivity. The economic growth rate is relatively fast and sustainable.

Maintaining a relatively fast, long-term economic growth rate due to the use of input factor which are invisible resources and less tangible resources.

Environmental responsibility

KBE use clean-technology, high-technology, to help protect environment, consume less raw material.

Social progress

KBE is capable of opening up new industries and services using advanced technology and high labor productivity. Therefore, it can create a lot of products to better meet the needs of people. In addition, the knowledge economy has created many jobs, contributing to increasing incomes and improving the lives of people. This is the basis for political and social stability.

Advantages of sustainable business model.

- Using information technologies to shorten the gap between consumers and producer.
- Help the economic growth rate is relatively fast and sustainable.
- Using high technologies and clean technologies to protect environment.
- Opening up many new industries and services with advanced technologies and high labor productivity that can create many jobs, create a lot of products to better meet the needs of people, contributing to increasing incomes and improving the lives of people.
- Stabilize the political and social situation.

Disadvantages

For small businesses in developing countries, it is difficult to try to grow their business in all three directions: economic, environmental and social. The venture capital is not plentiful to apply the new technology, using the old technology will adversely affect the environment. Moreover, when the enterprise is in the process of development, it will not be able to produce high quality products to meet the needs of the people and improve the social life.

Opportunities

Enterprises can develop the market: enterprises produce products that meet the needs of consumers, as measured to increase the turnover for enterprises.

Improve the social life, while improving the living standards of workers, leading to increased labor quality. Therefore, enterprises can improve production efficiency and business expansion.

Businesses that focus on protecting the environment, exploiting resources effectively will avoid the negative effects later, better economic development.

Challenges

Sustainable growth is the result of improving the quality of management systems, technology development product innovation and human capital development.

The difficulties faced by developing economy and small company which follow sustainable development

The capital is still difficult

- The potential of country is still poor, nation reserves is small
- The domestic company 's size of capital is limited.
- Mint-set
- Over-reliance on FDI.

The difficulties in the field of science- technology.

- Equipment and machinery are backward, especially state-owned enterprises.
- It depends on the technology imported from foreign countries, not yet being able to produce and manufacture machinery and equipment.
- The agricultural production is main, which does not attach much importance to the manufacturing industry.

The difficulties about Human Resources.

- Has a great number of labor but low quality.
- The structure of labor isn't reasonable.
- The quality of labor training is low, focus on theory, not practice.
- The government does not yet have appropriate policies that lead to brain drain or human capital flight
- Weaknesses in the management and administration of the Government, together with the inherent weaknesses of the economy, have made our economy vulnerable to adverse changes from the outside.

4. PROPOSAL FOR SUSTAINABLE DEVELOPMENT FOR SMALL AND MEDIUM ENTERPRISES IN AGRICULTURAL SECTOR

Characteristics of vietnamese agriculture today

Agricultural growth in recent years has been largely based on the width, the current growth model has only created a large volume but low value, the efficiency of exploiting resource use is not high and is slowly reaching the limit. Due to the over-exploitation of the Vietnamese economy, this model of economic growth has led to many limitations and shortcomings in economic efficiency and competitiveness, macroeconomic imbalances seriously, social instability and environmental pollution

With the advantage which is a tropical agricultural country and has been integrated deeply into the global economy, Vietnam is able to produce a wide range of agricultural products with high nutritional and commercial value. By the end of quarter II / 2018, Vietnam has more than 10 major export agricultural

products, sold more than 160 countries and territories in the world. The value of exported products is over \$1 Billion, there are a number of products namely coffee, rice, cashew nuts, fruits and vegetables, etc. There are available in most major import markets of the world such as USA, EU and Japan. If the value of fruits and vegetables exported in 2003 is only 105 million USD, then by 2017 will reach 3.5 billion USD. According to statistics of MARD, export turnover of agriculture, forestry and fishery in the first five months of 2018 reached \$ 15.6 billion, up 9.9% over the same period of 2017 and Vietnam has the opportunity to be in the top 5. the largest exporter of agricultural produce in the world.

Limited processing capability, do not develop brand strong lead to the quantity of Vietnamese exported agricultural products, food of Vietnam but the turnover value is not matched and Export profits must be shared through many intermediaries.

Due to the information presented at the Seminar promoting trade of agricultural products and foodstuffs to EU and Japan market. 90% of Vietnam's agricultural exports are in raw form, with low processing content. In particular, about 80% of the agricultural products sold on the world market are not branded, and must use foreign brands which are negative affect the process of participating in the global value chain of agricultural products in Vietnam.

Climate change issues, production habits lack of environmental concern make great obstacles in changing the model of economic growth from the breadth to the economic growth depth in Vietnam agriculture today.

While the livelihood of the majority of farmers in Vietnam is extremely difficult as most of the labor force in the economy is still in rural areas, that make incomes and employment are not guaranteed. Vietnamese farmers find it difficult to access advanced science and technology and sustainable development goals.

More than that, the pressure of international economic integration with the active participation of Vietnam in new economic integration mechanisms such as TPP, AEC, FTA of Vietnam - Economic Union of Asia and many other cooperative agreements where agriculture is one of the top issues of concern for cooperation will create tremendous opportunities for the Vietnamese agricultural industry to transform profoundly the quality of growth and Sustainable development, but at the same time creates tremendous challenges, without preparation steps.

Production activities of Vietnamese enterprises towards sustainable development

Currently, Vietnam has about 49,600 enterprises (8%) invest in agriculture, of which, investment capital in agriculture accounts for only 8% - 10%.

In the period of 2005 - 2016, the number of enterprises operating in agro-forestry-fishery sector increased from 2,217 enterprises to 4,400 enterprises, an average increase of 6.4% / year. In 2017, there are 1,955 registered enterprises established in the agricultural sector, bringing the number of enterprises operating in the field of agriculture to over 5,661 enterprises. By the second quarter of 2018, there were about 7,600 agricultural enterprises. In addition to the increase of small and medium enterprises in agriculture, some large enterprises besides agro-forestry -fishery products also promoted agricultural investment, such as Vingroup, MaSan, Himlam, Viettel, FLC, Hoang Anh Gia Lai, Pan group ... These units also apply modern production processes, apply new technology and have good initial results.

However, investment in agriculture in recent years is not commensurate with the potential of the country and not really sustainable and effective. According to the Minister of Planning and Investment Nguyen Chi Dung, there are more than 49,600 enterprises investing in agriculture, accounting for 8% of the total number of enterprises operating in the country; However, enterprises directly producing agricultural, forestry and fishery products account for only 1% of the total number of enterprises with the number of 7,600 enterprises; the remaining enterprises in the chain of agricultural related industries such as commodity processing; Provide input materials, commercial service enterprises ...

The business model and production activities of Vietnamese small-scale agricultural enterprises do not go in the direction of sustainable development and the limitations of the model.

The main form of agricultural production is still in the form of households with nearly 14 million farm households, which owns 78 million small plots of land, which is difficult for large-scale agricultural production with high quality. This leads to obstruction when enterprises want to invest in agriculture. Vietnam's agriculture is still based on small scale farms, so it is difficult to produce large scale. In terms of labor size, 96% of enterprises invest in agriculture mainly in small and micro scale.

The capital of enterprises operating in agriculture only accounts for 8% - 10% of total capital of the whole enterprise sector. In particular, the capital of direct enterprises only accounts for about 1%

According to the survey, about 70% of agricultural materials are purchased from farmers, the rest is from enterprises themselves invested or purchased from the state farms. Harvesting and pre-processing are handled mainly, the area of agricultural raw materials far from the processing plant makes the loss rate after harvesting up to 25 - 30%, the cost of transportation is high, raw materials can not meet the quality requirements can not be processed for export. . Also due to the small and spontaneous production characteristics, the lack of linkage leads to low quality of agricultural products in Vietnam. Only 5% of products are VietGAP certified; post-harvest processing has many problems ...

Moreover, the farmers have not been thoroughly guided in the treatment measures in cultivation and husbandry, which makes the productivity of agricultural production low. The area of growing vegetables is scattered, scattered and difficult to handle. The harvest is not uniform, products are uneven, causing difficulties for processing and exporting to the market extremely harsh like EU , America, Japan.

Remarkably, there is still the use of unknown chemicals in processing and preserving fresh vegetables. Not only that, the post-harvest technology in Vietnam is poor, very little of high technical progress in this field was transferred to farmers.

Business model and production activities of Vietnamese agricultural enterprises have been following the trend of sustainable development and achievements.

Over the past time with the contribution of businesses, we have from 3,300 to 3,700 enterprises, 33,000 farm households, thousands of large cooperatives.

Public Private Partnership (PPP) model states that the State and the investor jointly implement the infrastructure development project, provide public services on the basis of the project contract. .

Under the PPP model, the State will establish standards for the provision of services and private sector incentives to be provided through a quality service payment mechanism. This is a form of cooperation to optimize the efficiency of investment and provide high quality public services, which will benefit both the state and the people.

Participants in the PPP Working Group on Tea invested 440,000 Euros to train and link production models with more than 23,000 farmers in six provinces. Train enterprises under the Rainforest Alliance (RA) certification, of which 18 enterprises are RA-certified, providing 32,000 tonnes of sustainable tea for export markets; Increase fresh tea yields by 20% compared to prior to training; increased income to 113% for tea farmers.

The PPP working group on coffee has implemented a total of 256 demonstration orchards and three PPP cooperatives in four provinces (Dak Lak, Dak Nong, Lam Dong and Gia Lai), bringing positive impacts to 130,000 ha (20% of total coffee cultivation area in the country); The productivity of the sample garden coffee increased by 17% (from 2015 to 2016); The average income of coffee growers is about 14%; The model helps reduce the greenhouse gas emissions by using a reasonable amount of fertilizer.

Through the failure of sustainable development, the experience of enterprises should be closely linked with farmers to be able to develop sustainably.

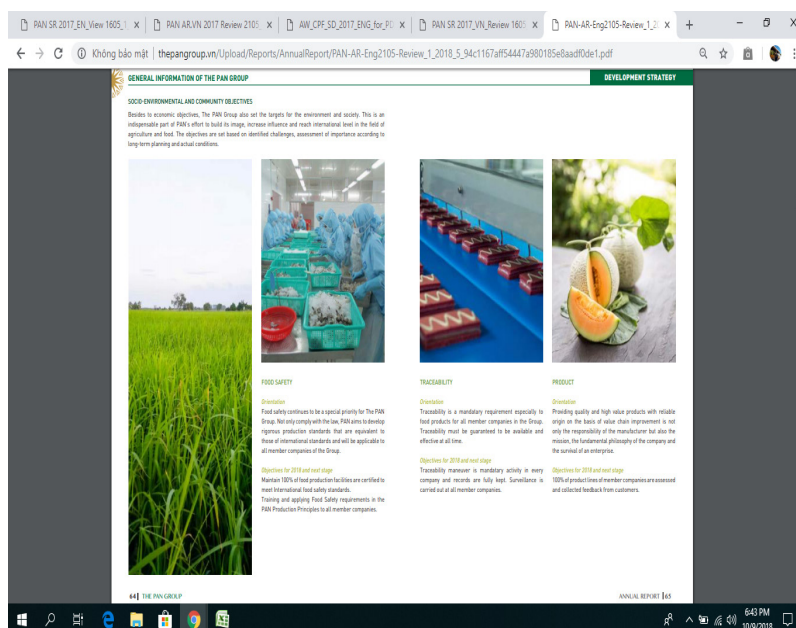

Nafoods is a typical enterprise in the transformation and development of business model in the direction of sustainable development. After many experiences, Nafoods is keenly aware that in order to be determined to pursue and grow sustainably with the agro-processing industry, only one option is to change the management model (chain model global competitive agricultural value). With this core value, Nafoods insists on the strategic goals, vision, mission set. Application of high technology in agricultural production and processing. According to this model, in recent years, Nafoods has strongly changed both in quantity and quality. Up to now, after the ups and downs, Nafoods has risen to become the No.1 company in Vietnam and the Asian region for export of fruit juice and nutritious drinks derived from nature. With the model of linking four houses: farmer, entrepreneur, state and scientist, Nafoods has been completely active in the raw material area. Up to now, Nafoods has planned over 900 hectares of high-quality lemon in Que Phong, 250 hectares of Gac in two districts of Anh Son and Quynh Luu (Nghe An), 300 hectares in the southwestern provinces ... Not only monotonous products, Nafoods advocated diversification of products. Nafoods products, in addition to lemon juice concentrate, condensed pineapple juice, nutritious drinks ... also added puree Gac (pure g ac oil) and Nafoods are proud to be the Enterprise Gac oil is the largest exporter in the world and is the first company in Vietnam to be active in high yielding lemons. Successfully followed success, Nafoods has boldly invested a frozen vegetable line and now Nafoods is a manufacturer and exporter of fruits and vegetables prestigious reputation to the fastidious markets such as: Australia, USA, Korea, Japan. Nafoods' products have obtained international certificates such as: International Quality Assurance System (SGF IRMA); Certificate of Global Food Safety and Quality Certification for Retail Food KOSHER, HALAL, BRC; Food safety management system ISO 22000: 2005 / HACCP.

|---|---|---|

In recent years, the change had been noticeable, such as the Chamber of Commerce and Industry (VCCI), which had collected information on hundreds of enterprises had plans related to sustainable development and had initial remarkable results. The report of the Vietnam Report showed that not only the businesses that had been pointed out had great revenue, high profits and contributions to the state, but also created more jobs, especially with the most attention to regular activities on environmental protection. That was very encouraging.

Today, businesses are more and more focused on sustainable development because this is the trend of the times, it is the trend in the long-term development of the global economy. Businesses that follow this trend are likely to grow larger than small and medium-sized enterprises that are only interested in growing in size and revenue (immediate benefits). Companies in the world such as CP Group in Thailand have changed their business model towards a sustainable economic model and they have achieved great success in the world market. This business is considered as “The Kitchen of the World”, their products are internationally recognized and the level of safety, provenance of origin that adds value to the product. The Company operates its business on the principle of Corporate Social Responsibility towards Sustainability under 3 pillars - “Food Security, Self-Sufficient Society and Balance of Nature”, which supports UN Global Compact principle and Sustainable Development Goals (SDGs). In 2017, the Company determined to uplift food quality and safety, resulting in the Company’s broiler production being certified with food quality and safety standard (QS Standard) from Germany. Currently, CPF has affirmed their brand value and products in the world market, they are constantly growing when they operated and invested in 14 countries, export to more than 30 countries across 5 continents, catered to over 3 billion citizens of the world. As a result of driving business with principle of sustainable development under good corporate governance. In 2017, the Company have been a member of DJSI Emerging Markets for three consecutive years, and a member in FTSE4Good Emerging Index for the first year. The Company retained the Excellent rating for Corporate Governance from Thai Institute of Directors, and was ranked 191th Best Employer of 2,000 companies Worldwide by Forbes magazine. At the same year, the Company successfully delivered business growth as planned, with revenue from sales of 501,507 million Baht, increased by 8% from 2016, and net profit of 15,259 million Baht. The improvement in performance was mainly attributed to overseas business expansion according to the expansion strategy to potential countries.

Thanks to the sustainable development based on 3 pillars - “Food Security, Self-Sufficient Society and Balance of Nature”, CPF can develop and affirm its position on the world market. From there, we can see the potential development of businesses towards sustainable development. Vietnamese businesses that follow this development model will be a very solid foundation in winning the world market, raising the value of Vietnamese products in the world.

Like CPF, PAN group is also moving towards sustainable development, and builds production and business strategies based on SUPPLY CHAIN FROM FARM TO TABLE (Farm-feed-family). Sustainable development and social responsibility are one of the special interests of investors. Although the concept is still new in Vietnam but PAN assess the importance and the inevitable trend in the future to make a consistent orientation in development strategies. 2017 is a successful year for The PAN Group. Not only continue to perform well several business activities, the Group also succeeded in expanding its scale in term of capital, finding more potential partners, merging more member company and creating close relationship with key members of the Agri-food chain. The operational structure of The PAN Group is being shaped clearly so that we can expect the better growth of Vietnamese brands. Together with promoting the economic growth, The PAN Group also strives to establish a sustainable operating platform with investment and improvements in infrastructure and management systems that enable businesses to be productive and more responsible for the environment, community and society. PAN has been contributing to the development of Vietnam's agriculture and food sector, bringing in more value than its economic value. PAN's goal is to bring the Vietnamese brand beyond the Vietnamese territory. It is easy to see that PAN Group's image for investors has become more prestigious and friendly when it comes to a clear sustainable development strategy and concrete actions. With this strategy, PAN has attracted many prestigious domestic and international investors such as SSI, NDH, CSC (Vietnam), IFC (World Bank), ADB, TAEL Fund (Singapore) , Daiwa Group, Sojitz (Japan)

Conclusion: Compared with other economic sectors, agriculture has low economic efficiency and the proportion of the economy is decreasing. However, Vietnamese agriculture still plays a role in ensuring food security, supplying raw materials for processing industries and creating export sources. Therefore, overcoming the shortcomings, taking advantage of opportunities and facing challenges in the context of integration need to have uniform and rational solutions. Within five years, the number of sustainability reporting firms has doubled, with 90% of registered businesses having the 500 largest companies reporting sustainability. Moreover, the network of cooperation has also been strengthened with strong and active linkages between enterprises and countries.

In the 21st century, sustainable development is seen as the biggest and only opportunity to create competitive advantage. Investors are increasingly using the "lens of sustainable development" for investment decisions and management processes. Sustainable development brings sustainable benefits to the business by creating more cohesive relationships with the stakeholders, creating a satisfactory working environment for the employees, the satisfaction of customers, customer loyalty therefore revenue are higher when new business opportunities are created, cost savings, and risk reduction. Therefore, the profit maximization business model is gradually being supplanted by the benefits maximization model for stakeholders.

Policies to promote the development of sustainable agricultural model in Vietnam

For the sustainable development of agriculture in the context of integration, it is necessary to have synchronous solutions from the Government and concerned agencies, which should focus on the following objectives:

Firstly, renew the growth model, continue to restructure agriculture towards enhancing added value and sustainable development associated with building new rural areas. The restructuring of agriculture should focus strongly on the restructuring of public investment and public services in agriculture, creating a favorable environment for effective and sustainable formation of agro-based agricultural value chains based on comparison of region, each locality; continue to invest in infrastructure ; research and application of science and technology, especially technology of agricultural production and processing, focus on developing products with comparative advantage, competitiveness and consumption market; market diversification, both domestic and export; invest in developing human resources in agriculture.

Secondly, implementation of agricultural planning based on open markets, should not fix the area of rice, should conserve agricultural land. Agricultural development planning should be implemented both in the medium and long term (50 or 100 years), in order to have a strategy for preserving and using agricultural land prior to the implementation of industrial and urban development plans. In the case of agricultural land, it should be possible for land users to decide on the use of each type of land according to market signals rather than the fixed method used for each type of land. Farmers can switch to growing flowers, ornamental plants, vegetables, other valuable agricultural products according to market signals.

Thirdly, mechanisms and policies for comprehensive renovation of management systems and public services for agriculture. To perfect the state management system in agriculture from the central to local levels on the basis of appropriate assignment and decentralization and clearly define the functions, tasks and responsibilities of the heads. Ensure transparency, strict control of quality and price of agricultural inputs, pest management and food safety. Agricultural service agencies should only provide public services in range and field where the market does not meet the key areas. The remaining scope should be for private and professional organization supply. Public service budget, necessary and can be freely, public bidden.

Enhance the application of scientific and technological advances and reorganize agricultural production in forms of cooperation, organization of association, formation of associations, development of cooperative groups, cooperatives, participatory and extensive participation of enterprises. This will be a new impetus for Vietnam's agriculture to increase value added and sustainable development in the coming period.

Fourthly, in order to respond to climate change effectively, we have to focus on improving the capacity for managing and responding to weather-related risks and mitigating the impacts of climate change as well as the risks on the market; Improve the system of forecasting, warning early and linking this system with agricultural advisory services; Change farming methods and select varieties suitable for areas with different climatic variations; Research and development capacity to address the emerging challenges of climate change and rising sea levels. Promote the agricultural insurance market, Improve resilience of farmers to risks, Ensure that agriculture is less vulnerable to climate change; Localities should have a timely response plan and appropriate agricultural production

Fifth, take measures such as increasing public investment in natural disaster prevention and mitigation works, reducing adverse environmental impacts, enhancing agricultural waste water management, intensifying the application of reduction measures greenhouse gas emissions; Conscious thinking green economy in agricultural development..

Some targets have been implemented: In order to attract enterprises to invest in agriculture, Minister Nguyen Chi Dung said that it is necessary to cut 40-50% of the current administrative procedures, improve the business environment and develop the business seriously. At the same time, to review and avoid overlapping in management, so that not one item is under the management of too many units; To change the management mode in the direction of increasing post-inspection, reducing the inspection charge.

On August 17, 2018, the Prime Minister approved the communication program on sustainable development and national competitiveness of national competitiveness. objectives of the program

1. Propagate widely to raise awareness of agencies, organizations, enterprises and people about sustainable development and enhance national competitiveness; Integrate the content of economic development with environmental protection and socio-cultural development.

2. Promote timely guidelines, solutions, measures and results of the implementation of sustainable development goals and enhance national competitiveness in each stage of national development.

Proposal for sustainable development model in agricultural sectors.

Bocken et al. (2013) claim that the SBM archetypes are important in implementing and driving business model innovation for sustainability. They can help attach sustainability into business processes and purposes, and serve as a key driver of competitive advantage. One of the key challenges addressed in this regard is to design a business model in such a way that it enables the firm to capture economic value for itself through delivering social and environmental benefits (Bocken et al., 2013; Schaltegger et al., 2012; Girotra and Netessine, 2013; Esslinger, 2011).

Sustainability itself does not necessarily lead to increased profitability, but sustainable behavior, as a result of the business models, can cause the company to offer new types of value to the customer, attracting new resources or they are able to carry out new value-added activities that they otherwise would not be able to execute (Jørgensen and Pedersen, 2015; Esslinger, 2011; Jolink and Niesten, 2013).

All the companies are working with various elements, which are integrated to all levels of the companies. Mainly they correspond to three parts of the companies' business models when BMC are used as a framework of analysis. The various companies' focus on sustainability and actual integration of sustainability not necessarily are related in a high degree. This might be due to several reasons, but lack of knowledge, initiative programs, regulations and demands from the government seem to influence these decisions for the case companies.

The companies can contribute to creating value related to the three dimensions of sustainability by integrating elements related to the economical and social dimension of sustainability, in addition to the economical dimension.

ACCOUNTING AND AUDITING TRENDS IN INDUSTRY 4.0 FOR SUSTAINABLE DEVELOPMENT

Nguyen Ba Minh* - Nguyen Ba Linh**

ABSTRACT: *The Fourth Industrial Revolution has been affecting all aspects of our life and society today. In the context of countries accelerating industrialisation and modernisation, this is one of the important keys to the new era of humanity. Through technologies such as the internet, artificial intelligence... the Fourth Industrial Revolution will bring about fundamental changes in most industries, including the accounting and auditing industry. This article outlines the Industry 4.0 and its implications for accounting and auditing. Therefore, accounting and auditing trends in Industry 4.0 must also be transformed to suit the era in order to develop sustainably and thus offer solutions for accounting development in the Industry 4.0 era.*

Keywords: *trend, accounting and auditing field, sustainable development Industry 4.0*

Industry 4.0 is a keyword that appears in many places today. So, what is the Industry 4.0? How does it affect the accounting and auditing sector? This article will help you clarify.

The Fourth Industrial Revolution or Industry 4.0, which is the current trend of automation and data exchange in manufacturing technology based on three key areas: Digital includes Big Data, the Internet of Things (IoT), Artificial Intelligence (AI); Biotechnology applying in agriculture, medicine, pharmaceutical products, environmental protection, renewable energy, chemistry and materials; and Physics: new generation robots, self-driving cars, new materials, nanotechnology..., is essentially based on digital technology; it integrates all the smart technologies to optimize the production process and methods, and emphasises the technologies that are and will have the greatest impact such as 3D printing technology, biotechnology, new materials technology, automation technology, and robots... It includes physical networking, IoT, and cloud computing.

Meanwhile, Industry 4.0 is a revolution in smart manufacturing, based on the use of IoT to transform the whole real world into a digital world. This revolution has a powerful and comprehensive impact on the economy, society and the environment around the world and affects all sectors and areas with unprecedented technological breakthroughs speed in history, including accounting and auditing. Vietnam is integrating deeply into the world economy, and obviously, is not standing outside this global revolution.

According to Gartner, the Industry 4.0 (or the Fourth Industrial Revolution) derives from the term “Industrie 4.0” in a German government report in 2013. “Industrie 4.0” connects embedded systems and intelligent manufacturing facilities to create digital convergence between the industry, businesses, functions and internal processes.

If Gartner’s definition is confusing, Klaus Schwab, founder and president of the World Economic Forum, gives a simpler view of the Industry 4.0 as follows:

* Academy of Finance, VietNam, Corresponding author: 0989191962. E-mail address:nguyenbaminh2009@gmail.com

** Academy of Finance, VietNam

“The First Industrial Revolution used water and steam power to mechanize production. The Second used electric power to create mass production. The Third used electronics and information technology to automate production. Now, a Fourth Industrial Revolution is building on the Third, the digital revolution that has been occurring since the middle of the last century. It is characterised by a fusion of technologies that is blurring the lines between the physical, digital, and biological spheres.”

Followed by Klaus Schwab’s definition, the 4th Industry Revolution will take place on three main areas: Biotechnology, Digital and Physics.

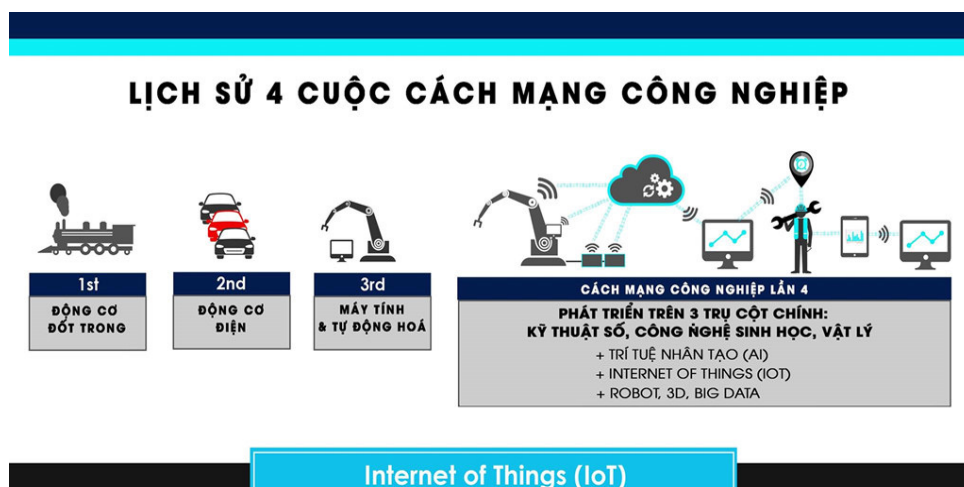

The core elements of Digital in Industry 4.0 will be AI, IoT and Big Data.

In the field of biotechnology, Industry 4.0 focuses on research to create leaps in agriculture, fisheries, medicine, food processing, environmental protection, renewable energy, chemistry and materials.

Finally, it is the field of physics with new robots, 3D printers, self-driving cars, new materials (graphene, skyrmions...) and nanotechnology.

Currently, the 4th Industry Revolution is taking place in developed countries like USA, Europe, part of Asia. In addition to the new opportunities, Industry 4.0 also pose challenges for mankind to face.

Specifically:

The 4th Industrial Revolution and the impact on accounting – auditing

Industry 4.0 provides opportunities as well as challenges for the field of accounting and auditing.

In the era of increasingly developed information technology, Industry 4.0, with the internet, helps accounting– auditing work not be limited by geographic distance. Accountants - auditors in Vietnam can perform accounting and auditing work in any countries in the world, if the individual, who performs the accounting and auditing work, is qualified to do so.

In contrast, any accountants - auditors in any countries that are permitted to practice in Vietnam can perform the accounting and auditing work for enterprises and organisations in Vietnam. This creates both opportunities and challenges, for those practicing accounting - auditing in Vietnam. It is necessary to improve our competence as well as our self-conditions so that we can meet the conditions of international practice, improve our position and broaden the scope of our practice.

Big Data gives people the access to an infinite knowledge base that helps people learn anything they need to know, but there are also limits which are informal information. It makes us cautious when accessing and using information.

In addition, there are many factors affecting Industry 4.0, in which, the factor affects greatly Industry 4.0 is artificial intelligence.

Many people think that artificial intelligence cannot replace humans but we cannot deny the threat of artificial intelligence. According to Elon Musk, founder of Tesla, artificial intelligence is what he calls an immortal dictator. This immortal dictator is a dark scenario for humanity's future if we do not control the research on artificial intelligence. In a recent AI documentary entitled "Do You Trust this Computer?", Musk said *"We are rapidly headed towards digital super intelligence that far exceeds any human, I think it is very obvious. [...] If a company or a small group of people manages to develop godlike digital super intelligence, they can take over the world"*.

With artificial intelligence, economists predict that many industries are at the risk of disappearance because of automation trend. And the fact that it happened; the development of artificial intelligence led to redundancy. In the world, McDonald's recently announced that it will build 25,000 new restaurants, mostly operated by robots and automation, that could cut hundreds of thousands of employees. And recently, the Foxconn Technology Group, which supplies components for Apple and Samsung, also announced that it would cut 60,000 workers and replace them with robots. As a result, many automated industrial sectors replace human and the skills requirements for workers will be high.

In Vietnam, the electricity industry will collect electricity bills completely through the transfer system or the form of collection with the support of internet banking, smart phone or other modern forms of payment. However, how to deal with the force of tens of thousands of employees who are doing the work of directly collecting monthly electric bills? These are great issues not only for the electricity industry in particular but also for the whole society.

In the field of accounting - auditing, artificial intelligence can replace manual accounting – auditing works such as collecting, processing and calculating data, but stages such as analysis, finding cause, giving solution for each specific situation cannot be replaced. However, to synthesize data and make financial decisions for the company, there is always a need for human participation. Although artificial intelligence cannot replace humans, it is changing the environment and the working context of accounting - auditing.

The trend in accounting – auditing areas in the era of Industry 4.0

All the above factors are creating new trends for accounting – auditing profession. According to the survey conducted by the Association of Chartered Certified Accountants (ACCA) on future professional accounting in 2016, that took place in 22 countries around the globe (including Vietnam): Regarding the trends expected to have the greatest impact in the next 3 to 10 years, up to 55% of respondents said that the development of automated accounting systems was rated the greatest impact among trends, in addition to trends such as accounting standards harmonisation (42%), penetration of cloud computing in business (41%), economic fluctuations (42%) ...

Accounting includes stages such as collecting, processing, analysing and providing information. All these stages can be replaced by machines. At this point, the accountant must be someone who understands technology and uses technology for his/her job.

Machines are artificial intelligence that can do what humans can hardly do. However, they are solely tools to support accounting – auditing works, operating under the inherent programming; they can hardly come up with verdicts, advices in each case arose especially with new and unprecedented situations.

In addition, accounting - auditing needs to follow certain legal norms; people are always needed with the update period for equipment as tools for their job. Artificial intelligence is a man-made product that

serves the purpose of human. Automation can change the circumstances and conditions of work, but it cannot be asserted that artificial intelligence can completely replace human in the field of accounting and auditing. It will also place higher demands on accounting: processing by computers, information security, data analysis and computer networks.

However, every individual and organisation working in the field of accounting - auditing must be aware of the importance of technology to apply it to suit the trend, save resources and increase working efficiency. ACCA has conducted many surveys. The results of the joint research show that in order to survive and develop in the digital age, future accountants - auditors need not only factors such as intelligence and emotional quotient but also need to be supplemented with necessary elements for career development such as technology skills, visions ...

ACCA's research report on future professional accountants – factors that lead to the change and future skills, which announced in 2016, also indicated that in the digital age, each professional accountant would be reflecting competencies and skills across 7 areas: professional skills and ethics, experience, intelligence, digital skills, creativity, emotional quotient, and visions.

Accounting development solution with Industry 4.0 in the new era

For individuals who have been and will be working in the field of accounting - auditing, there are two highlights in the digital age that every person must be aware of to change, namely, the technological ability and the ability to make judgments (visions); and a core factor beside professional competence is professional ethics.

When all the work can be handled by technology, professional ethics become more necessary than ever, so that it is possible to build and define the true image of enterprises. Only accountants with professional ethics and respect for the truth are able to create true value for shareholders so that shareholders continue to invest in enterprises. Only ethical auditors are able to help investors determine a direction that is less risky and has more opportunities, and help protect the legitimate interests of the public.

In order to take advantage of opportunities in the digital age, first and foremost, each accountant - auditor must be aware of the fundamental principle of any behaviours in the professional field to know whether the conduct is right or not in accordance with the standards and principles set forth, and must understand the most basic knowledge, then be able to advance to the higher knowledge in the process of becoming professional accountants – auditors.

In order to do this, people working in the field of accounting - auditing must understand the background of expert knowledge, improve experience, and frequently update the changes. In addition to that, it is necessary to maintain professional ethics, and put the public interest above self-interests. This will contribute to the formation and development of professional skills and ethics, experience and visions for accountants and auditors.

In addition, accounting and management accounting are also playing a growing role in the new trend, helping enterprises regulate business operations in both the present and the future. Thus, at the basic level, accounting works can be automated; enterprises also need people to examine, analyse and even make assessments for current and future financial situation. Depending on the level at which the employer pays his/her employees.

An accountant – auditor seizing opportunities, is someone who not only foster his/her professional skills, but also has the ability to use technology for his/her job, visions, professional ethics, creativity, sensitivity, and intelligence.

At this point, every existing and future accountant – auditor needs to cultivate the use of artificial intelligence (using technology) for his/her job from simple things such as excel functions to the accounting software, management and analysis software..., and the way to secure information for the enterprise itself and customers, thereby exploiting the customer market thoroughly. In addition, they need to cultivate knowledge, and apply the ability to recognise the problem of management accounting in enterprises, besides the trend of financial accounting as today. This is the field that helps increase the investment interests for the enterprise itself.

In addition, an indispensable means that help existing and future accountants – auditors reach beyond their range of activities is the international language. Particularly in the area of accounting and auditing, the language provides added value not only in communication but also in international professional knowledge.

Therefore, the opportunity will be expanded for accounting and auditing teams of international standards that are recognised in many countries around the world such as ACCA, CMA, CIA, CPA Australia. These certificates can help Vietnamese accountants – auditors maximise their scope of activities and enhance the competitiveness of human resources in the field of accounting and auditing in Vietnam.

For organizations providing accounting, auditing, financial consulting services, in the global trend, investment far beyond the national boundaries, it is required for professional accountant - auditor to have a vision, and to be able to evaluate the financial capacity honestly, keep investors interested in the enterprise. Financial consulting companies are forced to make changes so that they do not fall into disruption or be removed from the market when they do not exploit the value that the digital age brings forward.

Basic, easy-to-carry services, such as accounting services, providing financial information in the form of basic data, yields normal returns, but more advanced services such as providing financial analysis data, specialised consultancy... are sources of high profits for enterprises. Thus, globalisation, Big Data, the internet, technology is bringing a global market for enterprises operating in this field, especially for those that have international employees and service quality.

Conditions of implementation

On the side of regulatory agencies

The 4th Industrial Revolution requires regulatory agencies to prepare a better information technology (IT) infrastructure to keep pace with the technology, and ensure safety in the management of network security. Industry 4.0 has pushed up the level of information sharing, thus, creating a huge need for network security. Accounting and auditing regulatory agencies should pay special attention to build data backup centers, upgrade a security system at a high level and with multi-layer, and ensure that the expansion of the scope of activities is stable, safe, bringing long-term efficiency...

It is necessary to continually promote international cooperation, research and application of international accounting - auditing standards which are being used by countries in the world, thereby, learning and exchanging experiences in preparing for Industry 4.0.

On the side of accounting and auditing firms.

It is necessary to continually increase the number, size and quality of auditing services. Advanced training courses should be held so that auditors can catch up and adapt to IT applications and modern auditing tools in order to meet the increasing demands of the job. The auditors need to be trained and fostered to grasp the new audit trail and program set up on the technology and digital platform, and must be proficient in using auditing software, understand the processing process as well as how to synthesise accounting information, how to prepare and present financial statements in accordance with financial reporting standards in the context of digital technology.

On the side of higher education institutions

The 4th Industrial Revolution requires the educational programs, contents, and methods of bachelor's degree in accounting – auditing at the university to be fundamentally innovative. Educational institutions need to study and analyse the characteristics of this revolution so as to propose and recommend innovations in all aspects, especially the innovation in teaching methods. It is necessary to continually improve the quality of the curriculum with the knowledge that is associated with the development trend of Industry 4.0.

It is also essential to apply virtual accounting and auditing model about economic activities which is both simulated and skilful for students to practice. When software, electronic documents, electronic signatures, calculations, rotation and recording of information on available forms have been programmed and automated, it is necessary to step by step abandon accounting – auditing teaching method according to regimes as well as by manual processing.

On the side of accountants and auditors

Each accountant - auditor must be aware of the fundamental principle of any behaviours in the professional field, to know whether the conduct is right or not in accordance with the standards and principles set forth. In addition, they need to cultivate the use of artificial intelligence (using technology) for their job from simple things such as excel functions to the accounting software, management and analysis software..., and the way to secure information for the enterprise itself and customers, thereby exploiting the customer market thoroughly. Furthermore, it is needed to cultivate knowledge, and apply the ability to recognise the problem of management accounting in enterprises, besides the trend of financial accounting as today.

Therefore, globalisation, Big Data, the internet, technology is bringing a global market for enterprises operating in this field, especially for those that have international employees and service quality. Vietnam's accounting and auditing industry needs to make more efforts to take advantage of the opportunities, and overcome the challenges in the process of integration that has been going on and deepening for sustainable development in the future.

RASING TAX TREND TO STABILIZE STATE BUDGET

Phan Huu Nghi - Le Hung Son

Summary: *The 2011-2016 period, there are 13/63 provinces, cities under the central having abilities to do financial autonomy, 2017 this number has increased to 16 provinces, cities under the central. Governor`s budget revenues estimate of these 16 provinces has occupied 80% of budget revenues. The group of consumption taxes (value added tax, special consumption tax, environment tax, import tax) has made up 50% of budget revenues. Especially, when considering the structure of regular revenues and expenditures, it is able to see that the stability of state budget has the trend of decreasing, lacks sustainability. So increasing taxes in the next years is obvious trend but what taxes and how to increase?*

Key words: *State budget, taxes, regular revenues, regular expenditures*

1. SETTING THE PROBLEMS

In 2017, the Ministry of Finance showed the plan to increase the value added tax 2% more, which met the tensed reactions from public, finally the Government concluded not to raise value added tax permanently. In the early 2018, the offer to increase the environment tax to oil and gasoline more 1000 dong/1 liter can bring more than 15000 billion dong has met many contrary opinions, but almost disagreed, incoming there is the draft of asset taxes with the tax rate 0.3%-0.4% to houses having the value over 700 million dong or over 1 billion dong. Parallely, there are plans and drafts of changing six tax laws like extend the tax base : value added tax law, cooperate income tax law, personal income tax law, special consumption tax law, natural resources tax law and import-export tax law with the aim to extend the tax base to increase revenues for state budget according to international general rules. So what problems can be prioritized to be considered today with fixing tax writings?

Increasing tax is the result of increasing budgetexpenditures according to the rule “Extending the government”. Vietnam is not beyond the exception to other countries all over the world when budget expenditures increased faster 10%/year, 20% in some periods, budget expenditures` speed of increase is much faster than economy`s one (6-7%) as a result, it will put a burden on state budget: where can it be taken to sponsor expenditures ?

Especially, considering objectively, the stability of state budget has been very “weak” for a long time so when the economy comes into troubles, revenuesare decreased, limits are revealed. Specifically, basic rules in management are: regular revenues of state budget is generally higher than regular expenditures of state budget to set aside a small part of regular revenues for development investment expenditures. So governments make loans just for development investment expenditures, not for regular expenses and that is government bond tool or public debt but from many years ago, regular revenuesare just enough for regular expenditures, if decreasing income from crude oil, natural resources tax or reclaiming capital from cooperation, revenuesare still not enough for expenses, it means that governments have to make loans for regular expenditures.

2. SITUATIONS OF STATE BUDGET OVER YEARS

One rule mentioned in public finance field is: “extending government rule”. Extending here is not the territory, almost countries in the world extend government expenditures. In fact, the speed of increasing budget expenditures is very fast, absolutely and comparatively, speed of increasing budget revenues and expenditures is much faster than speed of the economy. From that fact, there is a question to be set: how to raise the limit of increasing budget revenues, expenditures at which appropriate levels? Numbers of state budget over years has shown:

State budget estimates in 2013-2017 (Passed by Congress)

Unit : Billion Dong

| Items | Targets | 2018's estimates | 2017's estimates | 2016's estimates | 2015's estimates | 2014's estimates | 2013's estimates |
|----------|--|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| A | Total balanced state budget revenues | 1.319.200 | 1.212.180 | 1.014.500 | 911.100 | 782.700 | 816.000 |
| 1 | Domestic revenues | 1.099.300 | 990.280 | 785.000 | 638.600 | 539.000 | 545.500 |
| 2 | Revenues from crude oil | 35.900 | 38.300 | 54.500 | 93.000 | 85.200 | 99.000 |
| 3 | Revenues from import- export | 179.000 | 180.000 | 172.000 | 175.000 | 154.000 | 166.500 |
| 4 | Revenues from aids | 5.000 | 3.600 | 3.000 | 4.500 | 4.500 | 5.000 |
| B | Total balanced state budget expenditures | 1.523.200 | 1.389.180 | 1.273.200 | 1.147.100 | 1.006.700 | 978.000 |
| | <i>In that:</i> | | | - | - | - | |
| 1 | Development investment expenditures | 399.700 | 357.150 | 254.950 | 195.000 | 163.000 | 175.000 |
| 2 | Expenditures for paying interests (from 2016 to the past including principals) | 112.518 | 98.900 | 155.100 | 150.000 | 120.000 | 105.000 |
| 3 | Regular expenditures | 940.784 | 896.280 | 823.995 | 767.000 | 704.400 | 658.900 |
| 4 | Additional expenditures for reserving financial funds | 100 | 100 | 100 | 100 | 100 | 100 |
| C | State budget deficit(2017 not including paying principals) | 204.000 | 177.000 | 254.000 | 226.000 | 224000 | 162.000 |
| | <i>Ratio deficit compared to GDP</i> | <i>3,7%</i> | <i>3,47%</i> | <i>4,95%</i> | <i>5,00%</i> | <i>5,30%</i> | <i>4,8%</i> |

Source: State Budget Department – Ministry of Finance

With the rule that budget revenues must always be higher than budget expenditures to spend a part for development investment expenditures, every year's state budget estimates are made to the rules. Based on numbers of state budget announced international in the latest 3 years, according to unaccounted estimates:

Structure of regular expenditures and regular revenues

(Numbers according to estimates announced international)

Unit: Billion Dong

| Items | Contents | 2015 | 2016 | 2017 | 2018 |
|-------|-------------------------------------|---------|---------|----------|-----------|
| 1 | State budget's regular revenues | 867.195 | 961.093 | 1144.631 | 1.227.750 |
| 2 | State budget's regular expenditures | 862.040 | 935.600 | 1004.030 | 1.091.403 |
| 3 | State budget's reserve expenditures | 25.000 | 29.300 | 25.000 | 32.097 |

Source: Ministry of Finance website

So over years regular expenditures have been almost equal to regular revenues; if adding obligatory reserve expenditures every year, then budget revenues will be less than total regular expenditures in some years. It means that state budget must go to make partial loans for regular expenditures, and 100% loans for development investment expenditures (especially 2015-2016).

However, the classification to items in regular revenues of Vietnam has been received lots of warnings from domestic and international researchersthat: There is a need to review the regular and irregular qualities of every items. Revenues from crude oil, from selling capitals from state enterprises, from environment tax about 30000 billion/year should not be classified into regular revenues. It is needed to set aside for development investment expenditures to make new revenues for the future, because these are unrenewable revenues, not having regular qualities like value added tax or lending lands and infrastructures... If splitting these revenues from regular revenue group, state budget need to be reviewed the stability as the definition above clearly, also the rule that revenues have to be higher than expenditures has not been followed anymore.

With the 2108 state budget estimate, total revenues of 16 provinces having contributions to state budget approximately 1 million billion (1.050.000 billion), especially 4 Mekong delta provinces have made up 541.000 billion, revenue estimates of Hanoi and Ho Chi Minh city are expected to bring about 611.000 billion for state budget in 2018.

According to calculations from researching state budget numbers over years, with the difficulties in finding new revenue sources for state budget in front of the force of increasing expenditures, short-term solution is loans and in advance is raising indirect taxes in the incoming times (such as value added tax, special consumption tax and environment tax), because these taxes primarily contributing state budget revenue have made up 50% of budget revenues.

While direct taxes and import-export taxed will be hard to have ability to increase because the general trend is competing tax among countries and integrating in economy. For example, the tax rate of value added tax in common maybe no more 10%, special consumption tax will raise in some items which have great incomes, environment tax to oil and gasoline will be raised and some revenues will be found such as asset tax.

3. REALITY OF TAX POLICIES AND REVENUES

| Items | 2018's estimate (billion) | 2017's estimate (billion) |
|--|---------------------------|---------------------------|
| State budget revenues and aids (I+II+III) | 1.319.200 | <u>1.212.180</u> |
| Regular revenue | 1.227.750 | 1.144.631 |

| | | |
|--|------------------|----------------|
| Tax revenues | 1.027.408 | 956.607 |
| Cooperation income revenue | 242.393 | 221.051 |
| Person income revenue | 96.869 | 80.977 |
| Non-agriculture land use tax | 1.303 | 1.180 |
| Registration fee | 32.270 | 26.069 |
| Value added tax | 355.158 | 337.315 |
| Special consumption tax | 102.681 | 89.477 |
| Natural resource tax | 29.818 | 26.781 |
| Agriculture land use tax | 13 | 27 |
| Export tax, import tax, special consumption tax and environment tax for imported goods | 91.000 | 132.310 |
| Environment protection tax | 48.804 | 17.420 |
| Revenue from lottery | 27.100 | 24.000 |
| Revenues from fees and revenue outside taxes | 200.342 | 188.024 |
| Fees | 35.243 | 28.270 |
| Lending lands | 21.294 | 12.427 |
| Others | 143.805 | 147.327 |
| Revenues from capitals (selling houses, land using fee) | 86.450 | 63.949 |
| Non-refundable aids | 5.000 | 3.600 |

Source: State budget department

According to these data, it can be seen that direct taxes (cooperation and person income tax) have the revenues about 338.000 billion, almost equal to revenues from value added tax after reducing tax refund. Revenues of direct taxes have the trend to grow in the long run in Vietnam.

Indirect tax including value added tax is 460.000 billion if not reducing 104.000 billion value added tax refund. If adding special consumption tax, environment tax and export-import revenues, it will occupy more than 50% of total state budget revenues. Experiences have shown that countries are always developing indirect taxes and the ratio of indirect taxes is always higher than that of direct taxes. Because indirect taxes are easy to be collected, managed, checked, they don't meet harsh reactions from taxpayers like direct taxes. Besides, developing countries will need capitals to develop so they will prioritize attracting investment, not concentrate on raising direct taxes. So raising indirect taxes is not only the obligatory trend but also the accurate trend to Vietnam.

To raise indirect taxes, what taxes should be concentrated on and how? Experiences in raising taxes have shown that if government want to raise tax, they will find the biggest, easiest revenues to raise, least to face reactions and find new revenues so in the indirect tax group, value added tax will be put into consideration first because if raising 1% on tax rate, revenues will raise at least from 32.000-40.000 thousand billion.

Next is special consumption tax with the current revenues is more than 100.000 billion, but in 16 groups of goods, services, there is a need to choose the high ratio revenue goods groups to raise tax and there are : beer, alcohol, tobacco, cars and gas and at the same time extend the tax base to soft drinks and sugar-containing products.

With special consumption tax, environment tax will be studied to raise, but about 97% of environment tax or 45.000 billion comparatively is oil and gas. So why raises more 1000 or maximum about 5000 dong/1 liter gasoline.

Export-import tax, cooperation income tax and person income tax check again in order to open tax base. Preventing price transfer will be considered to bring synchronization to integration.

Researching to enact asset tax law, this is a tax sooner or later will be needed to be published in order to support cooperation income tax. Because income can hide but assets are hard to hide. Moreover, asset tax belongs to direct tax, it is applied by almost countries in the world and a part of tax agreement having international quality when being negotiated to sign among countries. The problem in Vietnam is how to tax and how much is the tax rate to really create social balance heading adjusting incomes of the rich?

4. RECOMMENDATIONS

To head to a stabilized state budget, it need to be reviewed the structure of regular revenues and regular expenditures, raised controls and adjustments to indirect tax groups and concentrations in 16 provinces having contributions to state budget.

-For taxes:

+ Value added tax: Government needs to raise tax base according to the route to threshold of 14%. For example, 2020 is 1%, 2022 is 2% and 2025 is 4%, also review the lists of non-tax and 5% tax. Especially, Government needs to consider to apply tax exemption experiences or apply the 0% tax rate to goods like necessary food like meat, fish, vegetables and dairy products for children, the elder like many countries. Because this is the group of products affecting most to people having medium, low income in society.

+ Environment tax can be raised from 1000-2000 dong/liter of gasoline according to the route calculating the pace of price in planning raising tax phase. But research group does not offer to raise special consumption tax to cars because gasoline is used for cars, motorbikes. Because special consumption tax has 10% to gasoline already and added environment tax so it need to be kept stable or reduced special consumption tax to cars, also Vietnam's special consumption tax to cars is the highest in the area, some countries do not apply special consumption tax to cars.

+ Special consumption tax needs to add group of gas drink and sugar-having drink with the tax rate about 10%, estimated to have 4.800 thousand billion revenues. Also raising tax to beer and alcohol to 70-75% and tobacco to 80-85% according to the route.

+ Researching early the asset tax law taxing on housing at the level of progressive tax rate according to international practices, to insure equality in vertical way and to tax the rich, the tax base can be applied

Asset tax base (Expect)

| Tax levels | Tax base (asset value) | Tax rate % |
|------------|------------------------|------------|
| 1 | 0 – 1 billion | 0 |
| 2 | 1 – 3 billion | 0,1 % |
| 3 | 3 – 7 billion | 0,2 % |
| 4 | 7 -12 billion | 0,3 % |
| 5 | > 12 billion | 0,4 % |

+ Besides, quickly applying information technologies into tax management. Because the rate of loss in tax revenues of Vietnam is evaluated to be very high compared to area's by international organizations. The reason is the lack in managing the cash flows and the destinations of these flows. Information technologies in tax are still behind the times and cannot catch up with information technologies in banking and telecommunication. The data systems of selling goods at the end of the day of taxpayers are not computerized to be transferred back to the servers of tax authorities at levels of management ... While the Tabmis system has just helped a basic part of managing state budget expenditures.

+ Managing tax debts and preventing price transferring with preference in cooperation income tax which are needed to be enhanced will bring many thousand billions to state budget. Concentrating enhancement in managing revenues from 16 provinces having contributions to state budget group.

-For state budget expenditures

+ Needing to check and evaluate periodically the expenditure management mission (from distributing to disbursing and checking, controlling expenditures) in order to distributing effectively resources to limit the force of raising state budget expenditures therefore impact on raising state budget revenues. Now the evaluation, distribution, checking expenditure criteria are not clear, not evaluated well enough to be the base for budget management science, combined with the ability to forecast. If it is not good enough, it will be hard to perform midterm expenditure efficiency.

+ Promoting reform in administration procedures, reducing the government system. Because the salary of officers is a part occupying large proportion of state budget. Besides, there is a need to review public investment expenditures and exploit financial potentials from public assets, because public assets' value is much greater than twice of Vietnam's GDP and every year there is a need of regular expenditure in order to maintain, which is approximately high. Combining with the fact that managing capitals, assets at state enterprises needs to be really effective. If exploiting the source of public assets well, this will become a regular revenues for state budget in the long term.

Conclusion : with the fact that state budget has the need to have basic changes in operating state budget heading to a stabilized balance for both state budget and local budget, also enhance the economy to develop better, since then effect back on the tax system to hold the policy system to be stabilized, create conditions to develop the economy.

THE EXPERIENCES OF SOME ASIAN COUNTRIES IN ENHANCING COMPETITIVE CAPACITY OF EXPORTING WOOD PRODUCTS TO THE EUROPEAN MARKET AND POLICY IMPLICATIONS FOR VIETNAM

Nguyen Trong Nghia*, Tran The Tuan**, Nguyen Huu Dung***

ABSTRACT: Wood and wood products are one of the key export items of Vietnam, with export turnover of the industry rising to the top of Southeast Asia, second in Asia and fifth in the world (2017 \$ 7.66 billion). Until 2018, Vietnam's wood and wood products are sold in 120 countries and territories in the world, with five main markets being the United States, China, Japan, the EU and Korea. However, of more than 7 billion USD in exports of wood and wood products of Vietnam, the EU market accounted for more than 700 million USD while the potential of the EU market is quite large. Therefore, the study of the experience of some countries such as China, Malaysia and Indonesia is necessary to help Vietnam boost export turnover of this product to the EU. In addition, these countries have good market policies, product development policies, creating long-term supply assurance. This is a valuable experience for Vietnam to look forward to sustainable development for the export of wood and wood products in Vietnam in the coming time.

Keywords: wood and wood products, EU, EU market, Vietnam

1. INTRODUCTION

Since Vietnam integrated into the world economy, the wood processing industry in Vietnam has achieved enormous achievements, especially from the year 2007 to now, when Vietnam became an official member of the World Trade Organization (WTO). This is reflected in the fact that annual export growth always reaches 2 digits during the period 2010-2015. In addition, Vietnam's wood processing industry has increasingly diversified its products for exported wood products are just raw products (logs, sawn timber). However, the competitiveness of Vietnamese wood products exported to the EU market is still limited, so the output and value of Vietnam's wood exports are still lower than those of China, Malaysia, Indonesia, Vietnam should learn lessons from the export of wood from these countries.

2. OVERVIEW OF WOOD EXPORT VALUES OF VIETNAM AND SOME COUNTRIES IN THE EU MARKET

To have a comprehensive view on enhancing the competitiveness of Vietnam's export wood products in the EU market since Vietnam joined the WTO, in addition to the analysis based on the following criteria: Export turnover, market share, exporting price, quality, brand. For each criteria, there are comparisons with direct competitors in Vietnam such as China, Malaysia, Indonesia. By comparing the export value of wood

* Dr, University of Finance and Business Administration, Hung Yen, Vietnam

** Dr, University of Transport Technology, Ha Noi, Vietnam.

*** MA, University of Finance and Business Administration, Hung Yen, Vietnam, Corresponding author: Nguyen Huu Dung. Tel.: +84912644087, E-mail address: huudungkh@gmail.com

and wood products in Vietnam and other regional competitors into the EU market. Therefore, it is necessary to draw lessons from other countries in the region so that there will be solutions to improve the competitiveness of Vietnamese wood products exported to the EU market by the government and wood product processing and exporting enterprises.

Figure 1. Export turnover of wood and wood products of Vietnam and some direct competitors in the EU market in the period of 2006-2015.

(Source: Data collected by the author on Trademap, 2015)

Compared with direct competitors: China, Malaysia and Indonesia finding that the period 2006-2015 was like Vietnam, the export turnover of timber and wood products of all three countries to the EU market gained. unstable growth (see Figure 1.1).

+ In the period 2006-2008, while both Vietnam, China and Malaysia both had impressive export growth and reached a record export turnover in 2008, Indonesia had a sharp decline when it reached only \$ 797.4 million. For example, China's wood products export turnover to the EU market reached \$ 4.077 billion, while Malaysia reached \$ 403.8 million.

+ In terms of the longest continuous decline, Malaysia has the longest continuous decline in export turnover from 2008 to 2013, export turnover in 2013 reached only a half over the year. 2008. The reason is that the cost of producing wood and wood products from Malaysia is increasing, leading to high exporting prices. At the same time, the Malaysian government has forced wood processing enterprises to use the input wood material with the legal Certificate of origin. This led to a sharp fall in timber producing and processing.

+ In terms of the largest decrease in export turnover, Indonesia was the country with the largest decrease in export turnover in the period 2006-2015 to the EU market, the country's export turnover in 2015 reached US \$ 382.1 million, down 56.73% from 2007, followed by Malaysia down 48.53% and China was the country with the lowest decline of only 4.8%.

+ In terms of export value, China is the largest exporter of wood products to the EU market in the period 2006-2016. In 2006, China's exports totaled \$ 2.585 billion, 4.19 times higher than that of Vietnam, 8.1 times higher than that of Malaysia and 3.25 times higher than that of Indonesia. By 2015, this gap has narrowed when the export value in 2015 reached \$ 3.526 billion, 4.5 times higher than that of Vietnam, but the gap widened for Indonesia with 9.23 times. times and especially for Malaysia, this gap reached 17.27 times. This shows that Vietnam is improving its competitive capacity against its strongest competitor, China, while Malaysia and Indonesia are lagging behind. Alone for Indonesia as the largest exporter of ASEAN wood products to the EU market from 2007 and earlier, since Vietnam's accession to the WTO, its competitive capacity has significantly improved, surpassing Indonesia to become ASEAN's largest exporter of wood and wood products to the EU market from 2007 to now. In order to provide appropriate measures and policies to improve the competitive capacity of wood products in the international market in general and in the EU market in particular, the review and learning experiences of some leading countries and strength in enhancing the competitive capacity of wood products to the EU market is very necessary.

3. LESSONS DRAWN FROM SOME ASIAN COUNTRIES

3.1. Chinese experience

China has rapidly become the world's largest exporter of wood products in terms of value and the second largest one behind the United States in terms of imports in 2007. China's forests now meet only a small fraction of the demand. for consumption of input materials of the domestic wood industry. Currently, Chinese wood products are mainly exported to big markets such as USA, EU, Japan Of which, the EU market is one of the key export markets for Chinese wood products. China and China is the largest exporter of wood products to the EU market, both in terms of value and volume. China's market share of wood products accounts for 20% in the EU market. In order to gain such achievements, China has implemented very effective policies and strategies to improve the competitive capacity of its export wood products. This is shown as follows:

In order to meet the domestic demand for wood and to create stable material areas, early in the 1980s, the Chinese government made adequate investments in sustainable forest research and development. China has also promoted an ambitious national forest plantation program while maintaining strict control on illegal forest destruction in the country. As a result, China's forest cover increased from 157 million hectares in 1990 to 197 million hectares in 2005. for recent years realizing an increase in the trend of EU consumption of wood products with their sustainable forest origin. China's wood product processing and exporting enterprises have sought and invested in developing countries with abundant forest resources such as Vietnam, Laos and Myanmar. In addition, in order to ensure stability of inputs for the wood industry, China has reached an agreement with the governments of countries with abundant wood resources, has bought the rights to exploit wood legally in the forests with forest certificates and wood materials must have clear certificate of origin. Namely, China has imported wood from Russia, China annually imports 19.2 million m³ of timber from the country. In addition, since 2003, Chinese wood companies have signed contracts to exploit more of the forests in Germany and export back to the Chinese market about 50,000 m³ of sawn timber valued at \$ 7.5 million. Since that time, more and more Chinese wood companies have come to Germany to sign wood purchase agreements.

In addition, China established a wood processing zone at home to exploit the forest. For example, China has become the first overseas wood processing zone in Russia under an agreement between 18

wood processing companies in Wenzhou City, China, with the Russian government. According to the above project, the industrial zone has an investment capital of US \$ 81 million with an output of 1.5 million m² of timber, mainly sawn timber, grafted wood and pressed wood products. The project is known to be one of six overseas industrial parks funded by the Chinese government. The Ministry of Commerce and the Ministry of Finance of China provided a loan of 200 million yuan (\$ 25 million) to the 18 companies above.

In order to limit anti-dumping lawsuits from the EU, the Chinese government has assigned local chambers of commerce to disseminate knowledge about this field. For example, the Guangdong Chamber of Commerce and Furniture Association held a workshop on a discussion on countermeasures against European anti-dumping investigations of wooden furniture in order to raise public awareness of furniture exporter of the province.

To ease the competitive pressures, the Chinese wood industry for flooring has launched a marketing campaign to encourage consumers to use real flooring instead of using other flooring materials.

China has also established large-scale production centers very early. Following the policy of market reform and opening, China's wood furniture industry started to develop strongly with leading manufacturing centers such as Guangdong, Zhejiang, Northeast area, China South area and there are now 4 more manufacturing regions which are newly established including the Southern Furniture Industrial zone, located between Guangdong and Fujian; Eastern wood Furniture Industrial Zone, located in the center of Zhejiang, Jiangsu and Shanghai; The Northern wood Furniture Industrial zone, located between Beijing, Tianjin, Hubei and Shandong; and the Northeast wood Furniture Industrial Zone, located between Shenyang and Dalian.

The Chinese government is trying its best to improve the rural economy by accelerating the speed of urbanization, aiming at consumer markets and stimulating consumer demand of people. The above solution will clearly stimulate demand for housing construction and the development of related industries. The construction of housing participating in market as a kind of goods has facilitated the development of the wood furniture industry. Although China's local wood furniture manufacturing industry has a trend of enterprise centralization, medium-sized wood enterprises account for a majority and the level of concentration is low, as up to now there have not been any enterprises, which accounts for over 1% of the market share. This, on the one hand, will create opportunities for large businesses, but on the other hand it will lead to the bankruptcy of small companies and companies with ineffective management.

The Ministry of Commerce and the General Department of Taxation jointly issued a circular on the collection and refund of value-added tax (VAT) on scrap wood and furniture wood. This Circular encourages the utilization and exploitation of all wood sources and applied to scrap wood, including by-products from timber trees (eg branches, bark, leaves, roots, etc.) and scrap wood in processing (wood bars, by products from, bamboo, sawdust, broken wood, wood cores, etc.). wood furniture waste includes secondary wood logs with bad quality, small diameter timber and logs with less than 2 m in length and less than 8 cm in diameter. The decision also requires taxpayers to ensure that quality products meet standards before applying VAT refund.

With the support of the government, investments in factories and transportation contributed to the strong development of manufacturing sector of the high value wood products, especially wood furniture. In the past, wood export turnover of China is estimated to grow at an average of 34% per year. China has become the largest supplier of wood furniture to the EU market. The advantage for the Chinese wood

furniture industry is that cheap labor, offsetting the rise in raw material costs, energy and transportation costs. However, competition for cheap Chinese wood products has also led to an increase in trade disputes. Many EU wood suppliers have filed complaints against China's wood exporters.

3.2. Experience of Malaysia

For a long time, Malaysia was the number one country in South East Asia in exporting wood products to the international market in general and to the EU market in particular, in 2013, Vietnam surpassed Malaysia to become the number one wood product exporter. Malaysia's wood processing and export industry has been employing more than 300,000 employees at 1,202 enterprises, contributing an annual amount of about \$ 7 billion to the Malaysian economy. Wood products are one of the five key export items of Malaysia to the international market in general and the EU market in particular.

Malaysia is the largest world timber and log exporter and the second largest exporter of plywood; ranked 10th in export of wooden furniture. Malaysia's strength is abundant in forest resources, so Malaysia can be self-sufficient in its source of raw materials. However, this country is limited in human resources and high labor costs, but thanks to proper development strategies for the wood processing and export industries, Malaysia has become one of leading exporters of wood products in the world.

3.3. Indonesian experience

Indonesia's wood furniture sector is ranked third in Southeast Asia, behind Vietnam and Malaysia. Export revenue reached \$ 3 billion in 2014, recovering from the global recession, lasting for years and affected by the decline of western markets. Recovery is the result of new government regulations that help improve the quality of wood furniture by legalizing the source of timber and logs.

The Indonesian Ministry of Industry aims to strengthen the structure of the wood furniture industry and reduce the cost of input materials for wood furniture production in order to increase the competitiveness of the exporting wood industry. Therefore, the Indonesian Wood Furniture and Handicraft Association has announced a strategy to improve the competitiveness of the wood furniture industry, the need to reduce the cost of all input materials to producers, especially the cost of accessories and completing costs.

4. LESSONS DRAWN FROM THE EXPERIENCE OF ENHANCING THE COMPETITIVE CAPACITY OF EXPORTING WOOD PRODUCTS

4.1. Lessons drawn from China's experience in improving the competitive capacity of exporting wood products

Firstly, to stabilize the input materials for the wood industry. For this problem, the Chinese government has proposed a strategy for stabilizing the wood material for timber production. This is an important factor contributing to the success of the Chinese wood industry compared to competitors such as Vietnam, Malaysia.

Secondly, the establishment of overseas wood processing zones right in the country exploiting wood materials to save costs.

Thirdly, in order to concentrate the largest resources and create linkages in the timber industry, the Chinese government has established large timber product production and export centers in the advantageous provinces.

Fourthly, the government through the Ministry of Commerce, Ministry of Finance, General Department of Taxation, through tax collection and value-added tax (VAT) refund on scrap wood to stimulate enterprises to exploit and use raw wood materials effectively. Value-added tax refunds to encourage the utilization of wood

wastes as by-products from timber trees (eg branches, bark, leaves, roots, etc.) and scrap wood in processing (wood bars, by products from, bamboo, sawdust, broken wood, wood cores, etc.). wood furniture waste includes secondary wood logs with bad quality, small diameter timber and logs with less than 2 m in length and less than 8 cm in diameter. The decision also requires taxpayers to ensure that quality products meet standards.

Fifthly, governments, wood and forestry organizations and associations, enterprises should cooperate with other international organizations to implement marketing campaigns to drive consumption to export markets.

Sixthly, agencies, organizations and businesses should be well prepared to deal with anti-dumping lawsuits of countries. Organize workshops, meetings to raise awareness for businesses.

4.2. Lessons drawn from Malaysia's improving competitive capacity of wood products

First, like China, Malaysia has also identified a strategic vision for wood material sources from early on. Being a country with abundance of forest resources, Malaysia does not exploit massively for export but its exploitation is based on a well planned plan. Forest plantations are developed to make up for in time the exploited forests. Therefore, Malaysia not only has a very stable source of raw materials for producing wood products, but also exports a lot of raw wood materials to the world market in general and the EU market in particular. However, due to the EU requirement for timber certification for tropical wood products, the Malaysian Timber Certification Council (MTCC) was established in 1999. Accordingly, all companies, organizations Certified by the MTCC must meet the standards of the MTCC and be allowed to use the MTCC logo as a guarantee that timber materials exploited from forests certified by the MTCC in a sustainable manner. This is also Malaysia's strength when the world trends in general and especially the EU market in particular increasingly require the use of wood products from sustainable plantations. In addition, Malaysia is also trying its best to prevent the illegal export of timber, not allowing the precious wood material source to be illegally consumed, affecting the processing and export of the country. This is a reference point for Vietnam to improve its competitive capacity of wood products to the EU market.

Secondly, sign a voluntary partnership agreement in accordance with the law of forest protection of the exporting country to prevent illegal wood product production and to create a competitive advantage over other countries exporting to that market.

Thirdly, Malaysia has many restrictions on labor and high labor costs, so the government has invested and developed wood processing technology. Improving the level of wood product processing technology reduces the dependence on workers, turning the weakness into strengths. Most of Malaysia's wood processing plants are equipped with modern technology lines from Italy and Taiwan. As a result, Malaysia's wood products are very uniform and of stable quality, giving them a competitive advantage over regional competitors such as Vietnam and Indonesia.

Fourthly, it is important to focus on the value chain to remain competitive capacity in the international market, so designing, model improvement and creativity increasing are to create high quality wood products and trademark registration for the product becomes the designer with its own brand.

Fifthly, the Malaysian government has special policies to protect the wood furniture production industry, such as applying a competitive exchange rate policy to the dollar and applying taxes to foreign workers who work in this country for more 3 years to help this production industry maintain its competitiveness and growth. At the same time, the Malaysian government is trying to provide low-interest loans to businesses to help them increase their forest coverage area.

Sixthly, Malaysia considers the wood processing and exporting industry as a key exporting sector. Therefore, the country will soon have export promotion activities and build brands for wooden furniture right after entering the world furniture export market. In particular, the Malaysian government uses incentives to promote the export of wood products through: no export taxes on raw wood products, logs, plywood, wood to create a mold, except for timbers with 15% tax rate. The Malaysian government has set a timber export quota of 5 million cubic meters per year, and has abolished log export quotas from the year 2002.

The solutions above adopted by the Malaysian Government are the valuable lessons drawn for Vietnam in enhancing the competitive capacity of wood products exported to the international market in general and the EU market in particular.

4.3. Lessons drawn from Indonesia's Enhancement Competitive capacity of Wood Products

Indonesia has become the first country to be exempted from monitoring operations to ensure that wood source is used in products comply with EU regulations in the Asian region, resulting in a huge boost to export to European markets in particular and other markets in general. Indonesia basically has similarities in climate with Vietnam, China, Malaysia. However, Indonesia's access to export market for wood furniture is quite different

- First; Indonesia has implemented the legal system of origin of wood and national timber products under the name (SVLK,) in order to meet the FLGT certification of the EU market, thereby Indonesia's timber export volume and value have grown significantly over the last few years. Indonesia's export value of wood products has increased to \$ 10.6 billion in 2015 after the SVLK standard is launched in 2013. Currently the forestry sector accounts for 1% of Indonesia's GDP.

Secondly, Improvements in design, such as finding out to produce more durable wood furniture, will become important factors. This should be noted along with supervision of illegal export activities that have hindered the timber industry for a long time. Thus, changing the design of wooden products and wood furniture of Indonesia is an important step, determining the growth of Indonesia's wood export sector to the EU market.

Thirdly, Indonesia expressed its clear commitment that in 2011 Indonesia ended FLGTVPA negotiation and signed in 2013, until 2016, FLGTVPA came into effect. This said that the Indonesian wood and forestry sector realized the competitiveness of the wood exporting sector from countries in the region.

5. IMPLICATIONS FOR VIETNAM

By analyzing the lessons drawn from enhancing the competitive capacity of exporting wood products of some countries such as China, Malaysia and Indonesia, these countries are known to consider the EU as a key market in exporting wood products. Each country has its own challenges and policies consistent with the circumstances and potentialities to enhance the competitive capacity of wood products in this difficult market. The policies and practices of China, Malaysia and Indonesia in improving the competitive capacity of exporting wood products have suggested some implications for Vietnam in enhancing its competitive capacity of wood products in the EU market as follows:

Firstly, it is necessary to develop a stable and sustainable wood raw material area. This is proved in China, Indonesia and Malaysia, when these countries have developed policies and methods to develop wood raw material areas in a stable and sustainable way so as to be active in production, reduce production costs and prices. For China, in the 80s of the 21st century, the Government has made adequate investments in sustainable forest

research and forest plantation planning at the same time implementing a national program of afforestation while maintaining a policy of tightening management of illegal timber exploitation in the country.

In addition, in order to ensure stability of inputs for wood industry, China has reached an agreement with the governments of countries with abundance of wood resources, buying the rights to exploit timber legally in the forests which has forest certifications and wood raw materials have a certification of origin. For Malaysia, despite a abundance of forest resources, Malaysia does not exploit massively for export and the wood exploitation is based on a well-planned plan. In addition, the Malaysian Government established the Malaysian Timber Certification Council (MTCC) to manage and license wood exporters to the international market in general and to the EU market in particular. This is a very good idea for Vietnam to establish stable and stable wood raw material areas.

Second, science - technics and new technologies must be invested in processing and production of wood products, so wood products will have more diversification, reducing costs and lower prices at the same time quality of wood products will be improved and meeting the increasing demand in the EU market. Realizing the importance of science and technology in enhancing the competitive capacity of Chinese exporting wood products, Malaysia has significant investment in processing and wood production technologies such as Most of the Malaysian exxporting wood processing and production factories have imported advanced technologies from Italy and Taiwan, while China has considered investment in technology in the wood industry as an important point to create a absolutely competitive advantage of China's export of wood products to the international market in general and the EU market in particular.

Third, there must be special mechanisms and policies to support the development of the timber industry. According to Chinese experience, the government through the Ministry of Commerce, the Ministry of Finance and the General Department of Taxation, through value added tax (VAT) collection and refund on scrap wood to stimulate enterprises to exploit and use wood material effectively. For Malaysia, the government has adopted a number of special policies, such as a competitive exchange rate policy with the dollar or a tax policy for foreign employees operating in the country for more three years. to help the industry maintain competitiveness and growth; Providing preferential credits to wood processing and manufacturing enterprises. Special supporting mechanisms and policies from the government have helped Chinese, Indonesian and Malaysian timber processing and manufacturing enterprises to increase the competitive capaccity of the EU market.

Fourthly, it is necessary to carry out diversified and effective trade promotion programs. Trade promotion activities will advertise trademark of exporting wood products of countries in importing markets; raise the awareness and demand of markets for exporting wood products, thereby the competitive capacity of wood products for export has improved. China has been very successful in promoting trade for wood products. The Chinese government not only promotes trade promotion through state promotion units, industry associations, commercial counselors in EU but also through the policy of encouraging overseas Chinese in the EU to promote the promotion of Chinese wood products through cultural exchanges and, especially, the widespread distribution channel system. of the overseas Chinese in the EU market. This is a good suggestion for trade promotion activities of wood products of Vietnam in the EU market.

DIVIDEND POLICY AND STOCK PRICE VOLATILITY

Dinh Bao Ngoc* - Nguyen Chi Cuong**

ABSTRACT: *We investigate the impact of dividend policy on the stock price volatility in the context of Vietnam. The panel data derived from 108 listed companies in Vietnam during the period from 2008 to 2015 (809 observations) is analyzed by using Fixed Effect Model (FEM) and Random Effect Model (REM). The results indicate a significantly negative relationship between payout ratio (PAYOUT), dividend per share (DPS) and stock price volatility, and a positive relationship between dividend yield (DY) and stock price volatility of the companies.*

Keywords: *Dividend policy; stock price volatility; panel data; Fixed effect model; Random effect model.*

1. INTRODUCTION

Reaction of stock price to the dividend policy is a debate topic during the last several decades. In terms of the relation between the dividend policy and the firm value, there are two conflicted theories which are dividend irrelevance and dividend relevance. According to the dividend irrelevance theory developed by Miller and Modigliani (1961), there is no relation between the stock value and the dividend policy in the perfect market. However, the bird-in-the-hand theory presented by Linter (1956) and Gordon (1963) argues that shareholders prefer receiving dividend payments rather than uncertain capital gains in the future. The payment of dividend would create the value for the shareholders; hence the dividend policy possibly affects the firm value. In addition, several previous empirical studies about the relation between the dividend policy and the stock price volatility have been conducted and shown different results.

In this research, we analyze the influence of cash dividend policy on the stock price volatility of firms in Vietnam which has not much been considered previously. We use price volatility as a dependent variable to see the effect of cash dividend policy on stock price over the long run period.

2. LITERATURE REVIEW

Although study of the dividend policy has attracted considerable attention of finance experts and economists for more than a half century, the main contradictory approaches of dividend policy impact can be briefly summarized in two theories: the dividend irrelevance theory proposed by Miller and Modigliani, (1961) and the dividend relevance theory proposed by Graham and Dodd (1951). Moreover, some of other arguments including the information content of dividends (signaling), efficient market hypotheses, the clientele effects, and the agency cost hypotheses can be also used to explain corporate dividend behavior.

One of the most important theoretical studies about the impact of the dividend policy on firm value was firstly proposed by Miller and Modigliani (M&M) in 1961. They indicated that under certain assumptions of perfect capital markets and rational investors, a firm's dividend policy does not affect its value, i.e., the

* Faculty of Finance, University of Economics, The University of Danang, Vietnam.

** Department of Accounting, Economics & Finance, College of Business, West Texas A&M University, Canyon, TX, U.S.A.

dividend policy would be irrelevant. Instead, the value of firms is estimated based on the capitalized value of their future earnings and it does not matter that the firms pay dividends or not. In other words, the firm value is determined by the income generated from the investment decisions of a firm. M&M mentioned that the pre-existing dividend clientele effect hypothesis probably determines the dividend policy under certain conditions. They also argued that these imperfections might cause investors to choose securities that reduce costs and supposed the tendency of investors to be attracted to a certain type of dividend-paying stocks a “dividend clientele effect”.

Other empirical studies including Black and Scholes (1974), Miller and Scholes (1978, 1982), Chen et al. (2002), Adefila et al. (2004) and Uddin & Chowdhury (2005) have been done to support the M&M theory. However, this theory also received strong criticism from different studies conducted by Ball et al. (1979), Baker et al. (1985) and Baker and Powel (1999) since the theory strongly relied on unrealistic assumptions.

An alternative view which needs to be considered is that the dividends affect firm value. Indeed, the bird-in-the-hand theory developed by Linter (1956) and Gordon (1959) showed that in a world of uncertainty and imperfect information, dividends are valued differently to retained earnings (or capital gains). For risk-averse investors, shareholders are more likely to prefer a higher dividend payment in the present rather than uncertain capital gains in the future since “a bird in the hand is worth two in the bush”. Indeed, a high dividend payout ratio would reduce the cost of capital associated with an increase in firm value. The empirical studies which support the bird-in-the-hand theory consist of Bhattacharya (1979), Travlos et al. (2001), Baker et al. (2002), Mayers and Frank (2004), Dong et al. (2005) and Maditinos et al. (2007).

The asymmetric information between the managers and the shareholders is also a hypothesis for an inadequate dividend irrelevance hypothesis of M&M. It is likely that the dividends have implicit information about a firm’s prospects and convey this information to the market. This proposition has been considered as the “information content of dividends” or the “signaling hypothesis”. The announcement of increased dividend is good news leading to higher share prices. On the other hand, the announcement of decreased dividend causes unfavourable prospects which tend to reduce share prices. More details about the dividend signaling models can be found in John and Williams (1985), and Miller and Rock (1985).

Several empirical studies have been carried out to examine the effect direction of the dividend payments on the stock price fluctuation and showed different results. Indeed, Friend and Puckett (1964), Basin (1989), Nishat and Irfan (2003), Nazir et al. (2010) and Asamoah (2010) found that there is a positive correlation between dividend and share price volatility. However, the results obtained by Fama and French (1988), Ohlson (1995) and Hussainey et al. (2011) indicated a significantly negative relation. On the other hand, Allen and Rachim (1996) and Rashid and Rahman (2008) claimed that no evidence of the impact of dividend yield on price volatility was found. In Vietnam, Vinh (2014) investigated the correlation between dividend policy measured by payout ratio and dividend yield and firms’ stock price volatility by using panel data regression methodology. The data of 103 listed firms in Vietnam in the period 2008-2012 showed a significant correlation between dividend policy and stock price volatility.

3. DATA AND METHODOLOGY

We analyze the long-run impacts of cash dividend policy on stock price volatility. Based on the sample consisting of 403 listed companies in Vietnam, we decide to select the companies that had paid

cash dividends continuously during the period 2008 to 2015. As a result, a panel data derived from financial statements of 108 listed companies in Vietnam during the period from 2008 to 2015 (809 observations) is utilized (unbalanced panel data) for this study. This data was collected from the annual reports of companies listed on the Vietnamese Stock Exchange. The stock prices were obtained from the website www.cafef.vn and www.stockbiz.vn. (Following Muhammad et al., (2011), firms in the financial sector or services sector have been excluded).

We investigate the relationship between dividend policy and stock price volatility by using estimation models which are Pooled OLS, Fixed Effect Model (FEM), Random Effect Model (REM). The regression model can be designed as follows:

$$PV = C + \beta_1 * \text{PAYOUT} + \beta_2 * \text{DY} + \beta_3 * \text{DPS} + \beta_4 * \text{EPS} + \beta_5 * \text{ROA} + \beta_6 * \text{GROW} + \beta_7 * \text{SIZE} + \beta_8 * \text{CAP} + u$$

The Breusch-Pagan test and the Hausman test are used to determine which model is more reasonable. Finally, in order to increase the significance of the results, we estimate the regression model with robust option.

Measurement of Variables

Price volatility which is a statistical measure of the dispersion in stock returns is set as the dependent variable. Two proxies of the dividend policy which are the dividend yield and dividend payout ratio are used as the explanatory variables:

Dependent variable: *Price volatility (PV)*: Price volatility indicates the degree of change in the price of a stock over time. High price volatility shows that a stock value can theoretically span to cover a large range of values, meaning that the stock price can change significantly within short time horizon in either direction.

Following Parkinson (1980), price volatility can be measured by using the following formula:

$$PV_i = \sqrt{\frac{H_i - L_i}{\left(\frac{H_i + L_i}{2}\right)^2}}$$

Where: H_i and L_i are the highest and lowest stock price during the period i .

Independent variables: Three proxies of the dividend policy which are the dividend payout ratio, dividend yield and dividend per share are used as the explanatory variables. The other variables of the regression model are presented in the table below.

Table 1. Definition of variables

| Variables | Code | Measurement | Related empirical studies |
|------------------------------|--------|---------------------------------------|--|
| Explanatory variables | | | |
| Dividend Payout Ratio | PAYOUT | Dividends / Net Income | Allen & Rachim (1996), Pani (2008), Rashid & Rahman (2008), Khan (2011), Khan (2012), Nishat & Irfan (2003), Vinh (2014) |
| Dividend Yield | DY | Dividends Per Share / Price Per Share | Rashid & Rahman (2008), Nishat & Irfan (2003), Habib (2012), Vinh (2014). |
| Dividend Per Share | DPS | Dividends / Total Shares | Nazir et al. (2010), Asamoah (2010), Khan (2012). |
| Control variables | | | |
| Earn Per Share | EPS | EPS | Baskin (1989), Allen & Rachim (1996), Adefia et al. (2004), Khan et al. (2011). |

| | | | |
|-------------------|------|-----------------------------|---|
| Profitability | ROA | Return/ Total Asset | Allen & Rachim (1996), Nishat &Irfan (2003), Rashid & Rahman (2008), Vinh (2014) |
| Firm's growth | GROW | Growth in Revenue | Rashid & Rahman (2008), Habib (2012), Vinh (2014) |
| Firm Size | SIZE | Log ₁₀ (Revenue) | Rashid & Rahman (2008), Nazir et al. (2010), Asamoah (2010), Vinh (2014), Hussainey (2011). |
| Capital Structure | CAP | Debt / Total Asset | Rashid & Rahman (2008), Nazir et al. (2010) |

4. EMPIRICAL RESULTS

4.1. Descriptive Statistics

The descriptive analysis in table below shows the mean, standard deviation, minimum, and maximum values of the variables. It is useful to mention that in order to limit the impact of outliers in the sample, we reduced and winsorized the number of extreme observations.

Table 2. Descriptive Statistics

| Variable | Number of Observations | Mean | Standard Deviation | Minimum | Maximum |
|--------------------------|------------------------|-------|--------------------|---------|---------|
| PV | 769 | 0.722 | 0.357 | 0 | 2 |
| PAYOUT (%) | 769 | 52.59 | 29.24 | 0 | 179 |
| DY (%) | 769 | 13.81 | 12.67 | 0 | 119 |
| DPS (thousands VND) | 769 | 1.761 | 1.393 | 0 | 22 |
| EPS (thousands VND) | 769 | 2.882 | 2.882 | -8.65 | 20.59 |
| ROA (%) | 769 | 10.33 | 10.56 | -0.32 | 170 |
| GROW (%) | 769 | 16.28 | 35.91 | -100 | 342 |
| Log ₁₀ (SIZE) | 769 | 5.794 | 0.659 | 4.24 | 7.35 |
| CAP (%) | 769 | 44.45 | 23.08 | 4 | 94 |

Table 2 shows that the price volatility has a value ranging from 0.0 to 2.0 with mean value of 0.722 and standard deviation of 0.357. This indicates that the degree of change in the price of different listed companies in Vietnam is totally different.

The correlation analysis results are shown in table 3. Our results imply that there is no multicollinearity among the independent variables in the regression model.

Table 3. Correlation matrix

| | PV | PAYOUT | DY | DPS | EPS | ROA | GROW | SIZE | CAP |
|---------------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| PV | 1 | | | | | | | | |
| PAYOUT | -0.11 | 1 | | | | | | | |
| DY | 0.18 | 0.29 | 1 | | | | | | |
| DPS | -0.08 | 0.29 | 0.46 | 1 | | | | | |
| EPS | -0.14 | -0.16 | 0.08 | 0.63 | 1 | | | | |
| ROA | 0.03 | -0.14 | 0.21 | 0.51 | 0.56 | 1 | | | |
| GROW | 0.05 | -0.11 | 0.03 | 0.02 | 0.10 | 0.09 | 1 | | |
| SIZE | -0.19 | -0.09 | -0.14 | 0.05 | 0.11 | -0.08 | 0.15 | 1 | |
| CAP | -0.01 | -0.07 | -0.06 | -0.23 | -0.23 | -0.46 | 0.11 | 0.44 | 1 |

Table 4 reports the results of the regression analysis based on the Pooled OLS, Fixed Effect Model (FEM), Random Effect Model (REM).

Table 4. Regression Results and model tests

| Dependent Variable: PV | Regression Models | | | |
|-------------------------|---------------------|---------------------|---------------------|---------------------|
| | Pooled OLS | FEM | REM | Robust FEM |

***, ** and * represent significance at the 1%, 5% and 10%.

Based on the results of Breusch-Pagan test and Hausman test, the fixed effect model is chosen to analyze the influence of cash dividend policy on the stock price volatility of the firms in Vietnam. Then, this model is estimated with robust option in order to remove the heteroscedasticity and increase the significance of the regression results. The results of the regression analysis based on Robust Fixed Effect Model (Robust - FEM) are also presented in the Table 4.

As seen in Table 4, the relationship between dividend per share (DPS) and share price volatility is negative and statistically significant at 5%. A negative and significant association at 1% between price volatility and dividend payout ratio is also observed in this table. This means that as long as the firm's dividend per share or payout ratio increase, the price volatility decreases. Since this observation is consistent with the view that the high cash dividend reduces the firm's cash flow uncertainty, leading to more stability in the price, it could provide a supporting evidence for the duration effect theory. This result also shows that the high dividend can be considered as an indicator of the firm's stability and therefore there would be an expected inverse association between the dividend and the price volatility. In addition, our finding is in good agreement with the assumption in which an increase of the dividend causes a reduced stock value uncertainty and in good agreement with the previous studies, e.g, Travlos et al. (2001), Akbar and Baig (2010), Nazir et al. (2010) and Khan (2012).

The results of regression provide an evidence of a significantly positive relationship between dividend yield (DY) and stock price volatility (significant level at 1%). In other words, the market reacts favorably to the announcements of dividend policy, i.e., dividend yield of the companies listed on the Vietnamese stock market. This implies that the dividend policy announcement relating to the dividend yield of the listed firms

in Vietnam conveys positive information to market participants. It is useful to recall that according to the dividend signalling theory, a company decides to announce its dividend yield to signal its future prospects to the market, leading to a change of its stock prices. Investors invest their money in stocks to earn a return either by dividends or stock appreciation. The dividend yield is a financial ratio which measures the amount of cash dividends distributed to common shareholders relative to the market value per share. Dividend yield is usually used by investors to show how their investment in stock to generate either cash flows in the form of dividends or increments in asset value by stock appreciation. A good signal relating to dividend yield seems to be more attractive to investors. In addition, in the context of Vietnam's emerging financial market, continuous buying and selling behavior in stock of investors in short time may create the high fluctuation of stock price. This result agrees well with the previous works, e.g., Nishat & Irfan (2003), Rashid & Rahman (2008), Muhammad et. al., (2011), Zakaria et al. (2012), Habib (2012), however not with Bakisn (1989) and Vinh (2014). The effects of the internal factors, such as growth rate and firm size on the stock price volatility of the companies listed on the Vietnamese Stock Exchange is also clearly illustrated.

Overall, in terms of the long-term impact, our results show that the dividend policy strongly influences the stock price volatility. Indeed, there is a significant negative effect of the dividend policy's components comprising the dividend payout ratio and the dividend per share on the share price volatility. Particularly, in Vietnam, when the firms increase their dividend payout ratio or their dividend per share, the stock prices tend to be stable, i.e., the price volatility fall, leading to a decrease in the share price risks. Furthermore, our results indicate a positive significant association between the firm's stock price volatility and its dividend policy measured by the dividend yield. Consequently, when the dividend yield rises, the price volatility or the uncertainty of the stock value rises.

5. CONCLUSION

Our study has investigated the effects of dividend policy on the stock price volatility in the context of Vietnam. The results indicate the significantly negative relationship between dividend per share, dividend payout ratio and stock price volatility, and a positive relationship between dividend yield and stock price volatility of companies. These conclusions have also supported the dividend relevance theory.

Our findings would enhance current understandings of the dividend policy impact on the stock price and that allows financial managers to be able to determine an optimal dividend policy which improve the performance of the firms.

ANGEL FINANCING: WHAT WE KNOW AROUND THE WORLD

Doan Huong Quynh*, Pham Thi Van Anh**, Doan Thuc Quyen***

ABSTRACT: This study conducts a comprehensive review of recent literature on angel financing and its effects on entrepreneurial firms from a corporate finance dimension. Previous literature emphasizes the role of angel financing as the fundamental funds for innovative startup firms. Apart from venture capital funds and private equity funds, angel investors are private investors, who are willing to take high risk to exchange for equity. This paper not only reviews the very sparse academic literature on angel financing in Vietnam but also identifies previous research gaps and provides recommendations for future studies.

Keywords: *entrepreneurial financing; angel investor; venture capital; Vietnam*

1. INTRODUCTION

One of the most challengeable issues of entrepreneurial firms is their ability to find financing resources. Entrepreneurship finance, previously, seems to be seen separated from corporate finance since financial issues faced by public corporation are totally different from entrepreneurial firms. However, recently, financial economists consider financial issues of entrepreneurial firms in the light of corporate finance theory. Since such firms are lack of profitability, tangible assets, and cash flows, debt financing is not easy to access. Thus, entrepreneurs seem to rely on three fundamental sources of outside equity financing including venture capital funds, angel finance, and corporate investors (Denis, 2004). Previous studies on entrepreneurial finance tend to put more weight on the importance of venture capital funds or corporations, the institutional investors while relatively little work has been done on angel investors. National Venture Capital Association indicates the size of the angel finance to be roughly US\$100 billion and the size of the independent venture capital market to be US\$48.3 billion as of January 2000 (Wong, 2002). The dominance of capital volume funded by angel investors at the seed and early stage expresses the need for more studies on angel capital, both from macro and micro perspectives.

Regarding to the staged financing for entrepreneurial firms, it is undeniable the role of angel investors during the seed or early stage. Especially, angel finance becomes prime funds for investment with small amount of initial money and less attractive to venture capitalists. Venture capital funds invest their money based on the risk pooling; hence, entrepreneurial firms have to satisfy many requirements in case of approval. One of the essential conditions is the profitability of entrepreneurial firms in markets. However, it is difficult to predict and prove the probability of success of an entrepreneurial firm in reality. Hence, venture capital is ideal fund for entrepreneurial firms yet not easy to access. Venture capital tends to get a lot of attention

from policy makers but the primary source of external seed and early stage equity financing for many start-ups is angel financing. This fund via providing start-up enterprises not only financing but also managerial experience increase the surviving and growing likelihood of entrepreneurial firms. Moreover, the investment of angel investors provides a signal of a firm to the market and allows a hybrid model, a combination between angel investors and venture capital funds in funding an entrepreneurial firm. Hence, fostering business angel investment in start-ups has shown significant impacts on economies and societies (BAF, 2010).

Topica Founder Institute indicated that Vietnam was given 92 investment deals for entrepreneurship, innovation, and creation with a total investment amount of US\$291 million in 2017. This is double the number of deals in 2016 with a 50% increase in total deal size. The ambitious “startup nation” plan of the Vietnamese government will better succeed via considering the valuable lessons from the success of other nations. This paper conducts a comprehensive review of recent research on angel financing around the world and outline policy recommendations for Vietnam to enhance start-up ecosystem. The previous studies emphasize the role of angel investors during seed and early stage of start-up enterprises, as well as the differences between angel financing and venture capital funds. Recent literature emphasizes the key drivers of angel investors when selecting a start-up enterprise and the underlying motivations of an individual to become an angel investor. This study not only reviews the very scant academic literature on angel financing in Vietnam but also identifies previous research gaps and provides recommendations for future studies.

The remainder of the paper is organized as follows. Section 2 reviews the recent literature to discuss the importance of angel financing in entrepreneurial firm’ performance. Section 3 presents the differences between angel financing and venture capital funds as well as the factors of being an angel investor. Section 4 summarizes the recent empirical studies literature on angels in specific markets. Section 5 introduces angel financing in Vietnam and provides an outlook for future research.

2. ANGEL INVESTORS AND THE ROLES IN ENTREPRENEURIAL FIRM’S PERFORMANCE

The term “angel” was first used as a business term by Wetzel (1983) to describe the investors who supported those entrepreneurs as “angels”. Angel investors have a long history as informal investors in the narrow subset of the private equity market (Lamoreaux et al., 2004; Shane, 2009). Wong et al. (2009) indicates “Angel investors are high-net worth individuals who typically invest in small, private companies on their own account”. Angel-backed firms are usually high-risk, high-growth in an early stage (Frear et al., 1994). Angel financing is at the second round of a start-up cycle, after seed capital from family circle but before formal types of institutional investments such as venture capital funds. Being different from venture capitalists, who make investing decisions in the interest of the limited partners, angel investors act on their own money. Hence, in some cases, instead of returns, enjoyment of fun in involvement is the priority when angel financiers make investment decision (Ibrahim, 2008; Van Osnabrugge, 2000).

Angel investors can be classified into two general groups: related and unrelated angel investors. The first group refers to the people with business relationship such as suppliers, customers, employees, or competitors while the second one includes individuals without any connection to the entrepreneur or business (Edelman et al., 2017). Some authors generated their own clusters for angels, for example, 5 groups by Evanson (1998) including corporate, entrepreneurial, enthusiastic, micromanagement and professional.

Many studies indicate angel investors as “the most important source of capital for start-up firms”. However, it is undeniable that business angels play a major role in the development and growth of entrepreneurial firms considering financial capital investments, governance, and quality signal.

Being a direct investor: Since angels invest their own money without any particular compensation plans, they can nature ventures' long-term innovation. Moreover, the high probability of failures at early stage of an innovation may require angels more time and efforts to develop and commercialize innovation.

Providing value added to entrepreneurial firms: The most important role of angel investors is to add value to entrepreneurial firms through angels' involvement. Involvement was defined first by Tybjee & Bruno (1984) as all activities unrelated to supplying financial capital. Lennart Page (2014) defines involvement as all activities of the angel investor apart from the provision of capital and uses the set of roles of Politis (2008) to classify different types of involvement: sounding board/ strategic management, supervision and monitoring, resource acquisition and mentoring. The first value added role of angels is advising the entrepreneur based on extensive business know-how and management expertise. From the perspective of resource-based arguments, business know-how and strategic management from experienced angel investors can generate competitive advantages for smaller firms, which are lack of knowledge in critical management as finance and marketing (Prahalad and Hamel 1990; Barney, 1991; Teece et al. 1997; Shepherd et al. 2000). The second dimension of angels' involvement in entrepreneurial firms is monitoring and supervising (Ehrlich et al., 1994; Politis, 2008; Sætre, 2003). The conflicts between business angels (principal) and the entrepreneur (the agent) can lead to moral hazard or adverse selection problems (Jensen and Meckling, 1976). Hart (1995) proposed that in the risky small firms, the best way to gain ex post control and exert power over the investment would be through active involvement in the investment. Supervising and monitoring role of angel investors can mitigate the agency problems, hence, minimize potential asymmetric information, and reduce agency costs.

The last value-added function of angel investors is resource acquisition and mentoring. Angels can use their personal networks to help the venture better in preparing for unexpected events in marketplaces (Harvey and Evans, 1995). The resource acquisition aspect of involvement includes activities such as interfacing with investor groups, providing important business contacts and raising additional funds (Lennart Page, 2014). With the support of angels, small firms in the early phases of development can overcome the lack of connection to major key stakeholders (Aldrich and Zimmer, 1986) as well as the dependence on external environment. About mentoring, it refers to establishing a stable business relationship between angels and the entrepreneurs (Freear et al., 1997; Mason and Harrison, 1997; Brettel, 2003). The mentoring role of business angels refers to the theory of relational governance, which emphasizes the role of norm-driven definitions of appropriate behavior in regulating an economy (Huse, 1993). The attendance of angels in entrepreneurial firms can generate added value for firm through mutual understanding, vision sharing, and trusting between the angels and the entrepreneurs.

Quality signal: Angels may provide an early endorsement of quality that alleviates uncertainty around the initial stages of technology development (OECD, 2011; Elitzur and Gavius, 2003). Taking into account a situation of co-invest in deals between angels and venture capitalists, thereby gaining the expertise of a professional investor, or albeit in relatively rare cases, even invest as a limited partner in a venture fund (Mason and Harrison, 2000). Additionally, investment by an angel investor may send a positive signal of a start-up firm to the venture capital funds, thus mitigating possible moral hazard issues (Elitzur and Gavius, 2003) in future VC investments.

3. THE DIFFERENCES BETWEEN ANGELS AND VC/PE

Previous studies on entrepreneurial financing indicate several major differences between angel investors and VC/PE funds. These points are clarified in following table.

Table 1. A comparison of angel financing and PE/VC funds

| Criteria | Angel Financing | PE/VC funds |
|-------------------------------|---|---|
| Stage of the start-ups | The seed or early stage | Later-stage/mature |
| Type of firms | Local firms | Not limited |
| Screening process | Based on personal relationship Informal procedure | Due diligence & portfolio management |
| Investment amount | Small | Large |
| Source of investment | Private money | Financial intermediaries |
| Investment method | One time On going support | Staged financing |
| Control mechanism | Geographic proximity | Board seats, staged finance, contract provision |
| Required returns ¹ | 20%~30% on average | 35%~45% on average |
| Incentives | Not only returns Others: social or economic reasons; investing personal knowledge and time | Financial returns |

(Source: Cumming and Johan, 2013; Sudek, 2006; Ibrahim, 2008; Sohl, 2003; Avdeitchikova et al., 2008; Aernoudt, 1999; Cochrane, 2005; Shane, 2005; Chua and Wu, 2012; Wong et al., 2009, 2010)

4. EMPIRICAL STUDIES ON ANGEL FINANCING

Despite of the importance of angel investment in filling the equity gap at early stage of a start-up firm, studies on angel financing seem to be spared. Most of the studies on angel financing were conducted in the developed economies such as the US, the UK, and OECD countries. The emerging markets and frontier markets attract little attention of academic research. Generally, prior studies on angel investors focus on three main contents: the profile of angel investors; the differences between angel investors and venture capitalists; the public policies for angel financing. Empirical studies were conducted mostly in the US and the UK, where data of angel and venture investment deals were available. Struggling with the lack of data is the most challenging of researchers (Wong, 2009).

In term of the profile of angel investors, Wetzel (1983) is the earliest author providing the profiles of angel investment in the survey of New England area angels. Prowse (1998) describes the characteristics of angel investors in the Dallas area. Ehrlich et al. (1994) publish survey results comparing the level of investor involvement of venture capitals and angels. Sohl, Van Osnabrugge, and Robinson (2000) provide survey evidence on the investment behavior of angels within certain industries. Recently, study of Wong (2009) uses the final sample consists of 215 investment rounds made by angel investors in 143 companies from 1994 to 2001 in the US focuses on the control aspect of angel investors. This paper presents the characteristics of angel finance, from the implemented control mechanisms to the determinants of funding levels. A part from venture capitalists, angels are not given the traditional control rights. Rather, one of the primary mechanisms to control agency costs is the alignment of the entrepreneur's interests with those of the firm through the large ownership positions. Angels receive a higher equity stake to compensate for the extra risk of investing under greater uncertainty. The statistically significant and positive coefficient on the first round dummy indicates angels receive a premium for investing early

About the dissimilarities between angels and venture capitalists, Casamatta (2000) develops an empirical model that captures some of the differences between angel investment and venture capital. The

author indicates that the optimal choice of security is a function of the size of investment. Moreover, this study finds empirical support the hypothesis that larger investments (mainly by VC) should use complicated securities while smaller investments should adopt common equity and straight preferred equity. The study of Wong (2009) also identifies several differences between venture capitalists and angel investors. Angels fund is smaller amounts than venture capital. Firms that require larger amounts will seek venture capital investment, while angels may be preferred for small capital. Angel investors appear to nurture younger firms until the company is established enough for venture capital consideration. Chemmanur and Chen (2006) developed a model to explain the reasons behind why entrepreneurs might want to obtain angel investments first before approaching VCs. Schwienbacher (2009) assumed that both angels and VCs can add value, and his model explains the differences in choosing early-stage financiers between angels and VCs from the perspective of entrepreneurs. Hellmann and Thiele (2014) presented a “Friends or Foes” theory that models the interdependences between angels and VCs. This model assumes that the investee firms want to proceed from angel financing to VC financing, and those VCs might use their market power or control rights to squeeze out angels in later stages.

Cumming and Zhang (2016) using the data from PitchBook with a collection of over 5,000 angel deals and 80,000 PE/VC deals from 96 countries in the period from 1997 to 2012 developed 2 hypotheses about the differences between angel investors and venture capitalists in term of market conditions, legal environments, and cultural dimensions (higher levels of individuals and risk endurance). This study is the first to use a multi-country private equity deal-level database to observe the investment behaviour of angels versus PE/VC funds. The authors found legal and cultural differences around the world have a more pronounced impact on angel investors relative to PE/VC funds.

Regarding to the public policies supporting angel investors, prior studies tend to concentrate on the tax regime and institutional framework. Lerner (1998) analysed the plausibility of public efforts to fund new firms via angels. The investment tax credit program and its impacts on entrepreneurial activities were studied in the US. Hendon, Bell, Blair, and Martin (2012) found that more than 20 states offered angel investment tax credit programs for the purpose of increasing entrepreneurial activity. Bell et al. (2013) developed the hypothesis that “the rate of increase in entrepreneurial activity will be significantly greater after the introduction of a state angel investment tax credit programs.” The results of this study supported the theory that state angel investment tax credits affect state level entrepreneurial activity.

5. ANGEL FINANCING IN VIETNAM AND SOME RECOMMENDATIONS FOR FUTURE STUDIES

Previous literature reviews on the angel financing around the worlds indicate not only the importance of angel investors in development and performance of entrepreneurial firms but also various aspects of academic studies on such topic. However, it is clear that most of the prior research is about the developed markets with a focus on the US, UK, and big markets in OECD, where dynamic financial system and legal institution support angel investment strongly. Studies on Asian markets tend to focus mostly on developed economies as Japan, Singapore, and Korea (Wong and Ho, 2007; Kutsuna and Harada 2004; Hindle and Lee 2002; Tashiro 1999). Emerging markets as Thailand and Philippines have received little attention of academic studies. However, emerging markets are becoming the most attractive due to the investment from MNCs in developed markets. Hence, studies on investment opportunities in Southeast Asian markets, including Vietnam, will increase in the near future.

Scheela et al. (2012) conducted a survey to study the business angel in 4 Southeast Asian markets including Vietnam. The profile of business angels in Vietnam was described as following table:

Table 2. A summary of angel financing in Vietnam

| Criteria | Value |
|--|----------------------------|
| Fund size | US\$1.0M (\$250K ~ 1.5M) |
| Investment size | US\$85K with median \$100K |
| Average number of years of investing | 6.4 years |
| Investors/angel | 3.3 partners |
| Total number of investments | 54 companies |
| Average investments | 9 companies |
| Seed stage/Early | 82 |
| Growth stage | 18 |
| Mature stage/buy out/other | 0 |
| Average investment duration | 5.2 years (3~10 years) |
| Time for monitoring | 44% |
| Level of education | 33% BA/BS and 67% MS/MBA |
| Number of board seats/BA | Mean 5.3 (2~15 seats) |
| Investment performance vs. expectation | Average (33%); Above (67%) |

(Source: Scheela et al., 2012. Data from survey with 6 business angels in Vietnam)

This study suggests some policies for Vietnam including corporate governance and transparency; and better legal and financial institutions. Regarding angel investors, forming a business angel club, and better access to bank financing for BA and entrepreneurs are indicated to enhance angel investment in Vietnam.

There is very scant research on angel financing in Vietnam, both in drawing the personal portrait of angel investors and the impacts of angel financing on investment performance. Some studies on entrepreneurial financing investigate the determinants of venture capital's success on entrepreneurial firms. For example, Scheela and Van Dinh (2004), one of those few empirical studies on five venture capital firms in Vietnam, found that the venture capitalists focus more on monitoring entrepreneurial firms in Vietnam compared with those in the US due to the insufficient institutions (Dao, Tran, and Nguyen, 2018).

Despite the emergence of innovative start-ups and entrepreneurial ecosystem, the scarce studies on the relationship between angel capital and entrepreneurs provoke potential future research in Vietnam.

Suggestion for future studies

First, with the surge of more than 3,000 Vietnamese entrepreneurial firms according to the Echelon Magazine, the research on the role of angel financing in entrepreneurial firms in Vietnam should focus on conducting quantitative models to statistically examine what kinds of roles and subsequent value that angel investors may add to entrepreneurial firms. Among those roles of direct investor, value-added functions, and quality signal, which one is more dominant in supporting entrepreneurs in Vietnam?

Second, the newly established of angel investor network such as IANGEL with the participation of 9 organizations to nurture and support start-ups and entrepreneurial firms in Vietnam indicates the current development of business angel in Vietnam. Hence, it is necessary to investigate the characteristics of angel investors, the motivations, as well as the key factors of being successful angel investors. Another question is about how angel investors select entrepreneurial firms to invest. Especially, with the establishment of the project "Supporting the startup ecosystem until 2025", the Vietnamese government commits to set up a national fund and use a considerable proportion of public budget to invest in entrepreneurial ventures,

innovation, and creative activities. Future research should study how effectively the Vietnamese government support angel investors to promote startup and entrepreneurial firms.

Last, previous studies in well-developed countries indicate the sensitivity of angel investors with institutional framework, financial system, and cultural dimensions. Moreover, angel investors tend to invest in local firms in affiliated industries. With the commitment of the Vietnamese government to promote a startup nation for Vietnam, new public policies will be launched to attract angel capital both from domestic and oversea investors. As denoted above, incomplete legal framework and lack of transparency are main obstacles for Vietnam. Further studies can enhance understanding of the implications of public policies in boosting angel capital as well as performance of angel investment. Another research stream should clarify the impacts of tax policy or credit based supporting program on willingness to be angel investors in Vietnam.

THE APPLICATION OF INTEGRATED REPORT IN BAOVIET HOLDINGS

Le Kim Ngoc* - Pham Thanh Long**

ABSTRACT: *Integrated Report (IR) is a new approach for Vietnamese Enterprises. Under the international framework of International Integrated Reporting Council IIRC, Baoviet Holdings has implemented Integrated Report. This study gives a content analysis about various aspects of IR in Baoviet Holdings. For this purpose, a study has been conducted with content analysis on the basis of Baoviet Holdings Integrated Report for the financial year 2015-17. The finding of this study explore different aspects of Baoviet Holdings Integrated Report and show preeminent points of Integrated Report in comparison with Sustainability Reporting and Annual Reporting.*

Keywords: *Integrated Report; Reporting; Baoviet Holdings*

1. INTRODUCTION

Integrated Report (IR) means reporting in an integrated manner. It is a process in which organization's strategy, governance, performance are communicated for value creation in short, medium and long run. (IIRC, 2011) Under this, a report is prepared which fully integrates a company's financial and non-financial performance aspects. In other words, it is the combination of financial report and sustainable report. Companies can use it as a management tool as it helps management and stakeholders for decision-making. In 2013, an Integrated Report framework has been developed by The International Integrated Reporting Council (IIRC) which is a principle-based framework rather than a detailed disclosure and this measurement standard is named as Integrated Report. The framework has given overall content of IR. The prime objective of an IR is to explain to the providers of financial capital about the way an organization generates value over time. In IR, only material aspects are needed to be disclosed.

The aims of IR are: (i) Improve the quality of information available to providers of financial capital to enable a more efficient and productive allocation of capital; (ii) Promote a more cohesive and efficient approach to corporate reporting that draws on different reporting strands and communicates the full range of factors that materially affect the ability of an organization to create value over time; (iii) Enhance accountability and stewardship for the broad base of capitals (financial, manufactured, intellectual, human, social and relationship, and natural) and promote understanding of their interdependencies; (iv) Support integrated thinking, decision-making and actions that focus on the creation of value over the short, medium and long term.

An IR explains how an organization creates value over time. Value is not created by or within an organization alone. It is influenced by the external environment, created through relationships with stakeholders and dependent on various resources. So IR presented the value creation process:

* School of Accounting and Auditing, National Economics University, Hanoi, Vietnam.

** School of Accounting and Auditing, National Economics University, Hanoi, Vietnam.

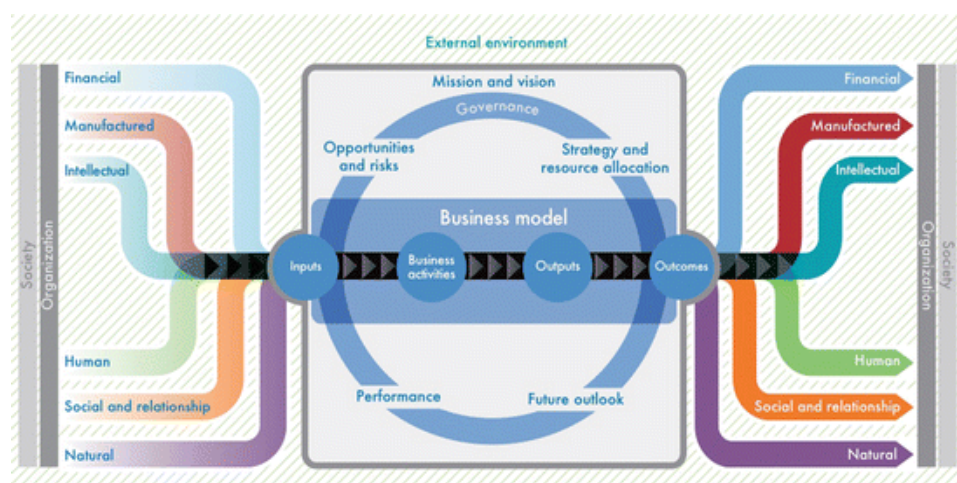

Figure 1. Value creation process

Source: *The International Framework IIRC*

The external environment, including economic conditions, technological change, societal issues and environmental challenges, sets the context within which the organization operates. The mission and vision encompass the whole organization, identifying its purpose and intention in clear, concise terms. Those charged with governance are responsible for creating an appropriate oversight structure to support the ability of the organization to create value. At the core of the organization is its business model, which draws on various capitals as inputs and, through its business activities, converts them to outputs. The organization's activities and its outputs lead to outcomes in terms of effects on the capitals. The capacity of the business model to adapt to changes can affect the organization's longer term viability. Business activities include the planning, design and manufacture of products or the deployment of specialized skills and knowledge in the provision of services. Encouraging a culture of innovation is often a key business activity in terms of generating new products and services that anticipate customer demand, introducing efficiencies and better use of technology, substituting inputs to minimize adverse social or environmental effects, and finding alternative uses for outputs.

The IIRC (2013b) proposes that preparation of an IR should be based on six guiding principles:

- Strategic focus and future orientation: to provide insight into the organization's strategy and how it affects the organization's ability to create value over time.
- Connectivity of information: to show how components that are material to value creation are interconnected and dependent on each other.
- Responsiveness and stakeholder inclusiveness: to explain the organization's relationship with key stakeholders and how it responds to their needs.
- Materiality and conciseness: to provide all material information concisely.
- Reliability and completeness: to include all positive and negative material matters in a balanced way.
- Consistency and comparability: to present information in a consistent manner to allow comparison over time with other organizations.

An IR includes eight content elements:

- Organizational overview and external environment (what do we do and how do we do it and the external environment under which it operates).

- Governance (structure and how this supports its ability to create value)
- Business model
- Risks and opportunities (how they are dealing with them and how they affect the company's ability to create value).
- Strategy and resource allocation
- Performance and achievement of strategic objectives for the period and outcomes)
- Outlook and challenges facing the company and their implications.
- Basis of preparation and presentation (including what matters are to be included in the IR and how the elements are quantified or evaluated).

Eight content elements

Figure . 2. Elements of Integrated Report

Source: The International Framework IIRC

2. LITERATURE REVIEW

The International Integrated Reporting Council (IIRC) states:

“Integrated Reporting brings together the material information about an organization’s strategy, governance, performance and prospects in a way that reflects the commercial, social and environmental context within which it operates. It provides a clear and concise representation of how an organization demonstrates stewardship and how it creates value, now and in the future. (IIRC, 2011, p. 6).

There are many studies on IR in past few years which have explained about IR framework, elements, and its link with corporate reporting of some countries such as South Africa, India, UK and Australia. Eccles and Saltzman (2011) has discussed about IR in USA, its benefits and challenges. Main and Hespeneide (2012) has explained about IR, challenges and benefits of preparing business reports based on IRs. Makiwane and Padia (2013) has examined the corporate governance disclosures and non - financial information included in annual reports of 92 companies. Loana and Adriana (2013) have provided a brief history of IR and have also identified the three stages of evolution of IR such as introduction of non-financial reporting, sustainability reporting, contemporary IRs. Abeysekera (2013) has outlined the IR concept and provided a template for IR in organizations. Babita Kundu (2017) has chosen 10 large scale organisations in India and has conducted with content analysis, t-test & anova between public & private sector organisation on the

basis of their reporting elements of Annual reports for the financial year 2013-14. The finding of this study shows that all companies are reporting almost all the aspects and there is no significant difference among reporting of all selected companies.

Non-financial reporting in most countries remains voluntary, but, in 2010, the Johannesburg Stock Exchange made IR compulsory for all listed companies (Eccles & Saltzman, 2011). The voluntary adoption of IR in Europe is becoming more common facilitated by long established traditions of triple-bottom-line reporting in several countries, but adoption of the practice in the United States is slow. Philips, Watson, and Willis (2011) suggest, “the primary benefit of IR is a more holistic view of information relevant to the company and its value proposition and strategy”. In Vietnam, IR is still a new concept and only a few enterprises implement it under the International Framework of IIRC.

Research gap: Even though numerous studies have been conducted on IR worldwide but a few studies are related to Vietnamese Enterprises. Most of the above studies are theoretical and have explained about IR, its evolution, process and its various dimensions. Further, it is evident from the above reviews that no study has been conducted on a specific enterprise. This study contributes to understand different aspects of Baoviet Holdings IR and show preeminent points of IR in comparison with Sustainability Reporting and Annual Reporting.

3. RESEARCH METHODOLOGY

This research uses the case study method, a qualitative research method commonly used in social science research. According to Robert Yin, a case study is an empirical investigation of a contemporary phenomenon in depth and in its real context.

Case selection: In 2016, Baoviet Holdings was the only Vietnamese enterprise to be honored in the Top 100 Best Integrated Reports Worldwide and Top 11 Best Integrated Reports in Asia-Pacific Region. This is the only one Vietnamese enterprise that publishes a comprehensive set of reports on IR, Sustainability Reporting and Annual Reporting on its website for three financial years from 2015-2017. The selection of the Baoviet Holdings aims to specifically study the dimensions of the IR and ensure comparability with other reports, ensuring consistency in the research context.

Data collection: secondary data it collected from Baoviet Holdings reports, research papers, articles, journals, published topics related to research issues. The collected data is analyzed and evaluated for the current report of Baoviet Holdings and compared with the annual reports and sustainability report.

4. RESULTS

4.1. Overview of Baoviet Holdings

Baoviet Holdings is the first leading Finance - Insurance Group in Vietnam. Baoviet proactively takes part in shaping the insurance market and capital market of the financial sector of Vietnam. Baoviet plays a key part and is a typical success story in the State-owned enterprise equitization process, achieving a lot of comprehensive innovations. Baoviet remains a pioneer in socially responsible insurance plans, such as agriculture insurance, natural disaster risk insurance, export credit insurance, aquaculture insurance... As Vietnam's leading financial-insurance group, Baoviet boasts a half century of development history, the top reputational brand on the market, a team of more than 120,000 employees, agents with the most extensive experience in the financial-insurance market. Large-scale distribution network that includes 200 branches, over 700 insurance transaction offices in all cities and provinces of Vietnam, which is difficult to find elsewhere

in Vietnam. Baoviet has created a solid foundation making the momentum for a sustainable growth in the future and get ready to exploiting tremendous opportunities in Vietnam insurance financial market. Baoviet has consistently and steadily grown its revenue and profit over the years, in all businesses including insurance – investment – financial services. In 2017, Baoviet is the first financial – insurance group in Vietnam reached the total revenue of more than USD1.5 billion, affirming its leading position and financial capacity among the largest players in the financial – insurance sector. Baoviet is the public listed company with large market capitalization. BVH stock, with high liquidity is the most influential among other stocks of financial and insurance companies, and is always included in the investment portfolio of international exchange traded funds (ETFs) in Vietnam. The first State-owned enterprise to successfully seek attracts a foreign strategic partner. The leading group of financial institutions has the highest dividend yield over the latest years. Following is the 10 impressive figures over 10 years of equitization of Baoviet Holdings.

Figure . 3. 10 impressive figures over 10 years of equitization of Baoviet Holdings

Source: Baoviet Holdings

4.2. Integrated Reports of Baoviet Holdings

The first IR of Baoviet Holdings was prepared for the fiscal year 2015 and announced in March 2016. According to Nguyen Anh Tuan, Operations Director of Bao Viet Holdings: *“The position of Vietnamese enterprises in the eyes of international investors are always what Baoviet wants to do. Baoviet has researched and implemented an IR under the international framework assured by PWC and has been honored with an effort to demonstrate the completion of International standards for the realization of sustainable development strategies and corporate governance in the short, medium and long term”*.

For the first time, Baoviet carried out an IR taking into account the guidance of the International Integrated Reporting Council (IIRC), which complies with the other standards such as: sustainability Report in compliance with Global Reporting Initiative GRI4, Procedures as per the ISO 9001:2015, Standards by International Organization for standardization, Information security management certification as per ISO/IEC 27001, environmental certification as per 5S certificate, the ASEAN corporate governance scorecard by ASEAN capital markets forum. This report was based on Ernst & Young Independent audited report on the VAS and IFRS financial statements, assured by PWC on the financial and non-financial indicators.

Baoviet IR was a report that allows information to be environmental and social responsibility to provide a comprehensive perspective on the operation of the business in the short, medium and long term.

They used this IR as an engagement tool of dialogue with stakeholders on clear strategy plans and resource allocation and value creation. The components in the model of IRs included: strategy and resource allocation, organizational overview and external environment, business and management model, opportunities and risks, prospects, performance efficiency. The following is main contents of Baoviet IR .

Figure .4. Contents of Integrated Report

Source: Baoviet Holdings

After presenting Chairman’s message, Chief Executive Officer’s message, company overview highlights and some key performance Indicators in the 1st part - Value creation, the report showed the business lines and network, business and value creation model, identify material matters, development strategy and resource allocation, business strategy.

As a business that delivers products and services to millions of people in Vietnam, Baoviet has identified that sustainable development strategy can only be implemented when growth objectives, economic profit are balanced with social development and environmental protection. These themes provide a framework for their business model to maximize efficiency of inputs - including existing and potential resources in the system, capitals, human resources, technology, environmental and social elements to create output including products and services, economic values (revenues, profit, dividends) that bring added value to the stakeholders. The contents are generalized under the following model:

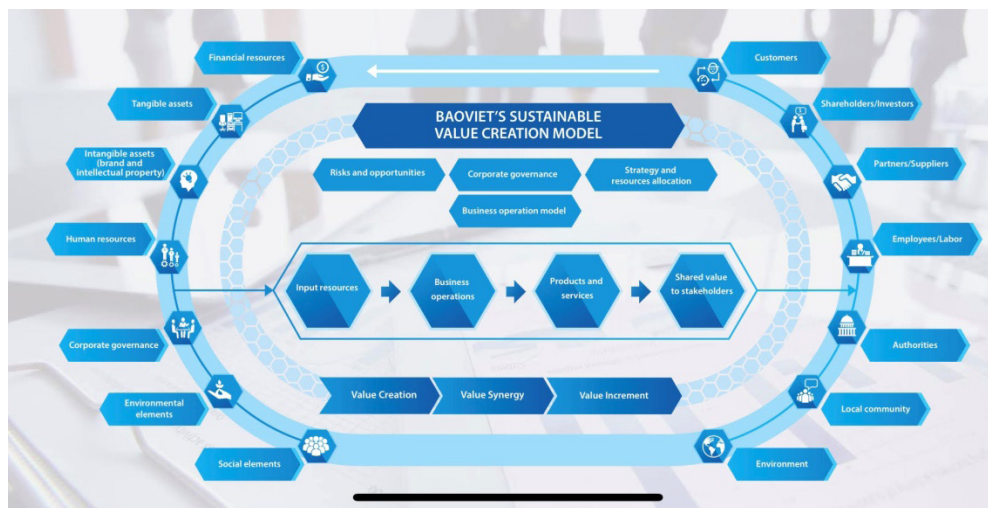

Figure . 5. Bao Viet Sustainable Value Creation Model

Source: Baoviet Holdings

Based on the model of sustainable value creation, Baoviet has identified seven key factors affecting the operation. These identify factors that creating growth momentum for corporate growth is essential since this facilitates them to make the right decisions regarding the allocation or generating of resources in developing factors which promote growth of the enterprise. They identified factors that have impacts

on firm performance, consisting of internal factors (human resources, capital, intellectual property, brand value...), which have been established and reinforced for half of century, as well as considering external factors such as sustainable growth trend, demography, social responsibility will be the momentum for solid and sustainable growth of Baoviet in the near future.

Baoviet identified its stakeholders as whom Baoviet's activities have possible impacts on or those may have concerns, or affect current activities at Baoviet. Through communicating and exchanging information, they have drawn issues that are of interest to related parties and in turn have significant influence on the operation of Baoviet. After identifying material issues and concerns of stakeholders, Baoviet has implemented measures and taken actions to maximize the efficiency of input resources - including available and potential resources in the system, which helps to create output values and added value to the stakeholders.

To develop strategies and allocate resource appropriately for the next stage of development, Baoviet has considered their stakeholders as important partners with their feedback as a source of valuable information for Baoviet to reinforce their business operations. Through exchange of information and discussions with stakeholders, they have synthesized the issues raised by interested parties, and evaluated their impacts on the operation of Baoviet; as a result, they implement investments, and allocate resources to fully meet expectations of the stakeholders as well as to ensure the sustainable development of the business.

By assessing the importance of critical factors in the correlation of stakeholders' interests and the impacts of such factors on the business, Baoviet has defined the priorities for strategic planning and proper resource allocation in order to make the most of opportunities, deal with challenges and minimize risks so as to increase the enterprise's value, meet stakeholders' expectations and ensure sustainable development of the enterprise.

In the part of Value convergence, they presented report and review from the management board, the board of directors and reports of subsidiaries. They analyzed the operational performance of the year and objectives, business plan and orientation for the next year.

Corporate governance was the main content of the part Value synergy. It is considered as the vital factor to ensure the effective growth and long-term sustainable development. In order to maximize the business values, leaders of Baoviet Holdings focus on not only fostering the business activities to increase revenues and profits in the short run, but also step-by-step improving corporate governance capability to International standards, ensuring the most efficient exploitation of resources to create sustainable values in the long run, and especially attracting more investment flows to the business.

From the values created during the corporate governance activities, Baoviet understands the need to contribute for the environment and society in order to create sustainable values in the long run. The values to be shared and spreading in the community will generate new, tremendous and more sustainable values. These values will contribute to the sustainable development of the society; thereby facilitate to sustainably develop and continues creating new values.

Financial statements including audited consolidated financial statement (VAS), audited separate financial statements (VAS) and consolidated financial statements (IFRS) are presented in the end of the report.

In the years of 2016, 2017, Baoviet has continued to write their story of creating and spreading their value. The main contents of their IRs consist of overview the Baoviet Holdings, the development strategy, business performance, corporate governance, sustainable development and financial statements. They also aligned the 17 world's sustainability goals with corporate's activities.

4.3. Advantages of the Integrated Report compared with the Annual Report, Sustainability Report of Baoviet Holdings

The Baoviet Integration Report provides information that helps investors understand how to create value over time through the use of inputs including financial and non-financial resources, through the process of operation of the enterprise to create the output value of products and services of enterprises as well as the impact on the environment and society. The highlights of the IR compared to other reports such as annual reports, sustainability reports in the following points:

- Firstly, Baoviet IR is a way of looking at the way companies think about how to create greater value in the future, different from the traditional annual reports of businesses that are largely focused on the activities of past and present business.

- Secondly, Baoviet's IR incorporates the latest set of GRI criteria (G4) combined with financial industry criteria to help Baoviet better measure, evaluate and control its resources. which is balanced and adjusted in time, ensuring the correct implementation of the strategic direction of the Holdings.

- Thirdly, Baoviet's IR is likely to link and pinpoint key issues such as strategy and business direction to 2020 and vision to 2025, corporate governance, risk management as well as environmental issues.

- Fourthly, Baoviet IR provides the reader with sufficient information, quantified to specific indicators of value creation, growth of the business in the short run and prospects for the future of the business with a longer-term vision.

- Fifthly, Baoviet IR focuses on the fundamental and core elements of an integrated, high-reliability that enhances business information transparency and contributes to the development of the stock market in Vietnam and increase the benefits to investors.

- Sixthly, Baoviet IR is published bilingual Vietnamese - English and application of advanced technology on the mobile and digital platform (Web, Android-IOS Applications), programmed with flexible interface, similar with many digital devices in order to increase the convenience and accessibility for investors, shareholders, customers, and other stakeholders. The application of advanced technology reduces the number of printed reports and helps domestic and foreign investors to access and store information about business easily and conveniently.

5. DISCUSSION AND CONCLUSION

The IR is increasingly showing its influence when it creates a new trend in the world by providing investors, shareholders and stakeholders with a more holistic view about values and performance of the business in various aspects. IR is really driving companies to plan a comprehensive strategy and business plan, corporate governance, risk management, and value creation in the short, medium and long term.

The introduction of the International Framework for IR in 2013 has enabled businesses to better inform themselves about the six capitals: Financial, Manufactured, Intellectual, Human, Social and Relationship, Natural. Most of the capitals are not presented in the financial statements in accordance with current accounting standards. Accordingly, the IR has overcome the shortcomings of the accounting standards system, as well as the current financial reporting format. Prof Says Janek Ratnatunga, General Director of CMA Australia said: *"The current financial statements do not fully reflect the value of an enterprise where so many intangible assets are excluded from the balance sheet. While the world's largest enterprises such as Google, Facebook, Apple, Amazon are knowledge enterprises, the business platform is based primarily on the value of intangible assets. Due to the limitations and complexities of the current accounting standards system, existing financial statements need to have alternate formats, which IR is an option."*

In Vietnam, Baoviet Holdings is a pioneering enterprise for IR. With the Top 100 Best Integrated Reports and Top 11 Best Integrated Reports in Asia Pacific region; 03 Platinum Awards for the best Integrated Report in financial services award; 02 Platinum Award for Integrated Report and Sustainability Report with great development over the years in terms of content, reliability and presentation, Baoviet Holdings has made a great contribution to raising the position of Vietnamese enterprises in the eyes of domestic and foreign stakeholders.

SUSTAINABLE DEVELOPMENT - EXPERIENCES FROM BAOVIET HOLDINGS, A FINANCIAL INSURANCE GROUP AND RECOMMENDATIONS

Tu Pham Ngoc* - Khanh Pham Duy**

ABSTRACT: *Sustainable development is a target, key driver and foundation shaping a corporate in the market economy and also is a millenium goal of most nations, organizations and corporates under the current context. Sustainable development engages in maintaining growth in three pillars: economy, soceity and environment. To achieve national, regional and global sustainable development goals, each corporate, the key economic unit is required to embrace sustainable development models. Studying sustainable development models of Baoviet Holdings, a financial insurance Group aims at giving recommendations for the Group as well as other corporates.*

Keywords: *Sustainable development, Baoviet Holdings, corporate*

The global challenge of 21st century is how to reduce income inequality, ensure life quality of over 7 billion people to leave no one behind without depleting natural resources and maintain economic growth. To move towards this goal, the Government and its corporates need to find sustainable development models, in other words, they are required to engage economic growth with environmental protection and social responsibilities.

In the ‘Our common future’ report published by the World Commission on Environmental and Development (WCED) of United nations (UN) in 1987, experts provided the concept of sustainable development. It is thereby defined as humanity development to meet present needs without compromising the ability of future generations to meet their own needs. This concept is adopted by many organizations and nations and is widely used in discussions about sustainable development, implying fundamental requirements of sustainable development is stability and balance. This report however only concerned about sustainable goals rather than the content of sustainable development.

Asian Development Bank (ADB) has indicated that growth drives development, sustainable development is a model engaging business activities with conserving natural resources and ecosystem quality to meet present needs without compromising the ability to meet future generations’ needs. This concept has well demonstrated the way an economy operates and measures to ensure sustainable development. However, factors impacting on sustainable development and harmony between economic, social and environmental achievements have not fully mentioned.

At the United Nations Conference on Environment and Development (UNCED) held in Rio de Janeiro in 1992, WCED described more comprehensively the concept of sustainable development.

* Ph.D Candidate, Chief Executive Officer, Finance Block, Baoviet Holdings, 72 Tran Hung Dao, Hanoi 10000, Vietnam, Corresponding author. Tel: +84 91 308 8686. E-mail address: phamngoctu@baoviet.com.vn.

** Ph.D Candidate, Hanoi 10000, Vietnam

According to WCED, sustainable development engages economic growth with environmental protection and social responsibility. Not only is economic target required to achieve, but the social responsibilities and environment protection are also considered. Among its principles, that human being are entitled to a healthy and productive life in harmony with nature, biodiversity of natural ecosystem is maintained, unrenovable resource exploitations are restricted, pollution is reduced and attitudes towards life and lifestyles are required to change to create a self-managed environment, unified national structure, thereby bolsters economic growth and cultural values preservation and builds up responsible allien structure all over the world.

WECD concerns more about environmental perspectives while economists tend to focus on effective economic development and socialogists engaged in social development and preserve traditional cultural values. Despite of different approachs prioritizing different perspective, until now scientists, international organizations and nations all agree the concept of sustainable development that it requires the harmony between three pillars: efficiently and effectively use and manage available resources - economic growth pillar; create better life for present humanity and future generations - social development pillar and maintain environmental and ecological balance - environmental protection pillar. To achieve national, regional and global sustainable development goals, each corporate, the key economic unit is required to embrace sustainable development models.

In recent years, sustainable goals and demands for creating a ecosystem of corporates to develop sustainably are always mentioned in every conference in Vietnam. To demonstrate concerted efforts into sustainable development, the Government has issued “Orientation for sustainable development in Vietnam” (Vietnam Agenda 21). The concept of sustainable development in Vietnam in the 21st century is: fast, efficient and sustainable development, economic growth is alligned with social justice and environmental protection, ensuring the harmony between the artificial environment and the natural environment and biodiversity preservation. Among the participants involved in the implementation of the goals of sustainable development, the Vietnamese Government focuses on promoting managerial practices, administrative reforms and restructuring of state-owned enterprises, reforming the growth model, implementing the policy and guidelines of “start-up country”, demanding and encouraging localities and especially enterprises to achieve sustainable development. Sustainable development of enterprises is set within the framework of sustainable development of the economy, in which each enterprise is both an independent economic entity and an integral part of the business entities within local, regional and global economies. Businesses are required to establish close economic and social ties with other entities within the economy, communities and the environment. Corporates need to pursue economic growth, setting a stage to increase their capital accumulation, reinvestment, technological innovation and financial resources to fulfill their social responsibilities, protect the environment and increase their competitiveness. Sustainable Development.

Thus, sustainable development of enterprises is also the interference of the three basic pillars, if the interference of the business is wide and deep then the foundation for growth and sustainable development of enterprises is solid. It is possible to better visualize the model of sustainable development of enterprises in Figure 1.1:

Figure 1.1. Sustainable development business model - Source: writer

Figure 1.1 requires business leaders to incorporate economic development with social justice and environmental protection. The process of simultaneous implementing these three pillars consistently arises from binding relationships affecting each other, often in the form of policies, strategies and actions creating interest conflicts between corporate and its stakeholders, even among departments, the group of interests of the enterprise itself, but in general, the conflict and resistance must be studied and resolved in a timely and reasonable manner to create the nucleus of sustainable development for the enterprise. Research on sustainable development experiences of Baoviet Holdings, the pioneer Group evaluating Sustainable development of enterprises will support each enterprise to perceive and more clearly define its sustainable development business model.

SUSTAINABLE DEVELOPMENT OF BAOVIET HOLDINGS

Baoviet Holdings (Baoviet - BVH) is one of the pioneering economic groups pioneering to adopt the sustainable development standards of GRI (**Global Reporting Initiative**), prepare the GRI G4 (PS) Sustainable Development Report complying principles and standard disclosures (GRI 100) and add details of three standards including Economic disclosures (GRI 200), Environmental disclosures (GRI 300) and Social disclosures (GRI 400). The first Baoviet sustainability report was prepared and published in 2012, since then presentation and quality of the report has won many awards from international and regional organizations. Bao Viet has won the Best Sustainability Report From Asia 2017 and the best Sustainable Development Report interacting with stakeholders in Asia selected by ASRA. Baoviet always engages economic growth with environmental protection and social responsibility – three pillars on which a long-term success of Baoviet is built. More specifically:

Regarding economic development:

BVH is leading the insurance business in the market share: (Figure 1 and 2)

Figure 1: Market share of new business revenues of life insurance companies in the first six months of 2017

(Source: <http://www.mof.gov.vn>)

Source: <http://www.mof.gov.vn>

Total assets and revenues of Baoviet are quite stable in the period of 2010-2016 and accelerate in 2017. Total assets by the end of 2010 were VND39,252 billion, increased to VND65,816 billion by 31/12/2016 and peaked at VND82,240 billion by 31/12/2017. Total revenues of Baoviet also dramatically rose when revenues was at VND10 billion in 2010 and hit a record high of over VND30,000 billion in 2017, outperformed 108% plan of the year.

Figure 3: Total assets and revenues growth of Baoviet in the period of 2010- 2017 (Unit: VND billion)

Tổng tài sản: Total Assets, Tổng doanh thu: Total Revenues

Source: Audited consolidated financial statements of Baoviet Holdings from 2010 to 2017

Although total assets and revenues of Baoviet grew stably, profit of Baoviet had significantly fluctuated. In the period of 2010-2012, profit growth was quite stable but in 2013 and 2015, profit decreased dramatically. In more specific, consolidated profit in 2013 was VND1,234 billion, 14% lower than 2012; consolidated profit in 2015 reached VND1,175 billion, dropped by 12% in comparison with 2014. However, an upward trend is recognized from 2016 until now, especially 2017 consolidated profit peaked at VND1,934 billion, 39% higher than previous year's. This impressive result continued to demonstrate the leading position of Baoviet in financial insurance industry in Vietnam.

Figure 4: Profit growth of Baoviet from 2010 to 2017 (Unit: VND billion)

Quy mô lợi nhuận: Profit, Tốc độ tăng trưởng lợi nhuận: Profit Growth

Source: Audited consolidated financial statements of Baoviet Holdings from 2010 to 2017

Figure 5: ROA and ROE of Baoviet from 2010 to 2016

Source: Calculated from Audited consolidated financial statements of Baoviet Holdings from 2010 to 2017

Return on equity through years of Baoviet was relatively modest within a range of 9.03% to 13.63% while return on assets was only from 2.11% to 3.19%. Baoviet witnessed a downward trend in ROE and ROA from 2012 and bottomed at 2015 (ROE of 9.03% and ROA of 2.21%). However, these ratios gained its momentum in 2016 and hit a high record in 2017 (ROE of 13.36%).

Brand value of Baoviet reached US108 million, affirming the leading financial insurance brand. BVH share was one of the most stable stocks in the VN30 basket. In the first few months of 2018, BVH share price increased sharply, closing the session on 09/4/2018 at VND107,000 per share and closing the session on 07/6/2018 at VND95,900 per share, capitalizing at around US \$ 3 billion.

Regarding social responsibility: Baoviet always engages economic growth with environmental protection and social responsibility – three pillars on which a long-term success of Baoviet is built. In addition to achievements of economic targets in terms of revenue, profit and profitability, BVH has increased its investment in and assess values the Group has brought to society on the basis of GRI standards and corporate goals itself. Social values are values that BVH brings to stakeholders and the whole community. It is possible to outline the responsibilities of BHBV in bringing benefits to the stakeholders in Table 1 as follows:

Table 1: Benefits from Baoviet to community

| Stakeholder Engagements | |
|----------------------------------|--|
| Shareholders / Investor-s | <ul style="list-style-type: none"> • Fully exercise the rights of investors such as organizing the Annual General Meeting; dividend payment, information disclosure... • Establishing department responsible for shareholder relations, well-trained and supplied with sufficient resources to meet the needs of interests related to shareholders. • Organizing the reception, introduction and updating of information with institutional investors; Participating in domestic and international investment conferences. • Actively publish and disclose information through media, press conferences, websites and publications of Bao Viet. |
| Customers | <ul style="list-style-type: none"> • Periodically conduct research and survey customer satisfaction. • Improve the efficiency of customer service through the website providing online support for customers. • The key to BVH's success is building strong relationships with customers, not only selling products so the “Best Insurance Brand in Vietnam 2018” for the 2nd consecutive year awarded by Global Brands Magazine (GBM) - a prestigious international magazine based in London (United Kingdom) is a convincing evidence of BVH benefits to customers ... |
| Employees | <ul style="list-style-type: none"> • Taking care for employees: Periodically carry out the employee satisfaction Survey, conducting two mid-term and end-of-year assessments on a five-level performance rating scale and applying the corrective measures to evaluate the individual performance and behavior to ensure clear, reasonable and equitable treatment and promotion. Caring for the health of employees through regular medical check-ups; Health Care and life insurance “An Nghiep Thanh Cong” for employees, while supporting preferential insurance package for employees' relatives. • Facilitating employees to participate in the decisions of the enterprise such as organizing labor conferences, end-of-year business meetings with the participation of all employees. • Successfully issuing share through ESOP to bolster commitment of employees and increase benefits for employees. • Organizing internal communication by issuing weekly e-newsletters, internal newsletters, internal websites to communicate the activities of enterprises. With regard to gender equality in the company, the number of female employees is 2,915, accounting for 54% of the labor force. BVH always attempts to ensure equality for female employees in all activities of the enterprise and being awarded “The best working place in insurance industry in Vietnam” by Anphabe in consecutive years ... |
| Part-ners | <ul style="list-style-type: none"> • Making public tenders and selecting reputable partners with a transparent financial system and business practices in compliance with law, environment, society and business ethics. • Holding meetings/workshops to share and exchange experiences. |
| Communi-ty | <ul style="list-style-type: none"> • Coordinate with local authorities to build basic facilities, help people in the most disadvantaged provinces throughout the country, activities of gratitude to all ethnic groups in the war zone, appreciation of war matyrs and veterans' family ... • Coordinate with schools, hospitals, and humanitarian centers to provide opportunities for children, disadvantaged people, vulnerable populations to access to the pharmacy and healthcare... • Baoviet builds a Score Matrix including a scorecard with 15 different criteria. The total score of 38 is divided into three basic categories: <ul style="list-style-type: none"> + Donor project and implementation unit; + Social objectives; + Benefit of Bao Viet when sponsoring project. • With great contribution to the society throughout the past 50 years, BVH has received prestigious social responsibility awards such as Top 50 “Good Corporate Social Responsibility and Community Development” by Journal of Economics and Forecasting - Ministry of Planning and Investment held in 2014 up to now. Top 10 “Gold Star Award of Viet Nam 2013 typical of social responsibility” by VCCI. |

| | |
|--------------------------------|---|
| Government, Authorities | <ul style="list-style-type: none"> • Participate in conferences, workshops organized by the Government, the Ministry and the Committees to provide comments on social security policy ... • Exchange of information as a member of many organizations, associations: Vietnam Insurance Association; World Economic Forum; Vietnam Chamber of Commerce and Industry; Vietnam Information Security Association (VNISA); ... |
| Media | <ul style="list-style-type: none"> • Periodically holding press conferences to publish semi-annual and annual business results. • Contacting and attending interviews with press agencies at events, forums ... that Bao Viet participated in. |

(Source: Sustainability report of Baoviet Holdings)

RESPONSIBILITY OF ENVIRONMENTAL PROTECTION

Baoviet has devoted resources to control consumed energy, waste and waste treatments within the whole group; also embedded the environmental protection to the supply chain management with related parties; investment projects appraisal and risk management... Throughout recent years, Baoviet has focused the review, evaluation following GRI 300 in order to reduce negative impacts to environment with Baoviet value chain. Growing annual financial resources spent for this aim year by year has proven Baoviet's contribution toward environment protection, enhancing solid foundation for the sustainable development.

BVH's investments toward environment protection includes:

The first: reduce the greenhouse effect – committed to green environment in building management of BVH;

Since 2014, Baoviet has evaluated impacts from operations of Baoviet's buildings in Hanoi to environment and transparently report on annual Sustainable reports.

The second: implement 5S program to enhance labour efficiency, create an clean and healthy working environment. Therefore, Baoviet has collaborated Vietnam National Productivity Institute to ensure that document and filing systems are "Sort – Set in order – Shine – Standardize – Sustain", aimed to saving searching time, increasing productivity, and reducing paper and stationary use - which has negative impacts on environment.

The third: Raise awareness about green life environment through movements for employees and their family.

Baoviet has organized "Baoviet GoGreen – Green journey" to raise employees' awareness on environment protection, painting competition about "For a one green planet" for employees' children with the whole group to send a message "Each of us give a hand for a no polluted environment. Together we can make our children's dreams to be come true". With a message of "small habit for a great effectiveness" in order to change employees' awareness and habits in using energy, Baoviet has organized "turn off the light, turn on the future" program, following the Earth Hour. "Turn off the light, turn on the future" is the message Baoviet use to communicate within the group to follow the Earth Hour, via: posters, electronic announcements and bulletins...to raise the awareness of employees and their family on environment protection – which is the responsibility of the whole society, not any individual or organization; any over - exploitation of any resources can cause the imbalance of the ecosystem, which in turn, can lead to counterproductive effects and restricts business activities.

RECOMMENDATIONS FOR SUSTAINABLE BUSINESSES:

The first: Proactive prepare reports and keep improving Sustainability reports' quality.

From Baoviet experience, proactively preparing Sustainability report following GRI standards, Integrated report following International Integrated Reporting Council ('the IIRC') will help business

enhance its value and its related parties. Baoviet 2017 Integrated Report has both basic and core factors of an integrated report, not only combined key issues such as strategy and business orientation up to 2020 and vision to 2025, but also created motivated factors for growth, detailed contents on business management, risk management and related society and environment issues. Following the IIRC helps the company to integrate detailed quantified information completely in most of key aspects: finance, management, environmental and social responsibility. Baoviet has used reports as one of communication method to related parties which is transparent about its strategy, business plan and the ways to utilize its resources and generate its values. Therefore, Baoviet Integrated report provides an overview on its business operation, hence, supports long term investment decisions. Despite the fact the GRI Standards are expected to widely used in 2018, Baoviet was the pioneer to apply these in its 2016 Sustainability report. The GRI were formed as a measurement for business, based on factors of sustainable development, detailed on economy, society, environment; acting as a method for objectives setting, change measurement and management; and focused on successful factors of a business – for people, by people in order to achieve sustainable development. The quality of the report would be enhanced if the company improve included qualified information and provide benchmarks for specific targets of each industry in order to supply effective information for the management in decision making process.

The second: Enhance quality of management information following ASEAN Corporate Governance Scorecard.

With the wish to share information on business management to the investors and market players, Baoviet has implemented the evaluation of business management based on ASEAN Corporate Governance Scorecard. In the upcoming years, Baoviet will commit to complete the scorecards in the directions of: more details on step-by-step application; the effectiveness of international standards on management, internal control systems, internal audit and risk management at Baoviet; combine with descriptions on the business process and models, embedded with actual performance, applying international standards into performance of each company of the Group. This is a very good experience to enhance the effectiveness of business management process.

The third: Focusing on investment in applying the application of scientific and technological advances of the 4.0 revolution, creating an ecological environment for creative development in enterprises.

Strengthening investment in applying the achievements of the 4.0 revolution into the management and administration of business activities in order to increase the competitiveness of enterprises in the industry. The era of relative stability has ended with the growing advanced sensor technology and related services. Every business encounters the risks and opportunities of the 4.0 technology. The development of digital technology, artificial intelligence ... will help insurance companies to increase customers, improve the efficiency of customer records management, promote sales and design financial solutions to meet the customers' needs, in particular, help to improve the review of claims and compensation in non-life insurance. This however is also a threat to the insurance market, many new insurance companies entering the market are using advanced technology to set up customer profiles and distribution channels with cost-effective governance and even more effective than current competitors'. Enhancing big data analysis (Big Data): Insurers have a huge advantage in being able to access to a lot of valuable information from customers. ***Discovering, collecting and analyzing big data is the key to winning markets and taking advantage of opportunities, hedging are the absolute advantages that revolutionary technology 4.0 brings to business. Enterprise mastering the data system will lead the market.***

Regarding big data analysis, product development, adding value to the traditional products for customers ... new products will become more attractive to customers and meet diversified customers' demands, which in turn helps to increase business turnover. Availability of huge amounts of data is creating a new era for the service sector, especially in insurance and finance. For example, traditional spreadsheet rates will now be updated in real-time and the dynamic pricing process. Companies such as Digital Fineprint specializing in exploiting data from social networking platforms may be under the control of insurance companies. Uniphore provides fast analysis, virtual assistant and biometric voice capabilities in 80 languages. The technology for wearable tech and telematics technology also provides the insurance industry with more personal data ... These are the experiences that every insurance business needs to equip.

PROMOTING GREEN MARKETING MOVEMENT FOR THE SUSTAINABLE DEVELOPMENT OF COMPANIES IN VIETNAM

Anh Thi Van Nguyen* - Nga Viet Le**

ABSTRACT: *As sustainable development and environmental protection are becoming more and more popular in the public eyes, green marketing has risen as a new tool for companies to achieve sustainable development. However, many companies, especially in Vietnam still do not have thorough knowledge about green marketing and how to apply it. The paper first introduce some basic concepts of green marketing, the importance of green marketing to companies, then it analyse the state of green marketing application in Vietnam, and finally looking at some successful applications by large companies in the world to draw out solutions to promote and apply green marketing for companies in Vietnam.*

Keywords: *green marketing; sustainable development, marketing application*

1. INTRODUCTION

In recent years, the public has gradually become aware of the importance of sustainable development and environmental protection. Environmental protection campaigns have become the trend and concern of the masses. This is followed by the emergence of the new “green” concepts such as green food, green products, green tourism, and green consumption - consumption of products that are not harmful to the environment. In business, a new concept - green marketing or environmental marketing - is born, gradually developed, and is expected to become the inevitable trend of the 21st century.

Many experts believe that the birth and development of green marketing is from three main causes. Firstly, as “sustainable development” becomes a top concern, governments all over the world are building the legal system surrounding environmental matters with strict regulations. Secondly, the “awaked conscience of environmental protection” promotes the “green consumption” movement. Finally, the existence of a “technical barrier” system in international trade appears under the umbrella of “green environment”.

2. OVERVIEW OF GREEN MARKETING

Nowadays, most businesses think that green marketing focuses mainly on media communication or advertising the products with some environmental characteristics. In theory, the American Marketing Association (2008) defined green marketing as marketing activities for products that are considered safe for the environment. Meanwhile, Hardeep (2011) that Green marketing is considered the most essential part of development in business process now a days. According to Henion “Green Marketing is defined as the implementation of marketing programs directed at the environmentally conscious market segment. As such, green marketing is a combination of a range of activities, including product design, production,

* MA, Academy of Finance, Hanoi, Vietnam, Anh T. V. Nguyen, E-mail address: vananhnguyen@hvtc.edu.vn.

** MA, Academy of Finance, Hanoi, Vietnam

pricing, as well as advertising, and distribution to create an environmental friendly product that best meets the needs of customers.

Green marketing can be applied to consumer goods, industrial goods, or services. For examples, many overseas resorts have provided “ecotourism” services targeting customers who are well aware of environmental issues. The fashion industry also catches up with the trend by holding shows with collections of recycle products (May 1991, Ingram and Durst 1989, Troumbis 1991).

The marketing mix of green marketing includes 4P but with some distinctive features:

- **Products:** Products/ services must not only meet the needs of consumers but also need to minimize the negative impact, even protect the environment. Packaging plays a very important role.
- **Price:** Because of the environmental friendly features, most of the “green” products are priced higher than the average products.
- **Place (Distribution):** Effective distribution channels not only bring the product to the right place at the right time, many companies are committed to using the optimal solution to minimize the impact on the environment.
- **Promotion:** Mixed promotion activities focus on the environment aspect of the product and brand. An environmental certificate will also have the same weight as the ISO quality certificate. Sponsoring activities for environmental protection organizations and campaigns should also be considered.

3. GREEN MARKETING CONTRIBUTION TO THE SUSTAINABLE DEVELOPMENT OF BUSINESSES

So why do businesses need to carry out green marketing? Green marketing helps businesses to reach and navigate green trends in consumer spending, minimize pressure from regulatory agencies, minimize costs, and above all, green marketing contributes to sustainable development of the businesses. Applying green marketing can bring notable advantages to companies such as:

- **Opportunity to approach the increasingly popular green consumption trend:** Today, more and more customers, individuals, and organizations are concerned about the environment. In 1992, a study in 16 countries showed that more than 50% of consumers in each country were interested in environmental issues (Ottman, 1993). The EPA-NSW study also found that 80% of consumers commit to changing behaviours which could cause negative impacts on the environment (EPA-NSW, 1994). Trends in consumer awareness and consumption are clear, so environmentally conscious marketing activities will help businesses gain competitive advantage and better prepared for the green future.
- **Minimize pressure from the government:** Governments are paying more attention to the environment with a range of policies, strict regulations on environmental protection, consumer protection, and education for their people. The “green” trend helps businesses keep pace with the country’s sustainable development, with many incentives and support from the government.
- **Help businesses to reduce operating costs:** There is opinion that increasing green marketing efforts can increase costs, but actually solutions to re-use products not only increase the efficiency of the production systems but also reduce raw materials supply. This helps the company to save money on recycling and reduce the demand for raw materials. Moreover, proper use of energy is a smart way of doing business. This is one of the easiest and most effective steps to cut costs, increase profits, and create value for the businesses.
- **Green marketing contributes to the sustainable development of enterprises:** Successful application of green marketing not only contributes to environmental protection but also contribute to promoting

companies' brands. Developing an environmentally-friendly business brings enormous benefits to business owners who are eager to control costs, attract customers, and take on more responsible business with the society and community.

4. GREEN MARKETING PRACTICE IN VIETNAM

Like many other developing countries, Vietnam is facing heavy pollution and more than ever manufacturers and businesses' social responsibility is being discussed a lot on the domestic media. The State's policy regarding the environment is tightened and gradually completed, including the legal system, environment bodies and strict punishments for businesses that pollute the environment. At a time like this, if the company carries out a proper green marketing strategy, this will not only improve their image but also creates many other benefits.

In reality, companies in Vietnam have started to apply green marketing to their activities. Although still new, the application of green marketing by these companies has raised customers' and businesses' awareness and responsibility toward the environment. A number of television programs have begun to spread knowledge to people such as "Let's go green", game show "Sống xanh - Ai là chuyên gia?", and reality show "Họ đang làm gì?". State involvement also plays an important role such as the Electricity of Vietnam Corporation (EVN) has provided support to individuals and businesses for the installation of solar water heating systems.

One of the past green strategies that the media crazed about is the case when Metro Group decided to sell reusable bags to customers instead of free plastic bags like before. Similarly, Big C supermarkets encourage customers to use bags that can be used for many occasions to reduce the use of plastic bags. Or many stores now use environmentally friendly paper bags instead of plastic bags. This is a "proactive" decision of the businesses (the tendency to prohibit the use of plastic bags is becoming so popular in many countries in the region and in the world), aiming to awaken the consumers' green demand and improve the image of business with the public. However, there is also the opinion that the plan of Metro, Big C selling bags instead of providing free plastic bags, will cause negative reactions of customers because this affects their immediate benefits.

On the other hand, many businesses in Vietnam till now have not taken seriously their social responsibility and intentionally polluted the environment. For examples, the discharge of untreated wastewater caused serious environmental pollution to the rivers and communities of Miwon, Hao Duong Leather, Viet Tri Paper, or Hyundai Vinashin (Khanh Hoa). The production of food containing substances harmful to human health, such as soybean containing cancer-causing 3-MCPD, noodles containing phormol, milk containing melamine. Vedan Company, ignoring the damage that people living along the Thi Vai River suffered, led to the demise of a long-standing brand in the Vietnamese market has become a lesson for all other companies in Vietnam.

5. SOLUTIONS TO PROMOTE GREEN MARKETING IN VIETNAM

The role of green marketing for the sustainable development of businesses in Vietnam is indisputable, so how can businesses apply green marketing, what conditions are needed, and which sources they can get the help from. By researching some green marketing campaigns of big companies such as Toyota with Prius product line, Procter and Gamble with Dawn product line, and American Apparel. Some recommendations are suggested for businesses in Vietnam as below:

Firstly, enterprises should have strategic commitment to environmental protection: A company committed to sustainable development and environmental concern always receives sympathy from the consumers. Through research on a number of pioneering companies, we found that in order to succeed, these companies focused on some of the typical features:

- **A visionary leader with a commitment to sustainability:** Visionary leaders who are committed to the environment are the company's top priority. Executives at Patagonia (Yvon Chouinard), Stonyfield (Gary Hirshberg), Timberland (Jeff Swartz) and Tom Maine (Tom and Kate Chappell) are great and experienced leaders. Not only committed to the businesses, these leaders bring in their personal commitment to customers on environmental protection, and thus gradually gaining the trust of their customers, partners, and employees.

- **Environmentally conscious staff:** equipping and updating the staff with the latest knowledge on climate change, green technology, and green consumer behaviour; establish information channels for staff to take initiative in accessing information. For example, the promotion of employees to actively participate in Earth Hour.

- **High initiative:** The initiative of the company and its leaders sends a message to investors that risk has been minimized. Regulators will reduce the imposition on companies that operate beyond the minimum environmental standards. Highly active companies help define new standards and explore opportunities for increased efficiency in ecological solutions.

- **Convey the value of the company to customers:** Many leaders including Patagonia, Stonyfield and Tom Maine convey the core values of the company in an effort to establish an emotional connection with their customers. This is also known as "Cause Marketing" or "Social Marketing".

- **Smart and environmental friendly marketing:** These companies do not limit their commitment to only environmentally friendly products and services, but also in their daily operations. Using recycled paper or paper produced in a sustainable manner, printing with soy-based ink reduces environmental impact, as well as the use of electronic media to replace printed press.

- **Closely connected with environmental groups/organizations:** Some brands have partnered with organizations such as the Sustainable Strategic Partnerships in Advertising to learn product lifecycle analysis methods. It aims to provide standardization for the product line and to test the environmental impact.

Secondly, transparency in activity and reporting: Companies should provide detailed information on the product and production practices, as well as actively report in a transparent manner. Vietnamese enterprises should also pay attention to social reporting. Social report is a part of in the annual financial report. This report summarizes the social commitments made by the company during the year. This helps businesses to promote corporate image in the eyes of consumers, further enhance the intangible value of the business and help businesses stay in line with the sustainable development strategy.

The Global Reporting Initiative is a global not-for-profit organisation, active through the United Nations Environment Program, ISO, and other groups. The organization has introduced global standards, the framework for assessing and reporting on economic, social, and environmental performance for the company in many areas. More than 1,500 companies, including Coca-Cola, General Motors, IBM, Novartis, Philips, and Unilever, are adopting its reporting standards.

- **Information is transparent, complete, and updated:** Companies can win over their competitors and score points with consumers by providing as much information as possible.

- ***Do not hide bad news:*** Consumers always react negatively or angry when they suspect that the company has hid some information from them. Vedan has learned this difficult lesson by hiding the complaints of its neighbours, denying the company's influence on the Thi Vai River and leading to the boycott of its products.

Thirdly, enrol the support of third parties relating to the environment: Common and trusted third-party formats include environmentally friendly labels, awards, sponsorship, and cause marketing.

- ***Environmental friendly labelling:*** There are a number of brands that now have a significant impact on consumer purchasing decisions, such as recycling logo, clean star-shaped energy certification, or organic certification, ISO. If the business sector does not have specific environmental labels, businesses can contribute to the development of a sector's own brand, in association with the authorities. Marketing strategies need to be closely linked to these icons, creating a strong perception among the target audience of the business.

- ***Awards and sponsorship:*** Trusted third parties can enhance the brand image. When launching the Prius, Toyota has emphasized that the car has received a number of environmental friendly awards, sponsored by the Sierra Club, the National Wildlife Federation and the United Nations car.

- ***Cause marketing:*** Cause marketing consists of advertising efforts as businesses donate a portion of product revenue to a non-profit organization that works for the environment. Cause marketing can help shape and differentiate brands in a confused market with more competitive brands. Procter & Gamble's Dawn dishwasher launched a campaign in which the brand donated USD 1 to the Marine Mammal Research Centre and the International Poultry Research and Salvage Centre for each product bought. The campaign is part of a larger campaign by Dawn to clean oil-contaminated sea water to save waterbirds. Cause marketing is not without risk. Businesses must also make clear to customers what they will contribute to the purchase or merely a campaign to raise awareness.

Fourthly, raise awareness for consumers throughout the product life cycle: Businesses can actively research and design green products but to minimize the impact of the product on the environment requires the involvement of customers. For example, for detergent products, more than 90% of the energy produced and used is in use. Consumers need to understand that it is their responsibility to use and handle the right products, provided they are provided with sufficient information and education. Some companies have attempted to design this feature into their products, such as the Toyota Prius' in-panel controls that provide direct information on fuel efficiency during runtime.

Fifthly, focus on key benefits: As Ottman and colleagues (2013) argued the surest way for businesses is to avoid using green claims. The consumer always wants to know first whether the products can benefit their individual. Focus on the right niche when environmental responsibility is viewed by customers as a preferred complement. Does your product help customers save more when using? Ads by Sears for Kenmore steam washing machines claim that this washing machine saves 77% of water and 81% of energy compared to older models. Does your product satisfy the target audience? The famous American Apparel clothing company offers clothing products that use organic cotton, and are comfortable to wear. But in 2004, when it was not enough for their customers, Dov Charney, the CEO of the company at the time, decided to move on to a more youthful, sexy image of the company. Three years later, the company had 180 stores with estimated revenue of USD 380 million a year, still fashionable products sold with all the same social and environmental benefits as before.

6. CONCLUSION

Green marketing is no doubt very important for companies pursuing sustainable development. It is necessary for companies in Vietnam to apply green marketing in their sustainable strategies. By looking at some successful companies applying green marketing in their practice, the paper has drawn out 5 advices for the companies including: strategic commitment to protecting the environment, transparency, call for third parties support, raise awareness of customers, and finally focusing on key benefits of the companies.

SUSTAINABLE DEVELOPMENT OF RETAIL BANKING IN VIETNAM IN THE CONTEXT OF GLOBALIZATION: A CASE STUDY AT VIETCOMBANK

Thu Giang Nguyen*

ABSTRACT: While the wholesale banking market is gradually becoming saturated and thus more difficult, the retail banking market in Vietnam remains rudimentary with much potential to be exploited. Vietnamese commercial banks have shifted their business strategies by expanding into retail and non-credit activities due to its nature of risk diversification and the possibility of product diversification. Being known as a commercial bank with a multi-purpose model providing the full range of leading financial services in Vietnam, the JSC Bank for Foreign Trade of Vietnam (VCB) has pioneered the development of e-banking services. In this process, VCB has achieved a lot of success, but still contains some limitations that need to be overcome. In addition, VCB continues to face challenges brought about by globalization. Based on the assessment of the retail banking services of VCB, the paper proposes solutions for sustainable development of retail banking in balance with sustainable objectives of economic benefits, social benefits and environmental objectives.

Keywords: Retail banking, sustainable development, globalization

1. CONCEPTION ON SUSTAINABLE DEVELOPMENT OF RETAIL BANKING SERVICES

The term ‘sustainable development’ first appeared in the 1980 World Conservation Strategy, which was widely disseminated through the 1987 Brundtland² Report of the WCED³, and reaffirmed at UNCED⁴ in 1992, supplemented and completed at the Rio Conference⁵ in 2012. Accordingly, ‘sustainable development’ is defined as “development that meets the needs of the present without compromising the ability to meet the needs of the future generations”.

Sustainable development focuses on a number of principles as following: Developing an equitable society in which people are at the center of sustainable development; Sustainable development of the economy, reasonable exploitation, and thrifty and efficient use of natural resources within the allowed limits; Sustainable development along with environmental protection; Development aiming at meeting the needs of the present generations while creating no adverse impact on the lives of future generations; Sustainable development associated with the process of industrialization and modernization on the basis of scientific and technological development.

Sustainable economic development is a global concern. Considered as the life arteries of the economy, the banking system of Vietnam has aimed at comprehensive and sustainable development. As the market for

⁴ Global summit on sustainable development held in Johannesburg (South Africa)

wholesale banking services is gradually becoming saturated and increasingly difficult, commercial banks have turned to the retail banking market in Vietnam which is still rudimentary and full of potentials for exploitation.

Retail banking services are understood as banking services provided to individuals, business households and small and medium enterprises through traditional distribution networks or e-networks. Development of retail banking services involve the expansion of commercial scale, the increase in the number and utility of products and services, the development of the distribution network, updating technology, improving the quality of retail banking services to best meet the needs of the customers in the market.

Sustainable development of retail banking services is to develop retail banking services in which sustainable economic benefits go hand in hand with social and environmental sustainability objectives. In order to be sustainable in terms of economic benefits, commercial banks focus on boosting their operations, promoting safe growth and ensuring quality of services through reasonable exploitation and efficient use of resources. For sustainable benefits, commercial banks are trying to satisfy the increasing demand of the customers in the market. In addition, commercial banks aim to provide finance and encourage social projects, balancing between urban and rural areas, providing development opportunities for customers, balancing between wholesale and retail, and finally, prioritizing human development projects. For environmental sustainability, commercial banks will consider the impact of financial projects, to assess if they are harmful to the environment. Sustainable development of retail banking services also aims to meet the increasing demand of the current generations, which lay a foundation for meeting the future demands. Retail banking services are simultaneously developed sustainably in the process of industrialization and modernization, based on the advances of science and technology.

2. GLOBALIZATION AND ITS IMPACT ON SUSTAINABLE DEVELOPMENT OF RETAIL BANKING

Globalization and regionalization have become objective and indispensable trends in the world economy. They have occurred in two parallel processes: economic liberalization and international integration. International integration in banking is essentially liberalizing and expanding the banking market in line with international commitments.

From 2011 up to now, the banking sector in Vietnam has made breakthrough innovations and penetrated deeper into the process of international integration through signing a series of free trade agreements. Under the Master Plan, by 2020, liberalization of financial services and of capital accounts will take place. The free flow of capital, people, goods will become a reality.

Globalization has brought opportunities for the development of banking in general, and of retail banking in particular: to attract foreign investment, to improve financial capacity and to increase capacity for solvency; to inherit and transfer technology, to access to new and modern retail banking products; have more chances to expand cooperation, to get experience-sharing and support, technical advice in banking technology application, and in management skill training to enhance the ability to prevent and handle risks from foreign financial institutions; to expand the market to the region and the world; to be involved in a leveled and highly professional business playground; Globalization requires Vietnam to improve its regulatory environment, to create an attractive investment environment for business entities, and thus commercial banks will have more opportunities to provide retail banking services; Competition has also motivated the banking system of Vietnam to restructure towards fast, comprehensive and sustainable development.

Besides the benefits, commercial banks in Vietnam also face many challenges:

Fierce competition: 35 commercial banks out of 118 credit institutions in Vietnam have realized the potentials of this market, and have accordingly shifted their business model to focus on retail services, have expressed their ambition and determination to become 'No.1 bank on retail'. The competition tendency among commercial banks is evident in credit activities and in the mobilization of capital from retail customers, especially consumer credit and individual credit. Some commercial banks even set goals to buy back, or set up new financial companies to exploit the consumer credit market. The competition is more acute for electronic payment services, banking technology and partner association. The competition pressure has increased as foreign banks gradually expand their business areas.

Competitiveness of Vietnamese commercial banks has not been high: The biggest challenge for domestic commercial banks is the big gap between their financial capacities, IT levels, management levels, human resources and quality of retail banking products. In addition, competition can lead to 'brain drain', when foreign commercial banks attract high-quality human resources by offering learning and development opportunities, professional working environment, institutional culture, high salary, rewards as well as other attractive perks.

Governance and control of Vietnamese commercial banks may become fragmented, as local banks improve their financial capacity by selling more shares to foreign shareholders, resulting in an increase in the ratio of foreign ownership at domestic banks. Decision No. 986/QĐ-TTg dated 08/8/2018 of the Prime Minister approved the development strategy of Vietnam's banking sector, specifying the direction of reducing state ownership in the three biggest commercial banks, allowing foreign major shareholders to buy some weak commercial banks, to turn them into 100% foreign-owned commercial banks. Vietnam has also decided to reduce state ownership in VCB, BIDV and CTG to 51% instead of 65% as previously, allowing these three commercial banks to select strategic shareholders who possess market prestige, strong financial capacity, and solid management experience – to prepare the prerequisites to proceed to public listing on the foreign security markets.

3. RETAIL ACTIVITIES OF VCB DURING 2012 - 2017

VCB was formerly known as the Foreign Exchange Management Department of the State Bank of Vietnam, which was established in 1955. In 1963, VCB was separated into the first commercial bank specializing on foreign trade banking in Vietnam, to conduct national foreign exchanges, to make international payment, and to provide import and export credits. In 2008, VCB pioneered in equitization, officially started to operate under the model of joint-stock commercial bank, continued to develop and maintain its position as the leading commercial bank in the country, while gradually reaching out to the international market. Together with the restructuring of the organization model and the deployment of many transformation projects for sustainable development in accordance with international standards, VCB shifted business activities to focus on some main pillars: retail, capital and service banking; asset control and quality improvement; income restructuring; enhanced cost control and especially shifting to digital banking.

For retail interest group. During this period, VCB retail capital mobilization has increased by 22.5%/year, higher than the 19%/year increase in deposit by big customers. The majority of retailers came from the population accounting for 55% of total VCB deposits, growing at the rate of 22%/year. The SMEs deposit proportion is 8%, with a growth rate of 28%. 70% of the retail deposit is short-term, which has been growing at the rate of 17%/year. The remaining 30% is long-term, which means a 51%/year growth. 81% of VCB's retail capital was mobilized in VND while the rest 19% was mobilized from other currencies.

Table 1: VCB retail banking activities for the period of 2012-2017

| Indicators | 2012 | 2013 | 2014 | 2015 | 2016 | 2017 |
|--|---------|---------|---------|---------|---------|---------|
| Interest Retail Product Group | | | | | | |

| Outstanding insured credit loans | 35.4% | 3.0% | -11.8% | 3.0% | 37.4% | |

(Source: Synthesized from annual reports, reports on retail banking services of VCB over the year)

VCB retail credit has grown by about 36%/year, higher than the 11%/year growth rate in outstanding wholesale credit. Credit portfolio expanded with a focus on retail loans, have shortened the gap between wholesale and retail loans, accounting for 58% and 42% respectively. Particularly, individual outstanding loans have accounted for 33% of total outstanding loans of VCB, with a 52%/year growth. Outstanding SMEs loans have accounted for 9% of VCB total loans, which showed a growth of 15%/year. Medium and long term retail loans have increased to account for 44% of the total outstanding loans. Outstanding loans in Vietnam dong have accounted for 84% while 79% of the outstanding loans have been made to customers with collateral. The diversified loan portfolio, focusing on high growth industries with good credit quality such as manufacturing, processing, transportation, warehousing, telecom, etc. The ratio of current loans is about 98% while bad debt ratio is 1.14%.

For premium retail product group, VCB continued to maintain the leading position in payment card market: Card payment volume has increased by 33%/year; Total number of VCB cards has reached 16.3 million cards, of which the number of international credit cards has increased by 1.35% over the same period; Card usage volume has increased by 23%/year; E-banking services meanwhile, have grown by 46%/year, bringing the total number of customers to 13.1 million. Customers using SMS banking still accounts for the majority of 66%. Remittances, meanwhile, have grown by 6.3%/year; Bancassurance of VCB is still at an early stage but has also increased by 13.4%/year. The majority of VCB's premium revenue has come from BaoAn Credit with about 100,000 loans covered for the first five years, with average insurance premiums of VND 200 million per loan. Outstanding insurance has increased 13.3%/year, with an increase of 37% in 2016.

Retail banking has helped to increase revenue and profit for VCB. Retail sales has increased 21.4%/year, higher than the 16.36%/year increase in VCB revenue, reaching the proportion of 41.6%. In particular, fee income has increased by 27.47%/year. Retail income has accounted for 85% of VCB's total revenue,

an increase of 20.8%/year. For individual credit, 95% of interest income has come from personal loans, while only about 5% has come from credit card loans. SMS and Mobile banking have accounted for 82%, Internet banking charges have accounted for 17% while approximately 2% comes from Mobile bankplus and Phone banking charges. 99% of Bancassurance fee comes from BaoAn Credit. 62% of the fee collected from domestic remittance and treasury services, while only 38% comes from international remittance. 88% of the fees collected is from card payment, while 5% is sponsored from international card organizations and 7% from foreign currency gained during international card payment process. Profit from retail banking has accounted for 20% of VCB's profit, showing a better growth which has been higher than VCB's net sales and retail cost.

Competitiveness of VCB in the Vietnamese retail banking services market

Regarding financial strength, with the total assets of USD 46.2 billion (VND 1,035 trillion), VCB was behind BIDV (owning VND1,202 trillion) and CTG (owning VND 1,095 trillion). Equity of VCB reached VND 52,558 billion at the end of 2017, after CTG at VND 63,765 billion and BIDV at VND 48,834 billion.

Competition in the retail market in Vietnam is becoming fiercer as major commercial banks have been focusing on developing retail services and are aiming at becoming 'No.1 retail bank' in Vietnam. Retail deposit in Vietnam in this period has increased by 15%/year and the majority of such deposit has come from the population.

Except for Agribank with different characteristics, to compare with the three strongest commercial banks in Vietnam, at the end of 2017, VCB has risen to an equal position and even slightly higher than CTG, reaching VND 392,013 billion mobilized from the population. VCB is still ranked third in terms of retail loan.

With strong technological infrastructure, VCB has always

(Source: Annual reports of VCB, CTG & BIDV, 2017)

(Source: Annual Conference 2017, Vietnam Bank Card Association)

led the market with modern distribution network with ATM market share accounting for 15% and POS for 32%, leading the market in electronic payment. Card payment turnover of VCB has been leading in the market accounting for 22% of the market share while the figure for CTG is only 21% and for Agribank is 18%. VCB's card issuance market share has ranked third with 16%, followed by CTG with 21% and Agribank with 19%. VCB card usage has grown well with 23% market share, higher than Agribank 19% and East Asia 11%.

VCB currently attracts about 25% of Internet Banking customers, 62% of E-commerce payment turnover, 55% of

payment turnover for goods and service bills through electronic channels, 37% of domestic card payment and 45% of international payment card payment. After launching Digital Lab, VCB expects to achieve 40% of transaction volume through e-banking channels and to attract $\approx 50\%$ of customers using e-banking services such as internet banking, and mobile banking.

VCB currently maintains a 17.7% market share of remittances, higher than Sacombank 16% and CTG 15%. VCB ranked 8th in Bancassurance market with 5.3% market share (by gross premium income), lower than Generali, Vietin Aviva, and slightly higher than BIDV-Metlife.

4. ASSESSING THE SUSTAINABLE DEVELOPMENT OF VCB RETAIL BANKING IN 2012 - 2017

4.1. Retail performance of VCB in accordance with sustainable development objectives:

Regarding economic benefits: VCB has pioneered in the market and has successfully developed retail banking services, fulfilling beyond targeted on all the retail indicators set out for each year while closely following the business direction by the management board. VCB has increased utility and diversified retail banking products in each market segment. Retail deposit and loans have surpassed the targets set with relevant structural shift in line with VCB's focus on retail development. Personal credit growth has been strong at 51% per year. Service activities have grown well; VCB has actively connected with international card organizations and partners in different industries to cover electronic payment services for many electricity, telecommunications, insurance, securities, etc. partners. *It has successfully implemented the electronic payment development (is currently the market leader), money transfer and Bancassurance products; The most obvious reflection of the economic benefits brought about by VCB retail banking is the dramatic improvement in profitability, positive sales and earnings growth (21.4% per annum), the proportion of retail sales in VCB's total revenue which has increased significantly (from 20% in 2012 to 42% in 2017), interest income accounted for 85% and retail banking has accounted for 20% of VCB's profit.*

Developing retail banking services towards security: When the wholesale market becomes more risky, VCB moves to focus on developing retail services (so as to diversify risks and to obtain product diversification) in parallel with trying to reduce inefficient wholesale loans; VCB has also implemented tight lending procedures, to secure collateral and credit conditions, and to keep pace with changes in the capital sources and the use of capital; VCB has implemented the Basel II Capital Treaty, CTOM, CLOS Project, Corebanking; It has also refined the credit risk framework, liquidity risk, market risk and operational risk in line with international practices, to make it more suitable with the Vietnamese market and its own development strategy. Compared with 2012, the proportion of short-term mobilized capital has dropped from 84% to 69.5%, while long-term capital has increased from 16% to 30.5%. The ratio of capital mobilized in domestic currency has increased from 73.7% to 81%; meanwhile, credit quality has been put under tight control. Bad debts and off balance sheet liabilities have been made more effective. Standard debt has increased by 29%/year, accounting for 98% of VCB's outstanding loans. Bad debt has declined and currently accounts for only 1.14%. Non-performing loans of VCB concentrate more on shipbuilding, seafood processing, acquisition of raw materials for industrial production and construction and so on in the South West provinces, Hanoi and Ho Chi Minh City.

Development of retail banking towards environmental sustainability: VCB strictly implemented Directive No. 03/CT-NHNN dated March 24, 2015 by the Governor of the SBV on promoting green credit growth and socio-environmental risk management; and Decision No. 403/QĐ-TTg dated March 20, 2014 by the Prime Minister approving the national action plan on green growth for the period 2014-2020, as well as other regulations related to environmental protection in loan provision. VCB has asked that investors of projects considered for credit granting meet the criteria for environmental and social protection. For a

number of investment projects with potential adverse impact on the environment, VCB requires that the investors provide environmental impact assessment reports and environmental protection commitments in accordance with relevant laws such as the Law on Environment, the Law on Natural Resources, Decree No. 18/2015/ND-CP, Circular No. 16/2015/TT-BKHDT... In late 2016, VCB implemented the project 'Green for life' with a view to raising awareness among primary school students about the importance of protecting the surrounding environment; VCB also joined the program 'Green message from the earth' to overcome the consequences of postwar landmines– the program has been implemented by the State Steering Committee following Decision No.504/QD-TTg of the Prime Minister, etc.

Developing retail banking towards social sustainability: In the period of 2013-2017, VCB spent over VND 971 billion on social security programs with focus on education, health care, the poor, natural disaster recovery and other areas. Concretely, it provided loan assistance through reducing lending rates and implementing competitive interest rate programs; actively implemented lending programs on priority areas, developed credit support policies for the poor, for affected clients, damages caused by the weather, natural disasters and environmental incidents; the program of providing preferential loans to individuals and business households in disaster-hit areas, programs for building houses of gratitude and helping families of war invalids, fallen heroes, former war youth volunteers and war veterans, poor people and marine soldiers in duty to protect the Paracels and Spratlys, etc. to sponsor the construction project to bring electricity to Co To Island;

On education, health and human development: VCB focuses on developing human resources, further training for employees, developing satisfactory wage and rewarding schemes, fair rewards and punishment, using the right people in the right job. For external relations, VCB co-sponsors the 'Vietnamese National Talent' (2013-2017) which aimed at stimulating creativity from the community, seeking for initiatives and individual or group researches to bring about practical solutions to the community, to boost the socio-economic development of Vietnam in many fields; VCB also cosponsored 'Light Up Vietnamese Children's Dream' (since 2008) a program designed for poor and studious children, street children and disadvantaged children; VCB has also been implementing a number of grant programs, preferential credit packages for infrastructure construction, procurement of equipment for schools and health facilities in some localities; the bank has given support to cover surgical costs for many patients, especially disadvantaged children; Through the Study Encouragement Fund, VCB has given scholarships to outstanding students with excellent academic achievements. From 2014, in each school year, VCB has launched an event series of 'VCB welcomes new students' to introduce and consult on the use of retail banking with many incentives. In 2017, VCB was given the "Bank of the Community 2017" along with many other awards.

Sustainable development of retail banking has been associated with the process of industrialization and modernization, on the basis of scientific and technological development, to meet the needs of the current generations and not hindering the lives of future generations: VCB is a commercial bank with the strength of modern technological infrastructure, and a leading role in the market for its modern payment networks, e-banking, card payment, international payments, etc. In 2016, VCB launches Digital Lab services, confirming a pioneering trend, its strong investment in technology and the ability to apply digital technology in providing banking services with a view to meeting diversified demand of the customers and preparing the basis for the future development under strong influence of the great revolution 4.0.

4.2. A number of shortcomings that need addressing in order to sustainably develop retail banking

Continued problems in service products: VCB is currently neglecting domestic credit cards, asset keeping services, prepaid cards (4% market share)...; VCB retail products are still rather conventional,

and limited in type and utility and need to be increased and refined; Cross-selling products, remittance services, ... are still monotonous and not competitive enough. The market of retail banking is still in early stage as current exploitation has realized only 20-30% of the market potentials. Globalization, the Great Revolution of 4.0, e-commerce boom and the fact that 95% of Vietnamese people are using smart phones have led to the inevitable trend of mobile banking. But VCB smart banking development is still at an early stage.

Retail performance of VCB is still limited: retail sales of VCB are uneven and low compared to market potentials; The short-term outstanding retail loans remain large in proportion leading to high risks in liquidity; Credit quality for some customer groups and at some branches is still low; Safety prioritized business strategy will force VCB to reduce profits to increase the reserve to the highest level to deal with risks. Despite strong growth, retail banking is still modest compared to the investment costs.

Distribution channel network has not been optimal with redundancy here and shortage there; There are still problems with broken ATM, software errors, out of money ... and thus, many transactions still have to be carried out in transaction branches; POS is still not enough to meet the market demand, concentrating in big stores and big cities; mPOS and online remittance transactions have not been deployed.

Increasingly fiercer competition in the market: VCB's capital mobilization and lending activities have not proved superior to those of other commercial banks of the comparable size; there is still a big gap between VCB and commercial banks in the region and in the world in terms of competitiveness. The challenge gets bigger as Vietnam gradually liberalizes its banking and finance sector in accordance to its integration commitments.

In management administration: Procedures have not been flexible enough, while information exchange among the transaction offices is not timely updated; Retail sale department was set up quite late (2015), although the retail development target had been set very early. Management of information has been rather confused between retail and wholesale banking. Assessment criteria have not been developed fully. The development, review and improvement of the operation model and the development of functions and duties of the department has been slow. A number of management capacity-building projects such as ALM-FTP-MPA, Corebanking ... are still behind schedule.

On the objective of sustainable development of economic benefits: At present, the retail operation of VCB, despite having brought about good results in terms of economic benefits, has not been commensurate with the market potentials. The proportion of retail revenue and profits is still very low compared to wholesale, while growth is uneven and stable over the years; Selling bad debts is only a situational measure. Thus, it is necessary to have better measures to manage credit quality in order to achieve sustainable growth.

On the objective of social and environmental sustainable development. Social security activities are mainly carried out under the form of sponsorship or the provision of preferential credit packages which are limited to people with very specific, and typical backgrounds, or areas suffering from natural disasters, or from serious incidents or islands/sea areas of political significance. In fact, many poor or disadvantaged people (but not serious enough to attract the attention of the society) are also in need of preferential credits, or at least credits under loosened conditions. The social projects deployed by VCB have been quite extensive and widespread, and yet attention has not been adequately paid to the startup projects. The environmental protection of major credit application projects still responds more to formality rather than being substantial while the inspection and supervision of these projects have yet been effective.

Limitations on IT infrastructure: VCB has invested heavily in infrastructure and technology, but has not utilized effectively. Network errors continue to happen during website surfing. Errors also happen during internet transactions or transactions through smart phone. The scope of electronic transactions is still limited and is highly dependent on the transaction over the counter. Although the market demand for online payment is very high, customers are still concerned about the safety, transaction and information security.

5. SOLUTIONS FOR SUSTAINABLE DEVELOPMENT OF RETAIL BANKING IN THE CONTEXT OF GLOBALIZATION

5.1. To improve financial capacity, governance and administration

To improve financial capacity through increasing ownership capital and to structure towards maximizing capital by: withdrawing capital from credit institutions (EIB, MBB); to propose to the Government to reduce the ownership ratio of state capital to 51% and to leave at least 50% of annual dividends; to issue bonds at competitive interest rates; to pay dividends by stock; to attract and allocate funds to promote banking operations. To increase the quality of ‘Assets’; to propose to raise the ownership ratio of foreign investors to 35% to meet Basel II standards;

To enhance management capacity in the market economy based on the 4.0 technology: To refine the model of retail banking in the direction of specialization; To reform the administrative procedures, to improve the management capacity and to standardize business processes on the basis of high technology and international practices; To digitalize the procedures, and monitoring and inspection programs, ... to detect early risks to overcome the consequences in time; To continue the deployment of Basel II; to complete ISO 270001 on Banking Management

5.2. To expand market share by sustainable development of retail products

To develop diversified retail banking, to increase utility and improve the quality of retail services; to continue to move ahead with the market and make careful market exploration before mass supplying new products; to increase cross-selling and cross-selling to wholesale customers; to allow flexible conversion between depositing and deposit withdrawal; To promote loans on credit for SMEs (those lacking collaterals and yet having low SME bad debts); To implement automatic fee collection and fee management solutions; to standardize retail real estate credit and business production packages. To improve Bancassurance efficiency and remittance services. To simplify administrative procedures (maturity, verification and compensation for customers) to create trust and attract customers. To expand the network of remittances in the country. To expand cooperation with other countries with many Vietnamese expats.

To enhance e-banking services, especially mobile banking: To enhance cooperation with other business partners to expand e-payment services; to refine and increase the utility of ebanking; to apply high security measures for securing transactions and customer information. To demonstrate the demand for Mobile Banking by: deploying payment on Mobile Banking, Mobile Payment; to promote Mobile Banking advertisement integrated with multi-functional utilities to meet multiple customer needs. To simplify registration procedures; to enhance value to the user experience on Mobile Banking; to provide intelligent interface design, suitable for each type of mobile device; to regularly update new mobile technology applications: new operating system, and upgraded version.

5.3. To promote and improve the effectiveness of supporting activities for sustainable development of retail banking

To implement a marketing campaign with a reasonable pricing policy in the spirit of “to offset the price reduction through increase in the quantity”. To determine the price of retail products while balancing with the price and the impact of supply and demand on the market. In order to do so, commercial banks

need to exploit the market to the fullest by developing diversified retail services suitable for different market segments, with different groups of customers and at the same time enhancing the cross-selling of products.

Optimizing business models and payment methods through modern distribution channels on the automation platform, multi-dimensional and intelligent connectivity of FIR 4.0. To build up transactional space through a computer screen/tablet system, etc., without the help of traditional operators; To implement mPOS, to additionally install and reasonably adjust ATM and POS network; To focus on developing modern electronic payment methods most suitable to the market such as: Ecommerce; Contactless payment and Mobile payment.

To modernize IT technology while prioritizing the development of new integrated IT solutions from suppliers: To continue to invest in equipments, in upgrading the technological infrastructure, upgrading the broadband transmission line of high volume and high speed; to continue to upgrade Core banking; Data appliance, TF & LOS, KPI, the ATM system following EMV standards, IT upgrades using cloud computing (Cloud Computing), card switching system and so on.

To renovate customer care policy, creating a close and sustainable relationship with existing retail customers by ensuring service quality and offering incentives developed for traditional customers (VIP). To attract new customers through the synchronized implementation of sales promotion activities.

To improve customer interaction and customer care on the basis of technology 4.0: to offer internet-based experience to customers, to open mobile trading locations at specific locations (airports, trade centers, trade bazaars, etc.); to deploying the 24/7 bank initiative, to establish more channels to interact with customers through technology applications such as web, skype, social networks. *To maintain and enhance the strong brand name VCB:* to finalize and communicate the “VCB quality standards” for retail banking services.

Enhancing internal risk management and control capacity in retail banking: to strengthen ‘Internal Audit Committee’ (established on 01/8/2015), to enhance internal auditing capability following Basel II; to regularly and continuously monitor critical activities, to promptly detect and issue risk warnings on liquidity, market risk, operational risk, etc., from which to propose to all levels of banking management with recommendations to correct errors.

Development of high quality human resources: Fair and transparent recruitment of people who meet professional requirements, possess computer skills, and are proficient in foreign languages with a high sense of responsibility and good professional ethics; commercial banks should also use the right people in the right place; and regularly update their staff to catch up with the pace of development of the world.

5.4. Sustainable development of retail banking in the direction of balancing between the goals of economic sustainability and sustainable social and environmental protection

The stable growth of retail revenue and profits and the increase in the proportion of retail banking in the total turnover of commercial banks are the economic benefits gained when commercial banks synchronously implement measures to develop retail banking in a sustainable manner. Moreover, digital banking (especially mobile banking) is an indispensable trend, associated with the process of industrialization and modernization on the basis of science and technology, to meet the needs of the current generations and to lay the foundation for future generations.

For retail banking to be developed sustainably and safely, commercial banks need to strengthen measures to ensure network security as high as possible by continuously upgrading their network security system, building backup center (Disaster Recovery), ensuring electronic payment security, customer information security, and closely coordinating with agencies in charge to prevent, detect, and handle legal violations using high technology. Network security is the key to building customer trust.

Balanced with the goal of sustainable social and environmental development while seeking economic benefits from retail activities: In addition to the effectiveness of capital use and repayment capacity, commercial banks need to assess the impact of their business on the environment and society, requiring that the investment owners observe relevant environmental and social protection standards, and commercial banks should also regularly monitor the environmental and social risk management of the credit granted to clients. In addition, commercial banks also need to communicate the policies of the Government that regulate the responsibility of environmental risk management of credit institutions so that the customers understand and cooperate. Commercial banks should also continue to promote social security, beside designing incentive packages for students, for startup projects, as well as projects that have a positive impact on the society. For employees, banks should always create conditions for employees to promote their capabilities, to expand their opportunities to progress, to ensure the legitimate interests of laborers

CONCLUSION:

Retail is still a hot spot for development for commercial banks in Vietnam as the Vietnamese market has only been exploited by about 20-30% of its potentials. However, in the next phase, commercial banks will focus on developing mobile banking and payment methods using high technology. This is an inevitable development trend when the world is undergoing the process of globalization and the 4.0 technology revolution. In order to develop sustainably, commercial banks need to quickly adapt and take full advantage of the opportunities to overcome the difficulties by improving financial capacity and competitiveness, optimizing the business model on High-tech platform, development of retail banking products in accordance with the market trends, focusing on improving the quality of products and services, enhancing network security, building brand and enhancing the prestige in the market. /.

FACTORS AFFECTING CONSUMER DECISIONS ON PURCHASING ORGANIC AGRICULTURAL PRODUCTS IN HANOI

Vu Duy Nguyen* - Nguyen Vu Viet** - Pham Thanh Hang*** - Nguyen Thi Ngoc Anh****

ABSTRACT: *The study analyses the factors that influence consumer decisions on purchasing organic agricultural products in Hanoi. By synthesizing previous research, the authors establish Ordinal Logistic Regression (OLR) through survey questionnaires for 300 consumers in Hanoi in March 2018. The empirical model shows that there are eight factors, which have significantly positive impacts on the consumer decisions to purchase organic agricultural products, including: (i) the quality of products; (ii) trademarks, product labels; (iii) advertising, media, cultural factors; (iv) the understanding of the consumers about products of organic agriculture; (v) the convenience of the point of sale; (vi) income of consumers; (vii) psychological factors (attitudes, interests, taste, age, gender, etc.); (viii) the consumer's career. The research also finds out the two factors affecting negatively on decision of consumers, including: (i) the value-added tax for the import of organic agricultural products; (ii) the age of the consumer. Based on quantitative results, the study proposes recommendations to promote the purchase of organic agriculture products in Hanoi.*

Keywords: organic agricultural products; ordinal logistic regression; value-added tax.

1. INTRODUCTION

1.1. Literature review

Safe and quality are always one of the most concerned issues of the consumers to choose food products, especially agricultural products. Since the agricultural products currently offered rampant on markets, not least of which are products of unknown origin and the production process that is not controlled. So, they cause the harmful environment, the product does not meet the standard of food hygiene and safety products and bring the health burden for consumers. Therefore, organic agricultural products are a necessary and timely step of Vietnam's agriculture and adapt for current consumers.

The Eco-products are becoming more popular on the market and more approachable to consumers, and they are predicted to grow further in the future, especially in Hanoi. Since consumers nowadays have increasingly awareness of their health and environmental protection, they realize that organic agricultural products (OAPs) not only protect the ecological environment but also provide all the necessary nutrients for the body. However, a problem has arisen: there are fewer people buy organic agricultural products than other conventional products. This fact clearly shows that it is a big difference between hobbies and behaviors of the consumer toward organic agricultural products.

According to the International Federation of Organic Agricultural Movements (IFOAM), Organic Agriculture is a production system that sustains the health of soils, ecosystems and people. It relies on ecological processes, biodiversity and cycles adapted to local conditions, rather than the use of inputs with adverse effects. Organic Agriculture combines tradition, innovation and science to benefit the shared environment and promote fair relationships and a good quality of life for all involved. Thus, organic products are also called natural foods or healthy foods.

Basically, organic products are classified into 4 types depending on the percentage of contained organic components: (i) “100% organic”; (ii) “Organic” means the product contains more than 95% organic matter; (iii) “Made with organic ingredients” is product with at least 70% organic matter; (iv) “Some organic ingredients” has less than 70% organic component.

Organic products are usually called natural products due to the important role in maintaining the balance of the ecosystem and protecting the health of even the tiniest creatures in soil through the whole process from cropping, processing, distributing to consuming. Having been strictly accredited, organic products positively affect consumers’ health by reducing the risk of poisoning or cancer etc. Besides, as not containing any unnatural components, artificial preservatives, pesticide residue, growth stimulants, organic products are safe and nutritious. Moreover, organic agriculture contributes to reduce earth and water pollution since no chemicals is used.

Currently, the production of organic agricultural products in Vietnam have been deployed in the 33 provinces and cities across the country. The area of organic agriculture in 2016 has increased 3.6 times as much as in 2010 and approximately 77,000 ha. However, this is only a tiny number compared with 50.9 million hectares of organic agriculture of the world and the 11.53 million hectares of agriculture in Vietnam. Therefore, besides organic agricultural products of the domestic origination, imported products also tend to increase in order to meet the needs of consumers Hanoi city.

Theories of consumer behavior are important factors in establishing reasonable model for purchase decisions of organic agricultural products.

Fishbein and Ajzen (1967) with the Theory of Reasoned Action – TRA indicated that intention is the most important motivation of behavior and influenced by attitudes (positive or negative) and subjective norms, which mean the awareness of the appropriate manner. Through this research, they proposed the Theory of Reasoned Action model:

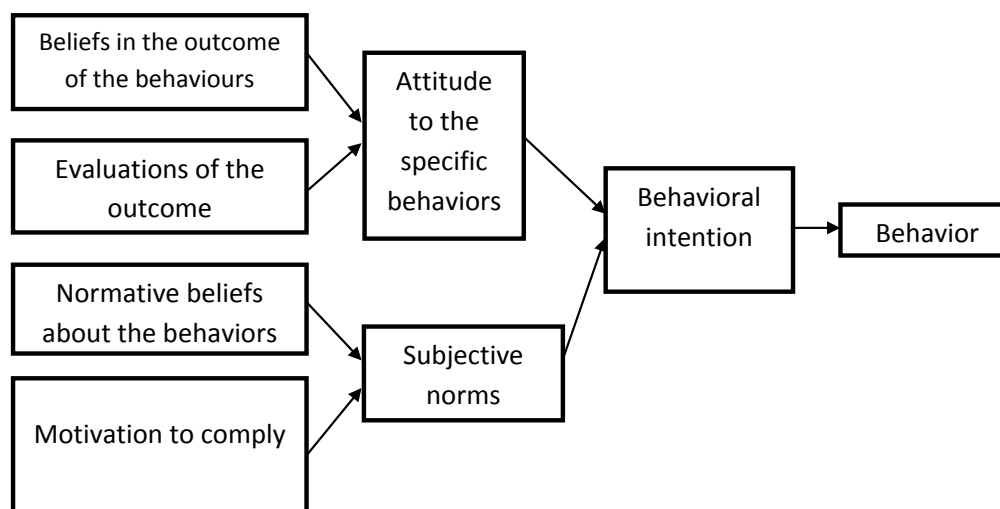

Figure. 1: The Theory of Reasoned Action by Fishbein and Ajzen (1975)

In 1991, Ajzen continued completing the TRA and gave birth to the Theory of Planned Behavior (TPB). He added a factor influencing the intention of consumers: Perceived Behavioral Control, which refers to people's perceptions of their ability to perform a given behavior. The addition had contributed to complete the TRA, which became the most popular research to be applied to explain human behaviors (Ajzen, 1991)

Figure. 2: The Theory of Planned Behavior by Ajzen (1991)

Phillip Kotler (1967), with the research “Marketing management” pointed out that the consumers’ decision took a process with 5 steps: (i) Problem recognition; (ii) Information search; (iii) Evaluations of alternatives; (iv) Purchase decision; (v) Post purchase behavior.

Next, the book “Consumer behavior” argued that the buying process of consumers also contains 5 steps: (i) Demand recognition; (ii) Information search; (iii) Evaluations; (iv) Purchasing; (v) Post purchase behavior (Engel et al, 1978).

While the book “Customer Behavior UK” was researched by Jim (2008) to state that when making the purchasing decision, consumers consider questions such as: How? Where? When? Why?. Besides, the research “*Factors affecting International Demand and Supply for Organic Products*” indicated also that there are 5 main factors impacting on consumers’ organic products purchasing decisions, including: Price; Quality; Origin; Genetic Engineering; Social purposes (Luanne Lohr, 2001).

Meanwhile, the research “Who consumes organic foods? Reasons why consumers choose organic foods”, pointed out 10 factors affecting organic products purchasing decision, following: Health benefit; Support for the local economy; Trend; Price; Market supply; Brand; Certification; Marketing (Rene’e Shaw Hughner et al, 2007).

Phong Tuan Nguyen (2011) with the “Research comparing organic foods purchasing intention in North and South Viet Nam”, tested and emphasized 6 factors, including: Attitude toward the ecosystem; Quality; Awareness of health protection; Knowledge about the product; Subjective norms; Care about food safety and cleanliness.

1.2. Framework of research model

In order to analyze the factors affecting consumer purchasing decisions of the organic agricultural products in Hanoi, the Ordinal Logistic Regression (OLR) model is constructed with a dependent variable Y and independent variables X_i .

The dependent variable Y (represents the consumer decisions on purchasing organic agricultural products) is measured with a 5-leveled scale. Y is collected through the observed variables (items) Q1 and Q2 in the questionnaire.

The Ordinal Logistic Regression model is accredited the influence of 12 independent variables on the decisions of purchasing organic agricultural products.

In OLR model, the dependent variable Y is classified into 5 level according to Likert: (1) Never; (2) Rarely; (3) Sometimes; (4) Often; (5) Always. If Pr is the possibility of a certain variable then $\Pr(Y_i \leq j)$ is the possibility that $Y_i \leq j$. The Odds coefficient is determined with the following formula:

$$\frac{\Pr(Y_i \leq j|X)}{\Pr(Y_i > j|X)} = \frac{\Pr(Y_i \leq j|X)}{1 - \Pr(Y_i \leq j|X)} \quad (1.1)$$

$$\text{With } \Pr(Y_i \leq j|X) = \sum_{m=1}^j \Pr(Y_i = m|X) \quad (1.2)$$

And we have the OLR model:

$$\ln \left[\frac{\Pr(Y_i \leq j)}{1 - \Pr(Y_i \leq j)} \right] = \alpha_0 + \alpha_1 X_1 + \alpha_2 X_2 + \alpha_3 X_3 + \dots + \alpha_{12} X_{12} + u_i$$

This is called the Logistic distribution function. In this function, the model uses the Maximum Likelihood estimations method to estimate the coefficient α_i . The independent variables (from X_1 to X_{12}) is estimated through the items Q3 to Q36 using the Liker scale. The factors affecting decision of consumers on purchasing the organic agricultural products in Hanoi include:

- *Quality of the product (X_1):* Quality is one of the most important factors influencing the purchasing decision. About 20% of food is polluted with chemicals, pesticide, which could seriously affect our health and cause illness such as cancer congenital abnormalities. Consumers who care for their health will have positive attitude toward organic products as they believe that they are better and healthier. The correlation between X_1 and $\ln(\text{Odds})$ is expected positive (+) and coefficient $\alpha_1 > 0$.

- *Brand and label on the product (X_2):* Brand and label are also significant factors to take into consideration when purchasing OAP. Products from famous brands are more trustworthy and the label is a guarantee that the products are organic. The correlation between X_2 and $\ln(\text{Odds})$ is expected positive (+) and coefficient $\alpha_2 > 0$.

- *Knowledge about organic products (X_3):* People will never buy products without awareness about them. This fully awareness about the OAP are determined through certain aspects such as: Knowledge about the qualification and process to produce the products; information of the products' origin; main functions. The correlation between X_3 and $\ln(\text{Odds})$ is expected positive (+) and coefficient $\alpha_3 > 0$.

- *Trend of consuming organic products (X_4):* Nowadays, trends have become a key factor influencing consumers' mentality, also known as "herd mentality". The effect of trends on consumers' purchasing decision are measured with certain aspects such as: people's awareness of the trend; whether the decision depending on trends; whether consumers chose the product regardless of their demand being meet. The correlation between X_4 and $\ln(\text{Odds})$ is expected positive (+) and coefficient $\alpha_4 > 0$.

- *Marketing and advertisement (X_5):* This factor impacts directly on the consumers' knowledge about the OAP as advertisement provides such complete and positive information. With skillful marketing strategies, advertisements always catch your interests and create demand for the products. The correlation between X_5 and $\ln(\text{Odds})$ is expected positive (+) and coefficient $\alpha_5 > 0$.

- *Cultural factors (X_6):* Culture is a spiritual value which is deep in the blood of a society, it becomes a part of the people, it controls every thought, every behavior. The effects of cultural factors are evaluate by: How the culture and awareness of protecting the environment also impact on the purchasing decision. The correlation between X_6 and $\ln(\text{Odds})$ is expected positive (+) and coefficient $\alpha_6 > 0$.

- *Psychological factors (X_7):* Psychology is emphasized as one of the most important factors. It directs people's point of view subjectively. The influence of psychology factors are evaluated with aspects such as: consumers' emotion, interest; family and friends' advice; belief in quality and usefulness of the products; the impact of trends. The correlation between X_7 and $\text{Ln}(\text{Odds})$ is expected positive (+) and coefficient $\alpha_7 > 0$.

- *Rate of value added tax on organic agricultural products (X_8):* Tax is a government's tool to adjust the macro economy, it affects directly the demand – supply of OAP in the market. For example, VAT will increase price of OAP in the market, which influence the supply, thus affect the demand, specifically the consumer purchase decisions of OAP. The correlation between X_8 and $\text{Ln}(\text{Odds})$ is expected negative (-) and coefficient $\alpha_8 < 0$.

- *Price (X_9):* Organic agricultural products' prices are usually higher than other products. It is clear that too high prices are the reasons why consumers choose organic agricultural products less. The influence of price is determined by: customers' consideration about the prices of the OAP; expectation of a reduction in the price of the OAP; the OAP's price stability. The correlation between X_9 and $\text{Ln}(\text{Odds})$ is expected negatively (-) and coefficient $\alpha_9 < 0$.

- *Retail outlets location (X_{10}):* This factor affects the cost and spending time to buy the OAP. The factor is judged by: the convenience while shopping, spending time to buy the product. The correlation between X_{10} and $\text{Ln}(\text{Odds})$ is expected positively (+) and coefficient $\alpha_{10} > 0$.

- *Consumers' income (X_{11}):* influences directly the consumers' ability to afford the OAP and fulfills the consumer demand. While intention is the prerequisites, the ability to buy the product is the sufficient condition. The correlation between X_{11} and $\text{Ln}(\text{Odds})$ is expected positively (+) and coefficient $\alpha_{11} > 0$.

- *The government's policies (X_{12}):* The government has many macro tools to affect the macro and micro economy. The correlation between X_{12} and $\text{Ln}(\text{Odds})$ is expected positively (+) and coefficient $\alpha_{12} > 0$.

2. DATA AND RESEARCH METHODS

2.1. Object of research

- The theories about the main factors that affect the purchasing decisions of consumers for organic agricultural products in Hanoi.

- To estimate regression factors that affect the purchasing decisions of consumers for organic agricultural products in Hanoi from the OLR models

- To draw recommendation and propose significant recommendations and solutions to support consumers, who have more knowledge of the organic agricultural products and come to exact decisions in choosing OAPs.

2.2. Subjects and scope of the study

- *Subjects:* Analysis of the factors affecting consumer decisions to purchase the organic agricultural products in Hanoi.

- *Scope of the study:* consumers that purchase and sell the organic agricultural products in large supermarkets of all large districts, such as Hoan Kiem, Dong Da, Cau Giay, North Tu Liem, Hai Ba Trung, Thanh Xuan, Hoang Mai district in Hanoi.

The study carry out estimate, regression, and statistically significant tests for the number of factors impacting the customer decisions on purchasing organic agricultural products in Hanoi. After that, there are some possible recommendation and solutions are proposed from pattern.

2.3 Research Methodology

- In the process of implementing this study, the authors have used qualitative research methods such as dialectical materialism, historical materialism associated with the method of analysis, comparison, synthesis and chemical systems. Specially, the research bases on the method of investigation, a random survey by questionnaire investigation that the research team has built, and then using the software SPSS20 to analyze, estimate the multivariate regression model and Ordinal Logistic Regression method maximum matching, prediction and statistical hypothesis testing relevant to the model.

- Particularly, researching method bases on a survey method, a random survey 300 consumers who consume the organic agricultural products, through the questionnaire, scientific working group build and use SPSS20 software to analyze, estimate regression model and statistical hypothesis testing relevant to the model. The steps of quantitative analysis process includes: (1) Rudimentary accreditation by the Cronbach's Alpha reliability estimate; (2) the Exploratory Factor Analysis (EFA); (3) Ordinal Logistic Regression Analysis.

2.4. Data of research

- Rudimentary research: The rudimentary research process was done with quantitative method, including: The research of the theoretical model; the questionnaires and measure scale building for 34 items on the basis of Liker 5-leveled scale. After having modified and completed the questionnaire and experimented on 10 consumers, the questionnaire is officially completed.

Official research: The authors suggest 34 items according to Liker 5-leveled scale and 4 qualitative questions. The study sample size is 300 ($n = 300$). Total surveys handed out is 310, total survey received is 300. Sample is both representative and random for consumers in large districts of Hanoi, such as: Hoan Kiem, Dong Da, Ba Dinh, Cau Giay, Bac Tu Liem, Hai Ba Trung, Thanh Xuan, Hoang Mai district.

3. RESULTS OF RESEARCH

3.1. Measure scale description and descriptive statistics of the study sample

Table 1: Measure scale and Descriptive statistics

| Group | Question | Scale | | Standard deviation |
|---|---|------------------------------------|------|--------------------|
| Organic products consuming status (Y) | Q1: Purchase and consume imported organic agricultural products | 1-Never 2-Rarely | 2.88 | 1.129 |
| | Q2: Purchase and consume domestic organic agricultural products | 3-Sometimes 4-Often 5-Always | 3.33 | 0.996 |
| Organic products' quality (X ₁) | Q3: OAP is hygiene and food safety. | 1-Never | 3.93 | 1.022 |
| | Q4: Quality of OAP meets consumers' demand | 2-Rarely | 3.89 | 0.942 |
| | Q5: Believe that the OAPs have been accredited | 3-Sometimes 4-Often 5-Always | 3.85 | 0.962 |

| | | | | |
|---|--|---|--------|-------|
| Brand, label on the organic product (X ₂) | Q6: Take into account the brand name and label when purchasing decision. | 1-Never 2-Rarely | 3.55 | 1.064 |
| | Q7: Trust in the brand and label on the OAPs. | 3-Sometimes | 3.78 | 0.977 |
| | Q8: The more famous brand, the more influence the OAPs has on the purchasing decisions. | 4-Often 5-Always | 3.82 | 1.011 |
| Knowledge about organic products (X ₃) | Q9: Knowledge about standards and the process of OAPs cropping. | 1-Very little 2-Little | 3.13 | 1.074 |
| | Q10: Knowledge about origin of OAPs | 3-Average | 3.13 | 0.988 |
| | Q11: Knowledge about the functions of the OAPs. | 4-A lot 5-Very much | 3.82 | 1.041 |
| Trend in consuming organic products (X ₄) | Q12: Awareness of the OAP trend in the market. | 1-Never | 3.08 | 0.986 |
| | Q13: Choose the OAPs depending on trends in the market. | 2-Rarely | 3.02 | 1.112 |
| | Q14: Choose the OAPs depending on trends although they do not fulfill consumers' demand. | 3-Sometimes 4-Often 5-Always | 2.68 | 1.333 |
| Advertisement about the products (X ₅) | Q15: Choose the OAPs because of the advertisement. | 1-Never | 3.17 | 1.154 |
| | Q16: Believe in the advertisement about the OAPs. | 2-Rarely | 2.78 | 1.242 |
| | Q17: The products fulfill the demand as advertised. | 3-Sometimes | 2.74 | 1.199 |
| | Q18: Aware of the OAPs due to friends and family. | 4-Often | 3.32 | 1.543 |
| | Q19: Sales' advice when shopping. | 5-Always | 3.35 | 0.982 |
| | Q20: Aware of the OAPs due to studying and research. | | 2.78 | 1.156 |

3.2. Accredited the scale's reliability by Cronbach's Alpha reliability estimate

The Cronbach's Alpha reliability estimate is used to accredited the reliability of the items groups following independent variables in order to analyze the Exploratory Factor Analysis (EFA). Cronbach's Alpha reliability estimate is calculated and measured by the following scale:

Table 2: The Cronbach's Alpha reliability estimate

| STT | Variables | Questions | Cronbach's Alpha | Đánh giá |
|-----|--------------|------------------------------|------------------|----------|
| 1 | (X_1) | Q3, Q4, Q5 | 0.74 | Useful |
| 2 | (X_2) | Q6, Q7, Q8 | 0.715 | Useful |
| 3 | (X_3) | Q9, Q10, Q11 | 0.689 | Useful |
| 4 | (X_4) | Q12, Q13, Q14 | 0.594 | Useful |
| 5 | (X_5) | Q15, Q16, Q17, Q18, Q19, Q20 | 0.691 | Useful |
| 6 | (X_6) | Q21 | 1 | Useful |
| 7 | (X_7) | Q23, Q24, Q25, Q26 | 0.762 | Useful |
| 8 | (X_8) | Q27 | 1 | Useful |
| 9 | (X_9) | Q29, Q30, Q31 | 0.669 | Useful |
| 10 | (X_{10}) | Q33 | 1 | Useful |
| 11 | (X_{11}) | Q35 | 1 | Useful |
| 12 | (X_{12}) | Q36 | 1 | Useful |

Source: Data collected through surveys in March 2018

So, coefficient of Cronbach’s Alpha is close to and bigger than 0.6 level. There are 31 items with coefficient of correlation bigger than 0.3 level. The items with coefficient of correlation less than 0.3 level are temporary eliminated such as Q18, Q20, Q26, Q31. Therefore, all 12 factors are evaluated to be reliable and useable. This is the precondition to analyze the Exploratory Factor Analysis (EFA) in order to group the items into general and significant factors affecting the organic products purchasing decision of consumers in Hanoi.

3.3. Analyze the Exploratory Factor Analysis (EFA)

Based on the results of the Cronbach’s Alpha reliability estimate and observable reliability with coefficient of correlation less than 0.3 level are eliminated, meaning 22 items are used to analyze main factors: Q3, Q4, Q5, Q6, Q7, Q8, Q9, Q10, Q11, Q12, Q13, Q14, Q15, Q16, Q17, Q21, Q22, Q23, Q24, Q25, Q29, Q30.

- Factors analysis in round 1: with KMO = 0.81 and 4 items are eliminated due to disqualification: Q8, Q11, Q12 and Q15.
- Factors analysis in round 2: with KMO = 0.799 and 2 items are eliminated due to disqualification: Q14 and Q22.
- Factors analysis in round 3: with KMO = 0.772 and all items are qualified and 16 items (observable variables) are divided into 5 factor groups:

Table 3. KMO coefficient and Bartlett’s Test

| | | |
|--|--------------------|--------------|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy. | | 0.772 |
| Bartlett’s Test of Sphericity | Approx. Chi-Square | 1597.062 |
| | Df | 120 |
| | Sig. | 0.000 |

Source: Data collected from SPSS20 software

Through analysis, we can come to implication:

Firstly, Factor loading - The relationship of each variable to the underlying factor, is a very important coefficient which assure the level of significance of the EFA. With 300 observation, the factor loading should be larger than 0.55.

Secondly, KMO (Kaiser-Meyer-Olkin) value is a factor used to consider how suited the data is for Factor Analysis, the KMO value should be no larger than 1 but no less than 0.5. The result shows that KMO value is 0.722, which means the EFA analysis is suited with the observable variables.

Thirdly, the Bartlett Test.

H₀: All population variances are equal 0

H₁: At least two are different.

Due to the Chi-square which are 1597.062, Sig = 0.000, the conclusion is that the observable reliability are related to each other.

Following appendix A, the Average Variance Extracted is 67.122% (>50%), which means the 5 groups of factors explain 67.122% changes of the data; so that the scales are acceptable. Eigenvalue of the fifth group is 1.056 (≥ 1) indicates that the changes explained by each factor is acceptable.

The Rotated Component Matrix (appendix B) suggests that among 22 items used to analyze the Exploratory Factor Analysis (EFA), 6 variables are eliminated (Q8, Q11, Q12, Q14, Q15 and Q22) due to factor loading less than 0.55. Therefore, 16 qualified items divided into 5 groups explain 67.122% the changes of data as the following results:

- FT1 includes: Q3, Q4, Q5, Q7 explains 25.943% the changes of data.
- FT2 includes: Q13, Q16, Q17, Q21 explains 14.421% the changes of data.
- FT3 includes: Q6, Q23, Q24, Q25 explains 12.816% the changes of data.
- FT4 includes: Q9, Q10 explains 7.34% the changes of data.
- FT5 includes: Q29 and Q30, explains 6.602% the changes of data.

3.4. Ordinal Logistic Regression

Model 1: Using the Ordinal Logistic Regression between the dependent variable Q_1 (imported organic agricultural products purchasing decision of the consumers) and the following independent variables: FT₁, FT₂, FT₃, FT₄, FT₅, Q₂₇, Q₃₃, Q₃₅, Q₃₆, Age, Gender, Work, Number.

Meanwhile, Age variable is the variable that describes the age of consumers with 5 level: Age = 1 means consumers are less than 30 years old; Age = 2 means consumers are less than 40 but older than 30 years old; Age = 3 means consumers are less than 50 but older than 40 years old; Age = 4 means consumers are less than 60 but older than 50 years old; Age = 5 means consumers are older than 60 years old.

Gender is the sex of the consumers with 2 level: Gender = 1 means the consumer is male; Gender = 0 means the consumer is female.

Work is the occupation of the consumers with 4 level: Work = 1 means that the consumer is an officer; Work = 2 means that the consumer is staff such as: accountant, sales, engineer and architect; Work = 3 means that the consumer is freelancer; Work = 4 means that the consumer is student and stay home mom.

- Number variable is the number of people in the consumers' family.

Table 4: Model Fitting Information

| Model | -2 Log Likelihood | Chi-Square | Df | Sig. |
|----------------|-------------------|------------|----|------|
| Intercept Only | 877.147 | | | |
| Final | 531.103 | 346.044 | 89 | .000 |

Source: Data collected from SPSS20 software

Firstly, through the table 4 we can see that final model with Sig = 0.00 and -2, Log likelihood = 531.103 and quite large Chi-square value. The H_0 is deny at 1%. Therefore, the interact between factors and Ln(Odds) exists.

Table 5: Goodness-of-Fit

| | Chi-Square | Df | Sig. |
|----------|------------|-----|-------|
| Pearson | 1307.656 | 895 | .000 |
| Deviance | 515.453 | 895 | 1.000 |

Source: Data collected from SPSS20 software

Secondly, the model is suited with the data collected due to the Goodness-of-Fit (Deviance) value is 1.000 and Chi-square value is 515.453, quite big.

Table 6: Pseudo R-Square

| | |
|---------------|------|
| Cox and Snell | .684 |
| Nagelkerke | .720 |
| McFadden | .384 |

Source: Data collected from SPSS20 software

Thirdly, the model indicates that the independent variables are able to explain most of the changes of the dependent variable (Q1). The Pseudo R-Square of Nagelkerke = 0.72 means that 72% of the changes of Q1 is explained by the main factors. Besides, the Pseudo R-Square of coefficient McFadden = 0.384 also shows that this is a good model (Appendix C).

Finally, the table of OLR shows that the model is statistically significant with Q2 at the fourth scale (often), Sig = 0.069 and there are differences in the purchasing decision between the level of Q2.

As the model 1 which implements the regression with Q1, factors of FT1, FT2, FT3, FT4, Age, Work, Q35 affect Ln(Odds) positively.

However, the model 2 which is not as good as model 1 due to the smaller R² and factors such as Q27 (VAT), FT5 (factors related to price), Q33 (convenience in buying the product), Gender, Number do not have any effect on Ln(Odds).

4. IMPLICATIONS AND RECOMMENDATIONS

Based on the survey results of 300 samples and the results of Ordinal Logistic Regression analysis, it is clear that the factors that influence the purchase decisions of consumers for organic agricultural products in Hanoi are statistically significant. So, some implication and recommendation are proposed as follow:

4.1. It is necessary to enhance the management and make sure the quality of organic agricultural products which are supplied in Hanoi

Based on both the coefficient of FT1 factor and the 4 items with Q3, Q4, Q5 and Q7, the recommendation should aims to some possible solutions, such as: First, the market management Department of the local Administration, the Health Ministry and the Consumer Rights Protection Association should coordinate closely to manage, inspect and overlook the OAPs bought in the local supermarkets of Hanoi. It has to guarantee and observe the announcement of national standards for such OAPs which are promulgated and come into force from 29/12/2017. Next, the General Customs Department and the Border Management Department should enhance to control and enforce the quality of imported OAPs. Last, it is useful to encourage the manufactures and the OAP manufacturers Association to commit and undertake the quality of organic products with consumers.

4.2. It is significant to support the propaganda and communication for the useful of OAPs on the media and educational programs.

This recommendation is supported by the significant influence of both coefficient of factors FT2 and 4 items with Q13, Q16, Q17, Q21. Particularly, it is useful to enforce the introduction of process and manufacturing system of OAPs on the local media and internet network. In addition, it is necessary to not only encourage the advertisement of new products on the media, public areas, but also communicate the OAPs knowledge of people. Second, bringing the knowledge of production, consumption about the organic products on the educational program for students in the school and universities. So, it is significant to improve the awareness, shape the culture of production and consumption of fresh organic agricultural products and protect the natural environment. Third, there are many communication instruments such as banners, slogans, drawings, which need to be applied propaganda in educational organizations, students clubs, television advertising, the large social networking site (Facebook, Zalo, ...). It is important to use the media to the propaganda of knowledge, standards and production processes, the effect and usefulness of the product for each person and social issues such as the protection of the ecological environment. When

consumers are fully aware of the benefits of organic agricultural products, they will change consumer habits, a closer approach to the products of ORGANIC AGRICULTURE from which are aware of the value of organic agricultural products. Since promoting the supply and demand, making the market more vibrant, expanding production, as the basis for the expansion of exports and the development of the national economy. Finally, the State should encourage households to self-cultivation of organic agricultural products home in order to create conditions for households who have not condition to access the organic products and take advantage of resources the soil in the surroundings. The fact that the current price of organic agricultural products is too high, so that it is important to innovate the process and technology of current production for the organic agricultural products.

4.3. It is clear that public policy-making should promote brand and label development of organic agriculture products.

Based on the coefficient of factors FT3 and 4 items Q6, Q23, Q24, Q25 in the OLR model, specific recommendations are suggested that:

Public policies should encourage to protect and develop big brands and labels of OAPs through strengthening the efficient of legal regulations, supporting quality of human resource, priority of access to credit funds, and stimulating farmers and producers to carry out projects of R&D about the race of pest and disease resistance, organic fertilizer, biological plant protection and botanical medicine. There are policies and regulations to encourage development of theoretical foundation which promotes more sustainable organic agricultural production. In addition, it is useful to establish key organic agricultural products or inputs caters for organic production which only are implemented by priority policies in encouraging public and private investment in the field of agricultural production and rural development in Hanoi and northern provinces.

Besides, it is important to enhance the anti-phenomenon of counterfeit goods, counterfeit trademark, infringement of the rights of industrial property on trademarks, labels in order to build the confidence of consumers for products of organic agriculture originated in the country. The State should strengthen the communication of the usefulness of organic agricultural products for personal health, eco environment and sustainable development through the channel relatives, friends, colleagues, neighborhood to expand distribution channels, build and maintain the trust of consumers.

Lastly, it is very important to perform the reform of the value added tax system for organic agricultural products. On the basis of statistics the items of Q27 and Q28, the authors can be seen in the framework of the sample with 300 customers, the value of Q28 showed 98,4 % consumers desire the VAT rate to be lower than 10%, particularly 40.7% consumers (0% VAT rate), 13.3% consumers (1% VAT rate), 27.7% consumers (the VAT rate of 2%), 5.3% consumers (the VAT rate of 3%), 2.0 % consumers (the VAT rate of 4%), 9.3% consumers (the VAT rate of 5%).

It is clear that VAT policy is a macro- economic tool which manages the important socioeconomic of the government and is also a factor with vital influence on production - consumption. A reasonable VAT policy can create economic incentives to promote the production, marketing and consumption of organic agricultural products. So, it is necessary to carry out policy of tax incentives through reduction of VAT rate in order to encourage investment in the production and consumption of OAPs, in particular to propose reduction of the VAT rate on OAPs from 5% to 2%. This solution not only encourage production and consumption of products, reducing the pressure on prices, but also remove the quite high price of food organic agriculture which becomes current barrier in access to OAPs of consumers inspire of having big demand.

At the same time, reduce or exempt from the VAT rate for services and material inputs to manufacture related to OAPs, such as organic fertilizers, biological fertilizers, microbiological preparations of plant protection bio ... From that support reduction of manufacturing costs, product cost to create important conditions adapting for consumer demand. In addition to the VAT, a corporate income tax policy which affects benefit of producers and investors in field of organic agriculture should also be reformed in tax base and tax rate following to expand tax base and reduce tax rate. Specifically, the State may apply rate deduction for the type of corporate income tax in the short term, or accompanied by certain conditions for private organizations specialized in the production of organic agriculture.

4.4. It is significant to improve the understanding of consumers for organic agricultural products.

Related to factors FT4 and items of Q9, Q10, the authors support also development of the communication on mass media in order to expand awareness of consumers in field of national and international standards of OAPs and the process of OAPs cropping and seeking origin of OAPs. Producers should enhance not only to carry out the consultancy activities on the nature and benefits of OAPs at the point of sale of organic agricultural products, such as the system of big supermarkets in Hoan Kiem, Dong Da, Tay Ho, Hai Ba Trung, Thanh Xuan districts, but also to implement measures for advertising, leaflets, customer conferences, agriculture exhibitions to provide useful information about the manufacturing process, the consumer benefits of organic agricultural products.

CONCLUSION

The research has achieved the target that finds eight significant factors affecting positively consumer decisions on purchasing organic agricultural products in Hanoi. Based on articles and research papers, this study has established a theoretical model of 12 factors with 36 items impacting on consumer decisions on purchasing organic agricultural products. It has used a multi-variable regression of Ordinal Logistic Regression model on 300 survey samples and identified eight major factors which have statistically significant effects, including: (i) the quality of products; (ii) trademarks, product labels; (iii) advertising, media, cultural factors; (iv) the understanding of the consumers about products of organic agriculture; (v) the convenience of the point of sale; (vi) income of consumers; (vii) psychological factors (attitudes, interests, taste, age, gender, etc.); (viii) the consumer's career. Besides, the research also finds out the two factors affecting negatively on decision of consumers, following: (i) the value-added tax for the import of organic agricultural products; (ii) the age of the consumer. In addition, the study proposes four solutions derived from the results of the model. However, the regression model should continue to be studied in order to explain and detect new influencing factors.

APPENDIX

Appendix A: Total Variance Explained

| Component | Initial Eigenvalues | | | Extraction Sums of Squared Loadings | | | Rotation Sums of Squared Loadings | | |

VAR ANALYSIS ON DYNAMIC RELATIONSHIP AMONG WORLD GOLD PRICE, WORLD OIL PRICE, EXCHANGE RATE AND VIETNAMESE STOCK MARKET INDEX RETURNS

Thu Thuy Nguyen* - Minh Ngoc Ha Pham**

ABSTRACT: *This study is an attempt to explore the dynamic relationship among world gold price, world crude oil WTI price, exchange rate of VND/USD and Vietnamese stock market index returns. Daily data from 2nd May 2013 to 27th April 2018 is taken, constituting 1245 observations. To capture dynamic and stable relationship among these variables, we use Vector Autoregressive Technique. The results show that each variable is highly affected by changes of value and past value of its and the other variables' at different degree.*

Keywords: *Vector auto-regression (VAR), world gold price, world oil price, exchange rate, Vietnamese stock market.*

1. INTRODUCTION

In any economy, there is always a weak or strong relationship between different markets. Investigating the relationship between financial markets help policy makers to control the economy efficiently and investors to make right decision in time. In this paper, we focus on studying the relationship between world gold price, world oil price, exchange rate and Vietnamese stock market index returns.

Though there have been many empirical works carried out on the relationship between these variables in the developed markets, research on emerging markets is just evolving. Risks and returns in emerging markets are higher than those of developed markets. It becomes important to examine the relationship between them so that the policy makers can crisis forecast and the investors can diversify to reduce risk.

As far as we know, there are just few studies carried out till now in the context of Vietnam such as, Loc and Doan, 2009 but the authors just explored the relationship between the change of domestic gold price and Vietnamese stock price only by Pairwise Granger Causality Tests. We add two more objects in research - exchange rate, world crude oil WTI price, which so on called world oil price for short - with a more model (Vector auto-regression (VAR)) and world gold price is used instead of domestic gold price. We hope to give more useful results after doing that.

This research aims to answer the question: How does each variable respond to the shocks in any of the other variables studied?

The paper proceeds along the following lines. Section 2 presents the review of literature, Section 3 devoted to methodology and data description, Section 4 discusses the empirical results and Section 5 offers conclusions.

2. REVIEW OF LITERATURE

Considerable research exists to understand the relationships or interactions among various indicators of economic activity. Economic indicators included, among others, industrial production, interest rates,

* ** Academy of Finance, 58 Le Van Hien, Duc Thang, Bac Tu Liem, Hanoi, Vietnam

inflation and currency rates,... The dynamic and complex relationship among gold price, exchange rate, oil price and stock market index returns has attracted the researchers, policy makers and business people alike. There are several research on these in developed countries (Eric et al., 2006; Ai Han et al., 2008) and emerging countries (Abdalla and Victor, 1997). For example, using co-integration techniques, Eric et al. (2006) suggests that there is a long-term relationship between the price of gold and the US price level. Second, the US price level and the price of gold move together in a statistically significant long-run relationship supporting the view that a one percent increase in the general US price level leads to a one percent increase in the price of gold. There was a positive relationship between gold price movements and changes in US inflation, US inflation volatility and credit risk. The study also found a negative relationship between changes in the gold price and changes in the US dollar trade-weighted exchange rate and the gold lease rate. Ai Han et al. (2008) proposes an interval method to explore the relationship between the exchange rate of Australian dollar against US dollar and the gold price, using weekly, monthly and quarterly data. The empirical evidence suggests that the ILS estimates well characterize how the exchange rate relates to the gold price, both in the long-run and short-run. Abdalla and Victor (1997) analyzed the interactions between exchange rates and stock prices in emerging market economies including India, Korea, Pakistan and Philippines applying co-integration techniques and Granger causality tests. On the basis of the analysis of data relating to January 1985 to July 1984, they concluded that there is a unidirectional causality from exchange rates to stock prices in all the sample countries other than Philippines.

A large number of studies have attempted to statistically model the determinants of the price of gold. Broadly these studies follow three main approaches: Models variation in the price of gold in terms of variation in main macroeconomic variables (Kaufmann and Winters, 1989; Dooley et al., 1995; Sjaastad and Scacciallani, 1996); Focuses on speculation and the rationality of gold price movements (Koutsoyiannis, 1983; Diba and Grossman, 1984; Baker and Van Tassel, 1985; Pindyck, 1992); Gold as a hedge against inflation with particular emphasis on short-run and long-run relationships (Chua et al., 1982; Laurent, 1994; Mahdavi and Zhou, 1997; Wang et al., 2013; Dee et al., 2013).

Besides, Pravit (2009) uses Multiple Regression and Auto Regressive Integrated Moving Average (ARIMA) to forecast gold price. The research result suggests that ARIMA (1, 1, 1) is the most suitable model to be used for forecasting gold price in the short term. Using multiple regression model the study suggests that Australian Dollars, Japanese Yen, US dollars, Canadian Dollars, EU Pounds, Oil prices and Gold Future prices have effect on the change of Thai gold price.

The study by Zhang et al. (2010) analyzes the co-integration relationship and causality between gold and crude oil prices. The study finds that there are consistent trends between the crude oil price and gold price with significant positive correlation during the sampling period. The study further suggests that long term equilibrium between the two markets and the crude oil price change linearly Granger causes the volatility of gold price. With respect to the common effective price between the two markets, the contribution of the crude oil price seems larger than that of gold price.

Samanta and Zadeh (2012) examined the co-movements of selected macro-variables (gold price, stock price, real exchange rate and the crude oil price) based on 21 years data using econometric models for the periods from January 1989 to September 2009. The study exposes that there is a co-integration relationship between the variables.

Le Thai-Ha et al (2011) have made a study to investigate the relationships between the prices of two strategic commodities, that is, gold and oil in terms of index of US dollar by using monthly data from

January, 1986 to April, 2011 with the application of financial econometrics. Empirical results of the study showed that there is a long-run relationship existing between the prices of oil and gold and the oil price can be used to predict the gold price.

The significant highlights of the study by Ismail et al. (2009) reflects the fact that several variables like USD/Euro exchange rate, Inflation rate, Money supply (M1), NYSE Index, S&P Poor Index and US dollar index have an influence on gold price.

The paper by Sujit and Kumar (2011) aims to establish and validate the dynamic relationship of commodities prices involving gold and crude oil with exchange rate and stock index. The paper uses daily time series data to explore the impact of fluctuations and interrelationship among crude oil price, stock market returns and Trade Weighted Exchange Index which is computed by taking major Currencies (DTWEXM) and gold price. The study used two models to show the dynamic relationship. The result shows that exchange rates have a direct influence on gold price; oil price and stock market index. It is also shown that there is weak long run relationship among variables.

Base on the idea of Sujit and Kumar (2011) when studying the dynamic relationship among gold price, oil price, exchange rate and stock market returns in Saudi Arabia, we do research on gold price, oil price, exchange rate and stock market returns in Vietnam, with some similar characteristics, hoping to fill the gap in literature review of works about Vietnam, while there are not many related research. We believe that the paper will supply useful scientific information for investors and policy makers to make right decisions.

We can express the object of the study as follows. As discussed in the review of literature that the results of interrelationship among various important variables are varied and mixed. Reasons of these results could be due to time period of study and the time series modeling technique used by the studies. Hence, it is imperative to verify the relationship with sophisticate techniques. The paper explores the of linkages of stock market returns price, exchange rate, oil price and gold price using vector autocorrelation with the recent data. The objective of the study is to validate the relationship systematically.

3. METHODOLOGY AND DATA DESCRIPTION

The study has taken world gold daily price/gram in USD from <https://www.investing.com>, the market price of USD in Vietnamese Dong from <https://vn.investing.com>, the world oil price from <https://www.investing.com> and VNindex from <https://www.vndirect.com.vn> from 2nd May 2013 to 27th April 2018, constituting 1245 observations. This normal period is taken after Global Financial Crisis and upated to the presence. Some other interesting results about crisis will be explored in other papers. In the series taken there were some missing data due to holidays and other reasons, these missing values were omitted while data were handled using Microsoft Excel. The variations on indexes is calculated by taking first difference of two successive days, i.e., $V_t = P_t - P_{t-1}$, where P_t is the price of each financial asset at time t . The descriptive statistics which shows that there is high value for standard deviation in all the variables indicating variability. High Jarque-Bera statistics show that the series is normal.

About the methodology, in order to examine the relationship among world gold price, world oil price, Vietnamese stock market and exchange rate, Vector Auto-regression (VAR) has been used. In this model, all the variables are considered to be endogenous and each endogenous variable is explained by its lagged or past values and the lagged values of all other endogenous variables included in the model. There are no exogenous variables in the model and hence, by avoiding the imposition of a priori restriction on the model the VAR adds significantly to the flexibility of the model. The VAR is commonly used for forecasting

systems of interrelated time series and for analyzing the dynamic impact of random disturbances on the system of variables. The VAR approach sidesteps the need for structural modeling by modeling every endogenous variable in the system as a function of the lagged values of all of the endogenous variables in the system.

The mathematical form of a VAR is $y_t = \beta_1 y_{t-1} + \beta_2 y_{t-2} + \dots + \beta_p y_{t-p} + \gamma x_t + \varepsilon_t$, where y_t is a k vector of endogenous variables, x_t is a d vector of exogenous variables, $\beta_1, \beta_2, \dots, \beta_p$ and γ are matrices of coefficients to be estimated, and ε_t is a vector of innovations that may be contemporaneously correlated with each other but are uncorrelated with their own lagged values and uncorrelated with all of the right-hand side variables. Since only lagged values of the endogenous variables appear on the right-hand side of each equation, there is no issue of simultaneity, and OLS is the appropriate estimation technique.

4. EMPIRICAL RESULTS

4.1. Stationarity of Variables

A stationary time series is significant to a regression analysis based on the time series, because useful information or characteristics are difficult to identify in a non-stationary time series. Therefore, a non-stationary time series would lead to a spurious regression. However, most economic time series are non-stationary in practice. Hence, time series should be made stationary after differencing. Useful information or characteristics can still be identified in the time series after differencing. A time series is said to be stationary if its mean and variance are constant and, the co-variances depend on upon the distance of two time periods. At first, we have a look at the graph of EXCHANGE_RATE, VNINDEX, OILPRICE and GOLDPRICE in Figure 1.

Figure 1. Graph of EXCHANGE_RATE, VNINDEX, OILPRICE and GOLDPRICE at level

Figure 1 shows that the index data series are not stationary. We make a try to the graphs of the first difference of the above variables in Figure 2.

Fig. 2. Graph of EXCHANGE_RATE, VNINDEX, OILPRICE and GOLDPRICE at first difference

Figure 2 shows that the first difference index data series are stationary. The unit root test is used to test the station of variables and the order of integration. The Augmented Dicky-Fuller unit root test (ADF) is often used in this case. For the VAR estimation all the variables included in the model should be stationary. The result of ADF test is presented with lag 4 suggested by Newey-West, including trend and intercept in test equation. Table 1 and 2, respectively, present ADF tests for series at level and at the first difference.

Table 1. ADF test results for EXCHANGE_RATE, VNINDEX, OILPRICE and GOLDPRICE

| Null Hypothesis: | t-Statistic | Prob.* |
|-------------------------------|-------------|--------|
| EXCHANGE_RATE has a unit root | -1.730286 | 0.7374 |
| VNINDEX has a unit root | -1.157498 | 0.9174 |
| WORLD_GOLD has a unit root | -3.433249 | 0.0475 |
| WORLD_OIL has a unit root | -0.281203 | 0.9911 |

Table 2. ADF test results for d(EXCHANGE_RATE), d(VNINDEX), d(OILPRICE) and d(GOLDPRICE)

| Null Hypothesis: | t-Statistic | Prob.* |
|----------------------------------|-------------|--------|
| D(EXCHANGE_RATE) has a unit root | -14.19204 | 0.0000 |
| D(VNINDEX) has a unit root | -14.35469 | 0.0000 |
| D(WORLD_GOLD) has a unit root | -14.56059 | 0.0000 |
| D(WORLD_OIL) has a unit root | -15.92368 | 0.0000 |

The unit root test with first difference and the results shows that all the index data series are not stationary at the level but stationary after the first difference. In other words, all the data series are I(1) which denotes that the time series is integrated at the first difference level. Figures 1 and 2 support this. There are at least two advantages when using the first difference data series to explain the impulse response function. Firstly, it focuses more on the increase or decrease trend rather than the actual change. Because the first difference data series is the increase or decrease between every two consecutive days, a strengthening

or weakening of the trend will be detected by the impulse response function. Secondly, it captures more information on the shocks of gold price, because the first difference data shows the changes in the past two days while the level data shows the changes in one day in impulse response function.

4.2. Selection of Optimal Lag

One of the important aspect of VAR model is to select the optimal lagged term. Traditional way of selecting the lag length was by repeating VAR model by reducing lag length from a large lag term until 0. In each of these models, the smallest value of the Akaike information criterion and the Schwarz criterion are used to select the optimal lag length (Gujarati, 2004). In this study however, five criteria: Sequential modified LR test statistics (LR), Final prediction error (FPE), Akaike information criterion (AIC), Schwarz criterion (SC) and Hannan-Quinn information criterion (HQ). Similarly, the smallest value of these 5 criteria points to the optimal lag length. Table 3 shows the summary results of VAR lag order selection criteria.

Table 3. VAR Lag Order Selection Criteria

| Lag | LogL | LR | FPE | AIC | SC | HQ |
|-----|-----------|-----------|-----------|-----------|-----------|-----------|

* indicates lag order selected by the criterion

The first left hand column shows the model for which the lag length has been selected using The LR, FPE, AIC, SC and HQ criterion. The numbers are the smallest value in each of criteria. Before selecting the lag length, one must consider that too short a lag length in the VAR may not capture the dynamic behaviour of the variables (Chen and Patel, 1998). Table 3 presents VAR Lag Order Selection Criteria. Based on the results, the study will choose six lag to be appropriate.

4.3. Estimation of VAR and Dynamic Analysis

We also may omit some lags if they are not really necessary. We use VAR Lag Exclusion Wald Test as in Table 4.

Table 4. VAR Lag Exclusion Wald Tests

| | DEXCHANGE_RATE | DVNINDEX | DWORLD_GOLD | DWORLD_OIL | Joint |
|-------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| Lag 1 | 34.37749 [6.23e-07] | 12.40610 [0.014574] | 12.21679 [0.015810] | 17.23337 [0.001741] | 78.78528 [2.75e-10] |
| Lag 2 | 2.557842 [0.634309] | 14.23266 [0.006588] | 4.412537 [0.353045] | 4.855110 [0.302490] | 25.54484 [0.060779] |

| df | 4 | 4 | 4 | 4 | 16 |

Numbers in [] are p-values

The results in Table 4 suggest us to omit lags 3 and 4 in the estimation. So we have found the truly relationship among exchange rate, gold price, oil price and stock market index thanks to VAR Estimation in Table 5.

Standard errors in () & t-statistics in []

Impulse response functions and variance decompositions are carried out to examine how shock to the variables bounce back through the system. Before carrying out these analyses, it is important to ensure that the VAR model is stable. We use the AR Root Graph as in Figure 3.

Fig. 3. Inverse Roots of AR Characteristic Polynomial

In Figure 3, the model satisfies the stability condition, as there are no roots lying outside the unit circle in the model. Besides, the residual serial is indeed white noise thanks to VAR Residual Serial Correlation LM Tests, with result in Table 6, and thanks to VAR Residual Portmanteau Tests for Autocorrelations, with result in Table 7.

Table 6 – VAR Residual Serial Correlation LM Test

*The test is valid only for lags larger than the VAR lag order.

df is degrees of freedom for (approximate) chi-square distribution

Impulse Response Function (IRF) track the response of each variable to innovations in each of the other variables. We can examine the magnitude, direction and length of time that each variable are affected by a shock of a variable in the system, keeping all the other variables constant. The impulse response functions are in Figure 4.

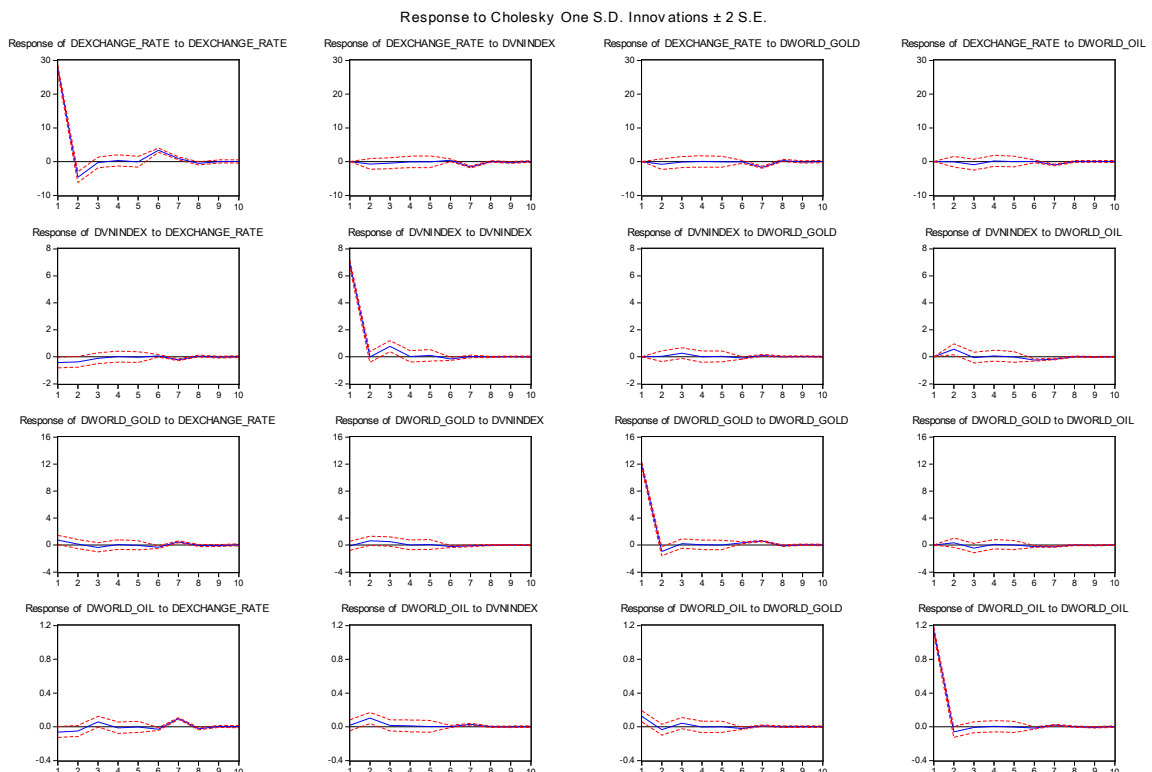

Fig. 4. Response to Cholesky One S.D. Innovation ± 2 S.E

We can see that, each variable is positively affected immediately by itself on right the first day. There is a common feature is that all effects of each variable on itself and the other variables disappear after a week. Exchange rate shocks have no impact on all the variables on the first day but have effects from the following day until a week passes. However, these effects are low. The stock market shocks have influences on exchange rate right on right the first day, and on world gold price and world oil price after a day. The world gold have rather low impact on the other variables. The world oil price shocks have a strong impacts on all the other variables. The impulse response of each variable to each other variable is absolutely rational, because if there is one of the financial assets is decrease in price, for example, investor can soon or later buy the others instead. The intensity of response can be seen from Variance Decomposition in Table 8.

Cholesky Ordering: DEXCHANGE_RATE DVNINDEX DWORLD_GOLD DWORLD_OIL

The change of historical exchange rate can explain around 97% variations in the change of itself in about a week. After 10 days, this explanation does not decrease. At the same time, each change of gold price, the change of Vietnamese stock market index and the change of oil price explain is all below 1%. The variation of change of world gold price is explained almost by its historical change (around 98%). The variation of the change of world oil price is explained almost by its historical change (around 96%) and the change of world gold price (around 1.4%) and the change of exchange rate (around 1.6%). Finally, the variation of the change of Vietnamese stock market index is rather independent of the change of exchange rate and world gold price, and slightly explained by world oil price (all below 1%). Exchange rate, world oil price and world gold price innovations explain below 1% of the variation in Vietnamese stock market index, while historical Vietnamese stock market index explains over 98% its variation. All these findings can also be seen from the impulse response function discussed above.

5. CONCLUSION

The study has found that the exchange rate, world gold price, oil price and stock market index can sometimes explain the pricing process of the each other. When stock prices fell financial advisors were expected to advise investors to maintain a position in gold during the period. Conversely during boom times, gold investments often decreased in value as stock prices increased. In the currency market, exchange rates are often predicated on the health of a country's economy. If the economy is robust and growing, the exchange rates for their currency reflect that in higher value. The simple relationship between currencies through a single common commodity does not exist and the interconnection between gold price and exchange rates are all complex. There are many factors on which the prices of gold may depend upon: government policies; budget, inflation, economic and political condition of the country etc. Besides, the oil price can have impact on the others but the others can difficultly have impact on oil price.

This paper aims to establish and validate the dynamic relationship of world gold price, exchange rate, world oil price and Vietnamese stock market index. The paper uses daily time series data to explore the impact of fluctuations and interrelationship among them. This paper demonstrated systematically that dynamic relationship using VAR technique with one model to show the dynamic relationship. Due to VAR estimation with lag six, we can see that all these factors can be effectively used by the investors in the analysis of the return generating process. The results of this paper perform the strict relationship

between exchange rate, world gold price and stock market index in Vietnamese financial market and a slight relationship between these three variables and world oil price. Historical price of each asset is found to be not the only driver of that asset but also the other three other assets. The results of this study also have important implications for the investors. Vietnamese financial market investors should closely follow all of these three assets even when their portfolios contain not all of three assets. Historical exchange rate, world gold price, world oil price and Vietnamese stock market index can be used as a good predictor of future prices of all of them in the short run. Investors may minimize the risk of their portfolio by distribute their capital rationally among these markets.

We can see that the fluctuations of each variables are explained almost by itself. Therefore, this study suggests us to try some rational models to study each variable through its historical information such as AR, MA or ARIMA... This will be carried out in near future research by the author.

TOTAL FACTOR PRODUCTIVITY WITH SUSTAINABLE DEVELOPMENT-RESEARCH ON FOREIGN DIRECT INVESTMENT IN AGRICULTURAL SECTOR OF THE RED RIVER DELTA

Vu Viet Ninh* - Le Thu Ha*

ABSTRACT: *Over the past 30 years of economic reform, Vietnam's development record is remarkable. However, the productivity, efficiency and competitiveness of the economy are low. Vietnam's economic growth is mainly driven by over-exploitation and intensive use of capital, natural resources and labor, which leads to a vulnerable and less flexible economy in the face of fluctuations in the market economy and also results in unstable growth. Sustainable development is developing all three pillars: Economy, Society and Environment. On the economic pillar, sustainable economic growth is the key component of sustainable development. Modern economies have shown that economic growth rates based on the total factor productivity (TFP) are more sustainable than those based on capital and labor because of their limitations. In recent years, Vietnam is gradually considering the TFP index as a basic statistical indicator for assessing the economic growth of the sector, region or entire economy. In this article, based on the Solow function, the author uses the methods of growth accounting to calculate the contribution of total factor productivity in a specific case when researching foreign direct investment (FDI) in the agricultural sector of the Red River Delta. In brief, TFP plays an important role in contributing to the growth of agriculture in the Red River Delta region. Sustainable economic growth should be relied on increasing TFP that maintains sustainably and longly.*

Keywords: *Total factor productivity; TFP; sustainable development; sustainable economic growth.*

1. INTRODUCTION

At the World Summit on Sustainable Development held in Johannesburg, South Africa in 2002, the concept of “sustainable development” was complemented and completed from previous ideas. Accordingly, sustainable development is a process of development that has a close, reasonable and harmonious combination of three aspects of development, including economic development (especially economic growth), social development (especially progress, social justice, poverty reduction and employment) and environmental protection (especially treatment and remediation of environmental pollution, restoration and improvement of environmental quality; rational exploitation and economical use of natural resources [5].

For sustainable development, from an economic point of view, its pillar is sustainable economic growth. Sustainable economic growth is a high-growth, stable economy in the long run.

In recent years, the economic growth rate of Vietnam is always quite high. In the period of 1995-2016, the growth rate of Vietnam ranked fifth in East Asia, only after Myanmar, China, Laos and Cambodia and always higher than the average of ASEAN countries. Specifically, the growth rate had been over 7.0% before 2010; 6.42% in 2010; 5.42% in 2013; 5.98% in 2014 [2]; 6.68% in 2015; and 6.21% in 2016 [6]. These figures show that the economic growth rate of Vietnam is quite high but not stable. The unstable productivity of Vietnam is one of the reasons. Based on the production function to explain the economic growth, economic growth is due to the contribution of capital, labor and invisible elements beyond capital and labor. Capital and labor factors, however, are limited input factors; therefore, for sustainable economic

development, it is necessary to increase the contribution of factors other than capital and labor. This factor is called *total factor productivity (TFP)*.

Total factor productivity is an index used to measure change in output per unit of input that is combined. It includes factors other than capital and labor, such as macroeconomic policies of the Government; business environment; manager level; level of labor; technological level...

Total factor productivity reflects the contribution of hard-to-quantify factors beyond capital and labor to GDP. Its effects are not as direct as the productivity of parts but through the transformation of tangible elements, especially labor.

2. LITERATURE REVIEW

The concept of total factor productivity in research is presented in a variety of ways, and as the process of development grows, this concept is expanded.

Solow, R.M (1956), "A contribution to the theory of economic growth", *The Quarterly Journal of Economics*, 1956-JSTOR, Volume 70, No.1, pp 65-94 [4]. The total factor productivity is referred to Solow when explaining the origin of economic growth as a Cobb-Douglas production function:

$$Y = F(A, K, L)$$

The Solow model focuses on four variables: output (Y), capital (K), labor (L), and technological progress (A). In his model, Solow mentions the role of A in promoting growth, but he considers it exogenous and sees it as a "surplus" that is not explained yet. According to Solow, the Solow surplus reflects total factor productivity such as technological progress, managerial level, skill level, random factor ... in generating output of the national economy.

Ilke Van Beveren(2007), "Total Factor Productivity Estimation: A Practical Review", *LICOS Discussion Paper, No.2007* [3]. The author presents the TFP estimation method of the business and considers that TFP is a factor in the production function that is not perceptible. TFP reflects the productivity of the depth elements such as technological level, management and workmanship of the workforce in the enterprise. In this study, Ilke Van Beveren points out the factors that influence the TFP of the business.

ABBP-Ackerberg, Daniel, C. Lanier Benkard, Steven Berry and Ariel Pakes (2007), "*Econometric tools for analyzing market outcomes*" in James Heckman and Edward Leamer, eds., *Handbook of Econometrics*, Volume 6(1), Amsterdam: North Holland, pp 4171-4276 [2]. The authors use the Cobb-Douglas production function to determine the TFP value and contribute to the output of the business. In this production function, output levels depend on factors such as capital, labor, and other factors. The author develops the model, estimates components such as components representing technology, differences in management levels among businesses, measurement errors in production ...

The research differs in terms of accessibility, scope of research but basically confirms that: (i) Growth on the macro or micro level depends on the indefinite factor in addition to capital and labor; (ii) this factor is increasingly important and contributes significantly to output growth; (iii) This factor reflects productivity of factors such as technical progress, institution, business environment, labor qualification ... and other random factors; (iv) This factor does not seem to be limited to other factors.

3. RESEARCH METHOD

The author calculates TFP based on the method of growth accounting. This is the method used in most empirical researchs. Based on the Solow function, TFP is considered to be a residue in the growth model, based on the Cobb-Douglas production function, the TFP growth rate formula is constructed as follows[4]:

$$TFP_g = Y_{tg} - (\alpha \cdot K_{tg} + \beta \cdot L_{tg})$$

Including: Y_{tg} is the output growth rate

TFP_{tg} is the TFP growth rate

K_{tg} is the capital growth rate

L_{tg} is the labor growth rate

α is the contribution coefficient of capital

β is the contribution coefficient of labor

$$\beta = \frac{\text{Labors' aggregate income}}{\text{GDP}}$$

With $\alpha + \beta = 1$ and $\beta = \frac{\text{Thu nhập đầy đủ của người lao động}}{\text{Tổng sản phẩm trong nước}}$

4. RESEARCH RESULTS

The TFP calculations for agricultural FDI sector in the Red River Delta for the period 2000-2016 are as follows:

Step 1: Use the values α and β based on the values of capital (K) and labor (L) from the annual survey of enterprise by the General Statistics Office. The values α and β are respectively 0.29 and 0.71.

Step 2: Calculate the growth rate of VA - K and L elements in 3 stages 2000-2005; 2006-2010; 2011-2016 based on original data.

Table 1. Growth of the VA - K and L elements of FDI sector's agricultural in the Red River Delta in 3 stages

Unit: %

| Stage | VA | K | L |
|-----------|------|------|------|
| 2001-2005 | 8,8 | 8,4 | -0,2 |
| 2005-2010 | 11,9 | 27,6 | -2,5 |
| 2011-2016 | 7,1 | 17,3 | -3,0 |

Source: Author's calculations

Step 3: Finally, calculate the contribution of K-L elements and TFP- aggregating elements into agricultural VA.

Table 2. Contributions of K, L and TFP elements into VA of FDI sector's agriculture in the Red River Delta in 3 stages

Unit: %

| Stages | VA | K | L | TFP |
|-----------|-------|------|-------|------|
| 2001-2005 | 8,76 | 2,44 | -0,11 | 6,43 |
| 2006-2010 | 11,93 | 7,99 | -1,78 | 5,72 |
| 2011-2016 | 7,13 | 5,02 | -2,12 | 4,24 |

Source: Author's calculations

The results of Table 2 show that in the 2001-2005 period, the VA grew by 8.76%, the contribution of the capital element (K) to the VA growth of FDI agricultural sector in the Red River Delta area is 2.44%; Contribution of labor (L) is -0.11% and TFP elements is 6.43%. For the period 2006-2010, contributions

of Capital, Labor and TFP are respectively 7.99%; -1.78% and 5.72%. For the period 2011-2016; they are respectively 5.02 %, -2.12% and 4.24%.

The data shows that the contribution of Labor (L) to the growth of VA in the agricultural FDI sector in the Red River Delta indicates ineffectiveness, reflected in the contribution of this factor to growth of VA is negative in all 3 phases. This value is negative because in all three periods, the labor tends to decrease while the labor is mainly used with simple labor, low labor force, so the labor productivity is not high. The equity factor has a higher contribution in the VA growth in both elements L and TFP for the 2006-2010 period and for the 2011-2016 period. This shows that the equity growth is effective in contributing to the VA growth. Therefore, the strengthening of attracting FDI and improving the efficiency of capital use will contribute to increasing the agricultural VA of this region. TFP compared to this index of the whole country is higher. According to the OECD report on agriculture in Vietnam, in 2001-2005 period and in 2006-2010 period the contribution of TFP was 2.52% and 2.18%. Apparently, the contribution of TFP to the growth of agricultural VA in FDI area in the Red River Delta is higher than that. This indicates that the le management and technology level in the agricultural FDI business of the region is quite good and the policy environment of the region is more effective than that of the whole country. However, the TFP of the uplands is also partly due to the specificity of the agricultural sector which its application of technology is not too high and is not invested as much as other industries, manufactures, and mining, etc.

5. CONCLUSION

In brief, the total factor productivity (TFP) plays an important role in contributing to the growth of agricultural VA in the Red River Delta by FDI sector in particular and in GDP in general. In order to develop the economy sustainably, it is necessary to develop in depth, and increase the total factor productivity instead of relying on the limited factors of capital and labor. This is also the development model of most countries in the world and the economic sectors today.

TAX COMPLIANCE COST OF SMES: CASE STUDY IN HANOI

Vu Van Ninh - Diem Thi Thanh Hai - Doan Minh Thanh - Nguyen Dinh Hoan*

ABSTRACT: *This study focuses on the burden of tax compliance of Small and Medium Enterprises (SMEs) in Vietnam which is a vital component of Vietnam economy, accounted for 45% GDP and 31% of total State budget revenue, attract more than 5 million employees. Based on a quick survey on the compliance cost and their impact on the performance of Vietnamese SMEs, we try to make a contribution not only for researchers but also for legal and taxation system to improve the transparency of accounting information system, internal control of the firms. The result of our study suggests that among those tax compliance cost in the SMEs: external, internal tax cost, and miscellaneous tax cost, the internal tax cost accounted for the major expenses in tax compliance in Vietnam, after that the miscellaneous tax cost also a significant cost for complying with tax regulation. External costs were evaluated at low percentage compared to the left component of tax procedure cost.*

Keywords: *Compliance cost, internal cost, external cost, miscellaneous tax, tax procedure cost*

1. INTRODUCTION

Vietnam is one of the fastest growing developing countries in Asia, located specifically in the middle of South East Asia region, sharing border with China, Laos, and Cambodia. The total area is at 310,060 square kilometers, and a population of about 93 million in which 34% of total population living at urban area. Regarding to the economy, Vietnam has been transforming from being a largely agricultural economy to an increasing industrialized economy that focuses on manufacturing and service factor. Association with the strong development, Vietnam has to face with many challenges and limitations which still incurred with the developing countries. According to the world-bank organization review on Vietnamese market, it is clearly stated that poverty are contributed a significant portion of the whole population, especially in rural areas. The wealth gap between the rich and the poor is more extended. In the financial sector, the fiscal imbalance, and unresolved assets quality in banking sector require highly attention. However, the private sector is a star and an engine for the economic growth compared to other sector in the economy. The Vietnamese government continues to show commitment to reform. Vietnam's 2011 – 2020 Socio-Economic Development Strategy (SEDS) is a 10 year strategy which highlights the need for structural reforms, environmental sustainability, social equity and emerging issues of macroeconomic stability. And the private sector, particularly the Small and medium enterprise will be the main rocket to fuel the whole economy.

Like the rest of the world, the taxation plays an important economic role in Vietnam, and contributes significantly to the State budget. Taxation in Vietnam categorized into some main types: Corporate income tax, Value added tax, Personal income tax, and others taxes.

* Academy of Finance, 58 Le Van Hien, 1000 Hanoi, Vietnam

Corresponding author. Tel.: +84966141469; E-mail address: diemthanhhai@hvtc.edu.vn

In the 21st century, SMEs has been given due recognitions for exerting a crucial role towards fostering the economic growth, development in several countries, especially in developing countries. Prior to the year 2018, the small and medium enterprises in Vietnam are defined by satisfying 2 factors: the average number of employees and total capital (Decree 56/2009/ND-CP).

Table 1: The classification of the SMEs based on the capital size and total labor

| Sector | Size | Small-sized enterprises | | Medium-sized enterprises | |
|--------------------------------------|------------------------|-------------------------|----------------------------------|--|-----------------------------------|
| | Very small enterprises | Total capital | Number of labor | Total capital | Number of laborer |
| I. Agriculture, forestry and fishery | < 10 people | < VND 20 billion | Between 10 people and 200 people | Between VND 20 billion and VND 100 billion | Between 200 people and 300 people |
| II. Industry and construction | < 10 people | < VND 20 billion | Between 10 people and 200 people | Between VND 20 billion and VND 100 billion | Between 200 people and 300 people |
| III. Trade and service | < 10 people | < VND 10 billion | Between 10 people and 50 people | Between VND 10 billion and VND 50 billion | Between 50 people and 100 people |

Source: Article 3 - Decree 56/2009/ND-CP dated 30-6-2009

However, per the tax perspective, the definition of small and medium enterprises is based on the average number of employee and total revenue of preceding year. According to Circular 78/2014/TT-BTC dated 18 June 2014, guiding the corporate income tax regulation, the average number of employees per tax perspective is at the same with the rate in the investment law, while the total revenue is lower than twenty (20) million in order to determine the size of the enterprises.

From 2018, according to the law on supporting SME, two indicators perspectives are combined into one in order to support the SME, including: the average number of employees contributing social insurance of no more than 200 and meet one of the following two criteria:

- (i) Total capital shall not exceed VND100 billion;
- (ii) Total revenue of the preceding year shall not exceed VND 300 billion.

According to the statistics number of Chamber of Commerce and Industry of Vietnam, recently, the SME not only contributes to 45% GDP and 31% of total State budget revenue, but also attracts more than 5 million employees. Furthermore, following the Vietnam annual business report by the Chamber of Commerce and Industry of Vietnam, in 2014 for the criteria of ownership, the number of SME was belonged significantly to non-state and private enterprises. Regarding to the total capital contributed and number of employees, the number of SME was nearly 98% of total enterprises in both criteria.

The SMEs provide the wide range of job opportunities for people, and is a key factor to increase income for labor, and help to mobilize social resources for development investment, poverty reduction simultaneously. The amount of fund source remains at the high proportion in the population, thus in case we have some appropriate mechanism for exploiting these capital in order to create material wealth and benefits for the whole society. The SMEs not only contribute to the dynamic economy in the market mechanism, but

they also help to speed up the transition of economic structure, especially to the agricultural sector village. Diversification the number of entities joining the economy may accelerate the market, play a crucial factor to reduce Vietnam's inflation at the lower. And Vietnam rural economy has been shifting to processing and service industry, while the SMEs usually implement and cover the services, trade or construction or repairing maintenance. Moreover, SMEs are the place to nurture the entrepreneurial talent, and create and train entrepreneurs, help them get familiar with the business environment. Especially, the start-up wave has increased significantly in recent year, and attracted many young people to participate in. Hence it clearly shows that the SME plays a vital role regarding to the economic impact and social impact.

The World Bank also concludes that the improvement in the process of tax declaration and payment, associate with fundamental reform in inspection, examination and refund, result in the score of Vietnam's Tax Payment Index and Vietnam's General Payment Index is enhanced significantly which increase by 81 levels compared to the Business Environment Report 2017 and ranked fourth in the ASEAN6. This result is supported by the strong and continuous improvement in administrative procedure reform. Vietnam Tax department has implemented both legitimation and tax administration.

Although in 2017, Vietnam made paying tax easier and the cost for tax reducing by the minimizing the administrative process of complying with tax obligation. Vietnamese government has together performed several improvements in tax legitimation relating to the tax declaration period, specifically:

For Corporate tax income purpose: Circular 78/2014/TT-BTC, Circular 151/2014/TT-BTC, Circular 119/2014/TT-BTC, Circular 96/2015/TT-BTC, Circular 45/2013/TT-BTC

For Value-added tax income purpose: Circular 219/2013/TT-BTC, Circular 26/2015/TT-BTC, Circular 39/2014/TT-BTC

For Income tax issue: Circular 111/2013/TT-BTC, Circular 92/2015/TT-BTC and other document guidance by the Government.

However pertaining to the above amendment and enhancement in the tax regulation, the result for these improvement processes are not seemed to be efficient and sufficient for tax payer.

The number of document required for each item are different and consumed high cost of compliance by internal employees. It can be generally explained that these procedures contribute to the high tax compliance timing burden for the SMEs. As the similar documentation has been mentioned in the OECD ("Organization for Economic Cooperation and Development") that less frequent filing offer the SMEs approach to reduce the tax compliance cost.

Furthermore, the Government will provide assistance for the SME regarding to capital factor, taxation factor, technology factor, human resources supporting and others. The Government also emphasizes that SME will be the main contributor of the whole country in the next several years, and target the SME is the rocket for the economy.

However, the issue of tax compliance costs is quite complicated, including the costs of bribes, tax evasion, psychological costs (anxiety or frustration) which cause damage to taxpayers, etc. These costs are difficult and not usually available for the author, hence these data may not be possible to be collected, but the cost of tax compliance is an objective issue that needs to be explored in order to partially find and contribute appropriate solutions to reduce the burden. Thus, with author ability, the data which will be collected and analyzed are limited and may not appropriate recently. The approach of dividing cost and methodology to carry out research are based on the published international studies and research, and other supporting from lecturer to fulfil the research.

Vietnam is approaching to a more dynamic and integrated economy with the developing in GDP and living standard, together with the improvement in regulation and business environment. The SMEs in Vietnam are important factor of the developing economy which contribute high amount of revenue and increase the living social welfare. However, even the fact that SMEs are crucial to the economy, the SMEs definitions are not clearly defined by the law at this point of time, and there are lack of supported policy and tax incentive for them to facilitate and expand their business activities. One of these burden for the SME is the Corporate Income Tax compliance burden which are further presented in the below part for having clear and appropriate view on such procedure expenses.

The paper is organized as follows. Apart from introduction in section 1, a literature review will be presented in the section 2. Section 3 presents methodology in the research. In the next section, we show the results and discuss about the burden of CIT in Vietnamese SMEs. We conclude the topic in the last section.

2. LITERATURE REVIEW

There are several studies relating to tax compliance cost facing by the SMEs in many countries. The term “tax compliance cost” has different interpretations, a consensus as to the precise meaning of compliance cost, according to Sandford (1995, cited in International Journal of Accounting and Taxation 2014, vol 2, p65), the tax compliance cost was defined as these cost which incurred by tax payers, or business... for achieving the requirement in complying with a given structure, and level of tax. They include the cost of collection, remitting, and accounting for tax on the profits of business and other related cost. Eragbhe and Modugu (2014) carried out research for tax compliance cost in Nigeria, interpreted that the tax compliance cost were the amount of resources expended by tax payer, exclude the amount of tax liabilities, in complying with the requirements of the relevant tax regulations. These tax compliance cost in their research were:

- The administrative cost,
- Timing spent for tax compliance
- Internal-external cost,
- Computational and tax planning cost,
- Commencement cost, accounting and tax cost.

As their result, the tax compliance cost in the SMEs factor in Nigeria was considerably high and took long time period for complying with the regulations. According to the study of the Corporate Income Tax compliance cost of Smalls and Medium Enterprises in Thailand by Papaporn C. (2013) the PHD of Curtin Business School in Thailand, by applying both the quantitative approach and qualitative approach for carried out the research such as questionnaires, interview... and divided the tax compliance cost in his research into 3 categories including: (i) internal tax cost, (ii) external tax cost, and (iii) miscellaneous tax cost. In both quantitative and qualitative results, the highest tax compliance cost per his research was in miscellaneous cost such as: transportation, software and training cost because of the requirement of tax filing. His study was conducted among more than 200 sample includes Limited company and Partnership in Thai Land. As his result, the highest tax compliance cost for the SMEs was in the wholesale business with regard at all criteria of the research. Moreover, according to his research, there were several reasons which result in high tax compliance cost in Thai Land: technical knowledge of tax was complicated, the available of guidance was still limited, the cost for hiring the tax professional for declaring tax, the final important additional reason was the informal business transactions of the SMEs which have to deal with Tax authority if challenges. Mr Papaporn also pointed out the limitation in conducting his research included:

- The data was used to analysis was the primary data which could not be respond correctly and appropriate since the tax revenue data was not published,
- The tax knowledge understanding of some respondents was still limited, and
- The sample may not sufficiently represent for the SMEs in Thai land...

Furthermore, Mr Hijattulah A. (the PHD of the Curtin Business School, 2009) has carried out another research in tax cost compliance of the SMEs in Malaysia. His sample in the research includes many sectors include SMEs and non-SMEs and collecting data through questionnaire, pilot interview and survey implementation. In his research, there were 3 categories of tax compliance cost which was evaluated: internal tax cost, external tax cost, and additional compliance tax cost such as (travelling, printing document ...). The highest average of tax compliance cost in Mr Hijattulah research was the internal tax cost which amount to 52% of total tax cost, and the external and additional tax cost were in the second and third position respectively. Notwithstanding with the above factor, one of his finding was that the SMEs were more concentrated on tax incentive rather other field of tax such as: tax audit, tax fairness... According to the interim report of Tax committee in South Africa, they conducted a research on the tax burden in the SMEs among the large sample, and found that time consuming in tax compliance was the major burden for the SMEs in complying with taxes even the government has issues several support and guidance to facilitate the tax compliance procedure. Further in this research, it was suggested that for the purpose of minimizing tax compliance cost, the Tax authority should reduce the meeting and inspection procedure, and request bulk data whenever there was high probability of significant impact related to tax compliance cost.

Mustafa (2002) has measured the tax compliance cost compared to the company tax obligations, specifically, for Malaysian SMEs, the compliance cost amounted to more than 1% of total tax payable, and admitted that the tax structure was more complicated and complex, which would be resulted in higher compliance cost for the SMEs to meet the requirement of tax regulation. Jeff Pope (2001) divided the tax compliance cost into external and internal tax cost, and he conducted his research in the international tax case and figured that the compliance tax cost shall be more concentrated in each country and put into the applicable policy in order to grant more support to the tax payer. Abdul (2008) has carried out research of the effect of self-assessment system on tax compliance cost in the SMEs in Malaysia, one of his result is that internal cost (timing spent and wage rate for employees) and external cost (financial audit and tax professional fees) amounted to more than 90% of total compliance cost in Malaysia, and the SMEs with capital less than RM250,000 shall be the main suffered object. These cost increased as the relative size of employees become larger.

Gurd (1998, in Schoonjans, Cauwenberge, Reekmans & Simoens (2011)) admitted that the SMEs suffered the burden of compliance tax cost higher than direct tax liabilities, and insufficient ability to deal with many bureaucratic and legal knowledge requirements. Also in their research in 2011, the tax compliance cost in corporate income tax and value-added tax portion just amounted to 65% of total cost compared to other tax (Environment tax...). This can be explained by the requirement of filling in Malaysia and supporting document attached. In the case of United Kingdom, Hansford & Hasseldine (2012) has performed the study in calculating the tax compliance cost in UK with the sample of member of ACCA associate, as a result, the internal tax compliance cost were relative higher than the external tax cost, and increasing as the firm size expand in number of employees and production. The compliance cost for VAT and CIT were the major contribution for high level of tax compliance cost. In Australia case, the compliance cost in VAT accounted for more than 50% of total cost compliance in the research conducted

by Lignier (2012). He further illustrated that from 1995 to 2010, the compliance burden has been raised up, specifically the SMEs had to afford with the amendment in tax requirement by higher external cost in hiring tax professional bodies to perform the tax declaration and review at the company.

In summary, there have been several studies which had been conducted in order to measure and determine the tax compliance expenses internationally. They indicated tax compliance burden for the SMEs around the world, and suggest the Government to recognize the problem and focus on tax reform. In Vietnam, there are not many researches focuses on the tax compliance expenses, one of these is the research carried out by Ms Le Thi Hai Binh (2014) on the CIT compliance cost in Ho Chi Minh city, Vietnam. She has conducted her research on the financial year 2014 follow the regulation in such period which Vietnam made paying higher taxes for companies by increasing employer's social security contribution rate according to research "Doing business 2017" by World Bank organization. She also achieved some specific results regarding these procedure expenses in these periods. However, according to research by World Bank (2017), from 2015, Vietnam has enacted a number of tax regulations which made paying tax less costly and easier for tax payer by decreasing the tax procedure and compliance. Although there were many researches regard to tax compliance burden around the world, while in Vietnam, such researches are still limited and not sufficient for the topic. Therefore, identifying the tax procedure burden after these updated and reformed procedures come into effect in Hanoi, Vietnam is the purpose of this study. The result of this study may suggest and contribute to further reduce the CIT compliance expenses in developing country such as Vietnam.

Regarding about Tax compliance cost, the general definition of compliance cost is interpreted as the general cost that the SMEs has to bear for the purpose of complying with the effective regulations. In this section, we evaluate and examine the category of tax compliance cost in 3 criteria:

Figure 1: Scheme of tax compliance costs

→Internal tax cost

Internal cost generally are incurred inside the business relation, mainly in the accounting and administration department of the company, it consists of all internal tax work in office hours and the appropriate tax rate plus overhead cost (Pope, Fayle, & Chen (1994, p. 27 in the Papaporn Chunhachatrachai 2013). In the research carried out by Eragbhe & Modugu (2014) divided the internal tax cost in 5 elements:

- (i) Time spend on filling and keeping record,
- (ii) Cost incurred in filling process
- (iii) Cost incurred for researching and studying the new updated tax regulation
- (iv) Time by internal staff for addressing audit
- (v) Overhead cost.

Regarding to factor inside the internal tax cost, Hanefah, Ariff & Kasipillai (2002) noted that internal cost in the tax compliance composed of:

- Timing spent by staff in accounting and collection:
- Preparing supporting document and information for professional advisers,
- Training staffs for acquire tax knowledge
- Dealing with tax authority.

Jeff Pope (2001) had made a figure to illustrate the elements of internal tax cost:

- Self-employed cost
- Monetary cost: Staff cost and Miscellaneous cost

Tran-Nam, Evans & Walpole (2000) further illustrated that internal tax cost were substantially more important than external cost in Australia. We can infer from the above perspectives that internal cost exert an important part to build up the tax compliance cost for SMEs.

Briefly, based on such definition and categories of internal tax cost, this research will measure such tax compliance cost burden by dividing into 2 criteria: expenses and timing spending in following and solving with internal tax procedure cost such as: wages for internal accounting staff, expenses dealing with tax authority, management expenses for serving such procedure purpose...

→ External tax cost

External tax costs are defined as the payment to acquire the professional service: lawyers, accountants, investment adviser from outside company (Hanefah, Ariff, & Kasipillai, 2002). Other author has the same definition of external tax cost such as Jett Hope (2001), Papaporn Chunchatrachai (2013), Hansford & Hasseldine (2012)... External costs of tax compliance are primarily expenditures that taxpayers incurred while seeking tax advice or outsourcing compliance activities (Lignier & Evans (2012) such as:

- Tax service
- Non-tax service
- Payroll service

According to Mr Jabbar & Pope (2009) research, the external cost are generally classified as compliance are a straightforward monetary cost charged by external tax professional solely on tax activities. He further indicated that hiring tax professional bodies were common in Malaysia and the fees may not different with other financial service for carrying out the tax inspection and filing. Trepelkow & Verdi (2014) has also classified the external cost was one element of compliance cost, and defined the external cost as payment paid by a business to third parties in order to comply with its tax obligations. The commissioning of third parties presumes a charge or payment for the service rendered. Hansford & Hasseldine (2012) presented that for the SMEs, acquiring service from tax professional could create more favorable tax position advantage.

In this type of external tax compliance cost, the author will determine such cost including hiring external accounting services, and timing to fulfil tax procedure, keeping up with new and changing in tax regulation, others....

→Miscellaneous cost

Miscellaneous cost is defined as other cost except internal staff cost that are incurred inside of the business in relation to the corporate income tax such as: stationery, postage, travelling, software and computers cost (Papaporn Chunchachatrachai (2013). He also found that high miscellaneous cost shall be the significant factor affecting the tax compliance cost in Thailand. Not only Mr Papaporn, Hijattluah (2009) also concluded that additional cost except internal and external cost could be the main contributor to the high tax compliance cost in Malaysia. In his studies, the additional cost includes: Postage, stationery, travelling, printing and telephone cost of the business. However Jeff Pope (2001) has included the miscellaneous cost into the internal cost of the Company to measure the tax cost. Other studied conducted by Tran-Nam, Evans & Walpole (2000) also provides that portion of their miscellaneous expenses include: tax preparation fees, safe deposit box rental, etc).

Therefore in this study, author will apply the criteria of the miscellaneous cost which will be applicable in Vietnam market in order to find the time and cost burdens for the SMEs for complying with tax requirement. Such miscellaneous are measured include stationery expenses, travelling cost, expenses for document storage... the result is employed for finding the large actual miscellaneous expenses in the SMEs.

3. METHODOLOGY

This research will be conducted about the Tax compliance for SMEs in Vietnam especially in Hanoi. The SMEs in Hanoi are subject to the research since the SMEs play a crucial important role in developing country; also in Vietnam the tax procedures are still complex and complicated. The SMEs in every country are the vulnerable subject which will suffer high tax compliance cost. Further to that, there are not enough research regarding to tax procedure expense for SMEs in Hanoi to have an appropriate view on the expenses which are absorbed by the SMEs.

Although there are several type of tax in Vietnam such as: Value-added tax, Personal Income Tax, Corporate income Tax, Excise tax, Import-export tax... however the tax compliance in Corporate Income tax will be the main concentration of this study. Corporate income tax ("CIT") is a direct tax which is imposed on the net profit of a legal entity at the end of the accounting period. Although the definitions and categories of the SMEs are not clearly applied consistently between each Ministry in Vietnam. Therefore, for the purpose of this study, the SMEs, which are classified by the size of entity, defined by the regulation of the Vietnam Ministry of Planning and Investment will be the subjects to carry out research.

Furthermore, in this study, the size of the SMEs follow this regulation association with the regulations stipulated in Tax law are employed in order to have more accurate and appropriate information for this research. The survey is designed to suit with the purpose of this study to identify the CIT compliance burden for the SMEs in Vietnam.

Research objectives

The research objectives of the study are:

- To identify the tax-compliance burdens of the SMEs when applying the Vietnam taxation system, especially the corporate income tax.

- To uses the estimation and findings to place the issues within a taxation policy context and suggest appropriate policy implication

Research design

In theory, the research design is the crucial part of the research, which will present the idea and discussion of author. In order to apply research design, the methodological research shall be identified. The research design provides the guidance the overall plan to answer the research question (Saunders, Lewis, & Thornhill (2009). Understanding the research approach is especially helpful to clarify the appropriate approach for the research. Together with an understanding of the research philosophy, it is necessary for researchers to select the methodological approach as it guides the researcher's plan to conduct the research (McKerchar, 2010). Generally, there are 3 methodological approaches to conduct the research include: qualitative, quantitative approach, and mix method. According to Saunders, Lewis, Thornhill (2009), the quantitative approach are the collection results in numerical and standardized data, and analysis through the use of diagram and statistics. They also further stated that the quantitative approach was widely used in order to collect primary data. Ticehurst and Veal (2000) explained that quantitative research was about:

- (1) Statistical analysis;
- (2) Accuracy in numerical evidence to make a conclusion;
- (3) The reliability of results based on a relatively large number of people;
- (4) The reliability of data analysis based on computer analysis; and
- (5) The data being obtained from questionnaire surveys, observations or secondary sources.

Moreover, Saunders, Lewis, Thornhill (2009) illustrated that the non-standardised and complex nature of the data would probably need to be summarized, grouped or restructured as a narrative to support meaningful analysis. Creswell (2003) defined the quantitative approach as “the author primarily applied the post positive claims for developing knowledge such as cause and effect thinking, reduction to specific variables and hypotheses and questions, use of measurement and observation, and the test of theories), employs strategies of inquiry such as experiments and surveys, and collects data on predetermined instruments that yield statistical data.” However, in quantitative method, the reliable of the data together with the context of cultural backgrounds or people's views were the limited point to this approach (Creswell (2003).

Although there have been several difficulties and disadvantage of applying the quantitative analysis, the quantitative approach is the more appropriate and precise, shall provide the applicable information in the nature of this research in tax compliance cost. The author will choose to apply the quantitative approach for the research for such case in the compliance cost. Other researcher also has employed the quantitative method to carry out the research on the tax compliance cost (Lignier & Evans (2012), Tran-Nam, Evans & Walpole (2000), Trepelkow & Verdi (2014), Papaporn Chunchatrachai (June 2013), Hijattulah Abdul Jabbar (2009), etc.

The research was conducted within 2 months from September to November 2017. There were 100 questionnaires which have been sent to the respondents, however only 66 questionnaires were received (at 66%). Vietnamese and English version are prepared, however only Vietnamese version are distributed to the respondent since the English are not popular in Vietnam. The English version will be attached in this study for reference,

Due to limited time and resource to carry out this research, and the quantitative approach would be applied in this research, the result of those questionnaire shall be evaluated, assessed and concluded as the result of the study.

Research methodology

Survey data can be obtained in several ways includes: questionnaires (either administered personally, by mail, web), and interviews (face to face, or through telephone). Survey research is the most widely

and frequently employed method in the social sciences (Babbie (2017)). He also stated that one of overall advantage of survey research is the feasibility of obtaining a wide range of standardized information from a large population, which is cost beneficial. However, there were several limitations for survey research as such: the unwilling to response of people, lack of in-depth information, or technical term could create the difficulties for survey research as also point out in Babbie research (2017). Despite these limitation and difficulties, the survey research is seem to be the popular method to conduct research in social field, and also in business research. Lignier & Evans (2012) has applied the electronic survey in computing the tax compliance cost in his studies. They admitted that the advantage of this survey was the quicker response from target people, and applied over wide geographical area, association with cost beneficial regarding to the fees of printing and mailing survey. However, the limitation in this type of survey includes requirement of Internet which may not be provided in several area. Other author such as Schoonjans, Cauwenberge, Reekmans & Simoens (2011) also applied the electronic Internet-based survey. However, Jabbar & Pope (2009) performed the research based on the traditional survey questionnaire technique, with support from tax professional, tax expert, even the tax officer for the purpose of clearly understanding the questionnaire. It could be implied that the technical term together with some in-depth knowledge may affect the result of response in this research. The traditional survey questionnaire also employed by Hanefah, Ariff & Kasipillai (2002), Jeff Pope (2001), Trepelkow & Verdi (2014) in collecting data for computing the cost of tax compliance.

In this study, together with the perspectives and consideration of the expert in the tax field, we perform the quantitative approach by conduct the survey research method which will be employed in order to satisfy the purpose of researching the tax compliance cost.

Questionnaire design

This section explains the survey instrument applied in this current study. The design of the questionnaire should be appropriate with the research, pertaining to Abdul Jabbar (2009) emphasized some consideration to improve the response rate:

- Clear wording of the questions
- Appropriate layout and design of questionnaire
- Possible length
- Relevant respondents
- Personalizing the cover letter of questionnaire
- Providing a reply paid envelope.
- Keeping confidentiality of the respondent information.
- Carrying out a pilot test.
- Performing a pilot survey carefully.
- Appropriate timing of the survey.
- Enclosing a further copy of questionnaire in the
- Including second reminder.
- Scrutinizing and validating the responses.
- Selecting an advisory committee.
- Obtaining advance publicity.
- Sending photo-montage press cuttings with the reminder.

- Using a telephone reminder.
- Making available a pre-paid telephone help line.

Babbie (2017) also point out some improvement which can be made in order to have higher response rate from questionnaire include:

- Choosing the appropriate question form.
- Clarifying items which may be confused
- The respondent should be competent to answer those question.
- Avoid Double-Barreled Questions
- Relevant question
- Short item is more preferable
- Avoid negative items,
- Avoid Biased item and technical terms

In business case, Jeff Pope (2001) indicated that some information should be composed in the questionnaires: time spent on tax affair of the company employee and employer, fees paid to tax professional bodies, and any miscellaneous cost incurred. Besides that, the nature and additional cost should be taken into account when conducting questionnaires. Abdul Jabbar (2009) has developed the questionnaire for his survey including 16 questions for tax compliance cost and characteristics of SMEs in Malaysia.

In this study, electronic questionnaire and traditional questionnaires will be employed both in order to have the highest and quality response rate from the respondent. Business writing principles that have been adopted in the current study compose the use of simple words, question wordings and technical term explanation (but modified to suit the current study). Considerate that the electronic survey could be carried out to increase the sample size, and more important with no significant additional costs.

Furthermore, the final questionnaires, which will be delivered, are prepared in both English and the Vietnamese language. It is common to make available in both language version since Vietnamese people do not perform business transaction and communicate in English frequently and Vietnam is also a developing country. To some extent, some people may not feel comfortable of the technical term in tax field. Additionally, the Vietnamese language version was considered necessary to substantially reduce the length of the questionnaire and, more important is to get the reasonable response result.

The basis for designing the research questionnaire is the above assessment and dividing the tax compliance cost for the SMEs in Vietnam, specifically: Internal tax cost, external tax cost and miscellaneous cost. However, determining and figuring the accurate expenses spending on tax procedure need significant effort and human resources. Hence, with limited time and ability to perform the study, the time and expenses are designed on hierarchical scale such as (very small, small, normal, large, very large....). Moreover, the document and studies in various researches together with the effective CIT regulation will be considered to have the questionnaire completed. Since the limited in the time and capability of the author, together with the available information provided, the questions cover part of the Company expenses relating to tax compliance in the Company. There are three parts in the questionnaire:

Section A: General information – the question in this section were about the SMEs legal structure, geographical location, ownership type, main business activities, the number of labor employed, the total revenue of the year 2016, and the general compliance of tax in the Company. The question was designed to be straightforward to the point and expected the answers to be more clear and easy for the respondents.

Section B: Tax Compliance Costs - This was the main part of the questionnaire. The questions were about the time, money spent, and the difficulties of the SMEs regarding to comply with corporate income tax in the 2016 tax year, including internal, external and miscellaneous expenses. The internal cost composed of factor in complying with tax regulation such as: time filing requirement, fees for keeping recording and updating technical knowledge in tax field... The external cost consist of the question to require the respondent whether they seek the assistance of tax professionals or tax agents in understanding and complying with the Corporate Income Tax law. For the purpose of analysis, respondents were asked to give their comment and the average cost per year spent on professional charges. The miscellaneous cost were designed for including several expenses incurred during the working of fulfilling the tax requirement such as travelling, printing, stationery, and extraordinary expenses dealing with tax department... Some questions were applied the five-point scale to ask the respondent of the compliance cost in the SMEs.

Section C: The questionnaire concluded by asking the respondents to give their comments in relation to the suggestion and recommendation to improve the tax compliance, and reduce the tax compliance cost for the SMEs.

Population and sample

Since the research project focused on the cost of tax compliance with corporate income tax, the survey population was mainly concentrated on SMEs including limited companies and others.... Sampling methods were adapted to determine a group of representative units from a population. Reid (1996) further indicated that samples are not meant to represent large populations, and purposeful samples of respondents were used because they could provide important information, not because they are representative of a larger group. A sample of entities from Hanoi (Vietnam) would be determined and to cover the tax compliance cost which the SMEs may routinely incurred during their business process. There is no comprehensive list of taxpayers publicly available in Vietnam. Hence personal income tax, excise tax, Value-added tax and other tax imposed by the Government which affected specific activities and products were excluded from this study.

The framework of the SMEs definition in this research followed the definition provided by the Tax Department since the overall SMEs classification were widely accepted in Vietnam. Firstly, because the SMEs categories by the Tax authority were easily assessed and determined by self-entities. Secondly, the definitions were more specific and regarding to tax purpose. Although there were slight differences between the definitions of Tax Department with other Ministries, for the purpose of this study, the definition of SMEs in Tax regulation shall be applied accordingly.

The current study considered a sample size consists of 100 questionnaires which have been sent to the respondents, however only 66 questionnaires were received (at 66%). The main respondents are the accountant in the company. Two applicable approaches were to send questionnaires through social accountant network, and employ online survey for getting answer from accounting and auditing online sources. Furthermore, interviewing tax specialist were conducted, but the number of interviewees was limited since the tax procedure field for the SMEs in Vietnam were not concentrated sufficiently, and the tax procedure were consider still complicated and unrealistic several procedures. The author also seek my colleagues advice in tax field to have accurate adjustment and additional for the questionnaires.

4. DISCUSSIONS

Regarding to the internal cost for complying to the tax procedure, in total received sample, there is 80% people and organization do not use the external accounting service for tax procedure because of several

reasons such as the Company has enough accountants for fulfilling such tax work (62.5%), while 12.5% illustrates the higher external tax cost lead to employing only the internal accounting staff, and the left 5% sample is represented for the tax compliance work is not difficult hence using only internal staff for such work. Furthermore, among the total collecting sample, 20% respondent has selected the external tax work.

According to the survey, the SMEs in Hanoi mainly incurred several expenses for tax procedure of CIT criteria. The detail is based on the above evaluation and categories which present such cost as below:

Table 2: Internal tax compliance cost survey

| | Number of respondent | Percentage |
|---|-----------------------------|-------------------|
| Fees and charges on updating and preparing knowledge for the CIT regulation (including access to new tax laws and updated tax laws) | 16 | 24.24% |
| Wages for internal staff for completing the CIT procedure | 48 | 72.73% |
| Expenses dealing with tax authority | 33 | 50% |
| Administrative penalties regarding to late tax submission | 16 | 24.24% |
| Other expenses (Management expenses regarding to digital signature, applying technology in tax compliance....) | 13 | 19.70% |

(People may select more than 01 answer in order to express their opinion)

Source: Elaborated by the authors

Result of assessing the tax compliance cost from scale 1 – 5 with rate 1 is very low, while rate 5 is very high

For the first factor: cost for updating and preparing tax knowledge is amounted to only 24.24% of total respondent to be recognized the incurring cost in your business. This may indicate that the updating tax knowledge are not concentrated in the SMEs, while under Vietnam circumstances, the tax law has been amended several times. This could lead to non-updated to the regulation, and the accountant may misunderstand and wrong treatment with some tax procedure. Furthermore, this result is indicated by the cost for updating. 34.85% of respondent select the cost for updating tax regulation at the low cost, while 50% spend at the normal cost, only 15.15% apply high cost for this criteria. This result may impact the fact that the SMEs accountant may not updated and prepared enough to the effective regulation, and these causes high cost spending on tax procedure which may be eliminated by the tax authority. However, recently, many sources of updating tax law is free, and not charge fees such as Internet, or legal firm issuance paper... hence which may result in lower this cost, and the dependent of accountant on this type of source for updating and preparing tax updated regulation.

The second criteria is the salary for internal accounting staff in the Company. According to the survey, the percentage of respondent regarding to this factor is about nearly 72.73%. It can be understood that the accountant in the Company play a vital role related to tax compliance. Since the SMEs depend solely on the accountant to declare tax accordingly, which lead to mainly internal cost of tax compliance relating to wages paid to the accountant. Specifically, 28.78% of total people choose the cost for salary paid for

internal accounting at the high level, while only 10.60% records this criteria as low cost. The rest amount is belonged to acceptable cost for the SMEs. Hence, it is generally accepted that the internal accounting wages consume high expenses as their opinion, since it could be difficult to fulfil tax procedure in the Company, and the management need to hire more internal accountant to complete these requirements which lead to high cost for wages for them.

The third criteria incurring in the SMEs is the expenses dealing with tax authority which is amounted up to 50% of all selection. This amount is higher compared to other criteria of internal cost. It is because the tax regulations in Vietnam are updated regularly which the SMEs may find it difficult to complete its procedure accordingly, thus they have to pay some under-table to the tax authority in order to overcome these errors. Specifically, there are about 18.18% of selection recognize the cost for dealing with tax authority at the low level, while the percentage recording at high expenses is more than double the number of low cost as at 39.39%. It is represented for the large expense spending for tax inspection team. It can be further inferred that the SMEs in Vietnam usually face with the tax issue which include the tax compliance requirement. The mistakes during the completion of tax compliance may occur regularly and hard to find appropriate method such as declaring tax deductible expenses and revenue under CIT regulation. Hence the SMEs want to cover those errors, and paid directly to the tax officer in order to cover those mistakes.

The administrative penalties for late tax submission is come at the fourth position which at 16 respondents at 24.25% of the SMEs incurring such expenses in this tax year period. The tax submission are the requirement of the Vietnam tax authority which specify for each type of tax declaration with one of their purposes is to be convenient for tax department to take control and adjustment for business activities inside Vietnam boarder. Specifically, regarding to CIT regulation, the company shall submit the CIT finalization at the period of 90 days from the end of the company financial year. While the process of fulfil the form under current regulations are not easy to achieve, together with requirements in such other criteria of the business such as Financial statement, and other required report by the government. These create the expenses and fee for the SMEs to pay penalties for late tax submission. Among that, only 12.5% respondent agree that these penalties are at very low level, compared to 31.25% sample indicate the high expenses for the late tax submission. Remain selection is at normal level; hence these can be inferred that the administrative penalties for late tax submission and payment could generate obstacle for the SMEs to comply with tax requirement.

The other cost includes the management expenses regarding to digital signature, applying technology in tax compliance.... are recorded at 19.70% incurred such cost. Furthermore, the impact on such cost for the SMEs according to the survey is mostly at the normal phase, while the rest of respondent is divided at 2 stages which 7.58% with the opinion at very low level, while 30.30% recording at very high level. It is since to some companies, the expenses for such cost are small and the company staff is familiar and equipped enough tax knowledge. While other SMEs realize such expenses at high level because of the complex and complicated of tax procedure such as the digital signature or employing the supported technology for tax declaration...

The section for external cost included the second part of questionnaires design. It demonstrates the type of external cost of tax compliance in the SMEs together with the overall cost for such service. Among several type of external cost for the SMEs, the questionnaire is designed for suit with the reality of external service in Vietnam. The detail is presented as below:

Table 3: Number of respondent applying external tax service

| | Percentage |
|-----------------------------------|------------|
| Tax accounting service | 7.58% |
| Tax consulting service | 30.30% |
| Payroll service | 15.15% |
| Using internal accounting service | 46.97% |

Source: Elaborated by the authors

In the questionnaires, three services have been mentioned such as: External accounting service, consulting service and payroll service. According to result of the survey, 30.30% of total SMEs were asked has employed the external tax accounting service together with 15.15% using the payroll service. While the number of using tax consulting service in the SMEs just 7.58%. However the amount recording for not using external service amount to almost 50%, which clearly show that for the SMEs, hiring external services are not popular.

Among those who employed the external service, nearly 50% of respondent indicate the tax field is complex, and required huge amount of knowledge and experience, thus they choose to hire the external tax service in order to comply with tax regulation. While timing to fulfil tax procedure and keeping up with new and changing in tax regulation also account for the reason for using outside tax service at 6.45% and 12.90% respectively. For the remaining selection, the response consists of both timing and keeping up with changes above. It may imply the fact that with the SMEs who renting external tax service, they realize the difficulty and time consuming of the tax compliance, and the penalties if wrong treatment in the tax field, hence they decide to use outside service to ensure the accurate treatment and limit mistakes carried by the internal staff.

Furthermore, with regard to the cost for hiring external tax service, pursuant to the research result, it illustrates that the cost for using outside tax service is normal at 54.74%, while reporting high cost at 40% for the SMEs. In general, the external tax service is quite expensive compared to the scale of some companies. Furthermore, in such criteria, nearly 67% selection has reported the higher cost for outside service rather than internal service, but they still employ the outside tax service for their company. Hence, it can be denied that the SMEs in Vietnam are more aware of the importance of complying tax procedure and paying tax to the State Budget.

To sum up, in this section, the cost for external tax service are evaluated. Overall, these costs also contribute highly to the tax compliance cost for the SMEs such as hiring external accountant service, or payroll service. Since the nature of the SMEs together the business size, the renting such service may not be preferable which represent into the number of respondent choosing such criteria. Moreover, the expenses for such service are recorded at the high level, and these circumstances lead to the outside tax service consumes higher cost than internal.

The miscellaneous cost in the tax compliance of the SMEs

This section indicates the miscellaneous cost to the SMES relating tax procedure consist of some factors: Stationary expenses, Cost for collecting supporting document, invoice, Expense for document storage, Travelling expenses... The detail of respondent is represent as below:

Table 4: Summary of miscellaneous tax expenses

| | Number of respondent | Rate | Mean |
|--|----------------------|--------|------|
| Stationary expenses | 40 | 60.61% | 2.51 |
| Cost for collecting supporting document, invoice | 45 | 68.18% | 3.78 |
| Expense for document storage | 48 | 72.73% | 3.54 |
| Travelling expenses | 30 | 45.45% | 2.92 |

(People may select more than 01 answer in order to express their opinion)

Source: Elaborated by the authors

In this section, only four (04) elements of miscellaneous expenses are selected in order to conduct the research. Among 4 elements, the number of respondent answered highest is the expenses for document storage at 72.73% choose this factor. At this point, this expenses also have high mean point at 3.54 point. It is represented that the high tax compliance cost for such item. Since for business size of the SMEs, the amount of fund spending on document storage is quite high compared to other activities. Further to recent CIT regulation, the Company has to store the supporting document for maximum 10 years long, while the expenses for keeping such items increase over time to time, since the document needed for any expenses or revenue shall be recorded and storage.

The second position number of respondent is the cost for collecting supporting document, invoice, contract... at 68.18% selection, but this element has the highest mean variance (3.78). According to Vietnamese tax law, any expenses or income shall be supported by supporting document such as invoice, list of detail, receipts, invoice... hence the accountant staff has to collect and prepare these documents for tax purpose. In case the tax authority carry out the inspection at the Company, these document are required to provide, if not the punishment with the administrative penalties would levy on such amount. Furthermore, with the SMEs have the factories or other branches in other province, the supporting document shall return to headquarter to declare and pay CIT under current tax regulation. These requirements make the Company difficult to collect and prepare when possible. Or even the mistakes of the supplier including do not issue invoice appropriately, do not supply the goods and service at the time of stipulated in the contact, time to send invoices to the Company... which lead to high compliance cost for the SMEs.

The third and fourth position is for travelling expenses and stationery expenses. As can be seen in the above table those 2 criterias have mean point below normal level (3) of cost. The stationery stay at 2.51, and the travelling is at 2.92 point. Among these, the stationery has low mean for such criteria since the stationery cost in the Company include telephone, fax, photocopying, pen, paper, print ink... which may not expensive in the market. But for the purpose of filing requirement, the stationery expenses are still a problem of the SMEs. In reality, through observation, in many SMEs, the paper are limited and strictly control in order to limit the cost together with increase the effective and efficiency in printing supporting large document for the Company. The last option is travelling expense. Since the electronic submission through Internet is not developed and popular in Vietnam, in major part of SMEs, travelling to the tax department to pay tax and submit tax return occur regularly. Some explained these circumstances that the bank charge fee when paying taxes hence they choose to go directly to the tax department for such procedure, also the submitting tax declaration experience the similar situation. Many accountants would like to direct submit the tax return to the Tax officer rather than through Internet, which make them feel comfortable and secured.

Briefly, the miscellaneous expenses for the SMEs in Vietnam are also considered as consuming high cost for compliance to tax filing requirement and others. According to the survey, the highest cost refer to the cost of collecting document for tax purpose, the second point is document storage, and 2 last position are belonged to storage and travelling expenses. In addition, the causes which lead to high portion of miscellaneous cost for the SMEs as research in this study include 3 criteria: Request for supporting document for explaining to the tax authority; Requirement for supporting document for internal accounting control; Requirement for the purpose of management.

5. CONCLUSION

The first question of this study is to identify the tax-compliance burdens of the SMEs when applying the Vietnam taxation system, especially the corporate income tax. This study has shown that in the SMEs, there are 3 type of cost incurred during the tax compliance which included: internal tax cost, external tax cost and miscellaneous tax cost. Three pools of expenses contribute the large expenses for compliance. In which, the internal tax cost and miscellaneous tax cost placed in the first and second position at 48.48% and 33.33% respectively, while the amount for external cost is just 18.18%. Some internal cost reach at significant point at the SMEs such as wages for internal staff for completing the CIT procedure; and expenses for dealing with tax authority. The miscellaneous cost are also assessed as major contribution for high tax compliance cost such as document storage, cost for collecting supporting document, invoice, stationery expenses... Furthermore, Vietnam is a developing country, the hiring external accounting service is still limited, and the distribution and range of external service also are not popular to each SME, which lead to the external cost is quite low. It is implied the fact that the tax compliance expenses with regarding to updating tax knowledge, special treatment for some typical cases shall be recorded incorrectly.

The second objective is obtained through analysis the causes of incurring large expenses for tax procedure, we can conclude that the effort should come from both the SMEs and Tax authority to join hand for having proper and appropriate solution. The SMEs is recommended to have better internal control inside the company, and increasing the awareness of fulfilling tax obligation for the country. Whereas, the Vietnam tax department also need to further reform and complete the current administrative procedure follow the international practice. As such reducing the tax requirement for filing and preparing supporting document, limited criteria for declaring for the SMEs, applying technology in solving the problem arising from the SMEs... The Ministry of Finance must coordinate with other ministries, agencies and localities in a strict manner, with specific solutions, regularly monitored for the purpose of having accurate and appropriate solution for each type of business.

A PROPOSAL TO RESEARCH ON SOCIAL RESPONSIBILITY IN SMES IN TEXTILE AND APPAREL INDUSTRY VIETNAM

Thi Thu Hien Phan*, Tuan Anh Luong**, Viet Khanh Hoang***

ABSTRACT: *In a competitive, globalised world, corporate social responsibility (CSR) is proposed as a strategy to invigorate the competitiveness of small and medium sized enterprises (SMEs) in textile and apparel industry of Vietnam (VITAS). The primary objective of this paper is to identify CSR factors that influence the competitiveness of SMEs in VITAS and to develop a hypothesised model that can be tested on SMEs in VITAS. Although SMEs in VITAS are increasingly becoming the backbone of the economy, their rate of survival and competitiveness are a cause for concern. The outcomes of CSR activities can help to improve the survival rate of SMEs in VITAS, and may offer great opportunities for business competitiveness, locally and globally.*

Keywords: *Business ethics, competitiveness, corporate social responsibility, SMEs, VITAS*

1. INTRODUCTION

(SMEs) are universally acknowledged as effective instruments for generation of employment and economic growth. Even in countries with large corporations like the United States of America, SMEs contribute substantially to employment opportunities, and they supply goods and services to consumers and large businesses. The rapid transformation of high performing Asian countries such as Vietnam, India, Malaysia, Indonesia, Taiwan and Hong Kong also provides evidence that SMEs are major catalysts in economic development (COzigbo and Ezeaku, 2009). In VITAS, where the private sector, in general, is not yet well developed, SMEs could play a critical role in stimulating economic development and alleviating poverty (Hoang Thi Thanh Huong, 2015)

As global competitiveness continues to be a momentous trend, the notion of corporate social responsibility (CSR) is proposed as an impressive strategy to invigorate the operations and competitiveness of SMEs. CSR is viewed as a vital concept that businesses of all types and sizes need to understand and address. There exists a positive relationship between CSR activities of SMEs in VITAS and their enhanced competitiveness, at least if a long term perspective is considered (Hoang Thi Thanh Huong, 2015). Although CSR has been mainly discussed in the context of larger businesses, there is compelling evidence that it can also be used as a strategic tool to enhance the competitiveness of SMEs (Mandl, 2009). CSR can positively influence the competitiveness of SMEs in many ways, such as improved products and/or production processes, resulting in an improved customer satisfaction and loyalty, higher motivation and loyalty of employees, better publicity due to awards received and/or enhanced word of mouth references, better access to public funds due to a better corporate image and increased turnover/sales due to the competitive

advantage gained (Mandl, 2009). Hence, CSR is seen as an effective strategy for businesses to enhance competitive strength, financial performance and intangible assets.

Businesses undertake CSR, not necessarily out of a need to act benevolently, but more for survival in a globally competitive and legally complex modern environment (Moeti, 2000). Mandl (2007) demonstrate that an enhanced image, improved customer loyalty and better employee employer relationships are the most important intermediate effects contributing to increased competitiveness.

Although there is a great deal of optimism regarding the role that SMEs can play in improving responsibility in business, most researchers such as Silberhorn and Warren (2007) have focussed their research efforts on large businesses, and continue to do so. Most initiatives tend to take the tried and tested 'business case' developed in large businesses and 'shrink' it to fit SMEs (Jenkins, 2007). Despite the widespread practical and academic interest in CSR and its impact on the competitiveness of SMEs, theoretical and empirical studies are limited. Conclusions resulting from quantitative and qualitative research studies with respect to CSR in SMEs in VITAS are few.

The primary objective of this paper is to identify CSR factors influencing the competitiveness of SMEs and to develop a hypothesised model that can be tested on SMEs in VITAS. The paper is mainly a culmination of a synthesis of recent studies from the literature done on CSR, both in developed and developing countries, with conclusions compared to the VITAS situation. The outcomes of CSR activities can help a great deal in improving the survival rate of SMEs, and may offer great opportunities for competitiveness in business, locally and globally. It is noted, however, that it is a challenge to incorporate CSR activities simultaneously with other business priorities of SMEs in a balanced and motivating manner. This is especially problematic in developing countries where there are limited financial resources, weak institutions and poor governance (Beyene, 2002). The paper also contributes to a better understanding of the concept of CSR within a framework of different stakeholders.

2. DEFINITIONS OF CONCEPTS

As this research paper focuses on CSR and the competitiveness of SMEs in VITAS, it is imperative to present clear definitions of key concepts.

2.1. Corporate social responsibility

CSR is an evolving concept that currently does not have a universally accepted definition. In some studies, CSR refers to the integration of social and environmental concerns into the business operations, and to the interaction of the organisation with its stakeholders on a voluntary basis, that is, going beyond compliance with legal obligations (Mandl, 2009). According to Aaronson (2003), CSR refers to open and transparent business practices that are based on ethical values and respect for employees, communities and the environment, designed to deliver sustainable value to society at large, as well as to shareholders. It is a concept whereby companies decide voluntarily to contribute to a better society and a cleaner environment. CSR is also viewed as the commitment of businesses to behave ethically and to contribute to sustainable economic development by working with employees, their families, the local community, and society at large to improve their quality of life in ways that are good for business and sustainable development. CSR refers to a concept prevalent in today's business practices, where companies commit to be sensitive to the demands of all stakeholders in the scope of its business operations, beyond what is being regulated and expected by the community, and beyond the industry norm.

The focus of this research paper is on CSR activities that impact on the workforce of the SMEs, the society/community, the market (i.e., customers, suppliers, business partners, etc.,) and the physical environment, to enhance their competitiveness.

2.2. Small-and medium-sized enterprises in VITAS

There is no universally accepted definition of SMEs in VITAS. Definitions in other countries also lack uniformity, and reflect the relative development of the respective economies. In Vietnam, according to government decree 39/2018, SMEs in Vietnam are defined as businesses that are independently owned and managed, and employ less than 200 people. Other characteristics have not been fully defined (Hannun, 2004). A number of indexes are traditionally utilised to define SMEs (Harvie, 2004): Number of employees, invested capital, total amount of assets, volume of sales and production capability.

2.3. Competitiveness

Despite its acknowledged importance, the concept of competitiveness is often controversial and misunderstood (Li Hua, 2007). The literature on competitiveness provides a wide variety of definitions of the term (Herciu and Ogrea, 2008). As such, competitiveness means different things to different organisations (Rusu, 2003), depending on its context and level (Ambastha and Momaya, 2004). Generally, competitiveness is considered synonymous with success. In simple terms, success can be defined as the achievement of business objectives (Bibu, Sala, Pantea and Bizoi, 2008). To SMEs, competitiveness essentially means the liability and skill for market contention, and the skill to gain position and permanent commitment, all of which are indicated specifically by expansion of the business, market share and profitability (Markovics, 2005). Competitiveness is also viewed as the means by which businesses can improve their performance, which can be measured according to a number of dimensions, including market share, profit, growth and duration. From an entrepreneurial perspective, a competitive business needs to survive in the market and achieve market share and profitability. As such, the success of a competitive business can be measured by objective criteria, which include return on investment, market share, profit, and revenue from sales (Sultan, 2008). Based on various definitions, this paper considers competitiveness of a business as its ability to sustain long term performance better than its competitors in the market, as indicated by profitability, market share, sales and rate of growth.

2.4. Business ethics

Although ethics in general deals with what is good or right in human interaction, business ethics focuses on what is good and right in economic activity. In other words, it focuses on morally evaluating economic practices and activities (Rossouw, Prozesky, Van Heerden and Van Zyl, 2007). As such, business ethics is defined as a set of established rules, standards or principles for morally right conduct in specific situations and in specific cultures when applied to business activities and operations. According to Heisler (2007), business ethics is the ability of the business to pay attention to moral judgments, practices and commitments in business decisions. Business ethics is also viewed as a process of an organisation integrating values such as honesty, trust, decisionmaking. Hence, business ethics is inherently linked with corporate governance (Mahmood, 2008). For the purpose of this paper, business ethics is considered as business moral standards, values, norms and practices that over ride self interest while pursuing socioeconomic goals.

2.5. Nature and potential outcomes of CSR activities in SMEs of VITAS

CSR is a concept that every corporate member of a community and society should practise. Today, it is not enough for businesses to create and secure jobs, provide products and services to society and to pay

taxes. More and more consumers are showing a growing interest in ensuring that the products they purchase are produced in a socially and environmentally responsible manner (Lai, 2006). This puts businesses under pressure to make responsible and transparent efforts together with governments and civil society to create a more sustainable world (Kerby, 2001). As such, businesses should recognise that addressing wider social and environmental problems is fundamental in ensuring long term success. CSR involves working in partnership with local communities, practising socially sensitive investment, developing relationships with employees, customers and their families and involvement in activities for environmental conservation and sustainability (Maimunah, 2009). The nature of CSR activities in SMEs can be significantly different from CSR activities in large businesses. For instance, the relationships between SMEs and their key stakeholders, notably employees and customers, are qualitatively different from those of large businesses, and are characterised by a high level of informality. Relationships with customers are often based on personal knowledge of the needs of the customers, whereas relationships with employees are more family-like, with greater openness and social integration.

CSR includes a variety of different activities, and there is no one single approach to CSR, particularly for SMEs. However, to make the vague concept of CSR more tangible, it is vital to describe the conceivable CSR activities in more detail by classifying them into different categories (Mandl and Dorr, 2007). SMEs can be classified by the 'target group' of CSR activities, that is, the beneficiaries of the initiative set by the businesses so that different degrees of 'closeness of consideration' can be identified (Mandl and Dorr, 2007). Common CSR activities include sponsorship programmes, providing career development and training to employees, recycling of waste and being part of the activities of the community.

Related to this, Ararat (2008), Kramer, Pfitzer, and Lee (2005), Mandl and Dorr (2007), Mandl (2009) and Szabo (2006) demonstrate that SMEs are particularly active in workforce orientated, market orientated, society orientated, and environment orientated CSR activities. Such activities are categorised in accordance with their contents, as indicated in Table 1.

Table 1: *Categorisation of CSR activities of SMEs*

| Category | Content |
|---------------------------------------|---|
| Workforce-orientated CSR activities | This is about fair treatment of employees by the business and is often related to attraction and retention of employees, the improvement of working conditions and job satisfaction, work-life balance, equal opportunities and diversity, training and development of staff, participation in business decisions and fair remuneration or financial support of employees |
| Market-orientated CSR activities | This relates to issues of relevance to the markets in which the business operates. It entails activities to improve the quality or safety of products, fair pricing, ethical advertising, paying suppliers or business partners without delay and supporting the establishment of local or regional business alliances |
| Society-orientated CSR activities | This is about promoting social solidarity in the broadest sense in the local communities in which the business operates. It involves social and/or labour market integration at community level, improvement of the local infrastructure and cash or in-kind donations to local community institutions |
| Environment-orientated CSR activities | This is about policies, operational management and reporting in relation to the environmental impact of all activities of the business. It entails designing environmentally friendly products or production processes, efficient use of resources, reduction of waste and pollution, and informing business partners, customers and society on environmental issues |

CSR: Corporate social responsibility, SME: Small and medium-sized enterprises

It is also acknowledged (Mandl and Dorr, 2007) that CSR activities of SMEs, on the one hand, may have effects on the business itself (internal effects) and, on the other hand, on the respective target groups, such as society, customers or the environment (external effects). However, not all CSR activities need to be characterised by both, but in the majority of cases, internal effects, such as higher employee satisfaction, will also result in external effects, such as improved customer loyalty due to better service (Mandl and Dorr, 2007). CSR activities for SMEs can also be directed towards working conditions, safety, social development and human rights, ethical conduct in business practices or the environmental impact of business operations (Lantos, 2002).

Although CSR has traditionally been associated with large business, recognition of the growing significance of the SME sector has led to an emphasis on their social and environmental impact as well (Fuller, 2003). Whereas SMEs rarely attract the attention of the national media and may not individually have a significant impact, like large businesses, they constitute a significant part of the global economy and society (Spence, Schmidpeter and Habisch, 2003). SMEs account for about 90% of businesses worldwide and are responsible for 50-60% of employment (Virac, 2018). As such, they play a fundamental role in society, and can potentially have a significant impact on social welfare. It is noted that the majority of SMEs believe that businesses like themselves should pay significant attention to their social and environmental responsibilities (Southwell, 2004). It is argued that as they are smaller with a flatter hierarchy, SMEs maybe better placed than large businesses to take advantage of the changing needs of society (Perez Sanchez, 2003).

Some studies, such as the one conducted by Mandl (2009) confirm the positive impacts of SMEs that implement CSR. The impact can include: Higher productivity and decreased operating costs, better enterprise publicity, improved networking, new business opportunities, attracting new skilled and talented employees and a greater competitive advantage. Given their presence in local communities, SMEs are strongly connected with the community. With such personal interactions, SMEs can build trust in their communities (Mahmood, 2008).

Although businesses derive many benefits from implementing CSR activities, SMEs in VITAS still face several challenges that hinder such implementation. These obstacles include a lack of financial resources, a lack of experience in management, weak institutions, poor governance, poor infrastructure, poor skills in strategically reflecting upon the business, low demand for products and services, poverty, withdrawing too much cash for personal use, insufficient profits and lack of market research (Pham Viet Thang, 2018). Likewise, SMEs in VITAS are faced with limited capital, poor corporate governance, weak institutions, limited skills of management, lack of an incentive regime, low productivity and fierce competition. Regardless of these obstacles, SMEs do contribute to communities through conducting activities for the benefit of both the business and local community because of their relationship with the community. Moreover, SMEs that are more concerned about development of brands in the long term tend to be more conscious about their social responsibility (Mahmood, 2008). As SMEs have stakeholders and an impact on society, the concept of CSR is just as valid for small businesses as it is for large ones (Kate et al., 2007).

Also, in Vietnam, SMEs in VITAS do collectively exert a large impact on the economy through their operations. As such, they are required to pay attention to social, ethical and environmental issues. By engaging in dialogue with important stakeholders, SMEs can develop a good business image and achieve employee satisfaction and customer loyalty, thus enhancing their competitiveness. It is evident from the above that both theoretical and empirical research often point to a positive relationship between CSR activities and competitiveness of the business (Weber, 2008). The available literature also shows that higher

employee satisfaction leads to better publicity, as well as improved customer loyalty as important beneficial outcomes of socially responsible conduct (Mandl, 2007: 1). The subsequent section discusses the proposed hypothesised model of CSR activities and competitiveness of SMEs in VITAS.

3. PROPOSED HYPOTHESISED MODEL

A study of the literature revealed a number of CSR variables that influence the competitiveness of SMEs. Based on these factors, the following hypothesised model is proposed [Figure 1]. Figure 1 illustrates how the independent variables (workforce orientated, society orientated, market orientated and environment orientated CSR activities) impact the mediating variables, namely, employee satisfaction, reputation of the business and customer loyalty. These, in turn, lead to increased competitiveness (dependent variable), which is measured by profitability, market share, sales and growth rate. The various relationships hypothesised between the independent, mediating and dependent variables are summarised below:

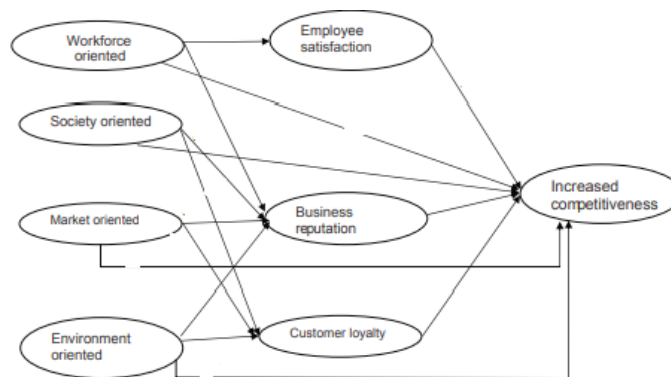

Figure 1: Proposed hypothesised model

4. DISCUSSION

From the review of the literature, a conceptual model of CSR was developed. The model is divided into three parts, namely independent, mediating and dependent variables. The subsequent sections briefly discuss the operationalisation of the variables in relation to the research hypotheses within the context of SMEs.

Workforce-orientated: CSR activities In this paper, workforce orientated CSR activities refer to those activities aimed at improving the working conditions, work life balance, job fulfilment, equal opportunities and diversity, training and development of staff, providing information to employees, participation in business decisions and fair remuneration. This is in line with a survey of SMEs, which showed the highest engagement in workforce orientated CSR activities (Polášek, 2010), namely, sufficient health and safety arrangements at the workplace, motivation of employees and education systems, possibility of flexible working hours for employees, contributions of the business to pension insurance and/or life insurance of employees, and the top management consulting with employees on important matters.

A survey of Danish SMEs (Granerud and Boesby, 2009) reveals that managers and employees in SMEs see a positive relation between CSR activities and the environment of work, mainly related to psychosocial conditions. This is more dominant in service orientated businesses. CSR activities seem particularly appropriate to impact the soft side of the environment of work, which is also the most difficult to regulate through legislation. Empirical studies demonstrate the positive impacts of CSR from a perspective of human resources. Businesses that run employee volunteer programmes report that such programmes can improve

morale of the employees and help participants to acquire and develop new skills. Furthermore, a study conducted on SMEs confirms the major benefits of implementing socially responsible and ethical behaviour towards employees as: Improved job satisfaction of employees, increased loyalty of current employees, reduced staff turnover and recruitment of new, qualified employees. Similarly, a survey of SMEs in Estonia found that many SME managers see CSR as a way of retaining qualified employees in a competitive labour market (PW Partners, 2007).

A survey of Malaysian SMEs (Jamaludin and Hasun 2007) show that training of staff is important in increasing the value of human capital. Training results in a high level of loyalty and productivity of the staff. Skilled employees are likely to be more efficient in performing their responsibilities, which results in an output of good quality and reduction of waste. This will directly increase the sales, market share, profit, growth, customer loyalty and demand of the business. Thus, a well skilled and trained workforce is a key tool for effective competitiveness. The knowledge and experience of the employees are unique, intangible businesses assets (Brdulak, 2006).

Society-orientated CSR activities: Society orientated CSR activities are defined as support for social and cultural community activities, as well as development of the community and other related issues. Such activities include cultural activities, sports, health and well being, education, assistance to low income groups and participation of the community (Vives, 2005). In this paper, society orientated CSR activities refer to the relations between the business and the citizens and communities that maybe affected by its operations. They include issues such as human rights, dialogue and partnerships with potentially affected communities, and an active contribution to the well being of the community. To become a good neighbour, a business can engage in such varied initiatives as providing financial and material support for local activities and projects, and making the time and the professional knowledge of its employees available to the local community (Polášek, 2010).

According to a survey of Czech SMEs (Polášek, 2010), the benefits associated with society orientated CSR activities include improvement of the reputation and image of the business, loyal employees and customers, simplified access to local resources, lower costs of security due to lower crime and vandalism, and new business opportunities. Businesses contribute to their communities, especially local ones, by providing jobs, wages, benefits and tax revenue. On the other hand, businesses depend on the health, stability and prosperity of the communities in which they operate. The reputation of a business at its location and its image as an employer and producer, but also as an actor in the local scene, certainly influence its competitiveness (Polášek, 2010).

Market-orientated CSR activities: In this paper, market orientated CSR activities refer to the ways a business operates in relation to its customers, suppliers and competitors. It entails issues such as responsible advertising, dealing with customer complaints and ethical practices. In today's market orientated environment, a socially responsible business is expected to conduct its activities in a transparent manner and to have positive relationships with its investors, customers, suppliers and other business partners. The ability of the business to succeed in the long term depends on its ability to create lasting and high quality sales networks for its products (Polášek, 2010). Examples of market orientated CSR activities include business policies guaranteeing adherence to ethical standards, provision of clear and accurate information on products and services, timely settlement of liabilities (payment of invoices), monitoring of and responding to complaints from customers, suppliers and other business partners, collaboration with other businesses on CSR activities and projects and high ethical standards in marketing and advertising.

A survey of Czech SMEs (Polášek, 2010) gives a list of benefits of market orientated CSR activities. These include increased customer loyalty, standing out among competitors, becoming an attractive business partner for socially perceptive business partners and customers, becoming a sought after supplier and business partner, and enhanced supplier chain performance. Similarly, retail data from a telecommunications business show that market orientated CSR activities are important drivers of the reputation of a business. Market orientated CSR activities are also often associated with better financial performance of the business.

Environment-orientated CSR activities: In this paper, environment orientated CSR activities are measures to minimise the negative impact of a business on the environment. It also means the production of goods and services that actively help improve the environment (European Competitiveness Report, 2008). The most important environment orientated CSR activities concern the consumption of materials and energy, handling pollution and waste in the most environmentally friendly way possible and responsibility for the product. It has been established (Polášek, 2010) that businesses that try to minimise the negative environmental impact of their activities can benefit through new business opportunities. For instance, a business that actively cares for the natural environment has a better chance of succeeding in tendering to large businesses and the public sector, and a better chance of attracting new customers from the ranks of environmentally conscious consumers. Examples of environment orientated CSR activities include environmentally friendly manufacturing, products, services and packaging, environmentally friendly practices of distribution and transportation, recycling, using recycled materials, energy and water saving practices, waste reduction practices, compliance with regulations and standards, protection of natural resources and the provision of accurate environmental information on products, services and activities. The benefits associated with environment orientated CSR activities include new business opportunities (e.g., attraction of environmentally conscious customers), protection of resources, reduced waste, lower costs due to efficient use of energy and resources and more efficient operations (Polášek, 2010). According to survey results of Czech SMEs, the main reason behind the involvement of SMEs in environment orientated CSR activities is related to improving the image and reputation of a business. This evidence suggests that SMEs help protect the environment to gain a competitive advantage. This is in line with the results from the survey of Danish SMEs that show that environment orientated CSR activities have a positive impact on the reputation of a business. Similarly, such activities have a positive impact on the reduction in the consumption of resources (European Commission, 2005).

It is also acknowledged that a positive relationship exists between embracing environment orientated CSR activities and increased profitability (Viviers, 2008). It has been empirically demonstrated that there is a positive relationship between environmental practices, customer loyalty and performance of the business. Competitiveness gains associated with the adoption of environmental practices are related to reductions in cost, saving of resources, opportunities for innovation, retention and loyalty of customers and improved morale of employees. Improvements in customer satisfaction lead to higher revenues and reduce future costs of transaction through improved customer loyalty.

Employee satisfaction: There are many factors that influence employee satisfaction. These include employee benefits, job satisfaction, the performance appraisal system, job safety, conditions in the workplace, and the relationships between managers and employees. Cranny, Smith and Stone (in Aydin and Ceylan, 2008) define employee satisfaction as the combination of affective reactions to the differential perceptions of what an employee wants to receive, compared with what he/she actually receives. As such, businesses should try to fulfil the expectations of employees to achieve employee satisfaction. In addition,

the emotional state of employees may also affect their satisfaction. This forces managers to create and sustain a positive working environment. The satisfied employee will work more willingly, and this contributes to the competitiveness of the business (Aydin and Ceylan, 2008). For the purpose of this paper, employee satisfaction is viewed as a measure of whether employees are happy and content, and having their desires and needs fulfilled at work. In other words, employee satisfaction entails attracting, developing, motivating and retaining qualified employees with a view to enhancing the competitiveness of a business. A survey by Sirota Survey Intelligence (2007) established that employees who are satisfied with the commitment of their business to social and environmental responsibilities are likely to be more positive, more engaged and more productive than those working for less responsible employers. Hence, a strong commitment to CSR has an impact on a wide range of attitudes of employees by fostering positive views about their employer in key areas such as its sense of direction, competitiveness, integrity and interest in their well being. Similarly, a study of the shipping industry in Taiwan (Tsai, Yu and Fu, 2005) confirms the positive relationship between employee satisfaction and the competitive advantage of SMEs. SMEs can use benefits to employees to increase the productivity of employees, and, in turn, achieve a competitive advantage. Therefore, investment in benefits to employees offered by SMEs represents not only costs, but also profits.

Business reputation: The reputation of a business has long played an important role in its success. It assures the license of a business to operate in the community, and helps to ensure its long term survival, alongside other factors such as financial stability and product quality. Today, businesses increasingly measure their assets in terms of intangibles, such as knowledge, brand visibility and customer loyalty. It is not what a business makes or does anymore, but how it is perceived, that matters (Money and Gardiner, 2005). In this paper, business reputation is considered to consist of attributes that form the perceptions of stakeholders of the extent to which a business is well known, reliable, trustworthy, reputable and believable, which attributes can collectively enhance the competitiveness of SMEs.

Business reputation is an important measure of the success of a business. It is the most important strategic and valuable asset a business can possess. Business people and scholars agree that a good reputation is the ultimate corporate asset that businesses strive to achieve (Shamma and Hassan, 2009). However, it must be appreciated that business reputation is hard to measure.

Theoretical and empirical research studies often point to a positive relationship between CSR and the competitiveness of a business (Weber, 2008). According to Hunt and Morgan, as cited in Eberl and Schwaiger (2005), business reputation is an intangible asset that could generate a competitive advantage in the marketplace and, hence, superior financial performance. An empirical study by Fombrun and Rindova (as cited in Omar et al., 2009) on leading US and UK businesses found that those businesses with a better reputation appear to project their core mission and identity in a more systematic and consistent fashion than businesses with lower rankings of reputation. According to a UK study, medium sized enterprises embracing CSR identified an improved business image and reputation, increased market share, and more business as dividends from their CSR engagement (Jenkins, 2006). Hence, a satisfactory business reputation is an important driver of successful business relationships with customers, which can have a significant impact on performance of the business (Ewing, Caruana and Loy, 1999). Empirical findings (Shamma and Hassan, 2009) highlight vision and leadership, emotional appeal and social and environmental responsibility as the important elements that businesses need to focus on as their reputation progresses. These elements are at the highest level of business reputation and represent an important source of long term sustainability and competitive advantage. Furthermore, empirical results from both autoregressive profit models and

proportional hazard regression models (Roberts and Dowling 2002) consistently suggest that superior performing businesses have a greater chance of sustaining their performance over time if they also possess relatively good reputations. These findings complement existing studies on the relationship between reputation and financial performance. Enhancement of the reputation of a business, in turn, makes it easier for it to sustain superior performance. The findings demonstrate empirically that a good business reputation is an important strategic asset that contributes to the sustainability of profits of that business. Hence, a good business reputation is an intangible asset that businesses use to create a competitive advantage, by distinguishing themselves from others (Flatt and Kowalczyk, 2006).

Customer loyalty: Developing customer loyalty is recognised as an essential concern for businesses. As markets become more competitive, businesses are more likely to attempt to maintain their market share by focussing on retaining current customers (Lee, Lee and Feick, 2001). In this paper, customer loyalty is the ability of the business to build and sustain long term relationships with stakeholders who have a deeply held commitment to repurchase or repatronise a preferred product or service consistently in the future, despite situational influences and efforts in marketing. Indeed, such long term relationships can enhance the competitiveness of SMEs, and loyal customers may frequently recommend a business to others. Scholars vary greatly in their measurement of customer loyalty. Although it is assumed that increased customer loyalty is strongly correlated with a high level of satisfaction, customer loyalty has, at times, been operationalised as a behaviour or an attitude. A study of the mobile phone market in France (Lee et al., 2001) confirmed the measures of customer loyalty as intent to repurchase, resistance to switching to the product of a competitor that is superior to the product of the preferred vendor and willingness to recommend the product of the preferred vendor to friends and associates. A customer who has the intention to repurchase and recommends a product is very likely to remain with the business. This is in line with the empirical findings of Brimpong (2008), which demonstrate the indicators of customer loyalty as length or duration of stay of customers, the willingness to recommend the product or institution to friends, and repurchasing products. Retention of a customer for more than a year is considered quite commendable in a highly competitive business environment. A shift in focus from finding customers to retaining customers has become prominent in recent years, and this perspective has been adopted by many businesses. The analysis of empirical data (Gable, Fiorito and Topol, 2008) shows that customer loyalty is key to the success of a business, and retaining existing customers costs far less than acquiring new ones. One way to do this is to create customer loyalty programmes that effectively reward potentially important customers.

Increased competitiveness: The long term goal of SMEs should be to stay in business, grow and make a profit. To effectively compete in local and global markets, SMEs must be quick and flexible in their response to the needs of stakeholders. Competitiveness can be treated as a dependent, independent or an intermediary variable, depending on the perspective from which the issue is approached. Such a variety of levels and approaches actually reflect the wide application of this concept. Measuring competitiveness is a very challenging task. Traditionally, the competitiveness of a business has been measured using only financial indicators such as profit, market share, sales and rate of growth (Singh et al., 2008; Man et al., 2002). It should be noted, however, that financial indicators measure only past performance. There are many indicators of competitiveness that are dependent on the nature of the study, and the industry and the size of the business being studied. Mandl and Dorr (2007: 49) found that a competitive advantage caused indirectly by CSR activities of SMEs leads to a higher level of competitiveness, indicated by increased volume of sales, market share and profitability. On the other hand, the competitive advantage of businesses in the

Chinese banking industry is measured by eight business criteria: Return on total assets, return on net assets, return on sales, asset liability ratio, total asset turnover, price cost ratio, loan losses and return on equity (Li and Wang, 2007). However, the survey of five owner managers of small and medium sized enterprises established that most SMEs today use a hybrid approach in measuring competitiveness. Financial measures include profits and sales turnover, while nonfinancial measures are the long term growth rate and market share of the business (Chong, 2008). Likewise, Jamaludin and Hasun (2007) measured competitiveness of a business by comparing the actual performance of the business sales, market share, profit, growth, demand, and customer loyalty with the forecast. Competitiveness is also measured by how the business perceives its performance compared to that of direct competitors in term of sales, market share, profit, and growth.

5. CONCLUSIONS AND RECOMMENDATIONS

The personal and ethical values of SME owners, managers and employees are a strong motivation for a business to pay more attention to social and environmental issues. As such, all stakeholders should be encouraged to view the opportunities that can arise from engaging SMEs in CSR issues. It should be recognised that SMEs in VITAS from the same sector often face common social and environmental issues. Addressing these issues collectively can reduce costs, and result in improvements that an individual SME acting alone cannot achieve. The forming of strategic alliances and networks in dealing with CSR activities allows SMEs to combine the advantages of smaller scale and greater flexibility with economies of scale and scope (Sultan, 2007). Hence, cooperation across different industrial sectors maybe important in addressing local CSR issues.

SMEs in VITAS should be encouraged to start with small steps. As CSR covers such a potentially wide number of issues, it can appear overwhelming. There is no need for a business to try to address all aspects of CSR from the beginning. For example, an initial focus just on simple measures to reduce costs and environmental impact, or giving priority to the local community during the recruitment of staff, could be a good start.

Finally, further research should be encouraged on action areas such as the success of different policies and techniques to increase the uptake of CSR amongst SMEs, the economic, social and environmental impact of CSR at sector level, and a typology of SMEs with regard to their engagement in CSR.

THE PRICING MODELS OF COVERED WARRANTS AND EMPIRICAL STUDY IN THIN MARKETS AND DEVELOPED MARKETS

Thi Kieu Hoa Phan* - Thi Tham Dinh* - Quy Thai Duong Nguyen*** -
Nam Thai Nguyen**** - Nada Thabets Alluhaibi*****

ABSTRACT: *The covered warrant is a financial product which is widely applied in many markets not only the thin markets such as HongKong, Singapore and Korea but also developed markets namely Germany, Australia, the UK and the USA. Towards the Vietnamese market, the covered warrant is a new type of investment, assisting investors in hedging and diversifying their portfolios. The occurrence of covered warrants in the next few months may increase the ranking of the Vietnamese financial market. However, in the reality, it is not easy for investors to value the price of covered warrants to make decisions. This paper aims to present three models including Binomial, Trinomial and Black-Scholes model, used to price the value of covered warrants, based on the value of their underlying assets. Moreover, based on these valuation models, the paper conducts the empirical study in thin markets (Hong Kong and Singapore) and developed markets (Australia and the UK) to select which is the best model for each type of market. The research is involved in 1,275 input data (the daily price in 6 months of 12 stocks in 4 markets) and then pricing the value of their covered warrants respectively. The research also applies the Kolmogorov-Smirnov method to test whether the stock price of underlying assets follows the log-normal distribution or not. In addition, the P-value approach is conducted to test the hypotheses. The research results indicate that the Binomial model may apply to price the value of covered warrants in thin markets, while developed markets should employ the Black-Scholes Model. Thus, this result may be a suggestion for Vietnamese investors as well as issuing organisations in selecting an approach to price the value of covered warrants. Nevertheless, the further research is required to apply for pricing covered warrants with the American-style exercise.*

KEYWORDS: *Covered Warrants, Underlying Asset, Thin Market, Developed Market, Binomial, Trinomial, Black-Scholes.*

1. INTRODUCTION

A new type of financial instrument in the year 1998, was introduced to the market of Italy known as covered warrants. The covered warrant is referred to a type of financial products that allows the holders to sell (put) or purchase (call) an underlying asset at a predetermined price (strike price) on or before a fixed day (exercised day) in the future (London Stock Exchange 2009). The investors have joined the world of derivatives and purchasing the covered warrants which are the financial instruments that derives their values from the performances of other assets such as stock exchanges indices, shares, interest rates, currencies, and commodities.

Distinctions between covered warrants, equity warrants, equity options

The covered warrant allows holders to sell (put) or purchases (call) **underlying assets** from **third party** at a predetermined price on or before a specific date in the future.

The equity warrant is the instruments issued by **the issuing company** that give **rights** to holders to purchase **stocks** at a predetermined price on or before a certain day in the future. The buyers of the equity warrant need to make the upfront payment to gain rights to the warrants issuer.

The equity option is a type of derivatives, issued by **Stock Exchanges** allow investors to buy or sell stocks at a predetermined price on or before a specific date in the future. The equity option has the powers to protect, diversify or develop share portfolios since it can be used regardless of conditions of the share market (Britton and Waterston 2013).

| Covered warrants | Equity warrants | Equity options |
|---|---|---|
| <ul style="list-style-type: none"> • Covered warrants are issued by the third party. • Underlying assets: Equities, Currency, Index or other assets • Covered warrants work in a similar way to the options contracts that allows the private investors to carry out trade in the prices of assets such as currencies, global indices, equities, and commodities. • The covered warrants generate a return if the prices of the underlying assets have increased above the strike price before the maturity date. | <ul style="list-style-type: none"> • Equity warrants issued by companies. • Underlying asset: The stocks of the issuing company • The warrants are issued by the way of the preferential allotment to institutional investors, promoters and other investors. • Equity warrants protect the participants of the market from the defaulting counterparties and provide the hedging opportunities. • The equity warrants are not the equity shares because they do not carry any voting or dividend rights. It is issued by the organization during the period of financing in order to purchase the security. | <ul style="list-style-type: none"> • Equity options issued by stock exchanges • Underlying asset: Equities on the market • The equity options are commonly used by the market participants which includes investors seeking exposure to movements of the shares for a fraction of the cost of an actual share. • Traders and brokers can access options, listed on the stock exchange through a technology platform that offers dual options structure of the market. • The equity option allows the regulators to gain the exposure to the share price movements for less than the actual share cost. |

2. PRICING MODELS

2.1 BINOMIAL DERIVATIVE PRICING MODELS

2.1.1 Overview

An options valuation method so-called Binominal option is developed by Cox, Rubinstein and Ross in 1979. In order to price options (or warrants), an iterative procedure is used by Binomial option pricing. Although Binomial option has an additional relationship with Black-Scholes model, when comparing with Black-Scholes model, it not only has simpler formal deduction but also is more concretely to demonstrate valuation of option's concept (Hull 2015).

The binomial option pricing model has an assumption that the stock's margin and probability will not change as well as the movement of price fluctuations is only possible between up and down during the whole

period of observation (Fard 2014). In some phases of the duration, the entire potential development path of basic stock is simulated by using the share price's historical volatility and handling in order to evaluate the exercise profits, the guaranteed price on each path and single node is calculated by discounted method.

In general, the Binomial option pricing model's basic hypothesis is that the price of share could only fluctuate two orientations in every phases including down and up. The pricing strategy of Binomial option depends on using stocks portfolio in order to simulate an option's market value, before creating a risk free hedge; otherwise, between different options, a cheaper one could be bought by the investor then sell the higher one to attain profit on risk free, if it exists the opportunities for arbitrage. However, these opportunities for arbitrage only happen in very short time period.

The call option's pricing method is given by the main function of this stock portfolio. The option hedging must be constantly adjusted until the date of expiration, different from futures, once created; the future hedging could not change. Generally, there are two approaches in order to use the Binomial pricing model including the Risk Neutral Approach and the Risk Less Hedge Approach which will indicate the similar consequences when estimate the warrant price with the different basic approach (Moon 2013).

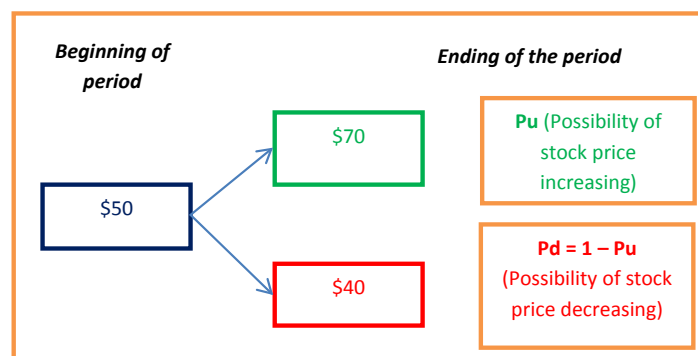

2. 1.2 The Riskless Hedge Approach

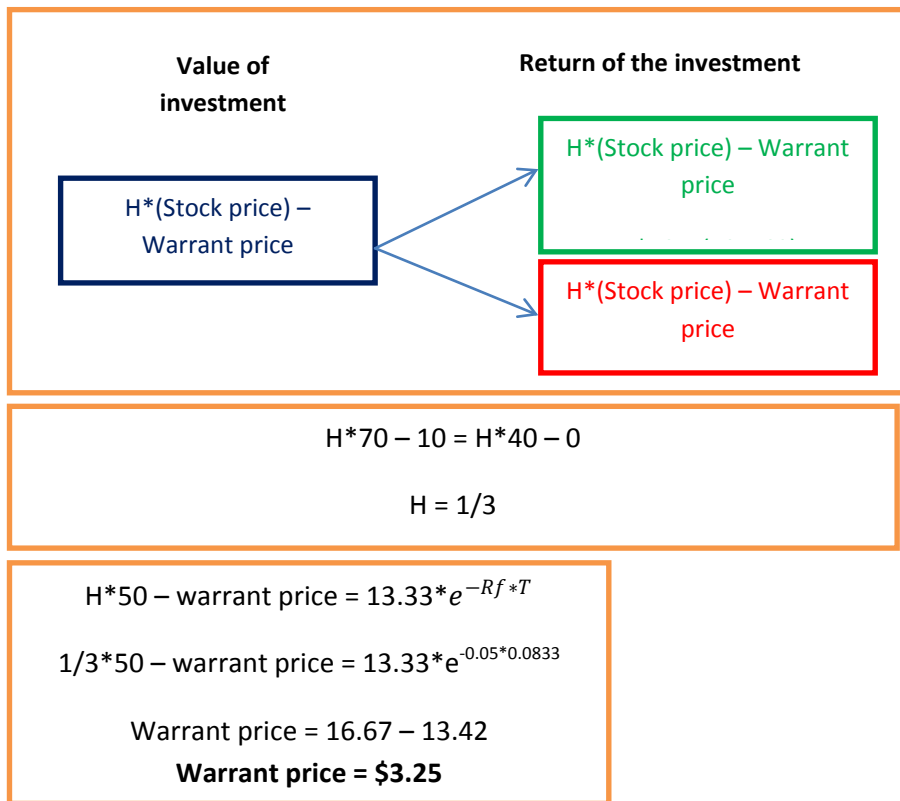

In term of the riskless hedge approach, the warrant price is calculated by using hedge ratio which could be found in a portfolio in each period between warrants and stocks. Therefore, finding a general hedge ratio for every single period is the first step of using riskless hedge approach. In this situation, a portfolio is established by an assumption including selling call warrants and buying shares. Assuming that, a number of shares are bought at \$50 and the strike price is \$60 if the call warrant is sold immediately. Under the situations, when the price of share rises to \$70, the price of warrant is \$10 (\$70-\$60). However, if the price of share falls to \$40, the warrant shall be valueless.

The initial portfolio investment is created by using the cost of shares after eliminating the profit from the sales of warrant. At the end of period, if the price of underlying asset increases to \$70, the return will consist of all value stocks as well as the warrant exercise's loss. However, the total portfolio return will be equivalent to the current price of stock if the price of stock decreases. In the below example, H is the hedge ratio.

Assuming that portfolio is invested without risk, resulting in an equivalent in the investment return. Otherwise, the hedge ratio also could be derived by using the equation.

The return value could be checked when the hedge ratio is gotten from the equation. In this situation, the portfolio value will equal $\$13.33 = (70 * 1/3 - 10)$ if the price of share has been risen. This result will be similar to the price of share when it decreases $= \$13.33 = 40 * 1/3$. The beginning portfolio value shall be discounted by the ending period return with the discount rate equivalent to risk free rate resulting in the present value of end period return. Therefore, the warrant price also could be calculated by using the present value. Assuming that, risk free rate equal to 5% with monthly period, every period will be equivalent to $1/12 = 0.0833$.

As a result, warrant price is \$325

2.1.3 The Risk-Neutral Approach

In term of the risk neutral approach, this model could apply for all the above assumptions. In order to comparing with the risk free hedge approach, there is an assumption that arbitrage is eliminated in the risk neutral approach. Generally, the return and risk always exchanges. For an illustration, if we are going to invest in an investment with high return, the money loss also must be proposal in case of failure. As a consequence, if the opportunity of arbitrage is ignored, there is not exist the potentiality of risk and return. When the probabilities of the stock price's trend are found by using this model, it is called the risk neutral probability.

When warrant price is calculated by using the risk neutral approach, the probability of the increase in stock price is pointed out by using P_u , and P_d indicates the probability of the fall in the stock price with $P_d = 1 - P_u$ is the association between P_d and P_u . Assuming that, risk free rate equal to 5% with monthly period, every period will be equivalent to $1/12 = 0.0833$. The same price is used to estimate as below:

All ending period possible warrant price must be discounted in order to calculate the warrant price. Based on the result above we have P_u (Possibility of the increase of stock price) as well as the ending period of warrant price is calculated by using the riskless hedge approach. As a result, when the price of stock has been risen, the warrant price will be equivalent to \$10. On the other hand, the warrant price will be equivalent to 0 if the price of stock has been fallen.

The results of two calculation methods demonstrate that the result of warrant price can be attained from two different approaches. It can be concluded that the warrant price only could be calculated in one period by these approaches, if the underlying assets have many stages, we must calculate the warrant price for every stage (using Excel).

|--|--|

2. 1.4 Restrictions of Binominal Model

Assuming for the price of future is the main limitation of the Binomial model. In fact, the stochastic performance is one characteristic of the stock market resulting in the most accurate number could not be obtained by the investor. Therefore, the prediction could lead to failure meaning that the results deriving from Binomial model cannot match the price of the market at all time

2.2. TRINOMIAL OPTION PRICING MODEL

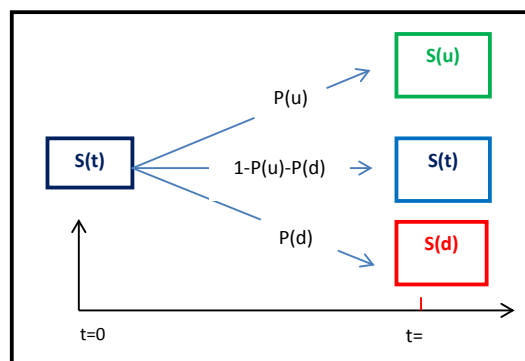

2.2.1 Overview

Binomial option pricing model was one of the first and most popular models for option pricing basing on straightforwardness and it’s easy to understand. However, this model also reveals a number of restrictions in the time of application resulting in emerging another model with more promising, so-called trinomial option pricing model.

Comparing to binomial model, the trinomial model adds a state which can be considered the main feature of this model. An assumption of binomial model is the option price in each step might be go up or might be go down while in the assumption of trinomial model, the option price could remain stable. This hypothesis is not only more similar to reality but also pricing better than the binomial model.

Assuming that, $S(t)$ is the price of stock at time t . In the future, at time $t+\Delta t$, we have three values of $S(t+\Delta t)$ including $S(u) = S(t) * u$, $S(d) = S(t) * d$ and $S(t)$ with $P(u), P(d)$ and $P(m) = 1 - P(u) - P(d)$ are their probabilities respectively.

2.2.2 Assumptions of the model

The price distribution over time $t+\Delta t$ is provided on the section above. The section above provides a distribution of price over time $t+\Delta t$. There are a number of assumptions before reaching a price in order to use this model.

a. No Arbitrage Pricing / Risk Neutrality: This assumption indicates that only one fix return could be reached for any given risk level meaning there is only one return is reached in a situation of risk free, so-called risk free return (rf).

$$E[S(t+\Delta t)|S(t)] = \text{Exp}(rf * \Delta t) * S(t) \quad (1.a)$$

b. The price of stock is assumed following the Brownian motion geometric with constant variance σ . This assumption will be equivalent to the log normal distribution's returns. As a result, we have the following equation.

$$\text{Var}[S((t + \Delta t)|S(t))] = \Delta t S^2(t) \sigma^2(t) + O(\Delta t) \quad (1.b)$$

c. For a given Δt time, the combination of equation (1.a) and (1b) is created as follow:

$$1 - P(u) - P(d) + u * P(u) + d * P(d) = \text{Exp}(rf * \Delta t)$$

d. Another assumption is established allowing the tree of trinomial complexity to grow only polynomial in order to make the calculation easier

$$P(u) * P(d) = 1$$

e. The size of jump is assumed now.

$$u = \text{Exp}(\sigma * \sqrt{2 * \Delta t})$$

$$d = \text{Exp}(-\sigma * \sqrt{2 * \Delta t})$$

The probability of lower and upper job of every intermediate node is obtained after solving these equations.

$$P(u) = \left(\frac{e^{(rf * \frac{\Delta t}{2})} - e^{(-\sigma * \text{SQRT}(\frac{\Delta t}{2}))}}{e^{(\frac{\Delta t}{2})} - e^{(-\sigma * \text{SQRT}(\frac{\Delta t}{2}))}} \right)^2$$

$$P(d) = \left(\frac{e^{(\sigma * \text{SQRT}(\frac{\Delta t}{2}))} - e^{(rf * \frac{\Delta t}{2})}}{e^{(\frac{\Delta t}{2})} - e^{(-\sigma * \text{SQRT}(\frac{\Delta t}{2}))}} \right)^2$$

$$P(d) + P(u) + P(m) = 1$$

2.2.3 Valuation of option (warrant)

The option valuation is analysed as below after we have the results of $P(d)$, $P(u)$, $P(m)$, u , d and m ($m=1$)

a. The factors including $S(u) = u * S(t)$, $S(d) = d * S(t)$ and $S(t) = m * S(t)$ is used to assign the price of underlying asset on $t + \Delta t$,

$$S_n = [P_u * S(u) + (1 - P_u - P_d) * S(t) + P_d * S(d)] * e^{-R_f * T}$$

b. The price of call option (warrant) or price of put option (warrant) is calculated respectively its intrinsic value situation.

In term of Call Option: $\text{Max}[(S_n - K), 0]$

In term of Put Option: $\text{Max}[(K - S_n), 0]$

c. Thus, the formula of final warrant price by using the Risk-Neutral method as below:

$$P_{\text{warrant}} = [P_u * C(u) + (1 - P_u - P_d) * C(m) + P_d * C(d)] * e^{-R_f * T}$$

$C(u)$: The option (warrant) price of an up move

$C(m)$: The option (warrant) price of the middle move (remain constant)

$C(d)$: The option (warrant) price of a down

R_f : Risk free rate of return, T : Time to maturity

2.3. BLACK-SCHOLES OPTION PRICING MODEL

2.3.1 Overview

The Black-Scholes Option Pricing Model was established and developed by Merton and Scholes who won the 29th economics Nobel Prize in 1997. The bonds, stocks as well as numerous of new derivative financial instruments are priced reasonably by this model.

2.3.2. Assumptions

Similar to other models, Black-Scholes model has a number of assumptions.

a. **Constant volatility**: The movement of a stock in short term (constant over time) could be measured by volatility which is one of the most important assumptions. The market will never change in long term although it experiences a fluctuation in very short term and relatively stable.

b. **Efficient markets**: The trend of individual stocks or market could not be consistently predicted by the Black-Scholes model in this hypothesis, instead of this, the stock is assumed walk randomly to move.

c. **No dividends**: Generally, the dividends are paid to the shareholders by most companies. However, the Black-Scholes model assumes that the shareholders will not receive dividends from basic stocks.

d. **Lognormal distribution**: The returns of underlying assets follow normal distribution in Black-Scholes model. This means that the price of underlying assets is lognormal distribution.

e. **European-style options**: European-style options are assumed.

f. **Interest rates constant and known**: The interest rates is assumed invariably

g. **No commissions and transaction costs**: There are not existed any trade barriers or extra costs in selling or buying options.

h. **Liquidity**: Assuming that every transaction takes place at any time and the markets are full liquidity.

2.3.3 Black-Scholes model's Function

This model consists of two parts with the expected return is absolutely basis of the purchase in part 1 and the paying's present value of the expiration exercise price is demonstrated in part 2.

$$c = S_0 N(d_1) - K e^{-rt} N(d_2)$$

$$p = K e^{-rt} N(-d_2) - S_0 N(-d_1)$$

where $d_1 = \frac{\ln(S_0 / K) + (r + \sigma^2 / 2)T}{\sigma \sqrt{T}}$

$$d_2 = \frac{\ln(S_0 / K) + (r - \sigma^2 / 2)T}{\sigma \sqrt{T}} = d_1 - \sigma \sqrt{T}$$

where, c - Call premium
p - Put premium
S - Spot price of underlying asset
K - Exercise price
r - Risk free rate of return
T - Time remaining for expiration of option in years
σ - Annualized standard deviation of returns expressed as decimal.

3. EMPIRICAL STUDY

3.1 Singapore market

| Warrant Ticker | Underlying Security Ticker | Issuer | Strike Price | Expiry Date | Style | Option type |
|----------------|----------------------------|--------------------|--------------|-------------|----------|-------------|
| CBJW | DBS | Macquarie Bank Ltd | 19.5 | 10/07/2017 | European | Call |
| CBHW | OCBC | Macquarie Bank Ltd | 9.5 | 02/10/2017 | European | Call |
| CBRW | UOB | Macquarie Bank Ltd | 22.5 | 01/11/2017 | European | Call |

- The risk-free rate is the SIBOR in 6 months.

The covered warrant price of CBJW, CBHW and CBRW is evaluated based on three models including Black-Scholes, Binomial and Trinomial as below:

| SINGAPORE_CBJW | Market price | Black-Scholes | Binomial | Trinomial |
|------------------------|--|---------------------|---------------------|---------------------|
| Mean value in 6 months | 0.0945 | 0.1203 | 0.1199 | 0.2062 |
| Average of Difference | | 0.0258 | 0.0254 | 0.1116 |
| T test | Null hypothesis: $H_0 = \text{Market Price} = \text{Price given by Model}$ | | | |
| | $H_1: \text{Market Price} \neq \text{Price given by Model}$ | | | |
| | Alpha = 0.05 (95% confidence interval) | | | |
| P value | | 0.0982 | 0.1167 | 3.48E-08 |
| Conclusion | | P Value > 0.05 | P Value > 0.05 | P Value < 0.05 |

Table 4: The results of warrant prices from 3 models

3.5 SUMMARY EMPIRICAL RESULTS

Between thin markets (Singapore and Hong Kong) and developed markets (Australia and the UK), there are some differences in the selection of models to calculate the price of covered warrants.

Towards the Singapore market, the results from models indicate that the Binomial model may be the best solution to calculate the value of covered warrants in this market. This is because the theoretical prices (mean value) from the Binomial model of two covered warrants (CBJW and CBRW) are closer to the market prices than those of the Black-Scholes and Trinomial model.

Similar to the Singapore market, regarding the Hong Kong market, the Binomial model may be the best selection because of some reasons. The results of the Binomial model (mean value) are nearly similar to the market price. In addition, since the returns of underlying assets such as China mobile or AIA do not follow the log-normal distribution (**seen as Appendix**), the Black-Scholes model may not be suitable to apply for this market.

In terms of developed markets (Australian and the UK market), the Black-Scholes may be the best model to calculate the price of covered warrants. This is due to the fact that the prices (mean values) from the Black-Scholes model may be less different from the market price compared to the Binomial and Trinomial model. Additionally, as the most returns of underlying assets in such markets follow the log-normal distribution, the Black-Scholes model can be applied to calculate the value of covered warrants (**seen as Appendix**).

5. THE BLACK-SCHOLES COMMENTS

Black-Scholes (BS) can be applied for pricing the value of covered warrants in developed markets such as Australia and the UK as the model is saving time. BS can calculate a huge number of warrant prices

in the short period of time (Kilic 2015). However, BS has many limitations that prevent it from forecasting accurately. Firstly, this model assumes that the distribution of underlying price is lognormal. Unfortunately, in the reality, the distribution is very different from lognormal such as having fatter left and right tails (Kilic 2015). For instance, thin market has very few buyers and sellers that lead to low transactions which lead to price more volatile and illiquidity (Rostek & Weretka 2008). This causes the distribution of underlying price movement is moved far from lognormal. Thus, Black-Scholes model is no longer applied correctly.

Moreover, the high volatility in price also relates to second huge limitation of BS model which is assuming volatility constant. Unfortunately, in the reality, the volatility is very hard to forecast and change randomly which often is referred to the term “stochastic volatility” (Lorig & Sircar 2014). Black-Scholes model has failed to take this issue into account; hence, it can lead to incorrect predictions. As a consequence, to modify BS model to enhance its result, volatility should be modelled stochastically (Fouque et al. 2000). It means that underlying price volatility will be random variables which could increase the precision of forecasts.

Similar to the volatility, another drawback of Black-Scholes is that interest rate is remained constant. This model only uses the same risk-free rate in calculation for the whole period. However, in practice, this rate is subjected to change every day (Spas’ka & Sheychenko n.d.); hence, it violates the Black-Scholes assumptions and makes the empirical results less accurate.

The fourth limitation of Black-Scholes is that it assumes there is no dividend payment throughout option’s life (Jonsson et al. 2013). Meanwhile, most companies pay dividend to their shareholders; therefore, it is a huge limitation of Black-Scholes because dividend yield can impact investors on deciding which underlying has better value. According to Spas’ka and Sheychenko (n.d.), they suggest that the common way to improve Black-Scholes model in this aspect is subtracting the discounted value of future dividend from stock price. As a result, dividend payment will be taken into account and make the results more accurately.

Some other limitations that make Black-Scholes model be less accurate is that when it comes to price warrants with American-style exercise, Black-Scholes model cannot calculate and forecast correctly (Kilic 2015). The reason is that the Black-Scholes model only calculate price options at expiration, while in American-style, options can be exercised at any time and even before expiration. Spas’ka and Sheychenko (n.d.) argue that there are some methods to adjust Black-Scholes price to make it calculating American option prices more precisely such as Fischer Black Pseudo American method but it is not really effective. In addition, Black-Scholes model also ignores commissions (Spas’ka & Sheychenko n.d.). In fact, investors always have to pay commission when buying and selling options. This may be small amount of money but it still has impact on output.

CONCLUSION

It can permit that there are three approaches, used to price the value of covered warrants including Binomial, Trinomial and Black-Scholes model. Between thin markets and developed markets, the selection of pricing models may be different. While the Binomial model may be the best method to calculate the price of covered warrants of markets namely Singapore and Hong Kong, the Black-Scholes should be employed to evaluate the value of covered warrants in advanced markets including Australia and the UK. However, it is important to notice that the Black-Scholes may have some limitations due to its assumptions and BS may not be applied for warrants with American-style exercise. Towards the Vietnamese market, investors and issuing originations may consider applying the Binomial model to evaluate the value of covered warrants.

APPENDIX

KOLMOGOROV-SMIRNOV TEST

Log-normal distribution Test

The test is to indicate whether the daily returns of underlying assets follow normal distribution or not. As the total samples of each underlying asset is higher than 50, the author uses Normal Q-Q plot and Kolmogorov-Smirnovtest (based on the SPSS software) to make conclusion. If the value of Sig is greater than 0.05, the return follows normal distribution. As a result, the stock price follows the log-normal distribution.

Singapore market

1.1 DBS return distribution *DBS is the underlying asset of CBJW covered warrant*

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|-----------|---------------------------------|----|-------------|--------------|----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| DBSreturn | .089 | 99 | .052 | .920 | 99 | .000 |

The Sig (0.052) is higher than 0.05

The returns of DBS follow normal distribution or the DPS's stock price follows log-normal distribution

1.2. OCBC

OCBC is the underlying asset of CBHW covered warrant

Tests of Normality

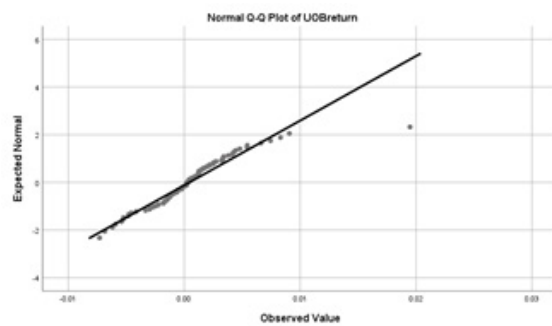

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|------------|---------------------------------|----|-------------|--------------|----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| OCBCreturn | .081 | 99 | .110 | .958 | 99 | .003 |

The Sig (0.11) is higher than 0.05

The returns of OCBC follow normal distribution or the OCBC’s stock prices follow log-normal distribution.

1.3. UOB

UOB is the underlying asset of CBRW covered warrant

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|-----------|---------------------------------|----|-------------|--------------|----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| UOBreturn | .103 | 99 | .011 | .909 | 99 | .000 |

The Sig (0.011) is lower than 0.05

The returns of UOB do not follow normal distribution or the UOB’s stock prices do not follow log-normal distribution.

2.HONG KONG

2.1. Chinamobile return

China mobile is the underlying asset of 16179 covered warrant

- The Sig (0.01) is lower than 0.05

The returns of China mobile do not follow normal distribution or the China mobile’s stock prices do not follow log-normal distribution.

2.2 AIA

AIA is the underlying asset of 20104 covered warrant

| Tests of Normality | | | | | | |
|--------------------|---------------------------------|----|------|--------------|----|------|
| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
| | Statistic | df | Sig. | Statistic | df | Sig. |
| AIAreturn | .131 | 76 | .002 | .890 | 76 | .000 |

a. Lilliefors Significance Correction

The Sig (0.02) is lower than 0.05

The returns of AIA do not follow normal distribution or the AIA’s stock prices do not follow log-normal distribution.

2.3. SMIC

SMIC is the underlying asset of 20104 covered warrant

| Statistic | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|------------|---------------------------------|------|-----------|--------------|------|------|
| | df | Sig. | Statistic | df | Sig. | |
| SMICreturn | .103 | 72 | .055 | .975 | 72 | .164 |

- The Sig (0.055) is higher than 0.05

- The returns of SMIC follow normal distribution or the AIA’s stock prices follow log-normal distribution.

3. THE AUSTRALIAN MARKET

3.1. ANZ return

- ANZ is the underlying asset of ANZWOB covered warrant

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|-----------|---------------------------------|-----|-------|--------------|-----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| ANZreturn | .055 | 122 | .200* | .983 | 122 | .116 |

- The Sig (0.20) is higher than 0.05

The returns of ANZ follow normal distribution or the ANZ’s stock prices follow log-normal distribution.

3.2 BHP return

- BHP is the underlying asset of BHPWOA covered warrant

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|-----------|---------------------------------|-----|------|--------------|-----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| BHPreturn | .080 | 122 | .056 | .970 | 122 | .007 |

- The Sig (0.056) is higher than 0.05

The returns of BHP follow normal distribution or the BHP's stock prices follow log-normal distribution.

3.2. CBA return

CBA is the underlying asset of CBAWOA covered warrant

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|-----------|---------------------------------|-----|------|--------------|-----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| CBAreturn | .074 | 122 | .158 | .969 | 122 | .006 |

- The Sig (0.158) is higher than 0.05

The returns of CBA follow normal distribution or the CBA's stock prices follow log-normal distribution.

4. THE UK MARKET

4.1 LLOYDS return

- LLOYDS is the underlying asset of CWN8144B2665

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|--------------|---------------------------------|-----|------|--------------|-----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| LLOYDSreturn | .318 | 123 | .000 | .847 | 123 | .000 |

- The Sig (0.000) is lower than 0.05

The returns of LLOYDS do not follow normal distribution or the CBA’s stock prices do not follow log-normal distribution.

4.2. RIO TIN TO return

RIO TIN TO is the underlying asset of CWN8143L3076

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|------------------|---------------------------------|-----|-------|--------------|-----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| RIO TIN TOreturn | .065 | 123 | .200* | .983 | 123 | .121 |

- The Sig (0.20) is higher than 0.05

The returns of RIO TIN TO follow normal distribution or the CBA’s stock prices follow log-normal distribution.

4.3. PRUDENTIAL return

PRUDENTIAL is the underlying asset of CWN8141J6687

Tests of Normality

| | Kolmogorov-Smirnov ^a | | | Shapiro-Wilk | | |
|-------------------|---------------------------------|-----|------|--------------|-----|------|
| | Statistic | df | Sig. | Statistic | df | Sig. |
| PRUDENTIAL return | .099 | 123 | .005 | .923 | 123 | .000 |

- The Sig (0.05) is equal to 0.05

The returns of Prudential may follow normal distribution or the Prudential’s stock prices may follow log-normal distribution.

LABOR PRODUCTIVITY- LEVERAGE FOR SUSTAINBLE GROWTH OF VIETNAM

Mai Tran Thi Phuong¹

ABSTRACT: *With the objective of sustainable development and enhancing competitiveness of the economy, Vietnam needs to move to a growth model based on productivity, quality and efficiency, in which the key point is improving labor productivity. In this paper, the author focuses on the analysis of Vietnam's labor productivity, presents opportunities and challenges and proposes some suggestions to increase labor productivity in Vietnam in the coming time.*

Keywords: *Labor productivity; sustainable development; sustainable growth*

1. INTRODUCTION

Sustainable growth is posing great challenges to Vietnam as one of the high growth economies in South East Asia. The reason why is that Vietnam's economic growth rate is on the downward trend in recent years. Specifically, from 7.3% in the period 1990-2000 to 6.7% in the period 2001-2010 and further reduced to 5.96% in the period 2011-2016. Forecasts of international organizations show that in 2017, Vietnam's economic growth may return to a high 6.7%, but this is not a sustainable growth. As the dynamics of economic growth have gradually come to an end, the old way of growth (mainly based on increasing investment capital, low labor cost and resource exploitation ...) is no longer. The leverage for sustainable growth of Vietnam is increasing productivity, in which increasing labor productivity is increasingly playing a decisive role.

The World Bank's Vietnam Development Forum report shows that in the past five years, despite a remarkable economic growth, weak labor productivity has been a serious concern for Vietnam. Vietnam's productivity growth rate averaged 4% a year, at the same stage of development as Vietnam, China at 7%, Korea at 5%. Therefore, in order to avoid the risk of lagging and overcoming the middle income trap, Vietnam needs to shift to a growth model based on productivity, quality and efficiency, in which the center is improving productivity to increase the competitiveness of the economy, to develop the country quickly and sustainably in the future.

2. DEFINITION OF LABOR PRODUCTIVITY

2.1. Definition of labor productivity

According to Marx: productivity is the productive ability of specific useful labor. It refers to the result of human-made production in a given unit of time.

According to the Organization for Economic Co-operation and Development (OECD), labor productivity is calculated by the number of final goods and services produced for a unit of labor engaged in production. The final product and service produced by the economy is gross domestic product (GDP). As

* Corresponding author: Mai Tran Thi Phuong. Tel.: +84979.683.599. E-mail address: tranphuongmai88@gmail.com

the workload completed in an hour increases, the overall productivity level will be higher, showing that the economy is healthy and growing.

Thus, labor productivity is an indicator reflecting the capacity to create wealth, performance of specific labor in the production process, measured by the number of products or quantities produced in a unit of time, or the amount of labor time spent to produce one unit of product. Labor productivity shows the characteristics and level of progress of an organization, unit of production or a mode of production, which is one of the important factors determining the competitiveness of enterprises and the economy.

2.2. Calculating labor productivity

According to the OECD's Performance Measurement Guidelines, productivity-based value added is the most common parameter for calculating labor productivity. To calculate the labor productivity of a country, the ILO calculates the gross domestic product (GDP) divided by the number of employees employed in the economy. According to the national statistical indicator system, labor productivity is the indicator which reflects the productivity of labor, measured in GDP per worker in the reference period, usually one year. The labor productivity is calculated according to the following formula:

| | |
|----------------------|---|
| Labor productivity = | GDP |
| | The number of employees employed in the economy |

3. CURRENT STATUS OF LABOR PRODUCTIVITY IN VIETNAM

3.1. Labor productivity of the economy

Based on comparative price in 2010, the productivity of the whole economy of Vietnam in 2017 will increase by 6% compared to 2016, the average growth rate in the period 2011-2017 will be 4.7% per year.

Table 1: Labor productivity and increase rate of labor productivity in Vietnam

| Year | Labor productivity (Million VND per person) | The labor productivity growth rate (%) |
|------|---|--|
| 2006 | 24,14 | 4,05 |
| 2007 | 27,58 | 4,22 |
| 2008 | 34,78 | 2,81 |
| 2009 | 37,89 | 2,57 |
| 2010 | 43,99 | 3,59 |
| 2011 | 55,21 | 3,49 |
| 2012 | 63,11 | 3,06 |
| 2013 | 68,65 | 3,84 |
| 2014 | 74,30 | 4,84 |
| 2015 | 79,3 | 6,45 |
| 2016 | 84,5 | 6,35 |
| 2017 | 93,2 | 6,0 |

Source: General Statistics Office

After a slow growth period from 2009 to 2012, labor productivity has shown signs of rapid recovery, according to the above data, labor productivity will increase from 2015 to 2017 faster than the previous period, highest is to increase by 6.45% in 2015. This shows the trend of recovery of the economy as well as the improvement of labor productivity. Increasing labor productivity is the main driver of economic growth and the improvement of people's living standards through GDP growth and GDP per capita. According to

the General Statistics Office, the gross domestic product (GDP) in 2017 is estimated to increase by 6.81% compared to 2016, this year's growth exceeded the target of 6.7% and higher than the increase of the years 2011-2016. Labor productivity has contributed about 89% of GDP growth in 2017, much higher than the 66.3% in the period 1990-2000 and 61.9% in the period 2000 – 2012.

It can be said that Vietnam's labor productivity has improved significantly over the years, but compared with other countries, Vietnam is still low and the gap increased. According to the General Statistics Office, Vietnam's labor productivity in 2016 only reached \$ 9,894, equivalent to only 7% of Singapore; 17.6% Malaysia; 36.5% Thailand; 42.5% Indonesia; 56.7% Philippines and 87.4% Lao.

Table 2: The comparison of labor productivity of Vietnam with other countries in the region and on the world

| Countries and regions | Labor productivity (thousand USD) | | |
|-----------------------|-----------------------------------|-------|-------|
| | 2000 | 2010 | 2015 |
| Singapore | 98,5 | 119,0 | 127,8 |
| Japan | 64,6 | 71,0 | 77,2 |
| Korea | 42,2 | 58,8 | 63,4 |
| China | 6,1 | 15,6 | 22,3 |
| Malaysia | 38,8 | 50,2 | 55,7 |
| Thailand | 16,4 | 22,4 | 26,5 |
| The Philippines | 11,9 | 14,4 | 18,1 |
| Vietnam | 4,8 | 7,6 | 9,6 |
| Lao PDR | 4,7 | 7,4 | 11,1 |
| Campuchia | 2,9 | 4,4 | 5,7 |
| Myanmar | 2,5 | 6,7 | 5,7 |
| ASEAN | 12,9 | 17,9 | 21,9 |

Source: APO Productivity Databook 2017, p.59

The above table shows that the labor productivity of Vietnam is very modest, the gap between labor productivity between Vietnam and other ASEAN countries is relatively large. Vietnam's labor productivity growth rate is faster, but the absolute gap widens. For example, in 2000, by 1/8 Malaysia, 1/4 Thailand, or about one third of the ASEAN average, by 2015, the gap between Vietnam's labor productivity and other economies in ASEAN does not shorten but there are signs of being left behind by the commune. This gap will widen as neighboring countries strive to strengthen their internal forces in the context of globalization and deep integration.

In the period 1992-2014, labor productivity in Vietnam equivalent of 2011 increased by 4.64% per year, the highest increase among ASEAN countries but still significantly lower than that of China in the same period (9.07%). In terms of speed, in the period 2005-2014, the labor productivity growth rate of Vietnam was 3.8%, higher than the average level of ASEAN (3.2%), Vietnam was in the group of countries with average labor productivity growth rate China's average (9.0%), India (5.99%), but higher than Malaysia (1.8%), Thailand (2.8%). Thus, efforts to increase labor productivity over the past 20 years have not produced satisfactory results when compared with neighboring countries. Without timely improvement, Vietnam will become the dark spot in the economic picture of the region. This can be considered as the biggest challenge to Vietnam's desire to increase incomes by 2035. According to the World Bank (2016),

Vietnam could become a high-income country by 2035 if it maintains the minimum economic growth rate (7% / year), and the labor productivity growth rate must be at least 6.2% / year.

3.2. Labor productivity in terms of economic sectors

The first three sectors of the national economic classification system are: (1) agriculture, forestry and fishery; (2) industry and construction; (3) services. Labor productivity of these three groups is large.

Table 3: Labor productivity of sectors and Vietnam's economy in the period 1998-2016

(Unit: million VND)

| Year | Agriculture, forestry and fishery | Industry and construction | Services | Economy |
|------|-----------------------------------|---------------------------|----------|---------|
| 1998 | 10,7 | 77,9 | 48,3 | 27,4 |
| 2000 | 11,3 | 83,6 | 53,3 | 29,7 |
| 2002 | 12,2 | 78,7 | 55,3 | 32 |
| 2004 | 13,4 | 76,1 | 56,3 | 34,9 |
| 2006 | 14,5 | 82,9 | 57,0 | 38,1 |
| 2008 | 15,9 | 80,8 | 61,5 | 41,4 |
| 2010 | 16,3 | 67,5 | 55,0 | 44,0 |
| 2012 | 17,5 | 73,5 | 56,5 | 46,9 |
| 2014 | 18,5 | 79,8 | 60,5 | 51,1 |
| 2016 | 21 | 80,9 | 66,2 | 57,4 |

Source: Vu Hoang Ngan (2017), Vietnam's labor productivity – Opportunities and integrative challenges, National Economic University Publisher.

In general, labor productivity in the agriculture, forestry and fishery sector is the lowest, while the labor productivity of the industry and construction is 4-7 times, the service sector is 3-5 times in compared with the agricultural, forestry and fisheries sector. This can be explained by the fact that the agricultural sector today is mainly small, backward, dispersed, low-tech products. In the three economic sectors, the highest labor productivity in the industry can be explained by the low proportion of industrial workers in the whole economy (24.7% in 2016).

In recent years, the average labor productivity of the economy has approached the level of services and industry, which can be explained by the tendency to reduce the proportion of low labor productivity sectors such as agriculture and forestry and seafood in the whole economy.

In terms of average labor productivity growth rate for the period 1998-2016, the industry was the lowest (only 1.2%). This shows that the policy of technology enhancement, production restructuring has not been implemented effectively, has not raised the technological level of the industry over time. The proportion of Vietnam's middle and high-end industries in 2014 was only 26.3%, much lower than the 50-60% in Thailand, China and Malaysia. The processing industry mainly performs assembly, low technology and slow change. The labor force employed in the industry is not high (the rate of trained workers in the manufacturing industry is 17.7%, because the quality is not high. The labor productivity growth rate of the service sector is about 1.9% higher than that of the industry but much lower than the agriculture, forestry and fishery sector (8.1%) as well as the whole economy (8.7%). In terms of the agricultural sector, although the value added by the agricultural sector has increased slowly, thanks to a structural shift, the number of labor in the agricultural sector has declined significantly. The labor productivity growth of this industry is higher than that of other industries.

3.2. Labor productivity in terms of ownership

In terms of ownership, Vietnam's economy is divided into three sectors: state, non-state and foreign-invested. Of which, the foreign invested sector always leads the labor force, the state economic sector is the second and the non-state sector has the lowest labor productivity.

Table 4: Labor productivity in terms of ownership in the period 2000-2015

Unit: Million VND/employee

| Year | The State-owned sector | The non-state sector | The foreign-invested sector |
|------|------------------------|----------------------|-----------------------------|
| 2000 | 119 | 16 | 419 |
| 2002 | 126 | 17 | 302 |
| 2004 | 132 | 19 | 228 |
| 2006 | 148 | 21 | 202 |
| 2008 | 134 | 22 | 324 |
| 2010 | 132 | 22 | 189 |
| 2012 | 131 | 24 | 223 |
| 2014 | 140 | 26 | 216 |
| 2015 | 155 | 28 | 222 |

Source: General Statistics Office (2016), Labor productivity Report 2016

In 2015, the labor productivity of the foreign-invested sector reaches 22.3 million VND / labor, 1.4 times higher than the state-owned sector and 8 times more than the non-state sector. In the economy, the foreign invested sector is considered dynamic and plays an important role in the economic development of Vietnam. In 2016, this sector contributed 20% of GDP, accounting for 22-25% of total social investment, accounting for 55% of industrial output value, 70% of export turnover, 18% of total budget revenue with 3, 7 million workers are working in this area. However, the labor force of the foreign invested sector has tended to decrease rapidly and slow down after 2008. This is explained by the fact that foreign investment in Vietnam has so far tended to focus on large-scale labor-intensive activities, the value-added of this sector increases much more slowly than the labor force (the number of employees is 1.0% (2000), 3.5% (2010), 4.4% (2016)).

The rate of labor productivity growth of economic sectors in terms of the ownership in the period 2001-2015 is illustrated in the table below:

Table 5: The rate of labor productivity growth of economic sectors in terms of the ownership

Unit: %

| Year | The state-owned sector | The non-state sector | The foreign-invested sector | The Economy |
|------|------------------------|----------------------|-----------------------------|-------------|
| 2001 | 4,6 | 4,2 | -11,0 | 4,5 |
| 2002 | 1,7 | 3,8 | -20,0 | 3,2 |
| 2003 | -0,3 | 4,3 | -16,0 | 4,3 |
| 2004 | 5,2 | 4,1 | -9,8 | 4,6 |
| 2005 | 3,6 | 8,2 | -8,4 | 4,7 |
| 2006 | 7,9 | 2,7 | -3,4 | 4,3 |
| 2007 | 4,8 | 4,0 | -2,5 | 4,7 |
| 2008 | -14,0 | 2,3 | 64,7 | 1,9 |
| 2009 | -35,0 | 15,3 | -33,0 | 4,4 |

| | | | | |
|------|------|-------|-------|-----|
| 2010 | 51,3 | -16,0 | -13,0 | 2,5 |
| 2011 | -9,2 | 6,0 | 76,5 | 4,4 |
| 2012 | 9,6 | 4,5 | -33,0 | 3,1 |
| 2013 | 6,5 | 2,9 | 3,8 | 3,8 |
| 2014 | 0,4 | 5,7 | -6,6 | 4,9 |
| 2015 | 10,7 | 5,8 | 3,0 | 6,5 |

Source: General Statistics Office

Despite the highest labor productivity, the foreign invested sector had negative labor productivity growth for most years. Labor productivity of the non-state sector increased at an average rate of 3.8% per year, higher than the level of 3.2% of the state sector in the period 2001-2015

In terms of the state-owned sector, by accelerating the privatization of state-owned enterprises and reducing staffing in administrative agencies, the workforce in this sector decreased (in 2000 the number of employees in the state-owned sector accounting for 11.7%, 10.4% in 2010 and 9.8% in 2016), which makes the average labor productivity increase 3.2%.

The non-state sector has more than 86.1 % (2010) and 85.8% (2016) in the number of employees in the economy, this means that the majority of employment is generated by this sector, but mainly low labor productivity, moreover, the slow integration of the sector into the global value chain has led to relatively low local added value.

4. OPPORTUNITIES AND CHALLENGES IN ENHANCING LABOR PRODUCTIVITY IN VIETNAM

4.1. Opportunities

Firstly, the scale of Vietnam's economy has many advantages in the context of international integration. Of which the size of the population (91 million in 2015) is about one or three times that of Thailand (67 million) and nearly one or eight times South Korea (51 million). Besides, Vietnam's area territory is more than a half of Thailand and 3 times more than Korea.

In addition, per capita income, despite reaching the threshold of medium-income economies, Vietnam has significant gap in comparison with other countries. The current level of income reflects the level of development in Vietnam while the size of population and labor shows potential growth for Vietnam's domestic market.

Secondly, Vietnam has the opportunities and advantages to enter into many bilateral and multilateral trade and investment (FTP) agreements, with more and more levels of market liberalization when Vietnam starts to implement industrialization policy, for example, the Comprehensive Partnership and Trans-Pacific Partnership (CPTPP), the Vietnam-EU Free Trade Agreement (EVFTA) and the Vietnam-Korea Free Trade Agreement. The economic agreements signed by Vietnam play an important role in breaking down tariff barriers to bring domestic goods to countries in the region. For the market of 634 million people, demand for food in the ASEAN region is enormous, creating opportunities for export of agricultural products to developed economies such as Singapore, the Philippines, Malaysia, Thailand and Indonesia.

Thirdly, the liberalization facilitates the improvement of the investment environment, the integration of the national economy to overcome the shortage of capital, to compensate for the shortage of investment demand and saving ability. In addition to attracting foreign investment, investors can access and enjoy tariff incentives from the markets which have signed agreements such as ASEAN, China, Korea and India. Besides, the implementation of the commitments in the new Free Trade Agreement will make the investment

environment of Vietnam more open, transparent, and more favourable from which to attract more investment capital more. Vietnamese enterprises also have the opportunities to access to the wider market, participate more deeply in the global value chain, and promote domestic enterprises to improve their competitiveness. Opportunities from tax reduction help increase the quantity of Vietnamese goods exported to ASEAN.

Lastly, from the advantages of the latter, Vietnam has the opportunity to learn advanced business management models, modern technologies and tools for integrating advanced information technology products and methods to increases productivity. Trade liberalization allows more diversified and convenient introduction and transfer of technology, facilitating improved labor productivity. Enhancing the ability to grasp and apply effective experience and rules of business in accordance with international standards will bring Vietnam's economy to the development of international level, as a motivation to improve labor productivity.

4.2. Challenges

Firstly, although big potential, it is not easy to export to ASEAN because Vietnamese products must compete with other products of other countries such as Thailand, Singapore, Malaysia... On the other hand, main exported products of Vietnam do not have brand in the international market; and raw exported has low the value added. The low competitiveness of Vietnamese enterprises on the international market requires enterprises to take the advantages of capital, technology, capacity to organize production, marketing and dominate the market, in order to enhance labor productivity of the enterprises which bring the growth of Vietnamese economy.

Secondly, Vietnam still has a lack of skilled labor and high technology workers. A large part of the labor force is still weak in terms of labor and industry techniques, time and behavior, and has not met the requirements of foreign languages in comparison with ASEAN countries. In addition to the attractiveness of the ASEAN working environment, a highly skilled workforce in Vietnam will easily move to countries with good treatment regimes that lead to brain drain and a shortage of high quality human resources. Vietnam is on the verge of falling back on power, losing its low labor cost advantage. Therefore, in the coming time, it is necessary to focus on the use of effective incentive funding for labor productivity improvement, especially when the capital is decreasing, as Vietnam becomes a medium income country. Industrialization is not progressing and labor will shift to low value services. If labor moves from low productivity to low productivity, then this shift does not change.

Thirdly, the domestic market is dominated by foreign firms. Foreign companies who have the advantage of capital, management experience, management imposed on the market, can make the Vietnamese enterprises under the pressure of competition. If the link between supply and demand with local firms is not established or the brand is promoted, or the high quality of products with high localization rate can not be improved and in long term, it is hard to enhance labor productivity. In terms of SOEs, there are monopoly advantages in accessing both business and market resources (in many areas such as transportation infrastructure construction, telecommunications services, insurance, etc.) due to the government's protection of the labor force to improve the efficiency of using resources available. The urgent need to do is to shorten the gap between foreign and domestic enterprises. By this way, Vietnamese enterprises avoid this situation and successfully solve the problem to connect to the global production chain.

Fourthly, the resources of the state and workers are limited. In order to develop the economy in a coordinated manner, to use advanced scientific and technical advances, but laborers without qualifications, sense of responsibility for work, weak technical and commercial infrastructures, slowly forming transaction

floors, information systems and analysis of labor productivity is not professional, passive. This slows down the flow of capital and increasing productivity

Fifthly, the technology gap, the connection in the business between domestic and foreign investors are still fuzzy, the spillover effects on technology and labor productivity from foreign partners to domestic enterprises is still limited. Most of the science and technology enterprises have infrastructure, production, business, investment scattered, but the commercializing of the enterprises have many barriers from the policy mechanism. The science and technological products are always innovated while there are no regulations on standards and quality of this new product, and the state management agencies are confused in licensing.

Lastly, most enterprises only exploit cheap labor force, available resources, large consumption market for processing, assembling, consuming domestic products and exporting. This can cause a depletion of resources, which the value on a product is low, leading to low labor productivity.

5. SOME RECOMMENDATIONS IN ENHANCING LABOR PRODUCTIVITY IN VIETNAM

In order to achieve an average GDP growth rate of 6.85% per year by 2020, productivity growth should be accelerated, with average productivity growth of about 6% against 4.6 % for the period 2011-2015 and 5.5% for the period 2014-2016. Thus, labor productivity growth has to increase by 26% over 2011-2017 and about 10% over the period 2014-2016. This is a challenging target for Vietnam today. Therefore, in order to increase productivity and create leverage for sustainable economic development in the coming time, attention should be paid to the following issues:

Firstly, appropriate resources should be allocated, with a focus on land and capital resources. In order to improve labor productivity, the Government prioritizes the allocation of investment budgets for education and training to improve the qualification and skills of workers. In fact, one of the most important factors leading to low labor productivity in Vietnam is the quality of education and training and the lack of human resources, high quality training, not emphasis on retraining and advanced training.

Vietnam is on the verge of falling back on human resource, losing its low labor cost advantage. Therefore, in the coming time, it is necessary to focus on the use of effective incentive funds for labor productivity improvement, especially when the capital source is decreasing as Vietnam becomes a medium income country.

Secondly, increase the productivity of the TFPs, reform legal institutions, improve governance capacity, improve business environment, and reduce transaction costs for the economy. Increasing TFP will contribute effectively to economic growth.

In 2017, TFP's contribution to GDP growth was estimated at 44.13%, higher than 2016 (40.68%) and much higher than the 2011-2015 average (33.58%). Therefore, in the coming time, attention should be paid to improving the TFP factor.

In addition, the quality of Vietnam's policy needs to be improved so that the Government can effectively support the private sector; continuing strong development of the private sector has become an important driving force of the economy by accelerating the application of advanced science and technology...

Thirdly, encourage the business community, especially small and medium enterprises to innovate and support the shift from low value-added activities to high-value-added activities by enhancing human capital and increasing spending on research and development. Encouraging businesses to invest in science and technology is an important factor to improve productivity and product quality.

At the same time, set up a technical advisory committee composed of industry experts, managers

and business representatives of Vietnam to identify Vietnamese enterprises in comparison with those in the frontline of technology and Institutional support measures. The committee regularly evaluates policy objectives against the goal of catching up and leapfrogging technology in existing markets and through innovative linkages.

Lastly, take the initiative in international integration, effectively exploiting opportunities from FTAs, especially new generation FTAs such as the Comprehensive Partnership and Transnational Partnership Agreement (CPTPP), the Vietnam-EU Free Trade Agreement (EVFTA) and the Comprehensive Economic Partnership Agreement (RCEP).

TRANSPARENTIZATION OF INFORMATION ON REAL ESTATE MARKETS WITH SUSTAINABLE DEVELOPMENT

Vuong Minh Phuong*

ABSTRACT: According to the Asia-Pacific Real Estate Transparency Report 2018 of Jones Corridor Lasalle (JLL) with survey of 100 real estate markets (real estate) worldwide (divided into 5 groups: Super transparency, transparency, semi-transparency, poor transparency and non-transparency), at the present, Vietnam ranks 61 in terms of real estate transparency - the highest ranking in the group of “poor transparency” and is at the transitional threshold to the group of “semi-transparency”. Vietnam has the higher rank than Sri Lanka, Myanmar... in the group.

Keywords: real estate markets with sustainable development; transparentization of real estate markets ...

1. INTRODUCE

Transparentization is one of the prerequisites for the sustainable development of the real estate market. It can be understood that transparent real estate is an open market that is clearly organized and operates in a certain legal framework, enforcement of laws and regulations and appreciation of private ownership is consistent in performance.

In comparison with other markets in the world and in the region, Vietnamese real estate market has made remarkable progress in the ranking of recent years, but in general, it has not been comparable to many other markets in the region of provided information openness, many foreign investors are still facing many obstacles in accessing information on real estate in Vietnam.

2. SOME MAIN CAUSES

- The difficulty in finding the right supply of property can satisfy the needs of large investors.
- Real estate prices in the market didn't really reflect the supply and demand relationship.
- The distance between the price offered by the seller and the desired price of the buyer makes the negotiation process last longer. This is due to differences in market view, investment growth prospects and profit potential.
- The information system is inaccessible, incomplete and ambiguous and lacks of publicity on planning or change of State policies, which is one of the important reasons for this market to become poorly transparent.

3. PROPOSED SOLUTIONS

In order to develop a transparent and sustainable real estate market, it is necessary to focus on the following issues:

Firstly, the State needs to develop legal, supervisory and regulatory frameworks that support healthy development of the market. In the coming time, it is necessary to improve and promulgate legal documents related to real estate markets. Policies, laws and regulations on real estate markets must ensure consistent, adequate and stable principles. Besides the new promulgation, it is necessary to revise the promulgated documents. If any one overlaps and does not conform to the practical situation, it shall be removed or amended immediately.

Secondly, transparentize information on real estate planning; create conditions for the market supply and demand to operate effectively. In fact, it is important to have a good, open, transparent and accessible information system for smooth operation of the real estate market. The information provided to subjects in the real estate market must be accurate, timely and complete.

Thirdly, in the long term, there should be a continuous update of data for buyers in all areas of planning, capital, transfers, taxes, legal status of houses and lands. Therefore, it is necessary to establish a center (with the participation or supervision of the State) in collecting, processing, analyzing, synthesizing and developing a information system related to the real estate market (including prices, economic & technical features, legal status, ... of real estate as well as planning, projects on real estate, technical infrastructure, urban areas ...). This center will respond promptly when anyone needs information on the market. However, customers who need to gather the information must pay fees and conversely, the information center is responsible for the information reliability.

For the real estate market of countries with transparency development, there is a digitized information system. All data relating to each particular land lot will be digitized including maps and drawings. Other ministries and agencies will have a password to access the system and update the changes related to the work they are in charge of. The system will save parameters and updated information such as updated contents, time, updating person, ... and be responsible for updated issues.

Fourthly, the issuance of land use right certificates has been legalized and is being implemented nationwide so that this can be done in the shortest possible time. Simplification of procedures to accelerate the issuance of certificates of land use rights and ownership of works on land would make the real estate qualify for official market transactions and prevent real estate owners from participating in underground transactions that are losing revenue to the State.

Fifthly, complete development and publicity of real estate assessment indicators throughout the country; propagate the State's guidelines, policies and laws on land through the mass media to people.

AN APPLICATION OF ORGANIC AGRICULTURE SYSTEM AS A STRATEGY OF WOMEN FARMER GROUP TO OVERCOME THE CLIMATE CHANGE

(Case Study: Ketapang Village, Subdistrict of Susukan, Semarang Regency, Indonesia)

Indah Prihastuti*, **Devy Mashulatul Mufidah****, **Ahmad Syihabul Fikri***,
Waridin**, **Indah Susilowati****

ABSTRACT: *Ketapang village lies in 613 m above sea level, it has high rain intensity about 3.572 mm per year, and that daily temperature average is 27° – 29° C. The problem found that climate change affected the agriculture sector. The impact of the climate change claimed by women farmers more than the farmers. The objectives of this research aimed to formulate Women Farmer Group (WFG) strategy in overcoming the impact of climate change. The methods used is mixed methods. Atlas TI is to analyse the qualitative data and logit model was applied for quantitative one. This research conducted in Ketapang village as one of administrative area in Susukan subdistrict, Semarang regency. Agriculture sector in Ketapang village is managed by the society. Women farmer is managed by Women Farmer Group (WFG) with the name of An Nisak I, An Nisak II and Bunga. The results showed that the factors influenced in organic agricultural system carried out by women farmer group amongs other are inputs of production individual characteristics of the farmers, and cultures. Finally, women roles is significant in overcome the impact of climate change in managing society and environment.*

Key Word: *woman, farmer, climate change, Indonesia*

INTRODUCTION

The agricultural sector in Indonesia has an essential role in the national economy. Based on the Strategic Plan (Renstra) of the Ministry of Agriculture in 2015-2019, during the period 2010-2014 the average contribution of the agricultural sector to GDP remains to grow, and in the same period, the agricultural sector absorbs the largest labor force despite a declining trend. Developing countries are more vulnerable to the impacts of climate change than developed countries because of the dominance of agriculture in the form of rainfed, the scarcity of capital for adaptation measures, and vulnerable to extreme events (Mertz, et al., 2009).

The agricultural sector is particularly vulnerable to climate change due to its high dependence on climate and weather (Ruminta, 2016). Climate change affected the temperature and patterns of fluctuations in monthly rainfall and increased frequency and intensity of extreme events such as La Nina and El Nino. In the agricultural sector, climate change has a notable impact on rice cultivation, because rice cultivation has a strong dependence on climatic elements, especially rainfall and temperature.

Sources: Statistics Indonesia, Central Java, 2016

Climate change is a multifaceted problem not only related to nature but also other aspects such as land management, cultural behavior including the gender aspect (Dankelman 2002 in Dey, 2018). The results of the preceding study (McCright, 2010 in Sadegh, 2015), showed that theoretically and empirically, gender impacts climate change.

Climate change can be affected by human behavior. Given different roles and responsibilities between men and women, varies according to cultural features in society. Climate change has gender-specific characteristics of women affected differently and more severely by climate change and natural disasters due to the role of social discrimination, poverty, and household injustice (Parikh, 2007 in Salehi, 2015). Women's household strategies play an essential role in tackling climate change. Some Oxfam studies said that women's social institutions and social outcomes could minimize the impacts of climate change and address poverty (Latifa, 2013). Efforts such as supporting women's access to finance, building a gender focus base to increase women's participation with training efforts, utilize legal reforms to ensure that gender-discriminatory legislation was revised as well as new regulations that do not cripple women (Shaw, 2012).

Three categories of gender roles according to Fakih (1996) in Rochmayanto, (2013), namely: (1) Productive roles, namely Roles undertaken by men and women to obtain cash payments, including market production with an exchange rate and production of household / subsistence with use value; (2) The reproductive role of functions relating to the responsibility of parenting and domestic duties to ensure the maintenance and reproduction of labor in relation to the sustainability of personnel; (3) The role of community and political management comprising two categories: (a) The role of community management (social activities), encompassing all activities within the community as an extension of reproductive, voluntary and non-wage roles; (b) The role of political management, ie, the role in organizing communities at the politi-

cal formal level, usually paid (directly or indirectly), and increasing power or status. The role of women in influencing household welfare: (1) Role as housewife and breadwinner, (2) role in position as a decision maker, (3) role of position as a citizen of the society that is supporting social organization or organization, economy, culture, and politics in the village.

Increasing the role of women in households by strengthening women's institutions/institutions is a necessary means to increase women's participation in gender justice programs. Women are vulnerable to the effects of climate change because of their lack of representation in the formal sector of the economy. Improving women's access to the formal sector is necessary if women are fully involved in a process. Human resource development and institutional strengthening are crucial to climate change mitigation strategies. Civil society especially women which is vulnerable to climate change need to be encouraged and facilitated; hence they could participate.

The role strategy of Kelompok Wanita Tani (KWT) in implementing the organic farming system is an environmentally friendly strategy to address climate change. It aims to develop resilience agriculture against current and future climate variability. The implementation of organic farming by KWT is expected to be able to overcome the impact of climate change that is to overcome the decrease in production.

METHODS

The method employed in this research is a mixed method. Mixed method is a research method that illustrates the procedure in response to a need by mixing quantitative and qualitative data in research (Creswell and Clark, 2007). The objective of the study was to analyze the shape of the KWT (Kelompok Wanita Tani) strategy in overcoming the impact of climate change; furthermore to analyze the factors influencing the KWT strategy in overcoming the impact of change.

The sampling technique applied was multistage sampling, which can be defined as sampling technique by utilizing various sampling method altogether, as efficient as possible. First, a cluster sampling was processed. Later was taken by applying purposive sampling method. Purposive sampling is a deliberate method of sampling based on specific characteristics, traits, and characteristics of samples that are considered to represent the characteristics of the population. The purposive sample yielded a more representative sample. Finally, the sampling was conducted on the farmer's wife in Ketapang village.

Data analysis based on questionnaire and interview data were grouped into two parts: qualitative analysis using ATLAS.ti and quantitative analysis using logistic regression. Methods of data collection were through interviews, observation, and documentation. Qualitative data analysis in this research begins by carrying an in-depth interview on Key Person and Key Informant, then processed using ATLAS.ti. The quantitative analysis used in this research is descriptive statistics and logistic regression. The logit model is a non-linear regression model that generates an equation in which the dependent variable is categorical. The most basic category of the model produces binary values of numbers 0 and 1. The resulting number represents a particular category of probability calculations for the occurrence of that category. The analysis model used in this research are:

$$\ln Y = \delta + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6 + \beta_7 X_7 + \beta_8 X_8 + e_i$$

$$\Pr(Y=1|X_i) = \beta_0 + \beta_i X + e_i$$

where :

$\Pr(Y=1)$ = farmer's probability

(1) Overcoming the impact of climate changes: Overcome the decline in harvest

(2) Implementing Farmer Women Group (KWT) strategy: (a) Application of organic farming; (b) Diversification of organic agricultural products,

X is a vector representing individual characteristics of respondents: (a) age, (b) education, (c) organic farming experience, and agricultural input: (d) number of family dependents, (e) organic fertilizer, (f) organic pesticides, (g) land area, (h) source of irrigation. and is estimated parameter; is residual in the model.

FINDINGS

General Description of Ketapang Village

Ketapang Village is one of the areas within the administrative sub district of Susukan, Semarang Regency, Central Java province. Ketapang Village is a highland area located at an altitude of 613 m above the sea level, which has a daily average temperature of about 27 ° -29 ° C, with an average rainfall of 3,572 mm per year. Development of organic farming in Ketapang village through quality improvement community economy through the sustainability of agriculture. The women farmers roles saw from the existence of Kelompok Wanita Tani (KWT) as an institution that established by women farmers.

Some activities organized by Kelompok Tani Women include physical activities, agricultural processing activities, and post-harvest activities. Physical activities including rice intensification, and the procurement of fertilizer. Agricultural processing activities cover seedbed, planting, maintenance, fertilizing, and pest and crop prevention. Then post-harvest activities include the management of Multipurpose Business Cooperatives (KSU), savings and loan activities, and organic rice products diversification.

Logistic Regression

a. Factors that Affect the Strategies Group of Women Farmers (WKT)

Based on the B values on the calculation of logistic regression model of equation formed is as follows:

Prob. Overcoming Production Decrease = -5,552 + 0,012 age + -0,093 education + 0,099 organic farming experience + 0,539 total family dependent + 0,100 organic fertilizer + 1.098 organic pesticide + 0,000 land area + 3,256 irrigation source

The equation shows the relationship between age, education, the experience of organic farming, the number of family dependents, organic fertilizers, organic pesticides, land area, and water sources against the probability to overcome the decline in output.

Table 2. The Analysis Result with Logistic Regression

| | Variable | Coefficient | Z-Statistic | Prob. |
|---|----------------------------------|-------------|-------------|----------|
| 1 | Age | 0.012374 | 0.416147 | 0.6773 |
| 2 | Education | -0.92719 | -0.793875 | 0.4273 |
| 3 | Organic farming experience | 0.099447 | 2.163216 | 0.0305 * |
| 4 | The number of dependent families | 0.538834 | 2.073052 | 0.0382 * |
| 5 | Organic fertilizer | 0.099516 | 0.217025 | 0.8282 |
| 6 | Pesticides organic | 1.097759 | 2.745442 | 0.006 |

| | | | | |
|----------------------|-------------------|-----------|---------------------|-----------|
| 7 | Land Area | -6.94E-05 | -0.804663 | 0.421 |
| 8 | Irrigation Source | 3.256149 | 3.345877 | 0.0008 ** |
| 9 | C. | -5.551969 | -2.228706 | 0.0258 |
| McFadden's R-squared | | 0.321625 | LR statistic | 42.50681 |
| | | | Prob (LR statistic) | 0.000001 |

On table 2 shows indicating four independent variables that had a significant influence and four independent variables have the impact is not substantial. Significant variables include organic farming experience, number of family dependents, natural pesticides, and irrigation sources. Can be interpreted the more extended knowledge of organic farmer farming then the probability of coping with the decline in production will be greater. The more the number of dependents of the farmer's family, the higher probability of overcoming the decrease in production. The use of organic pesticides by farmers suggests the probability of defeating the drop in production will be even more significant results. Sources of irrigation farmers in the form of technical irrigation show the probability of overcoming the decline in production will be higher.

b. Probability of Farmers Group Strategies (KWT) Dealing with Climate Change Impacts

Based on the calculation of the value of the Odds Ratio as follows:

Table 3. The calculation of the value of Odds Ratio Variables that affect the probability of overcoming the production decrease

| Variable | Z-Statistic | Odds Ratio | |
|----------------------------------|-------------|----------------|-------|
| Organic farming experience | 2.163216 | $e^{2.163216}$ | 8.69 |
| The number of dependent families | 2.073052 | $e^{2.073052}$ | 7.94 |
| Organic Pesticides | 2.745442 | $e^{2.745442}$ | 15.57 |
| Irrigation Source | 3.345877 | $e^{3.345877}$ | 28.38 |

*: Significant at level 10%; **: Significant on the level 5%; significant on the level 1%

Based on table 3 shows that organic farming has experience of variable odds ratio amounted to 8.69% can be indicated that when farmers have the knowledge of organic agriculture increased by 1 percent, then the probability of overcoming the decline in results production increased by 8.69% percent. The longer farmers in natural farming experience which related to the implementation of the organic farming system that is getting good, so the more extensive applicate organic farming then it will fertilize the land and increasingly enhance long-term production results. Then the variable number of dependents of the family has an odds ratio of 7.94% can be interpreted when farmers have the name of dependents of the family increased by one percent then the probability of coping with the decline in production grew by 7.94% percent. The increasing number of family dependents indicates that the burden on households increases and this causes the farmers to work harder to overcome the decline in production. Variable of organic pesticide that has odds ratio about 15, 57% percent Showing when farmers increasingly apply organic pesticides than the probability of defeating the decrease of output increased by 15.57 percent. The use of organic pesticides shows the application of the ecological farming system is progressing well. The purpose of organic pesticides has an effect on the natural pest control as its needed, compared to the use of chemical pesticides will cause plant pests more resistant, in addition to organic pesticides also function to increase the nutrients in plants to overcome the decline in production. The irrigation source variables have an odds ratio of 28.38 percent. Indicating that when farmers use irrigation through industrial sources than the probability of overcoming

the decline in production of 28.38 percent. Source of irrigation through technical irrigation cause watering on agriculture more secure than non-technical irrigation sources that depend on rain and natural conditions. So the source of irrigation through mechanical flooding overcome the decrease of production.

Qualitative data analysis Through ATLAS.ti

The ATLAS.ti app is a qualitative application of large textual, graphics, audio, and video data. This application is useful for accomplishing tasks related to a systematic approach to data. Interviews were held with stakeholders regarding the implementation of organic farming systems by Kelompok Wanita Tani (KWT) concerning strategies to address the impacts of climate change felt by farmers. Interview participants were comprising ABCG (*_ Academics, Business Sector, Communities and Government*).

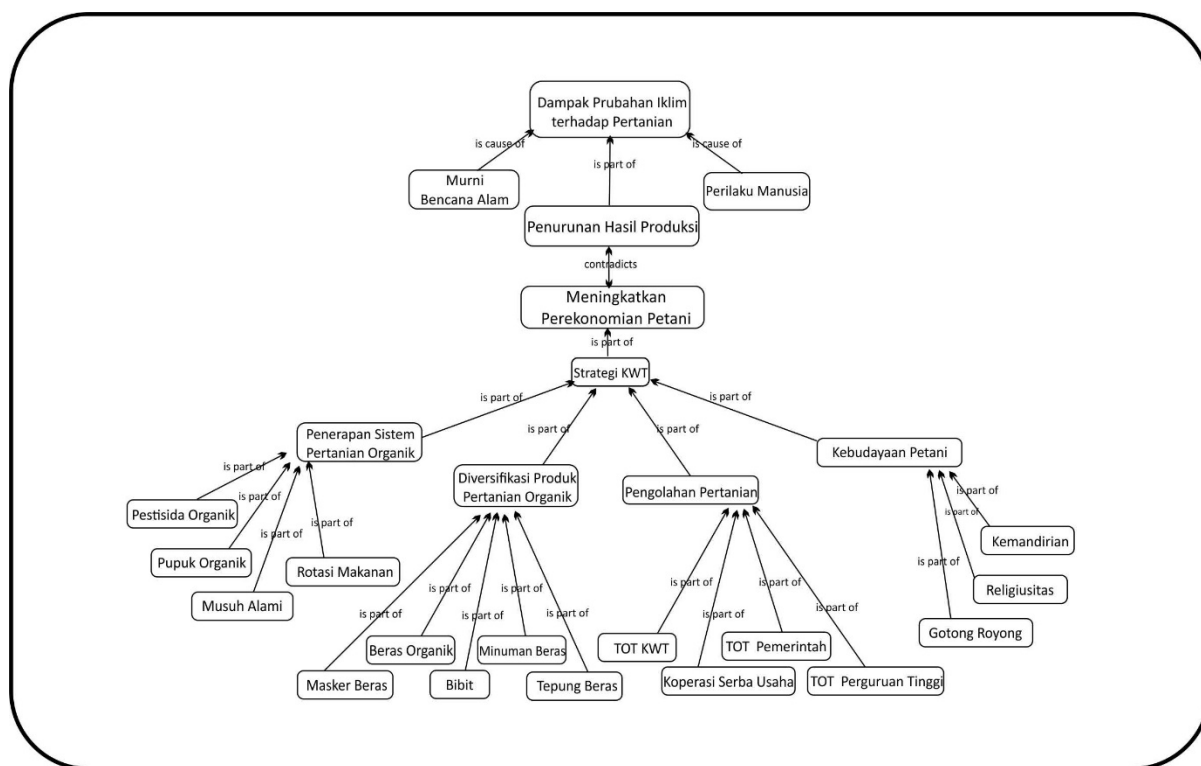

Figure 1. The strategy of Kelompok Wanita Tani (KWT)

Based on the results of interviews with ABCG (*Academics, Business Sector, Communities and Government*) obtained the appropriate strategy for Kelompok Wanita Tani (KWT) according to Figure 1.

Kelompok Wanita Tani (KWT) has a well-structured organic farming strategy to cope with the decline in yields resulting from climate change in the agricultural sector. The procedure is analyzed through encoding of interview results. Table 4 is a conclusion of the coding patterns of each variable.

Table 4. The results of the Recapitulation of Coding ABCG (Academics, Business Sector, Communities, and Government)

| Variable | Opinion | Total of Code |
|--------------------------------------|------------------------|---------------|
| Causes of climate change | Human behavior | 4 |
| | Pure natural disaster | 1 |
| Climate change affecting agriculture | Decrease in production | 5 |

| | | |
|------------------------------------|---|----|
| Overcome the decline in production | Increase the agricultural economy | 6 |
| Women's group strategy agriculture | Application of organic farming system | 22 |
| | - Organic fertilizer | 9 |
| | - Organic Pesticides | 7 |
| | -Crop rotation | 4 |
| | -Pure Enemy | 2 |
| | Diversification of organic agricultural products: | 12 |

Discussion and Conclusion

Climate change is a compelling case which is used to gender dynamics. at the developing country, a weak and susceptible person such as woman, because of the social norm has a minimum role to deal with the climate change however in this research will show the critical part of a woman to deal with the climate change at the agriculture sector through strategy of Kelompok Wanita Tani (KWT) organization

On the agricultural sector impacts of climate change are described as a decrease in the yield of production. Kelompok Wanita Tani (KWT) has factors that are affecting the probability to handle the reduction of the production result experience variable of organic agriculture, the number of dependents, organic pesticides, and irrigation sources has a significant influence on the 5 percent confidence level. Those variables have potential factors to overcome the decreasing of production results, indeed according to the interview analysis of ABCG (*Academics, Business Sector, Communities and Government*) to overcome the climate change which is depicted from the decreasing of production results. There is a role of women farmers by Kelompok Wanita Tani (KWT) which has a strategy in the form of application of the organic farming system, diversification of organic product, agricultural processing, and cultural development.

Solution

Rice farmer Development organic should be done for example organic production inputs increased good seeds, fertilizer, and pesticides for organic agricultural output which increases given the increasing

amount of demand for organic products in the market. Then importance of TOT (Training of Trainers) either from internal KWT, Government, colleges, or institutions for creating innovations of agricultural products. The importance of innovation and diversification by KWT purpose to increase the economy through increased farmer selling value so that it copes with the decline in the results of the production effects of climate change.

Acknowledge character

Sincere gratitude and gratitude to the organizer's *Gender and Women's Studies (GWS) 2018 5th International Conference*, related parties such as FEB (Faculty of Economics and Business) and WCU (*World Class University*), as well as Mrs. our supervisor Prof.Drs.H. Waridin, MS., Ph.D. and Prof. Dra. Hj. Indah Susilowati, MSc, and without exception to the friends that we cannot mention one by one. Final words from us, hopefully, this journal can provide benefits for us all. Amen _

THE ANALYSIS OF INVESTMENT BEHAVIOR OF INVESTORS IN THE NORTHERN BORDER PROVINCES OF VIETNAM

Tran Van Quyet*, Nguyen Viet Dung**, Nguyen Bich Hong***

ABSTRACT: *The paper applied the data from an in-depth interview with 165 enterprises in Quang Ninh, Lao Cai and Cao Bang provinces to analyze and evaluate the behavior of investors when deciding to invest in the Northern border provinces of Vietnam. This article evaluated and analyzed the behavior of investors when deciding to invest in four aspects: how to find information on investment location; analysis of investment location; decision process to select the investment location and process of investment deployment. The results show that the factors such as: investment policies, access to production factors and infrastructure, the availability of natural resources, the availability of intermediary services, local trade agreements, administrative procedures, local laws and regulations have a great influence on the investment behavior of investors. Based on the above results, the paper proposes some solutions to the Northern border provinces of Vietnam to attract strongly investment.*

Keywords: *Behaviour of investor; Investment decision; Northern border provinces of Vietnam*

1. INTRODUCTION

Following the success of marketing application theory in business in general and in the political and social issues in particular, Philip Kotler (2013) [4] proposed “Place Marketing” to develop the general theory of regional and territory marketing for all continents and territories in the world with the orientation to three target groups: Investors, Residents and Workers, Travelers. Accordingly, local and territory may also do marketing to attract these target customers. Specially, in the book “Asia Marketing” (2005), Philip Kotler analyzed the unique characteristics of Asia, where most countries are either developing or underdeveloped, and showed how Asian countries can develop by doing marketing activities targeted to attracting groups of customers (investors, residents and workers).

In Asia, over the past year, Vietnamese government have been taken concrete steps to ensure the security of the border regions, improve the business environment, reduce disparities in the development of district centres and communities, and address existing social problems. In the trend of regional development, the issues of attracting investment to the Northern border provinces such as: Dien Bien, Lai Chau, Lao Cai, Ha Giang, Cao Bang, Lang Son, and Quang Ninh has played a very important role in the development of the economy of the provinces, the area of border in particular and the country in general. To develop and adjust attract investment as well as improve the investment environment timely, it is very essential for those Northern

* Faculty of Economics, Thai Nguyen university of Economics and Business Administration, Tan Thinh ward, Thai Nguyen city, Vietnam

*** Faculty of Economics, Thai Nguyen university of Economics and Business Administration, Tan Thinh ward, Thai Nguyen city, Vietnam

border provinces to capture the behaviour of investors, including search for investment location information, how to choose the investment location, investment decision making process, and the decision to deploy the official investment. Based on Place marketing theory, the paper focused on analysing investors' behaviour when choosing to invest in a locality. This is an important part of local marketing, helping to attract investors. The foundation and effectiveness of each local marketing decision, including local strategies and policies, depends entirely on local knowledge of the investor, especially the target investors.

2. INVESTMENT BEHAVIOR INVESTOR THEORY

2.1. Definition of investor's behaviour

The behavior of investors is defined as the whole of the actions of investors in relation to investing in a particular locality, including: finding, evaluating, deciding the implementation of investment and subsequent reactions [2].

The behaviour of investors is described in the figure below.

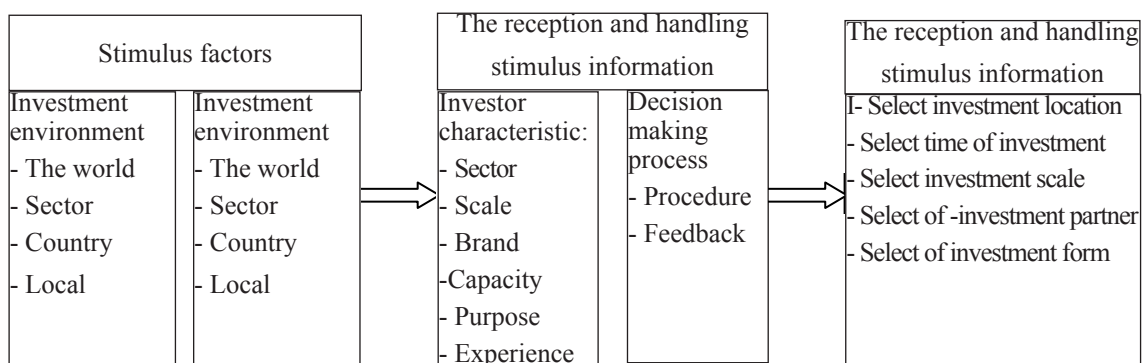

Figure 1: Behavior of Investor Model

(Source: The authors' analysis)

2.2. The investment decision making process of the investor

From the perspective of local marketing, the investment decision-making process of an investor includes their actions in chronological order to find the location for their investment.

This is a complex process. And there are many participants involved it, making a certain impact on the decision making of the investor. Studying the investment decision making process of investors will help local people get more accurate knowledge about them so that effective marketing decisions can be made.

Unlike the decision-making process in the conventional commodity market, the decision-making process of selecting an investment location has some basic features:

First, the decision-making process of choosing a location for investment is a long and complex process; therefore, the level of risk is high. Typically, this process takes place in an uncertain environment. This is largely explained by a lack of information for researching and decision making;

Second, the decision to choose an investment location involves a variety of decisions and is less formal. However, this process still has to comply with some basic finance and market requirements;

Thirdly, the decision-making process of selecting an investment location can be viewed as a dynamic, dynamic and continuous process that is influenced by different members of the organization;

Fourthly, this process is governed by many factors such as strategy, resources, goals and needs of the members;

Fifth, this is not a “trail” process and experience impact is not great. Each investment project is always considered on a new basis and according to frequent change criteria. Even for each project there will be a new management board.

The process of making investment decisions goes through the following steps:

Step 1: Recognize investment needs

Step 2: Establish investment project management board

Step 3: Identify and clarify the role of the consultants

Step 4: Identify and analyze the fundamentals that affect the investment project

Step 5: Set up a list of some of the most potential locations

Step 6: Field survey the locations and negotiation

Step 7: Final selection

According to marketing thinking, understanding is to adapt and to make influence. Therefore, only knowing the decision-making process of selecting investment locations, local leaders can develop and implement appropriate policies and activities to influence behavior. and the decision of the investor in each stage to achieve the highest efficiency in attracting investment development of their local.

3. DATA SOURCE, SAMPLE SIZE AND TECHNIQUE

The study used both secondary data and primary data. Secondary data was taken from the reports of the provincial People’s Committees, Provincial Statistics Offices, Provincial Department of Planning and Investment and annually PCI Provincial Competitiveness. Collected data were edited according to the contents of statistical reports on investment attraction of the central and local authorities in the northern border provinces.

Primary data was collected through field surveys and interviews with enterprises investing in Northern border provinces with selected representatives from Quang Ninh, Lao Cai and Cao Bang provinces. Sample size was calculated by:

$$n = \left[\frac{1}{N} + \frac{N-1}{N} \frac{1}{PQ} \left(\frac{k}{z_{1-\alpha/2}} \right)^2 \right]^{-1} \quad (1)$$

Where: N =population size; P =population proportion; Q = 1-P; k=acceptable sampling error. This study applied k=5%, Z=1.96.

Based on above formula, the number of enterprises collected to interview in each province was:

Table 1. *The number of selected enterprises*

| Province | No of enterprise in 2016 | Sample size | No of selected enterprises |
|------------|--------------------------|-------------|----------------------------|
| Quang Ninh | 5,761 | 59 | 65 |
| Lao Cai | 1,576 | 34 | 40 |
| Cao Bang | 659 | 55 | 60 |
| Total | 7,996 | 148 | 165 |

Source: *The authors’ calculation [6] [5] [1]*

4. ANALYSIS OF INVESTMENT BEHAVIOUR OF INVESTORS IN THE NORTHERN BORDER PROVINCES

4.1. Method to find information about the investment location

Interviewing 165 enterprises showed that the source of information that enterprises seek investment location is from the “colleague” with 86 answers. Source of information ranked second from “symposium, conference” with 78 answers. Internet sources (70 answers), “newspapers” (65 answers), “relatives” (48 answers), “friends” (35 answers), and “Television” (33 answers) ranked in turn third, forth, fifth, sixth và seventh. And the source information that respondents choosing at least was “leaflets” (18 answers).

Interestingly, these results pointed that the information from “colleague and “semina, conference” is very important reference source for enterprises to select the investment location. Most of interviewed enterprises participated in local business organization, which is a good chance to establish working network. Through calling for mutual investment among members of the organization, among colleagues and after evaluating the investment project, enterprises will make decisions on the location of the investment.

The survey results also show that when receiving invitations for investment from the province or from other enterprises, enterprises will make investment in provincial investment projects quickly if the project is feasible, although the procedures for bank loans may not be completed. Events such as symposium, conferences where enterprises get the official and important information about the location of the investment, the unit calling for investment, the local investment environment are a useful and meaningful source to help businesses reach their target investors.

4.2. Analysis of investment location

Analysis of enterprise’s the investment location is carried out through various stages and factors. According to Pham Cong Toan (2010) [7], investors’ motives are ranked from low to high as follows: (1) Searching for resources; (2) Search the market; (3) Search effectiveness and (4) Search for strategic assets. Considering the above four steps, we can see that the investment location analysis process performed in step 3 is “Search effectiveness”, which means that businesses must be aware of the favorable conditions, feasibility, and the benefits that investment projects, investment locations bring to the business. The analysis of the investment location can be based on a number of major factors: investment policy; access to production factors; the infrastructure. The assessment of factors of investment location is based on two scales:

- The first scale is “assessment of regulations” based on 5 levels: 1 - Very reasonable; 2-reasonable; 3-Normal; 4-Unreasonable; 5-Very unreasonable.

- The second scale “assessment the level of local support” also includes 5 levels: 1- Supports very much; 2- Support much; 3-Normal; 4-Less support; 5-Not supported.

The results obtained after the investigation are as follows:

- The investment policy includes the following elements: The specialized law provisions related to the enterprise’s operation; policy of tax; land policy; compensation policy for site clearance; credit policy; labor policy; environmental protection policy; technology-related policies....

First, with the criteria for assessment of regulations, investors rated it “normal” level (ranging from 2.99 to 3.51). However, there are a number of factors such as land policy (3.51), credit policy (3.46), compensation policy (3.20) and labor policy (3.20) are being evaluated by investors at “unreasonable” level. Only the factors related to technology (2.99) are judged “reasonable”by investors.

Second, with the criteria for assessment of the level of local support, investors evaluated at “normal” and support less. In Table 2, investors indicated that local support for credit policies was low (4.03); labor policies (3.70), land policy (3.45) and specialized law regulations related to the business sector (3.40) have not really received much support from local authorities.

Table 2. *Evaluating results on policies related to the operation of investing enterprises*

| Investment policy | Assessment of regulations | | Assessment the level of local support | |
|--|---------------------------|--------------------|---------------------------------------|--------------------|
| | Mean | Standard deviation | Mean | Standard deviation |
| 1. Specialized legal regulations related to the operation field of enterprises | 3.01 | 0.35 | 3.40 | 0.22 |
| 2. Tax policy | 3.00 | 0.45 | 3.20 | 0.35 |
| 3. Land policy | 3.51 | 0.23 | 3.45 | 0.23 |
| 4. Compensation policy for site clearance | 3.20 | 0.33 | 3.17 | 0.37 |
| 5. Credit policy | 3.46 | 0.58 | 4.03 | 0.15 |
| 6. Labor policy | 3.20 | 0.92 | 3.70 | 0.18 |
| 7. Environmental protection policy | 3.03 | 0.62 | 3.34 | 0.38 |
| 8. Technology-related policy | 2.99 | 0.28 | 3.12 | 0.48 |

Source: The authors' calculation

This is the first step (investment location analysis) so that investors make the decision to invest. Therefore, local governments need to be more open, flexible and more interested in their policies in order to create peace of mind for investors before making investment decisions.

- *Access to production factors* including: tourism resources; input materials; employment recruitment; access to capital; access to technology; finance and banking; providing information for business.

Table 3. *Evaluation of production factors assessment related to the operation of investment enterprises*

| Access to production factors | Assessment of regulations | | Assessment the level of local support | |
|---------------------------------------|---------------------------|--------------------|---------------------------------------|--------------------|
| | Mean | Standard deviation | Mean | Standard deviation |
| 1. Tourism resources | 4.12 | 0.25 | 3.99 | 0.33 |
| 2. Input material | 3.32 | 0.28 | 3.57 | 0.38 |
| 3. Employment recruitment | 3.22 | 0.36 | 3.43 | 0.57 |
| 4. Access to capital | 3.03 | 0.45 | 3.25 | 0.68 |
| 5. Access to technology | 2.92 | 0.55 | 3.23 | 0.38 |
| 6. Finance and banking | 3.89 | 0.29 | 3.68 | 0.29 |
| 7. Providing information for business | 3.97 | 0.71 | 4.00 | 0.27 |

Source: The authors' calculation

Table 3 shows that with the criteria of regulations, the general assessment of investors ranged from reasonable, normal to unreasonable. Factors that are reasonably assessed are access to technology (2.92). Factors that were rated at normal were input material (3.32), employment recruitment (3.22), access to capital (3.03), finance and banking (3.89) and providing information to businesses (3.97). And unreasonable rated factor was tourism resources (4.12).

Basically, local regulations on access to production factors still have many points that make investors feel unreasonable when making investment decisions. In addition to the regulatory assessment criteria, most investors assessed the level of local support at normal and unreasonable levels. In particular, factors related to the provision of information to businesses of localities are rated “not reasonable” by investors. This is a problem that localities need to overcome immediately if they want to attract more investors in their province.

- *Infrastructure* includes: electricity, water, transportation, post and telecommunication; infrastructure for business operations; finance, banking, providing information for businesses.

Table 4. Evaluation of infrastructure related to the operation of investment enterprises

| Infrastructure | Assessment of regulations | | Assessment the level of local support | |
|---|---------------------------|--------------------|---------------------------------------|--------------------|
| | Mean | Standard deviation | Mean | Standard deviation |
| 1. Electricity | 3.00 | 0.27 | 3.45 | 0.15 |
| 2. Water | 3.02 | 0.33 | 3.37 | 0.22 |
| 3. Transportation | 3.45 | 0.18 | 3.57 | 0.34 |
| 4. Post and telecommunication | 3.35 | 0.28 | 3.96 | 0.11 |
| 5. Infrastructure for business operations | 3.67 | 0.23 | 3.48 | 0.38 |
| 6. Finance, Banking | 3.23 | 0.62 | 3.44 | 0.26 |
| 7. Providing information for businesses | 3.74 | 0.74 | 3.63 | 0.42 |

Source: The authors' calculation

The results from Table 4 show that evaluation of the investors on the regulations and level support of local was “normal”. Although there are some factors that do not really make investors feel secure when making investment decisions such as regulations on providing information for enterprises, regulations related to infrastructure serving business operations, or the level of local support in post and telecommunications, providing information to enterprises, transportation... However, basically, the provinces are well prepared for the infrastructure factors to attract investors.

4.3. Decision making process to select investment location

In the decision-making process of selecting investment location, it is necessary to understand the main driving force for investors to invest in localities. The results of factors to consider when choosing an investment location are shown:

Table 5. Evaluation of factors influencing the decision to select investment location of enterprises in the local

| Influencing factor | Mean | Standard deviation |
|--|------|--------------------|
| 1. Ability to participate in policy formulation | 3.25 | 0.25 |
| 2. Access to policy makers | 3.32 | 0.35 |
| 3. Availability of natural resources | 3.78 | 0.24 |
| 4. Availability of human resources | 3.54 | 0.35 |
| 5. Availability of support areas for businesses (industrial parks, resorts, ...) | 3.01 | 0.46 |
| 6. Availability of intermediary services | 3.89 | 0.35 |
| 7. Trade Treaty or bilateral or multilateral treaty | 3.90 | 0.36 |
| 8. The relationship between business-worker | 3.26 | 0.28 |
| 9. Cost of intermediary services | 3.41 | 0.36 |

| | | |
|---|------|------|
| 10. Contract implementation | 3.62 | 0.18 |
| 11. Quality of infrastructure | 3.33 | 0.36 |
| 12. Labor cost | 3.69 | 0.26 |
| 13. Labor quality | 3.52 | 0.35 |
| 14. Land allocation | 3.48 | 0.28 |
| 15. Incentives on tax and land | 3.41 | 0.39 |
| 16. The similarity of investment place of other investors | 3.77 | 0.58 |
| 17. Macroeconomic stability (inflation growth, ...) | 3.62 | 0.35 |
| 18. Political stability | 3.09 | 0.25 |
| 19. Protection of property rights | 3.27 | 0.35 |
| 20. Distance to consumer markets | 3.76 | 0.36 |
| 21. Laws | 3.29 | 0.24 |
| 22. Market size | 3.19 | 0.58 |
| 23. Purchasing power of consumers | 3.06 | 0.34 |
| 24. Investment protection | 3.47 | 0.48 |
| 25. Address the problems of enterprise | 3.43 | 0.38 |

Source: The authors' calculation

The assessment of the impact of factors on investment decisions is based on 5 level Likert scale: 1- No impact; 2 - Little impact; 3 - Normal; 4 - Positive; 5 - Very positive. The results are shown in Table 2.29.

From Table 5, the investors assessed the factors influencing the investment decision is "Normal". Some factors have influenced positively on decision of investors such as: the availability of natural resources (3.78), the availability of human resources (3.54), the availability of intermediary services (3.89), local trade agreements (3.90), implementation of contracts (3.62), labor costs (3.69), relationships among industry players (3.77), macro stability (3.62), distance to markets (3.76). The remaining factors affect normally to the decision of the investor. Thus, the understanding and promotion of positive impact factors are not only important in inviting and attracting investment from local authorities but also directly affect the decision-making process of investors.

4.4. The process of investment deployment

In the process of investment deployment, enterprises will look back on the factors affecting their businesses. As embarking on any investment process, the investors will assess local investment environment more detailed and accurate. From there, they will have practical insights and recognize the positive aspects as well as the local constraints in attracting and implementing investment projects. The factors need to change to bring about more effective investment attraction for the local are shown by investors.

According to the opinion of investors, the factors that need to be reformed immediately to improve the efficiency of investment is corruption and negative reduction (88.89%), legal, policies, and administrative procedures reform accounted for 81.11%, infrastructure improvement accounted for 75.56% and human resources development accounted for 65.56%.

In fact, the corruption and negative issues in the localities in the process of investment assessment as well as in the implementation of investment is still very high. This has a negative impact on investors' sentiment when making investment.

Table 6. *Investors' views on the factors that need to be reformed to improve the effectiveness of local investment attraction*

| Factors that need to be reformed | Number of comments | Percentage (%) |
|--|---------------------------|-----------------------|
| 1. Reform legal, policies, and administrative procedures | 134 | 81.11 |
| 2. Restrict corruption and negative | 147 | 88.89 |
| 3. The competitive environment between enterprise is fair | 84 | 51.11 |
| 4. Plan and implement site clearance well | 92 | 55.56 |
| 5. Develop and raise the quality of human resources | 108 | 65.56 |
| 6. Improve infrastructure | 125 | 75.56 |
| 7. Support to solve difficulties and problems of enterprises | 73 | 44.44 |
| 8. Promoting investment attraction effectively | 104 | 63.33 |

Source: The authors' calculation

As discussed above, issues relating to administrative procedures and local legal policies have a positive impact on the decision-making process of investors. However, in the opinion of investors, this factor in localities is slow and cumbersome, affecting the progress of investors. Infrastructure factors have been paid due attention by local authorities, but they still have many drawback affecting the implementation of investors' activities. Other activities such as investment promotion, local human resource development or creating a healthy competitive environment are also urgent issues that need to be changed to improve investment efficiency.

5. POLICY RECOMMENDATIONS

Based on the research results, the paper proposes some solutions to enhance investment attraction in the Northern border provinces of Vietnam.

- *The group of solutions on policy mechanism*

- Formulating policies on exploitation and use of infrastructure construction

- + Promote the construction of inter-regional transport infrastructure

- + For general socio-economic infrastructure construction in their localities, the economic zone management boards or regional administrators shall have to organize the management, operation, maintenance and collect the infrastructure use levy from the investors, maintain the working conditions of these infrastructures, and manage them according to the provisions of law.

- Having policies and measures to improve the investment environment and support enterprises

- + To continue improving the investment environment, creating conditions to attract domestic and foreign resources for development investment.

- + To formulate support policies for the concentrated development of industrial parks and border-gate economic zones.

- + Develop policies to develop markets, create favorable environment for production and business.

- *The group of solutions to improve policies and regulations on investment promotion activities.*

- To broaden the objectives and objects of investment promotion activities

In addition to attracting investment from corporations and large enterprises in the country and in the world, provinces need to pay close attention to start-ups and small and medium enterprises. It is important to develop and support small and medium-sized businesses as a viable solution to attract corporations,

large enterprises and multinational corporations to invest locally because there has already a network of professional service providers and products and a stable business market.

- Strengthening the role and competence of the Investment Promotion Centers and supplementing specific regulations on the reporting mechanism and evaluation of the efficiency of investment promotion activities.

- *The group solutions of local marketing in attracting investment*

- The basic and urgent solution is that the top-level local marketing management apparatus need to establish a framework and roadmap to provide local marketing strategies that are relevant and valuable, difficult to imitate, practical, and Create an emphasis in providing different marketing strategies.

In the context of the fourth industrial revolution, if locality goes ahead in the practice of database marketing (Database Marketing), it will create a competitive advantage of sustainable leadership.

- Perfecting the marketing channel's strategic elements and promoting commodity investment, creating the premise for improving the efficiency and effectiveness of tactical and operational marketing management

IMPACT OF INTERNATIONAL INTEGRATION ON COMMERCIAL BANKING SYSTEM

Ha Minh Son*

ABSTRACT: *The opening up and integrating into the regional economy, joining the WTO also mean accepting competition on the same playing field with foreign banks in the domestic market and the world market. In order to survive and develop in the business environment with the presence of more qualified competitors, the issue of enhancing the competitiveness of the banking system Vietnamese trade is inevitable. For any country, banking is always the lifeblood of the economy, the development of the banking system affects the whole economy. In that system, commercial banks have great contribution to the development of the country. Banking system is an objective issue, resulting from the following reasons: international economic integration has become a trend in many fields; the more manufacturing of goods and services develop, the more goods is sold, the more suppliers are. In fact, no bank is capable of satisfying all requirements of customers; Competitiveness, the ability to survive and affirm the position in the market, especially the international market is not high.*

Impact of international economic integration on the commercial banking system

Positive Impact: Create new sources of capital and lead to international practices in banking supervision; Funds are allocated more efficiently; Improve the efficiency of the banking system in the country; Improve the management level of local banks; Improve the stability of the banking system in the country; Better financial services at a lower cost

Negative impact: Negative impact on the financial system and domestic economy; Impact on business performance of domestic banks; Impact on the credit portfolio of domestic banks; Impact on highly qualified human resources; Impacts on management activities, supervision in banking operations

International economic integration, in the simple concept, is the institutional link among countries. According to this understanding, economic integration has taken place for thousands of years and global economic integration has taken place two thousand years ago when the Roman Empire invaded the world and expanded its network. transport, promote the circulation of goods in the whole occupied territory.

Keywords: *International integration, International integration of the commercial banking system, impact of international integration on the commercial banking system*

Economic integration, in a more coherent way, is the institutional link among economies. This concept has been proposed by Besla Balassa since the 1960s and is accepted primarily in academia and policy. To put it more clearly, economic integration is the active process of simultaneously performing two things: on the one hand, linking the economy and markets of each country to the regional and world markets through opening and promoting the liberalization of the national economy; on the other hand, join and contribute to the building of regional and global economic institutions.

Economic integration can be bilateral - that is, between an economy or a region - that is, between an economic group or a multilateral one - that is, the whole world resembles what the Organization World trade

* Faculty of Banking and Insurance, Academy of Finance, Ha noi, Vietnam Corresponding author.
Tel.: +84984818383, E-mail address: SonNH1973@yahoo.com

is heading. The level of integration is usually divided into six levels: preferential trade area / agreement, free trade area / agreement, customs union, common market, monetary union, and comprehensive integration.

The system, which is a collection of components and parts that are closely coordinated and scientific to achieve a number of goals. A set is considered a system if it has three main characteristics: (1) The system consists of components, parts (usually elements), which usually have some similar characteristics or ; (2) These components are combined together in a method or process that is not systematic if the elements are only discrete, because the relationship among elements is vital, giving the system the characteristics and operating conditions. (3) This combination aims to achieve one or several goals.

Thus, commercial banks being in the system is inevitably because the commercial banks have similar characteristics and the nature of the operation and always in coordination with each other, doing a number of processes to achieve the certain goals. In the commercial bank system, each commercial bank is a part of the system, branches of a commercial bank are not considered as part of the system because they only operate under the authorization of the central (The head office). They can not inseparably link to cooperate with other banks independently.

The commercial bank system has its own characteristics and operating conditions, unlike other financial institutions, in that: (1) Commercial banks always have mutual borrowing or depositing transactions in the interbank market ...with the purpose of temporary investment to make a profit or to find cheaper capital than borrowing from the central bank. These transactions make commercial banks dependent on each other by the liquidity factor, so a commercial bank in the system with liquidity risk is likely to drag the liquidity risk for the whole system of commercial banks; (2) Due to the emergence of diversified financial needs, opportunities for the development of correspondent banks have created. The agent banks will help small commercial banks to perform some services to save time and investment costs ... so the bond between the elements (the commercial banks) in the system becomes more complex, binding and tighter; (3) In order to meet the diversified needs of customers, among commercial banks form a network of payment channels, this is the channel system connecting the banks together, leading to the smooth capital flow of the economy.

Therefore, the commercial bank system is a set of commercial banks combined closely and scientifically to achieve a number of goals.

In the field of banking, international integration is the process of opening up the domestic banking system to integrate into the regional and world banking system, banking operations are no longer confined within a country, an area. It expands on a global scale.

Banking must always be competitive within the legal framework, in compliance with international business principles, banking practices are carried out according to market signals without being blocked by administrative measures, interest rates, exchange rates, and credit activities are determined by the market.

The international economic integration process of the banking system can be understood as the gradual reform of the banking system, stemming from the practical requirements of the globalization of the national economy so as that the new banking system can take over and promote its role of financial intermediation in the context of the economy with many complicated changes of the international market in general and the domestic market in particular.

International integration in the banking sector requires the government and the state bank to eliminate incentives and to compete equally among domestic and foreign banks. Therefore, the level of international integration in the banking sector is closely related to the level of financial and monetary

liberalization. The more effective the liberalization of monetary - monetary system, the more favorable the integration of banking.

Thus, based on both the theory and the reality of development of the world economy, it is affirmed that a country that wants to exist and develop steadily and sustainably must take the initiative in international integration, actively integrate into the banking and finance sector - the sensitive and vital domain of the national economy in particular.

The system of international commercial banks is an objective and inevitable issue, stemming from the following reasons:

Firstly, international economic integration has become a trend and has taken place strongly in many countries. As a result, in parallel with reaching out to the world market, Vietnam also has to open the domestic market, including the financial sector - banking. In that context, the system of commercial banks in Vietnam must actively be aware and ready to participate in the process of integration and competition because the domestic market is no longer at the high level of protectionism as before, banks will have to compete globally and even compete at their home market.

Secondly, the more goods are produced, the more they are sold, the more suppliers are on the market. To survive and grow, it is imperative for businesses to compete. As a result, some businesses are losing out and being left out of the market, while others still exist and develop. Competition takes place all the time, wherever it is not dependent on subjective will of anybody so competition becomes an important rule promoting development. All businesses, regardless of their economic sectors, must mobilize themselves to stand in this mechanism. Any business that is not fit will go bankrupt. Being willing to accept competition and constantly improve competitiveness is a vital issue for every business enterprise. Especially in the current integration period, enterprises can only develop when the competitiveness of enterprises is improved.

Thirdly, in fact, no bank is able to fully meet all the requirements of customers. Often a bank has advantages in some respects and restrictions on the others. Banks must be aware of this in order to enhance their competitiveness by leveraging their strengths to best meet the needs of their clients. Thus, new banks can maintain and develop their market share, profitability in the context of market opening, and the increasing participation of domestic and foreign banks.

Fourthly, the competitiveness of commercial banks in Vietnam is still limited and weak, so the ability to survive and affirm the position in the market, especially the international market is not high. Based on the above analyzes, together with the importance and characteristics of the banking sector in the national economic development process, in order to maximize the opportunities, limit the challenges and improve the competitiveness of the banking system, improving competitive capacity of commercial banks are now indispensable.

International economic integration and international cooperation has become a trend and inevitably spread to all countries in the world with increasing speed and scale. With the establishment of a common currency, a central bank and the complete elimination of financial constraints among countries in the region, Europe has become a pioneer in the process of banking and finance integration at the regional level. On the global scale, there are EU banks in almost all financial markets in countries around the world.

Developing countries are well aware of the benefits of the global integration trend, gradually removing market access restrictions on financial institutions, thereby promoting self-innovation of domestic banks. Some countries allow foreign financial institutions to open their branches, and others allow them to open

representative offices. In other cases, such as Hong Kong, Panama and Singapore, exports are viewed as a source of employment and foreign exchange. Implementing integration commitments means that the country allows foreign banks to operate in the same regulatory environment as local banks and apply looser regulations to financial institutions.

In order to increase efficiency in allocating resources as well as undermining the financial sector, in the early 1980s, Korea adopted a number of competitive policies in financial markets by reducing the regulation of non-bank organizations, which significantly reduce the barriers to market entry. Foreign financial institutions, including banks and life insurance companies, are allowed to open branches. Commercial banks owned by the Government are allowed to privatize. The government also abolished preferential lending rates and did not implement any additional credit programs, and also foster greater competition among financial institutions by allowing them to expand their service scopes.

The integration of financial markets domestically and internationally is not only reflected in the liberalization of trade in financial services but also in the financial assets. Restrictions on capital inflows have been loosened in many developed countries that are often part of a broad reform agenda. Capital flows have been fully floated in Argentina, Chile, Malaysia, Mexico, the Philippines, Thailand, Uruguay. More and more developing countries are encouraging foreign participation in domestic stock markets.

However, in an increasingly globalized and globalized world, liberalization on a global scale, the abolition of regulations for markets has increased financial instability. Before liberalization, commercial banks are strictly controlled. These financial intermediaries are directed towards receiving deposits directly from customers and lending to large commercial and industrial enterprises, often state owned or closely related to the state. As a result, they can avoid strong competition and still make a profit despite their uneffectiveness. In the face of a series of bankruptcies, the results of financial intermediation are predictable and supported by the state.

Taking into account the overall development of the banking system, the large banks in developing countries rarely fail. Today, however, the removal of regulatory regimes has increased the impact of negative externalities. Banks' activities have shifted from a domestic market to a new and unstable environment - the market is liberalized, the exchange rate is floating and the pressure to earn a higher profit in a lower economic growth world and fiercer competition. The emerging global market has to deal with risks in business operations that are inherently sensitive. In the new environment, banks are forced to take higher risks to keep their customers, capital, and stock value. The participation of foreign organizations may not provide the desired benefits to the domestic competitive market while reducing the autonomy of domestic monetary and fiscal policy.

Impact of international economic integration on the commercial banking system

Positive impact

a. Creates new capital and leads to international practices in banking supervision

A characteristic of developing countries or transitioning economies is that the founding members, shareholders, regulators and big clients of commercial banks have a close relationship. Foreign banks entering the market in developing are very prudent in lending these closely related activities. In fact, the market entry of foreign banks has brought new funds to many developing countries that have experienced crises and they also bring international practices into banking supervision.

b. Funds are allocated more efficiently

International integration in the field of financial banking will make capital more readily available in the market as private savings increase. The interest rate is liberalized and becomes positive and creates an attraction for depositors. The fluctuation of interest rates as well as the rate of return will cause capital to be allocated to places where there is a real need and where it is used effectively. This means that capital will be efficiently circulated from surplus to scarce through the free market mechanism.

c. Improve the efficiency of the banking system in the country

Allowing foreign banks to participate in the domestic market can help improve the efficiency and stability of the domestic banking system. This is due to the fact that foreign banks are involved in improving the quality, price and supply of new financial instruments for the domestic market, improving their management skills and qualifications, and increasing competitive in the domestic market.

In addition, because foreign banks have better access to external sources, they have more appropriate forms of financing and lending than local banks. Foreign banks also seem to be more diversified in their credit portfolio and therefore will not be affected by the shocks or downturns in the countries they invest in. The presence of foreign financial institutions will enable domestic financial institutions to have access to international capital markets; apply new financial tools and techniques; improved monitoring and regulation framework, thereby improving the performance of domestic banks.

d. Improve the management level of local banks

The presence of foreign banks will be a condition for technology transfer activities to take place. Foreign banks will hire highly qualified local people. After working at foreign banks, the number of employees recruited by foreign banks will acquire international banking skills and technology and be able to transfer to local banks when returning to their work for domestic banks. The presence of foreign banks will also help improve credit management and thus improve the allocation of credit to the economy. There are many views that foreign banks are better at evaluating the risk of derivatives because they are more experienced in the international market.

e. Improve the stability of the banking system in the country

Researchers around the world have pointed out that the involvement of foreign banks can provide a source of credit for the economy and contribute to a healthier banking system as well as to reduce external shocks (such as crisis). The domestic financial market will be more stable because foreign bank branches or their subsidiaries can obtain capital assistance when necessary from the parent banks in the event of instability.

The involvement of reputable, global-scale banks in the domestic market can be seen as an import of regulatory mechanisms for the country's financial system. This is true if a foreign bank branch operates under the same control under the terms of the Basel Convention. Assuming that, for example, a subsidiary bank of a foreign bank (a separate legal entity with its own assets) operates in a particular country, due to its reputation effect, which forces its parent banks to closely monitored the activities of the bank. When a foreign bank participates in providing a new product or service to the market, it forces the bank supervisors in that country to be upgraded and improved to meet the requirements to comply with international standards for the operation of the commercial banking system.

It also shows that the presence of foreign banks also contributes to the stability of the domestic banking system by allowing domestic depositors to open accounts and switch their deposit to a foreign bank in that country if the depositors do not trust the stability of the domestic banks in the event of a crisis, this will help stabilize the total deposit of the system.

Recent research shows that large-scale foreign banks with branches or sub-banks often do not “run away” in the event of a crisis occurring in the country in which they have branches or banks. It is likely that the main reason for the failure of foreign banks is because they have invested a large amount of capital in fixed assets to establish a branch network and to gain market share. In fact, large equity banks are more stable in providing credit to customers after the crisis. [3] capital mobilization by foreign banks in Argentina during the financial crisis in the mid-1990s has grown significantly and [5] foreign bank branches have played a role as a safe haven for depositors during the banking crisis in Croatia in 1998.

f. Better financial services at a lower cost

Most of the foreign banks implement a transparent disclosure mechanism and implement the accounting system in accordance with international standards. Competition for providing financial services to customers as well as in obtaining funding or financial services will force local banks to gradually adopt international practices such as bank branches. The domestic financial market will be more disciplined and more competitive by minimizing the imbalance of the banking system. It is informative and reduces adverse effects such as adverse selection and moral hazard. As a result, the bank’s customers will receive higher quality financial services and lower costs.

Negative impact

a. Negative impact on financial system and domestic economy

Recent research indicates that the increasing and deepening involvement of foreign banks in the domestic market has also had a negative impact on the financial system in developing countries. Due to the ability to capture information around the globe and have more choices about where to invest, foreign banks often tend to “run away” when their investments are not as expected. In contrast, domestic investors often have a vested interest in their investments and are therefore more likely to incur higher transaction costs.

The greater the international integration of the banking sector, the greater the impact and interplay of financial markets. As one of the global banking and finance corporations, their foreign bank branches or subsidiaries may not be negatively affected at times when the banking system and the national finance of the host country was in a difficult situation. However, since international banks are consistently adopting a common policy for their subsidiaries and branches around the globe, when an event occurs in a country, foreign banks often adopt policies or mechanisms that may have a negative impact on the local banking and finance system.

Peek and Rosengren’s empirical studies [4] show that the problems of the Japanese financial and banking system that occurred in the late 1980s and early 1990s have spread to America through the operation of Japanese banks in the US market. In addition, another study by [6] has shown that the influence of US banks on developing countries often reflects the state and volatility of US economic conditions rather than the growth and interest rates of developing countries where they have branches or sub-banks. Especially when the branch of a foreign bank or a sub-bank occupies the majority of operation scale and the equity of the sub-bank occupies the majority of the capital of the total number of foreign banks in the home country (country where foreign banks have branches or sub-banks), the negative impact can occur on the economy of the host country in the event of a shock in the parent bank’s country. According to a study by [4] out of the five largest foreign banks in New Zealand account for over 90% of the total assets of the banking system, there are four Australian banks. Hull concludes that it is the ownership concentration of Australian investors and the interdependence between the New Zealand and Australian economies that can lead to

the instability of the Australian economy. It negatively affects New Zealand. In many Latin American countries, Spanish banks have occupied an important position in their banking systems.

b. Impact on the business performance of domestic banks

Recent studies show that there are differences in the market entry of foreign banks into developing countries and industrialized nations. In developing countries, branches of foreign banks often have higher gap between output interest rates and input interest rates, which are more profitable than domestic banks. Meanwhile in industrialized countries the situation is the opposite.

Studies have also shown that, with the increasing participation of foreign banks, the spread of interest rates on loans, profitability and general costs of domestic banks will be reduced. In addition, the effects on the business performance of foreign banks on the domestic banking system are likely to occur soon after their entry into the domestic market and are not dependent on the market share they occupy after accession.

c. Impact on the credit portfolio of domestic banks

In fact, in some cases, the involvement of foreign banks has not played a positive role in effectively allocating credit to the economy. In many cases, foreign banks only “choose delicious” and this situation is very common in developing countries. Foreign banks only choose the clients with the lowest return and risk, and the remaining firms considered to have a higher level of risk are left for the domestic bank, which makes the local bank’s portfolio of loans more risky. When foreign banks launch a “good tasting” campaign, they only choose healthy, high-rated clients, and normally they value risk better than local banks, or they find another way to pass on the risk to the domestic banks like wholesale loans, lending through domestic banks.

d. Impact on highly qualified human resources

Experimental studies show that when foreign banking corporations are involved in opening branches or establishing sub-banks in markets of developing countries in the context of international and global economic integration, the branches of foreign banks or subnational banks quickly attract a high-skilled workforce due to attractive salary schemes. Generally, the average salary paid by foreign bank branches or their banks to skilled workers is about four to six times higher than that of local banks. Therefore, foreign banks will quickly attract the best quality human resources from domestic banks to work for them. The phenomenon of “brain drain” is very common and becomes a natural trend in developing countries as the process of economic integration takes place more and more intensively.

Without a proper policy of attracting, recruiting and developing human resources, it is likely that local banks will lose their best employees. Clearly, the human factor plays an extremely important role for any organization or institution. It determines the success of the organization, especially in the context of increasingly intense competition, and in the context of international integration. Having a highly qualified, well-trained staff will be a key contributor in reaching and understanding new requirements, advanced technology and the demands of an organization in the process of national integration.

e. Impacts on management activities, supervision in banking operations

The involvement of foreign banks in the domestic market also means importing management technology to at least one part of the banking system and may contribute to improving the quality of staff and standards. In bank supervision inspection. However, some observers argue that when banking is out of the country, supervision and management are complex. In the process of international integration, the banking systems in each country are closely linked and interdependent in their activities, so there must be standard solutions for all. Aspects in banking supervision and inspection activities.

CONCLUSION:

To survive and develop sustainably in the context of deepening international economic integration, Vietnam's commercial banks must constantly improve their competitiveness so that they can survive and develop in the environment in the increasingly harsh international economic integration market. Vietnam's current commercial banking system, although gradually enhancing its competitive capacity with many efforts to improve and develop to integrate. However, in the turbulent business environment, international economic integration in the deepening banking sector coupled with efforts by the government to restructure the banking system, the impact study of international economic integration to improve the competitiveness of the commercial banking system in Vietnam is very necessary to build the direction of the commercial banking system in Vietnam, a development strategy as well as objectives, the solution to reform, transforming itself comprehensively in the new situation.

VIETNAMESE COMMERCIAL BANKS IN GLOBALIZATION CONTEXT: OPPORTUNITIES, CHALLENGES AND RECOMMENDATIONS

Le Vu Thanh Tam*

ABSTRACT: *It can be said that globalization or internationalization is an indispensable development trend of all economies, entails both opportunities and challenges that are intertwined. For the development of nations, organizations, enterprises and banks. In recent years, Vietnam has been increasingly integrated into the regional and global economy, has signed Free Trade Agreement (FTA), Trans-Pacific Strategic Economic Partnership (TPP) and joined the ASEAN Economic Community (AEC) which was established at the end of 2015. With the implementation of the international commitments in the financial sector, the commercial banking system in Vietnam will have a lot of opportunities as well as challenges. The purpose of this study is to propose opportunities, challenges and some recommendations for sustainable development of the commercial banking system in Vietnam.*

Keywords: Commercial bank, Globalization, Opportunity, Challenge

1. INTRODUCTION

In the context of extensive integration into the regional and global economy, Vietnam has held increasing attraction for investors in many fields including that of providing financial services from Vietnamese commercial banks. In particular, after acceding to the ASEAN Economic Community (AEC) established at the end of 2015, signing and implementing the international commitments in Free Trade Agreement (FTA), especially Trans-Pacific Strategic Economic Partnership (TPP), regulations in the Vietnamese financial sector will be loosened. Consequently, the commercial banking system needs to be prepared for competition as the number of foreign banks investing in Vietnam is on the increase. has been increasingly integrated. At the same time, since regional banks have been able to set up wholly-owned subsidiaries in Vietnam in accordance with the World Trade Organization (WTO) commitments and by 2020, they will possibly be free for establishment in the country. Accordingly, in the banking sector, especially in the period of 2011 - 2015, the commercial banking system has proactively implemented many intensive and effective integration programs, has been putting in constant effort to strengthen its cooperation with international monetary and financial institutions and has been looking for and expanding its relationship with potential partners to further support both technically and financially for Vietnam. However, the effectiveness of international economic integration of Vietnam remains insignificant in reality. The innovation process in the country, especially the reform of institutions, has not kept pace with the schedule and level of international commitments. Strategies for addressing risks and shocks for deeper integration have not been formulated. The integration context requires Vietnamese commercial banks to actively participate in the integration process

because the domestic market no longer maintains high levels of protection as before and the commercial banks will have more fierce competition not only on their home market but also on the global scale. The new context also requires the State Bank to actively adjust and create a favorable legal environment for credit institutions, develop appropriate policy frameworks for the banking system to ensure effective operation and timely resist possible external shocks. In order to build a reputable, competitive and secure banking system with the ability to mobilize all resources in society for effective investment, it is necessary to identify the right opportunities and challenges for Vietnamese commercial banks in the integration game.

2. OVERVIEW OF BANK GLOBALIZATION IN VIETNAM

In recent years, bank globalization in Vietnam has taken place intensively and comprehensively in both legislation system of the Government and the performance of commercial bank system.

2.1. Legislation system

Implementing the international integration commitments, Vietnamese Government has made legal reforms to open the financial market. The legal provisions relating to the integration of the financial sector include:

- Provisions on the level of ownership of foreign investors in domestic commercial banks, as reflected in Decree 58/2012 /ND-CP dated 20/7/2012 of the Government stipulating in detail and guiding the implementation of a number of articles of the Law on Securities and the Law on Amendments and Supplements to some articles of the Law on Securities; Decree No. 60/2015/ND-CP dated June 26, 2015 on amending and supplementing some articles of Decree 58/2012/ND-CP. Accordingly, the room for foreign ownership in securities companies will be reduced to 100% instead of 49% as before, while for banks is 30% with prudential roadmap.

- Provisions on the establishment of 100% foreign - owned banks are reflected in Decree 22/2006/ND-CP dated 28 February 2006 of the Government on the organization and operation of foreign bank branches, joint-venture banks, with 100% foreign capital and representative offices of foreign credit institutions in Vietnam; Circular No. 03/2007/TT-NHNN dated June 5, 2007 guiding the implementation of some articles of Decree 22/2006/ND-CP. Accordingly, in order to establish and operate a joint venture bank or bank with 100% foreign capital, a foreign bank must have total assets of at least USD10 billion at the end of the financial year preceding the year of application for the license. The condition of foreign bank's financial capacity for opening a branch in Vietnam is also required to be more than doubled, ie the parent bank must have total assets with minimum equivalent \$ 20 billion in the fiscal year preceding the year of application. All conditions to establish FDI banks in Vietnam's WTO commitments have been included in Decree 22/2006/ND-CP.

Under Vietnam's WTO accession commitments, foreign banks enjoy the most favored nation treatment and national treatment, ie they have the right to establish and operate automatic teller machines, Credit card issuance in Vietnam like commercial banks in Vietnam. So far, Vietnam has made regulations and specific guidelines for the banking sector under the WTO commitments. However, with the changes in the AEC and further steps in the TPP's open door approach to market access and cross-border investment, there is no regulatory document.

2.2. Performance of Commercial Bank System

Since acceding to the WTO and the roadmap for opening the Vietnamese banking and finance market, the number of foreign banks and branches has increased steadily from 31 (2006) to 53 (2013) and 50

(31/12/2015). Foreign commercial banks have started to enter the Vietnamese market in various forms in order to exploit a potential market, therefore the competition pressure has become increasingly severe. With the impact of the global financial crisis and economic recession, the commercial banks in Vietnam are in a difficult situation with poor asset quality and the risk of bankruptcy can occur. In that context, the Prime Minister signed Decision No. 254/QĐ-TTg dated March 1, 2012 to issue the project “Restructure the system of credit institutions in the period 2011-2015” aiming to encourage the merger and consolidation of credit institutions and implement solutions to financial health and operation of the system to ensure safety and sustainable development. After 4 years of implementation of this project, the system of credit institutions has decreased sharply. Accordingly, there are 17 CIs, branches of foreign banks have reduced due to merger, consolidation or withdraw operation license, A number of CIs have been transformed from a joint-stock commercial bank to a one-member limited liability bank. So far, the system of Vietnamese commercial banks has included four state-owned commercial banks, 31 joint - stock commercial banks (including three joint stock commercial banks with over 50% of charter capital owned by the State), five commercial banks with 100% foreign capital, joint venture banks and 50 foreign bank branches. (Table 1)

Table 1. The system of Vietnamese commercial banks

| Banks | 2012 | 2013 | 2014 | 2015 | 2016 |
|--|------|------|------|------|------|
| State commercial banks | 2 | 1 | 1 | 1 | 4 |
| Joint-stock commercial bank | 38 | 38 | 38 | 37 | 31 |
| Commercial joint venture bank | 5 | 4 | 4 | 4 | 3 |
| Commercial banks with 100% foreign capital | 5 | 5 | 5 | 5 | 5 |

Source: aggregated data of the State Bank of Vietnam over the years

Thus, in the period 2012 - 2017, there is a trend of opposite movement between the number of joint stock commercial banks and foreign banks, branches of State banks and commercial banks in the country. As the number of foreign banks and branches of foreign banks increased following the accession to the WTO, the number of domestic commercial banks decreased, especially by the end of 2015, the merging of nine weak commercial banks made the number of joint stock commercial banks decline.

The opening of the domestic market has increased foreign ownership in Vietnamese commercial banks. With the permitted cap of 30% (Decree 60/2015/NĐ-CP), Vietnamese commercial banks have actively sought strategic partnerships and offered shares for Shareholders are large foreign organizations, gradually increase the proportion of foreign ownership. Among Vietinbank equitization, Vietinbank has the highest foreign ownership ratio (from around 12% in 2012 to 28% at the end of 2014), followed by Vietcombank (from 5% in 2012 to to 20% by the end of 2014). The share of foreign ownership tends to increase in large and medium banks such as ACB, EIB, TCB, VIB, VPB with about 20% 30%. Banks with a sharp increase in foreign ownership during the reorganizing period (2012 - 2014) to 30% were ACB, ABB, SCB and SHB, which confirmed the positive impact of the rate increase. foreign ownership, helped these banks escape from the list of weak banks.

3. OPPORTUNITIES AND CHALLENGES FOR VIETNAMESE COMMERCIAL BANKS IN GLOBALIZATION TRENDS

When bank globalization takes place intensively and comprehensively as overview above opportunities and challenges for Vietnamese Commercial Banks are intertwined.

3.1. Opportunities

Globalization brings many potential business opportunities for Vietnamese Commercial Banks in not only improving their financial results but also advancing the profession in operation. In specific:

Firstly, Vietnamese Commercial Banks will broaden and diversify foreign markets.

International economic integration, especially after CPTPP was signed, opens up great opportunity for Vietnamese commercial banks to reach and broaden foreign markets. According to the content of the finalized negotiations in the financial services sector, a CPTPP service provider can provide financial services in other TPP markets if domestic companies operate. In this market is allowed to provide that service. In the period 2011 - 2015, commercial banks in the country are prepared to catch up quite well this opportunity. Commercial banks such as BIDV, VCB, Vietinbank have pioneered the export of banking, securities and insurance services to foreign markets. These banks are well-prepared, proactive and cautious in not only approaching and exploring the markets of developed countries such as the United States, Germany and Russia but also penetrating ASEAN countries' markets such as Laos, Cambodia and Myanmar; and opening representative office, branch. Up to now, there are more than 11 investment projects, 20 branches and representative offices of Vietnamese commercial banks in foreign countries (Table 2).

Table 2. Banks / branches of Vietnamese commercial banks in foreign countries

| Date range | Bank | Receiving country invest | Total estimated capital (USD) | Total Vietnamese Capital (USD) | Profit before tax in 2015 (million dollars) |
|------------|------------|--------------------------|-------------------------------|--------------------------------|---|
| 08/02/2012 | BIDV | Laos | 70.000.000 | 45.500.000 | 15.2 |
| 14/08/2009 | | Campuchia | 70.000.000 | 70.000.000 | - |
| 10/03/2010 | Agribank | Campuchia | 39.000.000 | 39.000.000 | - |
| 07/12/2010 | MB | Laos | 12.000.000 | 12.000.000 | 1.3 |
| 07/12/2011 | | Campuchia | 39.000.000 | 39.000.000 | - |
| 18/08/2011 | Sacombank | Campuchia | 38.000.000 | 38.000.000 | 1.7 |
| 20/12/2012 | | Laos | 38.000.000 | 38.000.000 | 4.1 |
| 19/10/2011 | SHB | Campuchia | 39.000.000 | 39.000.000 | 2 |
| 14/05/2012 | | Laos | 13.000.000 | 13.000.000 | - |
| 19/10/2011 | Vietinbank | Laos | 22.000.000 | 22.000.000 | - |
| 28/06/2012 | | Germany | 65.500.000 | 65.500.000 | - |

Secondly, new banking business models will be formatted.

The opening up and integration in the banking sector allow domestic and foreign commercial banks to run business, compete and grow in an equality and professional playing field. At the same time, extensive globalization creates favorable conditions for domestic commercial banks to penetrate the international market and expand business. By the end of 2015, the commercial banking system of Vietnam has had a strong and diversified development, with the form of state commercial banks, joint stock commercial banks, joint venture banks and foreign bank branches. This is also a prerequisite for Vietnamese commercial banks to develop and integrate.

Furthermore, implementing the integration commitments, the State intervention in the business activities of banks will increasingly reduce and the protection will be limited. This context makes it possible

for Vietnamese banks to be more active in their businesses, and at the same time, banks have the opportunity to demonstrate their capabilities and qualifications.

Domestic banks are forced to specialize more deeply in their operations so that they can quickly access and develop new banking services, improve the capital efficiency, exploit and apply more effectively the advantages of these banks in order to expand market share in domestic and international financial markets. International integration forces the domestic banks to operate on the principle of market, enhance the competitiveness that will boost the business performance of local banks.

Thirdly, integration helps commercial banks approach to new - aged technology and modern banking management techniques

Globalization will improve the health and safety of the entire system of Vietnamese commercial banks by bringing the opportunity to access capital, technology, experience and management level of the international commercial banks. At most joint-stock commercial banks with foreign ownership of over 5% such as Techcombank, VIB, foreign experts are in charge of such important positions in board of administration. The chance in working with foreign senior managers in the bank will help Vietnamese bank managers acquire technology, good management skills, particularly new - aged technology of the fourth industrial revolution. In addition, many domestic commercial banks have hired foreign consultants to provide consultancy packages focusing on: Strategic Planning, Business Planning, Risk Management, Human Resource Management, Evaluate service quality. It can be said that this is the initiative of commercial banks in anticipation of business opportunities in the integration environment to find common voice with investors and foreign partners on the way, compete for mutual development. In addition, many commercial banks have applied modern software systems to manage the banking system such as core-banking system, customer management system CRM constantly improve service quality. Compared to the time before equitization, state-owned commercial banks, including VCB, BIDV and Vietinbank, had a clear change in both quality and quantity.

Fourthly, globalization will create motivation to promote innovation and enhance transparency, publicity, governance and self - responsibility of the system of Vietnamese commercial banks in accordance with international standards.

On the one hand, under the impact of the global financial crisis, domestic commercial banks faced the pressure of a strong and comprehensive renovation of their organization and operation so as to affirm their firm position in the market. Many domestic banks have focused on strengthening their risk management skills, as well as international modern banking management standards (Basel II, III). Typically, Vietinbank, as soon as IFC had become a strategic shareholder (2010), signed and deployed a technical cooperation agreement in four components, including support for risk management. An important component in establishing the conditions for the application of Basel standards. It can be said that international integration help commercial banks have the opportunity to gain experience and knowledge of big banks and financial institutions over the world in risk management in particular and governance. general operating. Thereby, domestic commercial banks can improve the operating efficiency in the field of currency and banking.

On the other hand, as the rate of foreign ownership in commercial banks increases, it means that SOCBs must standardize governance, accounting and finance in line with international practice, Standards of transparency, publicity. Most commercial banks, when listed on the stock market, had to convert their accounting systems into international standards (IFRS), in addition to the Vietnamese Accounting Standards (VAS). This conversion is indispensable when commercial banks have a need to list on the international

market. Accordingly, a number of large commercial banks have also hired valuation organizations, international ratings to credit rating. Public ratings by international organizations will open up opportunities to penetrate international markets in the context of integration of Vietnamese commercial banks.

Fifthly, integration requires a better regulatory environment to implement international commitments, create an attractive investment climate, and encourage capital inflows through direct and indirect investment.

Direct and indirect foreign investment create opportunities for commercial banks to lend and mobilize larger capital. At the same time, globalization opens up opportunities for commercial banks to seek foreign strategic shareholders in order to overcome the limitations on financial capacity, governance and competitiveness to improve service quality, business performance. In the last 10 years, many Vietnamese banks have selected large foreign financial institutions as their strategic shareholders.

Table 3. Strategic shareholders of several Vietnamese commercial banks (As of 2016)

| Bank | Foreign strategic shareholder | Initial investment time | Share ownership ratio |
|---------------|--------------------------------------|--------------------------------|------------------------------|
| ABBank | Maybank | 03/2008 | 20% |
| ACBank | Standard Chartered | 06/2005 | 15% |
| Techcombank | HSBC | 12/2005 | 20% |
| Eximbank | SMBC | 11/2007 | 15% |
| Sacombank | Macquarie Capital | 11/2011 | 14% |
| Vietcombank | Mizuho | 09/2011 | 15% |
| Southern Bank | UOB | 05/2007 | 15% |

Source: Website of the above banks

In the context of the unavoidable development trend of the Vietnamese financial market, under the circumstance of the restructuring and integration into the global financial environment, the potential for the formation and development of financial institutions in the form of investment banking Comprehensive is an objective reality. The problem is that managers, market supervisors and policymakers need to study early to create a legal corridor for these new financial institutions, thus creating a level playing field, Competition and sustainable development in the current deepening integration.

3.2. Challenges

Besides the opportunities from international integration, the banking system in Vietnam faces many internal difficulties in the economy as well as the internal of each bank, the institution of the banking system is still many. Inadequate reform requirements and integration roadmap are major challenges for Vietnamese commercial banks in the globalization process.

Firstly, competition in the banking market in Vietnam will be fiercer.

Foreign commercial banks currently only hold a minority market share in Vietnam's banking and finance market, but will have a near-comprehensive advantage in the future, when the restriction of the Vietnamese State to Foreign commercial banks are loosened gradually. It is noteworthy that, in previous years, foreign banks appeared in Vietnam mainly in countries and territories with much investment in Vietnam, such as Japan, Korea, China, Taiwan... Recently, Asian banks have appeared more and more, such as DBS Bank (Singapore), Maybank (Malaysia) ... It seems that credit institutions in the region are ready to welcome opportunities from AEC.

Secondly, the share of foreign ownership in joint stock commercial banks will increase.

For commercial banks, opening up the domestic market means increasing foreign ownership. With the permitted ceiling of 30%, Vietnamese commercial banks, Vietinbank now has the highest foreign ownership ratio of over 28%. Among joint-stock commercial banks, the proportion of foreign ownership generally tends to increase in large and medium banks such as ACB, EIB, TCB, VIB, VPB, from 20-30%. In particular, ACB has a 30% ceiling rate of foreign ownership in the 2013-2016 period. An Binh Bank, although a small bank, has consulted with the International Finance Corporation (IFC, World Bank Group) since 2013, has increased its foreign ownership from 0 to 20% in 2012-2013 and 30% in 2014 to 2016. It was thanks to the increase in foreign ownership that ABB took the initiative to restructure, "escape" the list of weak banks forced to restructure passive. In addition, two banks with a sharp increase in foreign ownership in the restructuring period 2013-2016 are Saigon Trade and Industry Corp (SHB). This reaffirms the positive impact of the increase in foreign ownership, but poses a challenge for joint stock commercial banks, especially small banks, if not to hold. Proprietary rights will be transferred to foreign investors.

Thirdly, the market share of domestic banks will decline.

In the period 2011 - 2016, the market share of credit and capital mobilization of commercial banks compared to foreign banks decreased remarkably. Although large state-owned commercial banks dominate the credit market, they tend to decline. Moreover, in the capital mobilization market, state-owned commercial banks have been weak when the market share is lower than that of joint stock commercial banks because the joint stock commercial banks are more competitive. The deposit interest rate should account for a larger market share. In fact, in both the credit and capital markets of commercial banks in Hanoi, the market share of foreign banks is on the rise. As soon as WTO commitments enter into force, state-owned banks are entitled to mobilize capital from the population, providing personal lending services, and being a Vietnamese institution, which is rich land for foreign banks to exploit the strength of service quality outperform the domestic commercial banks. This is evident when in the credit market, foreign banks account for 10-15% of the market share with diverse products, rich and professional service quality has attracted Vietnamese customers. The market share of capital mobilization, although more modest, accounts for only 5-7% of market share, but foreign banks are also attractive to middle-income and middle-income customers. Average and high, then the cost of mobilizing 1 dong of foreign banks will be relatively low relative to the domestic commercial banks.

Fourthly, globalization poses pressure to improve service quality, product diversification, investment efficiency in modern technology.

It is from the sharp decline in market share of commercial banks in Vietnam, it can be seen that improving the quality of services of domestic banks is an indispensable requirement to improve competitiveness. In the context of integration. It is undeniable that foreign banks are becoming more attractive than local banks. As Vietnamese become more educated and have higher incomes, they are more likely to look to foreign banks. Better service providers. This segment of high-income and middle-income customers, intellectual customers will gradually shift to transactions with the SBV, then, of course, if the domestic banks do not invest, renovate strongly. High technology and quality, diversified products and services will inevitably "lost on the ground". In terms of technology infrastructure and payment systems, Vietnamese banks are far from the requirements of integration. Although local banks are making every effort to upgrade their technology systems through modernization projects, their financial capacity is limited so they can not meet the requirements in a short period of time. Over time, The State bank of Vietnam has asked local banks to

review their technology governance capabilities over Basel II through the Data Gap tool. As a result, local banks only meet about 40-60% of Basel II requirements. That shows that technology governance is a great challenge to the pressure of international integration of the commercial banking system in Vietnam.

Fifthly, integration requires Vietnamese commercial banks to have a human resource that is not only highly specialized in banking but also must understand the international trade law, be fully equipped with knowledge and techniques.

Research, analysis, evaluation and forecasting in line with international standards and models, while human resources of Vietnamese commercial banks are very weak in knowledge and skills. Unlike many service sectors, the human resources of the banking sector must be of exceptionally high quality, including skilled workers, good foreign languages, and scientific and technical progress. High technology and good morals. Among them, financial professionals must be strategic visionaries, taking decisive action and principles as a “leader,” especially when dealing with complex business events. Moreover, high quality human resources are important conditions to ensure healthy, efficient and competitive development; It is also a key factor for Vietnam to become a regional and international financial center. However, the banking sector in Vietnam is seriously scarce labor resources of high quality, especially financial professionals with international qualifications. Hence, in order to meet the rigorous requirements of integration, the banking system of Vietnam should enhance the training of human resources of high quality, meeting international standards, knowledge of practices, business practices and international risks.

Sixthly, opening up the banking and finance market in the globalization process will inevitably lead to the risk of being overtaken by domestic commercial banks and the consequences arising from the problem of cross-ownership.

With the strength of finance, technology and human resources, foreign banks often penetrate and develop new markets by buying shares of Vietnamese commercial banks and become strategic shareholders, seeking to acquire them. Acquire these banks, or carry out M & A banking deals. This is the way to help foreign banks get into the financial market in Vietnam more quickly. In this case, if Vietnamese banks do not have “sanity” in managing and controlling capital, then the probability of acquisition is unavoidable. On the other hand, integration with foreign room maps in the financial market of Vietnam will create momentum and opportunities for cross-border investment between commercial banks or between commercial banks. With large corporations, leading to the problem of cross-share ownership in many forms. This is a big challenge nowadays, and the biggest barrier to manipulate and affect the entire banking system in the process of restructuring. However, the promotion of offshore investment by Vietnamese commercial banks is also facing the political, cultural and legal risks of host countries. The government in accessing information and promoting investment to reduce national risk in the field of banking and finance.

4. SOME RECOMMENDATIONS

To seize the opportunities and overcome the challenges that the globalization context brings, Vietnamese commercial banks need to make good the internal shortcomings, continue to reorganize, enhance competitiveness, expand the scope of activity. In order to achieve that goal, the author would like to propose 2 groups of recommended solutions to be implemented as follows:

4.1. From the Government and the State Bank

Firstly, perfect the legislative system

It is necessary to amend, supplement and perfect a legal corridor of publicity, transparency and fairness at all levels of management in order to facilitate equal and safe commercial banks. In competition, ensure

system security, while improving public confidence in the banking system. At the same time, the State Bank of Vietnam should create a coordinated coordination with related ministries and agencies in the issuance of legal documents, as well as the control over the handling of cross ownership issues. The cross-treatment of cross-compliance should be to prevent deliberate infringement, to eliminate the benefits of cross-ownership of individuals and organizations.

Secondly, conduct inspection, assessment, classification of commercial banks based on criteria for good and safe banking evaluation.

Basel II is considered as the best criteria for good and safe banking evaluation nowadays. Applying Basel II in inspection, assessment, classification of commercial banks should be widely implemented by many synchronized solutions to legal corridor, infrastructure and human resource in the whole banking system. During the process of applying BASEL II, the smallest group of banks, failing to meet the rating criteria, will be forced to cease operations, merge with banks capable of restoration and good financial status are encouraged to merge. To form a new bank of a larger scale, to operate more efficiently.

Thirdly, enhance directing, managing, supervising the whole system of Vietnamese banks

The supervision of the State Bank and the Government for commercial banks must be carried out regularly, continuously and flexibly and so as to assist the organizations to be monitored, to ensure the systematic and effective coordination of policies. And international cooperation in financial supervision so that banks operate safely and effectively, avoiding unfair competition. At the same time, effective coordination of the restructuring of the commercial bank system with strong development of financial markets, securities, insurance and investment funds in accordance with international standards to meet capital needs for the fourth economy, continued active international integration in the field of monetary, credit and banking. This integration process needs to be calculated in a way that is consistent with the capacity of commercial banks and the ability of management and supervision of state management agencies.

4.2. From Vietnamese Commercial Banks

Firstly, reinforce financial capacity

The commercial banks should be active in the main aspects, such as equity, asset quality, liquidity, profitability. In order to ensure this, Vietnamese commercial banks must first build a roadmap and step by step increase their charter capital by: issuing shares to domestic and foreign investors, voluntarily merging, Accordingly, improve capital adequacy ratio according to Basel II standards. Increasing charter capital is a prerequisite for achieving economies of scale, meeting the ever-widening and large financial potential needed to cope with the uncertainties of the international business environment.

Secondly, enhance the capacity of executive management

In order to improve the governance capacity, commercial banks should clearly define the rights and responsibilities of boards and head office centers, as well as strengthen the coordination between these boards and their branches, To set up an early warning system and develop a system of tools and software programs for market risk management and operation in line with international standards and practices, enhancing the quality of the project work. Market research, management and market research for the development of non-credit services, and good policies for good managers to retain and attract talents.

Thirdly, improve the quality of human resources in the direction of improving professional level, creativity, ability to communicate, and professional working style.

In order to do this, it is necessary to set specific criteria at the recruitment stage, and to combine training and regular retraining of staff. For managers at all levels should have the potential in making plan for training, practicing, exchanging staff between reputable foreign banks operating in and outside the country. At the same time, research on the application of modern information technology in the effective management of human resource utilization, employee evaluation in accordance with professional ethics standards, and efficiency is the main measure.

Furrrthermore, training and retraining human resources in a comprehensive manner need to aim at step by step raising the quality of human resources in a uniform and steady manner in the direction of both intensive and comprehensive, highly competitive and always oriented. Attracting and using talents effectively also need to be highly appreciated and implemented in a scientific way by compensation policy in each stage of development.

Fourthly, continue to innovate and modernize banking technology

In recent years, although the application of banking technology of commercial banks has gone a step further, compared to commercial banks of advanced countries in the world, the technology used in commercial banks is quite backward. Therefore, commercial banks must have specific plans and conduct technological innovations in order to create highly competitive products and services and the ability to maintain good information to enhance their competitiveness.

Fifthly, restructure the network in a scientific way

To form a new bank of a larger scale, to operate more efficiently and competitively. Sofor a long time, commercial banks have been constantly expanding their networks, without paying much attention to their effectiveness, management capacity, and so on. In the coming time, commercial banks need to have specific solutions to restructure the network such as: merging, dissolving, changing management personnel, but minimizing disturbance, psychological puzzling for staff.

Sixthly, strengthen international cooperation

Vietnamese domestic commercial banks should strengthen international cooperation with foreign commercial banks and actively participate in programs and institutions tocombine with regional and international economic association in supervising and exchanging information, In additional, taking advantage of the support of organizations, extanding bilateral cooperation including the implementation of the Vietnam-US Bilateral Trade Agreement, paying attention to nternational and regional integration in multilateral economic organizations such as ASEAN, APEC, WTO should be promoted.

5. CONCLUSION

Bank globalization is an inevitable development trend of all economies, not only opens up many opportunities but also poses a lot ofchallenges and pressures for the development of bank system. Therefore, pressure created by the process of regional and internationaleconomic integration for business activities of Vietnamese commercial banks will greater and greater while thepotential advantage will belong to foreign commercial banks. The competition not only takes place overseas but alsotakes place in the domestic market, where Vietnamese commercial banks still have many advantages if they takeadvantage of those advantages. To be able to master the advantages, take advantage of opportunities and increasecompetitiveness, Vietnamese commercial banks need to know their position, equip themselves with a certain knowledge of integrationand assess their competitiveness based on the criteria mentioned. At the same time,identifying clearly the opportunities and challenges of integration that are intertwined will

help regulators, businesses, researchers, policymakers be active, cautious and confident in enhancing the competitiveness of organizations, enterprises, banks and countries in the international market.

EVALUATING THE DEVELOPMENT LEVEL FOR VIETNAMESE RETAIL SYSTEM IN THE CONTEXT OF GLOBALIZATION

Nguyen Huu Tan¹ - Nguyen Thu Thuong² - Nguyen Thi Lien³

ABSTRACT: Internationalization and its development effects have been typical trends on the global retail market in the past few years. The trade development, trade revolution and changes in marketing channel have influenced the expansion of large, global retail systems. These systems enter the markets of developing countries and change their structure and the manner of doing business. The retail system plays an important role in the development of the national economy during the integration period. At present, there is almost no measurement of the overall development level of the national retail system. The article will study the criteria to evaluate the development level of a retail system in the context of globalization. Based on the establishing criteria, the article will evaluate the development level for Vietnam's retail system in the international integration. From the analysis of the current situation, the paper proposes some policy recommendations for Vietnamese retailers to develop their retail system in the international integration.

Keywords: retail system; globalization; international integration

1. INTRODUCTION

After more 30 years of implementing the renovation policy, Vietnam has been deeply integrating into the international economy. Vietnam has achieved many important achievements in developing a socialist-oriented market economy in general and retail system in particular. For many years, Vietnamese retail market is in the Top 10 of the most attractive retail markets in the world. Vietnam's retail system is growing rapidly, combining both traditional and modern sectors with the participation of many other economic sectors.

However, besides the achievements, Vietnam's retail market still has many shortcomings. The establishment and development of the Vietnamese retail system takes place spontaneously for a long time, lacking planning and management. This has caused many conflicts and the instability of the market. The retail system shows many limitations, including small scale, weak purchasing power, low efficiency, dominance of traditional retail (76%), and minority of modern retail (24%). The distribution is not effective; goods are supplied with poor quality, unhealthy and unsafe for consumers. There are so many intermediaries that leads to the fact that selling price is higher than the actual value. This causes major shortcomings in the retail system, badly affecting production and social life.

In addition, becoming a member of the World Trade Organization (WTO), signing AFTA with strategic partner countries, participating in CPTPP negotiations have given Vietnam not only many opportunities, but also big challenges for Vietnamese retail system. Therefore, it is necessary to have criteria to evaluate the development level of a retail system in the context of globalization.

2. LITERATURE REVIEW

2.1. Theory of retail system development

Development is the process in which someone or something grows or changes and becomes more advanced. Therefore, the process of development of a thing, a phenomenon is often associated with the change in the direction towards the better, more complete and higher level. Therefore, the development is often seen as a process of change in both quantity and quality. It is a close combination of the completing process of the internal elements of things.

Retailing is the activities involved in the selling of goods to ultimate consumers for personal or household consumption. The retail system is understood to be a collection of organized components with structural and functional links to achieve target goals. Therefore, the implications of retail system development in the international integration include the growth of the retail system, the change of structure and the increase in quality.

Accordingly, development of the retail system is considered as a process of changing both quantity and quality of the system. In terms of quantity of development, it contains an increase in size and growth of the retail system. In terms of the change of quality, it includes changes in the internal structure of the retail system.

However, all the qualitative and quantitative changes in the retail system of each country need to be put in the context of globalization and development trends in the retail sector. Consequently, the retail system will develop sustainably in the current economic environment.

2.2. Criteria for evaluating the development of the retail system in the context of globalization

Based on the references about the evaluation methods of retail system's development and knowledge about the contents of developing retail systems in the international integration, the article has reviewed the retail system's development in focusing on the specific criteria as follows:

First, the scale and growth of the retail system. A retail system is considered to grow when its market scale is large enough and its growth rate is regular. To assess the increase of market scale, we use the growth of total retail sales of goods, services and consumption at actual price. And total retail sales of goods and services often depend on different factors such as population, economic growth rate, average income, participation of domestic economic sectors and foreign investment.

Second, the transformation and development of retail and the relationship between the traditional retail types and the modern retail types. When a nation's retail system integrates deeper into the world economy, the retail system has to move and develop to keep up with the general trend of the world. So, it is easy to notice that in the period of integration, the modern retail types are becoming more and more dominant in a nation's retail system.

Third, the network of retail systems. To help the retail system grow, the national retail system needs a rapid increase in retail network. The increase includes quantity, scale and the wide, equal distribution, minimal gap in development level in the network of retail systems. The retail network which is considered through the distribution of retail chains includes markets, trade centers, supermarkets, and retail stores... in provinces of the country.

Fourth, the retailer's competitiveness in the retail system. The retail enterprises' competitiveness plays an important role in improving the retail system's development. To evaluating retailer's competitiveness, we need to use some factors such as number of retail business, capital, ability to raise capital, business scale and quality of human resources, etc.

Fifth, the infrastructure development of the retail system, logistics and logistics distribution in the retail system. It is necessary to have an advanced and modern technical infrastructure system to improve rapidly the process of supplying retail goods from manufacturers to consumers at all stages of transportation, preservation, packaging and storage.

3. RESEARCH RESULTS

3.1. The development status of Vietnam retail system in the period of international economic integration

3.1.1. The scale and growth of the retail system

Vietnam accelerates the process of integration, participates in the World Trade Organization and signs AFTA agreement with ASEAN countries. Since then, Vietnam retail has made strong changes, always ranked high in the global retail development index (GRDI) and become one of the most attractive retail markets for foreign investors. From 2007 to present, total retail sale of goods and services is always growing at a high level, the scale of the retail system is expanding, contributing 15-16% for GDP.

Table 1. Scale and growth rate of total retail sales of consumer goods and services in the period 2007 – 2017

| Year | Total retail sales (VND billion) | Speed increase (%) | Consumer price index (%) | Real Retail Growth (%) |
|------|-------------------------------------|--------------------|--------------------------------|---------------------------|
| 2007 | 746.159 | 24,0 | 12,63 | 11,37 |
| 2008 | 1.007.213 | 36,0 | 19,89 | 16,11 |
| 2009 | 1.238.145 | 26,0 | 6,52 | 19,48 |
| 2010 | 1.677.354 | 24,0 | 11,75 | 12,25 |
| 2011 | 2.079.523 | 22,5 | 18,13 | 4,4 |
| 2012 | 2.369.131 | 13,3 | 6,81 | 6,5 |
| 2013 | 2.668.753 | 12,6 | 7,0 | 5,6 |
| 2014 | 2.970.300 | 10,6 | 4,3 | 6,3 |
| 2015 | 3.242.900 | 9,5 | 1,0 | 8,5 |
| 2016 | 3.527.400 | 10,2 | 2,4 | 7,8 |
| 2017 | 3.912.000 | 10,9 | 3,53 | 7,37 |

Source: Statistical Yearbook of the year, General Statistics Office

The Table 1 shows that the scale of the retail system has increased over the years. It reached about 3.912.000 VND billions, increased 5 times compared to 2007. Besides, the average annual growth rate of retail sale in the period 1996 - 2001 (after Vietnam joined ASEAN and before the BTA is in force) was 13.25%/year, it was 18,25%/year in the period 2002 (after the BTA is in force).

Hence, integration has contributed to promote Vietnam's retail system development. However, the average growth rate of the retail system decreased from 2011 to 2016, it was 6,5%/year. After integrating into the world economy, Vietnam's retail system has grown but growth rate is not as high as we expected. This proves the unstable growth of Vietnam's retail system in this period.

3.1.2. Retail types in the Vietnam retail system

Traditional retail types: Vietnam retail system is established and developed with both traditional elements and modern elements, between big production and small production. However, traditional retail system (traditional market, store, moving sale) is more dominant, accounting for 76% of the

entire retail system in Vietnam. Vietnam is a developing country with a not very high living standard. Thus, the traditional retail types are suitable for their low income level. Vietnam has more 8.600 traditional markets. They are concentrated in the Red River Delta (1.843 markets), the North Central and Central Coast (2.488 markets), the Mekong Delta (1.751 markets). Vietnam has over 2 million stores in the form of traditional stores, they appear from the urban districts to the suburbs. The stores scales are small, they are located near crowded areas. Their proportion is 38 – 40% of total retail sales of goods and services.

Civilized and modern retail types: When Vietnam integrates into the world and the regional economy, the retail has been modernized constantly to be able to adapt to the global modern retail trend. The modern retail types are trade centers, supermarkets, convenience stores, specialized stores, E-commerce. According to statistics, the number of new supermarkets increased about 20% in the period from 2008 to 2017. The number of new trade centers increased about 72%. Thousands of modern stores are located widely throughout the country. Modern retail market share accounts for about 24% of total retail sales, it increases 2 times compared to the time before Vietnam joined WTO. This shows that there is a big transformation in the type of retail organization in the direction from the tradition trade to modern trade.

Table 2. Number of supermarkets and trade centers for the period 2008-2015

| Year | Total number of supermarkets and trade centers | Number of trade centers | Number of supermarkets |
|------|--|-------------------------|------------------------|
| 2008 | 458 | 72 | 386 |
| 2009 | 563 | 85 | 451 |
| 2010 | 672 | 101 | 571 |
| 2011 | 754 | 116 | 638 |
| 2012 | 774 | 115 | 659 |
| 2013 | 854 | 130 | 724 |
| 2014 | 902 | 139 | 762 |
| 2015 | 973 | 174 | 799 |

Source: Statistical Yearbook of the year, General Statistics Office

Although these modern and civilized retail types has just developed for 10 years, it has confirmed its position in the entire retail trade of the country. Its share is over 24% in the retail system, but it contributes to over 45% of the total of goods retail sales. Consumers highly appreciate the products with features of quality, safety, style, design and packaging products which are bought in the modern retail types.

Table 3. Evaluating the quality, safety and design of goods in supermarkets and trade centers

| Type | Evaluating the quality, safety | | | | Evaluating the design, packaging | | | |
|--------------|--------------------------------|-------------|--------|-----|----------------------------------|------------------|--------|-----|
| | Good | Medium good | Medium | Bad | Beautiful | Medium beautiful | Medium | Bad |
| Supermarket | 42% | 49% | 9% | 0% | 57% | 34% | 9% | 1% |
| Trade center | 47% | 47% | 6% | 0% | 62% | 30% | 8% | 0% |

The level of consumer confidence in modern retail is increasing (Table 4). This shows that these retail types are liked more than the traditional retail types in Vietnam.

Table 4. Consumer credit for retail types in the Vietnamese retail system

| Retail types | Very good | Good | Medium | Bad |
|-------------------|-----------|------|--------|-----|
| Supermarket | 58% | 32% | 11% | 0% |
| Modern store | 9% | 73% | 18% | 1% |
| Trade center | 17% | 72% | 11% | 0% |
| Traditional store | 5% | 66% | 28% | 2% |
| Market | 5% | 11% | 75% | 9% |
| Moving sale | 4% | 6% | 50% | 41% |
| E - commerce | 9% | 20% | 62% | 10% |

The growth of modern retail types has significant steps, but the rate of modern retail model in Vietnam remains is at 24%, it is lower than other countries in the region: China (64%), Indonesia (43%), Thailand (46%), and Malaysia (53%).

3.1.3. Network of retail system

The circulation of retail goods is distributed through the network, which includes market, supermarket, trade center and store.

Retail network is distributed through traditional types (the popular type is market). Due to the daily needs of consumption, the traditional types have been built, expanded, upgraded, and distributed relatively in each region and locality. They meet consumer's needs well in the country.

Table 5. Number of markets by province in the period 2008 - 2015

| Year | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 |
|--|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|
| Total | 7.871 | 8.495 | 8.528 | 8.550 | 8.547 | 8546 | 8568 | 8660 |
| Red river delta | 1.717 | 1.745 | 1.771 | 1.782 | 1.798 | 1.815 | 1.823 | 1.843 |
| Northern Midlands and Mountains | 1.236 | 1.393 | 1.404 | 1.423 | 1.407 | 1.429 | 1.442 | 1.439 |
| North Central and Coast | 2.325 | 2.475 | 2.462 | 2.427 | 2.457 | 2.466 | 2.482 | 2.488 |
| Highlands | 345 | 352 | 356 | 370 | 368 | 362 | 369 | 378 |
| South East | 572 | 763 | 756 | 766 | 778 | 748 | 744 | 761 |
| Mekong Delta | 1.676 | 1.767 | 1.779 | 1.782 | 1.739 | 1.726 | 1.708 | 1.751 |

Source: Statistical Yearbook through the years, General Statistics Office

However, the rate of the distribution types is not suitable in local areas. For example, markets are concentrated mainly in the crowded areas: Red river delta is 22% in 2015 but South East is 9%.

Retail distribution network through trade centers, supermarket. This distribution network is more and more popular in Vietnam. It becomes an efficient distribution network and brings much revenue for investors. It satisfies the consumer's demand for modern shopping which is increasing rapidly in Vietnam.

Table 6. Number of trade centers and supermarkets at provinces in 2008 - 2015

| Area | Supermarket | | | | | | Trade center | | | | | |
|-----------------|-------------|------|------|------|------|------|--------------|------|------|------|------|------|
| | 2005 | 2009 | 2010 | 2012 | 2014 | 2015 | 2005 | 2009 | 2010 | 2012 | 2014 | 2015 |
| Total | 385 | 451 | 571 | 659 | 762 | 799 | 72 | 85 | 101 | 115 | 139 | 174 |
| Red river delta | 107 | 138 | 148 | 171 | 201 | 235 | 24 | 26 | 33 | 36 | 40 | 60 |

| | | | | | | | | | | | | |
|---------------------------------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|
| Northern Midlands and Mountains | 32 | 37 | 60 | 66 | 89 | 78 | 4 | 6 | 9 | 10 | 13 | 16 |
| North Central and Coast | 90 | 98 | 119 | 140 | 172 | 190 | 15 | 16 | 18 | 24 | 23 | 27 |
| Highlands | 17 | 14 | 24 | 25 | 23 | 24 | 0 | 1 | 1 | 1 | 5 | 3 |
| South East | 110 | 123 | 170 | 195 | 210 | 212 | 26 | 31 | 36 | 40 | 52 | 57 |
| Mekong Delta | 29 | 41 | 50 | 62 | 67 | 60 | 3 | 5 | 4 | 4 | 6 | 11 |

Source: Statistical Yearbook through the years, General Statistics Office

Thus this type of distribution is suitable all over the country. They concentrated in 2 big cities (Ha noi and Ho Chi Minh city). 70% of the types are in the cities. And 20% of the types are in other areas, of which 19 provinces only have 1 or 2 supermarkets.

3.1.4. Competitiveness of Vietnamese retail enterprises

Number of retail enterprises. Integration has made the number of retail businesses increase. According to statistics, the number of retail businesses has increased from 18,444 enterprises in 2005 to 34,666 enterprises in 2009 (increase 2 times). Moreover, economic sectors that take part in the retail system are more numerous and diversified. There are 3 groups: domestic distribution companies (state companies and private enterprises), foreign distribution corporations and small household.

Capital and ability to raise capital. According to GSO statistics, capital size of all enterprises is generally low in Vietnam. In 2014, there are about 37.635 retail enterprises. There are 6.570 enterprises (their capital is under 0,5 billion VND, occupied 19%), 7.004 enterprises (their capital is from 0,5 to one billion VND, occupied 20%), 17.656 enterprises (their capital is from 1 to 5 billion VND, occupied 51%), 3.482 enterprises (their capital is from 5 to 10 billion VND, occupied 10%). So many Vietnamese enterprises are small in size.

Quality of human resources in Vietnamese retail businesses. Because most of them have small scale, their employees are often small in number. In addition, the scale of labor is small and organizing parts are unprofessional. A person is both a sourcing and sales staff. This is not specialization in division of labor so organizational capacity and their experience will not be guaranteed.

3.1.5. Economic and technical infrastructure of the retail system

There are about 1.200 enterprises, which provide logistics service in Vietnam. They are concentrated in Ho Chi Minh City and Hanoi. It is possible to classify the logistics industry in Vietnam: transport operators, infrastructure enterprises, warehouse operators, logistics software as enterprises, consultancy, inspection and finance.

Most of these enterprises are of small and medium scale, their capital is about 4-6 billion VND, their labors are unprofessional. These Vietnam enterprises are agents, subcontractors in the logistics transfer for international logistics service providers. There are about 25 multinational logistics enterprises operating in Vietnam, but they occupy 80% share of logistics in Vietnam. So logistics services are fragmented, many intermediaries, lack of technology investment, unprofessional in Vietnam. It does not create value-added chains and it is difficult to be trusted by clients and this also affects retailers when they use logistics services.

3.2. A general assessment of the development level of Vietnam's retail system during the period of international economic integration

Generally, the Vietnam retail system has made remarkable progress in quantity and quality. In terms of quality, there is a significant change in the percentage between traditional and modern retail types, network development, competitiveness of retail enterprises, and possibility of joint venture.

Firstly, Vietnam's retail system increases in both speed and scale over the years. The reason of such results is due to some factors such as Vietnam is one of the most populous countries with a large consumer market, Vietnam has high economic growth rate that makes the market size is expanded, average income increases, the expansion of Vietnam retail system shows that the retail system is playing an important role in the economy.

Secondly, Vietnam's retail system is modernized towards modern and civilization trend so that it can adapt to the general retail trend of the world. The retail structure has changed considerably: in the past, share of traditional retail was 100%, but now share of modern retail type is 24% of total retail sales. There are significant changes in the type of retail organization, which moves from traditional types to modern types.

Thirdly, the competitiveness of retail businesses has improved significantly. Due to market requirements, Vietnamese retail businesses are expanding constantly and improve competitiveness in the retail system. In general, the workforce has been trained gradually in marketing skills, communication, customer care, business management qualifications. The mode of business management is developing towards the direction of civilization, modern and professional.

Fourth, technical infrastructure and commercial infrastructure are invested, strengthened and upgraded gradually. Beside of direct sale, retailers also use the form of television sales and online sales.

Fifth, the Vietnam's retail network has expanded tradition distribution types (market, store, moving sale, etc.) and modern distribution types (supermarket, commercial center, modern store, etc.). This met consumption demand and use goods of consumer.

So after integrating into the world economy, the Vietnam's retail system has made a big progress with civilization and modernity trend. Now, Vietnam's retail system is making great changes: retail scale is increasing, goods is more various, price is more competitive, the business environment is clearer, system retail's distribution is growing stronger with the links between domestic and abroad, the mode of organizing and managing the business are modern and civilization trend.

In addition to the achievements, the development process of Vietnam retail system still has limitations and weaknesses:

- The size and speed of retail growth is fast but not stable. The scale of the retail system is smaller than that of other countries in the region and in the world.

- The structure of the retail type is still the traditional retail types, modern retail types are only a small part (24%). Retail types develop spontaneously; they are not organized into a system and placed under the control of State. The retail system develops disorderly, the laws and interests of consumers are not respected, and the advantages of retailing are not promoted. The fact that consumers for their quality, design, value modern retailers highly and sales services, but they have a small market share in the retail system and consumers go to shopping in here less than in traditional market.

- Commodity prices are unstable, lack transparency and the quality of the goods supply is not guaranteed, this affects seriously consumer confidence.

- The retail network is distributed unreasonably. There are big differences between regions, between urban and rural areas. There is a difference in the level of development.

- The competitiveness of Vietnamese retailers is still limited. At present, most of the enterprises are of small scale, lack of capital, backward management level. And the method of business is not advanced. Business strategy is not paid attention properly.

- The technical infrastructure of the retail system is limited. It lacks uniformity and does not meet regional and international standards. This has bad effects on the retail system's development in the period of integration.

4. CONCLUSIONS AND RECOMMENDATIONS

The findings show that in the period of international integration (2005 – 2017), Vietnam's retail system has developed significantly in quality and quantity but there are still many shortcomings and weaknesses that need to be improved. The causes of this condition are:

- The management and administration of the government for the retail system is still weak and inadequate. The state does not have appropriate strategies for the development of retail distribution systems, appropriate policies to encourage the development of modern retail, suitable policies on price management, food hygiene and safety. The commercial infrastructure is backward, high quality human resources are insufficient.

- Retail businesses have some limitations such as: Vietnam's retail business is still confused in improving competitiveness (capital, technical level, staff and facilities); the link between domestic enterprises is weak so it is difficult to compete with foreign enterprises.

To develop the retail system sustainably in the process of international economic integration, we should do:

- To review the legal system and create a more favorable environment for the development of Vietnam's retail system. Vietnam must change the legal documents in accordance with WTO's rules to create transparency and a favorable business environment.

- To strengthen the organization and management of the retail system: Improve the quality of legal documents, the quality of administrative procedures; decentralize management between the Industry and Commerce Ministry; establish a system for managing goods quality, origin of goods, use duration and quality of food hygiene and safety; Strengthen the implementation of the Law on Consumer Protection.

- Complete the policy system for the development of retail systems to fit to each retail type. At present, the Vietnam's retail system exists in parallel with two types of retail outlets (modern and traditional retail). Both types have advantages and disadvantages. Thus, the government needs to change the policy system to suit each type.

- Develop technical infrastructure and science and technology infrastructure for the development of the retail system. This is one of the reasons that hindered the development of the Vietnamese retail system. Weak infrastructure in technology and science leads to difficulties in good source and reaching consumers.

- Strengthen the ability of joint ventures, links between Vietnam's retail enterprises. In the period of international integration, Vietnamese retailers should face the loss of protection from the state, accept the equal competition with the world's leading retailers in the local market. The ability of joint ventures is, therefore, one of the most important factors to develop.

TRANSFORMING THE ECONOMIC GROWTH MODEL – SUSTAINABLE DEVELOPMENT

Nghiem Thi Tha*

ABSTRACT: *Achieving sustainable development is currently the millennium goal of most countries, organizations, and agencies. In Vietnam, sustainable development is one of the basic parts in reforming the economic growth model. This study aims to examine the concept of sustainable development, to provide a preliminary assessment of the current situation and to propose solutions for fostering sustainable economic development in Vietnam.*

Keywords: *Sustainable development, economic growth, social value*

1. INTRODUCTION

The objective of sustainable development, formulated and developed from the realities of the social and economic life, is of critical importance in this millennium. Studies and understanding of sustainable development are rooted in the increasingly extreme phenomena of nature and society, which results in ever-increasing losses to every subject of society, a problem which no single individual, organization, country, or region can overcome unilaterally. In 1992, the United Nations Environment and Development Summit held in Rio de Janeiro set out the Global Agenda for the 21st Century, in which sustainable development was defined as “A development that satisfies the needs of the present generation without compromising the ability to meet the needs of future generations.” In paragraph 4, Article 3 of the Vietnam’s Law on Environmental Protection, sustainable development is defined as: “Sustainable development is development that meets the needs of the present generation without compromising the ability to meet the needs of future generations on the basis of closely combining and harmonizing economic growth and ensuring social progress and environmental protection.” (Vietnamese National Assembly, 2014). This is a broad definition, highlighting the most important requirements and objectives of sustainable development, in accordance with the conditions and situation in Vietnam. Accordingly, sustainable development requires the cooperation of all members of the global community on the basis of continuous development of a “tripod” – which stands for an economy with sustainable growth; a prosperous, equitable, stable and culturally diverse society; an ecologically balanced environment, where resources are sustainably extracted and generated. The basic content of sustainable development can be summarized as follows:

1.1. The nucleus of sustainable development must be economic development.

Nations cannot develop and become civilized if their economy does not flourish. Economic development is the foundation for social development. There are many models of economic development; however, sustainable economic development should be based on the model of circular economy. The circular economy is a model of development of a closed economy which guarantees that every member of every generation has the opportunity and is encouraged to understand and extract natural resources; as well

* Academy of Finance, Hanoi 100000, Vietnam, Nghiem Thi Tha, Tell: +84 912211669. Email: nghiemhvte@gmail.com

as has the right to use natural resources for economic activities in an effective, equal, responsible manner. The focus here is on creating common prosperity for everyone, on ensuring the redefinition and balance of the natural ecosystem, without infringing upon fundamental human rights of every generation.

Criteria used for assessing sustainable economic development are: increased energy savings and renewable resources in business establishments by increasing the use of new technologies, raw materials replace; adjusting lifestyle and orienting consumer demand to preserve biodiversity and the environment; ensuring equal access to resources, essential physical conditions, ensuring business operations to reduce emissions, proper treatment of waste before discharging, increasing environmental reuse, etc.

1.2. The foundation of sustainable development is to develop social values

All economic activities are carried out by human beings with the aims towards the development of a humane, modern and civilized society, a society for human and human rights are thus increasingly respected; therefore, the promotion of social values, which form the roots and the motivation for sustainable development, is indispensable. The social values - the root of sustainable development is the human element - the resource of all natural resources. With their wisdom, people discover, master nature and will definitely know to live with nature. For development, substantiate needs must be met in areas such as: food, clothing, shelter, transportation, clean water, electricity, medical care, education and legal counseling to survive; and while on the path of development, all nations will experience and be educated to realize that human discovered the world, and they can also develop or destroy the world. Therefore, sustainable development, from a social point of view, should focus on equality, creating a favorable environment for all people to have the opportunity to develop their potential and have better living conditions, good cultural values must be maintained and developed for the future generations. Sustainable social development should focus on the following criteria: improving the human development index (HDI), improving per capita income, increasing the percentage of population having access to basic services, rural development to reduce the pressure of urban migration; raising the rate of education; restoring and developing traditional cultural values and fostering cultural diversity; increasing the proportion of women participating in social work, ensuring gender equality, paying attention to gender needs and interests; encouraging public participation in decision-making processes by means of publicity, transparency and community culture development.

1.3. The acts to balance the ecological environment, preserve and develop biodiversity, ensure environmental safety would help protect the development values

While the process of economic development with four technological revolutions as well as the processes of industrialization, modernization, urbanization, etc. bring prosperity to many countries and economic zones, they also destroy the environment, exterminate many species of animals and cause serious ecological imbalance simultaneously. Nowadays no country is excepted from the extreme phenomena caused by natural ecological imbalance. Therefore, whether the results of social and economic development could be preserved and maintained completely depends on what human being has done and will do with the natural environment. Sustainable development of the environment requires that we maintain and control the balance between securing or enhancing the natural environment with the extraction and use of natural resources for the benefit of human beings. The restriction of natural resources extraction at a certain limit, through a process with environmental recycling and cleanup, together with the controlling of emission, waste disposal and discharge in all forms of solid, air, liquid to the environment, etc. all must ensure the standard living conditions for humans and living creatures on the earth at present and in the future. Only when humans preserve the balance of nature will the values of development be sustained.

Sustainable development of the environment should focus on the implementation of the following criteria: first, to use resources efficiently, especially non-renewable resources; second, not to exceed the load-bearing threshold of the ecosystem; third, to protect biodiversity and the ozone layer; fourth, to control and mitigate greenhouse gas emissions; fifth, to strictly protect the sensitive ecosystems; sixth, to minimize and control waste discharge, to remedy pollution (water, gas, soil, food), to improve and restore the environment pollution areas, etc.

2. RENOVATING THE GROWTH MODEL TO ACHIEVE THE GOAL OF SUSTAINABLE DEVELOPMENT IN VIETNAM

On the basis of the United Nations Millennium Development Goals (MDGs), in Viet Nam, the Socio-Economic Development Strategy 2011-2020 identifies three breakthroughs to restructure the economy and re-orient the economic growth model towards sustainable development. The goals are to operate an effective economy, coupled with social progress and equality; to protect natural resources and the environment, to maintain political and social stability; to firmly defend the independence, sovereignty and national and territorial integrity. After nearly eight years of implementing this strategy, the results and some solutions to transform the model of growth and achieve sustainable development in Vietnam focus on the three following pillars:

2.1. Economic development:

In the period of 2011-2015, the estimated average growth rate of the economy was 5.91%, which was lower than that of the 2006-2010 period (6.32%), thus failing to reach the target of 6.5-7%. From 2016 until now, the growth rate has remained stagnant at 6.7%. There are two main reasons for the failure to achieve targeted economic growth in the period 2011-2015: the negative impact of the previous global economic crisis and financial downturn, while national reforms have not yielded many results and the internal weaknesses of the economy have not been fully overcome.

Table 1. Economic growth in five-year periods, compared with the preceded period, calculated in percentage

| | 2001-2005 | 2006 – 2010 | 2011 - 2016 |
|-----------------------------------|-----------|-------------|-------------|
| Overall growth | 6.9 | 6.32 | 5.91 |
| Agriculture, fishery and forestry | 3.9 | 3.53 | 3.05 |
| Industry and construction | 8.7 | 6.38 | 6.92 |
| Services | 7.0 | 7.64 | 6.32 |

Source: IMF World Economic Outlook (WEO) Update, July 2017: A Firming Recovery (IMF, 2017)

The growth rate of countries such as Myanmar, Cambodia, the Philippines and Laos has been consistently higher than that of Vietnam over the same period. The growth rate of Indonesia in 2012 also declined like Vietnam, although the decrease was smaller (Indonesia's growth was 6.03% in 2012, 0.2 percentage points higher than that of 2011, while Vietnam's growth dropped by around 1 percentage point over the same period). Over recent years (2014-2015), Vietnam's economic growth has gradually improved, but its growth is still lower than that of Cambodia, Laos and the Philippines.

Vietnam's economy is still in a state of low-quality growth, according to the statistics released by the General Statistics Office in 2015: the industry and construction sector regained high growth momentum thanks to the policies that support and remove difficulties for the production sector, as well as the improvement of aggregate demand. The industry and construction sector in 2015 reached 9.64% over the same period and became the leading area for growth of the economy, however, the service sector growth has slowed down, particularly in the agricultural, forestry and fishery sector, showing signs of steady decline in the period 2011-2013. The figure dropped from 4.02% in 2011 to 2.64 % in 2013, then slightly improved in 2014; however, the downward trend returned in 2015.

It is estimated that in the period 2011-2015, the growth rate of agriculture, forestry and fishery is about 3.05%, lower than the rate of 3.53% in the period of 2006-2010. The contribution of the total factor productivity (TFP) to growth is still limited, and the (Incremental Capital - Output Ratio) ICOR is high. The national competitiveness has not improved much, especially in terms of economic institutions, infrastructure and technological innovation.

The objectives of renewing the growth model: In the period from 2016 until 2020 with the national start-up strategy, step by step raising the quality of growth, implementing green growth, developing clean energy and renewable energy; practicing sustainable production and consumption; ensuring food security, achieving agricultural and rural development in a closed loop with the supply and production chain through four linkages: the producers, the scientists, the businesses and the state. The average annual economic growth rate is 6.5 - 7% per year. By 2020: GDP per capita reaches about USD 3,200 - 3,500. The proportion of industry and services in GDP is over 85%. The average annual investment capital on the society accounts for 32-34% of GDP. State budget overspending shall not exceed 4% of GDP. Total factor productivity (TFP) contributes to 25-30% of the growth. Average labor productivity increased by 4-5% per year. Energy consumption per GDP is reduced by 1 - 1.5% per year. The rate of urbanization will reach 38-40% by 2020. Inflation remains below 5%.

The solution to achieving the goal of economic development is to restructure the economy in three pillars: public administration reform, state enterprise restructuring and financial market restructuring. The reform of the national bureaucracy in all aspects of institutions, organizational structure, administrative procedures and public finance associated with a rational, efficient hierarchical system, improving the quality of governance public. The relationship between the State and the market needs to be changed from the State which runs the economy to the State which creates and develops and fulfils following duties: withdrawing state capital from the enterprises, creating a healthy competitive environment, monitoring and detecting economic imbalances or signs of risk in all economic sectors, providing solutions to macroeconomic stability and system security, focusing on improving social security and social welfare, ensuring that all people enjoy growth.

2.2. Social development

Current situation: In parallel with economic growth, in recent years, Vietnam has also strengthened its investment in social development, investment in the development of education has made some progress, the state budget for education and training reached up to 20% of total budget expenditures; by 2011, all provinces and cities have reached secondary school education standards. Job creation achieved positive results: in 6 years (2006 - 2011), more than 9 million workers were employed. In 2012, the government created jobs for more than 1.5 million people; and it strived to create jobs for 1.6 million people by 2013; recruiting new vocational training for 1.9 million people; Implementing vocational training strategies linked to job creation. In 2012, the unemployment rate in urban areas was 3.53%, in rural areas was 1.55%. Poverty reduction has made progress, the percentage of poor households has decreased to 9.6% and by the end of 2013 it is estimated to be 7.6%. Gender equality policies and program to support women and girls are widely implemented through women's unions, youth unions ... at all levels. In 2012, Vietnam ranks 127 out of 187 countries and territories in terms of HDI and is classified as a country with high HDI. Vietnam fulfills 6/8 MDGs goal groups set by the United Nations for developing countries by 2015. There are many well-implemented social welfare policies; by 2014 there were 1.4 million people joining social insurances, over 8.5 million joining unemployed insurance, over 72% of the population was covered by health insurance. People's living standard has been improved. Per capita income reached USD 2,052 per person (2014). Life expectancy is 73.5 years (2015). Many millennium goals have been completed.

Social development objectives: In the coming years, Vietnam will focus on promoting sustainable poverty reduction; create sustainable jobs; The percentage of poor households decreases by 2% per year on average, and by over 4% per year in poor districts in particular. The percentage of agricultural workers in the labour force is about 35-40% (2020). The percentage of trained laborers is about 65-70%, of which 25 - 26% obtains diplomas and certificates. The unemployment rate in urban areas is below 4%. The target is to have 10 doctors and over 26 beds per ten thousand people. The health insurance coverage reaches over 80% of the population. The rate of poor households decreases by 1.3-1.5% per year on average. By 2020, there will be no poor households with earning less than \$2 per day.

Solutions: Stabilizing the scale, improving and enhancing the population quality; developing the culture in harmony with economic development, family building and development in Vietnam; sustainable urban development, new rural construction, rational distribution of population and labor by region. Particularly, the government should focus on raising the quality of education and training, shifting the direction of elite university training to practical university training, raising the people's intellectual level and professional qualifications to meet the requirements for developing country, region and locality; rapidly developing human resources, especially high-quality human resources; closely associating human resource development with the development and application of science and technology. This is a breakthrough of the source, the most important stage to increase the strength of the nation and create synergy, it has a decisive influence on the development of society, creating a sustainable root for sustainable development strategy. The emphasis in this breakthrough is to place the development of human resources, especially high quality human resources in coherence with the development and application of science and technology. This is to ensure the transfer of intellectual potential of human resources into the results of application and creation of science and technology - the key force of rapid and sustainable development. In addition, there should be activities to strengthen the conservation and development of cultural values. Solutions to these problems include:

- Promote information dissemination, education and provide guidance in accordance with moral standards (or criteria), cultural behavioral habits suitable for employment and social status as well as the habit of taking care of life culture, first of all among the leaders and managers at all levels; and continue to implement appropriate remuneration policies for professional thinkers and cultural professionals, through which foster the way of thinking, way of developing culture and educating on the basis of well-educated personality and lifestyle.

- It is necessary to formulate and orient the public opinion to care for and to respect the civilized lifestyle, cultured families, to honor academics, artisans, people with meritorious deeds, kind people, and to spread such influence and attract individuals to participate in cultural activities, education for the community, to attract all members of society to express attitudes and opinions on social issues, to encourage people to participate in or create cultural or educational activities. On the basis of that, it creates more resources and more importantly, builds an environment that honors culture; it contributes to adjusting the process of cultural development aiming at development and equity.

2.4. Protecting and ensuring the balance of the ecological environment

Current situation: More attention has been turned to the environmental issue in 2011 - 2015, 55% of urban population, 40% of rural population have access to clean, hygienic water while 40 - 45% of harmful wastes and 75 - 80% of medical waste are treated. The forest coverage rate is 30-40%. With rational policies, drastic measures, the protection of the living environment and the fight against pollution of water sources and air were supported and joined by the authorities from the central level to localities, all the sectors and people of all strata. The case of discovering and handling the FOMOSA problem is an example, etc. Forest fire and deforestation was reduced thanks to the increasing works of reforestation and forest protection. There were many programs on the efficient and sustainable use of land resources; protection of the water environment and sustainable use of water resources and mineral resources; protect the marine, coastal and island environment and the development of marine resources; forest protection and development; reduce air pollution and noise in big cities and industrial parks.

Objectives to achieved until 2020 and vision to fulfil until 2030: To achieve the goals of providing access to clean water to 95% of the urban population by 2020, 90% of the rural population, ensuring treatment of 80-85% of harmful wastes and 95 - 100% of medical wastes. The forest coverage rate reaches 44 - 45%. Other goals include substantially reducing the sources of environmental pollution; overcoming, improving the environment of polluted and degraded areas; improving the living conditions of the people; mitigating the degradation and depletion of natural resources; controlling the rate of biodiversity declination; strengthening the ability to actively respond to climate change, mitigating the increase of greenhouse gas emissions. There is also the needs to prevent and reduce the trend of increasing environmental pollution, resource depletion and biodiversity loss; improve habitat quality; actively respond to climate change; establish basic conditions for agreen economy, low waste, low carbon for the prosperity and sustainable development of the country.

Solutions: Preventing and controlling sources of environmental pollution: not to generate new polluting establishments, promoting economic restructuring in the direction of benefiting eco-friendly industries, reducing sources currently polluting the environment; basically solving environmental problems in industrial parks, river basins, craft villages and rural environmental sanitation; assuring the safety of chemicals, radiation and nuclear safety; raising the ratio of urban centers, industrial clusters and processing

zones with concentrated waste water treatment systems to meet the requirements; reducing the impact on the environment from mining; raising the rate of solid waste to be collected, recycled and reused; reducing the production and use of biodegradable bags and packages; cleaning up and restoring the environment of the polluted and degraded areas; promoting clean water supply and sanitation services; restoring lakes, ponds, canals and dike sections which have been polluted and degraded in urban centers and population quarters; treating and restoring contaminated land with dioxin residues, chemicals, pesticides and other pollutants; improving the quality of air environment in urban centers and population quarters; improving the environmental sanitation in urban and rural areas; extracting and using the natural resources; nature preservation and biodiversity effectively and sustainably; improving the law, institutional management, strengthening the capacity to enforce the law on environmental protection; strengthening and diversifying investment in environmental protection; promoting integration and strengthening international cooperation on environmental protection

HANDLING WEAK BANKS: VIEWING FROM BANKING CRISES IN UNITED STATE, JAPAN AND POLICY RECOMMENDATIONS FOR VIETNAM

Tran Thi Viet Thach*

ABSTRACT: This study focuses on analyzing solutions for weak banks in United State (US) and Japan during the banking crises. Especially, the study clarifies the process of resolving difficulties and challenges during implementation period. Moreover, it aims at deriving experiences from US, Japan and suggesting policies for Vietnam authorities to improve effectively handling Vietnamese weak banks from now to the year 2020. To ensure that, the goals of resolving bad banks in Vietnam under Scheme for restructuring system of credit institutions associated with settlement of bad debts in the period of 2016-2020 will be properly accomplished and that may leads Vietnamese banking system operate in soundness, safety and stability in the years to come.

Keywords: bank failures; failed banks; resolving failed banks; restructuring commercial banks; experiences of resolving failed banks.

1. INTRODUCTION

The health of banking system plays a vital factor for stability and development of the economy. The operations of banks are very vulnerable and always face with risk. The inefficiency of bank's governance or changes of business environments lead to difficulties, weaknesses or failures in bank's operations. When one bank weaken or fail, it can lead to weaknesses or failures of other banks and quickly spread in chain reaction throughout the economy. Risk occurred at a bank has a multiplier effect on all banks, financial institutions and economy. So that, the timely identification and effective resolution of weak banks are always seriously concerned in economies all over the world.

The term "weak bank" can be defined in different ways. According to Bank for International Settlement (BIS)[5]: *A weak bank is one whose liquidity or solvency is or will soon be impaired unless there is a major improvement in its financial resources, risk profile, business model, risk management systems and controls and/or quality of governance and management in a timely manner.*

A bank is considered the weak bank when it is illiquidity or insolvency and threatened with failures. There are different causes for the weakness of banks, it may form internal side (weak corporate governance, ineffective risk management...) or external side (fluctuating business environment, changing legal framework...). If the weakness of the bank is not identified and solved timely, it is in risk of failing. As a result, weak banks become worse and negatively impact on other banks and economy. So that, handling weak banks are very essential, it helps to maintain stability and confidence in the financial system, reduce systemic risk and ensure that banking system operate in soundness and stability.

* Add:Academy of Finance, No.58 Le Van Hien St., Duc Thang Wrd., Bac Tu Liem Dist.,Hanoi, Vietnam; City and Postcode:Hanoi,(+084); Country:Vietnam, Corresponding author. Tel.: +84984.04.1977, E-mail address: tranvietthach@gmail.com

However, handling weak banks are complicated, it depend on many factors such as legal framework, financial sources, characteristics of banking system. In 2002, based on the experiences and circumstances of various countries, Basel Committee on Banking Supervision (BCBS) released “International Supervisory Guidance for Dealing with weak banks”. In 2015, BCBS published “Guidelines for identifying and dealing with weak banks” that revised and updated the 2002 publication. The revised guidelines offered principles of identifying and dealing with weak banks, supervisory preconditions for dealing with weak banks, techniques for supervisors to identify problems, tools for dealing with failing or failed banks.

According to the BCBS’s guidance, supervisor should use appropriate tools to early identify weak banks, act promptly and intervene at an early stage. If supervisors find out serious weakness of banks (there is an immediate and significant threat of illiquidity or insolvency), supervisors and authorities should immediately act through a variety of tools for dealing with weak banks

Although BCBS’s guidance is considered as international standards for handling weak banks in general and failed banks in particular. In fact, dealing with weak banks differed from country to country; it depended on characteristics of banking system, legal framework and others in each country. So that, examining the process of handling weak banks of variety countries and drawing lessons from experiences are very necessary for resolving Vietnamese weak banks in the next time.

2. HANDLING WEAK BANKS IN UNITED STATE AND JAPAN DURING THE BANKING CRISES

In United State (US)

US experienced three serious crises: Great Depression of 1929-1933, saving and Loan crisis of 1980s-1990s and financial crisis of 2007-2008 which led to series of banking panics and collapse of several of the large banks. The way that US fixed banking system and overcame crises were valued lessons for handling weak banks in other countries.

Before the period of Great Depression, Federal Reserve (FED) was to address banking problems, act as a lender of the last resort through providing funds to solvent banks experiencing liquidity problems. In the Great Depression, there were a large numbers of banks weaken and failed, FED was not enough power to solve banking problems. In that case, Federal Deposit Insurance Corporation (FDIC) was established in June 1933 as independent legal entity. FDIC had three responsibilities: to act as an insurer, as a supervisor and as a receiver. As an insurer, FDIC protected depositors by guaranteeing timely funding of insured deposit. As an insurer and receiver, FDIC was assigned of resolving banking problems. Experiencing 3 serious crises, the methods of resolving weak banks of FDIC was improved based on changing conditions of US banking system. Before 1950, FDIC had only two options in resolving banks failures: deposit payoffs or Purchase and Assumption transaction (P&A). P&A transaction is a solution that a healthy institution (an acquirer) purchases some or all of the assets and assumes certain liabilities of a failing banks. Deposit payoff is a solution where depositors were paid an amount based on their insured funds and all other liabilities and assets were held by FDIC as receiver. Depending on the types and sizes of the assets and liabilities of failed bank, FDIC used the suitable methods that were the less costly option. Usually, P&A transaction was a preferable option because it was considered the least disruptive to the communities. In case of not finding acquirer, FDIC used the deposit payoff solution.

In 1950, FDIC was added a new option. It was “Open Bank Assistances (OBA)” solution in which FDIC provided an insured banks at risk of failure with financial help to keep it open. However, OBA was allowed to use only if such a bank was determined to be “essential” to provide adequate banking services in

the community. Until mid-to late 1980s, FDIC used OBA in case of maintaining operation of several large bank. After 1989, it was rarely used. The fact indicated that, financial assistances were inefficient, most of assisted banks failed after assistances. In 1992, FDIC prohibited to use OBA under amended FDIC act.

When thrift crisis happened and it had been getting worse during 1980s, The Congress passed the Competitive Equality Banking Act of 1987, FDIC was expanded their power and permitted to establish a temporary bridge bank (TBB) to resolve failing banks (a bridge bank is a full-service national bank chartered by Office of the Comptroller of the Currency and controlled by FDIC). Bridge bank transaction is a P&A transaction in which FDIC acts temporarily as an assuming institution. Under controlling by the FDIC, TBB was designed to take over the operations of failing banks and maintain banking services for the customers until a buyer can be found for its operations. So it is a very useful solution for large failing banks with complicated financial structures because it provides the time needed to arrange a permanent transaction. However, FDIC used TBB only if TBB solution is less costly than payoff solution.

The P&A transaction of FDIC has changed over time, its design depending on changing market conditions and others which could impact on acquirers' interests. In early P&As, acquirers assumed all of failed bank's deposit liabilities, (including uninsured funds), certain secured liabilities and purchased a limited amount of "clean" assets. So FDIC must be held risky assets. When amount of assets it received too big, it tried to transfer as much as possible to acquirers by using a "put" option in which FDIC encouraged acquirers to buy more assets and allowed them put back to FDIC those assets they didn't want to keep in a certain period. Using "put" option made FDIC face to several problems when acquirers chose to keep assets only they had a little risk. So this tool stopped using in the end 1991. In order to induce acquirers to keep assets, FDIC used another tool that prioritized to bidders who proposed the largest number of assets. Those tools created whole sale P&A transaction which transferred all of a failed bank's assets and liabilities to an acquirer. Whole sale P&A transaction was used popularly in the period of 1988-1991. In the early 1990s, this transaction became inefficient when FDIC was difficult to find bidders for commercial loans from large failed banks. In that case, FDIC developed P&A transaction with loss sharing in which FDIC agreed to share in future loss experienced by acquirer on certain pools of problem assets.

Using payoff solution, FDIC pay directly to insured depositors of failed banks (straight deposit payoff) or through a healthy institution that act as FDIC's agent (insured deposit transfer). Uninsured depositors and creditors of failed banks were given receivership certificates entitling them to a share of the net proceeds from sale of failed bank's assets.

In 1980s, FDIC was responsible for weak banks, Federal Savings and Loan Insurance Corporation (FSLIC) was responsible for insuring deposits of Saving & Loan Associations (S&Ls). In 1989, FSLIC was insolvent and closed. Resolution trust Corporation (RTC) established in 9th August, 1989 by Congress as a temporary federal agency which had a mission to resolve S&Ls crisis of the 1980s. Initially, RTC was managed by FDIC and most of the RTC's senior personnel came from FDIC. RTC acted as a conservator and receiver of the insolvent thrifts. As a conservator, RTC controlled the operations of insolvent S&L until the best method for resolution could be determined and implement. As a receiver, RTC acted similar to that of FDIC's, also used deposit payoffs or P&A transaction.

Unlike FDIC, RTC had no internal source of funds; the fund for its operations relied on congressional appropriations and other indirect sources. RTC's operations depended on legislation and congressional approval. So, RTC was often lack of fund, its decisions often delayed and less flexible than that of FDIC. On December 31, 1995, the RTC merged into the FDIC and FDIC was responsible for resolving weak thrifts.

Crisis of 2007-2008 was known as a global financial crisis. It began in August 2007 with subprime mortgage crisis in US and quickly spread throughout the world. US banking system was fell into a serious crisis since 2008 when Lehman Brothers collapsed and other large banks and financial institutions was fell into the same situation. In the case of failing a large number of large banks and other financial institutions, FDIC added the “Systemic Risk Exception (SRE)” tool that allowed FDIC to bypass the least cost method. Under the FDIC Improvement Act of 1991, the exception was used when “the failure of an insured institution would have serious adverse effects on economic conditions or financial stability”. The exception required at least two-thirds of FDIC’s Board of Directors must agree to make a written recommendation to the Secretary of the Treasury and at least two-thirds of Board of Governors of Federal Reserve System must also agree to make the same written recommendation to the Secretary of the Treasury who must first consult with the President. In the crisis of 2008, SRE was used for three US largest banking organizations: Wachovia Corporation, Citigroup and Bank of America Corporation. Applying SRE for Wachovia, It was approved to acquire by Citigroup. But an offer of Wells Fargo was a higher share price than Citigroup’s and without requiring government’s assistance so that FRB approved Wells Fargo to acquire Wachovia in October. After Wells Fargo’s acquisition, Wachovia returned normal operations. In case of Citigroup and Bank of America Corporation, SRE was invokes and Government assistances followed. Assisted banks were monitored by regulators until assistances were refundable.

In order to respond to the crisis and prevent a future banking crisis, Dodd-Frank Wall Street Reform and Consumer Protection Act released in 2010. Under the reforms, big banks were prevented from failing by restricting the size banks; scope of bank activities and requiring higher capital levels. The Dodd-Frank Act also expanded FDIC’s “resolution” authority that allowed it to seize holding companies.

After Dodd-Frank Act effected, failed and problem banks still increased, US Government continued applying policies to solve failed banks in which authorities improved their supervision, applied strict restrictions of banks’ operations, added power for FDIC. Since June 2011, Deposit Insurance Fund balance had turned positive, failed and problem banks had decreased year by year. US banking system gradually recovered.

In Japan

Financial crisis during the 1990s in Japan caused the failures of several of the large banks. Japan witnessed the worst banking crises in its history. Japanese banks underwent a very lengthy process and very costly in order to overcome the crisis.

In the second half of 1980s, the optimistic economic growth, highly overvalued Japanese stock market, increasing non-stop of land prices led to banks expand their credits, including consumer lending, lending to real estate industry and lending to small and medium sized enterprises with underestimating credit standards and principle of credit approval. In early 1990s, the financial crisis erupted after a bubble burst. The crisis led to sharply decreased quantity of loans (especially, loans to real estate industry) and value of collateral because of drastically falling stock and real estate prices. Japanese banks were lack of timely response to deterioration of quantity of loan while their corporate governance was unsound. Finally, most banks were weakened and failed because of not strong enough to cope with the crisis.

In the period 1991 to mid-1994, small-size Japanese banks began failing. But the failed banks was very little impact on other banks and authorities was expected the economy to be recovered soon so that there was not strong authorities’ action to response to current situations. The second half of 1994, banking

crisis became clearer when two credit cooperatives, Tokyo Kyowa and Anzen, collapsed and Cosmo, Kizu followed by August 1995. Authorities recognized that they had to take strong actions to stabilize financial system. In case of Tokyo Kyowa and Anzen, authorities decided not to allow them to fail because they were afraid of negative impacts on other unhealthy financial institutions. But their decision faced with problems: (i) no institution willing to assume the assets and deposits of failed institutions; (2) in order to clean up the balance sheets or cover losses of failed institutions, Deposit Insurance Corporation of Japan (DICJ) had to make financial assistance. Under current regulation, DIC's financial assistance was limited by "payoff cost limit". In the case of Tokyo Kyowa and Anzen, losses exceeded the "payoff cost limit", DIC's fund was not enough. To overcome obstacles, on December 1994 there were policies was created:(1) Bank of Japan (BOJ) and private financial institutions established a new bank with named "Tokyo Kyoudou Bank" to assume the business of two failed institutions; (2) Capital of new bank was created by funding from BOJ and private financial institutions; (3) DICJ provided financial assistance within the payoff cost limit, private financial institutions provided a low-interest loan to support the profitability of new bank.

By this way, the problem of "payoff cost limit" of DIC was tackled and all depositors were able to withdraw their deposits from the new bank.

In case of Kizu and Cosmo credit corporative, the losses was too big to be supported from the private sector, payoff cost limit became a big problem. Requirement of amending Deposit Insurance Law in which increasing payoff cost limit was very necessary.

In case of Jusen (housing loan corporations, almost founded by banks), the losses of jusen companies in 1995-1996 was so big that founder banks were unable to cover. Finally, The Government approved to use taxpayers' for handling. Finally, Jusen's losses was cover by 55% from founder banks, 27% from the lending banks, 8% from agriculture financial institutions and 10% from public funds [1].

In June 1996, Deposit Insurance Law was amended in which payoff cost limit was removed temporarily until March 2001, raised insurance premium from 0,012% to 0,084% [1] and reorganized Tokyo Kyodou Bank into the Resolution and Collection Bank (RCB) which acted as an assuming bank for failed credit institutions. As assuming bank for failed credit institutions, RCB purchased non-performing loan from failed institutions when no private assuming bank could be found.

In 1997, several large financial institutions, including large banks were in danger of bankruptcy. The weakness of banks made depositors to aggressively withdraw their fund from weakened banks so that the Governance had to guarantee the full amount of deposits despite of limited deposit insurance funds. Though, resolution of large banks met obstacles because the bank held a great deal of NPL which could not cover by Deposit Insurance Fund (DIF). The authorities solved banks in different ways. The first case was Nippon Credit Bank, It was survived through being injected fund from BOJ and consortium of related financial institutions. After supported, its performance was not improved and finally, it was nationalized in December 1998. The second was Long-Term Credit Bank of Japan (LTCB). Initially, the authorities sought a bailout merger LTCB with Sumitomo Trust Bank. But it was failed because Sumitomo Trust Bank had doubts about potential LTCB's NPL. Finally, it was also nationalized in October 1998. Case of Hokkaido Takushodo Bank(HTB), it was organized to merge into Hokkaido Bank, but merger was failed because of HTB's NPL. When announcement of failed merger, HTB suffered from accelerating in deposit withdrawals. Its business was transferred to Hokuyo Bank (a regional bank) and Chuo Trust Bank after being granted a special loan by BOJ.

Until mid-1990s, Inspection and Supervision of financial institutions in Japan was responsibility of Ministry of Finance (MOF), Bank of Japan (BOJ) controlled money supply and functioned as a lender of last resort. In order to improve legal framework for handling failed banks, in June 1998 Financial Supervisory Agency (changed its name to Financial services Agency in June, 2000-FSA) was established to take over the supervision of banks from MOF. In this period, Japanese banks were inadequate capital because quality of bank's assets sharply dropped while banks were difficult to increase capital both from internal and external sources. Along with passed the Financial Revitalization Law, Financial Early Strengthening Law and amended The Deposit Insurance Law, Diet provided 60 trillion yen for strengthening banking sectors. Under the new Laws and adding fund from Diet, 7.8 trillion yen was injected to major banks for increasing capital by DICJ through purchasing preferred shares of subordinated debts issued by banks. In that time, the authorities required banks to assess their balance sheets and identified JPY34 trillion non-performing loan of all banks, including JPY 22 trillion for major banks based on bank's own assessments which were very different from amount of NPL based on inspectors' calculations. In 2001, FSA was released a new policy to accelerate bank loan restructuring: Reduce amount of equities held by banks to level equal to 100% tier1 capital; strengthen the classifying and provisioning for NPL; remove 50% banks' NPL within one year and 80% within 2 years. Besides, Government established Industrial Revitalization Corporation of Japan (IRCJ) in 2003 to promote the restructuring of the large firms by buying their loans, and Banks' Shareholdings Purchase Corporation (BSPC) in 2002 to buy stocks held by banks. By efforts of both authorities and banks, in March 2005, Government announced banks' NPL problems were end. In order to overcome the crisis, Japanese spent JPY47.1 trillion for banking system through DICJ in which only JPY 25.1 trillion was recovered.

In the global financial crisis of 2007-2008, while the banking system of many countries fell in recession. By improving regulatory framework and financial safety net, Japanese banking system was immune from global crisis.

Policy recommendations for Vietnam

Under Scheme for restructure banking system period 2011-2015, State Bank of Vietnam (SBV) identified 11 Vietnamese weak banks (*) and listed them for restructuring, in which 8 banks was restructured by M&A transaction and got survived. GPBank, OceanBank and VNCB were acquired by SBV at zero VND in 2015. After acquiring by SBV, the 3 banks have turned to normal operations and maintained their liquidity. However, they have been still suffered from big accumulated losses and high bad debt ratio.

Characteristics of Vietnam banking system showed that, the way to fix Vietnam weak banks will not be the same as US or Japan. However, analyzing the process of handling weak banks in US and Japan indicated that, obstacles appeared in the process of handling and the way to overcome in the two countries provided useful lessons for policy makers in Vietnam. They are following:

The first, the Government should give an enough power of handling weak banks to Deposit Insurance of Vietnam (DIV). So far, under Law No 17/2017/QH14 "Amendments to some articles of the Law on Credit Institutions", DIV has been improved its role by empowering functions of lending to weak banks and coordinating with SBV to monitor the special controlled-banks. But the rights of resolving failed banks still

¹ Saigon Join Stock Commercial Bank (SCB), First Join Stock Commercial Bank (Ficombank), Tin Nghia Join Stock Commercial Bank (TinNghiaBank), Tien Phong Join Stock Commercial Bank(TienPhongBank), Nam Viet Bank(NaViBank), Great Trust Join Stock Commercial Bank (TrustBank), Hanoi Building Join Stock Commercial Bank (Habubank), Global Petrol Commercial Join Stock Bank (GPBank) and Western Commercial Join Stock Bank (WesternBank), OceanBank, Vietnam ConstructionBank (VNCB)

belong to SBV. The lessons from US, Japan was indicated that, the lack authority of handling failed banks of deposit insurance organization led to delays and ineffectiveness in dealing with weak banks. In order to improve efficiency of handling weak banks, DIV should be improved its role as follows: 1) Improving the Law of deposit Insurance and related regulations in which Government should regulate DIV's mission of handling failed bank, empower DIV to make decisions on selecting solutions; 2) Improving DIV's financial capacity through injecting more capital; 3) Establishing risk-based premiums system to improve deposit insurance fund; 4) Increasing the coverage limit (the maximum reimbursement of DIV is much lower than the standards in other countries) and designing coverage scheme involves scale of DIF in a given stage.

The second, SBV should promulgate the guidelines for resolving weak banks in which processes of handling have to distinguish between systemically important banks and non-systemically ones. Government should also create a legal framework for DIV to establish "temporary bridge bank". Experiences of US, Japan pointed out that bridge bank is an optimal solution for resolving a very large and complex weak banks. Vietnam should design TBB according to the Japanese model- the Capital of TBB will share between the public and private sectors to reduce the pressure on public fund and maintain confidence in financial system.

The third, protection of depositors should be prioritized when selecting solutions. The banking crises found out that, if ensuring of depositors' benefit would keep the confidence of financial system and avoid systemic risk. DIV and SBV have to prudently assess impacts of the selected solution on benefits of depositors and have plans to protect them during the process of implementation. In case of choosing payoff solution for "too big to fail" banks (DIF is not enough to reimburse depositors), the government have to share coverage with DIV to ensure depositors' benefit.

The fourth, authorities should be prudent with using financial assistance solution to avoid wasting public funds. The assistances have to depend on a bank's prudent plans of using fund which must be approved by related authorities. During the implementation period, authorities must strictly monitor the assisted banks.

The fifth, in case non-systemic risk banks failed, authorities can allow them to close if that solution is costly and don't disturb banking system. In order to protect depositors (both insured and uninsured depositors). Authorities should suggest supporting from private sectors. In order to encourage private sector to join in resolving processes, the government and related authorities should provide policies of financial assistances such as: tax policies, financial policies...

The sixth, P&A solution is considered as an expected solution of authorities. But acquirers always concern NPL of failed banks when making transaction. So that, authorities should have policies to share risk and losses from NPL with acquirers when used P&A solution, especially for failed banks with a large number of NPL. For 3 banks acquired by SBV at zero VND, SBV should accelerate the process of restructure in which focus on restructuring their assets and their corporate governance. After that, SBV should arrange to be acquired by health banks with loss sharing agreements between SBV and acquirers.

The seventh, SBV should strengthen and improve banking inspection and supervision in which quickly establish early warning risk system (EWS) and use Risk-Based Supervision-RBS to early identify weak banks, system risk as well as signals of economic recession. Supervisor has to use stress-testing tools to actively respond to stressful scenarios of banking system and economy. In order to run EWS as well as RBS, SBV have to coordinate with Ministry of Finance, Credit information center of Vietnam and National Financial Supervisory Commission to improve database. SBV should suggest to the government to upgrade technical infrastructure for EWS and RBS.

Conclusions

In recent years, the Vietnam banking system has been weakened due to bad debts and poor risk management. In the period 2011-2015, 11 weak banks was identified and resolved by M&A. After M&A, banks turned to normal operation, ratio of capital adequacy and liquidity improved but their NPL is still high level, some of them remained accumulated losses and lack of effective corporate governance, especially three banks acquired by SBV. In the period 2016-2020, resolving weak banks are still defined as a main objective of Scheme for restructuring system of credit institutions. The process of identifying and dealing with weak banks from now to 2020 remains a big challenge. Policy recommendations of this article are expected to be a good suggestion for the Government and the related authorities to handle weak banks effectively.

TAXATION LAW SYSTEM IN VIET NAM UNDER THE INFLUENCE OF FREE TRADING AGREEMENTS

Le Thi Thanh*, Trần Thị Thu Hương**

ABSTRACT: *As in many countries, taxation law system in Viet Nam has played important role in the economic- social development process and promoted international integration. However, there are many problems in Vietnamese taxation law system being required to solve when considering the impacts of Free Trading Agreements (FTAs) in which Viet Nam is a member. One of the main content in FTAs is incorporation international treaty into member countries' law. This paper aims to assess the Vietnamese taxation law system, focusing on import and export tax in the context of comparing to tax agreements in FTAs that Vietnam has joined. Then, authors suggests several solutions to improve.*

Keywords: *Taxation law system, Free Trade Agreement, effect of FTAs, import and export duties*

1. TAXATION COMMITMENTS IN FREE TRADE AGREEMENTS

FTAs are expected to offer not only opportunities but also challenges to member economy. According to FTAs framework, members of FTAs need to transform agreements into national law system. Tariff is a main content of FTAs.

Tariff commitments in Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) require each member to keep tax law system simpler and more transparent. In addition, taxation law system of each member country has to be concretised the commitments and ensure the neutrality of tax.

The negotiations of taxation in FTAs usually include two groups: import tax agreements and export tax agreements which are manifested with particularly tax lines in schedule. Members in FTAs may establish private tariffs for individual partner or common tariff for all members.

More specifically, taxation commitments contain tariff and non-tariff reduction regulations, categories of goods and services considered for tax reduction, and tax reduction roadmap.

Levels of tax incentive following FTAs are classified as the following:

Firstly, it is committed to remove tariff immediately after the agreement has been effective. In other words, tax rate would be zero percent at FTAs effective date.

Secondly, members commit to remove tariff gradually following a negotiated roadmap. It mean after a period of time, tariff lines have been cut to 0%.

Thirdly, tariff quota is committed. Tax reduction or elimination is only applied to a limited number or quantity of certain goods and services. The excess part will be subject to higher tax rate or non tax incentive.

Meanwhile, products of Viet Nam, exporting to members of FTAs, would be considered for different

tax incentive in each market in line with the country's commitments within FTAs framework. In each FTA, Viet Nam guarantees different incentive for each tariff line and applies to all members of this FTA.

Based on FTAs framework, tax incentive level in Commitment Schedule is the minimum. Member countries could reduce tax to lower tax rates or reduce and remove tax earlier than the roadmap.

Import duty is used by the state to protect domestic resources, keep materials for domestic production, and encourage exported processed goods...In certain circumstances, export tariff policies for each type of product may be changed. It could be taxed or not depending on government decisions. However, export tariff has to be removed gradually based on a roadmap under the country's commitments within FTAs framework. It is noted that there are still items in non-preferential treatment list which could be taxed normally by the state.

Besides common commitment in a FTA like CPTPP, there are private agreements among two or more cross member countries under other FTAs. Vietnam has agreed many bilateral and multilateral FTAs in which partners could also be members of other FTAs like CPTPP. More specifically, for Asean partners such as Brunei, Singapore, Malaysia, Vietnam has guaranteed two multilateral FTAs at the same time, including Asean free trade area in internal Asean and FTAs between Asean countries and external Asean countries. As a result, in order to assess current tax law system in Vietnam adapting to international integration, it is necessary to understand agreements in FTAs Vietnam has joined beside legal documents on tax.

2. THE CURRENT TAX LAW SYSTEM IN VIET NAM UNDER THE EFFECT OF FREE TRADE AGREEMENTS

Import and export tax law system is related to FTAs directly. On April 6, 2016, The National Assembly has passed the Law on Export and import duties 2016, named 107/2016/QH13. Then, The Government has recently issued Decree 122/2016/ND-CP regulating preferential import and export tax, the list of goods, the absolute tax rate, the mixed tax and import tax instead of quota. This decree took effect from September 1, 2016, specially removing 2 decisions of the Prime Minister and 9 circulars of the Ministry of Finance issued before September 1, 2016. Moreover, the Prime Minister also issued Decision 36/2016/QD-TTg regulating the normal tax rate for imported goods. This Decision stipulated regulations on tax rate of common imports.

Through applying the Law on import and export duties, the Custom law, the Law on tax administration, other tax laws, and related legal transactions, there are achievements beside limitations which need to complete.

Main achievements could be mentioned.

- *Firstly*, tax law system in common, and the import and export duties law system have been legal foundation adapting to integration requirements, making easier for tax payers to implement, improving business environment and national competitive ability. It has also reflected tax administration reform, applied the modern tax management mechanism in which tax payers could submit self-assessment tax report (tax declaration, computation, and payment) and have their own responsibility. Moreover, Viet Nam has also eliminated tax gradually according to the negotiated roadmaps in bilateral and multilateral FTAs.

- *Secondly*, Duty law system creates legal base to encourage domestic production and export activities, while Viet Nam has to cut many tax lines for import and export items under FTAs.

- *Thirdly*, current trade remedy regulations include safeguard measures, antidumping and countervailing duties are appropriate legal conditions for Viet Nam to participate in international market in the process of trade liberalization.

To sum up, it could be seen that current tariff law system in Viet Nam has been established in accordance with FTAs that Viet Nam joined.

Limitations in the current Vietnamese tax law system

The process of developing economy and integrating of Viet Nam, especially when CPTPP has become effective, has exposed some restrictions in tariff law system need to be controlled under FTAs framework. Import and export duties law continues to be main subject to assess.

The first limitation is that system of legal transactions on tax lacks of simple and transparency. Simple and transparency are key criteria of tax law systems under integration context. It is supposed to support tax payers to access information and detailed instruction from tax and customs departments easily, ensure the justice in implementing tax laws. Then, it could encourage the spontaneous compliance of tax payers. The lack of simple and transparency of Vietnamese tax law has been demonstrated as following:

- Each tax type could be controlled by different legal documents. For example, import and export tax legal regulations is determined in not only the Law on Export and import duties but also the Customs Law, the Law on tax administration and related legal transactions. In fact, tax laws may be amended and supplement while the decrees and circulars overlap. As a result, it is difficult for tax payers to find out and apply the exact legal documents. Moreover, tax legal transactions lack of framework to solve particular situations, leading to the difficulty in practising legal regulations. Tax and customs authorities usually have to promulgate official dispatches (not legal transactions) to solve particular cases. These official dispatches are not united, resulting in tax inequality. For instance, the definition of “consumed in Viet Nam” for exported services in value added tax is not clear and debatable. Consequently, tax authorities must promulgate many official dispatches for each problem of different corporation. Besides, the definition of “exported services and consumed outside Viet Nam” is similar.

- For import and export tariff: The tax rates, tax schedules, product codes, tax computation methods are complicated. The tax rates are regulated by both categories and origin of products (compulsory), making tax schedules too complicated. A product could be subject to many type of taxes. High and low tax rate in schedules depends on not only nature of items but also using purposes. As a result, the import and export tax rates applied to the similar products could be various because of different using purposes. In addition, tax computation methods include tax calculation based on percentage of taxed value of import and export goods and services (percentage tax computation method), calculation of absolute tax for a unit of import and export goods and services (absolute tax computation method), and mixed tax computation method are complex and difficult to compute.

The second limitation is that import and export duty law system lacks stability, transparency and suitability to intergation requirements. Legal regulations on import and export duties relate to tariff agreements in FTAs directly. In the Law on import and export duties, a number of regulations are not corresponding to the Customs law or the Law on tax administration. In addition, some regulations are not feasible and comprehensive, leading to difficulty in implement, creating more administrative procedure. It could be listed such as the regulation of export tax exemption for products which are exported to process at Clause 6 Article 16 and related regulations at Clause 13- Article 16- Law on Export and import duties 2016, tax refund regulations at Point d - Clause 1- Article 19 - Law on Export and import duties 2016, etc.

Furthermore, the roadmap of cutting import and export tariff is not conformable to commitments in FTAs Vietnam is a member, consist of CPTPP. In addition, import and export tariff schedules have not been an effective tool to promote domestic production and the export of high value added products. It also could not restrict the export of unprocessed natural resources and reduce low value added processed

goods. Last but not least, the Vietnamese import and export duties laws contain regulations to protect domestic production, but some of these regulations are not in line with country's commitment within FTAs framework.

Thirdly, regulations in tax legal documents in Viet Nam is influenced by social policies, resulting in the absence of tax neutrality. It againsts international routine and obstructs the practice of legal regulations. Tax reduction and tax exemption are examples.

Finally, tax law system could not ensure sources of revenue for national budget. The impacts of FTAs decrease income from export and import activities, while other domestic tax law system contains problems. The tax base has not been widen to involve new sources of revenue which have been born in integration.

3. SEVERAL SUGGESTIONS TO IMPROVE VIETNAMESE TAX LAW SYSTEM UNDER FREE TRADE AGREEMENTS

Firtsly, it is necessary to establish set of rules applied to negotiate and join to FTAs. It includes rules of adjusting tax regulations, determination of which cases are needed to cut tax immediately or gradually based on a roadmap, which cases are applied tariff quota, which cases are not tax elimination or reduction... This set of rules will be basis to build and adjust national tax law system, limit the number of time adjusting tax regulations. Consequently, the national tax law system becomes stable, consistent, and satisfies FTAs requirements. Tax laws quality guarantee may encourage production and business, enhance the competitive ability of domestic goods and services, promote investment and export, create sustainable economic growth.

Secondly, it is required to keep tax law system high transparent and clear.

- Recheck legal transactions on tax in order to eliminate unsuitable regulations; modify and supplement cross regulations; enforce new norms to regulated new tax relationship.

- Tax laws should include enough legal frameworks to solve particular circumstances. It limits the number of official dispatches that tax and custom authorities promulgate to solve each case. This official dispatches are not legal documents and have been changed in different situations, leading to unequal tax.

For import and export duties, it is necessary to simplify tax rates, tax schedule, product codes, and tax calculation methods....

Thirdly, it is suggested to ensure the relative stableness, obviousness, appropriateness of common tax law and import and export duties law system in line with agreements in FTAs which Viet Nam has joined. The regulations in the Law on import and export duties need to be consistent with these in the Customs law, the Law on tax administration and related legal transactions. Moreover, according to established set of negotiated rules, Viet Nam should build a roadmap to adjust import and export tax rates to sastify the commitments in FTAs, especially after CPTPP is in effect. Some inadequate regulations should be changed such as tax reduction and tax exemption regulations.

Fourthly, to remain the neutrality of tax, it is suggested that social policies should not be considered when setting tax regulations. It would bring a favourable and equal business environment, encourage investment and distribute income exactly.

Finally, under the influence of FTAs, tax laws system is required to change to balance sources of revenue to national budget. Tax is one of the largest source of income to state budget. However, implementing FTAs commitments results in a decrease in government revenue departing from the reduction in import and export duties. So authorities have to inspect all regulations on tax, including value added tax, special consumption tax, business income tax, personal income tax, property tax,... to widen tax base, embrace new sources of

revenue following international routine. Furthermore, in term of implementing FTAs commitments, it is required to reform tax administrative formalities, ameliorate the efficiency of tax management, avoid tax fraud and tax evasion, against transfer pricing...

CONCLUSION

The current Vietnamese tax law system has contributed to economic integration process and promoted economic and social development. However, economic and social relations have continued to change and develop while the level of integration become higher. Joining to new generation FTAs opens new development space, leading to quantitative changes. The development opportunities are wider and deeper for all fields, especially for creative areas and global business. It is required changes in the current Vietnamese tax law system. Under the influence of FTAs, the tax laws should be inspected to find out problems needed to modify. It would make the tax law system in Viet Nam effective and suitable to integration process.

BUSINESS REGISTRATION PROCEDURE FOR ENTERPRISES IN VIETNAM

– CURRENT SITUATION AND SOLUTIONS

Nguyen Thi Thanh*

ABSTRACT: *In recent years, the business registration procedure for enterprises have been improved significantly with more favourable legal framework for business registration; application of IT in business registration that makes the procedure of business registration and tax registration to be the first electronic interconnection model in the State management system in Vietnam. At the same time, the business registration has been computerized and modernized helping to reduce the time and cost of entering the market, contributing to transparent the investment and business environment; promoting the freedom of business of citizens in accordance with the Constitution. However, the business registration procedure for enterprises still have some limitations. Thus, solutions to improve the business registration procedure to facilitate enterprises to participate in the market in the current context of international integration is necessary.*

Keywords: *business registration, business registration procedure, enterprises*

1. MAIN TEXT

After more than 1 year of implementation, the Government's Resolution No.19/2017/NQ-CP and 35/NQ-CP of the Government have contributed to create the confidence of the business community. The Government's commitment to the business community has conveyed a strong message of a tectonic government to serve, support and promote enterprises, considering enterprises as an economic development dynamic. The business registration procedure is one of the important procedures when starting a business. Over the past years, business registration for enterprises has made many important changes that had been improving to meet the requirements of practice in the trend of international integration.

According to data of the Business Registration Management Agency – Ministry of Planning and Investment, there were 12,209 newly established enterprises in June 2018 with the total registered capital of VND 132,108 billion, an increase of 10.7% in terms of the number of enterprises, and 26.0% in terms of capital in comparison with May 2018. The average registered capital per enterprise in June reached VND 10.8 billion, increasing by 13.8% over the previous month. The registered number of employees of new enterprises established in June was 95,930 employees, an increase of 19.1% in comparison with May. In the first six months of 2018, Vietnam had 64,531 newly established enterprises with the registered capital of VND 648,967 billion, going up by 5.3% in terms of the number of enterprises and 8.9% in terms of the registered capital in comparison with the same period of 2017. The average registered capital per enterprises in this period reach VND 10.1 billion, an increase of 3.4% over the same period of 2017.

* Academy of Finance, No.58, Le Van Hien St, Duc Thang Wrd, Bac Tu Liem Dist Hanoi, Vietnam

2. CURRENT SITUATION OF REGISTRATION PROCEDURE FOR ENTERPRISES IN VIETNAM

After months of implementation, the reform of administrative procedures in the field of business registration for enterprises has basically achieved the following results

2.1. Regarding legal framework:

The legal framework of business registration has been completed, facilitating enterprises in participating and operating on the market. It establishes a one-stop-shop mechanism in accepting and settling procedures of enterprise establishment. Particularly, organizations and individuals registering for the establishment of enterprise shall submit only one set of dossiers (including information on business registration and tax) at only one receiving point (business registration agency) to obtain the Business Registration Certificate (it is also tax registration certificate) and a unique business code from a standardized process throughout the country. On the other hand, the one-stop-shop mechanism has significantly contributed to reduce the time to complete basic procedures for the market entry process. In particular, before 2005, it took from 32 working days, then 22 working days since the effective date of the 2005 Enterprise Law, and 15 working days from 2007, 5 working days from 2008 and according to the 2014 Enterprise Law, it is maximum of 03 working days. According to the Doing Business Report of the World Bank, in terms of time to complete business registration procedures, Vietnam is only behind Singapore (0.5 day) and Thailand (2.5 working days) in the Southeast Asia.

2.2. Regarding the national business registration portal:

The National Business Registration Portal of Business registration has marked a major step forward the application of IT in business registration, making the business registration procedure and tax registration procedure become the first electronic interconnection model in the State management system in Vietnam. The business registration is now computerized and modernized helping to reduce the time and cost of entering the market, contributing to transparent the investment and business environment; particularly:

- Unify the business registration procedure throughout the country, directly serving daily operations for nearly 500 staff in charge of business registration in 63 provinces/cities; publicize the whole process and status of business registration dossiers and help to transparent the operation of State management agencies in implementing administrative procedures of business registration.

- Develop the national business registration portal, store information on the legal status of all registered enterprises, facilitate the disclosure of information, legal status of enterprises, and be a useful tool to provide information serving the macro-economic management and other state management. Currently, nearly 90% of dossiers of registered enterprises have been digitized and stored in electronic file in the National Database.

- Enable online business registration to save time, cost of entering to the market, and to develop a transparent business registration system that minimizes the negatives may arise from human intervention. Currently, the Online Business Registration System has met the requirements of online public services level 4. According to statistics, in the first quarter of 2018, the rate of online registration in Vietnam reached 58.01% (this was 45.25% in 2017). This number in Hochiminh city was 64.84% and Hanoi was 99.62% which exceeded the target set by the Government in Resolution 36a/NQ-CP on the e-government.

- Develop the National Business Registration Portal to be an official information channel with a completed database and rich information services; which will be a bridge to bring information of firms to the community widely, thereby, enhance the ability of the society to supervise enterprises' operations,

contributing to a more transparent and secure business investment environment. The role and value of the National Business Registration Portal for the society is increasingly reflected in the number of visitors.

- The Business Registration Management Agency collaborated with the Foreign Investment Agency to set up an interconnection information processing system to settle the procedures of investment registration and enterprise registration for foreign investors. On April 18, 2017, the Ministry of Planning and Investment issued Circular no.02/2017/TT-BKHDT guiding the mechanism for cooperation in processing of applications for investment registration and enterprise registration submitted by foreign investors.

2.3. Regarding the information on enterprise registration certificate

The new registration procedure has improved the freedom of business of citizens in accordance with the Constitution by eliminating the regulation on inscription of business lines on the enterprise registration certificate. In addition, the management mechanism was completely transferred from pre-check to post-check by eliminating requirements on business conditions at the time of registration (such as the requirements on business licenses, certificate of eligibility for business, work permit, confirmation of legal capital). In addition, enterprises are given the right to make their own decisions on the contents, specimen and number of seals that only need to inform the seal's specimen with the Business Registration Agency instead of seal specimen registration with the police office as before.

2.4. Regarding the cost of entering the market of newly established enterprises

In the implementation of Resolution No.19-2017/NQ-CP dated 06/02/2017 on continuing to implement main duties and solution for improving business environment and enhancing national competitiveness in 2017 and orientation towards 2020, resolution no.75-CP dated 09/8/2017 at the regular meeting of the Government in July 2017 with the objective of reducing cost of setting up business and input costs for enterprises, proposal of policy for costs and fees reduction in enterprise registration of the Agency has been approved by the Ministry of Finance. According to Circular No. 130/2017/TT-BTC dated 04/12/2017 of the Ministry of Finance amending and supplementing circular no.215/2016/TT-BTC on the rates of collection, payment, management and use of enterprise information supply and enterprise registration fees, from 20 January 2018, the enterprise registration fee has been reduced by 50% compared with the previous regulations and 100% exemption if the enterprise registers online.

2.5. Regarding the implementation of regulations on enterprise registration:

to effectively guide the implementation of regulations on enterprise registration; to improve professional capacity for staff in charge of business registration. The guiding for implementing regulations on enterprise registration is carried out through various methods such as written documents, direct support via telephone, Skype, TeamViewer, email, leaflets, etc., to support enterprises in the business registration.

3. LIMITATIONS IN BUSINESS REGISTRATION PROCEDURE FOR ENTERPRISES

3.1. limitation in legal framework

- Regulation of online enterprise registration still has some unfinished points. Some principles in online enterprise registration are being implemented on the basis of guiding documents issued by the Ministry that have not yet legalized into legal normative documents such as: allow authorized person of legal representative to sign the enterprise registration application online, specify the time of settling the online registration dossier from the receipt of written forms of enterprises.

- Legal regulations related to the revocation of enterprise registration certificate has not been completed leading to some difficulties in the implementation process, specifically: there is no detailed regulation on the authority of the police agency in determining the act of forging dossiers, there is no regulation on the explanation of enterprise after receiving the notice of violations in the case of revocation.

- There is no legal regulation on dossiers, order, procedures for transferring business household into enterprise to be a basis for making related regulations in the Law on Support for Small and Medium-sized Enterprises come into practice after the effective.

2.2. Limitation in organizational implementation

- There is no link among Ministries, sectors and units related to business registration in terms of procedures of investment, land, construction, planning, fire prevention and fighting, environment, tax, business conditions, etc.

- The human resources for business registration in localities are almost unchanged while the number of new enterprises is increasing significantly leading to high pressure for division of business registration.

- A part of staff in charge of business registration activities do not really respect professional ethics, causing difficulties for enterprise during the execution of service. Some people and enterprises take advantage of loopholes of law to commit deceptive behaviour, illegal profiteer, affecting the business environment.

3. SOME RECOMMENDATIONS TO IMPROVE ADMINISTRATIVE PROCEDURES IN BUSINESS REGISTRATION FOR ENTERPRISES IN THE CONTEXT OF INTERNATIONAL ECONOMIC INTEGRATION

1.3. Completing the legal framework:

Continue to complete the legal framework for enterprise registration; review legal documents on enterprise registration, and actively coordinate with related agencies, organizations to develop contents of Draft Decree amending and supplementing a number of articles of Decree No.78/2015/ND-CP that will be issued in July 2018. Currently, the Draft Decree has been basically completed with many regulations in the direction of simplifying administrative procedures for enterprise registration, facilitating enterprises in participating and operating in the market, specifically:

- *Thoroughly implement the idea of renewing the viewpoint on enterprise seal.*

It is necessary to remove the regulation of compulsory seal in all documents issued by enterprises in the enterprise registration dossier. This will on the one hand simplify procedure for enterprises and on the other hand gradually reduce the power and role of the seal. With this regulation, the field of business registration will be one of the first field where enterprises are not obliged to use seals, and thereby help enterprises to focus on their production and business without any worries about difficulties may caused by the seal. At the same time, the procedure of notifying the seal specimen should be simplified. Enterprises only need to send the seal specimen online through the National Business Registration Portal, without submitting dossier by paper to the business registration agency. By this procedure, the time for completion of administrative procedures for enterprises will be reduce.

- *Promote the online Enterprise registration procedure*

It should have regulation to create favourable mechanism for users in using online enterprise registration service that allows legal representatives of enterprises to register online by themselves or by their authorized person.

- *Reduce procedure of registering information of founding shareholders of joint stock companies*

According to current regulations, enterprise must notify the business registration agency about any change in information of founding shareholders. This created unnecessary burden and cost of compliance for enterprises or even a tool that some shareholders may take advantage of or cause difficulty for enterprise. Therefore, to reform administrative procedures and increase the autonomy of enterprises in post-establishment operations, the notification of change in information of founding shareholders in other cases should be abolished.

- *Expand the freedom of business for enterprises*

To create more favourable conditions for newly operating enterprises and to ensure the flexibility and proactiveness of enterprises when start operating in the market, it is necessary to remove regulation that enterprise must only set up their business location in the province or municipality where the head office or branch is located to help them reduce operational management costs.

3.2. Organizational implementation

It needs coordination between the Business Registration Agency – the Ministry of Planning and Investment with the General Department of Taxation and other relevant ministries, sectors to implement the following solutions:

- The Ministry of Planning and Investment should collaborate with the Ministry of Natural Resources and Environment, the Ministry of Construction, the Ministry of Finance, the Ministry of Industry and Trade, the Ministry of Justice and relevant agencies to study to complete the unified interconnection process in procedures of investment, land, construction, planning, fire prevention and fighting, environment, tax, business conditions; establish an effective and smooth collaboration mechanism to concurrently perform investment procedures; avoid the re-verification and recognition of the results among state agencies; significantly reduce the time for completing procedures of a project compared to current one; implement uniformly throughout the country the Law on Investment (amended) when taking effect.

- The Ministry of Finance should study to amend regulation related to the requirement that enterprise must have bank account to reduce this procedure in the start-up procedure.

- The Ministry of Finance should study to amend the regulation related to the payment of license fee to remove this procedure from the Start-up Procedure

- Promote localities to strictly comply with regulations on enterprise registration, the time for handling administrative procedures in the field of enterprise registration

- There should have more closely monitoring to exchange and provide timely information to the World Bank on the Start-up Procedure in Vietnam.

- The division of business registration should have more personnels and at the same time, the staff should be send to attend courses of professional training, business ethics to facilitate enterprises in quickly and conveniently registration.

4. CONCLUSION

The current business registration procedure for enterprises has been improved but there are a number of shortcomings in terms of legal framework, organizational implementation. Therefore, to facilitate newly established enterprises, the legal framework should be completed and there should have collaboration between relevant ministries, sectors towards the international integration.

FDI THRESHOLD – AN INDICATOR IN FDI ATTRACTING TOWARD SUSTAINABLE DEVELOPMENT

Cao Phuong Thao* , Hoang Thi Phuong Lan**

ABSTRACT: *As most developing and emerging economies pursue the goal of attracting and implementing FDI (FDI scale – the number of registered FDI by investors) and support for economic developing. However, there is always a contradiction: Although the larger the size of FDI is, but it does not guarantee the economic efficiency and quality of FDI in the host country. In addition to the benefits that FDI inflows bring as capital, jobs, conditions for the host country to gain access to international markets, technological upgrading through spillover effects, FDI also creates negative impacts on economic development in the receiving country, such as the imbalance of the balance of payments, control of the development of domestic enterprises, the depletion of resources, environmental pollution, dependence on external resources ... So, the attraction of FDI in developing countries should be aimed at attracting as much as possible, but also effectively created positive effects for economic growth. Therefore, within the scope of the article, the authors refer to the FDI threshold as an important indicator for establishment of FDI attraction policy to create momentum for sustainable growth.*

Keywords: *FDI, FDI threshold, FDI attracting, sustainable development*

1. FDI THRESHOLD AND RELATIONSHIP BETWEEN FDI THRESHOLD AND SUSTAINABLE DEVELOPMENT

A country receiving FDI, does not only aim at economic efficiency of FDI, but also target to the final effect of FDI. FDI efficiency is the result of a scale consistent with absorption capacity and reflected in the quality of attracted FDI. FDI inflows are expected to contribute to budget, support to GDP, increase incomes after taking into account negative environmental impacts, taxes (OECD, 2002) ... In other words, it is close to the net contribution of the FDI sector to the country's socioeconomic development after deducting the opportunity costs for the negative issues that arise when attracting and using FDI. Because, the quantification of all those issues is difficult, many studies have used indicators of FDI threshold as an implication for FDI effectiveness.

A number of empirical studies have shown that the efficiency of FDI depends on the absorption capacity of host country that always changes over different periods, rather than on the result of attracted capital (Alfaro L., 2004). In terms of capital scale, ***FDI threshold is defined as the ratio of FDI to GDP at which the positive effects are still over negative effects*** (Demekas D. G., 2005). This indicator suggests an FDI scale that is consistent with absorption capacity of a receiving country. Therefore, one can understand that a country can change or expand FDI inflow if there is a suitable FDI policy system to absorb this source of capital.

* Lecturer, Academy of Finance, Ha Noi, Vietnam.

** Lecturer, Academy of Finance, Ha Noi, Vietnam

FDI threshold is important to FDI attracting framework in host countries.

Firstly, this indicator is a reference index for the process of planning attract FDI framework in each country to ensure that attracted FDI is controlled and exploited to its full potential (Sourafel Girma, 2005)

Secondly, comparing implemented FDI with FDI threshold indicator provides important implication in the process of investment management, especially in the process of planning the FDI policy. When the scale of FDI is below the threshold, policy makers can use preferential policies and investment promotion to attract more foreign investors. Conversely, when the size of FDI exceeds the threshold, it is important to screen and remove inefficient FDI projects which negatively impact to the economy, society and environment of receiving countries.

Thirdly, defining the FDI threshold helps the economy better keep its FDI expectations. Accordingly, the impact of FDI on the economy is optimized.

Fourthly, FDI thresholds need to be compared with actual needs of host countries because FDI threshold is the optimal size of FDI attraction to the economy. In a circumstance that the actual demand for FDI capital in host country is greater than the threshold, to maximize the benefits from the capital, it is necessary to increase the internal capital absorption of the host country. Consequently, it is basic to expand the residual attraction of FDI. In other words, policymakers need to have appropriate FDI policies to expand this absorption.

FDI AND FDI THRESHOLD IN VIETNAM

Since its appearance in Vietnam, the FDI sector has been gradually asserting itself as the most dynamic economic sector with the increasingly expanded scale of FDI capital in Vietnam. In the period of 2005 - 2016, except for abnormal fluctuations in 2008-2009, FDI inflows tended to increase over the years, while registered out of implemented FDI ratio also improved (Table 1). As of 20/12/2017, the country had 24,748 foreign investment projects in force, with total registered capital of valid projects was 318.72 billion USD, implemented capital was 172.35 billion USD (Nguyen Van Toan, 2018).

Table 1. FDI in Vietnam in 2005-2017

Unit: Billion USD

| Time | Registered FDI | Implemented FDI | Implemented/registered ratio |
|-------------|-----------------------|------------------------|-------------------------------------|
| 2005 | 6.84 | 3.301 | 48.26% |
| 2006 | 12.004 | 4.1 | 34.16% |
| 2007 | 21.349 | 8.034 | 37.63% |
| 2008 | 71.72 | 11.5 | 16.03% |
| 2009 | 23.1 | 10 | 43.29% |
| 2010 | 19.88 | 11 | 55.33% |
| 2011 | 15.59 | 11 | 70.56% |
| 2012 | 16.34 | 10 | 61.20% |
| 2013 | 22.35 | 11.5 | 51.45% |
| 2014 | 21.92 | 12.5 | 57.03% |
| 2015 | 22.76 | 14.5 | 63.71% |
| 2016 | 24.37 | 15.8 | 64.83% |
| 2017 | 33.88 | 17.5 | 51.65% |

Source: (Nguyen Van Toan, 2018)

FDI has contributed positively and impressively on many aspects in the process of integration and socio-economic development in each period of Vietnam economy. However, many studies have shown the impacts of FDI on the Vietnamese economy is bipartisan. On the one hand, FDI is an important additional source of capital for the economy, contributing to economic growth, increasing budget revenues, creating more employment opportunities, expanding markets, boosting exports. On the other hand, Vietnam is struggling to attract FDI by imbalance in economic structure, low labour income, low labour quality, environmental pollution, the limitations in technology transfer, discrete links between domestic and foreign firms... In addition, the main assessment of FDI have shown that FDI policy is imbalance and is gradually moving to the trend of increasing internal absorption of the economy rather than increasing FDI scale (Nguyen Van Toan, 2018). Therefore, it can be said that the links between FDI threshold and economic growth in Vietnam is very specific and clear.

Estimated results showed that the reasonable FDI threshold in Vietnam was of under 8.96% GDP (Nguyen Thi Quynh Tho, 2017). With 10% increase in trade openness, there would be 0.59% increase in GDP. If Vietnam continues to attract FDI (greater than 8.96% of GDP) and increases trade liberalization, it will be a reduction in GDP growth: a decrease of 0.05% for every 10% increase trade opening (Nguyen Thi Quynh Tho, 2017).

Because of the estimation of FDI threshold at 8.96% of GDP, comparing with the actual size of FDI in Vietnam, it can be seen that:

Firstly, in the period of 2012-2017, the amount of FDI in Vietnam was still in the range of 8.96% of GDP. That means in this period, the amount of FDI inflow into Vietnam still brought about positive effects to economic growth.

Secondly, Vietnam still has plenty of room to attract more FDI. However, with the increasing proportion of FDI/GDP, FDI inflow tends to decrease. In 2015, the size of FDI threshold was 6.1% of GDP and raised to 7.98% in 2017 (Chart 1). Therefore, with the current absorption capacity of the economy, Vietnam has only about 1% residual surplus for FDI to ensure that the impact of FDI inflow is positive for economic growth.

Figure 1. Implemented FDI/GDP and FDI threshold in Vietnam in 2005-2017

Source: Author's estimation under World bank Data ¹

¹ Online world bank data, accessed on <https://data.worldbank.org/indicator/NY.GDP.MKTP.CD?end=2016&locations=VN&start=1985&view=chart>

Considering objectives of economic development in 2016-2020 period, to achieve a GDP growth rate of 6.5% - 7% / year, the total social investment is about 32-34% of GDP. Therefore, the issue of attracting FDI towards sustainable growth must simultaneously expand the FDI threshold to attract more than 8.96% out of GDP, while enhance the absorption capacity of the economy. From the author's point of view, the policy of attracting FDI must be aimed at improving the quality of FDI inflows to ensure that FDI would be a positive capital source for the whole economy (Nguyen Quynh Tho, 2016).

(i) Vietnam should screen licensed projects and strongly withdraw investment licenses of unsuitable projects. Accordingly, Vietnam needs to screen carefully the list of investment projects, while reviewing the registered projects. There should be clear and rigorous rules to prevent projects that are unsuitable for development purposes, including:

- Heavy industrial projects with outdated technology
- Projects with environmental pollution risks
- Projects which are slow to disburse
- Projects which are not implemented

A standard verification procedure should be established to examine the feasibility of investment projects, investor status, financial capacity and operational capacity prior to licensing to ensure the feasibility of the project. For projects that are not implemented, projects causing serious consequences for the economy, for resources, for the environment ... or simple labour-intensive projects or not creating much value added... need to withdraw investment licenses to ensure the quality of capital, to attract enough FDI within the FDI threshold and bring positive effects for economic growth.

(ii) To create a separate policy to attract strategic investors. This is an effective measure in some countries such as Malaysia, Singapore and China to improve the quality of FDI. This measure, on the one hand, helps Vietnam avoid the situation of granting incentives and at the same time to allow potential investors to see their value when investing in Vietnam, thereby increasing the attractiveness for investors. On the other hand, the identification of strategic investors helps Vietnam implicitly orient FDI into specific types of projects and sectors, thereby effectively implementing the economic restructuring. Specifically, Vietnam should consider the objects are classified as "strategic investors".

- Big, loyal partners who have long-term relations with Vietnam;
- MNCs have strong capital and market potentials;
- Investors come from countries that hold source technology;

These orientations should be clearly stated in the investment policy law and the investment-related regulations.

(iii) Improve the technology transfer capability of FDI enterprises in Vietnam. To ensure that FDI enterprises invest in advanced technologies in Vietnam, in addition to encourage enterprises to hold source technologies, Vietnam should implement some policy adjustments, including:

- Set up specific criteria for more stringent technological level of FDI projects in Vietnam to control the minimum level of technology transferred and minimize the risk of becoming a technology dumping ground. However, these regulations should be consistent with the commitments in ACIA. In fact, Vietnam currently does not have standards on FDI project technology but most of them are only orientations and are scattered in different legal documents (Investment Law 2014 and Law on Science and Technology 2013).

- There should be clear regulations requiring investors to commit about technology transfer. At present, Vietnam has a law on technology transfer. However, in this Law, provisions on technology transfer

have not been concretized. China's experience has been very successful in requiring investors to commit to technology transfer as soon as the project starts, with a rigorous implementation control process. In addition, to ensure that investors invest in hi-tech industries with high added value, Vietnam should have clear commitments on the protection of intellectual property rights for FDI investors.

- It is necessary to have incentive and preferential policies for joint venture projects to take advantage of the linkages between FDI enterprises and domestic enterprises to learn and transfer technology. In the past, Vietnam had imposed localization rates to ensure that local firms were able to participate in and access advanced technology. However, according to AIA commitments, localization requirements for FDI projects were not available. Therefore, if Vietnam does not have specific preferences for joint venture, the capital FDI under the influence of globalization in general and of ASEAN economic link in particular will be mainly used in the form of 100% foreign capital.

- R&D needs to be strengthened. On the one hand, Vietnam should take advantage of strength of FDI enterprises to support R&D in the country. There is a need for stronger incentives, perhaps even setting conditions for foreign investors to set up R&D centers in Vietnam. This will help domestic partners exchange knowledge about technology, research and development, and technology. Several effective measures for the development of R&D activities from countries such as the establishment of favourable financial mechanisms for the construction and development of hi-tech research centers, import tax exemption, VAT on machinery for R&D and new product development; financial support, low interest loans for R & D projects. In addition, the Vietnamese partners also must invest in R&D facilities and train staff to gain access to technology.

(iv) Taking advantage of FDI to upgrade infrastructure. To facilitate the investment activities, the technical infrastructure in Vietnam needs to be developed and upgraded to meet the requirements of foreign investor. Accordingly, Vietnam should pay attention to the following issues:

- Review the plan on infrastructure so as to give priority to attract investment in infrastructure development. Maximizing resources for investment, including state budget, private capital, ODA and FDI. Priority will be given to infrastructure construction projects such as transport, water supply, sanitation, power generation, energy, information systems ...

- In the context of resource constraints, a number of key areas should be selected to invest in upgrading modern, advanced infrastructure; Applying the "bird call" model – to build high economic zones or hi-tech corridors with synchronous and complete infrastructure facilities to attract FDI inflows.

- Infrastructure construction should take into account to sustainability of the facility over time to ensure sustainable development of the infrastructure. To ensure the sustainability of construction, the quality control and inspection activities in the construction of works are very necessary and important. It is necessary to check the supervision from the design stage, the selection of building materials to the construction and maintenance of construction.

(v) Improve environmental protection policy:

- Prioritize the current environmental issues. In recent years, Vietnam has been facing large-scale environmental pollution caused by FDI projects (pollution of Thi Vai River, sea pollution...). To ensure that this situation does not happen again, the authorities needs to be decisive in dealing with violations related to environmental issues: Concentrate on dealing with polluting establishments besides the sanctioning forms. It is necessary to revoke business licenses for polluting enterprises; environmental rehabilitation and restoration in affected areas ...

- To adjust the policy system towards the priority of environmentally friendly production activities with high technical standards. Priority selection: partners from countries with high environmental standards; partners using technology to save materials, recycle technology, reuse and reduce waste; Partners in research and development of clean energy (wind energy, solar energy ...). For these subjects, incentives should be introduced to encourage. Accordingly, the highest tax incentives may be applied in the current corporate income tax law (tax exemption for the first four years, 50% reduction of the tax payable for the next nine years); or the lowest rate of corporate income tax (currently applying the tax rate of 10% for enterprises operating in the fields of education/ training, health and environment).

- The regulations on environmental protection standards and regulations should be clear, detailed and enforceable. The State should issue and direct the implementation of legal documents on environmental protection and guiding documents in a clearer, tighter and more serious manner.

- The effectiveness of international cooperation on environmental protection needs to be broadened and enhanced. In fact, Vietnam's environmental regulations are often lower than international standards, and monitoring is very loose. Therefore, to ensure effective international cooperation on environmental protection, Vietnam must commit not only to fully implement international regulations on environmental protection but also to specifically elaborate on environmental protection to ensure the environmental compliance of FDI projects.

- Need to research and build carbon tax law. Carbon is a form of environmental tax that targets the amount of carbon dioxide emitted by the fuel, thus reducing the use of fossil fuels. This tax has been applied in many countries. This is an environmental pollution control tool that Vietnam can fully apply for screening FDI projects./.

INDUSTRY 4.0 AND INDUSTRIAL INTERNET: COMPARISON, INSPIRATION AND COPING STRATEGIES

Tran Phuong Thao*

ABSTRACT: *Industry 4.0 and Industrial Internet are the future industrial development models born in Germany and the United States in the context of the new industrial revolution. By comparing and analyzing the similarities and differences between Industry 4.0 and Industrial Internet found that two models have a similarity in motivation, core, direction and results, but difference in comparative, which leads to obvious differences in connotation, realization path, implementation focus and the effect of two modes. A large number of similarities between Industry 4.0 and Industrial Internet actually indicate a new direction for the future development of global industry. Different points suggest that only the development mode combined with national conditions can be widely supported, which undoubtedly provides valuable experiences for Vietnam to formulate countermeasures and accelerate.*

Keywords: *Industry 4.0; Industrial Internet; Comparison; Inspiration; Coping Strategies*

1. INTRODUCTION

Since the 21st century, the speed of information and communication technology innovation and iterative evolution has been accelerating. Technologies such as information, biology, new energy, and new materials have shown significant cross-convergence, which is widely regarded as a new round of global technological revolution and industry. The historical experience of theoretical research and economic development has repeatedly proved that each industrial revolution is preceded by breakthroughs in major science and technology. Conversely, major technological breakthroughs form an industrial revolution through the comprehensive reform of production methods and production relations. In this round of scientific and technological revolutions and industrial changes, information and communications technologies have accelerated their innovation and quickly penetrated into other industries. Large number of researches has proved that the innovation and wide application of information and communication technologies have led to a significant reduction in cooperation, communication, and information processing cost (Brynjolfsson and Hitt, 2000), and complementing organizational change to increase productivity significantly (Zand et., 2011). In the 1970s to 1980s, a large number of Economists found that there were no obvious differences between IT investment and high performance. The associated “productivity paradox” has ceased to exist. As information and communication technology innovation accelerates further and accelerates integration with other technologies and industries, directly or indirectly promotes a significant increase in production efficiency (Saunders and Brynjolfsson, 2009), the structure of production input factors operating in the global economy may undergo further major adjustments. The economic functions of manufacturing may be redefined, and the global industrial competition landscape may also be reconstructed.

After the global financial crisis in 2008, in order to accelerate the economic recovery and further seize opportunities for the development of new industrial revolution, developed countries such as Europe, America and Japan have launched a stimulus policy based on manufacturing industry to accelerate the integration of information technology and industry. Germany Industry 4.0 and Industrial Internet of the United States have become the most representative new models. But the concept of Industry 4.0, Industrial Internet still not systematically reviews in the similarities and differences between two models. So based on analyze Industry 4.0 and Industrial Internet to realize their knowledge and experiences could narrowed the gap between Vietnam and the Developed countries and even surpassed in some areas.

2. INTRODUCTION AND EVOLUTION OF INDUSTRY 4.0 AND INDUSTRIAL INTERNET

According to the concept of Industry 4.0 and its progress, it can be divided into three stages (as shown in figure 1). First, the war strategy upgrading stage in 2011 mainly completed the evolution from concept proposal to national strategic project. In January 2011, the Industry Science Research Alliance (FU) of Germany proposed the strategy of Industry 4.0, believing that Industry 4.0 was the fourth industrial revolution based on Cyber Physics System (CPS). In April, Hannover Messe in Germany, German Research Center for Artificial Intelligence (DFKI) Wolfgang Wahlster professor publicly for the first time put forward Industry 4.0 concepts, since this concept with the German Academy of Science and Engineering, Fraunhofer Society, Siemens and other widely recognized in academia and industry. In November, the strategy of Industry 4.0 was included in the action plan of high-tech strategy 2020, and Industry 4.0 officially became a strategic action promoted by the whole country and all sectors of society.

Second-the development of the strategic framework from January 2012 to September 2013. In January 2012, the Industrial-Scientific Research Alliance's Communication Facilitation Team was initiated and co-chaired by Dr. Siegfried Dais from Robert Bosch GmbH and Professor Henning Kagermann from German Academy of Science and Engineering. The "Industry 4.0" working group was formally established. The main task of the working group is to draft a comprehensive strategic proposal for the implementation of the Industry 4.0 project. In October 2012, the "Future Project "Industry 4.0" Implementation Recommendation, coordinated by the German Academy of Science and Engineering, was formally submitted to the government department. This proposal became the basis for the 2013 version of the proposal. At the Hannover Messe in April 2013, three major industrial associations such as the BITKOM, VDMA, and ZVEI. The joint secretariat was established and the "Industry 4.0 platform" was formally launched. The goal is to introduce and develop technologies, standards, business models and organizational models. In September, the German Federal Ministry of Education and Research released the "Proposal for Seizing the Future of German Manufacturing - Implementing the "Industry 4.0" Strategy" revised and improved by the Industry 4.0 working group. This report has had a major impact on the world's government, industry, and research institutions. It has become an important window to look into the future production model, and also announced that the German Industry 4.0 strategic implementation framework has been completed.

Third, the strategy has been implemented since December 2013. In December, German Association for Electrical, Electronic & Information Technologies (VDE) issued the first Industry 4.0 standardization road map of Germany, which meant that the standardized action plan in the Industry 4.0 strategic proposal began to enter the practice stage, and it also marked the beginning of the implementation of the whole German Industry 4.0 strategy. At the same time, SIEMENS and other companies have also carried out the global layout and experimental construction of digital factory.

In the United States, the concept of Industrial Internet can be divided into two stages. First, the concept of Industrial Internet has been put forward and publicizing since 2012. At the end of 2012, GE published *Industrial Internet: Pushing the Boundaries of Minds and Machines*. It first proposed the concept of Industrial Internet, that the Industrial Internet is the flow and interaction of data, hardware, software and intelligence (Evans and Annunziata, 2013). In fact, it is through the advanced sensor networks, big data analysis, and software to build intelligent industrial networks with self-improvement capabilities. Since then, GE has invested 1.5 billion U.S. dollars for R&D in the Industrial Internet field within three years, and has spared no effort in promoting the concept of Industrial Internet in the United States, Vietnam, and other markets. It is expected that all parties will agree and join in the application of this model. The second is the application and promotion phase of the Industrial Internet model since 2014. At the end of March 2014, five companies including AT&T, Cisco, GE, IBM, and Intel jointly announced the establishment of the Industrial Internet Consortium (IIC), aiming to establish a technology that aims to break down industries and regions. Barriers, global open membership organizations that promote the integration of the physical world with the digital world. Currently, the alliance's members have expanded from the initial 5 companies established to 170 (as of June 20, 2015), covering large and small technological innovators, vertical market leaders, researchers, universities and governments. Departments, as well as multinational companies engaged in hardware, software, services, consulting, etc., such as Microsoft, Hewlett-Packard, Accenture, Symantec, National Instruments, Fujitsu, Hitachi, Huawei, etc. In October 2014, GE released "Future Intelligence" in Shanghai, stating that Industrial Internet, advanced manufacturing and global wisdom are three core elements that gave birth to a new round of industrial changes and significantly improved production efficiency, and demonstrated that they are using the Industrial Internet. Improve the efficiency of production and operations in the medical, aviation, energy, water treatment, oil, and gas industries.

3. SIMILARITY BETWEEN INDUSTRY 4.0 AND INDUSTRIAL INTERNET

The history of industrialization in different countries around the world shows that although different countries have adopted different measures and means in promoting the development of industrialization, each industrial revolution almost laid a general and consistent path for the global industrialization process. Under the wave of a new round of scientific and technological revolutions and industrial changes, industrial development has emerged as a trend of intelligence, networking, and service. Although Germany and the United States have proposed different strategic concepts, models, and road maps respectively, but there are many common similarities between the two in the trend of industrial development.

3.1. Changes in demand are common endogenous incentives

From the perspective of economics, the continuous evolution of demand is always the inexhaustible driving force for supply-side technology, structure, and model changes. The upgrading of market demand will lead to demand for upgrading industrial development technologies and models. The formulation and promotion of Industry 4.0 and the Industrial Internet concept are, in the final analysis, the exploration of a new path of market competition that revolves around changes in consumer demand or the development needs of the industry in the new era. Industry 4.0 is mainly due to the fact that German domestic companies and research institutes have come to realize that in the context of the transformation of market demand towards personalization, diversification, and convenience, Vietnam and the United States have accelerated the industrial transformation and model through the use of Internet technology. Efforts to innovate to enhance competitiveness have made significant progress. Germany's manufacturing industry is losing

the opportunities for innovation brought about by the Internet to accelerate innovation. It is only actively using Internet innovation technology to speed up the transition to personalization, diversification, and intelligence. To adapt to changes in market demand, maintain or enhance the international competitiveness of the industry. In this regard, the essential connotation of Industry 4.0 is summarized as a new generation of smart manufacturing production methods that are naturally generated in response to individualized consumer demand, and this new production method along the direction of demand upgrading naturally represents the future direction of industrial development. In the United States, although GE puts forward the concept and model of Industrial Internet from the perspective of production efficiency, this efficiency improvement is exactly what is currently in urgent need of the high-input, high-consumption, and high-emission industrial development model that exists worldwide, and it is also an industrial transformation and upgrading to achieve the sustained and healthy development of the constant demand. GE proposes that in the next 15 years, as long as the Industrial Internet promotes cost savings of 1%, the aviation, power, medical, railway, and oil and gas sectors will be able to realize values of 30, 66, 63, 27, and 90 billion U.S. dollars, respectively (Evans and Annunziata, 2012), such a huge potential market demand is the fundamental internal driving force for GE to push the Industrial Internet.

3.2. The information physics system is the same model kernel

With the continuous improvement of production technology and the continuous improvement of the complexity of the industrial ecology, the soft foundation required for industrial development has also become increasingly complex. While Internet technology has accelerated its development and increasingly penetrated into various fields of production and life, the industrial development base has also evolved from the embedded system in the 1970s to the Internet of Things in the 1990s. At present, the proposal of Industry 4.0 and Industrial Internet is based on the more complex network-the Information Physics System (CPS) (CPS is a further extension of the Internet of Things principles and technologies) (Berbon and Watkins, 2014). In May 2005, a study led by the National Academy of Sciences (2007) proposed the development of a new digital network infrastructure to make the best use of rapidly growing databases and multidisciplinary cooperation. This is actually the CPS system. In February 2006, the American Academy of Sciences further listed CPS as one of the important research projects in the report of the “American Competitiveness Plan” (Li Zuopeng et al., 2011). In July 2007, the US President’s Science and Technology Advisory Committee (PCAST) released a report on the evaluation of the Federal Network and Information Technology (NIT) R&D project, listing CPS (formerly NIT system linked to the physical world) as the top of the eight key information technology fields - the first in the technical field (Marburger et al., 2007). Even though the concept and connotation of CPS are still being extended, the community has already formed a relatively unanimous agreement that CPS may promote the improvement of production autonomy, functionality, availability, reliability, and network security (Baheti and Gill, 2011). It is precisely because of this global convergence that Germany’s Industry 4.0 and the Industrial Internet produced in the United States have a common technical foundation. In Germany’s Industry 4.0, CPS is at the foundation and core position and is the most frequently used term in the German Industry 4.0 implementation recommendation report. The origin of CPS in the United States, the concept of Industrial Internet is naturally based on this, but the connotation and function of CPS has been internalized in the concept of Industrial Internet proposed by GE. In fact, GE defined the Industrial Internet as “Big Data + Internet of Things” (GE and Accenture, 2014), and some scholars directly referred to the United States’ industrial strategy as the CPS strategy (Sui Mingjie, 2014). It can be seen that both Industry 4.0 and the Industrial Internet use CPS as the kernel, and the two concepts have significant homology with their evolution.

3.3. Integration development and industrial upgrading is a common direction

The process is a continuous evolution and upgrading of the industrial development in essence. The proposed and accelerated evolution of the concept of Industry 4.0 and Industrial Internet reflects the consensus that countries have formed such a consensus that in the face of the intelligent, networked and service-oriented trend of global industrial development in 21st Century, the accelerated integration of industry and the Internet and the accelerating transformation of the existing production and manufacturing systems are grabbing this development. It is called the fourth industrial revolution, Industry 4.0, and the third industrial revolution in the United States, which is characterized by the deep application of information and communication technology as the prominent feature of the technological revolution and industrial revolution. Despite the different calls, the depth application of information and communication technology will bring about major changes and even subversion in energy utilization, industrial production, enterprise management and so on. Industry 4.0 and Industrial Internet are only different appellations to the same trend. In practice, Industry 4.0 and Industrial Internet are based on the continuous evolution of the existing industrial system, the essence of which is the deep integration of industry and information and communication technology, and then to improve the overall quality of the industry. In the Industry 4.0 proposal, the upgrading of infrastructure, factory safety facilities, production equipment and old systems is proposed to adapt to the application of new technologies and models, and to integrate information and communication technology into the traditional equipment manufacturing industry to maintain global market leadership. In the Industrial Internet, GE is paying more attention to the upgrading of the large stock of traditional industries, as Immelt, chairman of GE, said: "The goal of the Industrial Internet is to upgrade those key industrial fields."

3.4. All will move toward smart manufacturing mode

The integration of information and communication technologies and manufacturing has spawned a smart manufacturing model. The industry sector has realized the potential of smart manufacturing in the manufacturing transformation process. However, the extent to which this model can bring about significant improvements in efficiency is still unclear (Trombley and Rogers, 2014). From a mediocre perspective, both Industry 4.0 and Industrial Internet are organic integration of Internet technology and industrial technology. Therefore, both of them will inevitably move toward a similar end point, namely, to realize an intelligent, networked production and manufacturing method. German Industry 4.0 directly proposed to focus on the development of smart production and smart factories, and strive to build Germany into a global supplier of smart manufacturing technology. GE's Industrial Internet puts intelligent machines, advanced analytics, and employees as three core elements (Evans and Annunziata, 2012) and highlights the application of big data mining and analytics technologies to realize device control, process optimization, analysis, and decision-making intelligence. Change. It can be seen that smart manufacturing is the common goal of both of them. It is to create an intelligent world in which everything is interconnected and information is tapped through the integration of Internet and industrial technologies, and to drive manufacturing efficiency and intelligence through technology-driven manufacturing. Information upgrade. What needs to be emphasized is that although both focus on industry or manufacturing, the two models will eventually have a transformative impact on the production and living patterns of the entire society and will even weigh the productivity and production relations to a certain extent.

3.5. Standards and security are the basis for common emphasis

In addition to basic conditions such as broadband infrastructure and various types of terminal equipment, standards and security are the common emphasis of Industry 4.0 and Industrial Internet. For

example, in the process of accelerating progress toward the Industrial Internet, GE emphasized the need for governments and industry to work together in the field of standardization and security to establish uniform standards and efficient Internet security mechanisms (Immett, 2012). Specifically, in terms of standards, Industry 4.0 and the Industrial Internet both regard it as the first field to achieve the ultimate goal. Industry 4.0 has formulated and issued a standardized roadmap. The main goal of the Industrial Internet Alliance is to promote the compatibility of all standards and develop a “universal blueprint” enables devices of different vendors to share and transmit data, speeding up the convergence of the physical world and the network world. In terms of security, Industry 4.0 believes that the security issue is a crucial factor in determining the success or failure of the implementation of the strategy. A more stringent data protection plan is proposed and security is one of the eight priority areas of action. In the Industrial Internet, cyber security management is also a top priority. GE proposes to realize the vision of the Industrial Internet and needs an effective cyber security mechanism while considering the security of network security (especially cloud defense strategies) and high-end networking equipment. In fact, whether or not a common and unified standard system can be established is the most important factor in determining the proliferation speed of each new model. Whether or not equipment, data, and other aspects can ensure the safety of each new model can be widely marketed. The key factor to accept is because it is the fundamental driving force for companies to profit.

3.6. The enterprise is the key subject for promotion and application

Both Industry 4.0 and Industrial Internet have a typical “civilian” character in their presentation and promotion. Leading companies and leading scientific research institutes play a central role. Industry 4.0 was first proposed by Prof. Wahlster of the German Artificial Intelligence Research Center in 2011 and has since been widely recognized and promoted by the academic and industrial circles of the German Academy of Engineering, the Fraunhofer Association, and Siemens. Although the German government department incorporated Industry 4.0 into the “High-tech Strategy 2020” in 2013 and plans to invest 200 million euros to support R&D and innovation in related fields, the main role of the German government department is still to “create the environment”. The Ministry of Research (BMBF), the Federal Ministry of Economics and Technology (BMWi), and the Federal Ministry of the Interior (BMI) play a major role in coordinating the entire system of advancement. Moreover, the German government is trying hard to promote small and medium-sized enterprises to become the creators and users of the new generation of intelligent production technology for Industry 4.0. The Industry 4.0 working group is also mainly established and operated by relying on professional associations. Similarly, the proposed and promoted Industrial Internet in the United States is still a typical corporate behavior. GE first proposed the Industrial Internet concept, and by the time the Industrial Internet Alliance was established in 2014, it had not seen the relevant government departments in the United States publicly claiming to implement the Industrial Internet strategy. Although the U.S. Secretary of Commerce once stated that “Industrial Internet is expected to completely reshape the interaction between mankind and technology, the government expects public-private partnerships similar to the Industrial Internet Alliance to jointly promote the creation of new job opportunities”. However, in reality, the U.S. government strongly supports the Advanced Manufacturing Partner Program (AMP) and its main approach is similar to that of Germany. Universities and companies that have a prestigious research institute in the world jointly promote it. It can thus be seen that even if the US government is involved in the promotion of the Industrial Internet in the future, it will start more from the perspective of the “public domain” and will not play a leading role in it.

4. DIFFERENCES BETWEEN INDUSTRY 4.0 AND THE INDUSTRIAL INTERNET

From the above detailed explanation of the similarities between Industry 4.0 and the Industrial Internet, it can be seen that the two new models that originated in Germany and the United States have much in common and can be described as similar. However, in fact, influenced by the economic development stages of Germany and the United States, industrial comparative advantages, and international trade characteristics, Industry 4.0 and the Industrial Internet still have significant differences in terms of backgrounds, model connotations, implementation priorities, implementation paths, and effects.

4.1. The concept and connotation of Industrial Internet is larger than that of Industry 4.0

In the European Union's statistical definition, industry and manufacturing are the same concept (Blanchet et al., 2014). Moreover, from the perspective of practical discussion, the concept of Industry 4.0 proposed by Germany should mainly refer to manufacturing industry. In the proposal of Germany's implementation of the Industry 4.0 strategy, smart production and smart factories are two major themes. Its main strategic intention is also to respond to pressure from the US manufacturing industry through the Industry 4.0 project to build Germany into a major supply of intelligent manufacturing technology. In GE Immelt's view, the Industrial Internet is an extension of the Internet application. It extends people, business, and information to connect people, data, and machines. This connection is not limited to industry or manufacturing field. In the same way, the new model created by this extension will not only be limited to manufacturing, but will also lead to the emergence of new modes and new forms of business such as R&D and service, and even promote the transformation of the entire industrial ecosystem. Correspondingly, although GE translates the Industrial Internet into the industrial Internet, from the perspective of its business expansion, it is actually promoting the evolution of the consumer Internet to the industrial Internet. For example, among the 4.0 Industrial Internet products launched by GE, the oil and gas platform monitoring and management, hospitals Management systems and other products have exceeded the industrial sector and have further expanded into service areas.

4.2. The implementation path is different

Among the major developed economies in the world, the United States is one of the countries with the strongest innovation strength. Especially in this round of scientific and technological revolutions and industrial changes, the United States has globally leading innovative strengths in fields such as information and communications, new energy, and new materials. In contrast, Germany is a traditional manufacturing powerhouse, especially equipment manufacturing has a prominent global competitive advantage. It not only possesses large multinational companies such as Siemens, but also has a number of globally invisible champions who specialize in new technologies, but innovation in Internet technology. With regard to applications, it is difficult to compete with the United States. At the same time, in terms of the development of the information economy, Germany also lags significantly behind the United States. In 2014, the top 20 Internet companies in the global market capitalization came from the United States and Asia. None of them came from Germany. It is precisely because of this development difference that the Industry 4.0 strategy proposed by Germany emphasizes the ontological status of industry. In the promotion, it focuses mainly on the integration of advanced information and communication technologies into the traditional manufacturing field in order to realize intelligent manufacturing. The transformation of the direction of smart services can be called the "manufacturing + Internet" path. In contrast, the Industrial Internet proposed by GE of the United States highlights the characteristics of the era of industrial development in the new era, paying more attention to software, networks, and big data technologies, and tries to achieve integration between different devices and people, communication, control, and calculation. Utilizing the United States' leading

advantage in the field of Internet technology to accelerate the penetration and transformation into traditional industries can be called the path of “Internet + manufacturing.”

4.3. There is a difference in emphasis

Industry 4.0 emphasizes the “intelligentization” of the process of production, especially the evolution of the whole production process from automation to intelligence. The intelligent factory put forward to focus on the process management of production. The purpose is to realize the flexible manufacturing and sexual production mode with the personalized needs of the user as the center, and finally complete the production. Intelligent transformation. For example, SIEMENS has built demonstrative digital factories in Germany, which are known as the basis for Industry 4.0, known as a high level of digitalization, automation and intelligence. Unlike this, the industrial Internet in the United States has more emphasis on the “productivity” promotion goal of production, more attention to data collection, analysis and value transformation based on networking equipment, that is, collecting data through sensing devices, and making use of large data technology to provide decision-making suggestions for reducing costs and improving efficiency through production system. Make meticulous control of each link to improve production efficiency. For example, GE, in the United States, has launched an industrial Internet test plant for the production of advanced sodium nickel batteries in 2012, and installed more than 10,000 sensors (Fitzgerald, 2013) connected to high speed Ethernet within the entire more than 16,000 square meter plant. The plant is collected, analyzed, and processed to improve the process. It is famous for improving efficiency. In short, German Industry 4.0 emphasizes the intelligent transformation of the manufacturing process itself, while the industrial Internet in the United States emphasizes the efficiency of manufacturing.

4.4. The promotion effect has shown a difference trend

Industry 4.0 and industrial Internet are the different strategic practices of German and American enterprises in dealing with the fierce competition of the new industrial revolution. There are many similarities between the two, and the direct competitive relationship is inevitable because of the two. From the practical effect, the promotion of Industry 4.0 and industrial Internet has also shown great differences. In spite of the fact that the German industry and research medium and other sectors are familiar with the strategy of the German industry 4.0, and the official cooperation between China and Germany is also being carried out in the Industry 4.0 project, in fact, Germany is mainly concerned with the huge consumer market in China, and it is relatively closed in the Industry 4.0, which is difficult for foreign enterprises to participate in. Unlike this, the American industrial Internet, driven purely by the enterprise, has developed rapidly after the establishment of an open industrial Internet Alliance in 2014. Leading enterprises in all fields of the world are gradually forming a gathering trend in the alliance. In the future, Industry 4.0 will be completely defeated if the industrial Internet Alliance further integrates all the leading enterprises in the world and truly establishes the unified standards for mutual recognition between enterprises. Therefore, although the Industry 4.0 strategies has the government to lift the flag, it has formed a good atmosphere of public opinion around the world, but in the actual promotion, the effect is less than the industrial Internet which is driven by the enterprise independently.

5. INSPIRATION AND VIETNAM'S COPING STRATEGIES

5.1. Inspiration

At present, the World is facing a new round of scientific and technological revolutions featuring the deep application of ICTs. Whoever can seize the new technologies to accelerate the industry's acceleration

of reforms will be able to occupy the commanding heights in future industrial competition. Both Industry 4.0 and Industrial Internet are new ideas and models put forward under this background. They eventually point to more digital, networked, intelligent, and service-oriented industries. From the perspective of the advancement of our country's integration strategy, the comparison and comparison between Industry 4.0 and Industrial Internet can at least give us the following important inspirations: (1) The characteristics, connotation, and foundation of the future industrial development model are basically the same, and the new model is established. Development and development need to focus on key areas for breakthroughs (such as CPS). The core technology with independent intellectual property rights is the basis for the vitality of the new model. (2) The difference between Industry 4.0 and the industrial Internet profoundly reflects the development basis and comparative advantages of Germany and the United States in the industrial and Internet industries. Only by grasping the characteristics of the country's industrial development base and comparative advantages can we formulate suitable conditions for the country. (3) Industry 4.0 and the Industrial Internet are rushing forward to formulate standards, which fully demonstrates that the competition of standards and rules is the strategic commanding point for the future development of industrial intelligence. At the same time, the security issue is the fundamental prerequisite for the advancement of the new model. (4) Both Industry 4.0 and the Industrial Internet are driven by market entities such as companies. This tells us again that only by relying on market forces can the new model gain vitality, and the current industry's current advancement advantage indicates that "opening" is a major boost. (5) Regardless of the new model adopted for industrial development, demand is a "fundamental" driving force that cannot be separated from it. Always actively adjusting production and business activities around the evolution of consumer demand can achieve long-term competitiveness. This also means that the economy transformation and upgrading of the production and operation model of the stock industry is the most important aspect of the new model.

5.2. Vietnam's coping strategies

The experiences of Germany's Industry 4.0 and America's Industrial Internet have provided useful inspiration for Vietnam's economics transformation.

Change the policy of SMEs. The experience of German SME development shows that the government must not only focus on solving the practical difficulties in the aspects of capital, skills, innovation, management, etc. faced by the development of SMEs. What is more important is to create a transparent, fair environment and open operation for SMEs to build an industrial organization structure conducive to the coordinated development of large enterprises and SMEs. Among the government's available policy tools, such as public procurement and industry-guided funds, we should try to lean towards SMEs so that SMEs can fully enjoy domestic policy resources. At present, the basic ideas of Vietnam's SME policies are supportive and supportive, lacking long-term, coordination, and operability. Drawing on German experience, Vietnam's SME policies should accelerate the transition from helping-oriented policies to improving the public service systems for small and medium-sized enterprises, increasing the degree of openness of innovative resources to small and medium-sized enterprises, and promoting the innovation capabilities of small and medium-sized enterprises.

Pay attention to the improvement of corporate management capabilities. The main battlefield for advancing the new industrial revolution is still a large number of micro-enterprises. It is necessary not only to guide and encourage enterprises in an orderly and intelligent way, but also to emphasize the complexity of the process in improving the management capabilities of enterprises. New requirements to prevent the potential risks facing blind transformation of enterprises. Compared to other versions of the new industrial revolution, the German "Industry 4.0" program highlights the importance of the complexity of business management

processes and advocates measures such as optimizing organizational processes, extending the life of skilled workers through lifelong learning, and demonstrating best practice projects. Enhance the company's own capabilities and prevent transition risks. These policies have direct inspiration for Vietnam companies.

Accelerate the application of advanced Internet technologies and models in traditional industries, and regard the transformation and upgrading of stock industries as the focus of Vietnam's integration strategy. The promotion of the integration strategy in Vietnam should speed up the promotion and application of advanced manufacturing technologies such as 3D printing, industrial robots, and collaborative design in the traditional manufacturing industry, promote the intelligent transformation of manufacturing modes in the traditional manufacturing industry, accelerate the Internet of things, big data, and The promotion and application of advanced information and communication technologies, such as cloud computing, in traditional manufacturing industries has promoted the evolution of traditional industries in the direction of digitization, intelligence, and service. At the same time, government departments must actively promote cooperation between production, teaching and research, and vigorously support high-end integrated personnel training and professional and technical personnel training that adapt to new technologies and new models, and provide talent support for the integration of large-scale stocks of traditional industries.

In addition, German industrial policy attaches importance to the construction of technological infrastructure, attaches importance to the importance of standardization for industrial development and international competitiveness, attaches importance to data and information security, and attaches importance to environmental protection, but also worthy of our country's industrial policy.

Of course, Germany's industrial policy practice is generally to serve Germany's industrial innovation model. We believe that drawing on the experience of Germany does not mean that we can deviate from the realities of domestic industry development. The attitude that we should adopt is based on the actual situation of Vietnam's industry, economic and social development, and clearly defines the optimal industrial innovation model that suits Vietnam's industrial upgrading, and adjusts the industrial policy around this model to improve the efficiency and cost-effectiveness of the policy. This is also a German experience in itself. It is also an issue that needs further study.

PROBLEMS IN FDI ATTRACTION TOWARDS SUSTAINABLE ECONOMIC DEVELOPMENT IN VIETNAM

Nguyen Tien Thuan - Tran Thi Thu Nga*

ABSTRACT: *On December 29th, 1987, the Law on the Promotion of Foreign Investment in Vietnam officially came into force, which creates the legal basis for foreign investors to invest directly in Vietnam. Up to 2018, Vietnam has attracted FDI to develop the economy for 30 years. It cannot be denied the positive role of FDI for economic and social development of our country in the past 30 years including partly solving difficulties in investment capital to ensure economic growth, creating jobs for laborers, creating incentives for domestic investment enterprises to develop; however, the negative effects of FDI inflows on the economy is recognized, especially in economic sustainable development. This article highlights whether attracting FDI into Vietnam in the past 30 years has ensured sustainable economic development or not and proposes solutions to ensure the attraction of FDI into Vietnam will develop the economy sustainably.*

Keywords: *FDI attraction, sustainable economic development, Vietnam*

1. MAIN TEXT

What is FDI attraction to develop economy sustainably?

FDI attraction is a common issue that developing countries have been working on to solve capital shortage in the process of economic development. However, attracting FDI for sustainable economic development is a problem that is emerging in the developing world at the turn of the 21st century. In order to attract FDI for sustainable economic development, firstly, FDI attraction should be sustainable. Many people believe that the attraction of sustainable FDI is the attraction of “clean” FDI, which is right but not enough yet because in this conception, attracting “clean” FDI will also aim to facilitate the sustainable economic development (ie, ensuring all economic aspects for both investors and receivers, achieving social objectives and protecting the environment). According to new perspectives, another criterion needs to be added that is “purified investment capital” which means capital FDI must be used for business investment and not for any other purpose (e.g: investment in money laundering or business investment with the purpose of maximizing the natural resources of other country). Thus, the attraction of sustainable FDI must meet four basic criteria: investment for business purposes, not for interest self-seeking purposes, ensuring economic benefits for both investors and the recipients, ensuring the social objectives and protecting the ecological environment.

How to understand FDI attraction towards sustainable economic development? Logically, it is reasonable that FDI attraction should be sustainable to guarantee FDI attraction for sustainable economic development. If objectives for sustainable FDI attraction are achieved, objectives for attracting FDI to develop economy sustainably will be achieved then. Thus, attracting FDI to develop economic sustainably means FDI attraction

* Academy of Finance, Hanoi, Vietnam, Nguyen Tien Thuan Tell: +84 912176363; Email: nguyentienthuan@gmail.com

should guarantee the sustainability of economic development. In other words, attracting FDI must ensure the sustainable development of economy, resolve social targets and protect environment.

Assessment of FDI attraction towards sustainable economic development in Vietnam

According to a report of Foreign Investment Agency - Ministry of Planning and Investment, by the end of 2017, there are 24,200 FDI projects operating in Vietnam with a total registered capital of over \$ 310 billion, of which disbursed capital is US \$ 167 billion equivalent to 54% of the total registered capital.

According to Vietnam Association of Foreign Investment Enterprises (VAFIE), FDI inflows have contributed to the country's economic and social development and are reflected in the following aspects:

Firstly, FDI inflows are regarded as important additional sources of investment capital for economic development and account for about 25% of total social investment. Thus, FDI has contributed to arousing and improving the efficiency of the use of production resources. For example, FDI by 2017 contributed 20% to Vietnam's GDP compared to 2% in 1992.

Secondly, FDI inflows have created a momentum for our economy since FDI enterprises are pioneers for growth in many sectors in addition to creating competitive pressure with local firms. For example, in 2016, FDI enterprises in Vietnam account for 50% of industrial output value (also account for higher proportion in many sectors such as petroleum, electronics, food livestock, beverages ...), contributing over 72% of export value, 25% trade surplus, thus offsetting the trade deficit of domestic enterprises and contributing 20% to domestic revenue and 15% of total state budget revenues. On the other hand, FDI inflows have played an important role in increasing surplus of the capital account, changing the structure of exports in accordance with the rules, contributing to the improvement of the balance of payments in a positive way, thereby, improving the trade balance effectively.

Thirdly, create jobs for laborers and contribute to the improvement of the quality of human resources and enhance the development of the labor market. According to statistics, by 2017, the FDI sector has generated nearly 3.7 million direct jobs and about 5 million indirect jobs, or nearly 9 million jobs in total. Moreover, FDI enterprises often access to new production technology faster, thus, the requirement of enhancing the quality of human resources promotes the technical skills of workers. FDI enterprises in Vietnam are considered to be pioneers in training to improve their professional skills and management skills.

Fourthly, the acquisition and transfer of new technologies are promoted. In fact, many FDI projects in our country have used modern technologies in the fields of oil and gas exploration and exploitation, post and telecommunications, electronic production (computers, microelectronic circuits, smart phones, etc,.) It is the technology innovation of FDI enterprises that stimulates domestic enterprises to invest in technology innovation to create higher competitive products to be able to compete with the products of FDI enterprises in the domestic and export market.

Fifthly, the economy and domestic enterprises are encouraged to participate in the global production network through participation in the global value chain of domestic enterprises. It can be seen that when attracting FDI capital, Vietnam not only attains its economic and social objectives but also has its own businesses in the country that have business relations with FDI enterprises. Then, the opportunity to participate in the global production network and the global value chain of the product are widened to these domestic enterprises.

Sixthly, economic restructure towards industrialization and modernization orientation are enhanced. According to current statistics, up to 58.2% of FDI capital is concentrated in the processing

industry and has created over 50% of industrial production value, thereby, contributing to forming some key industries of the economy including telecommunications, petroleum, electronics, and information technology. Although the achievements in agricultural production are not as great as those in industry, FDI has had an impact on the shift of agricultural structure towards diversification of products, improvement of product quality (especially export agricultural products), and increases investment in the agricultural product processing industry. In service sector, the presence of FDI enterprises has promoted the emergence and development of a number of high quality services in the areas of finance, banking, auditing, tourism, and logistic.

In addition to the positive contributions of FDI to the country's economic and social development over the past 30 years, the attraction of FDI has also shown the negative effects in 30 years to attract FDI capital to develop the economy in our country which are called "failures" by researchers. These failures are FDI attraction hasn't ensured sustainable development in all aspects of economy, society and environment.

Firstly, the objective of attracting modern technology (especially high technology, source technology) has not achieved yet and the transfer of technology of FDI enterprises to domestic enterprises is very limited.

Through studies and from my point of view, Vietnam's FDI attraction in the past 30 years has not attracted modern technology mainly caused by both objective and subjective reasons which is lacking of close link between FDI enterprises and domestic firms.

The subjective reason originates from domestic firms as they are state-owned enterprises, they have been assigned specific tasks so they do not recognize the need to create close links with FDI enterprises to attract high technology, to expand production scale and to participate in the global supply chain. A typical example is that Sam Sung is one of the world's largest manufacturers of high-tech electronics, but most local firms are not able to participate in its global production chain because Vietnam's support industry (SI) has not been developed although the government's strategy of developing the SI has been implemented for more than 20 years. Private enterprises also want to take alliance with FDI enterprises but they cannot meet the requirements of FDI enterprises on capital and management capacity of technology.

The objective reason is that when FDI companies invest in Vietnam, they have already set up a system of global production and supply systems. Therefore, when investing in Vietnam, they only exploit the advantages of Vietnam in terms of labour and resources, thus they do not necessarily transfer advanced technology to Vietnamese companies. The fact is that 82% of FDI enterprises in Vietnam are 100% foreign invested enterprises (Report of MPI's Department of Planning and Investment, July 2017). The overwhelming 100% foreign-owned enterprises in Vietnam shows that they do not intend to transfer modern technology to Vietnam. That technology transfer is not set to be the goal for FDI enterprises creates potential risks in the management of business since local companies can not participate in their global production chains.

Secondly, The problem of environmental pollution caused by FDI enterprises.

The environmental pollution caused by FDI enterprises has a logical relationship with the first "failure". This is considered the second "failure" of our country after 30 years of attracting FDI because: FDI companies in Vietnam aim at maximizing profits in business, so they only bring low technology which easily causes environmental pollution. Due to delays in the completion of the legal framework for environmental protection, many FDI enterprises in Vietnam have been breaking the law to reduce the costs of investing in their waste treatment facilities or FDI enterprises have imported many types of industrial waste pollution from developed countries to Vietnam, thereby increasing the risk of environmental pollution.

According to the report of the Ministry of Natural Resources and Environment, in our country, over 80% of industrial zones in Vietnam are violating environmental regulations and only about 10% or about 300 FDI enterprises has paid attention to investment in environmental protection for cleaner production; however, it is worth noting that these enterprises are supported capital by projects to implement, not enterprises invest themselves. Many FDI enterprises have been detected and treated by the Vietnamese management agencies for causing serious environmental pollution such as: Vedan Company, Miwon Company, Ha Tinh Formosa Company ... FDI enterprises found to be the culprit causing environmental pollution are only the “floating icebergs”. In reality, the figure is certainly bigger but we do not have the legal base to force or encourage FDI enterprises to invest in completed waste treatment systems before operating the company. The problem of environmental pollution in our country caused by FDI enterprises has created a pressing concern in the whole society so we need to implement the government’s view which is “not attract FDI capital at all.

Thirdly, the contribution of FDI capital to addressing social objectives is limited.

Although FDI capital in Vietnam has contributed to solving some of the unemployment problems for workers, it is not commensurate with the capability of FDI because of the relatively modest employment flows accounted for only 3.9% of total employment; the average income of workers working in FDI enterprises was only slightly higher than that of domestic ones, and some FDI enterprises have not fulfilled obligation of contributing social insurance for employees.

Training workers for FDI enterprises in Vietnam is not good enough to meet expectations. Actually, FDI enterprises only train workers to know a part of the work in the production process so workers will be disadvantage in competing with young workers. Therefore, many FDI companies often start to lay off workers over 35 years old through a variety of company regulations to recruit younger people with more advantages and the same wages (even lower because they are new employees) and make the number of workers 35 unemployed.

On the other hand, because the control of Vietnamese regulators is not synchronized, many FDI companies have evaded the obligation to pay income tax to the Vietnamese government through transfer pricing. The transfer of prices of FDI enterprises has caused a loss of state budget and led to unequal competition with domestic enterprises, even pushed domestic enterprises to face the risk of bankruptcy and workers into unemployment. According to a report by the VCCI and the United States Agency for International Development (USAID) published in the provincial competitiveness index (PCI) Annual Report in 2017(announced at the end of March 2018), the number FDI enterprises in Vietnam reported loss tends to increase rapidly from 2012 onwards.

Table 1: Investment and business situation of FDI enterprises in Vietnam

| Year | Rate of enterprises increasing capital investment (%) | Rate of enterprises increasing the size of labor (%) | Rate of profitable enterprises (%) | Rate of loss enterprises (%) | Average income (in 2010) million USD | Average cost (in 2010) Million USD |
|-------------|--|---|---|-------------------------------------|---|---|
| 2012 | 5,2 | 31,0 | 60,4 | 27,5 | 1,54 | 0,97 |
| 2013 | 5,1 | 30,0 | 63,3 | 24,1 | 1,45 | 0,94 |
| 2014 | 16,1 | 62,4 | 57,9 | 34,2 | 1,14 | 0,71 |
| 2015 | 11,4 | 62,4 | 55,1 | 37,6 | 0,69 | 1,42 |
| 2016 | 11,0 | 63,3 | 59,0 | 33,4 | 0,73 | 0,49 |
| 2017 | 13,2 | 62,4 | 54,3 | 37,9 | 2,43 | 2,02 |

Source: VCCI Annual Report on Provincial Competitiveness (PCI) Annual Report 2017

The figures above show that after five years (2017 compared to 2012), the rate of loss FDI enterprises in our country increased by more than 10% (from 27.5% in 2012 to 37.9% in 2017) and the rate of profitable one drops 6% (from 60.4% in 2012 to 54.3% in 2017), which means a gradual increase in loss rate and gradual declining in interest rates. But the figures also show that the rate of loss FDI enterprises and the decrease of profit ones is paradoxical. In the past 5 years, the rate of increasing capital investment to expand the production of FDI enterprises increased by 8% (from 5.2% in 2012 to 13.2% in 2017), the scale of labor increased to 31.4% (from 31% in 2012 to 62.4% in 2017). It is clear that losses are not the case in FDI companies increasing the size of capital and labor size. If the average comparison between revenue and average cost on the data sheet, the FDI companies in Vietnam in the last period always profitable (except for 2015).

Fourthly, Vietnam's economy is becoming dependent on FDI enterprises.

Statistics show that the contribution of FDI enterprises to Vietnamese economy is increasing, indicating that Vietnam's economy is increasingly reliant on FDI enterprises. For example, it is clear that export activities of Vietnam increasingly depend on the FDI enterprises, in 2009 the export value of FDI companies only accounted for 32.9% of total export value, but by 2016 accounting for 70.2%, it is estimated to be accounted for 72.4% in 2017. This shows that domestic enterprises are becoming weaker as the economic integration is expanding and they have not really benefited from the integration process. Another example shows the dependence of Vietnamese economy on FDI enterprises is that the domestic market of some products currently dominated by FDI enterprises including: soft drinks dominated by Coca-Cola and retail goods distribution dominated by foreign retailers.

The fact that Vietnam's economy is more and more dependent on FDI enterprises is a real concern for future economic development because the development of the economy does not originate from internal forces of the economy. The consequences are extremely unpredictable when assuming that foreign investors come back at some time. This is another reason for us to see that attracting FDI into Vietnam is not really a guarantee for sustainable economic development.

Fifthly, The attraction of FDI does not guarantee the rate of strategic investors.

According to statistics by the end of 2017, there is not any investors coming from Europe among 10 big investors in Vietnam. TOP 10 big investors in our economy still are Asia countries and Southeast Asian ones such as Japan, Korea, Singapore, etc.,. The situation shows that we need to make changes in the strategy of attracting FDI to ensure the balance of strategic investors in the coming years to avoid the big dependence on some Asian countries in the future and also to ensure national security while still achieve the objectives during FDI attraction process

Solutions to attract FDI for sustainable economic development

With "failures" in attracting FDI into Vietnam over the past 30 years (1987-2017), these solutions are proposed in order to attract FDI in the coming time to ensure sustainable economic development:

First, Develop a plan to attract FDI in a synchronized way across the country; based on that, the regions and localities develop their appropriate plans. This measure aims to put an end to the situation of pursuing their own purposes and local interests which disrupt the country's overall planning, thus affecting the interests of the country as in the past.

To implement this measure effectively, the Ministry of Planning and Investment (MPI) as a leading state management agency, should issue legal regulations that oblige provinces and cities to comply with the general plan which has been approved by the Government. In special cases that provinces and cities want to

implement separate policies in attracting FDI will need to develop a plan to send to the Ministry of Planning and Investment to submit to the Government for decision.

Second, complete the legal system and policies related to attracting FDI in a consistent, public, transparent and realistic manner so as to create an open but competitive investment environment.

To ensure the disclosure of information related to FDI inflows into Vietnam consistently, transparently and transparently, MPI is required to use electronic information portal to provide information to foreign investors. On the other hand, MPI should also coordinate with people's committees in relevant ministries, provinces and cities to hold regular investment promotion conferences (either periodically as planned or as often as necessary).

Third, it is necessary to attract selective FDI to ensure good quality FDI projects. In particular, priority should be given to attracting high-tech FDI projects.

The screening of FDI attraction is to ensure that the attraction of FDI achieves the overall goal which is to ensure the sustainable development of the Vietnamese economy and to overcome the limitations in attracting FDI into the country in the past time. In order to do so, MPI should regularly update and submit priority investment areas and priorities in line with each specific period of the economy to the Government.

Fourth, Renovation activities of investment promotion must be linked with the objectives and tasks of national socio-economic development. Investment promotion activities for small and medium enterprises in the country should be emphasized.

Fifth, the state management of activities to attract FDI more effectively should be strengthened to limit law violations of foreign investors.

To implement the above solutions effectively, it is necessary to clarify the responsibilities and powers of the concerned ministries and provincial People's Committees in solving issues related to FDI attraction. At the same time, the coordination between the ministries and the provincial People's Committees in dealing with problems arising in the process of attracting FDI into Vietnam is also stipulated to ensure the sustainable economic development.

CONCLUSION

With the analysis and evaluation of the "failures" in attracting FDI for economic development over the past 30 years and the introduction of basic solutions above, I hope that in the coming time, the attraction of FDI into Vietnam will ensure sustainable economic development.

FINANCIAL LIBERALIZATION IN THE CONTEXT OF GLOBALIZATION – RECOMMENDATIONS FOR VIETNAM

Ngo Duc Tien*

ABSTRACT: *The financial system has a critical role in economic growth of the world because it helps to provide the capital to business operation. Besides, the globalization has been the certain tendency in all over world, which has brought not only opportunities but also challenges for every country. In the process of globalization, financial liberalization is a factor of universal concern because it has an important affection on the stability of financial system. This paper is going to clarify benefits and risks of financial liberalization, summarize the process of financial liberalization in Vietnam and give recommendations for Vietnam in the globalization process in general and financial liberalization in particular. The financial liberalization process in Vietnam will be analyzed clearly and logically. Accordingly, Vietnam should: Strengthen the efficiency of macroeconomic policies; Complete the institution and laws; Develop and complete financial markets and Improve the efficiency of using capital of the economy, etc.*

Keywords: *financial liberalization; globalization; financial liberalization process.*

1. INTRODUCTION

Nowadays, Vietnam is not only being a member of international organizations such as the UN, WTO, IMF, WB, ADB, APEC, ASEAN, but it has also implemented the multilateral free trade agreements with ASEAN countries, South Korea, Japan, and China, or signed the bilateral economic partnership agreement with Japan. In line with that integration process, nations in general and Vietnam in particular have chosen to adopt financial liberalization solutions to increase their competitiveness in the financial system, thereby improving the efficiency of allocation and usage of their resources. However, in the wake of the current global economic fluctuation, economists and researchers have questioned whether the benefits of financial liberalization are greater than risk associated with it or not? Since the first studies of McKinnon (1973) and Shaw (1973), along with the widespread acceptance of financial liberalization concepts, many countries have made efforts to liberalize the financial sector by removing controls over interest rates and credit, allowing free access to financial markets, and particularly, in the branch of finance and banking, granting autonomy to commercial banks and promoting the capital account liberalization. However, after the financial liberalization, many developing countries found their financial markets less stable, while financial institutions become more fragile due to multiple unusual business activities involving high risk levels and a range of factors arising in the legal framework and supervisions.

Therefore, having knowledge of the benefits and risks of financial liberalization is necessary to better prepare for international economic integration as well as to promote the liberalization of finance. In this paper,

* Academy of Finance, Ngo Duc Tien. Tel.: +84 987 822 722, E-mail address: vcb.dtda.1@gmail.com

the authors provide the overview of financial liberalization in Vietnam as well as give some recommendations to enhance the advantages of financial liberalization and minimize the negative impacts of it to Vietnam.

2. LITERATURE REVIEW

2.1. The definition of financial liberalization

Auerbach and Siddiki (2004: 231) define financial liberalization as the elimination of a series of impediments in the financial sector in order to bring it in line with that of the developed economies. There are principally three types of financial liberalization. Firstly, this term may be used to describe domestic financial sector reforms such as privatization and increases in credit extension to the private sector. For example, Gelos and Werner (2002: 1) examine how domestic manufacturing firms in Mexico have responded to these types of reforms. Secondly, financial liberalization may be used to refer to stock market liberalization. In this case, stock market liberalization occurs when a country opens up its stock markets to foreign investors, at the same time allowing domestic firms' access to international financial markets (Bekaert and Harvey, 2003: 5). Finally, financial liberalization may refer to the liberalization of the capital account. This is a situation where special exchange rates for capital account transactions are relaxed (Loots, 2003: 237), where domestic firms are permitted to borrow funds from abroad (Schmukler and Vesperoni, 2006: 183), and where reserve requirements are lowered (Kaminsky and Schmukler, 2008: 259).

According to the IMF, "Financial liberalization is a process of mitigating and then finally eliminating the control of Government to the operation of the national financial system, which makes it freer and more efficient following the market rules." This is the process of easing restrictions on market accessing rights for stakeholders seeking profit within the scope of law. The nature of financial liberalization is financial system operates under the inherent internal market mechanism and the financial regulatory role is transferred from the government to the market. The goal of it is finding effective synergies between the government and the market in the implementation of socio-economic objectives and tasks. Financial liberalization and financial repression can be seen as opposites in the governance of a country's financial system. Statistically, no country has had completely financial liberalization or financial repression. Basing on the characteristics and level of development, each country will choose the sustainable method to manage their financial system. In overall, the developing countries have high level of financial repression and the developed countries often prefer financial liberalization more.

2.2. The content of financial liberalization

Financial liberalization policy includes the liberalization of interest rate, exchange rate, lending practices of commercial banks, foreign exchange transactions and the operation of financial institutions in financial market.

Interest rate liberalization: Interest rate liberalization allows credit institutions (CIs) to freely decide on interest rates for capital mobilization and lending. The essence of interest rate liberalization is the mechanism of operating interest rate based completely on the supply and the demand of capital market to determine the equilibrium interest rate. The central bank only uses indirect intervention tools to regulate interest rates in accordance with the strategies and objectives set in each development period of the economy.

Exchange rate liberalization: The exchange rate is gradually liberalized, however it still needs to be monitored with market instruments to control and regulate rather than impose a fixed exchange rate. This leads to enhance the competitiveness and responsiveness of the domestic economy to changes in the world

economy in the context of openness and international economic integration. Exchange rates have become an important tool to control capital inflows, outflows and the handling of external imbalances.

Liberalization of lending practices of commercial banks: Liberalization of lending practices of commercial banks is shown as the change from crediting to a small number of customers to crediting all of customers and separating lending and commercial loans.

Liberalization of foreign exchange transactions: Foreign exchange transactions are activities of residents, non-residents in current transactions and capital transactions, the use of foreign currency in the territory of one country, providing foreign exchange transactions and other transactions related to foreign currency. A capital transaction is a transfer of capital between a resident and a non-resident in the following fields: (i) direct investment; (ii) investing in valuable papers; (iii) foreign borrowing and repayment; (iv) lending and recovering foreign loans; (v) other forms of investment in accordance with the law. Current transactions are transactions between residents and nonresidents without the purpose of transferring capital. Liberalization of foreign exchange transactions includes the liberalization of current transactions and the liberalization of capital transactions.

Liberalization of the operation of financial institutions in the financial market: The liberalization of the financial institutions' activities in the financial market can be identified as the elimination of discrimination among financial institutions in the different economic sectors, among different types of financial institutions, between domestic financial institutions and foreign financial institutions (limited scope of activities, forms of provision, mobilization of capital...), and the domestic and international expansion of financial services for the economic sectors and financial institutions, gradually moving from providing banking services monopoly to multi-sector financial market. Countries may undertake financial liberalization according to the route and method chosen in accordance with their particular characteristics. Here, we will take a closer look at the benefits and risks of financial liberalization.

2.3. The effects of financial liberalization

The benefits from financial liberalization

Firstly, financial liberalization helps to allocate resources effectively in a country as well as in the world. Liberalization of interest rate is the process in which the stakeholders decide the value of capital, the most important resource. Accordingly, this scarce resource will be allocated to the most effective borrowers. The free movement of capital allows for a more efficient allocation of global savings and transferring resources to the most efficient use.

Secondly, it will help to promote savings, investment and economic growth. With the same condition, more types of financial institutions and more kinds of financial product will enhance the effect on the economic growth. Clients in the financial market may have more high-quality and low-cost products, which increase the national savings. The liquidity of capital allows investors to achieve higher return rate, adjusted with the risk. Higher yield will make the savings and investment increase and enhance the percentage of economic growth.

Thirdly, financial liberalization can also promote the reform of countries as well as the quality of growth. Openness, economic integration in general and financial liberalization in particular will force each nation to reform and adapt to the world's common standards in order to minimize risks and maximize benefits brought from financial liberalization process. This reform process is rooted in the vital momentum: the legal framework has to be changed, supplemented and finalized in accordance with the rules of the game.

The risks from financial liberalization

In general, beside the positive effects, financial liberalization process will make the financial markets of countries, especially developing countries, more vulnerable by risk factors, such as detailed:

Firstly, the financial liberalization can increase the risk of financial crisis. Financial crisis is defined as the failure of one or more elements of the economy to fully meet its financial obligations. The biggest risk that financial liberalization brings is the opening up of the domestic financial market to increasing the risk of financial crises. This concern comes from two emerging issues: (i) the opening up of the domestic financial market is not sufficiently developed to facilitate external financial attacks; (ii) financial integration increases the risk of chain crises or imports crisis issues from the external market into the domestic financial sector. However, financial liberalization is not the root cause of financial crises, it only exacerbates the inherent weaknesses in macroeconomic institutions and policies, and thus increases more risk of leading to financial crisis.

Secondly, financial liberalization can make the Government lose control of financial market. Financial liberalization can make the domestic financial market manipulated by external forces, especially in the context of a weak domestic financial system. Foreign corporations, organizations, and enterprises manipulating the financial market will influence the policies of the government to make these policies more profitable for them. Therefore, the government's power to control, manipulate and supervise the financial market will gradually shrink. Moreover, the domestic financial market will become more sensitive to the international financial crisis and may eventually result in domestic political turmoil.

3. THE FINANCIAL LIBERALIZATION PROCESS IN VIETNAM

Before 1986, Vietnam's economy had no market principles. Thus, the financial markets did not really exist. There was no money market or capital market. The banking system had no commercial banks, and the central bank did all activities alone ("mono-bank" system). In addition, the banking system worked under direct control of the government through government order, without regard to market forces. The Vietnam Government then significantly relaxed regulation following the Vietnam Communist Party (VCP) formally endorsing a program of "renovation", also known as

"Doi Moi", at its Sixth National Congress in 1986. Central planning was relaxed, prices were freed, public sector spending declined, and restraints were loosened on business activity. Agricultural co-operatives were disbanded; farmers were given land-use rights and - in a similar way to China's transitional period - were allowed to market whatever output was left after they had fulfilled state contracts. In the financial and banking sector, the effects of "Doi Moi" resulted in a financial liberalization.

According to Shaw (1973) and McKinnon (1973), in transition economies, the order of economic liberalization should be started by balancing the government's finances, then followed with the financial liberalization (together with trade and foreign currency liberalization), and ended with the opening of the capital account. We could also analyze the financial liberalization process in Vietnam following this order as in Figure

Figure 1. Financial liberalization sequencing

Source: Summarized from McKinnon (1973) and Laeven (2003) State budget

After “Doi Moi” was launched, the budget deficit improved sharply. The budget deficit which was higher than 7% in the pre-1986 period was reduced to 4.3% in the 1991-1995 period and continued to reduce into acceptable rates in the 2000s. In the 2009-2012 period, however, the budget deficits became larger due to the effect of the global financial crisis as well as the Government stimulus spending in response to it. In 2013, the budget deficits reached the bottom with -5%. In period 2014-2017, the budget deficits became smaller gradually owing the recovery of the global economy as well as Vietnamese economy after financial crisis.

Figure 2. Budget deficit over GDP (%)

Sources: Report from ADB

Monetary, interest rate and foreign exchange rate

Instead of being dependent on the fiscal policy as was the case before 1990, monetary policy has become a typical macroeconomic instrument with an overall objective of controlling inflation and promoting economic growth. Currently, the making and influencing of monetary policy by the State Bank is based on market principles; market factors are respected and taken as the basis for the State Bank to make decision on adjustment to achieve macroeconomic objectives. The process of reforming monetary policy was done step by step, under control and linked to the reform of monetary policy instruments and reform in the institutional structure. Since 2000, indirect monetary policy instruments such as open market operations, rediscounting, and SWAP arrangements for foreign exchange, etc. have been replacing direct monetary control and administrative measures.

In parallel, interest rates have been liberalized. The SBV only influences the interest rate and exchange rate through money market and monetary policy instruments. Therefore, interest rates and exchange rates currently reflect more closely the value of the Vietnam Dong, and follow the development of the international and domestic money market. Interest rates were gradually liberalized in sequence and with caution. First of all, the real positive interest rate principle was introduced in 1992. Deposit interest rates were liberalized in 1996, and lending interest rates have been determined through negotiation since June 2002. After “Doi Moi”, Vietnam opened its economy to other countries. As a consequence, the Vietnam Dong was allowed to exchange with other currencies. Up to now, the exchange rate policies of Vietnam has experienced 3 periods: period of free exchange rate (1989- 1991), period of fixed exchange rate (1992-1997) and controlled-floating exchange rate (1998-present).

Securities market

The opening of the Hochiminh City Securities Trading Centre (HSTC) in July 2000 marked a milestone in Vietnam's efforts in its economic reforms and reaffirmed Vietnam's determination in developing a market economy. After 10 years of operating the stock market, Vietnam has reached many achievements in the initial stage, generalized as follows: (1) successfully organized and operated the Hochiminh Stock Exchange (HOSE) and Hanoi Securities Trading Centre (HASTC); (2) ensured principles of the securities market; (3) gradually created more goods for the market, strengthening the management of listed firms and clarifying information on the market; (4) expanded operations of intermediary organizations on the market and improved service quality; (5) built domestic and foreign investor system; (6) developed the UPCOM (Unlisted Public Company Market) and OTC market; etc. At the end of 2010, there were 326 securities listed on the HOSE, accounted for nearly 6.834 billion U.S. dollars (around 8% of 2009 GDP). In the HASTC, the respective numbers were 977 listed securities with a value of 12.582 billion U.S. dollars (nearly 15% of 2009 GDP). OTC and UPCOM market had also developed. Vietnam's total stock market capitalization reached 19,542 U.S.\$ million in 2007 and reduced in 2008-2010 due to the global financial crisis (ADB, 2009b). The number of security trading accounts in HOSE had remarkably increased from 5,000 in 2000 to 106,393 accounts in 2006 and 822,869 accounts in 2009, in which 12,696 are from foreign investors (HOSE, 2009). This was a record which surprised even international investors. It led to the booming of the Vietnamese securities market in 2006-dollars (around 8% of 2009 GDP).

According to the financial liberalization sequencing of McKinnon, the financial liberalization follows, but not restrict to, a certain order. For example, the budget deficit should be dealt with at first hand, followed by the liberalization of interest rates and the deregulation in the banking sector (see Figure 1). By summarizing some of the important dates of the liberalization progress in Vietnam as in Figure 3, it is clear that Vietnam somewhat follows that order as well. First, the budget deficit issue was dealt with in 1991. Other deregulation policy regarding the banking system, exchange rates, and interest rates then followed. At the same time, the securities market was built up and developed. The final stage concerns the involvement of foreigners in the banking and insurance markets.

4. RECOMMENDATIONS FOR VIETNAM IN INTERNATIONAL ECONOMIC INTEGRATION

Vietnam has not been a country which has the high economic freedom, ahead of the trend of integration, Vietnam cannot stand out and we have been participating in a more positive way. What does Vietnam need to do to integrate into the international economy, especially when the financial liberalization can maximize the benefits while minimizing risks? The next section of the paper will provide some recommendations for Vietnam.

Strengthening the soundness of the framework of macroeconomic policy that facilitates the success of international economic integration and financial liberalization: In order to have the framework of sound macroeconomic policy, it is necessary to closely coordinate and enhance the effectiveness of macroeconomic policies. The purpose of the close coordination of macroeconomic policies is to make the macroeconomic policy system work effectively, thereby affecting the macroeconomic variables that the government wants to intervene. The strict coordination of macroeconomic policies is the basis for establishing a stable macroeconomic environment as well as a condition for coping with possible negative effects. It must be reflected in the management of macro policies of the government, especially the coordination between monetary policy and fiscal policy.

Completing the institution and law: With the gradual opening of the financial services market, it will need to be supported at the same time by improving the legal system in order to create a stable, effective and transparent legal framework, creating a fair playground for domestic enterprises with foreign direct investment (FDI) firms in the direction of national treatment. In particular, attention should be given to the legal basis to ensure the right for supervision and inspection by the government and law enforcement agencies of the economic activities of enterprises, including FDI firms to ensure the control of the government in maintaining the stability and the purity of the financial services market. Policy makers need to create a clear legal framework for basic laws about property, land, bankruptcy and civil rights and etc that are built on the basis of market economy. The legal documents on the rights of creditors, shareholders, accounting, auditing, capital adequacy and so on must be built with international routine. The government should limit the overlap between laws, banking regulations for laws and other regulations.

Developing and completing financial markets: (i) Monetary market: It is necessary to develop a safe, efficient, synchronous and highly competitive monetary market in order to create an important basis for the formulation and management of monetary policy, effective mobilization and distribution for financial resources, risk reduction for credit institutions; (ii) Foreign exchange market: Improving the operation of the foreign exchange market, rationally expand the market participants and improving the management of foreign exchange reserves of the State Bank of Vietnam (SBV) to facilitate the operation of the market. In order to better realize the role of the SBV in the foreign exchange market, it is necessary to increase the foreign exchange reserves sufficiently for the SBV timely and sufficient dosage to help the foreign exchange market stabilize and operate smoothly, helping the State Bank to protect against the reversal of capital flows, especially indirect investment flows of foreign investors; (iii) Capital Markets: Continuing to consolidate and develop the capital market, gradually completing the structure, improve the operating mode, developing more channels to provide capital for diversifying markets and improve the quality of services, creating conditions to attract more investors, especially institutional investors, etc.

Improving the efficiency of using capital of the economy: In order to facilitate the process of financial liberalization, it is necessary to improve the efficiency of the use of capital in the economy, thus opening up the flow of capital not only in terms of policy but also in terms of real advantages of

using capital. Implementing synchronous solutions for efficient use of investment capital, to develop infrastructure, overcome weaknesses, clear up the bottlenecks of growth and promote the development of a fast and sustainable economy. Concurrently, improving and increasing the attractiveness of the domestic investment environment, enhancing the effective absorption of capital in the economy. At the same time, at the micro level, businesses also need to understand when integrating, businesses are facing opportunities and challenges, assess their strengths and weaknesses to be confident in joining into this common playground.

CONCLUSION

In order for Vietnam to take firm steps in the process of international economic integration in general and integration of the financial market in particular, we need to prepare the best conditions, including macro policy, legal institutions, financial markets and the financial institutions themselves, businesses.

SUSTAINABLE MODEL FOR BUSINESS UNIVERSITIES IN DEVELOPING COUNTRIES

Nguyen Hoang Tien* - Vu Thi Minh Tien**

ABSTRACT: *The purpose of this article is to provide an insight into education systems of developing countries and models of their functioning. The article looks at the balance of business universities in different aspects and angles and finds that the approach that combines different alternative functioning models will make business universities more strategically sustainable. In developing countries (Eastern Europe and South-East Asia) there has been a lot of societal and political attention and tension paid to privatize public universities and/or put more control on private universities. Those attentions should be paid to the alternative models making them more competitive that means effective at a reasonable cost.*

Keywords: *university; finance; teaching; research; development; value proposition.*

1. INTRODUCTION AND OVERVIEW

At the core of education business, especially the tertiary education, the dialectics of business schools takes place between the two distinct purposes: to produce knowledge (research-intensive) or to educate students (teaching-led) (Fragueiro, Thomas, 2011). Some schools are on the extreme edges, while most of them are placed somewhere between with their dual and contradictory rather than cohesive purposes. This strategic dilemma is increasingly important in context of the following challenges in business environment that universities in the world must face (Rynca, Radomska, 2009, pp.88; Todose, 2008, pp. 109-110; Barolli, Sevrani, 2009, pp.5-6):

- Mobility of student and easiness of access to the education services;
- Rising need of flexible adaptation of teaching programs (curricula) to the real market situation;
- The necessity to apply information and communication technology (ICT) development such as Internet-based e-learning in teaching process to deliver knowledge and skills at low cost to the flexible and dynamic labor market;
- The need to make difficult strategic choices that enable effective competition;
- The need to build a strong brand and strengthen own reputation to secure and enhance long-term competitive position;
- The problem of reaching financial balance and sustainability, especially in the face of appearing demographic low.

The last challenge that is the problem of financial stability and sustainability of universities, especially the business universities, is only one side of a very complex problem to be thoroughly considered. If we talk about sustainability as a general, we should not have in mind the only financial aspect. As a consequence, both financial and non-financial drivers of business schools' model selection should be put under multilateral

** Thu Dau Mot University

analysis and exploration. We then see that the dialectics of business schools is related with more dimensions than simply a question whether to carry out researches, to concentrate on students, or to find themselves a place in-between.

2. RESEARCH METHODOLOGY

In this article, as a research methodology we use a comparative approach and qualitative analysis to carry out investigation on many important issues that universities in developing countries, such as Eastern Europe and South-East Asia, must be facing in the context of global trends and occurrences in the field of higher education set by top-level universities of leading developed nations. Those interested researched issues are the following:

- i) The genesis of education institution.
- ii) The ways of staffing, especially the lecturers' cadre.
- iii) The quality of faculty leader.
- iv) The source of textbooks studied by students.
- v) The direction of structural organization.
- vi) The location and infrastructure.
- vii) The language of instruction.
- viii) The source of revenue.
- ix) And finally, the value proposition – teaching or researching.

Those issues representing the dialectic orientations of business philosophy and activities are considered the most important for the industry and certainly will impact the quality of education services and the existence and the competitiveness of all institutions. Within those researched issues identified and mentioned above, we compare common approaches and practices used by Polish universities, representing the Eastern part of Europe and Vietnamese universities, representing the South-East Asia, a part of colossal Asia, sometimes referring also to the experiences of other countries in the regions, such as India, China, etc., as well as the reality and trends and set by top-level universities in the world, in order to draw interesting conclusions and recommendations at the end of article.

3. THE SCHOOLS' ORIGIN – PRIVATE OR PUBLIC

The first dialectic, rather of macroscopic character, that is often observed and most analyzed by specialists and experts in management of education in post-communist states (such as Poland and the rest of Eastern Europe) and developing countries (such as China, Vietnam and the rest of ASEAN states excluding Singapore), but not important in highly developed countries such as US, UK and other English speaking countries is the genesis of a given education institution. In the USA and in other countries, where English is the language spoken natively, all schools, regardless of the origination, compete based on the same market rules and regulations. In the Europe continental, especially in the Central-Eastern countries, and in most of the developing parts of the world, those institutions, depending on their originality, compete on different bases, even the different annual rankings are set separately for assessing them and measuring their popularity and attractiveness. Hereafter, we'll discuss the advantages and disadvantages of those public and private institutions. Probably, the advantage of the first ones, on the contrary, will be the disadvantage of the second ones.

Public schools in Central Eastern Europe and in other developing countries like China, Vietnam and some of the other ASEAN states have a much longer history of development than private universities, that came into being, like mushrooms after rain, after the start of transitional period of the above-mentioned post-communist countries. Longer development history, on one hand, usually means more experienced, reliable and professional staff, better infrastructure, guaranteed teaching and research quality, on the other hand, it is also equivalent to inflexibility and reluctance to diverse changes needed in order to be competitive in a global stage. Public, or other word, state universities are funded partly or mostly from the state budget. In Poland, students don't have to pay for their full-time education in both undergraduate, graduate and even post graduate level and that has been immutable for a long time. In Vietnam, instead, the public universities' tuition fees are extremely low, much lower than the price set by the market. As commonly considered and perceived in these parts of the world, public universities' mission is to offer public goods to the society as increasing investment spending on education would increase the country's GDP growth rate. Statistical data shows that in the period 2000-2011, the economic growth at a rate of 5% per annum in Poland was primarily due to a rapid increase in human capital stock (Konopczynski 2014, p. 329)

Furthermore, not only public education is funded from state budget, but the research grants are also more accessible and much more open for academic staff of public universities, strengthening at the same time their competitiveness and innovation in the field of scientific research. Public universities' faculties publish more, especially in top-tier international journals. Hence, we can see that, in financial and strategic terms, the advantages and prevails are on the side of public institutions. One more advantage of the public universities is the quality of enrolled students. Due to the free-of-charge or nearly free-of charge education service, public universities attract more capable candidates and the annual entrance exams carried out centrally by the ministry of education and training (in case of Vietnam) or locally by universities themselves (in case of Poland) each year serve to admit the right ones. In parallel, the advantage of private universities, that should be mentioned, is that they have a right to determine the price of their services offered up to the market conditions, as well as the salary (remuneration system) for academic staff they hired and the framework of cooperation with them (academic staff) also are up to the market conditions, the need and the wish of both sides. As a result, we can see that private universities, in case of headwinds in market conditions, have more rooms to operate in terms of creating, executing and adjusting strategy to adapt to the inconsistency and volatility of changing global market trends, innovation-based and knowledge-based society and economy.

4. THE SOURCES OF STAFF – ON LONG TERM CONTRACT OR ON TEACHING HOUR BASIS

The next dialectic, rather of microscopic character, but most important for all the universities in the world, regardless of the origination, the political and economic system of a given country, is how to hire and how to organize the staff effectively. Taking into consideration the facts that staff remuneration is a considerable part of the overall cost of functioning of universities in developed countries, and also the constantly rising part of it in developing countries that aspire to catch up and to keep pace in a very competitive and demanding global education market. There are at least three common options for those institutions to follow, which are:

- Long term contract – an anchored minimum of teaching hours each year is set up, aside from the obligation of carrying out research, participation in faculty's life. In this case, staff members have more responsibilities and more rights (and privileges), so they will respect and are more closely connected with their workplace.

- Teaching hour basis – in this case, academic teachers are treated as outsiders on the teach-and-go basis. They teach courses based on the program outlines according to that they have taught elsewhere for many years or in consultation with the program committee in order to conform and comply with specific requirements and standards set by a given university.

- Something in-between – this is the most common option since minimum staff members with adequate scientific degrees and professorial nominations is required and imposed as a prerequisite to establish schools and those requirements are controlled and watched carefully by ministerial education inspectors.

Universities are not just the centers of education which function on commercial basis, connecting teachers and students. The competitiveness of the universities with a mission of going global is based on their highly qualified human resources who are competent at teaching and doing researches. So, given university, in order to develop, to strengthen its position and to compete with others, must, based on long term contracts and commitment, look for talents, invest in development and promoting staff. So have done many American and European universities for a long time before the global crisis erupted in 2008. In the time when the economy is heading down, many cuts are in execution, not excluding the sector of education. The economic downturn combined with the negative demographical trends has compelled most of European universities including Germany, the economic powerhouse of Europe which is the least vulnerable by the then-ongoing crisis, to sharply reduce long-term tenure contracts and shift to the teaching hour basis in order to save money to survive. The situation also concerns Poland, not the economic powerhouse, but also the least negatively impacted country comparing to other European economies.

The case of rising ASEAN countries is totally a different history. Despite the impact of the global slump, together with the booming population and the pressing urbanization processes still taking place, the number of students and the need for education are increasing. The sector of education is the most crisis-proof and the least vulnerable among others as many analysts and experts considered. Many wealthy families even choose better option by sending their high school graduates to prestigious universities in the West to benefit from intercultural experiences, English qualification, high quality and standard of education there. Confronting this situation that is still happening both to China, India and ASEAN countries, many universities there, in a bid to improve the domestic education quality, are striving to attract European and American teaching staff offering them very lucrative, long-term working contracts, or wooing Western counterparts to cooperate with them, based on mutual benefits, in a hope to boost their competitiveness and attractiveness in the eye of domestic students, the customers. In the time of economic headwinds for many sectors that hardly survive, this is a bright spot in the global education scene, understood generally as a knowledge transfer from the West to the East.

5. THE FACULTY LEADER – ENTREPRENEUR OR HIGHLY QUALIFIED PROFESSOR

The dean or in other words, the faculty leader is a very important person for the universities development as many of them regards a faculty as an independent school within a system of schools. Most often, questions are raised in concern with the character of this job position, whether it should be management-oriented with a high load of administrative duties or academic-oriented concentrating on the research development, scientific and teaching quality reputation of the faculty. The problem seems not to be as serious as in developing countries, especially in the region far from largest urbanization centers, where there is not enough qualified human resource in the labor market. In Europe, in America and in other developed parts of the world, it is not difficult to find a suitable candidate combining both academic

competence and managerial skills even the competition of candidates vying for the prestigious post like this is very fierce. In the second-range cities of Vietnam it is troublesome to find a motivated enough candidate to fill in the post of a faculty leader. Local candidates are familiar adequately with the faculty staff, the character and the working style existing there, but they are not enough academically (or professionally) competent to undertake the job. Candidates from afar, sometimes foreigners, conversely, have a great knowledge, experience and competence, but are often not adequate for the job due to incapability to speak local language (the global English is not enough), unfamiliarity of, and inability to cope with the current specific and complicated staff issues and day-to-day operations of the faculty. In the Western countries, such as Germany and France, it is incredible for the candidates to fill in the operation position, not mention the management or even executive one, if he or she doesn't speak local language and is not familiar with the local traditions and business practices.

Returning to the education topic, here in the developing countries, Vietnam and the rest of ASEAN states, excluding Singapore, for example, a question has been put forwards concerning whether a professor of long years of teaching and researching experiences should get the faculty's top job or an authoritative, middle-aged entrepreneur with a Master degree is totally enough if his or her management skills proved by earlier successes in business activities might guarantee the same success, both financially and academically, and faculty development as experiences in the world show that many well-known perennial professors with international experiences might not have adequate management skills and deep insight into the current internal issues and trends in order to lead the faculty. Due to this fact, in many faculties, especially of business universities in Vietnam, for a certain time in the past, the top job is traditionally filled in with market experienced persons with Master degree.

6. TEXTBOOKS – OWN VALUE PROPOSITION OR EXTERNAL VALUE PURCHASING

Textbooks produced and written by faculty members are proprietary knowledge. Textbooks, based on the lectures delivered, are the unique value propositions that differ universities one from other. Many faculties and academic teachers normally have two choices, using proprietary, self-created knowledge or basing on well-known external curriculum taught in renowned universities. The statistic data shows that in Western universities, only 10-15% of the material used in MBA courses was based on teachers' own researches (Van Hoek, Peters, 2008). So what are the propositions for countries that are far or less behind the Western counterparts?

In middle-income countries such as Poland, university teachers are not obliged to publish a textbook, based on that they deliver their lectures, but some teachers, especially full professors, with years of teaching, researching and publishing experience, do so in order to increase their prestige and reliability in the eyes of students. After all, those senior professors give lectures mostly in the fields, in which they are deeply engaged, for a very long time, in term of interest and researching activities.

In case of Vietnamese teachers, who are teaching-oriented instead of research-oriented, they usually are not academically advanced and professionally competent in their field. Moreover, they have even several times more teaching duties than their colleagues in the West. Due to the insufficient competence and also due to the lack of times for students and for themselves, all of them choose the option of external value purchasing instead of creating own value proposition, bringing no distinctive value for the students and to the institution where they work.

7. THE STRUCTURE – TO CENTRALIZE OR TO DECENTRALIZE

Many European universities, including Polish ones, are decentralized in terms of general empowerment and academic power transferring from the top down to faculties and lower, with a very strong position of the faculty leaders. But they are centralized in terms of not to establish too many faculties within one university.

For example, in Poland, the business university such as Warsaw School of Economics (WSE), the largest one in Central-Eastern Europe, consists of only 5 faculties (collegiums), each of these faculties is divided into as much as 20 departments (WSE, 2018). Each of the departments is closely related with specific research fields being a domain of a given faculty.

In Vietnam instead, it is easy to see the reverse trend. Despite the lack of resources, especially the human resources in terms of highly qualified academic teachers (understood as the number of top academic leaders – professors and associate professors), the decentralizing trend is on the rise and intense. The National Economic University (NEU) in Hanoi, the largest economic university in the whole country in term of students, academic teachers and carried out researches, is structured down into nearly 20 faculties (NEU, 2018). Being incomparable to Warsaw School of Economics in term of qualified human resources, the teaching and researching capability of each NEU faculties is at the level of WSE' departments. In case of Vietnam and its NEU, decentralization is the simplest way to enhance bureaucracy that desperately should be eliminated. Consequently, WSE's faculties, with an academic potential of about 50 professors each, on behalf of the whole school, have the right to open and close doctoral and habilitation courses, to nominate professors for the need of their own teaching and researching activities, that is a sign of decentralization and empowerment. As a contrary, NEU's faculties, with an academic potential of several professors each, have the right to educate graduates postgraduate (master level) students and open doctoral courses only while theses' defense (closing doctoral courses) and professor nomination are executed centrally, out of the reach of NEU and that is a sign of centralization and disempowerment.

8. THE LOCATION AND INFRASTRUCTURE – TO HIRE OR TO BUY

In public universities all over the world, all the things such as location, building and the infrastructure are state-owned and no discussion and suggestion is needed at all. In case of private universities, the question is about whether to buy or to hire. Many universities in Central and Eastern Europe, due to the lack of capital and shorter history of development than their counterparts in the West, prefer the "hiring" option.

In Vietnam, there always exists a very popular thought that if schools do not have their own headquarter, building and infrastructure and so on in order to organize classes and have been pushed to hire all that somewhere, they will be badly credited and positioned lower in the general ranking (as level and ownership of infrastructure are one of the ranking criteria). This point of view has been widely recognized not only by local and central administrative authorities, but also by all people, students and schools management board themselves. So the main accent is put on the hard sides (buildings and infrastructure) instead of soft sides (knowledge, human capital), that is contradictory to the essence of industry where the major assets deciding on the advantage and the competitiveness of a given institution are just well-trained and qualified human resources. Based on that standpoint, many unproductive investment decisions are made. Many state-owned as well as privately funded universities in Vietnam invest heavily in best locations, magnificent headquarters, buildings and classrooms while the academic staff, in terms of quality and quantity, presents poorly, as well as their remuneration and benefit scheme (Nguyen Hoang Tien, 2018a).

9. LOCAL OR INTERNATIONAL LANGUAGE OF INSTRUCTION

Due to the fact that English is the most popular and is the only international language in the world, the barriers of introduction of courses taught in English or partly in English should be taken under detailed analysis to draw further going conclusions. English is the most commonly spoken in Western Europe, but the influence of English becomes weaker and weaker heading eastward. One might be sure that the rate of people speaking English in Poland is less than in Nordic countries, France and Germany. English is less spoken in Belarus and Ukraine, but regains increasingly its popularity in Russia and major Asian economies. In general, the level of popularity of the English as a spoken language is measured by the degree of openness of a given economy combined with its size and wealth. Taking this fact under consideration, Vietnam still has a far way to go for the English to be widely and commonly used here.

In Vietnam, many universities, which are situated in largest cities, are pushing themselves to open up and reach out to the world to level up the distances to adjacent countries in the region. Towards these ambitious and strategic goals, many of the universities strive to open courses delivered in English based on English textbooks, to push their students to become familiar with foreign language at the very first moments of their study. According to a survey of Intel in Vietnam, among graduates, only 10% of them are capable to work without further reeducation (additional professional training). But among those 10%, only half of them have adequate English proficiency required by the jobs (INTEL, 2018). To improve this situation, here in Vietnam, private schools, more aggressively than their public counterparts, put forward more practical initiative to enhance students' market value after graduation. Many private universities, funded from students' tuition fees, recruit native speakers, increase the weakly English class hours, or even invite foreign professors coming to deliver business lecture in English.

The language problem appears in postgraduate education, mostly delivered in part-time mode and for active professionally groups of older generation. People in the age of 40-ties and 50-ties are in the advanced stage of their career, they have enough money to pay for their relatively expensive executive education, but they are unwilling to take English as a language of instruction or even don't speak it at all. The workable solutions for this contingency are, in case of Vietnamese teachers, the lecture content should be delivered in Vietnamese, in case of foreign teachers, the lecture content should be translated live into Vietnamese by a third person. The above-mentioned problem is rather precarious since the today's generation of 20-ties and 30-ties acquiring English from a very young age will become the generation of 40-ties and 50-ties in 10 or 20 years, and then no language barrier will occur (Nguyen Hoang Tien, 2017a).

10. EXTERNAL COOPERATION – DOMESTIC VERSUS INTERNATIONAL

International relation and cooperation are the indispensable part of each organization, not only business universities, in context of integration and globalization and the need to reach out to the world. Poland, as well as Vietnam is at different phase of transforming their economy and the international cooperation with developed part of the world only serves them for better. Polish universities, due to their closer geographical distance to the West, are gaining more advantage on that. Vietnamese universities also try their best and do not want to lag behind while benefiting from traditional relation with France, strengthening at the same time strategic relations with developed countries in the region such as Japan, South Korea, Singapore and Australia.

In the aspect of domestic collaboration, which will complement the international cooperation in terms of supporting development and bringing mutual benefits, Vietnam differs very much from Poland. Polish

universities, after a period of booming, due to current demographical situation (demographical low), are now confronting the phase of integration and consolidation understood as a traditional merger and acquisition to cut cost and regain a sustainable competitiveness. Vietnamese universities, instead, due to the population being on the rise, the urbanization process gaining momentum, need more cooperation than consolidation. Traditionally, private schools need alliances with public ones to benefit from their resources and experience for development purposes, as well as provincial universities closely seek links with partners in the biggest cities for organizing joint education programs (Nguyen Hoang Tien 2017b).

11. SOURCES OF REVENUE – STATE FUNDING OR STUDENT TUITION

The state

Schools in continental Europe are more or less funded by state budget to educate societal workforce and produce public goods (research products) to generate returns to the nation in terms of productivity and taxes. Education is treated as a public good, so it should be publicly funded to create a long-term benefit for the whole society. Education, especially the higher education of the next generation is crucial for the upkeep and improvement of society (Reel, Block, 2013, p. 111). As M. Friedman and R. Friedman (1990) perceived, the focus of education institution should be to maximize the quality of education and value gained by individuals, not just only maximizing profit.
