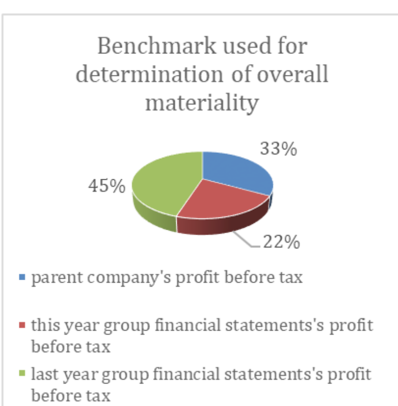
In addition, 45% of auditors believe that the overall materiality should be determined based on the level of audit risk, 83% believe that it is based on the information needs of users, and 100% believes that it should be based on professional judgment of the group auditor.



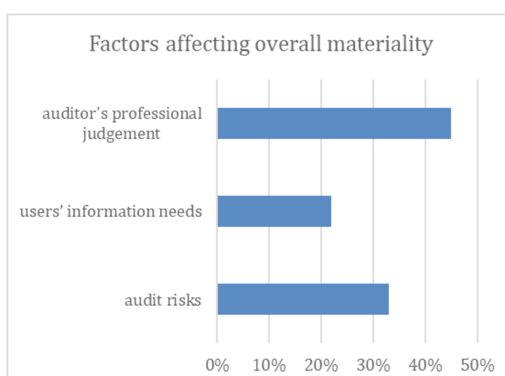


Table 2: Benchmark and consideration used for determination of overall materiality

Performance materiality (consolidated financial statements level)

Survey (Appendix A) and interview results (Appendix B) show that: most audit firms determine the performance materiality at a percentage of 50%-75% of the overall materiality, a few audit firms use higher rate up to 90%, but it all depends on the level of audit risk to determine the appropriate rate. It is noted that 6% of respondents stated that their audit firms did not use the performance materiality at consolidated financial statements level. Besides, the survey shows that most audit firms have not used the materiality for specific class of transactions and account balance but use a performance materiality for all balances.

Clearly trivial threshold

All audit firms have set a clearly trivial threshold at 3%-5% of the overall materiality. Normally, this threshold will be used to apply consistently to all components for reporting uncorrected errors. In in-depth interviews (Appendix B), auditors stated that they did consider the history of misstatement when determining percentage of 3% or up to 5% and this is quite consistent between audit firms.

RQ2: How is component materiality determined in group audits?

The survey results show that only 68% of auditors responded that their audit firm did use the component materiality in group audit. Accordingly, a certain proportion of group audits (i.e., 32%) did not allocate overall materiality to components.

In addition, when reviewing audit files and in-depth interviews with auditors, it is noted that the audit firms have different ways to calculate component materiality.

Table 3: Determining Component materiality in group audit

Firm	Audit practice
1	Component materiality can be set at 60% to 95% of overall materiality, depending on the auditor's judgments. The firm has no statistical method to calculate this threshold. In case of group structure with one parent and one subsidiary, Parent's total asset account for 99% the Group total asset, the firm can apply component materiality at 90% to 95% of overall materiality. In case of group structure with multiple equal-size components, the firm will reduce the component materiality to lower level, i.e., 60% to 70% overall materiality.
2	Calculate component materiality using the method from firm guidance. This is a Probabilistic method based on the model in AICPA (2013) guidance. This model is to ensure that component materiality is lower than overall materiality and factors are considered in this model are: Number of components in group Level of inherent risk and control risk of material misstatements
3	Generally, the percentage of 60% to 90% overall materiality is acceptable depending on the scale of component in the group. For example, if the total asset of the component accounts for 50% of the group's total asset, then the percentage of 90% can be applied.
4	Minimum level is 50% and maximum level is 90% overall materiality. If the component total asset accounts for 25% of the group total asset, then the percentage of 60% can be applied. Then this percentage can be increased to ensure the efficiency of the audit or decreased to reduce the aggregation risk.
5	Component materiality cannot exceed 90% overall materiality. The benchmark used for determination of overall materiality will be used for consideration of component materiality. Factors are provided for decreasing the component materiality. For example, if the number of components in the group is multiple or the scale of components in group are similar.

First, it can be seen that most of audit firms have no specific quantitative guidance and let it up to the group auditor's judgment in determining the value of the component materiality. Generally, those audit firms use component materiality at percentage of 60% up to 90% of overall materiality.

Second, regarding one audit firm using Probabilistic (statistical) model as designed in AICPA guidance (2013), we performed further discussion to understand the approach. They use a calculation method based on a maximum amount that the sum of the individual component materiality amounts may exceed group overall materiality, this amount is called a maximum aggregate component materiality (abbreviated as MACM). By discussion, we noted that this method is similar to the approach suggested by Glover, Prawitt, Liljegren, and Messier (2008). This actual practice of one firm is summarized as follows:

+ Step 1: determine "overall materiality"

+ Step 2: determine "standard multiple value", which varies according to the number of significant components by using table in AICPA guidance.

+ Step 3: determine the "Maximum aggregate component materiality,": equal to overall materiality multiplied by the standard multiple value.

+ Step 4: determine the component materiality by allocating the MACM to each component based on component scale (measured by revenue or total assets)

+ Step 5: determine the "risk co-efficient" of each component (based on the auditor's assessment of inherent risk and control risk with three levels "high, medium or low"). The risk coefficient is built by each audit firm and stated in the audit manual.

+ Step 6: determine the component materiality by multiplying the allocated component materiality (in step 4) with risk co-efficient in step 5.

Third, in addition, auditors of Big Four firms have clearly demonstrated their understanding of method and data sources, even the framework for benchmark multiples and risk co-efficient in the audit manual of the audit firm. The auditor of Non-Big Four firms has not shown this understanding and stated that the firms do not provide specific guidance.

Fourth, in case of an individual statutory audit of the component, the appropriate component materiality will be the lower between the component materiality allocated by group auditor and the materiality for statutory audit determined by component auditors. Even if the components are audited by other auditors, the group auditor still requires a lower level to be applied to reduce the aggregation risk to an acceptable level. This practice is agreed to and consistently applied in all firms.

Fifth, all firms responded that component materiality not only be evaluated quantitatively, but that qualitative factors are also considered. For example, one firm stated that "If there are multiple components in the group, the components materiality should be reduced". The factors shown in Table 4 are taken from ICAEW guidance on materiality (2017). Some firms also make reference to qualitative factors in determining performance materiality for group financial statements as guidance in current VSA.

Table 4: Qualitative factors included in consideration of component materiality

Qualitative factors	Firm 1	Firm 2	Firm 3	Firm 4	Firm 5
The size of the component (its individual financial significance to the group);	X	X	X	X	X
Whether the component has a statutory audit, in which case the level of materiality for statutory audit purposes (which is likely to be lower) may be used;	X	X	X	X	X
The characteristics or circumstances that make the component significant;	X	X	X	X	X
The strength of the component's control environment;	X	X	X	X	X
Whether the component is new to the group and so the group auditors have less understanding of its operations;	X	X	X	X	X
Whether the component's operations are similar to the rest of the group;	X	X	X	X	X
The likely incidence of misstatements, taking account of risk assessment and previous experience.	X	X	X	X	X

RQ3: Do audit firms need to determine component performance materiality in group audit?

The survey showed that in all group audits, component performance materiality was determined by component auditor when perform audit work at component. There has been no review of group auditor for this threshold. The interviewees also stated that there was no communication between group auditor and component auditor regarding this threshold. The reason given was that VSA600 and ISA600 do not mention to this threshold, therefore, it was up to component auditor in determination and application this one.

RQ4: What amounts are used to determine clearly trivial threshold applied at component level?

Both survey and interview showed that there is no need to determine the clearly trivial threshold at component level for group audit purpose. Group auditors stated that they only use the group clearly trivial threshold and inform this threshold to component auditor. All misstatements at components which exceed this threshold need to be reported to the group auditor for further consideration.

RQ5: How do audit firms determine materiality for associates and joint ventures?

Only 10% of respondents of survey showed the consideration on materiality applied for associates and joint venture. The reason (resulted from interview) is that the group did not own control over those entities, and their financial statements are audited by another audit firms. Therefore, the group auditor only performs analytical procedures to those components, or if the component is significant to the consolidated financial statements as a whole, group auditor will communicate with current auditor to discuss the main issues and review the audit file if necessary.

4.2. Discussion

In general, audit firms use the profit before tax as benchmark to determine overall materiality for the group financial statements. This benchmark is appropriate because this is the criteria that users of financial statements are interested in most. In addition, the firms show the consistency of determining performance materiality and clearly trivial thresholds at group level. The percentage applied showed that the firm's practices quite closely followed existing auditing standards.

The group auditor determined different levels of materiality to different components. Component materiality does not exceed the overall materiality to ensure that aggregation risk can be reduced to an acceptable level. Each audit firm has different guidelines in determining component materiality. All firms agreed that the percentage of 60% to 90% of overall materiality is suitable for component materiality. All firms have also considered the requirement for statutory audit of component financial statements and other qualitative factors in determining and applying component materiality. There is a consistent clearly trivial threshold which is determined at group level and applied to all components for reporting uncorrected misstatements.

However, there are some **limitations** in practical application of materiality in group audit:

Firstly, some auditors do not have a full understanding of the suitable benchmarks used for overall materiality. This threshold should be calculated based on the profit before tax of the consolidated financial statements, but some firms use the profit before tax of parent company to determine this threshold. This is not appropriate benchmark because the group financial statements should be consolidated from parent and subsidiary financial statements, then need taking into account a series of consolidation entries, therefore, these figures will be changed totally compared to parent's figures.

In addition, it is not appropriate if overall group materiality is based on the level of audit risk. The level of audit risks should only affect the performance materiality but not the overall group materiality. The higher audit risk, the lower performance materiality, and auditor should perform additional work, to ensure that no misstatements exist in the group financial statements that, individually or accumulated together, exceed the overall group materiality threshold.

Secondly, there is no clear explanation in method or model used to determine the component materiality. Most of respondents stated that it depends on auditor's judgment and only provide a range of percentages for component materiality. Moreover, there are some certain auditors who do not have full understanding of component materiality, and therefore did not perform allocating materiality to component. The survey and interview showed the consideration of qualitative factors in determining materiality, but the documentation is limited in audit files.

Thirdly, most group auditors were not concerned with component performance materiality. However, there is a risk that if the performance materiality account for a high percentage of overall group materiality (for example, 80%), and Component A has component materiality at 90% of overall group materiality, component performance materiality account for 90% of component materiality, then the component performance materiality exceeds the group performance materiality, this can increase the aggregation risk.

Fourthly, there was a little concern about the materiality applied to associates and joint ventures. However, in case of complicated group structure, with multiple associates and joint venture, or if the associates or join venture account for significant portion in consolidated profit, then the appropriate work done should be performed for those components.

5. RECOMMENDATION

First, overall group materiality should be determined based on users' information needs, not on how risky a particular balance might be to audit. In another words, auditors should not reduce the overall materiality level based on high audit risks. The appropriate benchmark for overall group materiality is normally group profit before tax (in case of listed company, this is the most items that users of financial statement interested in). The other benchmarks that could be considered are group revenue or group total assets. The benchmarks should be this year unaudited consolidated figures, or last year's audited figures with consideration of changes for the current year.

Second, when there is a limited instruction from regulators in determining the component materiality, audit firms should refer to guidance from international professional bodies, academic research to consider the appropriate method. The following are three methods that audit firms could consider: (i) Component materiality could be a percentage of group materiality, depending on the size of component to the group and the auditor's professional judgments regarding circumstances of group and components. For example, if the component accounts for 60% of the group, then the component materiality should be at 60% to 90% overall group materiality. (ii) Determine an aggregated maximum component materiality, then allocate this amount to component based on the revenue or assets. This aggregated maximum component materiality will increase if the number of components in group increase. (iii) In case of the fact that there is a statutory audit for separate financial statement of component, the auditor can choose the lower threshold between the materiality for statutory audit purpose and the allocated component materiality for group audit purpose. The group auditor should clearly communicate with component auditor to ensure the appropriateness of components materiality is applied.

Third, the additional qualitative factors that auditor should take into account that could lead to decision of lower component materiality threshold include: (i) the less similarity of risk of material misstatement between components in group; (ii) the higher complexity of components; (iii) the higher variety of business products or business lines in group; (iv) the less effective of group wide controls; (v) the more decentralized accounting system in group for group reporting purpose; (vi) the more difference of legislation.

Forth, component performance materiality could be set by component auditor, but group auditor should communicate and review to ensure that this threshold is lower than group performance materiality and is consistent with method of determining group performance materiality (for example, same percentage 75% of overall materiality, if not, the rationale should be properly documented in audit file). This communication should be done at the planning phase to ensure that the audit program and volume of audit work at component is appropriate. Avoiding the situation that, after the completing the audit work at component, the group auditor review and request to lower the component performance materiality, this could lead to addition audit procedures need to be performed and subsequently increase the audit costs and time.

Fifth, component materiality for associates and joint ventures can be determined in same method as for subsidiaries, in which, auditor also should consider the qualitative characteristics and existence of a statutory audit for separate financial statement of the associates and joint ventures. In another way, group auditor could use the materiality of statutory audit then multiplied by ownership percentage to determine component materiality for associate and joint venture since those components are consolidated in group financial statements using equity accounting method. This materiality threshold should be communicated with component auditors of associates and joint ventures and request them to report all misstatements exceeding this threshold for purpose of group audit.

Finally, the method and professional judgements involved in determining materiality thresholds in group audit should be fully documented in audit files, including rationales, appropriateness, related guidance, information, and reference sources, etc. It would be logical if the method should be consistently applied over the years.

6. CONCLUSION

Determination of materiality in group audit involves the exercise of professional judgment. Research results showed that audit firms in Vietnam did closely follow the VSA600 and related auditing standards in determining materiality in group audit. However, the existing auditing standards (both national and international) are limited in guidance of component materiality, component performance materiality and materiality for associates and joint ventures, which led to some different approach in group audit conducted by audit firm in Vietnam and over the worlds. These practices need to be improved by further guidance from auditing standards in future, learning experience from global networks and other professional bodies. Appropriate training should be conducted for all auditors of audit firms so that they can fully understand the requirement of auditing standards, the firm's policy, and properly apply it in group audit.

In addition, there are several areas that can be further studied. Future research should focus more on building models to determine the component materiality. The models should be built up in a way that is easy to understand and feasible to apply to practice. For example, the research can compare the theoretical model which is suggested in some current research (such as model of Stewart and Kinney (2013) [12]which ultimately affect group audit scope, reliability, and value. However, standards are silent about how these amounts should be determined and methods being used in practice vary widely, lack theoretical support, and may either fail to meet the audit objective or do so at excessive cost. We develop a Bayesian group audit model that generalizes and extends the singlecomponent audit risk model to aggregate assurance across multiple components. The model formally incorporates group auditor knowledge of group-level structure, controls, and context as well as component-level constraints imposed by statutory audit or other requirements. Application of the model yields component materiality amounts that achieve the group auditor's overall assurance objective by finding the optimal solution on an efficient materiality frontier. Numerical results suggest group-level controls and structured subgroups of components are central to efficient group audits". DOI.org (Crossref) with practice of Vietnamese audit firms to consider the appropriateness and challenges of application. Or further research can perform by direct access to the audit firm's working papers in Vietnam to verify more on the actual audit to make appropriate recommendation.

APPENDIX A: SURVEY QUESTIONNAIRES

Part 1: Demographic information

Please provide the following information:

Name:

Firm:

Mailing Address:

Phone:

Position:

Years in Position:

Total Years of Professional Auditing Experience:

Part 2: Discussion question

For these questions, please focus your responses collectively on the group audits that you have participate in recent years:

Question	Yes	No
1. Which of the following do your audit firms use in group audit?		
☐ overall group materiality		
☐ group performance materiality		
☐ materiality for specific account balances and transaction		
☐ clearly trivial threshold at group level		

☐ component materiality		
☐ component performance materiality		
☐ clearly trivial threshold at component level		
☐ materiality for associates, joint ventures		
2. Benchmark used for determining group overall materiality:		
☐ Profit before tax		
☐ Profit after tax		
☐ Revenue		
☐ Total asset		
☐ Others, [please specific …………]		
3. Benchmark used for determining group overall materiality is derived from:		
☐ this year consolidated financial statement (unaudited)		
☐ previous year consolidated financial statement (audited), adjusted for significant changes of this year.		
☐ this year parent financial statement (unaudited)		
4. Group overall materiality should be based on:		
☐ Information needs of users of financial statement		
☐ Audit risks		
☐ Auditor's professional judgement		
☐ Others, [please specific …………]		
5. Group performance materiality is based on:		
☐ Always 75% group overall materiality		
☐ 50%-75% group overall materiality, depending on audit risk		
☐ 50% - 90% group overall materiality, depending on audit risk		
☐ not applicable		
6. Clearly trivial threshold at group level is:		
☐ 3% - 5% group overall materiality		
☐ 5% - 8% group overall materiality		
☐ not applicable		
7. How do you determine component materiality:		
☐ using the aggregated maximum component materiality (follow AICPA guidance 2013)		
☐ Percentage of 50-90% on group overall materiality		
☐ Depending on auditor judgement (no specific guidance), just ensure that component materiality is lower than group overall materiality		
☐ Other, [please specific …………]		
8. Performance materiality at component level is:		
☐ 75% component materiality		
☐ 50% - 90% component materiality		
☐ No consideration. Depending on component auditor judgement		
☐ Depending on component auditor judgement, but not exceed the group performance materiality		
9. Clearly trivial threshold is:		

☐ 3-5% component materiality, used for consideration at component level, not reporting to the group		
☐ Do not use the clearly trivial threshold at component level. Just use this threshold at group level for purpose of reporting misstatement to group auditor.		
☐ Not applicable		
10. Assessment of audit risk will have influence on:		
☐ group overall materiality		
☐ group performance materiality		
☐ component materiality		
☐ Other, [please specific …………]		
11.Do you consider the following qualitative factors when determining component materiality		
☐ The size of the component (its individual financial significance to the group);		
☐ Whether the component has a statutory audit, in which case the level of materiality for statutory audit purposes (which is likely to be lower) may be used;		
☐ The characteristics or circumstances that make the component significant;		
☐ The strength of the component's control environment;		
☐ Whether the component is new to the group and so the group auditors have less of an understanding of its operations;		
☐ Whether the component's operations are similar to the rest of the group;		
☐ The likely incidence of misstatements, taking account of risk assessment and previous experience.		

APPENDIX B: INTERVIEW QUESTIONS

For these questions, please focus your responses collectively on the group audits that you have participate in recent years:

Discussion Questions	Response
a) How do your firm determine materiality at group financial statement level (overall materiality, performance materiality, materiality for specific account and transaction, clearly trivial threshold) b) How do your firm determine materiality at component level (component materiality, performance materiality, clearly trivial threshold, materiality for associates and joint venture) c) How do your firm apply the above materiality thresholds? d) How does risk assessment impact the materiality determination? e) How do your firms consider the qualitative factors when determining component materiality?	

RECORD TELECOMMUNICATION SERVICES REVENUE WHEN APPLYING IFRS 15 - CURRENT SITUATION AND SOLUTIONS

PhD. Ly Lan Yen[1], **MA. PhD student. Dao Tuyet Lan**[2], **BA. Hoàng Thu An , BA. Bui Bao Ngoc**[3]

Abstract: Vietnam is gradually perfecting and applying international general regulations on accounting. Applying the international financial reporting standards system (IFRS) to Vietnamese businesses is necessary to help the financial system be more stable. more public, transparent and healthy, but when applying IFRS there will be inevitable difficulties when starting implementation and conversion. The telecommunications industry is one of the industries most affected by the application of IFRS in Vietnam - especially IFRS 15 Revenue from contracts with customers. There has been a lot of research on this issue and there have been appropriate solutions, but it is only limited to a certain scope, so it is not possible to see all the problems or effective solutions for telecommunication unit . From the actual difficulties and problems occurring at some telecommunications corporations, the study used a number of traditional research methods such as: qualitative, empirical, analytical methods... to implement based on regulations and practical experiences present at telecommunications enterprises to provide a number of solutions to help recognize revenue according to IFRS 15 conveniently, appropriately and consistently according to regulations between telecommunications business units.

Keywords: Accounting for telecommunications service revenue; Apply IFRS 15, Apply IFRS 15 to telecommunications services

JEL: M41

I. SETTING THE PROBLEM

Telecommunications is the sending, transmitting, receiving and processing of symbols, signals, data, writing, images, sounds or other forms of information by cables, radio waves, optical media and media. other electromagnetic. voice calls, text messages (SMS) as well as Data (considered "basic" telecommunications) and a range of online messaging and information services and data retrieval and processing (considered value-added telecommunications).

In 2009, the National Assembly of Vietnam passed the Telecommunications Law with the concept: "Telecommunication services are the services of sending, transmitting, receiving and processing information between two or one group of users of telecommunications services, including basic services and value-added services. Telecommunications application service is a service that uses telecommunications transmission lines or telecommunications networks to provide services applicable in the fields of information technology, radio, television, commerce, finance, banking, culture, information, health, education and others ." When using telecommunications services, users and businesses must pay telecommunications fees to the telecommunications service provider.

According to the roadmap, VFRS is still in the construction and promulgation phase (2020 to 2024) and will begin implementation from 2025. With the purpose: " Issuing and organizing the new implementation of a reporting standards system Vietnam Finance Corporation (VFRS) which follows the principle of maximum absorption of international

[2] Van Lang University

[3] MA student of Academy of Finance

practices, in accordance with the characteristics of the Vietnamese economy and the needs of businesses, ensuring feasibility in the implementation process" - Date March 16, 2020, the Ministry of Finance issued Decision No. 345/QD-BTC on approving the project to apply financial reporting standards in Vietnam.

Applying IFRS to the Vietnamese accounting system is a challenge in terms of the level of market development, level of professional capacity, and foreign language for accountants, auditors, investors, and investors. manage. The application of IFRS will contribute to opening a new era, changing the way of recording, measuring and presenting factors on financial statements of enterprises, creating a common language with the industry. accounting, creating opportunities for the development of the capital market, increasing the transparency of financial statements, protecting the interests of shareholders, beside that also requiring efforts from businesses and accountants. . One of the industries most affected by the change when applying IFRS is telecommunications businesses when applying IFRS 15 (replacing IAS 18).

In fact, telecommunications companies around the world that have adopted IFRS 15 say it will have a negative impact on financial statement users' understanding of the company's transactions, and the companies report inconsistent across similar transactions. (Notably, after applying IFRS 15, on the stock market, the stock price of a telecommunications company may change because the revenue information on the financial statements changes and decreases when compared to the past, causing investors to reconsider their expectations.

II. ACCOUNTING FOR TELECOMMUNICATIONS SERVICE REVENUE IN VIETNAM WHEN CONVERTING AND APPLYING IFRS.

1. Changes in IFRS 15 compared to IAS 18 and VAS 14.

According to IAS 18, revenue is: "the sum of economic benefits for the period arising in the usual course of the entity's activities where they result in increases in equity, other than increases in connection with contributions from equity participants. From IAS 18, Vietnam has applied and released VAS 14 with the concept of revenue as follows: "Revenue is the total value of economic benefits obtained by an enterprise during the accounting period, arising from usual production and business activities of the enterprise, contributing to increasing equity capital.

But when switching to IFRS 15, revenue has become more about the nature of contracts with customers. IFRS 15 takes the view that: "revenue is recognized when the obligation is fulfilled by transferring goods or services promised to the customer (that is when the customer obtains control of the goods or services there).

Objective of IFRS 15 (IFRS15.1): The objective of this Standard is to regulate the principles that an entity must apply to report useful information to users of financial statements in terms of the nature , value , timing and uncertainty of revenue and cash flows arising from contracts with customers. [6] IFRS 15 has developed a 5-step approach to determine revenue that IAS18 and VAS have not yet built. The 5-step process is shown in the following diagram (***Diagram 1 and diagram 2)***:

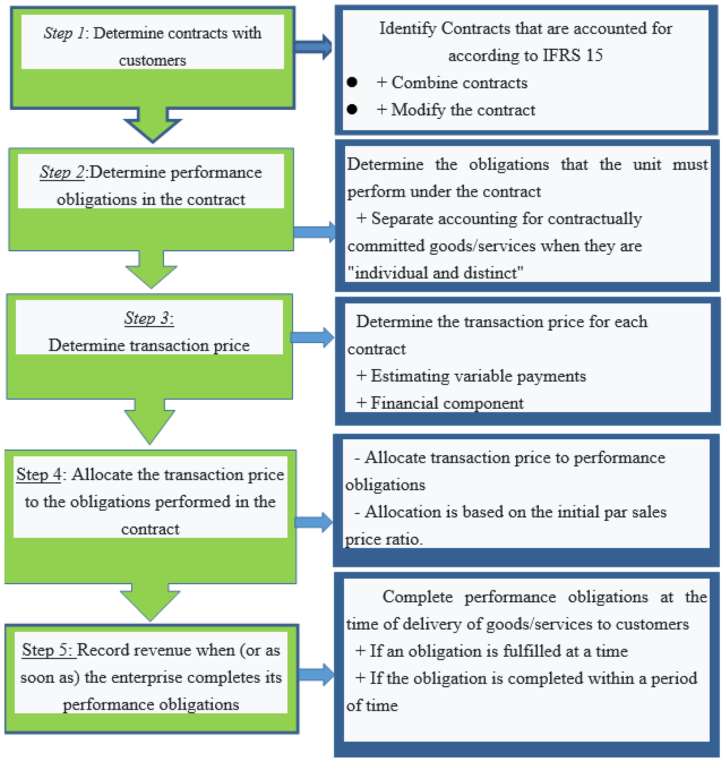

Diagram 1: 5 steps to determine revenue (according to IFRS 15)

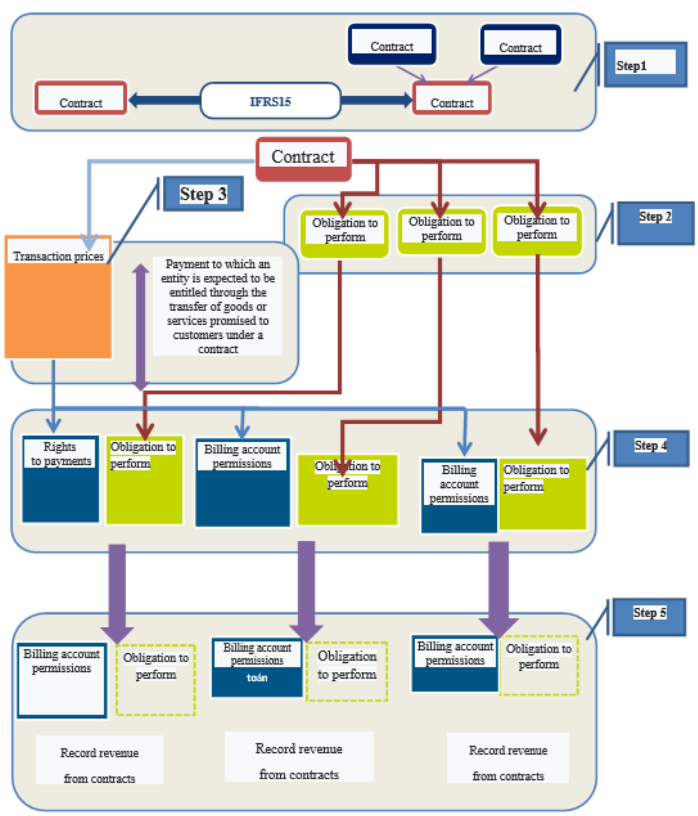
The 5 specific steps are summarized in diagram 2 below:



(JICA training materials source)

Diagram 2: 5-step process model for revenue recognition according to IFRS 15

- The introduction of IFRS 15 replaces the standards: International Accounting Standards - IAS (International Accounting Standards) 18 Revenue; IAS 11 construction contracts; Guidelines of the International Financial Reporting Standards Committee - IFRICs (International Financial Reporting Interpretations Committee) 13 Customer loyalty program; IFRIC 15 Real Estate Construction Agreements and IFRIC 18 Transfer of Assets from Customers; SIC 31 DT - Exchange of goods related to advertising services.

2. Telecommunications revenue and the current status of telecommunications revenue recognition in Vietnam.

Telecommunication service revenue can be understood in a simple way as revenue from services (voice, SMS, data, other VAT services) provided by telecommunications carriers to final customers.

Currently in Vietnam, prepaid mobile telecommunications revenue is recorded when customers pay prepayments in many different forms such as buying telecommunications cards, depositing money into main accounts, signing contracts to buy long term packages ... This does not reflect the actual nature of customers' use of the service. Specifically:

If recognition is determined according to the concept of revenue:

According to VAS 14, the Ministry of Finance has issued official dispatch 18494/BTC-CDKT allowing the three largest telecommunications service providers in Vietnam today, VNPT Group, Viettel and Mobiphone, to record revenue at the time of completing the obligation of sales of telecommunications cards to customers. For postpaid mobile services and other value-added services (television, security, etc.) Revenue is determined according to the amount of service usage by customers during the month and recorded periodically (usually closed at the 24h on the last day of the month, regardless of when the service is first provided to customers during the month).

When applying IFRS 15, telecommunications businesses will have to re-determine the true value of the service provision. According to IFRS 15, the sale of telecommunications cards to customers is essentially a prepayment by the customer for the use of the service. Only the portion of the service that the customer subsequently uses is recorded as revenue

For example: When a customer buys a telecommunications card worth 200,000 VND from the network and buys a package worth 120,000 VND.

According to VAS 14's recognition point of view, the telecommunications unit's accountant records customer revenue right at the time of card sale as 200,000 VND.

But according to IFRS 15, in reality, at the time of purchasing a telecommunications card, the customer has not used any basic telecommunications services or other added value, so businesses are only allowed to record the face value 200,000 VND card to the customer's prepayment. Only when a customer purchases a package worth 120,000 VND will the telecommunications service revenue worth 120,000 VND be recorded, the remaining 80,000 VND is still prepaid revenue of the customer.

From an economic contract perspective:

Telecommunications services are increasingly changing and diversifying services to suit the needs of customers. Therefore, the components that make up a service to provide to customers are also more diverse. One of them can be mentioned as providing phones with telecommunications packages and security packages. Then there will be a difference when distributing revenue according to IFRS 15 and VAS 14.

For example: Customer A signs a contract with a telecommunications enterprise starting from July 1/N to June 30/N+1 lasting 12 months with VAS 14 not giving any instructions on how to do this , to determine these components and how to allocate the selling price and as a result, different principles have been applied. So according to VAS 14, the revenue that will be recorded for fiscal year N will be as follows:

Table 1: Example of revenue determination when applying VAS 14

Name of goods and services	Unit price (VND) At day 1/7/N	Determine the value of revenue recorded in fiscal year N at July 1, 2019 (according to VAS 14)
Total fixed monthly package price	600.000	600.000
Phone price	2.400.000	2.400.000
Total price of included security package	120.000	120.000
Total	3.120.000	3.120.000

Under IFRS 15 telecommunications entities will have to determine the following steps:

+ Step 1: Contract to provide services within 12 months.

+ Step 2: Determine the obligations that need to be fulfilled with customer A:

Provide 1 phone

Provides a 1-year subscription package

Provides a security package included for 1 year

+ Step 3: Transaction value:

Equal to the total value of goods and services that customers must pay:

600,000 + 2,400,000 + 120,000 = 3,120,000 VND

+ Step 4: Allocate the transaction price of 3,120,000 VND according to individual obligations for each period of 12 months:

Revenue recorded for 1 month = 3,120,000 / 12 = 260,000 VND

+ Step 5: Record revenue when the enterprise completes its obligations

Revenue in July/N will be recorded as 260,000 VND. The remaining amount of 2,860,000 VND will be recorded as a prepayment from the customer and evenly distributed to the following periods:

- If considered in terms of year N financial statements:

Table 2: Comparison of revenue when applying VAS 14 and IFRS 15

VND

Targets	According to VAS 14	According to IFRS 15
Revenue from package provision activities	600.000	600.000/12*6 = 300.000
Revenue from mobile phone sales	2.400.000	2.400.000/12*6= 1.200.000
Revenue provides security services	120.000	120.000/12*6 = 60.000
Total	3.120.000	1.560.000

(Source: Author's own data assumed based on reality from telecommunications businesses)

When recording revenue according to VAS 14, the profit of the telecommunications unit will be stable because the recognition of 100% of the revenue value corresponds to the payment of 100% of the cost value. But when recorded according to IFRS 15, at the beginning of the period the telecommunications unit will report a loss and then a stable profit. This is because the cost price is 100% paid at the time of supply to the customer, but revenue is recorded according to allocation.

3. Difficulties and problems exist when applying IFRS 15 to revenue recognition of telecommunications businesses.

To apply IFRS 15 to a telecommunications entity is a big change and it requires a large amount of work not only from accounting, but also from IT, tax, people and possibly other departments in the company. To manage the large number of calculations required under IFRS 15, telecom financial regulators will need a fast tool to handle the large number of calculations required while requiring access and transparency for all contractual data. This includes the ability to connect accounting results and financial systems used by business units across different geographies and verticals.

How will the revenue previously recognized when converting to IFRS 15 be handled? (If a decrease in revenue is recorded and converted back to actual revenue, it will cause the adjusted revenue in the fiscal year of the 3 carriers will seriously decline, directly affecting the benefits and competitiveness of telecommunications businesses, and also affecting State agencies such as taxes or data receiving agencies to analyzed and used by the Ministry of Finance and the Ministry of Information and Communications.

- For customers' long-term prepaid revenue, the story also involves whether to re-evaluate the revenue when money will depreciate over time - Especially for a developing country with a fairly high inflation rate like Vietnam. IFRS 15 also requires that financing costs for long-term contracts be settled 12 months after the contract date. As a result, telecommunications companies will need to review customer contracts and account for the effect of the time value of money. Moreover, the recognition of revenue takes place in many periods but the cost price still has to be paid in one period for some services will not accurately reflect the service business on the financial statements of that period.

Most telecommunications operators have systems that are interconnected along with user intervention. At this time, the billing system is directly connected to the accounting system so that income and receivables from customers are automatically recorded when invoicing has occurred. Because under IFRS 15, recognition of revenue from handheld devices may be earlier than monthly billing, invoices may no longer reflect the amount of service revenue that must be recognized during the month. Therefore, manual adjustments must be made or significant changes to the information technology systems will be made to automatically calculate receivables each month.

- Contract modifications: Increasingly diverse customer service needs require telecommunications companies to allow a certain degree of flexibility for subscribers to choose the contract that best suits their needs . They now offer additional services billed on top of monthly fees or allow shortening of contract periods.

IFRS 15 requires entities to evaluate whether an amendment is a valid separate contract or part of an existing contract, depending on whether it results in additional goods or services. promised and whether it increases consideration.In the absence of a new contract, entities need to evaluate the nature of the modification, whether the change requires retroactive adjustments to previously recognized revenues or future revenue to adjust the future sales and income .

Managing the impact of contract modifications on billing and accounting systems may not be easy for telcos with huge subscriber base and variety of contracts offered to each customer. There is no denying the fact that IFRS 15 will change companies' policies and procedures for recognizing revenue. These changes will involve significant efforts across multiple departments, placing a burden not only on accountants and auditors but also on employees running IT, billing, marketing, product development and other related functions within the organization.

III. SOME SOLUTIONS AND RECOMMENDATIONS WHEN APPLYING IFRS 15 AT VIETNAMESE TELECOMMUNICATIONS CORPORATIONS

Some solutions to help telecommunications corporations perform well in the process of processing and recording revenue according to IFRS 15.

To meet the requirements of IFRS 15, previously, Telecom companies had to ensure that the company's sales department, product development department, and solutions consulting staff understood its impact on all terms contained in customer contracts that the company offers. This is the basis for creating a business plan defined in 5 beneficial steps.

It is essential to establish the best management accounting system for targets related to revenue, along with a database system to ensure reasonable management can collect and save all information necessary to implement IFRS 15 and the information is linked to the company's accounting system, to benefit the recognition, measurement and disclosure of revenue and to meet audit requirements for internal investigation.

During the transition to IFRS, there will be information gaps that affect the interests of investors, and businesses need to have convincing explanations in the notes to their financial statements. Pre-recognized revenue needs to be adjusted to pre-received revenue of amounts incurred in the converted fiscal year.

In addition, the company's leadership should also review and adjust key performance indicators (KPIs) related to the sales department, focusing on linking responsibility for collecting money with sales targets, due to IFRS 15 introducing collectibility as a criterion for revenue recognition.

Telecommunications companies need to carefully analyze the current accounting information system, identify issues that need to be changed, and upgrade the system.

Recommendations to State agencies:

There needs to be consensus from state agencies to create an environment for telecommunications units to apply IFRS 15. The policies proposed need to be unified such as: The Ministry of Information and Communications has issued Circular 21/ 2019 regulates the recognition of customer revenue according to actual use, but there is no guidance from the Ministry of Finance to replace Official Dispatch 18494/BTC-CDKTN on recording revenue from selling telecommunications cards.

DISCUSSION AND CONCLUSION.

In summary, the new standards provide a systematic approach that includes many detailed guidelines and principles, solving difficulties caused by the old standard's too high-level approach to general principles. This results in a reduction in inconsistent interpretations, increasing the comparability of revenue figures across companies. However, the accompanying consequence of the change is that it significantly affects the revenue recognition mechanism and presentation on financial statements, which can cause a relatively large decrease in revenue during the application period. Accompanying that are the costs of professional training and changing computing infrastructure to record telecommunications service revenue. Hopefully, after this transition period, businesses belonging to telecommunications groups in particular and businesses in general will implement the new regulations well.

SOCIAL RESPONSIBILITY ACCOUNTING – INTERNATIONAL EXPERIENCE AND LESSONS FOR VIETNAM

Asso. Prof., Dr. Ngo Thi Thu Hong[1], Dr. Le Thi Yen Oanh,
Dr. Lê Thị Hương, Dr. Nguyen Thi Nga, Dr. Ngo Thi Minh [2]

Abstract: *Currently, social responsibility accounting in Vietnam has been being implemented by many enterprises. However, due to the lack of legal regulations in this field, enterprises are facing many difficulties in practicing social responsibility accounting. This paper will discuss on social responsibility accounting and tools managing corporate social responsibility activities. Also, this paper will give an overview on global experience on social responsibility accounting practices and lessons for Vietnam.*

Keywords: *Social responsibility accounting, experience, lessons for Vietnam*

1. INTRODUCTION

Vietnamese businesses are currently implementing social responsibility activities along with profit goals, in accordance with the government's general policy of sustainable development. However, the use of social economics tools to support corporate governance and publish social responsibility reports has not been effectively applied by interested businesses. Most businesses only carry out social responsibility activities without independently recording these accounting objects, but only publish non-financial reports on social responsibility integrated in the annual report or sustainability report. Meanwhile, implementing social accounting helps businesses record social responsibility assets and liabilities, income and social responsibility expenses. Thus, it helps managers proactively build business plans, identify and allocate appropriate resources to balance profit goals and social responsibility. At the same time, social economic information provided to relevant parties will contribute to enhancing the brand reputation of the enterprise and promoting the development of the enterprise. Therefore, solutions are needed to promote the implementation of social economics in enterprises in the coming time, to improve the efficiency of corporate governance. The paper will provide an overview on social responsibility accounting, thereby summarizing the experiences of some countries on social responsibility accounting practices and lessons for Vietnam.

2. CONCEPT OF SOCIAL RESPONSIBILITY ACCOUNTING

The terms Social Responsibility Accounting (SRA), Sustainable Development Accounting (SA) and Social and Environmental Accounting (SEA) basically have the same content, nature and goals, which are: Providing information about the society, the environment, the situation and business results of the enterprise for administrators and other related subjects. For these subjects, businesses have legally binding responsibilities, or voluntary responsibilities. The use of these different terms depends on the development of the theory of corporate social responsibility, depends on the economic, political, social and environmental situation of each country and world, depends on the views

[1] Academy of Finance, Email:ngothuhong@hvtc.edu.vn.
[2] East Asia University of Technology.

of researchers, on the views of international organizations, etc. Specifically, in the early stages of development, social responsibility accounting is concerned and focuses on environmental aspects, so the term often used by researchers and administrators is social and environmental accounting, and environmental accounting is a part of social responsibility accounting. In the current period, businesses, countries and the whole world are interested and focused on sustainable development and achieving sustainable development goals, the commonly used term is sustainable accounting.

According to Mathews (1993), social responsibility accounting is the disclosure of financial information and non-financial information, qualitative information and quantitative information about the activities of an organization, which affects many people and related subjects. Accordingly, social responsibility accounting will provide information for employees, administrators, owners, customers, suppliers, sponsors, communities, government agencies, trade associations, etc. Social responsibility accounting includes both financial accounting and management accounting, which emphasizes the impact of non-financial information on social, environmental and economic factors (Tilt, 2009).

Social responsibility accounting is a science of observing, measuring, calculating, recording, reflecting, organizing, processing and analyzing information about the social responsibilities of businesses committed to such as: responsibility to protect environmental protection, responsibility to contribute to the social community, responsibility to suppliers, responsibility to employees, responsibility to ensure benefits and safety for consumers... in relation to the efficiency and effectiveness of production and business activities of enterprises, in order to provide information to business administrators, to governmental agencies, environmental management agencies, and to relevant parties such as employees, customers, suppliers, associations, local communities, etc.

Social responsibility accounting recognizes that the resources of a business to create wealth and added value depend not only on productive capital and financial capital, but also on human, social and natural capital. This means that payments to employees, environmental protection payments and community program expenditures can be reinvested in the assets of the business and thus can contribute to generating positive wealth.

Thus, social responsibility accounting basically reflects and quantifies information about the economy, society, and environment of an enterprise to provide administrators and other subjects related to the enterprise. Social responsibility accounting includes both financial accounting and management accounting for social responsibility.

According to the guidance of the UK SIGMA project in 2003, social responsibility accounting was implemented according to John Elkington's Trible Bottom Line (TBL) model, with the basic content of accounting for assets and capital, accounting for revenue, costs and operating results, cash flow accounting related to the economy, environment and society, within the scope of impact inside and outside the enterprise. Social responsibility accounting gives treatments for internal and external costs and benefits related to economic, environmental and social aspects.

Social costs include health care costs, employee training and development, expenses for taking care of the cultural and spiritual life of employees, expenses contributed to community development, charitable activities expenses, fines for violations of the State's social insurance regime, costs arising from civil and criminal liability lawsuits due to social disputes, costs arising from strikes and political instability, costs that businesses must pay to minimize damage or voluntarily compensate for damage to individuals, organizations, businesses and other entities due to activities that affect the environment and society that the business causes, etc.

Income and social benefits include income increases due to the reputation of the business contributing to community development, due to customer care, due to concern for employee benefits, due to clean production, due to the production of green products and environmentally friendly products; increased income from insurance cost savings due to improved health and safety for workers, income from avoiding fines due to violating laws, income from Government awards and subsidies government on community and social development achievements, etc. Social responsibility accounting provides techniques to record, reflect and present information about assets, capital, revenue, costs and operating results related to economics, environment and society on the financial statements of enterprises.

3. LITERATURE REVIEW

According to Dr. Akbar Sadeghzadeh (1995) of Wollongong University, Australia, in the 1970s, the world was facing environmental problems, climate change, epidemics and public health, human rights, inequality, etc. The main culprit is the economic activities caused by large corporations. Therefore, corporate social responsibility again takes center stage in social debates.

In the early years of the period (1970-1980), environmental issues were concerned as part of social responsibility accounting but were still in a primitive state. By the years 1980-1995, social responsibility accounting had completely shifted its research attention to environmental management, minimizing environmental damage caused by businesses. During this period, environmental accounting was considered an important management tool, as shown in the document "Environmental Costs and Liabilities: Accounting and Financial Reporting Issues" of the Canadian Association of Certified Public Accountants (1993) and research works of Gray (1993), Rusbinstein (1994). In the early 1990s, government agencies on environmental protection of several countries such as the United States, Japan, the Federal Republic of Germany, and the European Community (EC) provided regulations and instructions on some costs related to environmental issues and environmental protection in accounting and presentation of environmental information in accounting reports. Farooq Al Ani & M. Firdouse Rahman Khan (2015) concluded that the term "social responsibility accounting" was born and developed in the UK in the 1970s, when the Public Interest Research Group established the Social Auditing Company.

During this period, social responsibility accounting was established and was one of the hot topics of discussion among researchers, universities, political, economic, and social organizations, etc. Many articles and scientific conferences at the national and international levels discuss social responsibility accounting. Many research organizations, political and social agencies have been established to research different aspects of corporate social responsibility and social responsibility accounting. Social responsibility accounting courses are offered at different levels at universities around the world. Typical authors for research on social responsibility accounting are Gambling (1977, UK), Gaffikin (1978, New Zealand), Bremser (1982, USA), Booth, McCallum and Greenwell (1982-1983, Australia), Mathews (1983, USA);Bremser, Schwartz and Huang (1983, USA) and Mathews (1984, New Zealand).

From 1997 to present, corporate social responsibility has been affirmed and recognized through its contribution to sustainable development and social responsibility accounting is concerned, focused and oriented towards the development of sustainable development. Sustainable development of businesses, countries and the world not only for today's generation but also for future generations. And typical authors of research on social responsibility accounting in this period are Robert Hugh Gray (2002, 2011), J. Bebbington (2010), John Elkington (1997), Orlitsky et al (2003), Jensen (2002), Labelle (2006), Gendrol (2006)

4. MANAGEMENT TOOLS FOR CORPORATE SOCIAL RESPONSIBILITY ACTIVITIES AND CURRENT GUIDELINES ON IMPLEMENTING SOCIAL RESPONSIBILITY ACCOUNTING

It can be said that there are currently many management tools for corporate social responsibility activities and many guidelines on implementing social responsibility accounting as followed:

- Sustainable development accounting guidelines of the Commission on Environment and Development UN at the World Summit on Sustainable Development in 2002.

- Sustainable development accounting guidelines of the UK SIGMA project, 2003.

- Canadian Accounting Association's Sustainable Development Accounting Reporting Guide, 2005

- Sustainability Accounting Standards of the United States Sustainability Accounting Standards Board issued in July 2011

- Trible Bottom Line tool: People, Plannet, Profit (TBL, or 3P) by John Elkington, a world-famous British consultant on corporate social responsibility and sustainable development, was announced. published in 1997. Trible bottom line tool helps businesses incorporate sustainable development goals into business strategies, considering social and human results (People), ecological results (Plannet) , in a close relationship and interactive impact with the financial results (Profit) of the business.

- Sustainable development reporting guidelines of the Global Reporting Initiative (GRI).

- Set of standards and management tools for corporate social responsibility, ISO 26000 of the International Organization for Standardization (ISO), developed in 2005, officially announced in 2008.

In the current period, the development of social responsibility accounting focuses on management accounting, to help administrators implement and achieve sustainable development goals. The content of social responsibility management accounting includes the content of environmental management accounting, social cost and income management accounting, in addition it also has content that reflects specific accounting principles. Social responsibility accounting is assessing corporate social responsibility, applying the balanced scorecard (BSC) in evaluating corporate social responsibility. To evaluate the social responsibility of businesses, researchers, managers, consultants... use indicators that reflect the combined effectiveness of all economic, environmental and social aspects of the business. enterprise.

Some opinions say that, with current knowledge and experience, determining those indicators is unthinkable. In fact, businesses and international organizations (GRI, ISO...) set indicators that reflect the results and effectiveness of each aspect of economic, environmental and social activities of businesses and orientations to The development of indicators reflecting the overall overall efficiency if practical conditions at the enterprise allow. Regarding the application of the Balanced Scorecard (BSC) in assessing corporate social responsibility, some authors suggest expanding and adjusting the BSC to manage and monitor the implementation of responsibility strategies. corporate society, called the Sustainability Balanced Scorecard. There are two basic ways to apply the balance sheet to implement the vision, goals, and strategies of corporate social responsibility:

- Adding social and environmental goals, measures and indicators to financial aspects, customer aspects, internal business aspects, learning, experience and development aspects, in unified relationship, consistent with the common vision and strategy of sustainable development of the enterprise.

- Build a fifth operational aspect, the social and environmental aspect, linked to four aspects: Finance, customers, internal business, learning, experience and development. (Capron and Quairel Laoizelee, 2006).

5. INTERNATIONAL EXPERIENCE IN SOCIAL RESPONSIBILITY ACCOUNTING PRACTICES AND LESSONS FOR VIETNAM

5.1. Social responsibility accounting practices in the UK

Social accounting for small community organizations as well as large and medium-sized social enterprises is based on 3 steps: (i) Planning - designing, determining processes and goals; (ii) Accounting - decide on the scope and establish a social accounting system; (iii) Reporting and feedback - Report back to company stakeholders and respond to comments.

Assessing the impact of corporate social responsibility includes, evaluating relationships with all stakeholders and reporting specific instructions. Indicators may include establishing personal relationships with key decision makers or positive feedback from stakeholders. Changes in stakeholder relationships can be monitored using dialogues or surveys. This will help businesses decide on the scope of social accounting activities: Values and goals, activities (or programs), stakeholders and relationships between these factors.

Next, companies develop and measure KPIs that show the improvement in a company's competitiveness determined by CSR. In the CSR impact model, KPIs focus on customers and employees. For example, in a 2012 survey of 500 top managers in the UK, responsibility to customers, employees and shareholders ranked highest. Companies define quantitative indicators to measure KPIs depending on specific CSR strategies and activities.

Although KPIs should be evaluated individually, they are all interrelated. According to Tuppen (2002), CSR affects the level of customer satisfaction. Besides, CSR value can also be measured. Accordingly, businesses will have to calculate the costs and monetary benefits that CSR can bring. Wherein, CSR monetary benefits include increased revenue or reduced costs due to CSR participation. It can be additional revenue when businesses apply CSR, CSR subsidies. Savings range from cost reductions brought about by CSR, internal cost savings due to improved efficiency or from specific CSR collaborations. When evaluating CSR benefits, managers need to carefully consider the time horizon. Because the benefits of CSR often occur after a lag, the review focuses on longer time periods.

CSR costs include donations to support trademark or patent license fees. In addition, CSR costs also include recurring costs such as staff, materials, costs for managers to coordinate projects or material costs for the production of promotional materials for marketing campaigns. Cost accounting typically assigns costs to products based on volume indicators such as production volume. Risk-related costs of CSR can include reduced revenue or increased costs relative to expected revenue and expenses without CSR.

Currently, most businesses in the UK integrate social responsibility accounting reports into sustainable development reports for external publication. The process of preparing a sustainable development report is carried out according to the guidelines for sustainable development reporting and the International Integrated Report.

5.2. Social responsibility accounting practices in the US

The social responsibility accounting system in the US is recognized by the sustainable balanced scorecard. Unlike the conventional balanced scorecard, which only includes 4 groups: Finance, internal processes, customers, and people. The sustainable balanced scorecard in the US is supplemented with a fifth dimension, environment and society, linked to the remaining four dimensions.

During the process of recording social responsibility accounting, the costs incurred and the income of each of the above groups of subjects are recorded. Making a social responsibility report is done through the following steps:

Step 1: Plan your corporate reporting process including: Identifying a list of sustainability topics that are potentially relevant and that senior decision makers within the company want to act on and report on Report based on the company's business goals and development context.

Step 2: Collect input from key stakeholders on the above topics. A list of sustainable development topics that stakeholders value is established. This is the basis for making recommendations on reported topics.

Step 3: Identify key areas for the report. These are areas that reflect the organization's significant economic, environmental, or social impact or fundamentally influence the assessments and decisions of stakeholders. It is linked to the company's development goals, meets the needs of stakeholders and impacts the economy, environment and society.

Step 4: Supervise the preparation of social responsibility accounting reports. In particular, record each type of revenue and cost incurred according to each criterion, and provide explanations about those sources of costs or revenue.

Step 5: Check and exchange. The necessary information for each item of data required to comply with the disclosure of information to the outside must ensure accuracy.

The report must be comprehensive and targeted to specific stakeholder groups. The preparation of social responsibility accounting reports requires the application of reporting principles, especially the principles of clarity, timeliness and balance. Accurate and specific accounting data accompanied by illustrative examples.

For production and business enterprises, environmental factors are often considered the most important issues and are often given the most attention in reports. Meanwhile, for service and financial companies, other issues such as human resources or community are invested more. Businesses express their desire to implement CSR in parallel with sustainable development, making efforts to communicate their ability to meet the needs of stakeholders and the overall impact of business activities on the environment.

Performance indicators published in sustainability reports include materials (the total volume of raw materials used to produce and package the organization's products and services during the year and the percentage of raw materials used to produce and package the organization's products and services during the year). materials are recycled to produce the organization's products and services); energy (energy consumption, savings and initiatives); water (water supply and usage, savings and initiatives); compliance (number of fines and total fine).

5.3. Social responsibility accounting practices in Australia

Businesses operating in Australia use accounting tools with three parts: social, environmental and financial (Triple bottom line) to incorporate sustainable development goals into business strategies. The introduction of the Global Reporting Initiative (GRI) Sustainability Reporting guidelines, the Guidelines for Reporting Environmental Indicators and the Guidelines for Reporting Social Indicators (both Australian initiatives) is Reference documents for accounting work as well as preparing social responsibility accounting reports. Australian businesses record social responsibility accounting according to the stakeholder approach.

Besides, social responsibility accounting adheres to the overall principle and principles: Multi-dimensional, comprehensive, regular, comparative, verifying and ensuring and publishing. Social accounting reports of Australian businesses are mainly published in the form of sustainable development reports. More than 80% of sustainability reports in Australia are prepared in accordance with the guidelines of the global reporting initiative.

5.4. Lessons for Vietnam

Through studying the experiences of implementing social responsibility accounting in businesses of other countries, some contents can be suggested for Vietnam in applying social responsibility accounting, including:

Firstly, raise awareness of businesses. In fact, currently, no country requires businesses to implement social responsibility accounting. However, as the economy develops along with the increasingly strong globalization process, corporate social responsibility is increasingly emphasized. Businesses need to be encouraged to apply responsibility accounting and learn from each other to come up with a highly consistent way of implementing social responsibility accounting.

Secondly, the Government considers issuing documents to apply to social responsibility accounting such as Sustainable Development Accounting Standards of the United States Sustainable Development Accounting Standards Council, accounting guidelines. Sustainable development accounting of the UK's SIGMA project, the Australian Environmental Indicators Reporting Guide and the Australian Social Indicators Reporting Guide.

Thirdly, encourage businesses to apply sustainable development reporting guidelines of the Global Reporting Initiative and report templates of the International Integrated Reporting Council.

Fourthly, use Trible bottom line tools to incorporate sustainable development goals into business strategies, considering social and human outcomes, and ecological environmental outcomes in a close relationship. and the interaction with the financial results of the business.

6. CONCLUSION

For businesses to develop sustainably, providing information on social responsibility accounting to stakeholders is considered an important part of current business accounting reports. This will help enhance the public image of businesses, effectively promote product consumption, and demonstrate businesses' responsibility to society. Through this, businesses also show concern for the community, customers and other relevant subjects. Therefore, social responsibility accounting plays an important role in helping businesses develop sustainably. From the experiences of some countries in social responsibility accounting, the article has drawn some lessons for Vietnam.

PROMOTING SUSTAINABLE GROWTH OF ENTERPRISES ENERGY INDUSTRY IN VIETNAM

Dr. Tran Duc Trung [1]

Abstract: Natural resources and energy are basic resources to meet the economic development needs of each country. In recent years, the fluctuations in fuel and energy have been quite complicated. To meet the needs of economic development in the coming years, Vietnam has had economic growth scenarios and energy demand forecasts, set in the context of fierce competition and effective implementation of the strategy. green growth strategy. On the other hand, each country's economic growth is always associated with the growth of businesses, especially private businesses. Therefore, the article's main research method is analysis based on quantifying and synthesizing data from businesses; includes the following main contents: (1) Overview of studies on sustainable growth of businesses; (2) Some theoretical and practical issues about sustainable growth; (3) Solutions to promote sustainable growth of energy sector enterprises in Vietnam, will provide scientific exchanges to clarify issues of sustainable growth of enterprises.

Keywords: Energy, finance, business, growth, sustainable growth

1. INTRODUCE THE RESEARCH PROBLEM

In the face of strong competition and the current context of deep international integration, the top goal of businesses is growth. Growth is considered a vital factor for businesses, affirming their ability to adapt to the times and the rapid fluctuations of the market; It also demonstrates capacity and competitiveness in the economy. Growth in key aspects such as capital flow, income flow, and cash flow will create corporate financial strength, ensuring development and optimization of business opportunities. In particular, with the impact and influence of global financial crises or pandemics like the recent one, growth will help businesses be more resilient to the enormous pressures of the economy. Promoting sustainable growth of businesses, especially energy businesses towards the long-term development of the national economy, is always an urgent requirement in the current integration context.

Recently, especially in the current period , energy is an industry with a leading position in ensuring security and international integration trends. Vietnam's energy in general and sub- sectors : Coal, electricity, and oil and gas in particular have had rapid, relatively synchronous developments; closely follow the direction and achieve many positive results, basically ensuring national energy security. Renewable energy and green and circular trends are given attention to development, creating breakthroughs in ensuring national energy security, contributing to preserving energy resources, minimizing negative impacts on the environment and the environment. climate change in electricity production as well as other sub-sectors. Vietnam's energy industry enterprises are on the path to integration and strong development. Research and assessment of the current situation and growth potential, and propose solutions to promote sustainable growth for energy businesses is a very necessary requirement today.

2. OVERVIEW OF RESEARCH SITUATION

Recently, a number of domestic and international authors have mentioned and researched issues of growth and sustainable growth of businesses, issues related to the energy industry and

1 Email: trungpt.hvtc@gmail.com, Academy of Finance.

businesses. energy. Regarding research topics and scientific articles, we can mention author Pham Thi Van Anh (Academy of Finance) with the topic: *Sustainable growth of construction industry enterprises listed on the stock market Vietnam (2016), has researched and discussed issues of sustainable growth and evaluated the growth status of listed construction enterprises in Vietnam based on industry-specific issues such as scale. Large assets, slow capital turnover, long construction period. Author Tran Duc Trung (Academy of Finance) with the topic: Sustainable growth analysis of energy sector enterprises in Vietnam (2022) has compiled, analyzed and provided discussions on speed analysis sustainable growth of businesses in both theoretical and practical aspects, associated with the basic characteristics of the energy industry and practice in Vietnam.* Author group Nguyen Huu Dong (Ho Chi Minh National Academy of Politics) and Nguyen Thanh Trung (Central Inspection Committee of the Communist Party of Vietnam) with the article *" Perception of the concept of growth, economic development and public investment restructuring policy in Vietnam* ", Industry and Trade Magazine; Authors Pham Thi Van Anh and Nguyen Thi Bao Hien with the article *"The impact of financial capacity on sustainable growth in businesses" ,* Finance Magazine, period 2, November 2020... has researched and addressed growth issues with different and quite comprehensive perspectives.

In addition to books, topics, and articles, there have actually been scientific discussions and seminars at all levels addressing this topic. Specifically, Business Forum Magazine coordinated with the Vietnam Institute of Board Members to organize the forum " *Breakthrough solutions to improve the competitiveness of businesses for recovery and sustainable development* ", in August. year 2022; The Department of Electricity & Renewable Energy and the Danish Energy Agency with " *Vietnam Energy Outlook Report 2021* ". Or the International Conference *"Strengthening cooperation with Investment Funds to mobilize green finance for sustainable growth and restructuring of state-owned enterprises" organized* by The Ministry of Foreign Affairs, the State Capital Management Committee at Enterprises and the State Capital Investment and Trading Corporation (SCIC) jointly organized the event, November 25, 2022. The content and proceedings of the forums and seminars emphasize the requirements and necessity of sustainable development of businesses and important sectors in the economy.

In particular, *"New initiative: Promoting the practice of Environment - Society - Governance method in the private sector towards sustainable growth"* (November 22, 2022) by the US Diplomatic Mission in Vietnam Nam, through the United States Agency for International Development (USAID), and the Ministry of Planning and Investment announced, to promote sustainable and inclusive growth led by the private economic sector in Vietnam. The initiative aims to promote socially responsible business practices, known as Environmental, Social and Governance (ESG) standards. *This is a set of standards* often used by investors to measure how a business protects the environment, manages relationships with the community, and applies transparent and responsible corporate governance. Faced with the impact of climate change and partner requirements, the market towards sustainable production and consumption is going strong; Vietnam's commitments when participating in the United Nations Framework Convention on Climate Change (COP26), priorities in the ASEAN and APEC international cooperation frameworks on sustainable business, green production, issues Carbon tax... is posing challenges that need to be innovated for Vietnamese businesses, to keep up with new trends, otherwise they will lose competitiveness and lose the opportunity to participate and advance deeply into the global value chain.

In general, groups of authors of works and proceedings of conferences and seminars have discussed, evaluated and proposed initiatives and solutions to promote sustainable growth and development for businesses in all sectors. economic sectors, including the energy sector. The issue of mobilizing financial resources as well as other resources has shown the necessity for sustainable growth of businesses today.

3. RESEARCH CONTENT AND RESULTS

3.1. Some theories on sustainable growth of businesses

3.1.1. Sustainable growth of the business

Business *growth* can be called expanding the scale *of* that business. Successful businesses are always looking for ways to improve and expand the scale of their inputs and outputs, while enhancing the experience of their partners, especially customers, the main objects that create sales and revenue. benefits for businesses. *According to the author of the article,* Growth is understood as an increase with a balance between quantity and quality of a certain object. A growth business is one The business is growing faster than its peers or the economy as a whole.

There are many models and The strategy is for the growth goals of the business, but in general it is aimed at sustainability. *Sustainability, according to the author of the article, is an important state of growth* . This state is also a condition and goal for the long-term development of the business in the future. Therefore, it is very important to consider *sustainable growth rates* and impact factors, from which to propose and implement solutions. Businesses often have two growth methods: internal growth or external growth. Internal growth takes place within the enterprise, by investing to expand production capacity (buying machinery, equipment or building new factories), trade (opening more stores or strengthening distribution networks). distribution) and improving research capabilities (increasing costs for the research and development department). In contrast, external growth is accomplished by acquisitions, mergers or developing cooperative agreements between businesses. However, in the context of finite production resources, long-term business growth is no longer simply a matter of increasing scale. *Sustainable growth* is the highest growth rate that a business can achieve without needing to increase the level of financial leverage. Thus, the sustainable growth rate depends on the endogenous financial capacity of the owner and the efficiency of using equity capital of the enterprise. Since the late 20th century, the concept of sustainable growth has been developed for both countries and businesses. Sustainable business growth is about increasing value by applying effective production and business activities and focusing on social and environmental responsibility.

The business's growth perspective now needs to be placed within the framework of sustainable development with specific requirements and goals. The three basic pillars of sustainable business growth are economic, social, and ecological. An efficient business with high profit margins but whose production process pollutes the environment cannot be considered to be growing sustainably. A business that operates efficiently and has high profit margins but does not ensure safety requirements for workers or food hygiene for consumers cannot be considered to be growing sustainably. On the contrary, a business that focuses on social and environmental responsibility but incurs losses for a long time is unlikely to have enough resources to grow. In conditions where businesses often seek to maximize profits, the stability of financial indicators and business results only ensures growth from an economic perspective of the business. Sustainable business growth requires greater emphasis on social and environmental responsibility.

3.1.2. Evaluate the sustainable growth rate of the business

To achieve sustainable growth, evaluating and controlling business financial issues is considered one of the important principles. Therefore, analyzing and managing growth is a necessary issue that requires special attention when reviewing and evaluating the corporate financial situation, with the purpose of advising management entities. *For small and medium enterprises (SMEs),* growth creates opportunities to increase accumulation and increase competitiveness, however, to ensure stability, attention must be paid to limiting too fast a growth rate. Because SMEs often do not have enough internal resources to finance growth, they must mobilize more from outside, so uncontrolled growth leading to insolvency will push the business to the brink of bankruptcy. product. *For large businesses:* Can rely on both internal and external sources of funding to ensure growth. These businesses need to ensure stability and balance between financial resources to reduce financial risks and create long-term business advantages. Analyzing the growth situation allows managers to see the basic factors affecting growth, the causes of hot growth, no growth or recession of the business in each period, and opportunities for sustainable growth. sustainability of the unit, evaluate the quality of the enterprise's financial policies and business strategies, and propose consulting solutions for each management group. On that basis, it can be said that sustainable growth is the expected growth rate that any business wishes to achieve, when the business has reached the saturation level of asset profitability.

Determining the sustainable growth rate (ratio) should be based on the following assumptions: the enterprise has determined the target capital structure, and does not want to change that capital source. Additional equity is increased only by using retained profits, the business does not want to mobilize additional equity from outside; Asset utilization efficiency has reached its maximum level, so to increase revenue, it is necessary to correspondingly increase assets. Therefore, the limited rate at which a business can increase its total net turnover is its sustainable growth rate (Tbv). Sustainable growth rate is based on the expected growth rate of net revenue. Net revenue growth rate = Asset growth rate = Capital growth rate = Liabilities growth rate = Equity growth rate (maintain target capital structure) = Ratio of retained earnings to net profit.

Simply, sustainable growth rate (SGR) is the maximum growth rate that a company or social enterprise can maintain without having to finance growth. growth by adding external equity or raising more debt. Sustainable growth rates involve maximizing sales and revenue growth without increasing financial leverage. Achieving a sustainable growth rate can help a company avoid excessive leverage and financial difficulties. General formula: SGR = ROE x (1 – Dividend payment ratio). Specifically, Sustainable growth rate is determined as follows:

In which: Tbv: Sustainable growth rate; Lgl: Retained earnings; NP: Profit after tax; LCT: Total net turnover; Sd: Assets at the beginning of the period; C: beginning of period; Hgl: Retained profit ratio; ROS: Net operating profit ratio; SVkd: Number of business capital turnover cycles; Htc: Asset coefficient on owner equity.

Some main observations: *First,* Hgl and Htc reflect the financial policies of enterprises. Hgl is the business results distribution policy. Htc is the policy of mobilizing and structuring capital resources. When the Hgl coefficient increases, the Htc coefficient tends to decrease because equity increases faster than total assets and vice versa. *Second,* the ROS and SVkd factors reflect the situation and performance of the enterprise. In which ROS reflects the effectiveness of business management through the relationship of costs and profits. SVkd reflects the speed of business capital turnover, both depending on the characteristics of each industry and the level of management of the enterprise. In fact, the higher the ROS coefficient, the lower the SVkd and vice versa. If a business has an optimal cost structure, it will be able to take advantage of business leverage. In general, the sustainable growth rate of a business depends mainly on the above factors. If one of the four factors above changes, Tbv will also change. Therefore, if you want to have sustainable growth, managers need to flexibly influence the four factors and always pay attention to the interactions between the factors.

3.2. Practices of sustainable growth for businesses energy in Vietnam

3.2.1. Overview of Vietnam's energy industry

Energy industry is The phrase refers to a variety of different industries, from exploiting forms of energy such as coal, oil, gas... to producing electricity. The energy industry is one of the basic economic sectors especially important for a country. Modern production can only develop thanks to the existence of the energy industry. Through the average energy consumption index per capita, it is possible to judge the level of economic, technical and cultural development of a country. The modern energy industry is a complex system including many industries, necessary for all production and life activities.

In general, Vietnam's energy industry includes two main sectors : raw material and fuel exploitation industry and electricity industry. However, in the raw material and fuel exploitation industry, there are two main industries: coal mining industry and oil exploitation industry. Therefore, it can be said that the energy industry includes the following industries: Coal mining industry (coal industry); Electricity industry (electricity industry); Oil and gas exploitation industry (oil and gas industry). In particular, the coal mining industry in our country has existed for a long time with two main forms of mining: open pit method and underground method. In Vietnam, the most popular is anthracite coal (anthracite coal), concentrated in Quang Ninh with reserves of more than 3 billion tons, accounting for about 90% of the country's coal reserves. In addition to anthracite coal, in our country there is also brown coal distributed in the Red River Delta and peat concentrated in the Mekong Delta region.

The oil and gas industry has basically completed its set strategic goals, becoming an important economic-technical industry with the continued exploitation of existing fields, development of new oil and gas fields, and stable operation of new oil and gas fields. In the process of transporting and processing oil and gas, the oil and gas industry has completed the value chain from oil and gas search, exploration and exploitation, oil and gas processing and high-quality oil and gas services. More resources have been mobilized to develop the oil and gas industry from foreign and private enterprises, etc. through restructuring and equitization (in recent years, the oil and gas industry has mobilized investment capital of about 90 trillion VND, of which commercial loans are about 65-70%; direct capital contributions from domestic enterprises and foreign investments are about 30-35%). Oil and gas enterprises have initially improved their competitiveness and proactively integrated internationally. However, the financial potential of oil and gas enterprises is still modest, not enough to compete with large oil and gas corporations in the world.

Regarding electricity, due to the sharp increase in electricity demand while the supply cannot meet it, there is a risk of serious electricity shortage. In the context that the hydroelectric power supply is exhausted and unstable, and domestic sources of coal and gas for thermal power plants are not guaranteed, importing electricity is a mandatory solution to the current serious electricity shortage situation. eye. The amount of electricity purchased will double from 2020 compared to 2018. Electricity shortage also opens up great opportunities to invest in the construction of large capacity power plants with short construction times (gas power, wind power, solar power) to meet the electricity consumption needs in Vietnam, especially the southern provinces. Total energy consumption in Vietnam has continued to increase rapidly in recent years to serve the country's economic development. This growth is consistent with industrialization and economic integration. Energy is an important issue, having a direct impact on social security, national security and economic development. Therefore, it is necessary to have the right and appropriate direction to develop sustainable energy. The development of the energy industry will lead to the development of a series of other industries such as mechanical engineering, transportation, and construction. .. Therefore, the energy industry has the ability to create a very large area if it is located in a favorable geographical location and is exploited and regenerated effectively.

3.2.2. Practices of sustainable growth of energy enterprises in Vietnam

Up to now, Vietnam's energy industry system, with a focus on energy businesses, has always been based on three main pillars: oil and gas, coal and electricity. Vietnam's energy industry enterprises have developed rapidly and relatively synchronously in all sub-sectors and fields, closely following directions and achieving many remarkable goals: Providing energy, especially providing basic electricity to meet the requirements of socio-economic development with increasingly improved quality, the electricity access index ranks 27/190 countries/territories; The oil and gas exploitation and petrochemical refining industries have strongly developed, with increased commercial coal mining output; Hydropower is developing rapidly; recently, wind power and solar power have begun to develop at high speed; Mobilizing large resources for development investment with the participation of many economic sectors, the energy industry has become a very important contributor to promoting socio-economic development, ensuring national defense, security in many localities and countries. However, due to many reasons, our country's energy sector enterprises still have certain limitations. Domestic supplies are not enough to meet requirements, forcing increasingly large energy imports; Some indicators to ensure energy security are fluctuating in an unfavorable direction; Energy sector infrastructure is lacking and inconsistent; Technology levels in some areas of the energy industry are slowly improving, localization and market support from projects in the energy industry for domestically produced mechanical goods is still limited. Therefore, it is necessary to analyze and evaluate the current state of sustainable growth of businesses in order to have a basis for proposing solutions.

In the article, the author selected a representative sample of energy enterprises belonging to three groups of coal, electricity, and oil and gas industries to research over the three-year period from 2019-2020. Specifically, the sample includes businesses (with listed stock codes) as follows: (1) Vang Danh Coal Joint Stock Company - Vinacomin (TVD); (2) Nui Beo Coal Joint Stock Company - Vinacomin (NBC); (3) Pha Lai Thermal Power Joint Stock Company (PPC); (4) A Vuong Hydropower Joint Stock Company (AVC); (5) An Pha Petroleum Group Joint Stock Company (ASP); (6) Nam Song Hau Petroleum Trading and Investment Joint Stock Company (PSH).

Figure 4. Growth situation of the group of energy enterprises (%)

Source: Financial statements of businesses and author's calculations

In general, energy businesses have grown in basic aspects such as assets, capital, revenue, profits and cash flow. Notably, the increase in assets in hydropower and oil and gas enterprises (2021: AVC increased by 6.69%, ASP increased by 18.42%). To have an increase in assets, businesses' equity also increases correspondingly (in 2021: AVC increases 7.88%, ASP increases 3.32%, PSH increases 19.06%...). Net turnover of some electricity and oil and gas enterprises increased quite rapidly (AVC increased by nearly 70%, ASP increased by over 30%...). The profit growth and cash flow of businesses also have notable fluctuations over the years. Regarding profits, in 2020 TVD, NBC, AVC and especially PSH companies all increased rapidly. The cash flow of businesses all has large fluctuations, because the business field of businesses is quite specific, especially depending heavily on nature, weather and Government policies such as electricity. and international markets such as oil and gas.

Source: Financial statements of businesses and author's calculations

Regarding sustainable growth, the author studied samples of two companies with stock codes TVD and AVC. Sustainable growth depends on the influence of factors that reflect business policies. For TVD, in 2020, the sustainable growth rate will reach about 10%, down slightly compared to 2019. The growth rate is not high, because scale indicators are tending to decrease. This is not a good sign in the context that the coal industry is meeting increasing market demand. The basic reason is that in 2020, equity and retained profit targets both decreased slightly (down 0.33% and 1.44%). In the decrease in growth rate, capital mobilization policy expressed through the asset/equity ratio has the most important impact. The shrinking capital scale has reduced the level of sustainability. In 2021, the sustainable growth rate has reached nearly 18%, increasing 68% faster than the previous year. This increase is due to the fact that businesses have adjusted their financial and business policies, from which the indicators showing capital mobilization policies, profit distribution, performance and business efficiency have had positive impacts. positively impacted growth, with corresponding effects (0.0056; 0.0129; 0.0373; 0.0166 times), in which increased ROS of over 30% contributed mainly to growth. The rapidly increasing domestic and international coal demand is also having a positive impact on the business efficiency and sustainable growth rate of coal industry enterprises.

For AVC, the 3-year sustainable growth rate from 2019 to 2021 is 0.1582; 0.1296; 0.0164. Thus, it can be seen that in 2021, the sustainable growth rate is very high compared to 2029, reaching nearly 700%. The main reason is the very high profit growth, over 156 billion and the retention rate is over 80%. AVC's retained profit ratio is always high, due to the company's investment policy to meet the demand for electricity supply to the market. In the context that electricity is an essential need and prices always tend to increase, revenue and profits of businesses grow rapidly. This is both a positive signal, but also shows that the electricity market has the potential for great competition in the near future. Understanding that, AVC as well as electricity industry enterprises will have appropriate strategies and implementation roadmaps. Among the factors affecting AVC's sustainable growth, the ROS coefficient has the most significant impact at 0.0576; 0.0798 times.

Revenue and especially profit growth have shown that AVC's direction is suitable for the current electricity market context, in line with the goals in Power Plan 8. With the goal of ensuring energy security National electricity planning 8 aims to ensure adequate supply of electricity demand, meeting growth requirements of about 7%/year in the period 2021-2030, about 6.5 - 7.5%/year in the period 2031-2030. 2050. Notably, electricity planning 8 prioritizes the strong development of renewable energy sources for electricity production. This power source will reach a ratio of about 30.9 - 39.2% by 2030.

Overall assessment, the sustainable growth of energy sector enterprises in Vietnam over the past time has been at a level consistent with the field and the industry's development trend. Some businesses have grown quite rapidly, but there has been no uniformity over the years. Growth is affected by many factors, including both positive factors and limitations. Objective factors have a great influence on energy businesses such as weather, markets, state management issues... To develop the energy industry and contribute to the economic development process, it is necessary Effectively implement solutions to promote sustainable growth of energy sector enterprises.

3.3. Solutions to promote sustainable growth of energy sector enterprises in Vietnam

Firstly, diversifying forms of capital mobilization, ensuring financial resources, focusing on endogenous equity capital.

For businesses in the energy industry, capital and capital scale are always the first requirements and conditions for growth goals . Meanwhile, businesses are doing business in a changing and unstable environment, with many other challenges such as international terrorism, water security, food security, cyber security... leading to the need for capital. The medium and long term are currently very large. For example, with the electricity industry, in the recent period, Vietnam has made certain changes in the directions for future electric energy investment, instead of focusing on investing in traditional sources such as hydropower, coal power. However, the biggest difficulty is that to achieve the same output as with traditional coal and gas power sources, investment in wind and solar power sources requires higher investment. double or triple that, not to mention the transmission system requirements. The level of investment is also larger due to the dispersed nature of these investments. Forms of capital mobilization through banks, stock markets, bonds and through non-traditional channels are the trend of accessing capital for many businesses. However , weaknesses in capital sources Businesses today are too dependent on bank loans. Meanwhile, the credit market is sometimes overloaded due to both having to worry about providing short-term capital sources and providing medium and long-term capital sources for the economy and businesses. Therefore, energy industry enterprises need to diversify financial resources, but pay special attention to endogenous equity capital. Because this is a long-term capital source, a financial foundation for growth. This capital source, if used effectively, will contribute to increasing the sustainability of the business.

Second, improve business efficiency in a modern way, closely following the needs of the economy.

Improving business efficiency is a premise and a decisive factor for listed energy companies to grow sustainably. To improve business efficiency, energy companies need to focus on key measures such as: Investing in a closed production process, proactively sourcing raw materials for production. The ability to close production processes plays an important role for energy businesses.

Increase investment in modernizing technology lines. To leapfrog, energy businesses should import technology and develop technology by learning creatively like other countries have done. To do this, businesses in the energy industry need to solve some of the following issues: Businesses in the industry must find out information about the technology market, compare production technologies being applied to Ensuring the quality of imported technology. In addition, to apply and improve technology, instead of full investment, energy enterprises should also consider choosing joint ventures and partnerships with foreign businesses to transfer. technology. When linking, it is necessary to learn about technology transfer procedures such as signing contracts, transferring, and installing to avoid having unfavorable conditions imposed on the business.

Third, proactively approach new energy markets and products following the world's energy transition trend.

The dominant technologies in the world's energy industry, which were developed in the 19th century and aimed at using carbon-containing fuels, will generally be unsuitable by the end of the 21st century due to their energy-saving effects. low as well as ecological impact. The increased use of organic fuels has led to a situation where most of the easily exploitable fuels have been exhausted, while a significant portion of the proven sources are difficult to exploit, because they have to exploit small deposits. , located deep underground and difficult to reach geographically. Therefore, continuing to exploit requires skyrocketing costs, and the closer we get to exhaustion, the more costs increase. To ensure energy sources, in the coming time, businesses need to aim to invest in new energy technologies such as bioenergy, hydrogen energy, ocean thermal energy...

Fourth, financial management, risk control and good use of the leverage system.

cash flow checks and do so regularly and continuously through analysis of financial indicators. Specifically, those groups of indicators are: indicators on financial structure, indicators on solvency, specific indicators on operations and use of financial resources; Specific indicators of profitability. Deciding whether a business should borrow or not must come from the process of evaluating the effectiveness of an investment project or business plan. Specifically, only when the economic return on assets created is greater than the expected capital mobilization interest rate, businesses should choose the option of using borrowed capital to make investments.

Fifth, implement digital transformation and corporate financial restructuring.

Digital transformation helps businesses improve performance and increase productivity by optimizing operational processes. Automation is applied, eliminating inefficient manual processes and minimizing errors. This helps enhance performance and work quality. Digital transformation allows businesses to apply automation and artificial intelligence in their work, helping to optimize processes, reduce manual effort and significantly increase productivity. Enterprise restructuring strategies need to be designed based on the specific characteristics of each enterprise and the actual situation. For businesses in the energy industry, the restructuring model can be implemented according to business groups as follows: For businesses with long-term losses, on the one hand, it requires businesses to reorganize production and business, and on the other hand, they must restructure their finances to improve their financial situation... For open businesses Excessive expansion: need to reassess financial scale, businesses are forced to increase capital mobilization from outside such as borrowing through the commercial banking system, issuing bonds and using commercial credit from investors. provide. For small-scale enterprises: determine business strategies, strengthen operational restructuring, and possibly consider merger plans to improve efficiency as well as focus on accumulation and increase capital size and capacity. competitive force.

4. CONCLUSION

Sustainable growth of businesses is an important topic and a relatively difficult content, both theoretically and practically. In fact, this is both a goal, a driving force, and also an objective requirement of businesses in the new context. For energy businesses, promoting sustainable growth becomes more urgent as the world's energy industry is undergoing major changes. The trend of shifting from fossil energy to renewable energy sources is taking place very strongly among countries, aiming for sustainable development in the future. There is also the impact of the millennium goals, greening trends, circular economy and other factors. Promoting sustainable growth of energy sector businesses will make an important contribution to Vietnam's competitiveness in this field. These are also key factors towards the country's economic growth and sustainable development goals.

FACTORS INFLUENCING ENTREPRENEURIAL INTENTIONS AMONG VIETNAMESE STUDENTS: AN EMPIRICAL STUDY

PHD. Phuong Thi Thanh Nguyen[1], M.A Thi Thuy Anh Tran [2]

Abstract: This study explores factors influencing entrepreneurial intentions among Vietnamese students, drawing from The Entrepreneurial Event Model (Shapero & Shokol, 1982) and the Theory of Planned Behavior (Ajzen, 1991). Data from 144 Hanoi students were collected through offline and online methods and analyzed using SPSS 20. The analysis reveals that Entrepreneurial Desire, Confidence, and Gender are the primary influencers of entrepreneurial intent. Interestingly, University Support, Parental Self-Employment History, and Family Support do not significantly impact entrepreneurial intentions among Vietnamese students. These findings provide insights into fostering entrepreneurial mindsets among students in Vietnam's educational institutions and their implications for the nation's economic growth.

Keywords: Entrepreneurship, Entrepreneurship Intention, Student, Vietnam.Top of Form

1. INTRODUCTION

Entrepreneurship has emerged as a dynamic and transformative force, contributing significantly to economic growth, job creation, and innovation on a global scale Baumol (1993) and Audretsch and Keilbach (2005). In the specific context of Vietnam, a rapidly evolving and vibrant economy in Southeast Asia, entrepreneurship takes on distinct significance. The country's economic landscape has experienced profound shifts, transitioning from a centrally planned economy to a socialist-oriented market economy by World Bank (2021). This transformation has not only led to sustained economic growth but has also sparked a growing interest in entrepreneurship among Vietnamese students—an influential demographic essential to the nation's future by Nguyen & Pham (2018). The government has recognized entrepreneurship's importance, introducing policies to support startups and SMEs (Asian Development Bank, 2019). Vietnamese students' entrepreneurial decisions are influenced by personal motivations, family expectations, educational experiences, and resource access (Tran, 2020). Cultural norms and attitudes towards risk-taking and business ownership also shape their intentions (Nguyen & Pham, 2018). This research aims to understand these influences. Entrepreneurship's role in transforming economies has been recognized globally (Baumol, 1993; Audretsch & Keilbach, 2005; Kamua, 2013). However, Vietnam needs to increase entrepreneurial activity to drive economic growth and address unemployment. Changing attitudes and behaviors is a challenging task but essential for future economic development. While most research on entrepreneurial intention focuses on developed countries, cultural differences make further investigation in the Vietnamese context necessary. Promoting entrepreneurship is crucial for Vietnam's future economic development.

2. LITERATURE REVIEW

2.1. Related Definitions And Previous Researches of Start-Business Intention

Start-business intention, a critical precursor to entrepreneurial action, has been extensively studied in entrepreneurship research. It refers to an individual's mindset and determination to

1 Academy of Finance, Email: nguyenthanhphuong@hvtc.edu.vn

2 International School, Vietnam National University

initiate and operate a new business venture (Bird & Jelinek, 1988). Scholars have hypothesized that stronger intentions are positively correlated with a higher likelihood of taking entrepreneurial actions (Ajzen & Fishbein, 1977). This relationship between intention and behavior has been substantiated in various studies, emphasizing the predictive power of intention in entrepreneurial contexts (Ajzen & Madden, 1985).

Entrepreneurship involves creating and managing a business with the aim of providing products or services that address perceived market demand. Entrepreneurs, individuals who initiate and manage these businesses, are central to this process (Gale, 2008). The act of starting and managing a business is often referred to as entrepreneurship (Drucker, 2011). Cole (1968) defined entrepreneurship as a purposeful endeavor to initiate, sustain, and develop a business for financial or other gains. Shapero and Sokol (1982) highlighted that entrepreneurship encompasses the willingness to explore attractive and feasible business opportunities.

Early research in entrepreneurship examined the personality traits and characteristics of established entrepreneurs (Hornaday & Aboud, 1971). While such studies identified distinctive traits, they couldn't reliably predict entrepreneurial behavior. This led to a shift in focus towards identifying antecedents that lead to entrepreneurial behavior (Fawwaaz, 2017). The Theory of Reasoned Action (TRA) by Ajzen and Fishbein (1977) gained prominence as a comprehensive predictor of intention, sparking interest in researching entrepreneurial intention (Bird & Jelinek, 1988). Entrepreneurial Intention (EI), synonymous with the intention to start a business, reflects an individual's inclination to establish new ventures. Research has indicated that factors influencing EI include attitudes, subjective norms, education, and social support (Ajzen & Fishbein, 1977).

Numerous studies have supported these findings. Tkachev and Kolvereid (1999) suggested that universities offering entrepreneurship education and opportunities for practical business experience can increase students' inclination to start businesses. Luthje & Frank (2003) proposed that curriculum programs altering entrepreneurial attitudes and perceptions of self-reliance viability are beneficial in enhancing students' entrepreneurial intention. Vietnam has also seen research on factors affecting entrepreneurial intention. Notable studies include Le Quan's (2007) research on young Vietnamese entrepreneurs' startup processes and Phan Anh Tu and Giang Thi Cam Tien's (2015) study on factors influencing start-business intention among students at Can Tho University's Faculty of Economics and Business Administration.

2.2. Theoretical Background

Various theories have been used in the past to predict Entrepreneurial Intention, including Theory of Planned Behaviour developed by Ajzen (1991) and The Entrepreneur Event Model proposed by (Pauceanu, 2018). Theory of Planned Behavior (TPB) widely used framework, based on Ajzen's work, is the go-to choice for entrepreneurial research due to its effectiveness in predicting Entrepreneurial Intention. TPB posits that an individual's intention to engage in entrepreneurship can be predicted by three core factors: attitude toward entrepreneurship, subjective norms, and perceived behavioral control. These factors are shaped by an individual's beliefs, and collectively they influence the intention to pursue entrepreneurship (Schlaegel & Koenig, 2013). For instance, an individual's attitude towards entrepreneurship and their perception of the support from friends and family can significantly impact their intention to start a business (Ajzen, 1991).

Developed by Shapero and Sokol, the Entrepreneur Event Model (EEM) offers a comprehensive perspective on predicting Entrepreneurial Intention. It comprises three crucial antecedents: perceived desirability, perceived feasibility, and propensity to act. Perceived desirability relates to seeing entrepreneurship as an attractive career choice, while perceived feasibility concerns an individual's assessment of their skills and abilities to start a business. Propensity to act is closely associated with an internal locus of control, determining an individual's ability to independently execute entrepreneurial plans (Krueger, 1993). Successful entrepreneurs often inspire others through their positive experiences and knowledge sharing, influencing perceived desirability (Wilson, Marlino & Kickul, 2004).

Both of these theories provide valuable insights into the factors that influence entrepreneurial intention and behavior among individuals. By combining these frameworks, the research aims to uncover the specific factors affecting Vietnamese students' intentions to start their own businesses, contributing to a better understanding of entrepreneurship in the Vietnamese context.

3. CONCEPTUAL FRAMEWORK AND HYPOTHESES FORMULATION

3.1. Conceptual Framework

Figure 3 depicts the proposed framework created from hypotheses based on TPB and EMM as they consider the influence of attitudes, subjective norms, perceived behavioral control, external factors, and cultural elements on entrepreneurial intention among Vietnamese students.

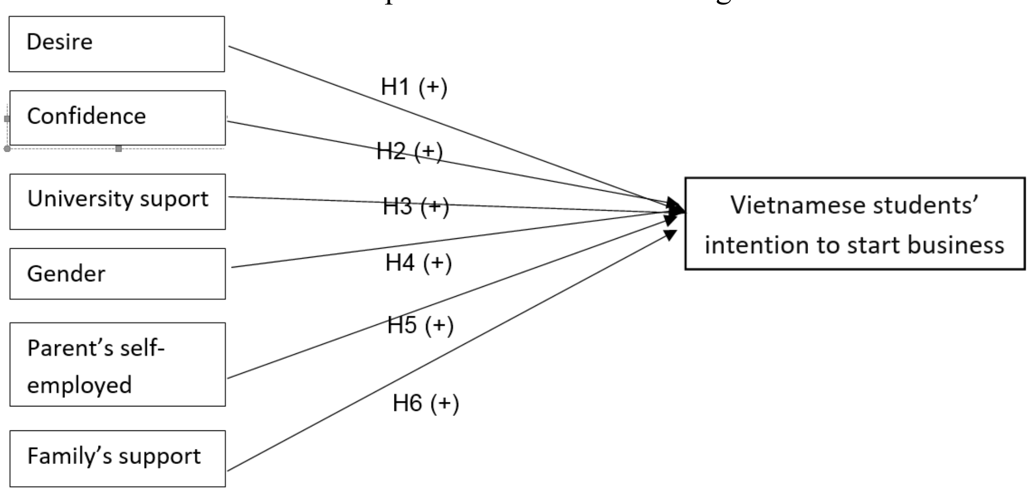

Figure 3: Conceptual Framework of the Research

3.2. Students' Entrepreneurial Desire

Entrepreneurial desire, a strong passion and inclination towards entrepreneurship, strongly predicts individuals' intentions to start a business (Krueger, 2007). This desire is marked by eagerness to create and manage a successful venture, closely linked to aspirations for entrepreneurial success (Cardon et al., 2013). In Vietnam, particularly among students, this desire is crucial due to the growing interest in entrepreneurship, given the country's developmental opportunities (Wang et al., 2021).

Wang, Luong, and Van's (2021) research in Vietnam, focusing on university students, found a positive connection between entrepreneurial desire and intentions to start a business. This aligns with the Theory of Planned Behavior (Ajzen, 1991), which suggests that a positive attitude towards entrepreneurship enhances the intention to engage in it (Ajzen, 1991). Furthermore, entrepreneurial desire not only fosters a positive attitude towards entrepreneurship but also enhances self-efficacy beliefs (Krueger, 2007). Individuals with high entrepreneurial desire tend to have greater confidence in their ability to succeed as entrepreneurs, further reinforcing their intention to start a business. In the context of Vietnamese students, entrepreneurial desire emerges as a critical motivating factor positively shaping their entrepreneurial intentions.

H1. Students' entrepreneutial desire has a positive influence on Vietnamese student's intention to start a business.

3.3. Student's Entrepreneurial Confidence

Entrepreneurial confidence, defined as an individual's belief in their ability to succeed in entrepreneurial activities, significantly influences entrepreneurial intentions (Liñán & Chen, 2009). It encompasses self-assurance in recognizing opportunities, managing risks, and overcoming challenges in business (Liñán & Fayolle, 2015). In Vietnam, a rapidly developing economy with a thriving startup ecosystem, entrepreneurial confidence plays a crucial role in understanding Vietnamese students' intentions for entrepreneurship.

Research by Nguyen and Huynh (2021) in Vietnam, focusing on university students, confirms the positive impact of entrepreneurial confidence on intentions to start a business. This aligns with the Theory of Planned Behavior (Ajzen, 1991), emphasizing the significance of self-confidence in forming intentions (Ajzen, 1991). Moreover, entrepreneurial confidence is closely linked to self-efficacy, a key element in entrepreneurial psychology (Liñán & Fayolle, 2015). Those with higher entrepreneurial confidence tend to have greater entrepreneurial self-efficacy, believing in their ability to perform entrepreneurial tasks (Liñán & Chen, 2009). In the context of Vietnam, where entrepreneurship is increasingly viable, students with high entrepreneurial confidence are more likely to view entrepreneurship as an achievable goal, reinforcing their intention to become entrepreneurs. Therefore, it can be hypothesized that entrepreneurial confidence positively influences Vietnamese students' intentions to start a business.

H2: Students' entrepreneutial confidence has a positive influence on Vietnamese student's intention to start a business.

3.4. University Support For Entrepreneurship

Universities globally, including those in Vietnam, play a vital role in promoting entrepreneurship by offering support through education, training, mentorship, and resource access (Fayolle et al., 2016). This support shapes students' views on entrepreneurship and their confidence in pursuing it. In Vietnam, a study by Le et al. (2020) explored the impact of university support on students' entrepreneurial intentions, including entrepreneurship education, startup incubators, mentorship, and networking opportunities. The findings revealed a positive relationship between university support and students' intentions to start a business. These results align with the Entrepreneur Event Model (Pauceanu, 2018), emphasizing external factors like university support in influencing entrepreneurial intentions.

Vietnamese universities are adapting their efforts to align with the country's economic development goals, transitioning towards a knowledge-based economy with a focus on innovation and entrepreneurship (Nguyen, 2019). This strategic shift recognizes the role of fostering entrepreneurial intentions among students in contributing to economic growth and job creation.

H3. University support for entrepreneurship has a positive influence on Vietnamese student's intention to start a business.

3.5. Gender

A recent study conducted by Vuorio et al. (2021) in Vietnam explored gender differences in entrepreneurial intentions among university students. The findings of this study indicated that male students reported higher entrepreneurial intentions compared to their female counterparts. This gender disparity can be attributed to various factors, including social norms, role expectations, and access to resources. The study suggests that societal expectations and cultural norms may influence women's perceptions of entrepreneurship, leading to lower entrepreneurial intentions. Moreover, the Global Entrepreneurship Monitor (GEM) report for Vietnam in 2020 highlighted gender disparities in entrepreneurial activities. The report revealed that the early-stage entrepreneurial activity rate for men in Vietnam was higher than that for women. This gender gap in entrepreneurial activity indicates that male students might indeed be more inclined to start businesses, aligning with the hypothesis.

H4. Male students are more inclined to start business than female students.

3.6. Students having parents with self-employment history

Family background significantly influences entrepreneurial intentions. Research by Kolvereid and Isaksen (2018) in Norway found that students with parents experienced in self-employment were more inclined toward entrepreneurship. Parental role modeling and exposure to entrepreneurial environments were key factors. In Vietnam, family plays a central role in young adults' lives. A study by Nguyen and Vu (2019) emphasized parental encouragement and support, influenced by their entrepreneurial experiences, in shaping students' intentions to start a business.

A study in Ho Chi Minh City by Truong et al. (2020) highlighted that students with parents having self-employment experience were more likely to consider entrepreneurship. This study also explored gender-specific influences on entrepreneurial intentions.

H5. Students having parents with self-employment history are more inclined to start a business than those having parents with no such history.

3.7. Family's Support For Student

The influence of family support on entrepreneurial intentions among Vietnamese students is a critical aspect of entrepreneurship research. A study by Nguyen and Le (2021) found that students perceiving higher family support, including emotional encouragement, financial assistance, and advice, were more likely to intend to start a business. In Vietnamese culture, family cohesion and interdependence are strong. A study by Le and Nguyen (2020) highlighted the importance of family values in shaping entrepreneurial intentions. Students feeling a sense of duty and responsibility toward their families were more motivated to explore entrepreneurship to support them financially.

Research by Phan and Dinh (2019) in Ho Chi Minh City revealed that students perceiving family support were more likely to have a positive attitude towards entrepreneurship and express a stronger intention to engage in entrepreneurial activities. This indicates that family support not only offers practical assistance but also shapes students' attitudes and beliefs related to entrepreneurship.

H6. Family's support has a positive influence on Vietnamese student's intention to start a business

4. RESEARCH METHODOLOGY

Data collection for this study on factors influencing Vietnamese students' entrepreneurial intentions involved distributing 95 online questionnaires in Hanoi via Google Docs and 49 in-person questionnaires at the International School of Vietnam National University. Convenience sampling was employed due to time and cost limitations, with Hanoi chosen due to its concentration of major universities. Respondents represented seven universities: Hanoi National University, Foreign Trade University, National Economics University, Financial Academy, Hanoi University, Hanoi University of Technology, and Hanoi Pedagogical University.

The study assessed Vietnamese students' entrepreneurial intentions with a 24-item questionnaire covering various factors. Questionnaire items were adapted from previous research, initially designed in English, and then translated into Vietnamese. The questionnaire included an introduction section and a main section with measurement items. Gender and parents' self-employment status used categorical scales (Yes/No), while other variables employed a 5-point Likert Scale. Data analysis was conducted using SPSS 20 to test moderation effects.

5. DATA PRESENTATIONS AND FINDINGS

5.1. Data description

A summary of the descriptive statistics are presented in table above. For each item the minimum, maximum, mean and standard deviation are taken into consideration. Among 150 copies of the survey were distributedand collected both online and offline. The received answered are screened to find out the invalid, then among 150 questionnaires, the research received 144 valid answer papers and 1 invalid answer paper. The research has 5 constructions. Variables EI1, EI2, EI3, EI4, EI5 are belong to construction Entrepreneurship (EI) . Variables of ED1, ED2, ED3, ED4 are group of construction Entrepreneurship Desỉe (ED). EC1, EC2, EC3 are group of construction Entrepreneurship Confidence (EC). US1, US2, US3, US4, US5, US are University Support (US). GD1 are belong to Gender. PS1 is Parent support. And FS1, FS2, FS3, FS4 are Financial Support

Cronbach's alpha coefficient is used to measure the reliability of the scale. If Cronbach's alpha coefficient is less than 0.6, the scale is considered unreliable. If it is between 0.6 and 0.8, it is accepted, and if the factor is 0.8 or close to 1, it is considered good. Furthermore, if a measurement variable has a Corrected Item - Total Correlation greater than or equal to 0.3, the variable is satisfactory (Hoang and Chu, 2008). The analysis has been presented in the following tables:

Table 3: Cronbach's Alpha

Dependent Variable	Cronbach's Alpha
Entrepreneurial Intention (EI)	0.888
Independent Variables	Cronbach's Alpha
Entrepreneurial Desire (ED)	0.762
Entrepreneurial Confidence (EC)	0.874
University support (US)	0.873
Family's support (FS)	0.611

There are 24 measuring items originally, now remain 24 with 18 items belong to independent variable (ED, EC, US and FS), 4 items belong to dependent variable EI, and final 2 items about GD and PS. All items in each variables are accepted.

The KMO and Bartlett's test were used to assess model fitness. In the initial exploratory factor analysis (EFA), the KMO for dependent variables was 0.832 (meeting the criterion of >0.5 and <1), and the significance level (Sig.) was <0.05, indicating data suitability. Similarly, for independent variables, the KMO was 0.838 (>0.5) with Sig. = 0.000, confirming data validity for EFA. However, FS1's factor loading did not meet the standard and was removed from the Rotated Component Matrix table. Following the exclusion of FS1, both KMO and Sig. results met the criteria, as shown in Table 18. All remaining items used to measure independent variables also met the requirements, as presented in Table 4.

Table 4: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.832
Bartlett's Test of Sphericity	Approx. Chi-Square	430.236
	Df	10
	Sig.	0.000

Source: By author

In KMO and Bartlett's Test, KMO value measuring the sampling adequacy equals to 0.826 (greater than 0.5) with Sig. is 0.000. These numbers confirm the validity of data for exploratory factor analysis.

Table 5: Rotated Component Matrix[a]

	Component			
	1	2	3	4
US6	.830			
US2	.786			
US3	.773			
US1	.717			
US5	.702			
US4	.671			
EC1		.854		
EC2		.846		
EC3		.833		
ED2			.768	
ED3			.763	
ED1			.691	
ED4			.653	
FS3				.876
FS4				.812
FS2				.699

Source: By author

From Table 5, the exploratory factor analysis extracted four factors. The first factor comprises six items from the US scale, the second factor consists of three items from the EC scale, the third factor includes all four items from the ED scale, and the fourth factor comprises all three items from the FS scale. In summary, these observed variables contribute to the formation of the scale variables and are suitable for subsequent regression analysis.

Based on the data, Pearson Correlation between the EI variable and the four independent variables: ED, EC, US, and FS. All correlations are positive. The results indicate that ED, EC, and US have a significant relationship with EI, with high Pearson correlation values (0.658, 0.567, and 0.357, respectively) and low significance levels ($p < 0.05$). This suggests a positive linear relationship between the dependent variable and these three independent variables. Additionally, the result shows strong correlations among these three components, warranting a check for multicollinearity through Variance Inflation Factor (VIF) values.

On the other hand, the correlation between FS and EI is relatively small, with an observed Pearson correlation of 0.027 (below 0.3). Consequently, there is no substantial linear relationship between EI and FS, leading to the elimination of FS from the model. Hypothesis H6 is not supported.

Table 7: Collinearity Statistics

Component	Variance inflation factor VIF
ED	1.348
EC	1.401
US	1.342

Source: By author

Table 7 displays the Variance Inflation Factor (VIF) values for the three components. All three VIF values are very small (VIF < 2), indicating the absence of multicollinearity issues and affirming the suitability of regression analysis for the observed variables. In the initial Model Summary table, the Adjusted R-square value suggests that 53.8% of the variance in Entrepreneurial Intention (EI) can be explained by the four variables: Entrepreneurial Desire (ED), Entrepreneurial Confidence (EC), University's Support (US), and Gender (GD).

Upon examining the coefficients presented in the table, it becomes evident that University's Support (US) has the smallest coefficient value, at 0.037, with a significance level (Sig) of 0.575, which is greater than 0.05. Therefore, H3 is not supported, indicating that University's Support does not reliably explain Entrepreneurial Intention (EI). Consequently, US is removed from the model.

Table 8: Regression analysis summary (2rd time)

Model Summary[b]					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.741[a]	.550	.540	.66312	1.953
a. Predictors: (Constant), GD, ED, EC					
b. Dependent Variable: EI					

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	75.100	3	25.033	56.929	.000[b]
	Residual	61.562	140	.440		
	Total	136.662	143			
a. Dependent Variable: EI						
b. Predictors: (Constant), GD, ED, EC						

Coefficients[a]						
Model B		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		Std. Error	Beta			
1	(Constant)	-.149	.297		-.503	.616
	ED	.667	.080	.522	8.281	.000
	EC	.306	.062	.318	4.950	.000
	GD	.291	.126	.134	2.309	.022
a. Dependent Variable: EI		Source: By author				

Table Model Summary reveals that Adjusted R-square indicates 54% of the variance in Entrepreneurial Intention (EI) is explained by Entrepreneurial Desire (ED), Entrepreneurial Confidence (EC), and Gender (GD). A Sig. value of .000 confirms the reliability of these variables in determining EI. As a result, Hypotheses H1, H2, and H4 are supported. The relationships among the constructs of entrepreneurial intention can be expressed as follows:

EI = 0.522ED + 0.318EC + 0.134*GD

Based on this analysis, the theoretical model has been examined and reconfigured, featuring one dependent variable (Entrepreneurial Intention) and three independent variables (Entrepreneurial Desire, Entrepreneurial Confidence, and Gender)

H1. Students' entrepreneutial desire has a positive influence on Vietnamese student's intention to start a business => **Supported**

H2. Students' entrepreneutial confidence has a positive influence on Vietnamese student's intention to start a business => **Supported**

H3. University support for entrepreneurship has a positive influence on Vietnamese student's intention to start a business =>**Not Supported**

H4. Men students are more inclined to start business than women => **Supported**

H5. Vietnamese students having parents with self-employment history are more inclined to start a business than those having parents with no such history. => **Not Supported**

H6. Family's support has a positive influence on Vietnamese student's intention to start a business => **Not Supported**

6. DISCUSSION, IMPLICATIONS AND CONTRIBUTION

6.1. Discussion and implications

This study aimed to explore predictors influencing Vietnamese students' entrepreneurial intentions, combining the Entrepreneurial Event Model and Ajzen's Theory of Planned Behavior to offer a comprehensive understanding. Results revealed that among the variables considered, Entrepreneurial Desire, Entrepreneurial Confidence, and Gender significantly predicted entrepreneurial intention. Entrepreneurial Desire emerged as the most influential factor, highlighting its pivotal role.

Entrepreneurial Confidence was the second most significant factor, emphasizing the importance of self-belief. Surprisingly, Gender also played a significant role, with males showing stronger intentions. However, University's Support, Parent's Self-Employment History, and

Family's Support had no direct influence on entrepreneurial intention. This suggests the need for universities to revamp their curricula and adopt problem-solving approaches. Motivational programs for entrepreneurship should be prioritized. Family support, while not directly impactful, could indirectly influence Entrepreneurial Desire and Confidence. Encouraging independent thinking and risk-taking in families is essential.

6.2. Contributions of the research

➢ *Theoretical contributions*

This research combines the Theory of Planned Behavior and the Entrepreneurial Event Model to create a unique research model. While this combination has been used in entrepreneurship studies before, it's the first time it's been applied to analyze the entrepreneurial intention of Vietnamese students in the specific context of Vietnam. The study offers fresh insights and approaches tailored to the evolving Vietnamese environment, providing updated results that reflect the current situation.

➢ *Practical contribution*

Entrepreneurship is vital for Vietnam's economic development and youth employment. However, much of the existing research on entrepreneurial intention is conducted abroad, and cultural differences can limit the applicability of those findings to Vietnam. This research addresses this gap by focusing on Vietnamese students' entrepreneurial intention, with a diverse sample from seven universities. Consequently, the results hold broader implications and can better inform strategies to promote entrepreneurship among Vietnamese youth.

6.3. Limitations and future research direction

First off, because this study was limited to one Vietnamese city, not all of the country's diversity may be represented in the findings. As a result, future studies on the subject should broaden the scope of the survey to include important Vietnamese cities including Ho Chi Minh City, Da Nang, and Hai Phong.

Second, even though there were 7 distinct universities represented in the study's student survey, the distribution of students among them was unbalanced. Since more than 70% of the students attend economic and business schools, their perspectives and backgrounds might not be typical of all Vietnamese students as a whole. If they make sure there is a balance of numbers in future research on the same subject, the results will be more representative.

Thirdly, because relatively few male students took part in the survey, the findings about how different genders affect students' intentions to launch a business are not really persuasive. Future studies on this subject should make sure that an equal number of male and female students participate in the survey in order to increase the accuracy of this variable. Last but not least, the number of respondents for this research is just slightly above the minimum acceptable level due to time and resource constraints. It is advised to employ a larger range of respondents if future studies wish to use the same model.

SUSTAINABLE DEVELOPMENT OF VIETNAMESE SMALL AND MEDIUM ENTERPRISES IN THE POST COVID-19 PERIOD

MA. Hoang Thi Hong[1]

Abstract: This paper aims to analyze the need for new solutions to support small and medium enterprises (SMEs) to overcome challenges for sustainable development after being heavily affected by the Covid-19 pandemic. By using the statistical, comparative and analytical methods, the authors have identified 4 groups of difficulties and challenges for SMEs after the COVID-19 pandemic including: (i) Demand in many markets declines, (ii) SMEs are not disbursed, lack cash flow; (iii) Logistics and input material costs increase, (iv) Labor shortages are at a worrying level. Based on the research results, the author has given solutions to support SMEs for 3 sides of the Government, SMEs and business associations.

Keywords: SMEs, solutions, sustainable development.

1. INTRODUCTION

In recent years in Vietnam, the development of SMEs has contributed significantly to growth goals as well as to the budget, job creation and personal income increase. Of the existing total number of enterprises in Vietnam, SMEs account for around 96%, of which 97% are private enterprises. It is estimated that SMEs contribute about 45% of gross social product (GDP), addressing over 50% of the country's workforce.

Vietnam experienced the COVID-19 pandemic from 2020 to 2022. Now the pandemic has been controlled, the socio-economic fields have also gradually recovered and developed again, achieving some positive results. However, after the COVID-19 pandemic, Vietnamese small and medium enterprises still face many difficulties, requiring comprehensive solutions to support their recovery and development.

The year 2023 has passed 2/3 of the way, we can see the Government's efforts and decisions in operating the economy to overcome the consequences of the world economic crisis over 2 years of Covid-19 pandemic. Our country still manages to achieve a decent growth rate compared to others; the package of solutions to support economic recovery has been considered one of the suitable salvations for businesses.

Although the world economy has been forecast to recover, it is still quite fragile. Many countries are still faced with a choice between stimulus-easing policies and narrower policies. Protectionism is on the rise, in different forms. Tightening monetary policies of the US and many development countries may cause disturbances to commodity prices, imports and exports and investment of relevant countries, especially economies with large openness, which are in the process of integration like Vietnam.

In the situation that the world economy is not forecasted to be bright, Vietnam's path to GDP growth target in 2023 must be considered more carefully. Vietnam's monetary policy and financial system still have shortcomings that need to be adjusted. The main actors and balances

---

1 Email: hoanghongmpi@gmail.com, Ministry of Planning and Investment.

of the economy remain uncertain, especially if you place them in trends that are more likely to occur in the post-crisis period. After the COVID-19 pandemic, Vietnamese SMEs still face many difficulties, requiring solutions to recover and develop.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

Businesses as well as SMEs around the world have been severely affected by the Covid-19 pandemic. According to the OECD (2020), global trade fell by 10.2% in 2020 and foreign direct investment fell by 40%, causing major disruptions in supply chains. Large cuts in private consumption led to an increase in corporate defaults in 2021, especially in sectors hit hard by new lockdowns. SMEs' revenues plummeted during the first wave of the pandemic in most countries. Financial markets have also been affected by the Covid-19 pandemic. The uncertain environment and declining confidence could lead to reduced credit and investment, exacerbating liquidity shortages.

Also follow OECD's research, the world is facing an unprecedented multidimensional crisis that demands coherent policy responses. The COVID-19 crisis has further highlighted the vulnerability of several of our basic systems, including healthcare, social protection, education, value chains, production networks, financial markets, mass transit systems and ecosystems. As such, sustainable recovery requires cross-sectoral actions and mechanisms to manage unavoidable trade-offs between short and long-term priorities, and between economic, social and environmental policy goals.

United Nations (2021) adviced Governments must walk a fine line between taking actions to save existing industrial firms and putting in place longer-term measures that build back better with more resilient industries, more able to resist shocks such as pandemics. Key policies that could drive the inclusive and sustainable industrial development necessary to achieve greater resilience are: Using already existing registries and platforms to channel aid to businesses on the verge of collapse. Improving access to finance for small firms and – even more difficult – those in the informal sector to help them maintain economic activities, retain jobs and maintain links to local and global supply chains. Refocusing policies on helping businesses including SMEs to develop higher value, and more sustainably produced goods that can be marketed with fewer risks to less volatile nearby markets. This calls for a renewed push towards diversification, using reshoring and nearshoring to shorten supply chains and moving towards greater regionalisation.

3. METHODOLOGY

From scientific researches and articles, regulatory documents, the author uses classification methods to divide types of content, time of issuance, legal validity etc. Through the information collected from reports on socio-economic development, on the development of enterprises in ministries and sectors, the data of the General Statistics Office, the author uses statistical methods and comparative methods to process data and information to compare the periods before and after covid -19. The author has applied the analytical method and the synthetic method to explain many dimensions, criterias and aspects to find out the limitations and difficulties of SMEs in the post-covid-19 period, thereby to propose appropriate solutions.

4. RESEARCH RESULTS

4.1 Assessment of SMEs development in the post-covid-19 period

According to survey data of the General Statistics Office, as of December 31, 2021, the whole country had 718,697 operating enterprises with production and business results, an increase of 5% compared to December 31, 2020, in which micro-sized enterprises account for the highest proportion. The number of micro-sized enterprises is 498,233, accounting for 69.3% of the country's enterprises, an increase of 4.1% compared to the same period in 2020; small-scale enterprises are 176,217 enterprises, accounting for 24.5%, an increase of 7.6% over the same period; The number of medium-sized enterprises is 25,402, accounting for 3.5%, an increase of 6.3% over the same period. Compared to the average period 2016-2020, the number of micro enterprises increased by 22.1%, small enterprises increased by 10.2%, and medium enterprises increased by 20.4%. In 2021, the rate of profitable businesses is 39.5%, 10% of break-even businesses, and 50.5% of loss-making businesses. The number of enterprises dissolved and ceasing to exist is also concentrated mainly in enterprises with capital scale from 0-10 billion VND and the data gradually decreases with the increase in capital scale.

In 2022, Vietnam has 148.5 thousand newly registered enterprises, with a total registered capital of VND 1,590.9 trillion, increased 27.1% in the number of enterprises, reduced 1.3% in registered capital compared with the previous year. The average registered capital of a newly established enterprise in 2022 reached VND 10.7 billion, reduced 22.3% compared with the previous year. The number of enterprises conducted suspending business for a definite period is 73.8 thousand, an increase of 34.3% compared to 2021; nearly 50.8 thousand enterprises stopped operation to conduct pending dissolution procedures, increased 5.5%; 18.6 thousand enterprises completed dissolution procedures, an increase of 11.2%. On average, 11.9 thousand enterprises withdraw from the market a month.

According to the Vietnamese Business White Paper, in 2021-2022, in the situation of our country experiencing many changes and difficulties affecting all socio-economic aspects, but overcoming the severe crises from the Covid-19 epidemic, Vietnamese enterprises continue to increase in number of enterprises and number of employees working in enterprises, but the growth rate is still low compared to the period before the Covid-19 epidemic; while the scale of enterprises based on labor tends to shrink, the scale based on capital tends to expand rapidly.

The scale of Vietnamese enterprises is still mainly micro, small and medium enterprises (accounting for 97.4%), and this sector tends to account for an increasing proportion in number in the period 2016-2021. Micro and small-scale enterprises are mainly non-state enterprises and are concentrated in the service sector, which is also an area with poor resilience and is sensitive to external impacts.

In general, the operating efficiency of a business increases gradually with scale; the larger scale, the more effectively business operates (shown by capital turnover indicators, ROA, ROE, ROS). Businesses' capability to access loans also increases with size. The smaller business, the more difficulties it faces due to lack of collateral, limited financial capacity and management skills.

4.2. Difficulties and challenges for SMEs after the COVID-19 pandemic

Demand in many markets declines

Small and medium-sized enterprises in most industries generally face difficulties in the post-covid-19 period. Despite being flexible in production, SMEs still face many difficulties when customers tend to tighten spending. Up to this time, although the first month of the third quarter has ended, but recorded in many businesses, the number of new orders has not shown positive signs, not meeting expectations as previously forecast.

According to the General Statistics Office, the index of industrial production in the first 6 months of 2023 compared to the same period last year increased in 48 provinces and cities and decreased in 15 localities across the country. The consumption index of the whole processing and manufacturing industry in the first 6 months of 2023 decreased by 2.2% over the same period in 2022 (the same period in 2022 will increase by 9.4%). The inventory index of the whole processing and manufacturing industry is estimated at June 30, 2023 to increase by 19.9% compared to the same time last year (the same time last year increased by 14.1%). The average inventory rate of the whole processing and manufacturing industry in the first 6 months of 2023 is 83.1% (the average of the first 6 months of 2022 is 78%).

In addition, the world economy recovered slowly with tightening monetary policies in many countries, reducing the consumer demand of major trading partners, thus affecting Vietnam's export and import turnover. According to the General Statistics Office, the total export and import turnover of goods in the first quater of 2023 is estimated at 154.27 billion USD, down 13.3% over the same period last year, of which exports decreased by 11.9%; imports fell 14.7%.

Consumer demand from Vietnam's major trading partners decreased sharply compared to the same period in 2022, causing the export turnover of goods in June 2023 to be estimated at 29.3 billion USD and down 11.4% over the same period last year. In the first 6 months of 2023, goods export turnover is estimated at 164.45 billion USD, down 12.1% over the same period last year.

SMEs are not disbursed, lack cash flow, must narrow production and business scale

SMEs face counless difficulties and challanges due to lack of capital. Many companies cannot access loans, therefore they are not disbursed or transferred bad debts. From mid-2022 until now, businesses have not invested and tend to resell, losing their brands.

According to the Ministry of Planning and Investment (2023), in a survey of more than 200 SMEs, more than 50% of surveyed businesses in the Textile and Garment sector had a revenue decrease of more than 50%. And up to 100% of businesses in the footwear sector showed a decrease in revenue of less than 50% . In which, the three fields of agricultural product processing, automation equipment manufacturing and metal fabrication have an almost equal rate of businesses with revenue decline and the rate of businesses maintaining or growing revenue. The field with the largest number of businesses decreasing in scale is footwear with 100% of businesses reducing their scale by less than 50%, followed by the textile and garment sector with 67% of businesses having to narrow their operations. Agricultural product processing and needle manufacturing are two sectors with a smaller percentage of enterprises reducing their scale than the remaining sectors (with the percentage of enterprises having a reduced labor size of 37% and 30%, respectively).

SMEs' revenue and profits have both decreased, leading to a serious impact on cash resources, so most businesses face many financial difficulties, especially short-term cash sources to pay for operating expenses. Besides, commercial banks still have many shortcomings in credit policies with lending conditions being too tight. Interest rates have tended to decrease but are still at a high level, causing many difficulties in business and production. The current lending interest rates will cause business costs to increase greatly.

In the situation of low market confidence, exhaustion of working capital and investment flows, assets of enterprises are at risk of being sold off. Information from businesses associations shows that there may be a wave of selling factories/production facilities of Vietnamese enterprises to foreign investors. This is a challenge not only for Vietnamese SMEs but also seriously affects the macroeconomy.

Logistics and input material costs increase

Logistics costs increased due to the sharp increase in gasoline prices, domestic transportation costs are forecasted to increase by about 10%, sea transportation costs increase by about 10-30% depending on each route. In addition, the increased congestion at seaports due to the increased demand for transportation after the COVID-19 period and the lack of operating capacity has significantly affected the finances of enterprises. Disruptions to global and regional supply chains have caused input shortages and increased commodity prices. The Russia-Ukraine conflict, which has led to disruptions to trade, rising fuel prices, and rising inflation, has prompted the Federal Reserve and other major central banks to raise interest rates, driving borrowing costs higher.

SMEs face difficulties in transporting goods, especially exported goods, with increased transportation and warehousing costs; Mobilizing and arranging production labor in conditions that ensure disease safety leads to additional costs incurred.

Labor shortages are at a worrying level

The shortage of labor leads to many SMEs having to recruit new employees to recover production and business, incurring recruiting and training costs for new human resources, taking more time to increase the quality and skill of the workforce.

The poor quality of labor due to low skills and lack of soft skills has greatly affected the production and business of enterprises. At the same time, the poor adaptability of workers to new working methods and models makes it difficult for workers to catch up with the speed of enterprise's innovation, which has slowed down the recovery process of enterprises. In addition, the impact of the COVID-19 pandemic on the physical and mental health of employees, affect to labor productivity and business efficiency.

5. DISCUSSION AND CONCLUSION

In order to restore and develop production and business activities of SMEs after COVID-19, it is necessary to implement the following solutions:

5.1. For the Goverment and authorities

In the situation of global economic integration, the role of the State in supporting businesses becomes even more important, especially for private enterprises. Indirect support measures, in line with the principles and spirit of WTO and AFTA, are essential to help SMEs grow in scale and competitiveness to be able to cooperate and compete with large enterprises, especially in the post-covid-19 recovery period. Some of the key solutions need to be implemented as follows.

Improve the legal environment to facilitate the establishment and operation of enterprises

- The Government and authorities at all levels should continue to make more efforts to support enterprises to overcome difficulties in production and business. In order to support the recovery of enterprises, especially domestic private enterprises facing great difficulties in cash flow, it is necessary to extend a number of policies that have brought into play practical effects during the recent COVID-19 pandemic to support enterprises until the end of 2023. The Government needs to continue the implementation of solutions to support interest rate reduction, tax exemption, and extension of tax payment time and land rent for SMEs. These supports will help SMEs have more financial resources to increase their resilience against the risks of supply chain disruption, instability or reduced market purchasing power.

- It is necessary to deploy separate credit policies aimed at target groups. There is a Law to support SMEs, so there needs to be a specific credit policy for SMEs to synchronize with the strategy to support SMEs in general, and some specific industries in particular such as science and technology, agriculture...

- Simplify and transparency regulations related to business conditions and market entry of enterprises in order to reduce barriers in the operation process of enterprises; to strictly and substantially implement the process of consultation and collecting opinions of enterprises when elaborating and promulgating relevant legal documents.

Improving access to capital and credit sources for private enterprises

- *C*onducting solutions to support and solve capital difficulties of enterprises in the process of recovery and start-up, lowering lending interest rates; banks should expand lending conditions and mortgage rates of borrowed assets. Simplify lending procedures, loosen lending conditions for SMEs; expand lending using assets formed from loan capital and unsecured loans to the private economic sector; Simplify property mortgage procedures, reduce property valuation time. There needs to be a specific solution to solve the problem of collateral for SMEs when accessing financial resources from financial institutions. In the current context, business assets are very undervalued, so businesses are not eligible for loans. Financial institutions can lend along the supply chain based on the reputation and risk level of a central business (large and traditional bank customers); diversify lending methods focusing on analyzing business cash flows to evaluate potential; Promote lending through unsecured loans, evaluate the effectiveness and profitability of investment projects to finance businesses.

- Enhance the operational efficiency of financial support funds and SME-supporting financial institutions such as credit guarantee funds, SME development funds, venture capital funds, financial lease-purchase programs, trade credits and fiscal incentives in the form of tax exemptions and reductions or microfinance programs for micro and small businesses. Financial support funds for SMEs need to have an operating mechanism to ensure fairness and objectivity and avoid the establishment of business support funds to increase the power of state management agencies. In addition to financial support funds, financial support in the form of lease and purchase is also a form of long- and medium-term capital settlement for SMEs. This form is very suitable for businesses that do not have collateral but have effective business plans, helping SMEs minimize risks in business.

And then, study the model of Small and Medium Enterprise Bank to support the demand for loans with preferential interest rates for small and medium enterprises; accelerate the restructuring of state-owned commercial banks in order to make the provision of banking services more efficient for enterprises, with emphasis on small and medium-sized enterprises.

-*S*implify lending procedures, relax lending conditions for private enterprises; expanding the area of lending with assets formed from loans and unsecured loans to the private sector; Simplify property mortgage procedures, reduce asset valuation time; further develop microfinance activities to provide capital to enterprises, especially small and medium enterprises.

Capacity building and competitiveness improvement of enterprises

- Accelerate the implementation of the program to support human resource training for small and medium-sized enterprises as stipulated in the Law on Support for the Development of Small and Medium Enterprises.

- To encourage SMEs to produce new products, implement advanced technologies, production methods, modern equipment and machinery in accordance with the needs of the growing and rapidly expanding market in the process of international economic integration.

- Strengthen the linkage between small and medium enterprises and large enterprises, globalc corporations investing in Vietnam to cooperate in manufacturing products, components, accessories, spare parts, receiving construction contracts.

- Establish an e-portal to provide information on government policies, public services, government financial support funds, solutions for business management and answers to business management issues to support businesses from the beginning of establishment to development progress.

5.2 For SMEs

The period of growth based on small and short-term investment and the business opportunities gained through relationships will become less and less as Vietnam officially integrates with an increasingly transparent environment and increasingly fierce competition. In order to cooperate and compete with foreign enterprises with economic potential, good management team and advanced management methods, Vietnamese enterprises must invest methodically in management to survive and develop sustainably; business opportunities will come more for businesses with competitiveness and good management systems. Here are some specific solutions that need to be thoroughly applied at each business:

- *Restructuring enterprises:* SMEs need to upgrade management mechanisms, finances, technology investments, and improve management skills to increase product competitiveness; design an effective business plan focusing on main production and business areas with advantages, capable of generating sustainable cash flow, avoiding scattered and risky investments. Especially during the Covid-19 period, it is necessary to urgently re-evaluate business items to have the most reasonable and effective capital restructuring measures.

- *Information transparency:* SMEs need to strictly comply with legal regulations on information disclosure, financial regulations, information transparency and audit annual financial statements. At the same time, businesses need to use loan capital for the right purpose and comply with the contents of the credit contract to enhance credibility.

- *Use of modern enterprise management tools, implement digital transformation:*

It is necessary to change the perception that investing in management systems is not urgent or just one thing is enough. Management tools will quickly become outdated compared to the requirements of the environment and the development process of the business. Enterprises need to regularly update and effectively apply modern management tools to improve productivity and increase the competitiveness of enterprises.

- *Find new directions, change marketing and sales methods*: When the pandemic occurs, customers will not go shopping directly at the store, at this time, enterprises need to change their business methods from serving at the store to serving at home, switching from direct sales to online sales.

- *Reduce production and business costs*: Accordingly, SMEs need to review all costs and reduce and cut costs to the maximum such as office rental costs, administrative costs, advertising costs ...

- *Training and retraining of the labor force*: In addition to implementing labor policies, SMEs need to train and retrain workers to better meet the requirements of enterprise development in the present and future. Businesses need to increase investment in internal training, develop management teams, increase the use of expert opinions, constantly learn and apply appropriate management toolkits and always innovate the approach and use of management tools in accordance with the development roadmap.

5.3. For business associations

It is necessary to encourage the establishment and operation of socio-professional organizations such as clubs or associations of large business executives with a rich program of activities aimed at sharing knowledge and experience using modern management tools, such as organizing seminars, etc. organize training, publish monthly newsletters on management tools.

Establish a network of small and medium-sized enterprises so that enterprises can regularly exchange experiences and knowledge and establish cooperative relationships;

Establish a network linking large enterprises with small and medium enterprises, in which large enterprises will train suppliers who are small and medium enterprises on skills to manage businesses, ensure quality and services.

In order for managers to have easy access to management tools, it is necessary to build a database of advanced management tools on the internet. In this database, there will be an introduction to the types of management tools, the application process, methods of evaluating the effectiveness of application, the implementation of these tools in enterprises in different industries in the world and the region, applicable lessons of businesses and forms related to each tool where appropriate. This database may also include a list of training organizations, consultants and software related to management tools, including reviews of businesses that have used the services of training organizations, consultants or used the software so that business managers can easily choose the tools and service providers that best suit your organization.

FINANCIAL DEVELOPMENT AND ITS IMPACT ON FINANCIAL INCLUSION – THE CASE OF VIETNAM

Dr. Nguyen Van Chien[1]

Abstract: The objective of this study is to evaluate the impact of financial development on financial inclusion in Vietnam. Using data from the General Statistics Office and the World Bank, and through quantitative analysis, research results show that attracting FDI capital flows has a positive impact on financial inclusion. Furthermore, economic growth helps comprehensive financial development. However, financial development does not have a clear relationship with financial inclusion. In some cases, international trade can have an adverse effect on financial inclusion.

Keywords: financial inclusion, FDI, GDP, trade.

1. INTRODUCTION

The role of the financial market is to mobilize idle capital in the economy and allocate this capital to effective investment projects, and thus develop banks, businesses and the economy. In countries with developed financial markets, businesses and investors have the ability to access capital in the market at low costs and therefore businesses have the ability to increase business benefits. Furthermore, a developed financial market creates opportunities for consumers to have access to financial services and products in the market, and thus the economy is capable of providing financial inclusion to everyone and share the benefits of economic development to all levels of society.

Normally, countries with high levels of economic development often have developed financial markets. The financial market has the ability to provide many low-cost financial services and products to different needs of society. Or consumers and investors have more access to financial services and products. Basically, vulnerable people and low-income people have access to financial products and services, they have more opportunities to improve their income and participate in business and economic development.

Vietnam is known as a country with rapid economic development over the past 20 years. Since the economic reform, Vietnam has continuously opened its capital market and developed its financial market. The banking system has been expanded with the participation of private capital and foreign investment flows. The banking network has expanded widely in most provinces and cities, towns and many towns across the country, increasing access to financial products and services. Commercial banks also develop payment channels, digital banking and electronic banking, so they can serve customers in many different places. Therefore, the goal of this study is to evaluate the impact of financial development on financial inclusion. The research results aim to provide some solutions for comprehensive financial development in Vietnam in the near future. In addition, the study also evaluates the impact of GDP, international trade and per capita income on comprehensive financial development.

1 Email: chiennv@tdmu.edu.vn, Thu Dau Mot University.

In addition to the introduction, the rest of the study includes: the next section discusses previous studies, data and research methodology, then the study discusses the results and discusses the results. Finally, study depicts the general conclusion.

2. LITERATURE REVIEW

Financial inclusion is the ability to provide financial products and services at optimal costs to consumers in society. Comprehensive financial development cannot lack the participation of the financial system, especially the commercial banking system. With their mission, commercial banks are responsible for providing financial products and services to all subjects, and comprehensive financial development is one of the ways to help banks fulfill their mission.

The study of Akande et al. (2023) argues that financial inclusion is among the priority programs of policymakers to eradicate poverty, especially in developing countries. When vulnerable people do not have access to formal financial products and services such as bank accounts, credit cards or insurance contracts, or educational loans, financial inclusion is the appropriate solution to increase access to financial products and services. Therefore, comprehensive finance is a factor in promoting sustainable development, especially for people in rural areas who are in dire need of financial access to develop private businesses. Akande et al. (2023) conducted a survey in South Africa on 283 farmers and subsistence businesses in the region and found that financial literacy affects financial inclusion and helps achieve sustainable livelihoods, including financial inclusion mediates the impact of financial literacy on livelihoods. This aims to inform structured intervention to improve financial literacy to support target groups in accessing financial resources to help them live better lives.

Research by Coffie&Hongjiang (2023) in Ghana suggests that the country has achieved significant progress between information communication technology and financial development. However, there have been no impact assessments on the development of the financial technology and financial inclusion market in Ghana to reassess the process of comprehensive financial development in the country. Coffie & Hongjiang (2023) have identified and argued that developing the financial technology market in terms of taking advantage of technology infrastructure to develop Fintech has the ability to improve financial inclusion. Governments, mobile phones, telecommunications companies, service customers and banks are the actors that influence inclusive financial development. However, access to finance across entities is not uniform, which hinders the sustainable development of financial inclusion in Ghana.

After the global financial crisis, many countries have sought to strengthen financial inclusion, including improving institutional quality to improve financial access in countries. Zeqiraj et al. (2022) argued that institutional quality is an important factor that determines whether individuals and businesses participate in financial institutions, because poor institutional quality does not encourage people to participate in the financial sector. In addition, institutional quality comes from corruption control, government effectiveness, political stability, regulatory quality, rule of law, voice and accountability. Zeqiraj et al. (2022) also argued that institutional quality promotes access to and use of formal financial services in developing countries. Based on this study, Zeqiraj et al. (2022) used three components for financial inclusions such as: automated teller machines per 100.000 adults, commerial bank branches per 100.000 adults, and depositors at commercial banks per 100.000 adults. The results of this study show that factors that are likely to impact financial inclusion are: economic growth, human development index, credit, financial depth and remittances. From there, it is confirmed that human capital plays a very important role in improving comprehensive financial access. The process of raising people's awareness helps them increase their financial understanding and access to financial products and services.

Hua et al. (2023) affirmed the superiority of financial inclusion due to its ability to provide effective financial services to all segments of society at affordable costs. Therefore, financial inclusion is achieved by establishing a comprehensive financial service system across a wide range of services. Informal financial institutions are also involved in financial inclusion through microcredit companies, loans to rural people, small and micro enterprises, other groups, along with The participation of commercial banks has helped people and businesses have comprehensive financial access. Hua et al. (2023) also affirmed that financial inclusion has a positive impact on financial stability, which has important implications for policymakers and state financial management agencies in making related decisions to financial inclusion and financial stability.

3. DATA AND METHODOLOGY

3.1. Data sources

In this study, we use Vietnamese data collected from the General Statistics Office and the World Bank. The data are processed for errors, then used in statistical analysis.

3.2. Methodology

Based on the previous study of Zeqiraj et al. (2022), in this study, Zeqiraj et al. (2022) investigated the relationship between financial development and financial inclusion in East Asian and Pacific, Europe and central Asia, Latin America and Carribian in the period of 2000 – 2018, the estimated equation can be shown as below:

Where,

is financial inclusion of Vietnam, this indicator is measured by the number of ATMs per 100,000 inhabitants. This indicator is supported by Zeqiraj et al. (2022) and Maity and Sahu (2023).

is financial development of Vietnam, this indicator is measured by the broad money as of GDP (%). This indicator is supported by Zeqiraj et al. (2022);

is net FDI attraction of Vietnam, is calculated as % GDP;

is the per capita income (USD/person/year);

is the trade openness of the economy, is calculated total export and import as of % GDP;

The study uses OLS regression to evaluate the influence of variables. Additionally, use GLM regression to compare the regression results.

Source: Authors' analysis

Research results show that: financial inclusion is increasingly expanding in Vietnam, increasing access to financial services for Vietnamese people. The number of ATMs installed is increasing, helping people access banking services through the ATM system. The study also confirms Vietnam's financial development in the past year. Specifically, the banking system provides increasing credit to the economy and businesses, investors, and consumers have the ability to access banking services. Regarding FDI inflows, Vietnam has also achieved certain success in attracting FDI, the FDI rate reached an average of 5.57% and at times reached 11.93% of GDP, showing that FDI inflows are a source of additional finance for Vietnam's economic development of the country. Regarding trade openness (TO), this index is quite high and shows that Vietnam has a relatively deep integration into the global economy. Foreign trade activities are expanding and Vietnam has trade relationships with many countries.

Source: Authors' analysis

The study tested diagnostics that could affect the results such as heteroscedasticity and autocorrelation and showed that the model results did not encounter these phenomena. In addition, regression using two different methods can make the results more reliable and robust, and thus increase the credibility of this study.

Results Table 2 and Table 3 show:

The regression coefficient of FDI has a positive sign and is statistically significant. This shows that foreign direct investment has a positive impact on financial inclusion in Vietnam. Indeed, the Vietnamese banking system has always attracted the attention of foreign investors, and many foreign investors have invested and become strategic shareholders of large banks such as BIDV, Vietinbank, Vietcombank, or VPBank. The participation of foreign investors can support domestic banks invest in technology and develop financial service products and thereby promote comprehensive financial development. However, there has been no impact from financial development on comprehensive finance in Vietnam.

The study also confirms the positive impact of per capita income on financial inclusion. This reflects that as income levels increase, access to financial inclusion increases. Indeed, as income levels increase, demand for financial products and services often increases, forcing banks to improve the quality of services and products to be able to meet these financial needs of the country.

Research suggests that over-reliance on international trade may not have positive benefits for inclusive financial development. International trade does not always bring positive effects to the economy, especially when the internal strength of the economy is weak, international trade can bring more benefits to FDI enterprises than to domestic enterprises. Therefore, Vietnam needs to improve the operations of domestic enterprises to help them produce to meet international requirements and exploit the benefits of international trade.

5. CONCLUSION

Inclusive financial development is an opportunity to help consumers and businesses have access to financial products and services at reasonable costs. Inclusive finance helps develop the national economy more harmoniously, reducing the impact of inequality and disparities in socio-economic development between regions and localities towards sustainable development. To develop comprehensive finance, the influence of the banking system on its ability to provide comprehensive finance is indispensable. Researching the impact of financial development on comprehensive finance in Vietnam in recent times, through quantitative analysis, the research results confirm that: there is no clear evidence of the impact of financial development. to comprehensive finance in Vietnam. However, the study confirms the positive relationship of foreign direct investment and per capita income to financial inclusion, thereby confirming the benefits of attracting international capital flows and economic development. social economy to the development of comprehensive finance. The study confirms that international trade has not had a positive impact on financial inclusion, and in some cases international trade can have a negative impact on the development of comprehensive finance.

Through this research, there are a number of comprehensive financial development solutions for Vietnam proposed as follows: Firstly, Vietnam continues to improve investment quality, attracting quality FDI capital flows into the banking and finance sector and thereby promote investment in banking technology and comprehensive financial development. Secondly, Vietnam continues to pursue a policy of sustainable economic growth, and generate per capital income, and that is an important driving force promoting the development of comprehensive finance.

INTERNATIONAL EXPERIENCE IN APPLYING SOCIAL RESPONSIBILITY ACCOUNTING AND POLICY IMPLICATIONS FOR VIETNAM

Assoc. Prof. Dr. Minh Ba Nguyen[1], MSc. Linh Ba Nguyen[2]

Abstract: Social responsibility accounting is a relatively new term in Vietnam, but around the world, social responsibility accounting has been researched since the 1970s and put into practice since the 2000s. Vietnamese enterprises during the integration period are clearly aware of the social responsibility associated with production and business activities. Large corporations have begun to carry out social responsibility activities and use social responsibility accounting tools for measurement. The article presents experiences in applying social responsibility accounting in some countries such as the US, Japan, and Australia, thereby drawing some implications for Vietnam. Research results show that through different tools such as the sustainable balanced scorecard, businesses in these countries have integrated social responsibility accounting reports into sustainable development reports for external publication with the trend of standardization of behavior and professionalization of organization

Keywords: enterprises, policy implications, social responsibility accounting, experience

1. INTRODUCTION

In the context of international economic integration, State management agencies and businesses are increasingly paying attention to social responsibility activities, aiming at the goal of sustainable development. Accordingly, the application of social responsibility accounting is gradually becoming an inevitable trend to help businesses minimize social and environmental risks and responsibilities that may cause damage to business operations, and will be mandatory to comply with international practices. Social responsibility accounting increasingly plays a key role in the production and business strategies of enterprises. It is an effective management tool that helps administrators proactively build production and business plans, identify and allocate appropriate resources to balance profit - people - society goals. At the same time, effective implementation of social responsibility accounting also contributes to improving community trust in businesses. However, up to now, the application of social responsibility accounting in Vietnamese enterprises still has many limitations. Many businesses have not been proactive in accessing social responsibility accounting content, because they are not clearly aware of the importance of transparency of relevant information to achieve sustainable development goals. This requires businesses and related parties to promote research on the implementation of social responsibility accounting in businesses in other countries. The article presents experiences in applying social responsibility accounting in some countries such as the US, Japan, and Australia, thereby drawing some implications for Vietnam. Research results show that through different tools such as the sustainable balanced scorecard, businesses in these countries have integrated social responsibility accounting reports into sustainable development reports for external publication with the trend of standardization of behavior and professionalization of organization.

2. LITERATURE REVIEW

Along with the development of corporate social responsibility, concepts and research on social responsibility accounting also change and develop over time. According to Anderson

1 Email: nguyenbaminh2009@gmail.com, Academy of Finance.

2 Academy of Finance.

(1977), social responsibility accounting is accounting that reports on individual items related to anti-pollution, safety measures and health protection, largely done on an ad hoc basis. Social responsibility accounting is considered a management tool, supporting the establishment of an organization's social goals by considering business needs and public expectations.

Gray et.al (1987) defined social responsibility accounting as the process of conveying the social and environmental impacts caused by an organization's economic activities to specific interest groups. Therefore, social responsibility accounting involves expanding the responsibilities of organizations beyond their traditional role of providing financial information to capital owners, especially shareholders. Part of such expanded responsibility is predicated on the assumption that businesses have broader responsibilities than simply making money for their shareholders. However, this definition is then further supplemented with details for environmental accounting, which is considered part of social responsibility accounting, and to include all areas of accounting that may be affected by businesses' responses to environmental issues including the new field of ecological accounting (Gray et.al, 1993).

Meanwhile, from the perspective of Mathews (1993), social responsibility accounting involves the voluntary disclosure of information made by organizations to inform, both qualitatively and quantitatively. Quantitative disclosures can be financial or non-financial.

Mathews and Perera (1995) insist that at the very least, social responsibility accounting means expanding information disclosure into non-traditional areas such as providing information about employees, products, and community services, and preventing or reducing pollution. However, the term social responsibility accounting is also used to describe a comprehensive form of accounting that takes into account external impacts... Public sector organizations can also be evaluated in this way, although most scholars studying the topic of social responsibility accounting seem to be more concerned with private organizations.

According to Schaltegger and Burritt (2005), leading corporations are realizing that adopting social responsibility accounting makes business sense, and engagement with stakeholders can actually help improve business performance.

Perrini, F. (2005) survey on SRA in European enterprises shows that among the 90 selected medium and large-sized listed enterprises (referred to as surveyed enterprises), 25% of enterprises belong to the financial sector, 20% belong to the consumer goods sector, 24% belong to the service sector, 10% belong to the basic industry sector and 21% belong to other sectors.

3. RESEARCH METHODS

Data collection method

The article collected data on the basis of researching existing documents and using logical thinking to draw the necessary scientific conclusions related to the content of social responsibility accounting. The article has drawn important conclusions on issues related to international experience in implementing social responsibility accounting by reviewing scientific literature from various authoritative sources around the world as well as practicing a theoretical and historical systematization method

Data analysis method

This article applies the method of synthesizing, analyzing and comparing secondary data on the content and issues related to international experience in implementing social responsibility accounting. From there, it recommends some policy implications for Vietnamese businesses in implementing social responsibility accounting for the coming period.

4. RESEARCH RESULTS

4.1. Overview of social responsibility accounting

Social responsibility accounting is a science of observing, measuring, calculating, recording, reflecting, organizing, processing and analyzing information about corporate social responsibility as committed: environmental Protection commitments; commitment to employees and suppliers; Committed to ensuring benefits and safety for consumers,... Social responsibility accounting recognizes that the resources of an enterprise that creates added value depend not only on production capital and financial capital, but also on human, social and natural capital. This means, payments to workers, environmental protection expenses and community program expenses can be reinvested in assets and create wealth for businesses.

Social responsibility accounting reflects and quantifies economic, social and environmental information of an enterprise to provide administrators and other subjects related to the enterprise, such as workers, administrators, owners, customers, suppliers, donors, communities, government agencies, political organizations and trade associations. Social responsibility accounting includes both financial accounting and management accounting, which emphasizes the impact of non-financial information on social, environmental and economic factors.

The role of social responsibility accounting for businesses and related units is shown as follows:

Providing non-financial information

Non-financial social responsibility information is qualitative, descriptive information intended to inform external stakeholders about policies, goals, and management systems for social responsibility. Social responsibility policy includes contents such as official policies and programs approved by the enterprise, and measures, levels of environmental protection, or responsibilities to employees have been implemented according to legal requirements. In the absence of such policies and programs, businesses should also clearly state the main improvements that have been made over the years. However, non-financial information cannot provide accurate, complete information about the interaction between business and social responsibility.

Providing financial information

Firstly, providing information about assets for social responsibility activities.

Enterprises can record assets serving social responsibility activities for the purpose of (i) waste treatment and control to ensure compliance with environmental regulations such as wastewater treatment system and dust collection system; (ii) environmental prevention and management such as environmentally friendly equipment and technology; (iii) environmental research and development, such as laboratories used for the purpose of researching solutions to better manage environmental problems and reduce environmental pollution; (iv) intangible assets such as emission permits and emission reduction certificates; and (v) assets serving employees such as cafeterias, rest rooms, changing rooms, gyms, etc.

Secondly, providing information about social responsibility liabilities.

Social responsibility liabilities are the current obligations that an enterprise must carry out to pay arising amounts related to social responsibility and meet the criteria for recognition as liabilities. For each type of liability and social responsibility, it is necessary to briefly describe the nature (e.g., environmental damage, environmental restoration regulations, reasonably expected changes to existing laws or technology), time, and payment regulations of the liability and the approach used to measure environmental liabilities. In addition, businesses need to disclose potential social responsibility debt with content such as a brief description of the nature of the potential debt, estimating the financial effectiveness of potential debts, and identifying uncertain factors related to not recording potential debt and the company's ability to compensate.

Thirdly, providing information about income/incentives for socially responsible activities

Income related to social responsibility activities can arise from the sale of scrap and waste or income arising from insurance reimbursements for environmental, consumer and worker-related complaints. Businesses can also evaluate the increased profits from environmentally friendly products, saving materials used, improving work efficiency... During operations, businesses can receive incentives from the Government related to social responsibility activities such as grants or tax incentives. Income information from socially responsible activities helps information users evaluate the social responsibility of businesses in environmental protection, worker protection, and other social activities

Finally, providing information about social responsibility costs.

Social responsibility costs are amounts that reduce economic benefits in the accounting period and are implemented to manage impacts on the environment, employees, and the community... to serves corporate social responsibility requirements. Enterprises need to disclose content on social responsibility costs such as a list of costs for social responsibility activities, costs for employees, and costs incurred due to fines for non-compliance with environmental regulations or compensation to third parties due to environmental pollution...

Social responsibility reports

Corporate social responsibility reports present and regularly publish economic, environmental and social information about the business. This information can be reflected and integrated in the enterprise's financial reports, and reflected in separate reports in the annual report system and disseminated in the media such as management letters, videos, CD Rom, business website. Corporate social responsibility reports are called by another name, Sustainability Report. Sustainability report first appeared in the late 1980s, under the name Environmental Reporting in companies in the chemical industry of industrialized countries, whose activities seriously affect the ecological environment and public health. (Schaltegger, S.; Bennett, M. & Burritt, R.,2006).

4.2. Experience in implementing social responsibility accounting in some countries and Implications for Vietnam

4.2.1. Japan

Japan is a country with many of the world's leading businesses in corporate social responsibility (CSR) activities. Throughout the process of formation and development, Japanese businesses have paid attention to and implemented CSR in many different aspects, not only limited to issues related to the ecological environment and charity activities as before, but also covering many fields inside and outside the enterprise, domestic and international, material and immaterial, profit and non-profit. The framework of CSR activities of Japanese businesses shows the complexity, diversity, scale and influence of this activity. Because CSR has a wide scope and interacts with many stakeholders, to implement it effectively, all necessary conditions must be met, from the capacity of businesses to the general awareness of the whole society about CSR.

To have the concept and effectiveness in the process of implementing CSR in Japanese businesses today is a change in perception and method of implementation. In the early days, many Japanese businesses believed that the implementation of CSR had no connection with the business because the business was an organization carrying out business activities, so it could ensure the goals of "revenue and profit"; that is, being responsible to society. The next step in the perception of CSR is that "CSR là sự tuân thủ pháp luật và thực hiện tốt các quy định của pháp luật có liên quan". In addition to generating revenue and profits, businesses need to comply well with relevant regulations, not at all costs to achieve this goal.

Along with growth and development, a number of Japanese social enterprises were born to carry out special missions according to society's requirements; Since then, a stream of thought has argued that "implementing CSR is the task and role of social enterprises" rather than the task of normal business enterprises, until new problems arise on a global scale that pose new urgent needs. For example, globalization of business and the emergence of social problems, the emergence of business scandals, requirements for existence and stability in society, the severity of environmental pollution, unemployment and the limitations of governments, issues of rights of shareholders, customers, and partners, expansion of activities of non-governmental organizations (NGOs), the diversification of financial instruments, and the issue of information technology development. All of the above issues have left Japanese businesses in both perception and practice with questions that need to be answered; and the most satisfactory answer to meet these requirements is to implement social responsibility.

Also from that awareness, CSR is increasingly becoming the most important activity of Japanese businesses with the trend of standardizing behavior and professionalizing organization, having clear strategies, plans and action programs, and being considered, monitored, and evaluated using a system of specific criteria and widely recognized standards. The application of a quality management system on CSR (ISO 26000, GRI G4, EU...), international and Japanese codes of conduct, and the development and publication of annual reports on CSR show the role and level of professionalism and standardization of CSR in this country.

4.2.2. Australia

Global Reporting Initiative (GRI)'s Sustainability Reporting Guidelines, the Guide to Reporting Environmental Directives and the Guide to Reporting Social Indicators (both Australian initiatives) are reference documents for accounting and social responsibility accounting reporting. Australian businesses record social responsibility accounting according to the stakeholder approach.

Besides, social responsibility accounting adheres to the overall principle and principles, which are multidimensional, comprehensive, regular, comparative, verification and assurance, and disclosure. Social accounting reports of Australian businesses are mainly published in the form of sustainable development reports. More than 80% of sustainability reports in Australia are prepared in accordance with the guidelines of the global reporting initiative.

4.2.3. America

The social responsibility accounting system in the US is recognized by the sustainable balanced scorecard. Unlike the conventional balanced scorecard, which only includes four perspectives:

finance, internal processes, customers, and innovation and learning. The sustainable balanced scorecard in the US is supplemented with a fifth perspective, environment and society, linked to the remaining four perspectives.

During the process of recording social responsibility accounting, the costs incurred and the income of each of the above groups of subjects are recorded. Making a social responsibility report is done through the following steps:

Step 1: Planning the company's reporting process, including: Identify a list of sustainability topics that are potentially relevant and that senior decision makers in the company want to act on, and report on the basis of the company's business objectives and development context.

Step 2: Collect input from key stakeholders on the above topics. A list of sustainable development topics that stakeholders value is established. This is the basis for making recommendations on reported topics.

Step 3: Identify key areas for the report. These are areas that reflect the organization's significant economic, environmental, or social impact or fundamentally influence the assessments and decisions of stakeholders. It is linked to the company's development goals, meets the needs of stakeholders and impacts the economy, environment and society.

Step 4: Supervise the preparation of social responsibility accounting reports. In particular, record each type of revenue and cost incurred according to each criterion, and provide explanations about those sources of costs or revenue.

Step 5: Check and exchange. The necessary information for each item of data required to comply with the disclosure of information to the outside must ensure accuracy.

The report must be comprehensive and targeted to specific stakeholder groups. The preparation of social responsibility accounting reports requires the application of reporting principles, especially the principles of clarity, timeliness and balance. Accurate and specific accounting data accompanied by illustrative examples.

For production and business enterprises, environmental factors are often considered the most important issues and often receive the most attention in reports. Meanwhile, for service and financial companies, other issues such as human resources or community are invested more. Businesses express their desire to implement CSR in parallel with sustainable development, making efforts to communicate their ability to meet the needs of stakeholders and the overall impact of business activities on the environment. Performance indicators published in the sustainable development report include materials (total volume of raw materials used to produce and package the organization's products and services during the year and the percentage of materials recycled to produce the organization's products and services); energy (energy consumption, savings and initiatives); water (water supply and usage, savings and initiatives); compliance (number of fines and total fine).

4.2.4. Implications for Vietnam

Through studying the experiences of implementing social responsibility accounting in businesses of other countries, some contents can be suggested for Vietnam in applying social responsibility accounting, including:

Firstly, raising awareness of businesses. In fact, currently, no country requires businesses to implement social responsibility accounting. However, as the economy develops along with the increasingly strong globalization process, corporate social responsibility is increasingly emphasized. Businesses need to be encouraged to apply responsibility accounting and learn from each other to come up with a highly consistent way of implementing social responsibility accounting.

Secondly, the Government considers issuing documents to apply to social responsibility accounting such as the Sustainable Development Accounting Standards of the US Sustainable Development Accounting Standards Council, Sustainable development accounting guidelines of the British SIGMA project, and Australian Environmental Indicators Reporting Guide and Social Indicators Reporting Guide.

Thirdly, encouraging businesses to apply sustainable development reporting guidelines of the Global Reporting Initiative and report templates of the International Integrated Reporting Council.

Finally, using Trible bottom line tools to incorporate sustainable development goals into business strategies, and considering social and human outcomes and ecological environmental outcomes in close relationship and interaction with the financial results of enterprises.

5. CONCLUSION

For businesses to develop sustainably, applying social responsibility accounting is considered an important part of today's business accounting reports. This will help enhance the public image of businesses, effectively promote product consumption, and demonstrate businesses' responsibility to society. Through this, businesses also show concern for the community, customers and other relevant subjects. In the context of an increasingly deeply integrated economy, with the need to respect and comply with international law in competition, Vietnam needs to pay more attention to the issue of corporate social responsibility. On that basis, the study of international experience on applying social responsibility accounting in businesses needs to be further promoted to build an empirical foundation for Vietnamese businesses to implement social responsibility accounting in the near future.

THE IMPACT OF FINANCIAL INCLUSION ON THE PROFITABILITY OF VIETNAMESE MSMES

PhD.Thi Huong Dao[1]

Abstract: Using the EFA, CFA, and SEM analysis methods with data from 50 Vietnamese MSMEs, this study explored the impact of the factors Financial intermediation, Financial Inclusion, and Access to Capital on the Profitability of Vietnamese MSMEs. The research findings indicate that Financial intermediation, Financial Inclusion, and Access to Capital have a significant impact on MSMEs' profitability. However, the study reveals that Financial Inclusion does not affect Financial intermediation and Access to Capital. The reasons for this result include the presence of systemic barriers, the creditworthiness of businesses, the priorities of financial institutions, and geographical disparities. The article emphasizes the importance of comprehensive finance and access to capital for MSMEs in Vietnam. While comprehensive finance can create favorable conditions, it does not always guarantee easy access to capital for these businesses. Systemic barriers, business credit factors, financial institution priorities, and local conditions can create disparities in capital access for MSMEs. The article provides recommendations for government and relevant agencies to improve this situation and create a more favorable environment for MSMEs.

Key words: Financial Inclusion, Financial intermediation MSMEs' profitability Access to Capital

1. INTRODUCTION

Financial inclusion plays a crucial role in the MSME sector, as it offers broad accessibility to financial services while eliminating barriers, as emphasized by Herispon (2017). Krishna (2016) asserts that financial inclusion not only strengthens the existing financial institutions but also extends the reach of faster and more extensive financial services. Fahmy *et al*. (2016) affirm that its impact on MSMEs is profound, as it aids in addressing the financial challenges they commonly face. Several earlier studies, including those conducted by Abdmoulah & Jelili (2013), Chauvet & Jacolin (2017), Lee *et al*. (2019), Khan (2011), and Morgan & Pontines (2014), have investigated the influence of financial inclusion on growth. The findings of Abdmoulah & Jelili (2013), Chauvet & Jacolin (2017), and Lee *et al*. (2019) consistently demonstrate that financial inclusion significantly and positively contributes to the growth and performance of companies. According to Khan (2011) and Morgan & Pontines (2014), it mitigates liquidity constraints and encourages investment, subsequently boosting output and employment opportunities. Effective implementation of financial inclusion measures has the potential to stimulate economic activities among MSMEs, as evidenced by the research of Egbetunde (2012), Martinez (2011), Mbotor & Uba (2013), Okafor (2012), Onaolapo (2015), and Yaron *et al*. (2013). However, recent research by Ejiofor *et al*. (2020) and Awoyemi *et al*. (2015) has explicitly concluded that financial inclusion exerts no discernible influence on the growth of MSMEs. This highlights the inconsistency in findings regarding the impact of financial inclusion on the performance of MSMEs. Conversely, some scholars have contended that financial inclusion does affect financial intermediation, and numerous studies have shown that financial intermediation does influence the performance of MSMEs. Prasad (2010) has argued that financial inclusion can enhance the efficiency of financial intermediation by increasing domestic savings and investment. Mishkin (2007) has also concluded

1 Email: huongdao@tl.edu.vn, Thuyloi University.

that financial intermediation, facilitated by the expansion of bank branches and the entry of new financial service providers into the financial market, can lead to the provision of a diverse array of financial products and services tailored to the needs of MSMEs. Furthermore, Fafchamps & Schündeln (2013) have identified a significant relationship between financial intermediation and the growth of MSMEs. Therefore, it is plausible that financial inclusion can influence the performance of MSMEs through the mechanism of enhanced financial intermediation, although the direct role of financial intermediation itself in this context has not yet been thoroughly explored. Other researchers have also delved into the relationship between financial inclusion and improved access to capital. Okafor (2012) and Nurjannah (2017) have both provided evidence to support the notion that financial inclusion can expedite the flow of credit to MSMEs.

In a different vein, Donati (2016) conducted an examination of the impact of access to capital on the performance of MSMEs and arrived at the conclusion that MSMEs lacking access to affordable credit encounter difficulties in enhancing their performance and expanding their business operations. These findings collectively underscore the idea that financial inclusion can indeed augment MSMEs' access to capital, and this increased access, in turn, holds the potential to significantly influence the performance of MSMEs. Despite efforts, MSMEs continue to grapple with access to capital challenges, as highlighted by Beck *et al*. (2004). Banerjee & Duflo (2014) and Muhajir (2015) have empirically demonstrated the hurdles faced by MSMEs when seeking loans from formal financial institutions. These challenges often originate from various factors, such as geographical distance, social factors, and personal circumstances, which have the potential to evolve into significant barriers to financial access within the community, as discussed by Shankar (2013) and Cnaan *et al*. (2012). According to Rifai (2017), MSMEs frequently encounter difficulties in accessing capital from formal financial institutions because their business profiles may not align with conventional banking standards, categorizing them as "unbankable." The infusion of capital can greatly bolster the growth and output of MSMEs, enabling them to expand their operations and foster job creation, as noted by Sohilauw (2018), Haltiwanger (2013), and Yudaruddin (2020). Access to diverse financing sources plays a pivotal role in ensuring the survival and performance of companies, enabling them to secure adequate funds for crucial aspects such as working capital, investments in fixed assets, recruitment of skilled personnel, and expansion into new markets, as emphasized by GPFI (2013). Primus (2015) underscores the immense potential inherent in MSMEs, highlighting the imperative need for both capital support and guidance to facilitate the pursuit of growth opportunities in MSMEs' performance, as articulated by Ahmad & Arif (2015).

In Vietnam, micro and small-scale enterprises constitute the highest proportion of businesses. As of December 31, 2020, there were 478,601 micro-scale enterprises, accounting for 69.9% of the total number of businesses, an increase of 6.6% compared to the same period in 2019. There were 163,760 small-scale enterprises, making up 23.9%, which decreased by 8.7%. Additionally, there were 23,895 medium-scale enterprises, accounting for 3.5%, an increase of 4.9% compared to 2019.

The primary objective of this study is to investigate the impact of financial inclusion on the performance of MSMEs and to analyze the mediating roles played by both financial intermediation and access to capital. What sets this study apart from previous research is its innovative approach in addressing existing gaps in the literature by incorporating specific variables. Additionally, this study employs more sophisticated performance indicators compared to earlier investigations.

While prior studies, such as those conducted by Abdmoulah & Jelili (2013), Chauvet & Jacolin (2017), and Lee *et al.* (2019), have primarily relied on the sales growth indicator, this research extends the measurement framework by encompassing four distinct indicators: sales growth, profit growth, workforce expansion, and market share growth. This broader set of performance metrics provides a more comprehensive understanding of the impact of financial inclusion on MSMEs' overall performance, adding depth and nuance to the analysis.

2. LITERATURE REVIEW

MSMEs' profitability

Profitability is the ability to earn a profit for a business (Pandey, 1980). Profitability interprets the relationship between various factors. It is one of the most important metrics and objectives in corporate financial management (Malik, 2011). The goal of financial management is to maximize the wealth of the owners, and profitability is a crucial determinant of performance. Profitability is closely related to profit but has a key distinction: while profit is an absolute amount, profitability is a relative figure. To assess a business's profitability, various indicators of profit rates are commonly used because they express the relationship between profit and actual production costs, demonstrating the business acumen of entrepreneurs in utilizing those factors. According to Lesakova (2007), profit rate indicators are a measure of a company's financial health and how efficiently it manages its assets. There are two commonly used profitability ratios: Return on Assets (ROA) and Return on Equity (ROE). Many studies employ ROA to measure a business's profitability, such as the research conducted by Goddard et al. (2005), Malik (2011), Odusanya et al. (2018), and Yazdanfar (2013). Return on Assets (ROA) is an indicator that measures a business's profit generation relative to its own assets. The ROA metric reflects the efficiency of the organization and management of a company's production and business activities. The results of this indicator reveal how much profit is generated for every dollar of assets utilized in the production and business process. So, this indicator will show how effectively a business uses its assets to generate profits. Additionally, ROE is also a commonly used measure to assess a business's profitability (Alarussi & Alhaderi, 2018; Chander & Aggarwal, 2008). ROE reflects the ability to generate profits using shareholder equity during the business operations. Analyzing the profitability of shareholder equity clearly illustrates how much profit after-tax income a single unit of shareholder equity generates. Examining this indicator is of significant importance as it helps determine the business leaders' objective of either maximizing profit or maximizing scale.

Financial Inclusion

Financial inclusion represents an economic state wherein both individuals and businesses enjoy unhindered access to financial services, as highlighted by Amidžić *et al*. (2014). Financial inclusion serves as an intervention strategy designed to overcome market frictions that impede financial markets from reaching the poor or disadvantaged, as pointed out by Julie (2016). This strategic intervention strives to attract the unbanked population into the formal financial system, offering them the opportunity to access formal financial services, fostering a culture of savings, expanding access to credit, and introducing efficient payment mechanisms, as highlighted by Chakravarty & Pal (2013). To effectively promote financial inclusion, policymakers must create conducive opportunities that facilitate the adoption of innovative technologies, enact regulatory reforms, and invest in infrastructure improvements. These measures aim to reduce transaction costs and enable the swifter, more efficient, and convenient delivery of financial services, as articulated by Neaime & Gaysset (2018). However, it is important to note that the impact of financial inclusion may not necessarily be positive in all instances, as indicated by Mehrotra *et al.* (2015). The foundation of financial intermediation theory was laid by Goldsmith (1969), Shaw (1973), and McKinnon (1973). Financial intermediation constitutes a multifaceted process. It involves financial institutions accumulating deposits and providing vital loan-related information to support investments in the economy, as expounded by Gorton & Winton (2002). Additionally, it encompasses the acquisition of surplus funds from various economic units, including businesses, governmental institutions, and individual households, with the primary objective of supplying funds to those economic units facing deficits, as elucidated by Rivai (2007) and Mathews & Thompson (2008). According to Mishkin (2007), Kendall *et al.* (2010), Demirguc-kunt and Klapper (2012), financial intermediation, achieved through the expansion of bank branches and the entry of new financial service providers into the financial market, can facilitate the provision of a diverse array of financial products and services that cater to the economic needs of lower-income groups, thus enhancing access to financial services (Chandan & Mishra, 2010). Furthermore, Gurley & Shaw (1960) and Diamond & Dybvig (1983) asserted that intermediaries like banks play a pivotal role in enhancing economic efficiency. They achieve this by streamlining transactions, enabling the creation of diversified investment portfolios, mitigating household liquidity constraints, spreading risk over time, and ameliorating issues related to asymmetric information in financial markets.

Based on these findings, the researcher assumes that financial inclusion will allow MSMEs to access more financial services at affordable costs, so it can improve MSMEs' profitability. Thus, the first hypothesis that is proposed is:

H1: Financial inclusion positively and significantly influences MSMEs' profitability.

Financial intermediation

The foundation of financial intermediation theory was laid by Goldsmith (1969), Shaw (1973), and McKinnon (1973). Financial intermediation constitutes a multifaceted process. It involves financial institutions accumulating deposits and providing vital loan-related information to support investments in the economy, as expounded by Gorton and Winton (2002). Additionally, it encompasses the acquisition of surplus funds from various economic units, including businesses, governmental institutions, and individual households, with the primary objective of supplying funds to those economic units facing deficits, as elucidated by Rivai (2007) and Mathews & Thompson (2008).

According to Mishkin (2007), Kendall *et al.* (2010), and Demirguc-kunt & Klapper (2012), financial intermediation, achieved through the expansion of bank branches and the entry of new financial service providers into the financial market, can facilitate the provision of a diverse array of financial products and services that cater to the economic needs of lower-income groups, thus enhancing access to financial services (Chandan & Mishra, 2010). Furthermore, Gurley & Shaw (1960), Diamond & Dybvig (1983) assert that intermediaries like banks play a pivotal role in enhancing economic efficiency. They achieve this by streamlining transactions, enabling the creation of diversified investment portfolios, mitigating household liquidity constraints, spreading risk over time, and ameliorating issues related to asymmetric information in financial markets. Various scholars, including Chandan & Mishra (2010), Ergungor (2006), Kempson *et al.* (2004), DeGennaro (2005), Mathew & Thompson (2008), Rau (2004), Nissanke & Stein (2003), Stiglitz & Greenwald (2003), Menkhoff (2000), and Mishkin (1998) have conducted extensive research into the relationship between financial inclusion and financial intermediation in developing countries. Drawing from their collective findings, it is reasonable to posit that financial inclusion has the potential to bolster financial intermediation.

Hence, the second hypothesis posited is as follows:

H2: Financial inclusion has a positive and significant impact on financial intermediation.

Ongore & Kusa (2013) and Chibba (2009) have contended that banks, through their intermediary role, play a pivotal part in efficiently allocating resources mobilized for productive endeavors. Merton & Bodie (2004) have also demonstrated that financial intermediaries possess the capability to allocate scarce resources effectively, even in uncertain environments. Banks heavily rely on the information they acquire to assess and identify new clients, including individuals from low-income backgrounds, as noted by Rau (2004), Nissanke & Stein (2003), and Mishkin & Eakins (2009). However, it's essential to acknowledge that due to information asymmetry and the presence of high transactional costs, financial intermediaries tend to be cautious and may not extend loans to individuals or entities lacking sufficient collateral, as highlighted by Rosengard & Prasetyantoko (2011). Fafchamps & Schündeln's (2013) delved into the impact of local financial development on company performance, revealing a noteworthy correlation between the availability of local banks and the accelerated growth of SMEs. Similarly, Nurjannah's (2017) established that access to financial institutions has a discernible effect on the development of MSMEs. Okello's investigation (2017) scrutinized the nexus between access to finance and the growth of MSMEs, concluding that access to finance has a significant and favorable influence on the growth of these enterprises.

Consequently, it can be deduced that financial intermediation holds the potential to augment the performance of MSMEs. In light of these findings, the third hypothesis can be formulated as follows:

H3: Financial intermediation has a positive and significant impact on MSMEs' profitability.

Access to Capital

Capital stands as one of the cornerstone factors essential for conducting business operations. Adequate capital not only propels the growth of MSMEs but also elevates their production output, enabling these enterprises to expand their operations and foster job creation, as underscored by Sohilauw (2018), Haltiwanger (2013), and Yudaruddin (2020). According to Xuan (2020), investment capital is imperative for businesses to invest in their development, enhance competitiveness, bolster productivity, and improve efficiency. The significance of access to capital cannot be overstated, as it ranks among the most pivotal factors determining the growth and survival of MSMEs, as acknowledged by IFC (2010) and OECD (2006). Access to financial resources empowers MSMEs to make prudent investments in expanding their operations, adopting cutting-edge technologies to maintain competitiveness, fostering innovation, fortifying macroeconomic resilience, and contributing to GDP growth, as highlighted by Beck & Demirguc-Kunt (2006). Furthermore, access to capital and financial resources serves as indispensable tools for pursuing growth opportunities that enhance the performance of MSMEs, as articulated by Ahmad & Arif (2015). Fahmy *et al*. (2016) have asserted that financial inclusion can serve as a solution to surmount financial challenges. They've also noted a positive and significant relationship between banking access and the extension of credit to the MSME sector. The greater the presence of bank branch networks, the more credit is absorbed within this sector. Drawing upon the findings of previous studies, it is reasonable to hypothesize that financial inclusion and financial intermediation contribute to enhanced access to capital for MSMEs. Consequently, the researcher has formulated the following hypothesis:

Hypothesis: Financial inclusion and financial intermediation positively and significantly influence access to capital for MSMEs.

H4: Financial inclusion has a positive and significant impact on access to capital.

H5: Financial intermediation has a positive and significant impact on access to capital.

Kevane & Wydick (2001) have also asserted that extending credit to MSMEs plays a pivotal role in fostering economic growth by increasing business capitalization, generating job opportunities, and fostering long-term income growth. Increased credit availability correlates with a higher number of businesses being formed, leading to economic growth, as elucidated by Aghion & Bolton (1997). Conversely, Brown *et al.* (2005) and Chauvet & Ehrhart (2018) have found that access to external credit substantially augments sales growth and company expansion, a viewpoint reinforced by Banarjee (2014). Dimitrov & Tice (2006) have unveiled that credit constraints, whether stemming from poor creditworthiness or economic downturns, can lead to lower rates of sales growth for businesses. A study conducted by the World Bank (2013) has demonstrated that access to finance enhances company performance and growth by streamlining market entry, mitigating risks, stimulating innovation, and fostering entrepreneurial activity, particularly in developing countries. Furthermore, according to the author's perspective, access to capital influences a business's profitability. Access to capital can enable a business to invest in infrastructure, purchase new equipment, expand its operations, or develop new products and services. This can help increase sales volume and profitability. Capital can also be used for the day-to-day financial management of the business, including payments to suppliers, employee salaries, and other debts. Therefore, if there is good access to capital, it ensures stability in the business's operations. Additionally, businesses with access to capital can easily undertake research and development projects, improve their products or services, and maintain competitiveness in the market. Ultimately, capital can also help businesses cope with adverse situations, such as financial crises or economic downturns. Having readily available capital can mitigate risks and sustain business operations during challenging times.

Therefore, in this study, the author proposes to supplement the impact of financial access on the profitability of MSMEs. From this perspective, the hypothesis is as follows:

H6: Access to finance positively and significantly influences MSMEs' *profitability***.**

3. RESEARCH METHOD

The research was conducted with MSMEs in Lao Cai, Bac Giang and Thai Nguyen province. Data was collected using a simple random sampling method, and questionnaires were distributed via Google Forms. The questionnaire was designed using the Likert scale 5 levels. The software used in this research includes SPSS (for EFA analysis) and AMOS (for CFA and SEM analysis). The variables in the model are encoded as shown in the table below:

Variable	Definition	Indicator	Item	
Financial Inclusion (FI)	Every endeavor aims to enhance the accessibility, availability, and advantages of the formal financial system for every participant in the economy (Amidžić et al., 2014, Global Financial Development Report, 2014, Hannig & Jansen, 2010, Sarma, 2012, Agrawal, 2008)	Benefits for well-being (FI1)	FI11	The financial services offered by banks/cooperatives increase the need for financing
			FI12	The financial services offered by banks/cooperatives increase access to financial services
			FI13	The financial services offered by banks/cooperatives add to the financing of employee capacity building
		Access to financial financing (FI2)	FI21	Financial services/ products provided by banks/ cooperatives are appropriate
			F22	Financial services/ products provided by banks/ cooperatives are secure
			FI23	Financial services/ products provided by banks/ cooperatives are available
		Quality of financial services (FI3)	FI31	The initial account opening fee charged by the banks/ cooperatives is affordable
			FI32	The account maintenance fees and service charges are affordable
			FI33	Chi phí di chuyển đến các điểm giao dịch của ngân hàng phù hợp
Financial intermediation (FM)	A process that establishes a connection between those who lend and those who borrow (Gorton & Winton, 2002, Rivai, 2007; Mathews & Thompson, 2008).	Market penetration (FM1)	FM11	Banks/cooperatives have the idea of increasing customer satisfaction
			FM12	Banks/cooperatives have the idea of increasing customer satisfaction
			FM13	Banks/cooperatives are trying to increase the frequency and volume of services
			FM14	Banks/cooperatives try to have product and price advantages over competitors
			FM15	Banks/cooperatives collaborate with communities and MSMEs organizations
		Infrastructure (FM2)	FM21	Banks/cooperatives have a clean and comfortable lounge area
			FM22	Banks/cooperatives have a well-maintained physical infrastructure
			FM23	The location of the banks/cooperatives is easy to reach
		Service quality (FM3)	FM31	Banks/cooperatives provide services appropriately and accurately
			FM32	Banks/cooperatives provide services appropriately and accurately
			FM33	Banks/cooperatives employees have good knowledge to answer customer questions
			FM35	Banks/cooperatives ensure the security of customer deposits
			FM35	Banks/cooperatives employees always listen to customer complaints and convey them to management

Access to capital (AC)	MSMEs do not perceive any hindrances associated with administrative expenses or procedures in capital provider institutions (Beck & Demirguc-Kunt, 2006, Ahmad & Arif, 2015, Ramadhan, 2018; Lusimbo & Muturi, 2016)	Formal credit procedures (AC1)	AC11	Banks/cooperatives employees always listen to customer complaints and convey them to management
			AC12	Banks/cooperatives employees always listen to customer complaints and convey them to management
			AC14	The loan amount received meets the companys credit needs
			AC14	The company find it easy to access credit from banks/cooperatives
		MSMEs costs in accessing capital (AC2)	AC21	The interest rates charged by banks/cooperatives are usually lower than those of other financial institutions
			AC22	The interest rates charged by banks/cooperatives are usually lower than those of other financial institutions
			AC23	The company believes that the interest rates charged by banks/cooperatives are reasonable
MSMEs' profitability (EP)	Profitability is the ability of a business to earn a profit, indicating the financial health of the business and how it can effectively manage its assets (Pandey, 1980, Malik, 2011, Lesakova, 2007, Goddard et al., 2005, Malik, 2011, Odusanya et al., 2018, Yazdanfar, 2013, Alarussi & Alhaderi, 2018; Chander & Aggarwal, 2008).	Profitability	EP1	The company anticipates an increase in business sales growth
			EP2	The Return on Assets (ROA) ratio increases
			EP3	The Return on Equity (ROE) ratio increases.

The research model of this study is presented in Figure 1:

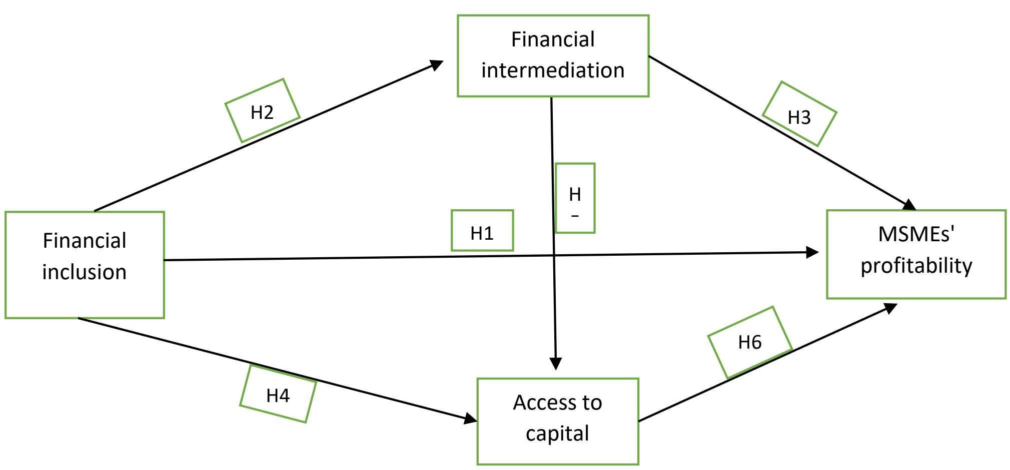

Figure 1. Research Model

4. RESEARCH RESULTS

To assess the appropriateness of the scale in the research model, the author conducted a reliability test for the scale. The results obtained are as follows:

Table 1. Scale Reliability Test

Items	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
AC21	0.846	0.955	0.947
AC22	0.904	0.910	
AC23	0.916	0.901	
EP1	0.803	0.886	0.91
EP2	0.815	0.876	
EP3	0.843	0.853	
FI23	0.778	0.923	0.927
FI24	0.791	0.918	
FI22	0.878	0.889	
FI21	0.876	0.890	
FI31	0.684	0.753	0.823
FI32	0.653	0.782	
FI33	0.702	0.734	
FM21	0.873	0.926	0.944
FM22	0.893	0.911	
FM23	0.883	0.918	
FM31	0.679	0.868	0.87
FM32	0.800	0.819	
FM33	0.705	0.856	
FM34	0.789	0.830	
AC11	0.838	0.833	0.892
AC12	0.762	0.862	
AC13	0.705	0.886	
AC14	0.759	0.864	
FM11	0.742	0.807	0.855
FM12	0.637	0.835	
FM13	0.695	0.819	
FM14	0.622	0.837	
FM15	0.658	0.828	
FI11	0.720	0.883	0.883
FI12	0.858	0.758	
FI13	0.746	0.857	

Based on the results in Table 1, all factor groups influencing profitability have Cronbach's Alpha coefficients that meet the requirements, with a standard Cronbach's Alpha not less than 0.6. However, variable EP4 has Cronbach's Alpha If Item Deleted of 0.955, which is lower than the corresponding Cronbach's Alpha of 0.91. Additionally, the intercorrelation coefficient of these variables is less than 0.3, indicating that these variables do not ensure reliability. Therefore, the author removed these variables from the study. After removing the unreliable scales, the measurement components of the scale were applied to the study sample for further EFA analysis.

The research employs Principal Components analysis with Varimax rotation in the exploratory factor analysis to determine the number of factors in a set of questions representing the factors under investigation. The total extracted variance is >=50%, and the Kaiser-Meyer-Olkin (KMO) measure >=0.5, while the Bartlett's test is statistically significant (Sig<0.05) (Gerbing & Anderson, 1988). Additionally, the factor loading of observed variables is >=0.5 (Hair *et al.*, 1998). The results of the EFA analysis are as Table 2 and Appendix 1:

Table 2. Exploratory Factor Analysis (EFA)

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.828
Bartlett's Test of Sphericity	Approx. Chi-Square	7032.953
	df	496
	Sig.	0.000

After rotation and removing variables with factor loadings less than 0.5, the factor rotation matrix is obtained in Appendix 2.

After conducting the CFA following the EFA analysis, the results in Table 3 indicate that the CFA model fits the data well. Specifically, all fit indices meet the criteria: The model has 398 degrees of freedom, the chi-square statistic is 551.355, Chi-square/df = 1.385 (< 3); CFI = 0.845 (≥ 0.8); RMSEA = 0.037 (≤ 0.08); P-close = 0.000 (> 0.05), TLI = 0.818 (≥ 0.8) according to Hair et al. (2010) and Hu & Bentler (1999). Only the GFI index with a value of 0.877 falls below the 0.9 threshold, but according to the perspective of Baumgartner and Homburg (1995) and Doll, Xia, and Torkzadeh (1994), a minimum GFI value of 0.8 is still acceptable.

Table 3. Fit Indices of the Model after CFA Analysis

Indices	Value calculated from the model	Required value
Chi-square/df	1.385	≤ 3
CFI	0.845	≥ 0.8
RMSEA	0.037	< 0.08
GFI	0.877	≥ 0.8
Pclose	0.999	>0.05
TLI	0.903	≥ 0.9

The method of analyzing a second-order linear structural model was used to test the research model, resulting in the findings shown in the figure.

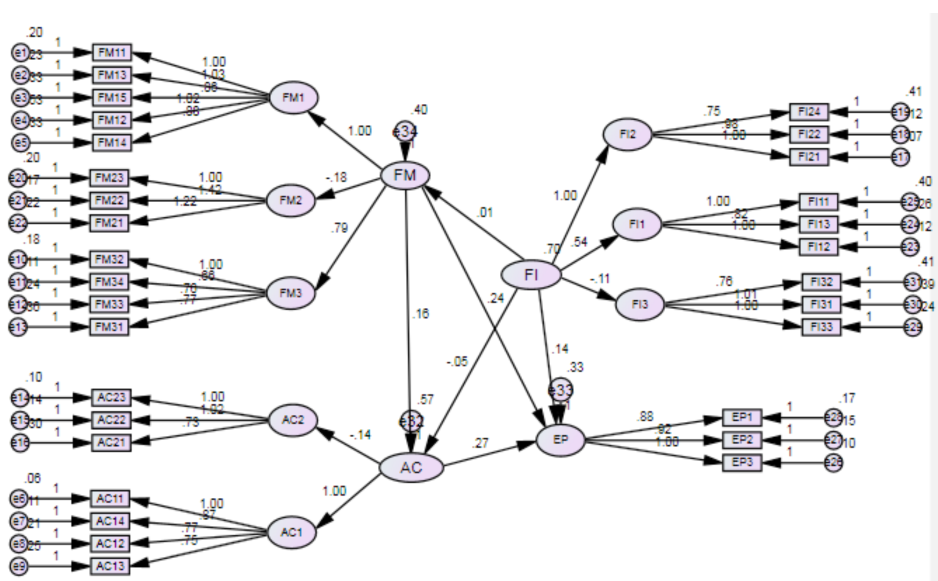

Figure 3. SEM Model Results at level 2

			Estimate	Standardized Coefficient	S.E.	C.R.	P
FM	<---	FI	0.012		0.056	0.211	0.833
AC	<---	FM	0.156		0.081	1.936	0.053
AC	<---	FI	-0.055		0.062	-0.885	0.376
EP	<---	FM	0.239	0.236	0.069	3.443	***
EP	<---	FI	0.142	0.185	0.054	2.653	0.008
EP	<---	AC	0.271	0.323	0.055	4.951	***

5. DISCUSSION

According to the research model results, FM, FI, and AC have an impact on EP, and FM has an impact on AC. Hypotheses H1, H3, H5, and H6 are accepted and are consistent with previous research findings. Conversely, FI does not have an impact on FM, and FI does not affect AC, leading to the rejection of hypotheses H2 and H4. The finding that FI does not influence FM contradicts the results of previous research by Chandan & Mishra (2010), Ergungor (2006), Kempson et al. (2004), DeGennaro (2005), Mathew & Thompson (2008), Rau (2004), Nissanke & Stein (2003), Stiglitz & Greenwald (2003), Menkhoff (2000), and Mishkin (1998).

Financial inclusion and financial intermediation are two interconnected concepts within the broader field of finance, but they don't always directly impact each other. Let's break down these concepts and explore why they may not always have a direct impact on each other.

Financial inclusion primarily focuses on expanding access to financial services to underserved populations. While this can indirectly contribute to financial intermediation by increasing the pool of potential borrowers and lenders, the primary objective of financial inclusion is social and economic inclusion, not necessarily enhancing the efficiency of financial intermediation. Financial intermediation is influenced by various regulatory and market factors, including interest rates, banking regulations, credit risk, and investor preferences. The existence of financial inclusion policies or initiatives alone may not alter these factors significantly. Besides, access to financial services doesn't guarantee that individuals or businesses will actively engage in financial intermediation activities. The willingness and ability of people and businesses to borrow or invest in the formal financial sector depend on various factors, including financial literacy, trust in the system, and economic conditions. And in some cases, financial inclusion efforts may target regions or communities where the financial sector is less developed. In such situations, financial intermediation may take time to evolve as the market infrastructure and financial literacy levels catch up with the goal of inclusion.

In summary, while financial inclusion is an important objective in its own right, it may not always directly impact financial intermediation because these two concepts have different goals and are influenced by a wide range of factors. However, an inclusive financial ecosystem can create opportunities for financial intermediaries to expand their customer base and improve financial intermediation over the long term.

FI does not affect AC. This result contradicts the findings of FC (2010) and OECD (2006), Beck & Demirguc-Kunt (2006), Ahmad & Arif (2015), Fahmy *et al.* (2016). To provide a clearer explanation for the research findings, the author conducted interviews with some business leaders to understand the reasons behind the results. From the interview results, the following explanations can be provided:

While comprehensive financial inclusion may create favorable conditions for mainstream financial institutions to provide financial products and services, systemic barriers may still exist. Large banks and financial institutions often have strict processes and requirements when lending to small and medium-sized enterprises (MSMEs). This can make it difficult for small businesses to access capital.

MSMEs may not have a high enough creditworthiness to meet the credit requirements of mainstream financial institutions. Banks often require good credit guarantees and credit histories from businesses before granting loans. If businesses do not meet these standards, they may have difficulty accessing capital.

Financial institutions may prioritize providing financial services to larger-scale customers because they have the potential for larger profits. Very small, small, and medium-sized enterprises may not be their priority. Therefore, the amount disbursed to MSMEs may not meet the businesses' requirements and expectations, or the interest rates may be higher compared to larger businesses, making them less flexible.

Comprehensive financial inclusion may have a more positive impact on businesses in developed areas with a better business environment. Meanwhile, in rural or less developed areas, businesses may face more difficulties in accessing capital.

Therefore, it can be seen that although comprehensive financial inclusion can improve the access to capital for some businesses, it does not always guarantee that very small, small, and medium-sized enterprises will be able to access capital easily. Systemic barriers, business credit factors, financial institution priorities, and local factors can create disparities in access to capital for these businesses.

Recommendations to the Government: To harness the benefits of comprehensive financial inclusion while addressing the issue of its lack of impact on the financial market and access to capital for MSMEs, the government and relevant agencies can create favorable conditions for MSMEs by improving the business environment, reducing inappropriate regulations, and fostering the development of small businesses. Encouraging MSMEs to engage in innovative business activities and develop new products or services can help them generate profits and improve their profitability. The government may consider implementing specific financial policies for MSMEs, including subsidy programs, guarantee programs, or interest rate reduction programs, to create more favorable conditions for accessing capital.

Solutions for MSMEs:

To optimize profitability (ROA, ROE, and revenue growth) through interaction with the financial market:

- Ensure that the business does not rely solely on a single source of funding. Actively search for and build relationships with various sources of funding, such as banks, private investors, and government-sponsored financing programs (if available).

- Develop a financial risk management strategy to ensure financial stability. This may include careful debt management, the use of financial insurance tools, and close monitoring of potential financial risks.

- Improve the efficiency of financial management by optimizing capital structure, managing cash flows effectively, and optimizing the use of both foreign and domestic financing.

- Build long-term relationships with banks and financial institutions, and meet with them regularly to build trust and promote financing opportunities.

- Establish key performance indicators and monitoring systems to assess financial performance and measure the impact of financial management strategies. Be flexible in adjusting business and financial strategies based on changes in the financial market and access to capital. Develop contingency plans to cope with unexpected financial difficulties and ensure the sustainability of the business.

These strategies can help MSMEs enhance their financial performance and navigate the challenges of accessing capital in a comprehensive financial environment.

To optimize access to capital for MSMEs through interaction with the financial market, consider the following solutions:

- Build and maintain long-term relationships with banks and financial institutions. Meet with them regularly to discuss financing needs and establish trust in the relationship.

- Avoid relying too heavily on a single source of funding. Explore various sources of funding, such as borrowing from banks, raising capital from private investors, participating in government-sponsored financing programs, or issuing bonds.

- Implement effective financial management to improve profitability and debt repayment capabilities. This includes optimizing capital structure, managing cash flow, and minimizing financial risks.

- Develop a detailed and specific business plan to convince investors and banks of the profit potential of the business. Consider opportunities for collaboration with business partners or other organizations to share financial risks or jointly raise capital for larger projects.

- Train staff and management in financial literacy so that they understand the lending process, financial management, and how to cope with challenging financial situations.

- Be flexible in adjusting your business and financial strategies to reflect changes in the financial market.

These management solutions can help small and medium-sized enterprises optimize their access to capital through proactive interaction with the financial market, creating more favorable conditions for securing financing.

STRENGTHEN STATE MANAGEMENT OF VIETNAM'S MONEY MARKET

Assoc. Prof. Dr. Ha Minh Son[1], PhD student Nguyen Phuong Thao[2]
MSc Mai Thi Trang[3], MSc. Pham Thi Hanh[4]

Abstract: *In this article, the author systematizes the theoretical basis of the money market and the State's management of the money market. At the same time, through studying actual data for the period 2018 - 2022 to analyze and evaluate in detail the current state of State management of the Vietnamese currency market, clearly pointing out successes, limitations, and causes. core. From there, we propose a few solutions to strengthen state management of Vietnam's currency market until 2030.*

Keywords*: Money market, state management, state management of the money market.*

1. INTRODUCTION

1.1. Reasons for choosing research topic:

The money market is an important part of the financial market, playing an important role in effectively allocating financial resources, but the money market always contains inherent shortcomings in it. ownership and high risk. Specifically expressed in the following issues: information asymmetry; high transaction costs; systemic uncertainties; risks related to financial liberalization and financial - monetary crisis.

In recent years, the currency market in Vietnam has made remarkable developments in both breadth and depth, especially the application of information technology, contributing to improving efficiency and increasing convenience, convenient, fast, accurate and secure. However, before the covid -19 pandemic, the Vietnamese and world economies faced many difficulties and declined sharply in many aspects, requiring effective policies to restore the economy...

In the context of digital transformation following the 4.0 Industrial Revolution with rapid changes in market constituents, requirements have been placed on state management of monetary market development and banking activities. Banks in Vietnam must be regularly cared for and innovated in terms of content and management methods with the goal of ensuring the full, healthy and modern development of Vietnam's financial market.

1.2. Overview of related research works:

There have been many research projects on state management of financial markets, state management of monetary markets in different specific periods such as research by: John Hawkins, Philip Turner, BIS paper 1999, "Banking restructuring in practice". WB Group, 2020, "Capital market development: A primer for remaining". Andrew Sheng, WB Institute for Economic Development "Issues and techniques in restructuring the banking system" Bui Van Thach (2022) State management

of Vietnam's financial market in the context of the first industrial revolution Wednesday, State level project - Party Central Office. Scientific research project "Restructuring Vietnam's stock market" by Nguyen Thanh Long and colleagues at the State Securities Commission (2013)

2. RESEARCH CONTENT:

2.1. Theoretical basis:

The money market is where short-term capital transactions take place between capital supply and demand. In particular, short-term capital is determined with a maturity of less than 1 year and has some characteristics such as: low risk level, high liquidity.

Some specific activities taking place in the currency market include: Bank loans, securities trading, certificates of deposit... This is where all of us (individuals, organizations) can Perform buy and sell transactions.

The structure of the money market includes 5 small markets: (i) Deposit market; (ii) Credit market; (iii) Open market; (iv) Interbank market; (v) Treasury bond market.

The currency market can be classified in two ways:

Based on organization: Primary money market (where bonds are issued, where capital is mobilized for bond issuers) and secondary money market (where bonds are bought and sold). operating in the primary market).

Based on operating tools: Short-term loan market (Transactions between organizations under the supervision of the central bank) and short-term bond market and other valuable papers (t-bills, promissory notes, etc.) vouchers, contracts...)

Entities participating in the currency market include: (i) Government, (ii) Central Bank, (iii) Commercial banks or financial institutions, (iv) Enterprises/economic organizations

State management is the exercise of state power by state agencies to establish a stable order and develop society according to the goals pursued by the ruling class.

State management is understood in a broad sense to include all activities of the entire state apparatus from the legislature, executive to judiciary operating as a unified entity. In the narrow sense, it is the guidance on law enforcement, administration, and administrative management performed by the executive agency guaranteed by the coercive power of the State.

The state management agency for the currency market is the Central Bank. The central bank performs the function of state management of credit currency, banking, and foreign exchange. With the basic task of implementing national monetary policy to stabilize the currency, manage and control the activities of commercial banks and credit institutions in accordance with the provisions of law, in order to develop Developing a banking system as well as financial intermediaries that are the largest distribution centers of capital flows in the economy, with enough competitiveness in integration conditions, the Central Bank is considered a key factor. The most important factor ensuring the sustainable development of the currency market.

The goal of State management of the currency market is to stabilize the currency; Manage and control the activities of commercial banks and credit institutions in accordance with the provisions of law, in order to develop a system of commercial banks as well as financial intermediaries that are the largest distribution centers of capital flows in the economy. economic, with enough competitiveness in integration conditions.

Contents of the State's management of the currency market: (1) Building and perfecting the legal and institutional system to ensure a developed commodity economy and a stable currency with controllable inflation controllable; (2) Organize the management and supervision of monetary market activities; (3) Support for the development of the currency market; (4) Command the entire banking system and ensure banks avoid systemic breakdown.

The state manages the currency market both directly through administrative law and indirectly through market mechanisms. The Central Bank is the agency representing the State that manages the monetary market mainly through monetary policies. These include: money supply policy, credit policy, foreign exchange policy... To ensure good implementation of policies, central banks of countries often use monetary policy tools, including monetary policy tools. Direct and indirect management such as: Credit limit, selective credit control, legal cash supply, mandatory reserves, open market operations, rediscount policy...

In most countries, the Central Bank is the sole state agency responsible for managing the money market. The Central Bank is an important and special management agency of currency. In the world, each market has its own types of tools and different levels of central bank participation, but the currency market is all under the management of the central bank. The Central Bank regularly introduces monetary policies and institutions to stabilize the currency, stabilize the value of the currency and ensure the currency market operates dynamically, effectively and in an organized manner. The Central Bank manages market activities by intervening in the money creation process of credit institutions and changing market interest rates by influencing money supply and demand through direct management tools and Indirect.

In addition, the Central Bank also acts as an intermediary broker in the currency market, helping intermediary banks in clearing debts with each other without having to move money by setting up exchange rooms. at the headquarters of the Central Bank. This role benefits the Central Bank and saves a lot of costs for banks in the market.

2.2. Situation in Vietnam

2.2.1. Status of state management of Vietnam's currency market

Based on the application platform of the 4.0 Industrial Revolution such as Internet of Things (IoT), Big Data, artificial intelligence (AI)... many new financial products have appeared on the financial market such as: Banks Digital currency, digital currency, fintech, peer-to-peer lending (P2P Lending)... The change in subjects of management in the financial market has made state management of the financial market complicated. more, requiring management agencies to change market management methods to adapt to new conditions. It is possible to draw some basic characteristics of state management of information technology and banking activities in the context of the 4.0 industrial revolution. These are: (i) Management content gradually changes, shifting from compliance monitoring to risk monitoring; (ii) Management methods have changed, from direct on-site monitoring to gradually shifting to remote monitoring based on a digital platform; (iii) Manage requirements for modern information technology infrastructure and high-quality technological and financial human resources; (iv) Management is carried out in a complex and volatile environment.

Recognizing the importance and strong impact of Industrial Revolution 4.0, the Party, Government and State Bank have proactively implemented many solutions and actions to improve the ability of subjects in the market to access Industrial Revolution 4.0. currency market.

In Decision 749/QD-TTg dated June 3, 2020 of the Prime Minister approving the Program "National digital transformation to 2005, orientation to 2030", banks and monetary markets are defined. This is an area that has a social impact, is related to people every day, changes awareness the fastest, brings efficiency, and helps save costs, so digital transformation should be prioritized first. Since then, the State Bank has been assigned the task of digital transformation in the banking sector towards providing digital banking services, building a banking and financial service ecosystem to promote national financial universalization; Issue mechanisms and policies so that businesses implementing digital transformation can access credit conveniently; Build and develop e-Government, moving towards digital Government.

The State Bank of Vietnam has researched and developed mechanisms, policies, strategies and projects to promote innovation and technology application of the 4.0 Industrial Revolution in banking operations, specifically:

In recent times, the State Bank has researched and developed regulations to prevent risks, fraud, and abuse of payment services and payment intermediaries for illegal activities; Issue a document directing banks and payment intermediaries to strengthen risk management measures for opening and using payment accounts, strengthen prevention measures, and minimize the risk of abuse. e-Wallet service for black credit activities; Establishing delegations to inspect and inspect a number of banks and payment intermediaries. To complete the legal framework for digital transformation in banking activities in the context of Industry 4.0, the State Bank of Vietnam has: (i) issued a Research Plan to prepare a proposal to develop a Law on Payment Systems (Decision No. 190 /QD-NHNN dated February 10, 2023); (ii) complete and submit to the Government a new Decree on non-cash payments and a Decree on a controlled testing mechanism for financial technology (Fintech) activities in the banking sector; (iii) develop a draft Strategy for developing payment systems to 2025, with a vision to 2030.

The State Bank of Vietnam continues to direct units throughout the industry to actively implement the Plan for implementing the Non-cash payment development project for the period 2021-2025 and the Plan for digital transformation of the banking industry until 2025, determining direction for 2030.

On March 2, 2023, the State Bank of Vietnam issued the 2023 Plan of the Banking Industry implementing Decision No. 06/QD-TTg dated January 6, 2022 of the Prime Minister approving the Data Application Development Project. on population, electronic identification and authentication to serve the national digital transformation in the period 2022 - 2025, with a vision to 2030. Accordingly, the Plan includes the following main contents: building and perfecting the institutional; Connecting the national population database, electronic identification and authentication system to serve public services and operations of the State Bank; connect and exploit the national database on population related to credit information operations, on civil servants in state agencies...; Application to authenticate people through chip-embedded citizen identification cards and electronic identification accounts when providing banking services...

Management through monitoring, supervising and operating the monetary market: Proactive, flexible and prudent management of monetary policy tools contributes to controlling inflation, stabilizing the macroeconomy, effectively supporting the economy. economic response to the adverse impacts of the Covid-19 pandemic. The management of the monetary market by the State

Bank in recent times has been demonstrated in operating monetary policy tools such as: Operating open market operations (OMO); Managing interest rates; Managing the mandatory reserve ratio; Administer the refinancing facility; Managing foreign currency market exchange rates.

Closely coordinate monetary policy with fiscal policy and other policies: The finance industry operates flexible fiscal policy, well managing revenues, especially revenues from e-commerce business activities death, anti-transfer pricing, tax evasion from real estate. Promoting the application and analysis of data from electronic invoices to properly manage budget revenues is also a key task of the financial industry in the near future. In parallel with that, continue to implement economical and effective spending policies; Strengthen strict control of expenses, limit transfer of expenses; proactively review and arrange expenses in order of priority; Review and balance resources for social security policies, supporting people to stabilize after the COVID-19 pandemic; Promote disbursement of public investment capital, create motivation for recovery and promote economic growth, create conditions to promote the demand for bank credit capital to participate in projects due to the loan needs of winning bidders. project construction, as well as businesses providing materials and raw materials for project implementation to facilitate capital flow from credit institutions.

The State Bank of Vietnam has developed projects to restructure the system of credit institutions associated with handling bad debts in stages (currently Project 689). The State Bank of Vietnam has directed credit institutions to actively improve asset quality, control credit quality, and limit new bad debts; self-handling bad debts by urging customers to repay their debts; sell or trade the security assets of the debt; selling debt according to market mechanisms; Use risk provisions...

Promote the application of IT to inspection and supervision of activities of members of the monetary market, especially commercial banks, to ensure system safety: Project "Building an information system to support operations "Remote Monitoring" has officially been put into operation since 2021, meeting the requirements of storing, updating, and developing a centralized database to serve the licensing, inspection, and supervision of the system of credit institutions.

Building digital technology infrastructure, modern banking services, ensuring safety and security in banking operations and the monetary market: The State Bank has directed construction and operation (from July/ 2020) Electronic clearing system serving retail transactions (ACH) with real-time payment capabilities, 24/7 continuous operation, multi-channel transaction processing capable of integrating and connecting with other industries and fields to provide banking products and services on digital platforms. The interbank electronic payment system has been innovated in terms of model and increased new payment and settlement services; Financial switching and electronic clearing systems continue to grow strongly; Payment via mobile phone, Internet is developing strongly...

In the first quarter of 2023, the State Bank will continue to flexibly and synchronously operate monetary policy tools. Specifically:

The State Bank of Vietnam continues to closely monitor developments in the monetary market and the available capital situation of credit institutions to stabilize the monetary market and meet the payment and settlement needs of credit institutions. Accordingly, the State Bank maintains daily valuable paper purchase sessions to support capital needs for credit institutions, contributing to stabilizing the monetary market.

In addition, the State Bank offers and sells State Bank bills to coordinate synchronously in operating monetary policy tools.

From the beginning of the year to March 15, 2023, the State Bank of Vietnam kept operating interest rates unchanged to stabilize market interest rates in the context of world interest rates continuing to increase and domestic inflation pressure increasing. Encourage credit institutions to reduce costs to stabilize lending interest rates to support businesses in recovering and developing production and business; Accordingly, commercial banks have reduced deposit interest rates from 0.2 - 0.5%/year for 6 to 12 month term deposits from March 6, 2023.

The period 2018 - 2020 was strongly impacted by the 4.0 Industrial Revolution, the world economy experienced complex fluctuations, and the Covid-19 pandemic occurred. Protectionism escalates, leading to fierce tensions and trade divisions between major countries (US - China, Korea - Japan, Australia - China, US - EU), negatively impacting confidence. news, trade, and investment, hindering the fragile recovery of the global economy; The consequences became even more serious when the Covid-19 pandemic broke out and spread worldwide since the beginning of 2020, causing a deep recession for the global economy - 4.4% (according to IMF, October 2020). The international financial and monetary market is full of instability, the monetary policies of major countries have reversed from "normalization", increasing interest rates to sharply reducing interest rates and easing in an "unprecedented" way. Capital flows into emerging and developing markets fluctuate complicatedly due to investors' fear of risk and in the context of many countries' domestic currencies depreciating against the USD. During this period, the State Bank of Vietnam has operated very flexible monetary market policies, suitable for each stage. In order to ensure that the Monetary Market is safe, healthy and transparent in information under the conditions of Industrial Revolution 4.0, the State Bank of Vietnam always monitors, supervises and operates the Monetary Market with tools. , policies in accordance with Industry 4.0 and set goals.

2.2.2. Assessing the current state of State management of Vietnam's currency market

The impact of the 4.0 Industrial Revolution has significantly changed the State Bank of Vietnam's management method for the currency market in recent years. However, with flexibility and quick adaptation, the State Bank of Vietnam has had a positive impact on the currency market, efficiency shown in the following aspects:

Achievements: (1) Institutional improvement continues to be focused, creating a full legal corridor, ensuring the safe operation of the banking system and monetary market, promoting non-cash payments face and digital transformation in banking operations; (2) the domestic currency market develops quite stably, average inflation is stably controlled at less than 4%/year (in line with the annual goals set by the National Assembly and the Government); (3) the foreign currency market and gold market are effectively managed and operate stably, contributing to converting capital sources into production and business activities; (4) interest rates are stable and tend to decrease; (5) credit growth in the period 2016 - 2021 is consistent with the economy's absorption rate, associated with improving credit quality; (6) has managed well and improved the capacity of market members, especially the commercial banking system; (7) IT infrastructure based on digital technology serving transactions on the currency market has basically been gradually formed and has made great progress; (8) payment activities in the economy take place safely, effectively and smoothly, non-cash payment indicators grow strongly; (9) revenue from service activities grew well, with the main reason being that people and businesses tend to use more digital banking services.

Limitations: (1) the system of legal documents for the operation of the currency market is not synchronized and there are still many shortcomings. There are still many legal gaps in the policy development process of the State Bank of Vietnam in Industrial Revolution 4.0; (2) commodities traded on the currency market are still quite monotonous; (3) monetary market operating tools are outdated and heavily administrative; (4) market participants lack diversity. The new members participating in the Vietnamese currency market are mainly commercial banks whose main purpose is to ensure liquidity, not currency trading; (5) The State Bank of Vietnam has not established a proactive interest rate control mechanism in accordance with international practices; (6) the implementation of Basel II application at some commercial banks is still limited, requiring banks to improve their financial capacity, risk management capacity, governance and operating mechanisms; (7) restructuring state-owned commercial banks faces difficulties in improving financial capacity through increasing charter capital while maintaining their role as a key force. in terms of scale, market share, and ability to regulate the market.

Causes of the limitations: (1) Vietnam's economy develops at a low level, growth is not sustainable, and is in the process of transition, so there are always potential risks that are difficult to predict; (2) the excessive "blooming" of the number of banks and other financial institutions in a narrow market; (3) the competitiveness of commercial banks is still weak; (4) the connection between parts of the currency market and between the currency market and the capital market is still lacking, causing many operating policies to be ineffective when implemented; (5) lack of early warning system and reliable information collection.

3. PROPOSE SOLUTIONS

To strengthen State management of the money market in current conditions in Vietnam, it is necessary to implement the following system of solutions:

The first. Completing the legal framework of the currency market: Continue to improve the legal framework of the currency market in a direction consistent with Vietnam's financial and monetary strategy until 2030 and major policies of the Party and State. on policies to proactively participate in the 4.0 Industrial Revolution

Currently, the legal environment for Vietnam's monetary activities has been fundamentally formed, but to meet development requirements in the context of Industrial Revolution 4.0 and international integration, the legal framework for the money market Currency is still lacking and not synchronized. Therefore, it is necessary to take measures to improve the legal system related to the operations of commercial banks and the money market in a way that is consistent with Vietnam's financial and monetary strategy until 2030 (according to Decision No. Decision No. 368/QD-TTg, dated March 21, 2022 of the Prime Minister) and the Party and State's policy on proactively participating in the 4.0 Industrial Revolution according to Resolution No. 52- NQ/TW September 27 2014 of the Politburo and Resolution No. 50/NQ-CP dated April 17, 2020 of the Government). It should focus on:

- Soon promulgate the Law on Financial Supervision to improve the safety of credit activities of banks; Promote research to establish independent financial supervision institutions to carry out unified supervision of the entire market.

- Issue a Code of Conduct on the Money Market according to standard practices and general standards for transactions (standard interest rates, standard transaction amounts, rounding rules,...) to serve as a basis for members when participating in market transactions.

- Amending Circular No. 01/2013/TT-NHNN dated January 7, 2013 and Circular No. 21/2012/ TTNHNN dated June 18, 2012 of the State Bank of Vietnam regulating lending and borrowing activities get a loan; buying and selling valuable papers with term between credit institutions and foreign bank branches in the direction of: supplementing instructions for loan and deposit transactions between credit institutions outside the Vietnamese territory Male; standard contract regulations apply to lending and deposit transactions, so currently each bank applies a separate contract, stipulating that credit institutions are not allowed to use capital mobilized on the interbank market to Long-term loans...

- Continue to improve the legal framework in the banking sector to adapt to the 4.0 Industrial Revolution to support digital transformation through facilitating and promoting business models and governance in the direction of breakthroughs and innovation. . Building a legal framework (including a Sandbox mechanism) for Fintech activities, digital banking, peer-to-peer lending, and cooperation between banks - Fintech and Bigtech in data sharing (Open banking ecosystem). -banking) ..., creating conditions for credit institutions to deploy digital banking, promoting successful non-cash payments. Continue to improve institutions and regulations so that non-bank credit institutions (including Fintech) participate in safe and healthy consumer lending; contribute to stimulating healthy consumption; Proposing a method to legislate bad debt handling when Resolution No. 42/2017/QH14 of the National Assembly expires in August 2022... At the same time, the State Bank of Vietnam is researching and preparing a draft Amend the Law on the State Bank, the Law on Credit Institutions and the Law on Deposit Insurance in accordance with the new situation.

- It is necessary to eliminate barriers due to scattered data, create large databases thanks to a high level of service integration in the financial ecosystem, and implement data migration to the cloud to help accelerate transition. At the same time, it is necessary to develop unified standards for QR codes for the market, build a system for sharing LNH information, perfect technologies related to the use of electronic documents instead of paper documents, and promote electronic signature application... Issue programs and action plans to encourage the development of online payment, policies related to human resources, protect user safety, and improve security. network security.

Second: Perfect and develop monetary market tools:

To develop our country's monetary market, it is necessary to consolidate and perfect existing market tools such as: Treasury bills, State Bank bills, bank promissory notes, and at the same time create additional instruments. New tools suitable to the level of development of the money market.

a) Treasury bills

Treasury bills are the main tool used in the currency market today because of their low risk, so they are very popular, and are also a tool to create sources to offset the State Budget deficit. However, this tool still has limitations and needs improvement measures:

- Organize bidding more frequently to help commercial banks, credit institutions, and businesses proactively plan and invest, and at the same time ensure the supply of a large enough amount of bills to the market, as a basis for Buying and selling development facility. resale transaction. However, the issuance scale must be placed in the correlation between the needs of the State Budget and the overall economic efficiency between borrowing on the domestic market and borrowing from abroad. This requires close coordination between the State Bank of Vietnam and the Ministry of Finance to decide the amount of Treasury bills issued.

- Treasury bills should be issued with many different terms such as 3 months, 6 months, 1 year to meet the needs of investors.

- Interest rates on treasury bills should be calculated according to fluctuations in capital supply and demand in the market. There needs to be coordination between the Ministry of Finance and the State Bank of Vietnam in providing a basis for determining interest rates on bills. To achieve this goal, it is necessary to reduce the use of guided interest rates in trading sessions of the Treasury bill bidding market as well as in open market operations.

- Limit the issuance of registered Treasury bills, expand the issuance of transferable bearer Treasury bills to increase the liquidity of this instrument.

b) State Bank bills

After Treasury bills, State Bank of Vietnam bills are low-risk instruments. However, the issuance of treasury bills from the State Bank of Vietnam should only be applied in high inflation conditions, or to support other tools, because it is often mandatory for commercial banks. . To be effective in operating monetary policy, the State Bank of Vietnam needs to:

- Issuing treasury bills recorded by the State Bank of Vietnam to facilitate the transfer.

- Improve and implement favorable repurchase methods through short-term refinancing and rediscount methods to encourage banks to buy T-bills instead of the mandatory form.

c) Short-term valuable papers issued by credit institutions

- Short-term valuable papers here include promissory notes, bank bills, certificates of deposit... are highly liquid instruments, freely transferable on the market, but in foreign countries. However, this transfer tool is not yet strong. Therefore, measures are needed to improve this tool in accordance with international standards to make transfer easier.

- It is necessary to standardize regulations on form, content, terms, and interest rates of these papers to facilitate issuance, transactions and payments in the market, allowing their owners to sell before maturity to increase liquidity for this instrument.

- Diversify types of deposit certificates such as fixed interest rate, floating interest rate, discount interest rate, foreign currency deposit certificates to create richness and diversity of tools for

Money market and increase the ability to attract capital for banks. At the same time, strengthen inspection and supervision of the issuance of short-term valuable papers to ensure safety for holders.

d) Love adventure

Negotiable instruments are a very popular tool in the world but are still hardly used in Vietnam. In order to promote commercial paper transfer activities in the money market, it is necessary to:

- Promote the implementation of the Law on Negotiable Instruments to soon apply negotiable instruments in the market, guide the issuance and circulation of negotiable instruments as well as regulate the legal effect of negotiable instruments, the levels Specific penalties and agencies handle disputes for violations of commercial instruments to ensure the safety of commercial instrument holders. These documents must be synchronized and consistent.

- Quickly conduct credit ratings for businesses so that banks have a basis to guarantee by letters of credit, creating conditions for issuers to participate in the commercial paper market.

e) Repurchase contract

Repurchase contracts are the most used and most effective tools in the world currency market. In our country, this tool has only just been put into use, so its scope of use is narrow. To develop this tool in the future, it is necessary to develop regulations on repurchase contracts:

- The term of the repurchase contract and the price of the repurchase contract are mutually agreed upon by both parties. In Vietnam, the maximum duration should only be 30 days.

- Regarding the rights of the transferee, the transferee has full ownership rights to the securities within the term stated in the contract. During the validity period of the contract, the transferor may not use, transfer or mortgage it to a third person.

- The interest rate of the purchase contract should be according to the agreement between the participating parties. In addition to the above tools, it is also necessary to research and take measures to add other tools and transactions to create diversity for trading tools such as types of options contracts, futures contracts, Bank mortgages... are very popular tools in the international currency market.

Third, enhance the role of the State Bank of Vietnam in regulating and guiding the market based on the application of technology of Industrial Revolution 4.0.

The State Bank of Vietnam is a special member of the monetary market, through the currency market to implement the goals of monetary policy in each period. As the organizer and operator of the currency market, the State Bank of Vietnam's ability to regulate and supervise market activities is an important factor determining the development of the market. currency. Therefore, under the conditions of Industrial Revolution 4.0, the State Bank of Vietnam needs a solution to enhance management effectiveness and lead the market on the basis of applying 4.0 technology, which are: (1) State Bank Vietnam must ensure to be the last interventionist in the currency market, (2) Strictly monitor trading and mining activities of Bitcoin and other digital currencies, (3) The State Bank of Vietnam Vietnam needs to establish proactive coordination and supervision institutions, (4) The State Bank of Vietnam needs to strengthen training of human resources to master 4.0 technology, (5) Continue to enhance the role of regulation and guidance market of the State Bank on the basis of applying the technology of Industrial Revolution 4.0

4. CONCLUSION

Based on the presented theory, the analyzed situation, based on the actual developments and the State's management orientation for the Vietnamese currency market until 2030. The article has proposed a system The solutions are quite consistent and feasible. Hopefully these opinions will contribute to improving the effectiveness and efficiency to strengthen state management of Vietnam's currency market until 2030.

RESEARCH ON MACRO FACTORS AFFECTING BANKRUPTCY RISK OF REAL ESTATE BUSINESSES LISTED ON THE VIETNAMESE STOCK EXCHANGE

PhD. Lam Thi Thanh Huyen[1], MA. Nguyen Thi Quynh Cham[2]

Abstract: This article studies the influence of macro factors on bankruptcy risk of real estate businesses listed on the Vietnamese stock exchange. By using the Logistic regression model with 53 real estate businesses listed on the Vietnam stock exchange in the period 2012 - 2022, it shows that high GDP growth of the economy reduces the risk of bankruptcy of real estate businesses. Meanwhile, the higher the interest rate, the greater the risk of bankruptcy that real estate businesses face.

Key words: Bankruptcy risk, Real- estate businesses, Logit Model, Z-score.

1. INTRODUCTION

The real estate market is one of the important markets of the national economy, playing an essential role in attracting resources, creating fixed assets for the economy, and promoting economic sectors. other economies to develop together (financial markets, construction, production of construction materials, furniture, labor...), meeting people's needs for accommodation, urban development, tourism... From half at the end of 2022, when the real estate market has many "negative" signals, real estate businesses face many difficulties, the market stagnates, and a series of businesses have had to narrow the scale of operations and cut staff problems, salary reduction, loss of liquidity, inability to pay bank debt... even bankruptcy. According to a report from the Ministry of Construction, in the first quarter of 2023, the number of real estate businesses dissolved or discontinued for a certain period of time was 341 businesses (up 30.2%) and 1,816 businesses (up 60.7%), compared to the same period last year.

Therefore, identifying and measuring factors that affect the bankruptcy risk of real estate businesses is an extremely necessary issue, a concern not only of the business itself but also of State management agencies, investors and analysts. In the world and in Vietnam, there have been many studies analyzing and evaluating the impact of factors on the bankruptcy risk of businesses. However, research mainly focuses on internal factors - the financial variables of the enterprise. This study was carried out on the basis of inheriting previous studies, focusing on analyzing macro factors affecting the bankruptcy risk of real estate enterprises listed on the Vietnamese stock market in the current period. The authors' research results can help managers identify and minimize bankruptcy risks, contributing to the stable development of the real estate market in particular and the Vietnamese economy in general.

2. THEORETICAL BASIS AND RESEARCH HYPOTHESES

Research on factors affecting businesses bankruptcy risk was developed very early with the first studies by *Beaver (1966) and Atman (1968).* These studies provide forecasting models using discriminant analysis or non-linear logistics regression methods with predictive factors from the financial indicators of enterprises. Based on that premise, many domestic and foreign authors have previously conducted empirical research or improved the model and forecast the possibility of

1 Email: lamthanhhuyen@hvtc.edu.vn, Academy of Finance.

2 Academy of Finance.

corporate bankruptcy within a group of companies, an industry or a country. In general, the studies all have the same variables: the group of financial indicators of enterprises and the group of macroeconomic factors.

Wadhwani (1986) analysed the factors that explain corporate failures focusing on the hypothesis of the significant role for inflation. The author regressed the liquidation rate of companies on two macroeconomic variables and found that real wages, real prices, capital gearing, the level of interest rate (nominal and real) are statistically significant in UK for the period 1964–1981. A conclusion of this research is that credit markets do not allow firms to adjust their debt levels for inflation, as the nominal interest rate is found to be significant.

Harada and Kageyama (2011) analysed in the same mood the case of Japan finding that the overall macroeconomic situation (measured by GDP), as well as interest rates, are determinants of firms' failures as well as some financial variables.

Tinoco & Wilson (2013) pointed out that interest rates, inflation and the ability to develop the economy are three macroeconomic factors that have a certain influence on business performance as well as contribute to determine the possibility of corporate bankruptcy risk.

Phan et al (2022) in their study also showed that interest rates have a positive impact on the bankruptcy risk of businesses, while the growth rate of the economy (GDP) has a negative impact.

Therefore, the following hypotheses are proposed:

H1: The growth rate of the economy (GDP) has a negative impact on the bankruptcy risk of real estate businesses.

H2: Interest rates has a positive impact on the bankruptcy risk of real estate businesses.

H3: Inflation has a positive impact on the bankruptcy risk of real estate businesses.

3. RESEARCH MODEL AND DATA

3.1. Research model

Based on an overview of the research situation in the world and in the country, the study focuses on studying macro factors affecting bankruptcy risk of businesses in the real estate sector including GDPG - GDP growth, IR - Interest rate, INF – Inflation. The bankruptcy risk of businesses is identified by one of the following signs: Net working capital (NWC) smaller 0, Return on total assets (ROA) negative and Book value of total assets are less than total debt. The dependent variable (RR) is a binary variable (equal 0 means business has no risk of bankruptcy; equal 1 means business has risk of bankruptcy). The symbol pit is the probability that a business is at risk of bankruptcy, with i is representing the real estate business and t being time (years) and is the noise variable, the research model will have the following form:

Table 1: Describe variables

Code	Explanation	Calculation	Expectation
Dependent variable			
RR	bankruptcy risk of businesses	RR = 1: Enterprise has risk of bankruptcy; RR = 0: Enterprise has no risk of bankruptcy	
Variables			
GDPG	GDP growth	Source from ADB and WB	-

IR	Interest rate	Source from ADB and WB	+
INF	Inflation	Source from ADB and WB	+
Control variables			
FL	Financial leverage	(Short-term debt + long-term debt)/Total assets	+
WCT	Operating performance (Working capital turnover)	Net revenue/ (Average short-term assets - Average short-term debt)	-
CFA	Net cash flow from operating activities on total assets	Net cash flow from business activities/Average total assets	-
CR	Current ratio	Current assets/ Long-term assets	-

Source: Summarized by the authors

3.2. Data

The research sample includes 53 real estate companies listed on the Vietnamese stock market in the period 2012 - 2022. Data was collected from audited financial statements or unaudited fourth quarter financial statements of real estate businesses listed on the stock exchange. Securities from websites specializing in providing financial information of listed companies such as Fiinpro, cafef, vietstock...

Fluctuating situation of macro factors during the research period

The figure 1 shows that from 2012 to 2019, Vietnam maintained a fairly stable economic growth rate. In 2020 and 2021, due to the impact of the Covid 19 pandemic, GDP growth decreased significantly, from 7.36% in 2019 to 2.87% and 2.56% and began to recover in 2022 with growth of 8.02%. Meanwhile, lending interest rates during the research period tend to gradually decrease, from 13.47% in 2012 to 6.96% in 2016 and increase again to 8.01% in 2022. Inflation during this period has many dynamics, INF decreased sharply in 2015.

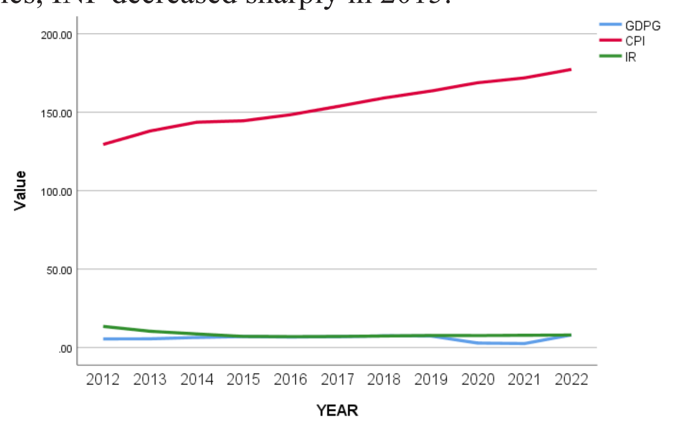

Figure 1: GDP growth, Interest Rate and CPI of Vietnam period 2012 – 2022

4. EMPIRICAL RESULTS AND DISCUSSIONS

We use the Logit model with panel data through fixed effects model (FEM), random effects model (REM). The study uses the *Levin Lin-Chu standard (LLC, 2002)* to test the stationarity of the variables in the model for panel data. The results show that the factors affecting bankruptcy risk are all stationary series with a significance level of 1% (P_value < 1%)

The research sample includes 583 observations; the average bankruptcy risk of real estate businesses is 16.639%. The average GDP growth during the research period is 6.0335%, of which the year with the highest GDP growth is 2022, the lowest in 2021 is 2.5615 due to the impact of the Covid 19 epidemic.

Correlation matrix shows that GDPG has a positive impact on bankruptcy risk, while IR and INF have a positive impact on bankruptcy risk of real estate businesses. The correlation coefficient between independent variables is quite small, showing that there are no signs of multicollinearity between variables in the model. The coefficient magnifies the variance of the independent variables in the model. The average VIF coefficient is 1.36, so the model does not have multicollinearity.

Estimate and test the model

First, we estimate the FEM model (model 1), REM model (model 2). Next, using the Hausman test to choose between the FEM or REM model. The estimation results show that the REM model is a more suitable FEM model.

Table 2: Logit REM and Logit FEM model estimation results

	(1)	**(2)**
	RR	**RR**
CR	-0.190	-0.456^{***}
	(0.144)	(0.170)
WCT	-0.0667^{**}	-0.0785^{**}
	(0.0310)	(0.0317)
CFA	1.341^{*}	0.757
	(0.699)	(0.655)

		(0.406)
Observations	374	583

Standard errors in parentheses

* $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$

From the results of model 2 in table 2, it can be seen that: GDPG, IR, CR, WCT affect RR with a significance level of 5%. The higher the GDP, CR, and WCT growth, the less the business faces bankruptcy risk, while the higher the interest rate, the greater the bankruptcy risk of real estate businesses listed on the stock exchange. Specifically:

➢ **GDP growth**

GDP growth has a negative impact on bankruptcy risk. This result is consistent with expectations and previous research by *Harada and Kageyama (2011).*

An increase in GDP is a sign that the economy is performing well and real estate businesses are confident to invest more. This is the foundation for future economic growth. On the contrary, when GDP growth is very low or the economy goes into recession, the opposite will happen: workers may be laid off, paid lower wages and real estate businesses have no intention of investing in further expansion.

➢ **Interest Rate**

Research results with real estate businesses show that interest rates are positively related to bankruptcy risk. This result is consistent with expectations and previous research by *Wadhwani (1986), Harada and Kageyama (2011), Tinoco & Wilson (2013) and Phan et al (2022).*

Most real estate businesses depend heavily on loans and sponsorship from banks. When interest rates increase, businesses face pressure on financial costs, which leads to reduced profits while real estate businesses invest for a long time. Besides, customers also have to borrow money to buy houses and invest. When interest rates increase, it will also affect investors' buying behavior. This causes businesses' profits to decline seriously, leading to a higher risk of bankruptcy.

➢ **Inflation**

Research results show that there is no clear relationship between inflation and bankruptcy risk of real estate businesses. In fact, Vietnam's inflation (CPI) during the research period tended to increase and did not fluctuate abnormally, so it did not really have much impact on the performance of businesses, especially real estate businesses.

IMPROVING FINANCIAL MANAGEMENT CAPACITY FOR PRIVATE ENTERPRISES IN VIETNAM

Dr. Nguyen Thi Hong Yen[1]

Abstract: *Enhancing financial management capacity for private enterprises in Vietnam is an urgent and important issue in the context of the increasingly competitive and volatile global economy. Financial management is the process of planning, coordinating and controlling the financial activities of an enterprise, aiming to ensure efficiency and sustainability in business operations. Financial management includes areas such as: working capital management, capital source management, cost management, tax management, risk management, accounting and financial reporting. This article analyzes the current situation and proposes some solutions to improve the financial management capacity for private enterprises in Vietnam.*

Keywords: *capacity, financial management, private enterprise, Vietnam.*

1. INTRODUCTION

1.1. Overview of private enterprises

Private enterprise or private company is a type of business entity regulated by the Enterprise Law 2020. According to Article 188 of this Law, private enterprise is understood as follows: Private enterprise is a business owned by an individual who is responsible for all activities of the business with his/her own assets. The sole owner of a private enterprise is an individual. Private enterprise does not have legal status (Enterprise Law, 2020). Private enterprise has the following characteristics:

- The initial capital source of a private enterprise mainly comes from the personal assets of the owner. The owner will register this capital source by himself/herself. During the operation, the owner can increase or decrease the investment capital according to his/her will without having to declare to the business registration authority except when reducing the capital below the initial registered level.

- The owner has full authority to decide on all business activities of the enterprise, including the use of profits after paying taxes and fulfilling other financial obligations according to the law.

- The owner is the legal representative of the enterprise. However, he/she can also hire someone else as the director to manage and operate the business. However, in this case, the owner still has to be responsible for all activities of the enterprise. The limit of this responsibility between the owner and the hired person will be based on the contract signed (Tran Ngoc Diep, 2021).

The government has issued Resolution 45/NQ-CP (Resolution 45) dated March 31, 2023, promulgating the Government's Action Program to continue implementing Resolution No. 10-NQ/TW dated June 3, 2017 of the 5th Plenum of the XII Party Central Committee on developing the private economy (Resolution 10). Accordingly, the Government sets the target of having 1.5 million enterprises by 2025 and at least two million enterprises by 2030. In which, the private economic sector contributes 55% of GDP by 2025 and 60-65% of GDP by 2030. Labor productivity increases by about 5% per year; annually, about 35-40% of private enterprises have innovative and creative activities... (Government, 2023).

---

1.2. Some issues on financial management in private enterprises

Financial management of enterprises includes the overall activities of managers in the process of researching, forecasting, analyzing, making financial decisions and organizing the implementation of those decisions to achieve the defined objectives. Financial management is one of the basic and most important management functions, playing a decisive role in the effectiveness and development of an enterprise. Financial management of enterprises is a fairly broad field, containing rich and specialized content of an important scientific discipline. These are issues related to the management of enterprise assets, mobilization and attraction of capital sources, allocation and investment decisions, financial reports and use of financial information in decision making (Pham Quang Trung & Le Thi Bich Ngoc, 2020).

Financial management is a component of business management, holding the most important position in enterprise management and having a close relationship with other business management activities. Mostly, other management decisions are based on the assessments drawn from financial management activities. Good financial management helps enterprises mobilize and use savings, effectively financial resources for business. Good financial management helps enterprises develop safely, sustainably, and proactively cope with financial shocks effectively. Through solving the financial relations of enterprises with the business environment, helping enterprises identify the demand for input factors, identify the supply capacity of output products; creating conditions for enterprises to actively mobilize sufficient and timely capital sources for business and flexibly use capital mobilization tools; accurately determining the value of enterprises, promoting enterprises to constantly improve business methods to achieve higher efficiency. Thus, the basic function of managing financial activities of enterprises is to mobilize and use effectively all financial resources suitable for the requirements of production and business activities of enterprises in each period. Through financial management, enterprises create regular balance between capital demand and financial capacity of enterprises; understand the characteristics of each capital source to choose competitive decisions to attract capital; exploit and use capital sources with the highest economic efficiency (Dao Thi Ho Huong, 2022).

In the context of the increasingly developing and competitive global economy, improving financial management capacity is a key factor for private enterprises in Vietnam to survive and develop sustainably. Improving financial management capacity has a great significance for private enterprises in Vietnam, for the following reasons:

- Improving financial management capacity helps private enterprises to identify the appropriate capital sources for their business activities, thereby reducing capital costs and financial risks, increasing solvency and profitability.

- Improving financial management capacity helps private enterprises to make effective financial plans, forecast cash inflows and outflows, balance budget and cash flow, thereby controlling the financial situation of the enterprise, making reasonable business decisions.

- Improving financial management capacity helps private enterprises to analyze the effectiveness of their business activities, evaluate financial indicators such as revenue, profit, return on investment, payback period, thereby grasping the strengths and weaknesses, opportunities and challenges of the enterprise, improving the quality of management and labor productivity.

- Improving financial management capacity helps private enterprises to comply with legal regulations on finance, tax, accounting, financial reporting, thereby avoiding legal risks, penalties and loss of reputation.

- Improving financial management capacity helps private enterprises to mobilize capital from banks, financial institutions, shareholders and other stakeholders, thereby expanding the scale of business activities, increasing competitiveness and market share.

Thus, improving financial management capacity is one of the important factors for private enterprises in Vietnam to develop sustainably in the increasingly harsh global economic environment. To do this, private enterprises need to invest in training and improving the level of financial management staff, applying modern financial management tools and methods, capturing market trends and changes, as well as cooperating with reputable financial organizations to get support and advice.

2. THE CURRENT SITUATION OF FINANCIAL MANAGEMENT FOR PRIVATE ENTERPRISES IN VIETNAM

According to the PCI 2022 survey results, the scale, growth rate and business efficiency of private enterprises are all low since the COVID-19 pandemic. In the PCI 2022 survey, an average enterprise has a capital size of about 15.6 billion VND and 21 employees; while in 2019, the capital and labor size of an average enterprise were 22.3 billion VND and 23 employees. In 2022, only 5.1% of enterprises increased their investment capital and 4.9% of enterprises increased their labor size, significantly lower than the corresponding levels of 2019 (with rates of 8.3% and 11.5%, respectively). Regarding business efficiency, in 2022 only 42.6% of private enterprises reported profits, significantly lower than the figure of 63% in 2019; the rate of loss-making enterprises in 2022 was 35.3% while in 2019 it was only 23.4%. Both figures of the profit or loss rate of the last three years are indicators showing that domestic private enterprises have gone through a difficult period in business operations (VCCI & USAID, 2023).

Thus, in recent years, Vietnamese private enterprises have faced many difficulties in production and business activities. In the new context, enterprises have to face many challenges in financial management. Some main challenges can be mentioned as follows:

- The difficult, volatile and highly competitive economic environment, affecting the business efficiency and solvency of enterprises.

- Lack of stable long-term capital sources, depending heavily on short-term capital sources with high interest rates and high risks.

- Lack of skills and experience in financial management, lack of transparency and control in financial reporting and accounting activities.

- Lack of support from state agencies, financial institutions and social organizations in providing information, advice and financial assistance for enterprises.

Although private businesses still face many difficulties and challenges, the new context also brings many opportunities for business financial management. The government has launched support programs to assist private firms in building sustainable business strategies and plans. These programs provide assistance in personnel training, technology access, digital transformation, capital resources access, communications, and trade promotion. With the rise of digital technologies, there are opportunities for private enterprises to leverage these technologies to improve their financial management processes… These opportunities can help private enterprises in Vietnam enhance their financial management capabilities and achieve sustainable development. Therefore, private enterprises need to grasp opportunities and proactively solve remaining problems to improve the efficiency of corporate financial management.

3. SOLUTIONS TO IMPROVE FINANCIAL MANAGEMENT CAPACITY FOR PRIVATE ENTERPRISES IN VIETNAM

In the context of the increasingly developing and competitive global economy, improving financial management capacity for private enterprises in Vietnam is an important factor to maintain and develop business activities. Some solutions to improve financial management capacity for private enterprises in Vietnam can be proposed as follows:

- Building a professional, transparent and international-standard accounting and auditing system. This helps enterprises to have an accurate, complete and timely financial database to support financial management decisions.

- Applying modern financial analysis tools and methods, such as: ratio analysis, cash flow analysis, present value analysis, discounted cash flow analysis, payback period analysis, risk and efficiency analysis. This helps enterprises to evaluate the effectiveness of their business activities, solvency, profitability and risk level of investment projects.

- Improving knowledge and skills on working capital management, including: inventory management, receivables and payables management, cash and cash equivalents management. This helps enterprises to maintain a balance between ensuring sufficient resources for business operations and minimizing capital costs.

- Searching and using effective capital mobilization sources, including: owner's equity, short-term and long-term loans, capital attraction from domestic and foreign investors. This helps enterprises to have a reasonable financial structure, reduce capital costs and increase dividend payment ability for shareholders.

- Establishing a scientific and effective cost management system, including: cost management by product, cost management by activity, cost management by responsibility, cost management by quality. This helps enterprises to save unnecessary costs, increase labor productivity and improve product and service quality.

- Establishing a comprehensive risk management system, including: identifying potential risks, assessing the impact and probability of risks, selecting and applying risk mitigation and transfer measures. This helps enterprises to minimize the negative impacts of risks on business and financial activities.

- Complying with legal regulations on tax and financial reporting, including: paying taxes fully and on time, preparing and submitting financial reports according to the standards and deadlines, conducting tax audits and inspections. This helps enterprises to avoid penalties, fines and disputes on tax and financial reporting.

4. CONCLUSION

Financial management is an important factor to ensure the survival and development of private enterprises in Vietnam. Improving financial management capacity for private enterprises is a necessary and meaningful task in the current economic situation. Enterprises need to have a high awareness of the role and importance of financial management, as well as strive to improve the current situation of financial management to enhance their competitiveness and create value for enterprises and society. To do this, enterprises need to have the attention, investment and continuous improvement on the aspects related to financial management. At the same time, enterprises also need to have the support from state agencies, financial institutions and experts in this field.

FASPS 17-COMPLETING THE INSTITUTION TO PROMOTE INNOVATION IN THE CURRENT VIETNAMESE ECONOMY

Dr. Vu Thi Thu Huong[1]

Abstract: *Innovation is an indispensable requirement for the sustainable development of the economy. To realize innovation, it is necessary to create favourable conditions for it. One of the input factors that facilitate innovation is institutions. Institutions that encourage innovation need to create favourable conditions for subjects, especially businesses, to produce, apply, and spread new knowledge, new processes, new technologies, and create new products. By analyzing data from the Global Innovation Report, the paper discovered that Vietnam has made remarkable progress in both scores and rankings of institutions that encourage innovation from 2015 to 2022, has followed the rules of the market economy and still need to be improved. The paper has pointed out limitations and recommended some solutions to improve institutions to encourage innovation in Vietnam in the coming time.*

Keywords: *economic institutions, innovation, institutions that encourage innovation*

1. INTRODUCTION

Institutions are factors that have a great influence on innovation. Institutions can encourage innovation, but can also inhibit and even stifle innovation. Institutions that encourage innovation need to create friendly and favourable conditions for new factors to arise.

The subject of innovation in the market economy is the system of businesses. The driving force that drives businesses to innovate is the impact of competition. In a market economy, competition is increasingly fierce and to survive in competition, businesses must innovate technical and technological methods, improve quality and lower product prices. Therefore, competition is an environment that forces businesses to innovate. However, innovation activities require investment resources and are relatively high risk, so if there are simply competitive market relations, it will be difficult for businesses to innovate. To promote innovation, state intervention is needed to support, create favourable conditions, and minimize risks for businesses that wish and dare to innovate. Therefore, institutions that encourage innovation must, on the one hand, create competitive relations to push businesses to innovate, and on the other hand, need to create a friendly innovation environment in which businesses can easily access resources (capital, technology, human resources, market access...) to carry out innovation according to market principles.

In recent times, Vietnam has emerged as one of the countries with the fastest innovation rate. Vietnam is also the country that performs best in innovation among the group of low-middle income countries. Contributing to that success, in no small part, is perfecting the institution. Therefore, it is necessary to research the contribution of institutional reform to innovation in Vietnam in recent times, pointing out successes and limitations and solutions to improve institutions that is more favourable conditions for innovation in Vietnam in the coming time.

2. LITERATURE

According to Veblen (1994), institutions are the normativity of behaviour or the rules that determine behaviour in specific situations, which are essentially accepted by members of a social

[1] Email: vuthuhuong.hvtc@gmail.com, Academy of Finance.

group and the compliance with the rules that is due to self-control or control by outside power. North (1990) considers institutions as the rules of the game in a society; Or to put it more formally, institutions are human-made constraints to shape relationships between people. Although there are certain differences, in general, institutional concepts include the three most basic aspects: "rules of the game" (formal and informal), "play" (mechanisms, enforcement competition), and "players" (people, organizations associated with the behaviour).

Acemoglu and Robison (2013) classified economic institutions into inclusive economic institutions and extractive economic institutions. Inclusive economic institutions are institutions that allow and encourage the mass participation of people in economic activities, thereby enhancing the talents, abilities and values of each person with best use. This institution is characterized by the guarantee of private property rights, a fair legal system and the equitable provision of public services so that people can participate and exchange with each other. Extractive economic institutions are institutions that do not have the above characteristics but are designed to deprive or exploit the income or wealth of one group to serve another group, or the majority to serve a small number of authorities and related people

Institutions have a close relationship with economic growth and innovation. Research by Barro (1991) shows that political instability has a negative impact on economic growth. The study by Alesina, Özler, Roubini, and Swagel (1996) also showed similar results. Kaufmann, Kraay, and Zoido (1999) studied the impact of public administration (governance) on per capita income. The results show that national governance has a strong and positive impact on per capita income, with better governance leading to higher per capita income. Besides, using indicators showing institutional quality, studies by Collins and Bosworth (2003); Easterly and Levine (1997); Glaeser, La Porta, Silanes, and Shleifer (2004); Tan (2010) also shows the positive impact of institutions on economic growth. Barro's (1996) research results in 100 countries during the period 1960 to 1990 show that the rule of law factor also positively affects economic growth. This result is also supported by studies by Dollar and Kraay (2003); Mehlum, Moene, and Torvik (2006); Rodrik and colleagues (2004) demonstrate that in countries where compliance with the rule of law or rule of law is higher, economic growth is better.

INSEAD has identified institutions as input factors for innovation since 2011 (GII, 2011). According to INSEAD, whether an institution encourages innovation or not will depend on whether that institution encourages private sector development and facilitates business startups. Based on that, INSEAD defines institutions for innovation as consisting of three elements: institutions for the political environment, institutions for the Regulatory environment and institutions for the business environment. These institutions need to create favourable conditions for the development of the private sector and encourage entrepreneurship and business. Specific indicators include:

POLITICAL ENVIROMENT

1.Political and operational stability: the likelihood and severity of political, legal, operational or security risks affecting business operations

2.Government efficiency: the government's effectiveness in providing public services that facilitate the operation of the private sector

REGULATORY ENVIROMENT

1. Regulatory quality: legal regulations need to be reasonable, creating favourable conditions for businesses to do business freely according to market mechanisms.

2. Rule of law: The legal system needs to be fully and seriously respected and enforced, especially the legal provisions on property rights, intellectual property rights, freedom of business, and enforcement. economic contracts, resolving economic disputes...

3.Cost of redundancy dismissal: legal provisions create favourable conditions that allow businesses to dismiss redundant workers at low cost.

BUSINES ENVIROMENT

1. Policies for doing business: the government needs to ensure a stable policy environment for business activities

2. Entrepreneurship policies and culture: policies need to create favourable conditions for startups and build a startup culture

There have been many research projects on innovation in Vietnam, but there has not been any projects that analysed the relationship between institutional reform and innovation in Vietnam in recent years. This is the space for the author to research and write this paper to clarifying the relationship between institutional reform and innovation in Vietnam from 2015 to 2022.

3. RESEARCH METHODOLOGY

The author uses WIPO's innovation data from 2015 to 2022 and uses methods of analysing, synthesizing, and comparing that data to clarify the relationship between institutional improvement and innovation in Vietnam.

4. RESEARCH RESULTS

During the period 2015-2022, the Communist Party of Vietnam and the State have made efforts to perfect institutions to encourage innovation in the following aspects:

- Perfecting socialist-oriented market economy institutions: perfecting a consistent economic and business legal system in the direction of creating a favourable legal framework for businesses to freely do business in areas that the government not prohibited under the conditions of a market economy. Fully and synchronously forming market elements, developing all types of markets to create a healthy competitive environment, using healthy competitive markets to effectively allocate resources and promote innovation.

- Innovating the management mechanism of state science and technology research units, using market principles to allocate and use state investments in science and technology such as: Transferring units scientific and technological research institute to operate on the principle of autonomy and self-accounting; Implementing and assigning regular operating funds to state research facilities; Narrowing in scope and increasing state investment in science and technology; Bidding for key national science and technology research projects; Combining state investment capital with business investment in projects implementing new technology application, high technology, technology transfer... These innovations aim to improve the quality of research, scientific and technological consulting to suit business needs.

- Building and perfecting a socialist rule of law state with the spirit of upholding the law, the people and civil servants must obey the law and civil servants are the subject to people's supervision. That will fight against abuses and harassment of state civil servants towards businesses

- Gradually building modern national governance: 2022 is determined by the Government as the year of national digital transformation and continued building of e-government. The government streamlines staffing and applies information technology to build a lean, transparent, clean and effective state apparatus. The State carries out administrative reforms to improve the business environment: cutting unnecessary and unreasonable administrative procedures, eliminating sub-licenses and burdensome administrative procedures that increase costs and fees for businesses

- Promoting the campaign against corruption: The campaign against corruption, against manifestations of political and ideological degradation, and the "burning the furnace" campaign have been carried out from the central to local levels. Strictly handling government officials associated with "backyard businesses" that is appointed to do state's contraction at high price. Strictly handling civil servants who harass businesses and demand unofficial expenses.

- Building a startup and innovation ecosystem through the formation of operating mechanisms for science and technology enterprises, technology transfer centres, startup and innovation centres, and various types of funds venture capital, startup funds, innovation funds. Forming high-tech zones and industrial parks with favourable infrastructure conditions, preferential policies, and simple and compact administrative procedures to attract businesses to invest in research, testing, training and transfer of science and technology.

Thanks to implementing those correct guidelines and policies, Vietnam has achieved outstanding results. According to WIPO's Innovation Report from 2015 to 2022, the institutional pillar and its sub-pillars have the following scores:

Table 1: Scores of Institutions pillar and sub-pillars in Vietnam, period 2015-2022

Pillar/sub-pillars	2015	2016	2017	2018	2019	2020	2021	2022
Institutions	51.8	51.7	52.8	56.2	58.6	58.5	58.8	60.6
Political environment	51.5	50	54.1	53.1	58.6	60.8	60.5	65.2
Regulatory environment	49.8	51	48.9	56.8	57.3	53.2	54.3	54.6
Business environment	54.2	54.2	55.4	58.6	59.9	61.6	61.6	62

Source: *WIPO-Global Innovation Index Report, from 2015 to 2022*

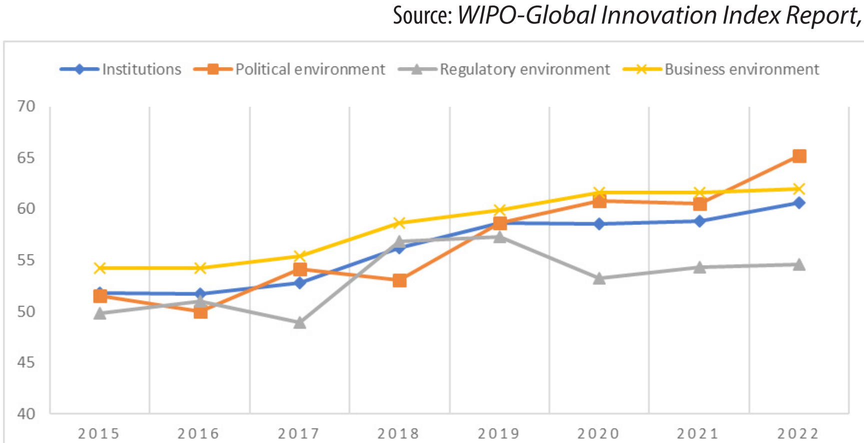

Figure 1: Scores of Institutions pillar and sub-pillars in Vietnam, period 2015-2022

In overall, the score of the Institutional pillar increased steadily over the years, from 51.8 to 60.6 scores, including 2 periods of increase. Strongly in 2017-2019, increased by 5.8 scores, from 52.6 to 58.6 and in 2021-2022, increased from 58.8 scores to 60.6 scores.

The sub-pillars of the Institutions pillar all increased in scores, in which the Political Environment sub- pillar increased the most, 13.7 scores, from 51.5 scores in 2015 to 65.2 scores in 2022 and is also the sub-pillar with the highest score. The Regulatory Environment sub-pillar also increased strongly, up 13.8 scores, from 49.8 scores in 2015 to 54.6 scores in 2022. The Business Environment sub-pillar increased from 54.2 scores in 2015 to 62 scores in 2022. All sub-pillar have increased scores, proving that Vietnam's institutions for innovation from 2015 to 2022 have been comprehensively improved, from the political environment, to regulatory environment and business environment

Table 2: Ranking of Institutions pillars and sub- pillars of Vietnam in the period 2015-2022

Pillar/sub-pillars	2015	2016	2017	2018	2019	2020	2021	2022
Institutions	101	93	87	78	81	83	83	51
Political environment	67	65	59	62	57	55	58	50
Regulatory environment	113	106	103	89	90	98	98	96
Business environment	121	116	113	103	106	101	101	30

Source: *WIPO-Global Innovation Index Report, from 2015 to 2022*

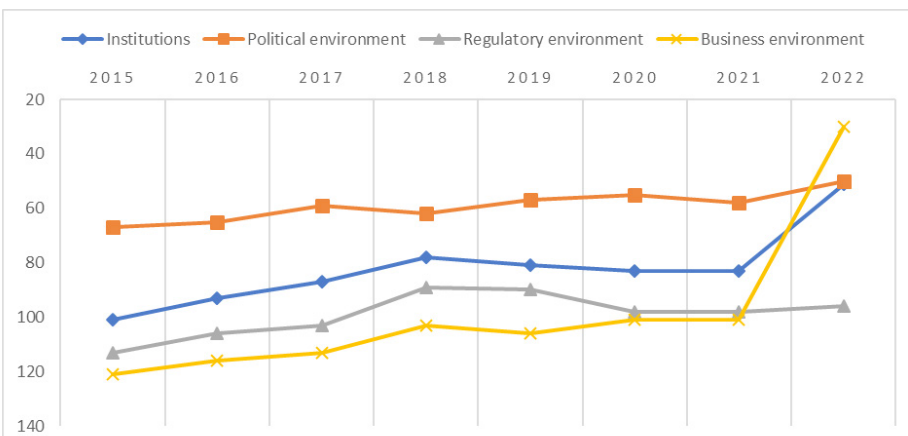

Figure 2: Ranking of Institutions pillars and sub- pillars of Vietnam in the period 2015-2022

Regarding rankings, the Institutional pillar has a jump in rankings, increasing 50 places on the rankings, from the 101st in 2015 to the 51st in 2022. The highest ranking jump occurred in 2021-2022 with an increase of 32 places. Contributing to the jump in the ranking of the Institutions pillar is the jump in the ranking of the Business Environment sub-pillar. The ranking of the sub-pillar Business Environment increased impressively, 89 places, from the 121st in 2015 to the 30th in 2022. The strongest increase in ranking position of the sub-pillar Business Environment also take place in 2021-2022 with an increase of 71 places, from the 101st to the 30th.

When regarding to the Political Environment sub-pillar, the Political Stability and Governance indicator achieved its highest score in 2019-2020 and also achieved its highest ranking during that period. By 2022, the score value and ranking will both decrease, to only 76.4 points and ranked the 37th/132 countries. Although there is a decrease in ranking compared to 2021, down 4 places, the score is quite high, higher than the overall Innovation index, showing that the international community highly appreciates stability of the political environment and consistency in economic development management policies of the Vietnamese government. This builds trust and prestige of Vietnam with the domestic and international business community. Analysing the Government Effectiveness indicator, in the period 2015-2017, this indicator achieved the highest score and ranking in 2022 with 54 points, ranked the 57th/132 countries. This was also the year that the Vietnamese government drastically reformed administrative procedures, cut payroll, and promoted decentralization in the direction of delegating more power to local governments; Promote digital transformation, build e-government, promote the application of information technology in management activities of governments at all levels...

Table 3: Scores and rankings of indicators of the Political Environment sub-pillar in Vietnam in the period 2015-2022

Indicators	2015	2016	2017	2018	2019	2020	2021	2022
Score of Political and operational stability	69.7	62.8	64.1	68.5	82.5	82.1	78.6	76.4
Ranking of Political and operational stability	53	66	59	57	32	29	34	37
Score of Government efficiency	33.3	37.3	44.1	45.4	46.6	50.1	51.5	54
Ranking of Government efficiency	86	72	68	71	71	72	71	57

Source: WIPO, Global Innovation Index, 2015-2022

Analysing the Regulatory Environment sub-pillar, the Regulatory Quality Indicator gradually increased in score and ranking over the years, from 30.4 points and ranked the 113rd/141 in 2015 to 41.2 points and ranked the 83rd/132, up 10.8 points and 40 places. This shows that the quality of Vietnam's business laws has been steadily and consistently improving in the direction of creating more and more favourable conditions for businesses to freely do business. The Rule of Law indicator achieved its highest score in 2019 with 48.2 points and highest ranking in 2018 with the 57th/126. By 2022, this index drops to 42.6 points and is at the 70th/132. The Cost of Redundancy dismissal indicator has a constant value, 24.6 points from 2015 to 2022 and ranks at a very low position, the 97th/126. This shows that Vietnamese businesses have to pay relatively high fees to dismiss redundancy.

Table 4: Scores and rankings of the indicators of the Regulatory Environment sub- pillar in Vietnam in the period 2015-2022

Indicators	**2015**	**2016**	**2017**	**2018**	**2019**	**2020**	**2021**	**2022**
Score of Regulatory quality	30.4	30.1	29.4	32.5	31.3	31.6	36.6	41.2
Ranking of Regulatory quality	113	103	100	99	97	99	93	83
Score of Rule of law	34.7	39.4	31.6	45.2	48.2	46.6	46.3	42.6
Ranking of Rule of law	89	76	74	57	59	64	64	70
Score of Cost of redundancy dismissal	24.6	24.6	24.6	24.6	24.6	24.6	24.6	24.6
Ranking of Cost of redundancy dismissal	109	101	101	97	101	103	104	105

Source: WIPO, Global Innovation Index, 2015-2022

For the indicator of the Business Environment sub-pillar, Policies in doing Business achieved the highest score in 2020-2021 with 85.1 points and the highest rank was the 31st/132 in 2022. Especially, in 2022 the score of Policies in doing Business indicator drops, from 85.1 points in 2021 to 63.3 points in 2022, but the ranking skyrockets, from the 88th/132 to the 30th/132 at the same time. The reason for this is because WIPO changed the indicator, from Ease of starting business indicator in 2021 to Policies in doing business indicator in 2022, so the score value of each country has changed.

The Entrepreneurship policies and culture indicator has a strong increase in scores and rankings in 2021-2022, from 38 points and ranked the106th/132 in 2021 to 60.7 points and ranked the 21st/132 (increased 22.7 points and 85 places). This shows that Vietnam's policies have targeted the main subject of innovation, which is the business system. State's policies have created conditions for businesses to access new technological advances, with credit sources, venture capital funds, innovation funds... has created favourable conditions for businesses that invest in innovation (innovating technology, processes, organizational structure, training human resources, developing new products, penetrating new markets...)

Table 6: Scores and ranks of indicators of the Business Environment sub-pillar in Vietnam in the period 2015-2022

Indicators	2015	2016	2017	2018	2019	2020	2021	2022
Score of Policies for doing business	77.7	81.3	81.8	82	84.8	85.1	85.1	63.3
Ranking of Policies for doing business	102	88	92	95	80	88	88	31
Score of Entrepreneurship policies and culture **	41.3	35.8	35.1	35.2	34.9	38	38	60.7
Ranking of Entrepreneurship policies and culture **	92	103	105	107	110	106	106	21

** In 2021, Ease of starting a business*

*** in 2021, Ease of resolving insolvency*

5. ASSESSMENT

The process of perfecting institutions to encourage innovation in Vietnam in the period 2015-2022 has achieved the following successes:

First, Vietnam's innovation promotion institutions have had clear and synchronous improvements in all aspects: political environment, Regulatory environment and business environment. All aspects of the Institutions pillar have increased scores and rankings, especially the leap in improving institutions to encourage innovation in Vietnam in the context of other countries in the world that stagnated back or somewhat decreased. This demonstrates the determination of the Vietnamese Government to innovate and improve institutions, considering it as the main factor promoting Vietnam's economic growth and development in the coming time.

Second, Institutions are the largest contributing factor to the index of innovation in Vietnam from 2015 to 2022. The innovation index is determined by calculating the average of sub-index, Input and Output. The Institutions pillar currently has the largest score value among the Input and Output pillar of innovation, so Institutions are the pillar with the greatest contribution to the Innovation Index of Vietnam in the period 2015-2022

Third, The improvement of institutions for innovation in Vietnam in the period 2015-2022 is consistent with the objective development rules of the market economy: The improvement of economic institutions to encourage innovation has associated with perfecting market economic institutions towards using competitive market relations as a driving force for innovation. The state mechanism to support businesses in implementing innovation has also changed, minimizing implementation based on the granting and asking-giving mechanism, and shifting to support based on market principles through technology transfer support centres, innovation centres, startup centres, startup investment funds, venture capital funds … state-invested scientific and technological research units have autonomy to operate according to the principles of the market.

State's policies have targeted businesses in the direction of cutting costs for businesses through reform of administrative procedures, anti-corruption, investment in infrastructure construction... at the same time, creating favourable conditions for businesses to access capital for innovation through credit policies, interest rate support for high-tech application loan projects, venture capital funds, startup funds, innovation funds. The establishment and operation of the NIC National Innovation Centre is a testament to that

Fourth, Institutional improvement for innovation in Vietnam in the period 2015-2022 is consistent with the trend of political innovation and modern national governance: The current trend of political innovation is increasingly more democratic, more transparent and fairer. Therefore, citizen have an increasing need to participate in economic management and social management, and they also require the state to be public and transparent in its activities, ensuring fairness in terms of income between different classes in society. The state management apparatus has been reorganized in a more compact and effective direction, the qualifications of civil servants have been improved, and information technology has been increasingly applied to state and government management activities. Switching to operating in a digital environment, e-government, applying information technology to communicate and handle administrative procedures for people...

Besides the successes, perfecting institutions to encourage innovation in Vietnam today has the following limitations:

First, some indicators also have low scores and rankings. The Regulatory Environment sub-pillar has improved and increased in score but is still at a relatively low position in the ranking. In 2022, the Regulatory Environment sub-pillar stands at the $96^{th}/132$, the Regulatory Quality indicator the $83^{rd}/132$; Rule of Law indicator the $70^{th}/132$; Cost of dismissing redundant the $105^{th}/132$. Therefore, improving and enhancing the quality of regulations along with enhancing the enforcement effectiveness of state regulations is one of the important tasks of perfecting institutions to promote innovation

Second, the institution that promotes innovation still has the imprint of the ask-give mechanism. Institutions for businesses to access resources have not had a breakthrough development and have not decisively shifted to market principles. The sub-licenses is also common in most fields, industries and levels of state economic management. Adding to many other invisible barriers and hidden costs when Vietnamese businesses want to access resources, business do not want to make fundamental, long-term investments, reduce its innovation motivation.

Third, institutions to protect property rights and intellectual property rights lack synchronization between regulations and implementation. Transactions and transfers of people's property rights are being carried out in a complex and overlapping institutional environment. Institutions to promote the connection between research agencies and businesses have only stopped at the calling level, not doing in practise.

Fourth, the institutions that ensure transparency and promote coordination for the overall national development in governance are still weak. Because the institutions are not clear about responsibilities and is not transparent from the planning stage to the implementation, the situation of pushing responsibility and blaming between state management agencies and between levels of state management that are quite popular, especially in solving comprehensive and complex problems; lack of coordination or coordination but not often. Rigid, fragmented, uncreative thinking combined with organizational and implementation methods that are rarely considered, adjusted, or innovated are becoming barriers to the process of freeing up the economy's resources.

6. RECOMMENDATIONS

To continue implementing innovation, achieving sustainable growth and development, and perfecting institutions, the following solutions need to be implemented:

- Further improve the quality of business law: review business legal systems, eliminate unreasonable, contradictory, overlapping, unfeasible regulations, and regulations that increase implementation costs for businesses; Supplementing legal documents on missing fields, especially the fields of e-transactions, artificial intelligence, and testing mechanisms (sandbox); Develop guiding documents to implement and enforce legal regulations.

- Continue to perfect and fully develop all types of markets, especially the land market, capital market and science and technology market in a direction that allows many entities to participate in activities to create a competitive environment. competition, aimed at effective resource allocation; On the other hand, increase the supply of capital flows and technology in markets to increase the opportunity for businesses to access resources to innovate according to market principles. Specifically:

+ For the land market: recognizing land use rights as a commodity and freely traded on real estate exchanges

+ For the capital market: develop new forms of capital mobilization and lending based on digital technology application platforms such as fintech, peer-to-peer lending, venture capital funds, startup funds, investment funds for private sector.

+ For the science and technology market: encourage the establishment of science and technology enterprises, technology transfer centres, start-up and innovation centres to provide a better consulting and transfer services; State scientific research units are allowed to operate autonomously and self-account according to market principles to improve the quality of scientific and technological research.

- Improve national governance capacity through promoting digital transformation and administrative procedure reform: promoting the application of information technology in state management; Develop and implement a mechanism to share, publicize and transparent information on activities and projects of state management agencies; promote anti-corruption more effectively from central to local levels; Complete the national master plan on the basis of implementing decentralization, decentralization and linkage mechanisms between agencies, localities, ministries and branches to realize development goals.

- Improve the participation and supervision mechanism of the people, non-governmental organizations, and auditors in state activities in a more effective way: innovate the form of citizen reception in an open and friendly way; Resolve complaints, denunciations, and anonymous letters in a more timely and satisfactory manner; Implement a regime to protect those who denounce corruption and negative phenomena...

7. CONCLUSION

Using data published in the global innovation report from 2015 to 2022, the paper has pointed out the successes and limitations of the improvement of institutions to encourage innovation in Vietnam, from that proposes a number of solutions to promote innovation in Vietnam in the coming time.

FACTORS AFFECTING THE BUSINESS PERFORMANCES: THE EVIDENCE OF TOURISM COMPANIES LISTED IN VIETNAMESE STOCK EXCHANGES

PhD Candidate. Tran Minh Giang, MSc. Le Hai Anh[1]

Abstract: *This paper examines the factors affecting the business performances of tourism firms listed in Vietnamese stock exchanges by using a cross-sectional panel data during 8-year period from 2015 to 2022. The authors adopt different models including OLS, REM, FEM, FGLS to test the effects of 10 factors on the tourism firms' business performances which are measured by three financial indicators ROA, ROE and ROS. The factors examined in the models include tourism firm size (SIZE), average sale growth rate (SAGR), fixed assets ratio (FIXED), leverage ratio (LEV), assets turnover (TAT), account receivable days (DAR), payable outstanding days (DAP), tourism firm ages (AGE), ratio of costs of goods sold to sales (CFS) and Covid 19 (COVID). The empirical results show that all referred factors have impacts on the business performances of tourism firms at the different levels. Specifically, factors including SIZE, SARG, TAT affect positively to business performances, while the opposite is true for other factors including LEV, CFS, DAR, DAP, AGE and COVID. According to the empirical results, we propose some solutions as well as recommendations for tourism firms to enhance their business performances in the context of recovering after Covid 19 pandemic.*

Keywords: *Factors, Business Performances, Tourism Companies,…..*

1. INTRODUCTION

Vietnam's tourist business has exhibited parallel growth with the country's recent initiatives during the past three decades, resulting in significant advancements and notable accomplishments. In conjunction with the country's advancements in innovation, the tourist sector has experienced significant expansion in terms of both scale and quality, thereby solidifying its significant contribution to the national economy. The travel and tourism industry consistently leads in innovation and demonstrates an improved ability to cater to diverse needs. Currently, Vietnam is actively engaged in the global integration process.

The business environment is experiencing significant volatility and unpredictability, particularly due to the widespread COVID-19 epidemic. In order to navigate these challenges, both general travelers and tourism companies listed on the stock market must strive to enhance their profitability. The pursuit of profitability serves as the primary objective and foundation for the sustainability and expansion of a business. Due to COVID 19, travel demand has sharply declined, causing many tourism-related businesses, such as hotels and restaurants, to close or reduce operations, while airlines face flight cancellations and a drastic decrease in revenue, leading to a significant rise in unemployment rates and a substantial decline in business performance. The COVID-19 has also disrupted the stable hierarchical network structure and the entire supply-demand system of the tourism supply chain (TSC), inflicting heavy losses on the tourism industry. Drawing upon the theory and practical application of travel services business management, as well as the critical requirements met within the context of travel tourism companies operating in a market economy and international economic integration, the author asserts that the chosen topic, "Factors affecting business performance of listed tourism companies in Vietnam" holds

[1] Email: lehaianh@hvtc.edu.vn, Academy of Finance.

both logical significance and pressing urgency. This research aims to assist tourism companies in enhancing their analytical capabilities and augmenting business performances

This study emphasizes examining the determinants of business performances for tourism companies listed in the Vietnamese stock market. The objective of this study is to use data from a representative sample of Vietnamese firms in the tourism sector listed on three largest stock exchanges in Vietnam including Ho Chi Minh Stock Exchange (HOSE), Hanoi Stock Exchange (HNX), and Unlisted Public Company Market (UPCOM) to investigate factors that influence profitability.

2. LITERATURE REVIEW

According to Theo Hult et al (2008), Onaolapo & Kajola (2010), Alimadar et al (2018), and Nghiem Thi Tha et al (2018), the most commonly used indicators for evaluating the financial performance of companies in empirical studies are: (1) Return on Assets (ROA), (2) Return on Equity (ROE), and (3) Return on Sales (ROS). ROA represents the net profits generated by total assets, ROE represents the net profit on the capital invested by shareholders, while ROS represents the net profit on total revenue.

Hypothesis 1: Firm size (SIZE) affects positively/negatively to the business performances

According to economies of scale theory, the larger firm size, the more expenses are saved, which helps to enhance the company profitability. However, the increase of firm size without control of board of directors can lead to waste of financial resources, then results to the decrease of the company's financial capability. There are various results of the effect between firm size and profitability. A. Vijayakumar, 2011; A. Stierwald, 2009; G. A. Ayele, 2012 found a positive influence between firm size and profitability. While A. K. Salman and D. Yazdanfar, 2012; B. Ramasamy, 2005 found that firm size has a negative impact on profitability. R. Dhawan, 2001 specifically added, companies that have a smaller size will result in higher profits but no longer competitive than larger companies.

Hypothesis 2: Sale growth rate (SAGR) affects positively to business performances

The empirical literature suggests that higher sales growth rates tend to have a positive impact on profitability. Li, et al. (2010) suggest that increased sales can lead to economies of scale, improved bargaining power with suppliers, and enhanced operational efficiency, all contributing to higher profitability. Mansi, et al. (2011) concludes that sales growth can lead to increased market share and improved firm value, ultimately positively impacting profitability.

Hypothesis 3: Fixed asset ratio (FIXED) affects positively to business performances

Companies with a higher proportion of fixed assets tend to have higher profitability. Ghosh and Maji (2010) found positive relationship between the proportion of fixed assets and profitability in the Indian manufacturing industry. Similarly, Hatzinikolaou and Mylonidis (2005) found positive relationship between the fixed asset ratio and profitability of Greek manufacturing firms.

Hypothesis 4: Leverage (LEV) affects positively/negatively to business performances

LEV can influence either positively or negatively to the business performances. There are various results of the effect between leverage and profitability. Akhtar, et al (2012), Murigu Jane Wanjugu (2014), Nawaf Ahmad Salem Alghusin (2015) concludes that leverage has positive effect on profitability. While other studys suggest that excessive leverage can increase financial risk and lead to higher interest expenses, thus reducing profitability including Rajan and Zingales (1995); Ferreira and Vilela (2004).

Hypothesis 5: Assets turnover (TAT) affects positively to business performances

Assets turnover is a measure of how efficiently a company utilizes its assets to generate revenue. The literature review suggests that there exists a positive and significant relationship between assets turnover and company profitability. Rina et al. (2018), Li and Gadhoum (2017), Kim and Yi (2016) revealed that a higher assets turnover ratio leads to increased profitability, indicating that efficient utilization of assets contributes to better financial performance. Companies that effectively manage their assets and generate more sales from them tend to achieve higher levels of profitability. However, it should be noted that the impact of assets turnover on profitability may vary across industries and regions, as different factors can influence the relationship.

Hypothesis 6: Receivable day (DAR) affects negatively to the business performances.

Receivable days represent the average number of days it takes for a company to collect its accounts receivable, which reflects the efficiency of a company's credit and collection policies. Lazaridis and Tryfonidis (2006) founds a negative relationship between receivable days and profitability, suggesting that companies with a higher number of days to collect on their receivables tend to have lower levels of profitability. Similarly, Appuhami and Bhuyan (2018) found a negative relationship between receivable days and profitability of listed companies in Sri Lanka. In general, the literature indicates that longer receivable days tend to have a negative impact on company profitability.

Hypothesis 7: Payable day (DAP) affects positively/negatively to the business performances.

Payable days represent the average number of days it takes for a company to pay its accounts payable, which reflects the company's management of trade credit received from suppliers. Uyar and Kilic (2012) found a negative relationship between payable days and business performances in Turkey. While Bethel et al. (1998) found a positive relationship between payable days and profitability of firms in the United States.

Hypothesis 8: The firm age (AGE) affects positively/negatively to the business performances.

Age is the length of time during which a being or thing has existed. We defined firm age as the number of years of incorporation of the company. Onaolapo & Kajola (2010), Nghiem Thi Tha et al (2018) identified the positive impact of Age on business performances, while Masulis et al (2011), Alimadar et al (2018) found the two-dimensional impact of age on company profitability. This trend is explained by the segmental characteristics of the growth cycle of the enterprise. During the maturity stage of an enterprise, there is an expectation of increased profitability. As companies advance in age, their capacity to innovate, adapt to evolving markets, and embrace new technology may be impeded, leading to a subsequent reduction in profitability.

Hypothesis 9: The ratio costs of goods sold to sales (CFS) affects negatively to the business performances

The ratio of costs of goods sold to sales is a financial metric that measures the expense management ability of a company's core operations by comparing the costs of goods sold to net sales revenue. Gombola and Liu (2010) found that a lower CFS is associated with higher profitability. Guerard and Markowitz (1994) found a positive relationship, indicating that companies with lower expense ratio tend to exhibit higher profitability. Similarly, Han (2014), Zardini and Audousset-Coulier (2016) suggest CFS affect negatively to the business performances.

3. RESEARCH DESIGN

3.1. Data

The paper studies factors affecting the business performances of tourism companies listed in Vietnamese stock exchange. The data used in the study comprises a panel of 30 tourism firms over the 9-year period from 2015 to 2022. The authors obtained the financial information from the financial statements and annual reports disclosed in the companies' website. We collected and eliminated all observations that have omissions of critical financial indicators. As a result, an analysis based on the sample of 224 observations.

3.2. Methodology

3.2.1. Empirical models

To test proposed hypotheses, analyzing data sample to the following models:

$$HQKD_{it} = \beta_0 + \beta_1 SIZE_{it} + \beta_2 SAGR_{it} + \beta_3 FIXED_{it} + \beta_4 LEV_{it} + \beta_5 DAR_{it} + \beta_6 DAP_{it} + \beta_7 AGE_{it} + \beta_8 CFS_{it} + \mu_{it}$$

In which: i and t denote the cross-sectional (firm) and time-series dimensions respectively.

Items	Definitions	Measurement	Expected Sign
Dependence variable			
ROA	Returns on assets	Net profit/Average total assets	
ROE	Returns on equity	Net profit/Average owners' equity	
ROS	Return on sales	Net profit/total sales	
Independence variable			
SIZE	Firm size	Natural Logarit of total assets	+
SAGR	Sale growth rate	Sales at year t/ Sales at year t-1 -1	+
FIXED	Fixed assets ratio	Fixed assets/ Total assets	+
LEV	Leverage	Total liability/owners' equity	+/-
TAT	Asset turnover	Total sales/average total assets	+
DAR	Account receivable days	365 x Average short-term account receivable/ Sales	-
DAP	Account payable days	365 x Average short-term account payable/ Cost of goods sold	+/-
AGE	Firm age	The number of operation years since establishment	+/-
CPS	Ratio of costs of goods sold to sales	Costs of goods sold/ Sales	-
COVID	Covid 19	Dummy variable: before 2020 = 0; 2020 and after 2020 = 1	-

Table 1: Variable definitions

3.2.2. Methodology

In order to test the factors affecting the business performances of 30 listed tourism firms in Vietnam during the period of 2014-2022, we conducted regression model in panel data by adopting various methods including Ordinary Least Square (OLS), Random-effect model (REM) and Fixed-effect model (FEM). The White, Breusch Pagan and Hausman tests indicated that the most appropriate regression model. Besides that, we also used Wal test and Wooldridge test to test the existences of heteroskedasticity and autocorrelation. To address these error problems, author continuously use feasible generalized least squares (FGLS). The results from FGLS model are final findings for factors affecting business performances' tourism firms.

4. EMPIRICAL RESULTS

According to the descriptive statistic in table 2, ROA over the period of analysis is 0.014 (~1.4%) on the annual basis, which represent relatively low returns on total assets. Over the period, ROA has low value of -0,49 and high value of 0.296 with standard deviation of 0.103. These results indicated that returns on assets of Vietnamese tourism firms have been varied significantly between different firms during the analysis period. During the analysis period, returns on equity of tourism firms have substantially fluctuated from lowest value of -6.452 to highest value of 36.521. Average ROE is 0.139 which means relatively sound returns on investors' equity, however standard deviation is greater (2.391). Besides that, average ROS of tourism firms is -0.131 ranging from -20.029 to 0.559 and standard deviation is 1.343. The results means that during the analysis period, tourism firms have been unprofitable, however there has been significant variety between different companies. Overall, descriptive results of ROA, ROE, ROS might indicate that Vietnamese tourism firms have low level of business performance and these levels have varied significantly between different firms. The tourism firm size is calculated as the natural logarithm of total assets, ranging from 23.161 (VND 11.452 billion) to 29.6 (VND 7.164.335 billion). A similarity between mean and median values at 26.38785 and 26.3204 respectively proved "well-behaved" distribution of this variable. However, the standard variable at 1.292 suggests this variable has variation relative to its mean. The sale growth rate of 30 listed tourism firms during period 2015-2022 is 80%, ranging from -100% to 11,190.9% and standard deviation at 7.673. These figures mean that almost the revenue growth rates of tourism firms have been varied significantly during the analysis period. This fluctuation could be explained by the effects of Covid-19 pandemic on tourism industry. The tourism firms in the analysis panel had an average fixed assets ratio of 0.345, which means they invested average 34,5% of total assets for fixed assets, however this ratio varied from lowest point of 0% to highest point of around 97%. This mean and standard deviation is quite similar, so fixed assets ratio of tourism firm distributed "well-behaved". Moreover, on average, leverage ratio is 0.935, which is relatively high compared to other industries. This means, on average, assets of tourism firms are funded mainly by external sources. The leverage ratio varied significantly from -405.676 to 256.876 with standard deviation of 32.589. This indicated the tourism firms' financing policies mainly depend on external sources and the financing policy varied significantly in different firms. Higher leverage ratio could lead to higher financial risk and lower financial independence of the business. Average account receivable days of tourism firms is 1,619.249 days, ranging from 5.938 days to 322.000 days with standard deviation of around 21,566 days. Therefore, it can be seen that tourism firms have relatively high days of account receivable compared to other industries. Average account payable days of tourism firm is 1,350.79 days, ranging from 16.163 days to 163,000 days with standard deviation of 11370 days. Therefore, average time that the Vietnamese tourism firms took to pay their liability is so high and varies significantly to different firms. Besides that, average ratio of costs of goods sold to sales is 0.743 with highest value of 1.631 and lowest value of 0, which means that operational efficiency of Vietnamese tourism firms is low and they are still struggling in management of expenses. Moreover, standard deviation (0.243) is relatively lower than CFS mean, so expense management ability has varied significantly in different firms. In addition, total asset turnover ranges from 0 to 7.264 with mean of 0.867 and standard deviation of 1.074. This shows that efficiency of tourism firms' assets in generating revenue is relative sound and slightly varies in different firms during the analysis period. The average age of insurance firms from 2015 to 2022 is 20.202 years, however this variable varied from 1 to 46 years with a high value standard deviation at 9.704. Thus, regarding to history of establishment and development, there could be the big gaps between tourism firms.

Pair-wise Pearson correlation coefficients are shown in Table 3. This table show a clearly signal for the potential of multicollinearity and autocorrelation problems. Therefore, the authors used many different methods to address errors in the models.

Because of the effects of Covid 19 on tourism firms' financial performance in recent years, there are some outliners in variables used in the models. Therefore, we winsorized 1% some variables containing significant outliners like Leverage ratio, return on sales, account receivable days, days of payable outstanding, gross profit margin.

Table 4: Regression to analyse the factors affecting the tourism firms' business performance.

Source: The data extracted from Stata 14

Table 4 presents the results for examining the factors affecting the business performance of tourism firms listed in Vietnamese stock exchanges. We found consistently strong fit of models with Prob>F is 0.000. The results shows that SAGR have positive relations to all indicators presented for business performance of tourism firms while the opposite is true for DAP and CFS. Firm size affects positively to ROA and ROS, while total asset turnovers also have a positive impact on ROA and ROE. Other factor like DAR has a negative impact on ROA and ROS and AGE impacts negatively to ROE and ROS. Besides that, the results also proved a negative significant effect of Covid pandemic on the tourism firms' business performances. Based on the multivariate results above, we proposed the models of factors affecting the tourism firms' financial performances, as below:

Model 1: Factors affecting the Returns on assets (ROA)

$$ROA = 0.006\ x\ SIZE + 0.013\ x\ SAGR - 0.01\ x\ LEV - 0.0000751\ x\ DAR \\ - 0.0000866\ x\ DAP - 0.244\ x\ CFS + 0.022\ TAT \\ - 0.019\ x\ Covid\ Dummy + 0.057$$

Model 2: Factors affecting the Returns on equity (ROE)

$$ROE = 0.012\ x\ SAGR - 0.0001295\ x\ DAP - 0.34\ x\ CFS + 0.09\ TAT - 0.001\ x\ AGE - 0.022\ x\ Covid\ Dummy + 0.148$$

Model 3: Factors affecting the Returns on sales (ROS)

$$ROS = 0.013\ x\ SIZE + 0.012\ x\ SAGR - 0.111\ x\ FIXED - 0.014\ x\ LEV - 0.000267\ x\ DAR - 0.0002523\ x\ DAP - 0.515\ x\ CFS - 0.002\ x\ AGE + 0.236$$

According to the results from empirical tests above, we would like to propose some solutions to enhance the business performance of Vietnamese tourism firms in next years.

5. SOLUTIONS AND SUGGESTIONS TO ENHANCE THE BUSINESS PERFORMANCES OF TOURISM FIRMS LISTED IN VIETNAMESE STOCK EXCHANGES

Firstly, it is necessary for all Vietnamese tourism firms to expand their business scales. According to empirical results, firm size has a positive relationship to business performances of tourism firms: an increase 1% in firm size will lead to an increase 0.006% in ROE and an increase 0.013% in ROS with the significant level of 5% and 1% respectively. Each tourism firm need to have a specific and comprehensive road map for expanding business scales. They should carefully prepare the appropriate financing policies, determining appropriate financial sources – internal or external sources, determining the suitable investment policies, have appropriate capital and asset structures. In the digital era and recovering economy, it is good time for Vietnamese tourism firms to expanding their operational scales by investing more on integrating advantaged technologies into tourism business activities, which could help to enhance the competitive advances as well as efficiency in business operation.

Secondly, it is important for tourism firms to determine the optimal capital structure to minimize the cost of capital and utilize the financial leverage to maximize the firms' profitability. The empirical findings indicate a relatively high level of using leverage system in tourism industry and increasing 1% leverage ratio would lead to a decrease 0.01% in ROA and 0.014% in ROE with the significant level of 1% and 5% respectively. Therefore, the financing policies of tourism firms have significant impacts on financial performances. The more the tourism firms increasing the independence with external sources in terms of financing, the greater profitability the firms would gain and vice versa. In order to lower using leverage system, the companies could choose different ways to increase owners' equity, such as issuing additional stocks, M&A with foreign corporations or large groups who have strong business ecosystem, retaining earnings, having appropriate dividend payment policies, restructuring capital structure.

Thirdly, expanding different selling channels, enhancing quality of services to increase sale growth rate and then enhance the financial performances. The sale growth rate has the positive influences to all three measures of business performances. Sale growth rate increases 1%, which could lead ROA increases 0.013%, ROE increases 0.012% and ROS increases 0.012% with the significant level of 1%, 5%, 5% respectively. The results suggest that sale growth rate plays an important role in enhancing and fostering the tourism firms' financial performances. In the context of rapid recovery after pandemic of tourism industry, tourism firms should take into account the application of advanced technology into provided services to enhance quality of services, customers' experiences, lower the administrative and selling expenses, eventually increase the companies' profitability.

Fourthly, focusing on monitoring, controlling cost of goods sold. For tourism companies, increasing marketing campaign, expanding variety of selling channels, providing additional types of services, integrating high-edge technology into services could be useful to enhance sale growth rate, however these implements could expose a side effect to the expense, the CFS could increase and then lead to a reduction in profitability. Following the empirical results, CFS has significant negative relations to financial performances with the significant level of 1%. In more details, if CFS increases 1%, ROA, ROE, ROS will decrease 0.244%, 0.34% and 0.515% respectively. The results mean that the better saving operation expenses, the greater profitability the tourism firms can achieve. Tourism firms need to pay more considerations on cutting redundant, non-efficient expenses like advertisement, marketing campaign for offered services and simultaneously catching market trends like pushing marketing and advertising in social media platforms like Ticktok or Instagram,…, integrating new technology into services like online-booking, virtual assistants, automatic payments…., which enable tourism firms to cut down unnecessary costs.

Fifthly, account receivable and account payable management are also play essential roles to foster the tourism firms' performances. Vietnamese tourism firms currently have high level of days of account receivables and days of account payables, which means they are still struggling in controlling account receivables and account payables. This could lead to increase in cost of capital, then lower the companies' profits. The findings show the negative relation of DAP and all three business performance indicators with the p-value 0.000, while DAR affects negatively to ROA at significant level of 5% and ROS at significant level of 1%. Although the coefficients of DAR and DAP effects on ROA, ROE, ROS are relatively small, paying more attention on monitoring, controlling account receivable management and account payable management is necessary for tourism firms to save more cost of capital as well as relevant operational expenses, then increase the companies' profitability.

Finally, the results show that the tourism firms' age has negative influences on ROE and ROS with the significant level of 5% and 1% respectively, however the levels of impacts are relatively low. Therefore, the history of establishment and development is not an advantage and an important element for tourism firms to enhance business performance. On the contrast, the conservative, obsolete management mechanism, bureaucracy of long-standing tourism firms in Vietnam could be a factor to preventing the improvement in their business performances.

Besides that, the empirical models are also included a dummy variable "Covid" to present for the appearance of Covid pandemic in 2020. In align with the fact, the empirical results indicate the significant negative effects of Covid 19 to the tourism firms' ROA and ROE. It is clearly that the existence of Covid 19 terminated the operation of tourism industries, has caused the industry to expose many challenges and even the risks of bankruptcy. However, the business performance of recent years after Covid has indicated a signal of recovery. The solutions proposed above would be useful for the tourism companies to consider and implement to enhance the business performance and strongly rapidly recover.

SUSTAINABLE PRIVATE ECONOMIC DEVELOPMENT IN VIETNAM IN CURRENT GLOBALIZATION

Dr. Dang Thái Bình[1]

Abstract: *The private economy has a particularly important position and role, being one of the basic components of the country's economy. Sustainable private economic development in Vietnam in the current context of globalization not only contributes to the country's economic growth but also contributes to political and social stability. In this article, the author focuses on clarifying some of the following contents: (1) Analyze and clarify theoretical issues about sustainable private economic development in the context of globalization (2) Survey the current situation Sustainable private economic development in Vietnam in the current globalization context (3) Propose some solutions for sustainable private economic development in Vietnam in the current globalization context.*

Keywords*: Sustainable private economic development; globalization context*

1. INTRODUCTION

Sustainable private economic development is one of the important elements to promote the country's economic development, especially in the context of globalization, which opens up strong development of the private economy and private enterprises. have opportunities to expand production and business, invest abroad and cooperate with foreign enterprises investing in the country. However, it also contains many challenges such as technological competition, geopolitics, ideological and cultural differences... Therefore, to develop a sustainable private economy, there must be feasible solutions.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

Manred B Steger "Globalization" [2011] (translated by Nguyen Hai Bang, edited by Tran Tien Cao Dang) Tri Thuc Publishing House: This book Manfred B. Steger presented his personal views on globalization and outlined the causes. impact of globalization on economic, cultural and social fields; while also debating whether globalization is, after all, a good or bad thing and whether we are truly living in a borderless world?

Nguyen Manh Hung (2021) "On international integration and participation in the globalization process of Vietnam". According to the author: in the country's development, Vietnam is promoting the process of globalization and deep integration with the region and the world. Currently, Vietnam's international integration process is being actively implemented. However, there are also many complex fluctuations. Private economic development is both an opportunity and a challenge.

Luu Hiep (2023) "Need policies to encourage private enterprises to be "leading"". The author thinks that it is necessary to filter 500 enterprises and survey to see what they need so that the State can provide a reasonable mechanism for businesses to develop. Businesses want to expand the market or scale, to have a solution.

Van Nguyen (2023) ""Family business" in Vietnam has many competitive advantages. According to the author, family businesses are aware that in the context of globalization, to gain a

competitive advantage, trust is required, trust is a valuable asset, the foundation for the success of the business and This is an important difference that creates a competitive advantage today.

The works and articles of the above authors are valuable resources for the authors to inherit and develop their articles.

3. SOME THEORETICAL ISSUES ABOUT SUSTAINABLE PRIVATE ECONOMIC DEVELOPMENT IN THE CONTEXT OF GLOBALIZATION

3.1. Theory of Globalization

In a broad sense, globalization is a phenomenon; a process; a trend of expanding links in international relations to increase cooperation and interdependence in many aspects of social life (from economics, politics, security, culture to the environment, etc. …) between countries based on the principle of mutual benefit. In other words: Globalization is the process of promoting the increase in relationships, cooperation, influence, interaction, and interdependence of all regions, countries, and peoples in the world. world, to highlight a series of changes in economics, politics, culture, security, defense... based on the interests of all organizations and individuals participating in this field .

In this sense, globalization is not simply cooperation and interdependence in the economic field but also in the fields of culture, politics, security, defense... These cooperation issues include Bilateral and multilateral must ensure the principle of mutual benefit, respecting the individualities and characteristics of participating parties on the basis of international law.

In a narrow sense, globalization is a concept in the field of economics that refers to the process of forming a global market that increases interaction, cooperation and interdependence between national economies when Participate in the field of economic and international cooperation.

The manifestation of globalization can be in the form of regionalization - the linking of regions and regional institutions and organizations, or specifically, globalization is the process of forming and developing global markets. world and region, increasing interaction and interdependence, first of all economically, between countries through an increase in flows of goods and resources across borders between countries along with the Form international institutions and organizations to manage international economic activities and transactions.

However, Globalization is just a concept with a similar meaning. Currently, the concept of globalization is fiercely debated in all world forums. There are millions of extremely diverse frames of reference about globalization in printed books and newspapers, on the internet, and in literature. from both popular and academic documents (typically books: The Clash of Civilizations by Samule Huntington and The Lexus and the Olive Tree by Thomas Friedman...). However, up to now the concept of globalization makes people think of a flat world on a global scale.

According to Roland Robertson (Professor of Aberdeen University in Scotland), he said: "Globalization is a concept that refers both to the compression of the world and to the increase in the intensity of consciousness about the world as a whole." can"[1]

Approached from another angle, Fredric Jameson (Professor of Duke University) said: "Globalization reflects the sense of vast expansion of world communications as well as the horizon of a world market, both seemed much more tangible and immediate in the earlier stages of modernity."[2]

From the above analysis, it can be understood that globalization is understood as the wide-spread exchange of economics, politics, culture... between many countries and territories around the world that are mutually regulated. , to enhance mutual understanding and mutually beneficial cooperation.

The manifestation of globalization is the process of "internationalization" of all human values, including international division, international markets, cross-border circulation of goods, services, technology, and information. news, talent and resource distribution...

As globalization changes and leads to the transformation of society, this mutual bond is increasingly growing. Each change in the nature of globalization will lead to changes in other areas. For example, the explosive growth of transportation and communication technologies has led to the promotion of the development of the international economic system. Globalization is the formation of a global village in which participating members come together to accept common rules of the game for all participants.

Globalization is also the process of internationalizing global values, and those global values may originate from a remote country or people but have products that conquer humanity.

The process of globalization is a necessity of the times, taking place according to objective laws, regardless of the will of any organization or individual. To promote economic development, culture - society and other issues, each national organization itself does not "closed", "closed" without interacting with other countries. In the age of technology, if you don't open up exchanges with organizations, countries around the world are suffocating their own economies.

Globalization occurs concurrently with other processes both as its counterweight and as its supporting factor. It is the process of regionalization, localization and localization on a large scale of countries and continents. The trend of economic globalization has brought many advantages to the economic development of each country, especially economically underdeveloped countries.

3.2. Sustainable private economic development in the context of globalization

Vietnam is in a period of transition to socialism. This is a period of intertwining old and new production methods. The new production method is gradually forming and asserting itself, the old production method still exists. During this period, Vietnam inevitably implemented a multi-component commodity economy. "Does the current regime have components, parts, pieces of both capitalism and socialism? Everyone admits that there is" [3] in which the private economy stands out.

A private economy is an economy where private ownership of means of production and material wealth belongs to individuals or a small number of people.

4. CURRENT STATUS OF SUSTAINABLE PRIVATE ECONOMIC DEVELOPMENT IN VIETNAM IN THE CURRENT CONTEXT OF GLOBALIZATION.

4.1. Achievements of the private economy in the context of globalization.

On March 31, 2023, the Government issued Resolution No. 45/NQ-CP Action Program of the Government to continue implementing Resolution No. 10-NQ/TW dated June 3, 2017 The Fifth Conference of the Committee The XII Central Executive Committee on private economic development has become an important driving force of the socialist-oriented market economy. These are mechanisms that create favorable conditions to promote private economic development.

In the context of globalization, sustainable private economic development has greatly contributed to promoting industrialization and modernization of the country, thanks to the right policy mechanism that creates favorable conditions for the private economy. stopped increasing, the proportion of the private economy in the total investment capital of the whole society always exceeds the state economy and the FDI economy; The private economy has a relatively stable capital turnover index, and the increase in domestic and international private investment has contributed to stabilizing the domestic economy. The private economy not only makes a very important contribution not only to the economy, but also to society - that is, solving labor and employment.

Achievements of the private economy: after the covid -19 pandemic, the private economy in Vietnam has made remarkable progress. According to statistics as of December 31, 2021, Vietnam has 694.2 thousand domestic private enterprises (VPE), accounting for 96.6% of the total number of operating enterprises (DN), attracting 58,000 enterprises. 1% of the workforce accounts for 59.3% of the country's assets"[4]. Of the total 694.2 thousand businesses, there are about 500 large private enterprises, creating jobs for 10.4% of workers, 13% of assets, and 15.8% of revenue in the business sector. private industry nationwide.

Over the past two years, although the world has had many negative changes that have had a significant impact on the production and business activities of private enterprises in Vietnam, private enterprises in Vietnam have gradually taken steps to overcome challenges and affirm its position in the international market.

For direct manufacturing enterprises, they have constantly innovated technology, especially approaching the 4.0 industrial revolution effectively, applying the achievements of this revolution to production and business activities, making Labor productivity is constantly increasing, product quality is confirmed. Some branded products of Vietnamese private enterprises are already competing in the international market. According to a PwC survey, "Vietnamese family businesses have good business growth results in 2022. Of which, more than 53% of businesses reported growth in sales, 36% of businesses said they achieved achieved double-digit growth"[5].

For private enterprises operating in the service sector, due to technological innovation, service quality is constantly improving, and service products have become competitive in the international market. 2022, when the pandemic is under control, the service industry group will increase the highest among the three industry groups (reaching 9.99%)"[6].

Developing the private economy is the process of promoting modern and advanced means of production of non-state-owned organizations and individuals so that these economies have the ability to grow from low to high, from simple to complex, from incomplete to perfect, gaining a competitive advantage in the process of producing goods and services in the market.

Sustainable private economic development is to accelerate the growth process of this economy, helping it gradually move toward perfection with a stable, solid, and long-lasting nature.

Sustainable private economic development in the context of globalization is the process of creating favorable conditions to promote this economy's stable growth and competitiveness in the international market during the period of economic integration. international.

Investment fields: Vietnamese private enterprises focused on mining (31.8%); agriculture, forestry, fishery (15.7%)… In recent years, Vietnam has also invested in high technology abroad.

Expanding foreign investment: Globalization has expanded opportunities for Vietnamese private enterprises to integrate internationally, strengthening mutually beneficial cooperation in production and business activities. Areas receiving investment: Currently, Vietnam has invested in 140 countries around the world, including Laos, Cambodia, Venezuela, Singapore, Cuba.... In the field of agriculture and forestry, there is Hoang Anh Gia Lai International Agriculture Joint Stock Company (HAGL Agrico) investing in the Southeast Asian market; In the field of communications, FPT Group (FPT) has invested in 29 countries with a network of 290 headquarters and offices; Vingroup is one of the typical corporations investing abroad and has so far registered to invest in 4 projects in the US, Germany and some other countries.

The amount of money Vietnamese private enterprises invest abroad. According to statistics, “by March 20, 2023, Vietnam had 1,625 valid overseas investment projects with a total Vietnamese investment capital of nearly 21.9 billion USD”[7].

Globalization also opens up the connection between Vietnam’s private economy and foreign private economies: Private enterprises in Vietnam are linked with increasingly diverse large economic corporations in the world. The transfer of technology, exchange of science and technology, production and business experience is increasing. All these factors have created favorable conditions for the private economy in Vietnam to constantly develop

4.2. Current status of limitations of the private economy in the context of globalization

First, the private economy in Vietnam is mainly small-scale enterprises, with a lack of large and medium-sized enterprises; The technology level is not high, the ability to link business cooperation is limited, the capacity to participate in regional and global value chains is weak; Operational efficiency is still low and uneven

Second, the awareness of a large number of officials and civil servants about the private economy is not really correct. The situation of making it difficult for businesses regarding administrative procedures still occurs in many places. A part of civil servants also use private enterprises as their “backyard” to conduct illegal business activities.

Third, state management of the private economic sector still has many shortcomings, especially in implementing regulations and policies with low effectiveness and efficiency, without many incentive mechanisms and policies. Innovative businesses create high-quality products that compete in the international market.

Fourth, the business ethics of a part of private enterprises is not really perfect. The situation of tax evasion, insurance debt of workers, production of counterfeit, counterfeit, and poor quality goods is a problem that private enterprises need to overcome.

Fifth, the capacity of the private economy still has limitations: in the context of globalization, we are facing many challenges: Some businesses understand the culture and laws of the countries in which they invest. and international law is not really profound.

Sixth, the private sector is still slow in technological innovation. In the era of industrial revolution 4.0, technology is the decisive factor in competition. However, a part of private enterprises still uses old technology and is slow to innovate, leading to poor product quality, under great pressure on product prices, and not having enough capacity. compete with high-tech products in the international market.

Seventh, investment capital of the private economy is still low: Private enterprises are under great pressure on investment capital compared to foreign enterprises. In the context of globalization, some rich countries spend a lot of capital on private economic development to improve the competitiveness of businesses, especially businesses that produce high-tech products and invest in research. Research is huge, while Vietnamese businesses, due to their modest investment capital, rarely have breakthrough new products launched on the world market. This is also one of the most difficult "problems" to solve. private enterprises in Vietnam.

Eighth, the pressure of international governance issues has been and is an obstacle for the private economy in international integration. Economic superpowers seek to impose their lifestyles and cultures on other countries. The competition for influence of the superpowers, especially war-making, for the market. Some countries have strong developed economies, do not comply with international law, and have unfair competition; Not following the rules of the market economy properly, when Vietnamese goods of better quality enter their market, they seek to impose taxes, embargoes...

In fact, in the first 6 months of 2023, the world economy will suffer many negative impacts from the unresolved Russia-Ukraine conflict. Some countries around the world increased interest rates to curb inflation, and many private enterprises Vietnam's private sector growth rate is slowing down....in just the first 5 months of 2023, more than 88,000 businesses have withdrawn from the market, an increase of 22.6% over the same period in 2022. Businesses are operation, most also have to reduce the scale of production and business.

From the above analysis, it can be seen that in addition to the positive aspects of private economic development in the context of globalization, certain negative factors still exist. From the perspective of sustainable development, there are still many problems. Law violations, unfair competition, lack of business ethics are quite common; discharge of wastes that pollute the environment, destroy the ecosystem, fail to ensure food hygiene and safety; commercial fraud… takes place in unpredictable complexity.

5. SOME SOLUTIONS FOR PRIVATE ECONOMIC DEVELOPMENT IN VIETNAM IN THE CONTEXT OF GLOBALIZATION

Firstly, renewing awareness of the role and position of the private economy, promoting the strengths and potential of the private economy. The process of developing the private economic sector is associated with the thinking of developing a multi-sector economy. During the transition period to socialism, the private economy is indispensable. Great resources contribute to country building. Therefore, it is necessary to have a comprehensive view and a correct awareness of the position and role of the private economy to create the right mindset, and only then can we come up with the right measures to promote private economic development. in the current context of globalization.

Second, institutional reform and private economic development to create a favorable and equitable business environment among economic sectors. Determining private economic development to become an important driving force of the economy. Institutionalizing the Party's policies, the Government has issued many institutional programs, improving the business environment, eliminating prejudices against the private economy,... Accordingly, the private economic sector has developed strongly.

Third, it is necessary to reform administrative procedures to gradually convert administrative procedures to digital, creating favorable conditions for handling administrative procedures for private enterprises in a neat, compact and effective manner. , promote investment, upgrade technical infrastructure, deploy the construction of many software, databases, platforms, and application software so that businesses have the most favorable conditions to deploy production activities. business.

Fourth, promote the role of the private economy, encourage private enterprises to innovate creative business models, create new products capable of competing in domestic and international markets.

Fifth, build a mechanism to encourage private enterprises to invest in new technology and create new products: The State needs to build a mechanism to encourage private enterprises to invest in high technology and exploit new products. scientific research results, effective application of scientific achievements in production and business, providing the market with high-tech products; Provide financial support for private enterprises to purchase scientific research results in domestic and international markets, and create favorable conditions for self-invested technology research institutes and development by organizations and individuals. .

Sixth, diversify foreign currency sources: The state needs to have a mechanism to diversify the supply and reserve of foreign currency, and support private businesses when geopolitical events occur. Strengthen financial cooperation and linkages with developed countries to create a common currency to avoid financial risks for the private economy.

Seventh, promote international cooperation multilaterally and seek new markets. Strengthen foreign affairs, expand cooperation with all countries around the world based on the principle of "equality, mutual benefit", encourage private enterprises to invest and attract investment in all countries. countries in the world. Diversify the supply chain of raw materials and fuel with many countries. Develop contingency plans to prevent geopolitical issues from disrupting the supply chain.

Eighth, shifting capital flows and responding to geo-political risks. Create a competition to attract capital from many countries. Tenth, increase the work of inspection, examination and supervision.

6. CONCLUSION

Sustainable private economic development in the context of globalization is a complex problem. To do this well, there needs to be participation from all levels, branches and fields.

For the state: on the basis of researching international law, promulgating documents and building a legal system for private enterprises to implement effectively.

For private enterprises: Continuously learn, improve management knowledge, improve technology, research domestic and international legal systems, and do business according to the provisions of law.

RESEARCH TOPIC: IMPACT OF MACROECONOMIC FACTORS ON THE VIETNAM'S STOCK MARKET

Assoc. Prof. Dr. Nguyen Le Cuong[1], PhD. Pham Thi Hoang Phuong[1], PhD. Nguyen Thi Thuy Nga[1], MSc. Ha Tuan Vinh[1], MSc., PhD Student, Trinh Quoc Hoa[1]

Abstract: *This research study is an insight into the intricate relationship between macroeconomic factors and the performance of the Vietnam's stock market. Drawing on an extensive dataset covering the recent five-year period, the study employs a multifaceted methodology that combines data analysis, time-series modeling, and sector-specific analysis to comprehensively evaluate the dynamic interactions between key macroeconomic indicators and stock market returns. The research identifies the significant macroeconomic variables that exert a substantial influence on stock market movements, quantifies the magnitude of their impact, and provides insights into the directional correlations.*

Keywords: *Vietnam's stock market, macroeconomic factors, Government's policies, sector-specific analysis, market volatility*

1. INTRODUCTION

1. Rationale

The impact of macroeconomic factors on Vietnam's stock market is a relevant, practical, and academically interesting topic with significant implications for various stakeholders. Following are the reasons for the authors to choose the topic "The impact of macroeconomic factors on Vietnam's stock market":

Macroeconomic factors play a crucial role in shaping the performance of a country's stock market. Understanding how these factors impact the stock market can be highly relevant for investors, policymakers, and financial analysts, particularly in a rapidly developing economy such as Vietnam. Vietnam has experienced significant economic growth in recent years and has become an attractive destination for foreign investors. Investigating how macroeconomic factors influence the stock market can provide insights into the sustainability of this growth and its implications for investment opportunities.

In terms of macroeconomic policies such as monetary policy, fiscal policy, and trade policies, they can significantly affect a country's economic stability and growth. Studying their impact on the stock market can help policymakers make informed decisions and adjust policies as needed. Additionally for investors and portfolio managers, understanding how macroeconomic factors affect the stock market is essential for risk management and asset allocation. It helps them make relevant and timely investment decisions and reduce exposure to market volatility.

Moreover, this topic offers an opportunity for academic research and analysis. It allows scholars to contribute to the field of finance and economics by exploring the relationships between macroeconomic variables and stock market performance in the specific context of Vietnam. Studying the impact of macroeconomic factors on Vietnam's stock market can shed light on market behavior, including the reactions of investors to economic news and events. This can be valuable for understanding market dynamics and investor sentiment.

---

[1] Academy of Finance.

Comparing the findings with other countries or regions can provide insights into the unique characteristics of Vietnam's stock market and its sensitivity to macroeconomic factors, helping investors make cross-border investment decisions. Vietnam has made strides in improving data transparency and availability, making it easier to collect and analyze data related to macroeconomic indicators and stock market performance.

Vietnam faces unique economic development challenges, and understanding how macroeconomic factors impact its stock market can contribute to addressing these challenges and promoting sustainable economic growth.

The research findings can have practical applications for investors, financial institutions, and government agencies seeking to enhance their understanding of the Vietnamese stock market's behavior and performance.

2. Research Objectives

The research objectives can be designed to investigate and analyze various aspects of this relationship. In this research, the authors identified some potential research objectives:

- Assess the relationship between six key macroeconomic indicators including inflation, interest, money supply, exchange rate VND/USD, industry GDP, and FDI and the performance of Vietnam's stock market.
- Address any policy implications and recommendations that emerge from the research findings, with the goal of improving the stability and efficiency of Vietnam's stock market.

These research objectives can guide a study that aims to deepen our understanding of how macroeconomic factors influence Vietnam's stock market and provide valuable insights for investors, policymakers, and other stakeholders in the financial and economic sectors.

3. Significance of the research

The study of how macroeconomic factors impact Vietnam's stock market is significant not only for investors but also for policymakers, businesses, and researchers. It provides valuable insights into the dynamics of the stock market and its role in the broader economy, aiding informed decision-making and contributing to economic growth and stability in Vietnam.

- Investor decision-making: Understanding how macroeconomic factors affect the stock market in Vietnam is critical for investors. It helps them make informed decisions about asset allocation, portfolio diversification, and risk management.
- Economic growth and stability: A well-functioning stock market is often indicative of a stable and growing economy. By studying this relationship, researchers can provide insights into the broader economic health and sustainability of Vietnam.
- Policy implications: Policymakers can use the findings to develop and adjust economic and financial policies, aiming to promote a stable and efficient stock market that encourages investment and economic growth.
- Risk mitigation: The study can assist financial institutions and market participants in developing risk mitigation strategies and hedging techniques to navigate the volatility of the stock market in Vietnam.
- International investment: For foreign investors and multinational corporations, understanding how macroeconomic factors impact the Vietnamese stock market is crucial for making cross-border investment decisions.

− Sector-specific insights: The research can provide insights into how specific sectors within Vietnam's economy are affected by macroeconomic factors, which is valuable for sector-specific investors and businesses.

− Academic contribution: The study contributes to the academic literature by adding empirical evidence to the field of finance and economics, specifically focusing on the unique dynamics of Vietnam's stock market.

− Global economic insights: Vietnam is part of the global economic landscape. Understanding how its stock market responds to global economic events and trends can provide insights into the interconnectedness of financial markets worldwide.

− Economic development challenges: Vietnam faces unique economic development challenges. By studying the impact of macroeconomic factors on its stock market, researchers can help identify potential roadblocks and propose solutions for sustainable growth.

− Data transparency: The research can help promote data transparency and integrity in Vietnam, potentially encouraging better reporting and data availability in the financial sector.

− Long-term investment: For long-term investors and retirement funds, knowledge about the relationship between macroeconomic factors and the stock market in Vietnam is crucial for crafting investment strategies that ensure financial security.

− Public awareness: The research can raise public awareness about the intricacies of stock market behavior and the role of macroeconomic factors in shaping economic outcomes.

II. OVERVIEW OF THE VIETNAM'S STOCK MARKET

1. History and Development of the Vietnamese Stock Market

The Vietnamese stock market, officially known as the Ho Chi Minh Stock Exchange (HOSE) in Ho Chi Minh City and the Hanoi Stock Exchange (HNX) in Hanoi, has undergone significant development and transformation since its inception. Here is a brief history and development of the Vietnamese stock market:

Early Development (1990s - 2000s): The foundation for Vietnam's stock market was laid in the early 1990s as the country began its economic reforms (Đổi Mới) to transition from a centrally planned economy to a socialist-oriented market economy. The stock market started with the Ho Chi Minh Securities Trading Center, established in 2000, which later became the Ho Chi Minh Stock Exchange (HOSE). Hanoi Stock Exchange (HNX) was founded in 2005. Initially, the market was small and mostly comprised of state-owned enterprises.

Foreign Investment and Liberalization (2007 - 2010s): Vietnam initiated various reforms to attract foreign investment and develop its financial markets. The government allowed foreign investors to participate in the stock market, and this led to increased foreign portfolio investment. Stock indices like the VN-Index (HOSE) and HNX-Index (HNX) were introduced to track the market's performance.

Market Expansion and Reforms (2010s - Present): The Vietnamese government continued to promote the development of the stock market as a key pillar of the country's financial system. Various reforms were introduced, including the equitization of state-owned enterprises and the introduction of new financial products like futures and options. The market also witnessed the emergence of various financial instruments and derivatives.

Market Capitalization and Listings: The market capitalization of both HOSE and HNX has grown significantly over the years. As of my last knowledge update in 2022, the Vietnamese stock market was among the top-performing markets in the world, with a rapidly expanding number of listed companies. Several major state-owned enterprises have been listed on the exchanges, attracting substantial attention from investors.

Integration with Global Markets: Vietnam made efforts to integrate its stock market with global financial markets. This was exemplified by its inclusion in the MSCI Emerging Markets Index, which attracted foreign institutional investors. Furthermore, the government sought to enhance transparency and improve the regulatory environment to align with international standards.

Challenges and Future Outlook: Despite its impressive growth, the Vietnamese stock market faced challenges related to liquidity, the dominance of state-owned enterprises, and market volatility. Ensuring stability and reducing market manipulation remained areas of concern. The COVID-19 pandemic also had a significant impact on market performance.

Technological Advancements: The stock market has embraced technological advancements, with electronic trading platforms and increased use of fintech in trading and settlement processes.

The Vietnamese stock market's development reflects the country's broader economic growth and transition to a more market-oriented economy. It has become an integral part of Vietnam's financial system and a source of investment opportunities for both domestic and international investors. Its future development will likely depend on continued economic growth, regulatory reforms, and efforts to enhance market efficiency and transparency. Please note that the information provided is based on my knowledge as of 2022, and there may have been further developments in the Vietnamese stock market since that time.

2. Current status and market size of the Vietnam's stock market in 2023

In the first six months of 2023, the Vietnamese stock market experienced various fluctuations in the backdrop of global economic and political instability. Worldwide, inflation surged in many places in 2022, leading to tighter monetary policies in many economies. In 2022, the US Federal Reserve (FED) increased the federal funds rate by 4.25 percentage points through seven consecutive adjustments. In the first five months of 2023, FED continued to adjust the interest rate three more times in February, March, and May, each time increasing it by 0.25 percentage points, bringing the US federal funds rate to its highest level in 15 years. On June 14, 2023, the Fed decided to maintain the interest rate at 5.0-5.25% during the June 2023 adjustment period. Similarly, the Bank of England adjusted its interest rate for the fourth time in the year on June 22, 2023, increasing it by 0.5 percentage points, bringing the base rate to 5%. The European Central Bank (ECB) also adjusted its interest rate for the fourth time, raising it by 0.25 percentage points on June 15, 2023, the highest level since 2001. These actions raised concerns about the "recession-inflation" risk in some countries.

Before the policy adjustments in the US, the US dollar strengthened significantly against many currencies, putting pressure on the exchange rates of many countries and leading to financial instability and increased debt. Although inflation has cooled off somewhat, it still remains high, causing difficulties in consumer demand and economic activities. Central banks in various countries continue to maintain tight monetary policies to bring inflation back to target levels. The consecutive collapses of some banks in the US and Switzerland in March and May 2023 raised concerns among investors about financial market stability. Meanwhile, the global political situation continued to be complex and unpredictable, with the ongoing Russia-Ukraine conflict escalating. Additionally, the slowing economic recovery in China in comparison to Q1/2023 was a cause for concern, especially since China remains a significant driver of global economic growth.

The global economic outlook is assessed as challenging, which has led to complex economic and political developments in global stock markets. Domestically, due to reduced global demand and currency market fluctuations, as well as slow growth among major trading partners such as the US, EU, Japan, and South Korea, Vietnam's import and export activities have been severely affected. Although Vietnam maintained a trade surplus in the first six months of 2023, import and export activities declined compared to the same period the previous year. In addition to the reduced import demand from foreign direct investment (FDI), this situation also indicates a decline in the activities of domestic enterprises. Furthermore, the total foreign direct investment (FDI) capital registered in Vietnam as of June 20, 2023, decreased by 4.3% compared to the same period in 2023. Even the advantages of cheap labor and taxes could be affected if global minimum tax issues are applied. These negative factors have a significant impact on the business performance for the second quarter and the remaining quarters of 2023.

However, there have been several positive aspects in the Vietnamese market in the first six months of 2023. The government issued Resolution No. 88/NQ-CP in the May 2023 regular government meeting, requiring ministries, agencies, and localities to proactively remove difficulties and obstacles, especially in terms of mechanisms and policies to support businesses and people. The resolution aims to promote economic growth drivers, including consumption, investment, and exports, and strive to reduce deposit and lending interest rates to support economic recovery, production, and business development. So far, the State Bank of Vietnam (SBV) has issued four decisions to reduce the operating interest rates. As a result, the deposit and lending interest rates of many commercial banks have continued to decrease in the second quarter of 2023.

Despite the challenges faced by businesses, according to the report on the economic and social situation in June 2023 and the first six months of the year by the General Statistics Office, several economic indicators, such as industrial production index, total retail sales of goods and services, and the proportion of capital investment from the state budget, have improved compared to the same period in 2022. The government's support policies in removing obstacles for businesses and people, along with the reduced interest rates, have improved market liquidity and encouraged domestic investors to return to the stock market.

In the face of the aforementioned factors, the Vietnamese stock market continued to experience a mix of ups and downs in the first six months of 2023. After making a recovery in January 2023, the Vietnamese stock market had some declining sessions in February. Moving into March, following news of instability in the banking systems in the US and Europe, the Vietnamese stock market had a few sessions with losses but later recovered in the following weeks. After several consecutive sessions of gains, the Vietnamese stock market saw an adjustment in April and then rebounded in the early weeks of May. Continuing into May, the Vietnamese stock market traded positively in June. As of June 30, 2023, the VN-Index reached 1,120.18 points, an 11.2% increase compared to the end of 2022. Meanwhile, the HNX-Index closed at 227.32 points, a 10.7% increase compared to the end of 2022. The total market capitalization of the HOSE, HNX, and UPCoM stock markets on June 30, 2023, reached 5,783 trillion VND, a 10.7% increase compared to the end of 2022, equivalent to 60.8% of the estimated GDP for 2022.

Market liquidity continued to be subdued in the first quarter of 2023, with the average trading value per session reaching approximately 11,300 billion VND, a 44% decrease compared to the 2022 average. Moving into the second quarter of 2023, market liquidity picked up, with the average trading value for the months of April, May, and June showing positive growth, reaching 13,374 billion VND per session, 14,495 billion VND per session, and 19,829 billion VND per session, respectively. In the first six months of 2023, the average trading value reached 13,729 billion VND per session, a 31.9% decrease compared to the 2022 average.

Regarding listing and trading registration (LTR) activities, as of the end of May 2023, there were 745 listed stocks and fund certificates on the two stock exchanges (HOSE and HNX), and 869 stocks listed on UPCoM, with a total market capitalization and LTR value of 1,993 trillion VND, a 0.5% increase compared to the end of 2022 (equivalent to 21% of the estimated GDP for 2022).

In the listed bond market, the average trading value for June reached 7,040 billion VND per session, a 6.2% increase compared to the previous month. However, over the first six months of 2023, the average trading value reached 5,871 billion VND per session, a 23.6% decrease compared to the 2022 average. In terms of the listed bond market scale, as of the end of May 2023, there were 451 listed bond issuances with a listed value exceeding 1,897 trillion VND, a 9% increase compared to 2022 (equivalent to 19.9% of the estimated GDP for 2022).

3. Issues and Challenges

In the early months of 2022, Vietnam's stock market had made significant progress due to the economic recovery after the COVID-19 pandemic, but still faced several issues and challenges. It's important to note that the situation may have evolved since then, but here are some of the key issues and challenges that were prevalent at that time:

- Lack of liquidity: One of the primary challenges was the relatively low liquidity of the stock market, especially for smaller-cap stocks. This made it more challenging for investors to enter or exit positions.
- State-owned enterprises (SOEs) Dominance: Many state-owned enterprises were listed on the stock market, and their performance significantly influenced market movements. The dominance of SOEs could lead to issues of corporate governance, transparency, and market volatility.
- Market manipulation: The market faced concerns about market manipulation, insider trading, and price manipulation. Ensuring fair and transparent trading was a priority.
- Limited derivative market: While derivatives, such as futures and options, were introduced to the market, their trading volumes remained relatively small compared to the equity market.
- Regulatory environment: The regulatory environment in Vietnam was evolving, but there was a need for further improvements in areas like investor protection, disclosure requirements, and trading rules.
- Foreign ownership limits: Restrictions on foreign ownership in certain industries and companies presented challenges for foreign investors and limited their ability to fully participate in the market.
- Market volatility: The Vietnamese stock market had experienced periods of high volatility, driven by a variety of factors, including global economic events and speculative trading.
- Infrastructure and technology: Developing and maintaining robust technological infrastructure to support electronic trading and settlement was an ongoing challenge.

− Global economic factors: The stock market was sensitive to global economic conditions and external factors, such as trade tensions, which could impact investor sentiment.

− - Currency risks: For foreign investors, currency risks were a consideration, especially in a market with exposure to the Vietnamese dong.

− Investor education: Improving financial literacy and investor education was important to ensure that investors made informed decisions and understood the risks associated with stock market investments.

− Corporate governance: Ensuring strong corporate governance practices among listed companies, including transparency and ethical behavior, was an ongoing concern.

− Long-term investment: Encouraging long-term investment and reducing speculative trading was a challenge in a market that sometimes saw short-term price fluctuations.

III. THE STOCK MARKET AND MACROECONOMIC FACTORS

1. Key macroeconomic factors

Several key macroeconomic factors can affect the performance of Vietnam's stock market. While the impact of these factors can vary over time, here are some of the critical macroeconomic factors that traditionally influence the Vietnamese stock market:

− Industry Gross Domestic Product (GDP) Growth: GDP growth is a fundamental indicator of economic health. A growing economy is often associated with rising corporate profits, which can positively impact stock market performance.

− Inflation rates: High and volatile inflation can erode the real value of investments and reduce investor confidence. Therefore, the inflation rate is a significant factor influencing stock market performance.

− Interest rates: The level and direction of interest rates set by the central bank can influence borrowing costs, corporate profitability, and investment decisions. Lower interest rates can stimulate economic activity and benefit the stock market.

− Exchange rates: Exchange rate fluctuations can impact companies involved in international trade. A depreciating currency can benefit exporters but may negatively affect companies with foreign debt.

− Money supply: Maxwell Ogbulu and Peter Chinyer conducted a study in 2011 to investigate the long-term impact of monetary policies, including money supply, interest rates, exchange rates, and inflation, on stock prices in Nigeria. Prior to their study, other authors had also identified the influence of money supply on stock prices, such as Chen Shaoping (2008), who argued that an increase in money supply in the market has a positive effect on stock prices, with stock prices rising correspondingly.

− Foreign Direct Investment (FDI): The flow of FDI into the country can have a positive impact on stock market performance as it can lead to increased economic activity and investment opportunities.

2. Mechanisms for transmitting macroeconomic effects to the stock market

The transmission mechanisms for macroeconomic effects to the current Vietnam's stock market can be complex and multifaceted. The interaction between macroeconomic factors and the stock market involves various channels through which economic developments influence stock prices. Here are some of the key mechanisms through which these effects are transmitted:

- Corporate profitability: Macroeconomic conditions, such as GDP growth and inflation, can impact corporate profitability. When the overall economy is growing, companies tend to generate higher revenues and profits, leading to an increase in stock prices. Conversely, high inflation can erode profit margins and negatively affect stock prices.

- Interest rates: Changes in interest rates, as determined by the central bank, affect borrowing costs for companies. Lower interest rates can reduce the cost of capital, making it more attractive for businesses to invest and expand. This can boost corporate earnings and subsequently stock prices.

- Currency exchange rates: Exchange rate fluctuations can impact companies that are exposed to international trade. A depreciating domestic currency can benefit export-oriented companies by making their goods and services more competitive in international markets. This can boost the stock prices of these companies.

- Foreign Direct Investment (FDI): Increased FDI can lead to economic growth, as foreign capital and expertise flow into the country. FDI can drive expansion and investment in Vietnamese companies, thereby positively influencing stock market performance.

- Trade balance: A positive trade balance (more exports than imports) can contribute to economic growth. Companies in export-driven sectors may experience increased demand for their products, which can lead to higher stock prices.

- Government policies and reforms: Changes in government policies, tax reforms, or regulations can have sector-specific effects. For example, tax incentives for certain industries may lead to higher profits and stock price increases within those sectors.

- Global economic factors: Vietnam's stock market is sensitive to global economic events and trends. Economic crises, trade tensions, and shifts in global demand can spill over into the domestic market, influencing investor sentiment and stock prices.

- Commodity prices: The prices of key commodities, such as rice, coffee, and oil, can affect the performance of companies involved in these industries. Changes in commodity prices can directly impact the revenue and profitability of related businesses, influencing stock prices.

- Domestic economic sentiment: Investor sentiment, consumer confidence, and business sentiment can have a significant impact on stock market behavior. Positive sentiment can encourage investment and drive stock prices higher, while negative sentiment can lead to sell-offs.

- Political stability: Political stability is crucial for investor confidence. A stable political environment can attract long-term investments in the stock market, while political instability can lead to uncertainty and market volatility.

- Market valuations: Valuation metrics, such as price-to-earnings (P/E) ratios, are key indicators of stock market performance. Overvalued markets may lead to concerns about a potential market correction, while undervalued markets may be seen as opportunities for investment.

- Regulatory changes: Changes in stock market regulations, trading rules, or listing requirements can influence investor sentiment and market behavior, especially if they affect market transparency and investor protection.

These mechanisms highlight the interplay between macroeconomic factors and the stock market in Vietnam. It's important to recognize that the stock market's response to macroeconomic developments can be influenced by a combination of these factors and can vary depending on market conditions, investor sentiment, and other contextual factors.

IV. RESEARCH METHODOLOGY

4.1. Qualitative analysis

In order to gain a comprehensive understanding of the intricate relationship between macroeconomic factors and Vietnam's stock market, a multi-faceted qualitative research approach was undertaken. The study commenced with an extensive literature review to draw insights from existing academic papers and reports, offering a foundational understanding of the topic and identifying research gaps. This was followed by in-depth expert analysis, wherein financial experts, economists, and scholars provided their invaluable insights into the current macroeconomic landscape in Vietnam, the key indicators influencing stock market dynamics, and predictions for the market's future. Furthermore, a series of structured interviews were conducted with various stakeholders, including investors, fund managers, and stock market analysts, yielding qualitative data on their perceptions, experiences, and decision-making processes in light of macroeconomic developments. The qualitative data was thematically analyzed to uncover recurring patterns and to synthesize emerging insights.

In this research, the authors conducted some activities to collect qualitative data to support the topic.

4.1.1. Literature review

The authors used selective and reliable sources of data such as Academic Journals to review academic articles from respected journals such as Journal of Vietnamese Studies, Emerging Markets Review, and The Vietnamese Economy; The Government Reports to explore reports from the State Securities Commission of Vietnam (SSC) and the Ministry of Finance, which provide valuable data on the stock market and macroeconomic conditions; World Bank and IMF Reports to consult reports from international financial institutions like the World Bank and International Monetary Fund (IMF) that provide macroeconomic analysis and assessments of Vietnam; and research papers by prominent scholars specializing in Vietnamese economics and financial markets.

1.1.2. Interviews

We also use the direct interviews of industry experts, investors, representatives from listed companies, fund managers and university professors from leading Vietnamese business corporations and universities who can offer academic insights into the subject matter. In addition, officials from Government and regulatory authorities such as the State Securities Commission were also interviewed to consult their perspectives on the regulatory environment and its impact on the stock market.

Besides conducting interviews of local individuals and organizations, we also attempted to conduct some interviews of industries experts from international financial institutions such as the WB, IMF, and ADB for their assessment of Vietnam's economical and financial situtation.

By using this wide range of research materials and interviews, we expected to ensure that to research was well-informed, comprehensive, and enriched with insights from various stakeholders and experts in the field, making it a robust and well-rounded study on the subject.

V. RESEARCH FINDINGS

5.1. Evaluation of the impact

5.1.1. Inflation

In the context of the stock market, when inflation increases, it leads to a rise in interest rates to ensure positive real interest rates. This makes the stock market less attractive compared to other investment channels, such as savings accounts. As a result, there is a higher supply of stocks compared to the demand, causing a decrease in stock prices. Additionally, an increase in inflation raises a company's input costs, indirectly affecting its profitability and leading to a decrease in stock prices.

In 1977, Fama and Schwert identified a relationship between inflation and the stock market. The authors used both expected and unexpected inflation to examine the impact of inflation on stock price indices. The results showed a negative impact of inflation on stock prices. Mohammed Omran and John Pointon (2001) also found a negative short-term and long-term impact of inflation on the Egyptian stock market. In 2011, Adel Al Sharkas and Marwan Alzoybi conducted a study on "Stock Prices and Inflation: Experimental Evidence from Countries like Jordan, Saudi Arabia, Kuwait, Morocco." Using a VAR model, the authors provided empirical support for the long-term relationship between inflation and stock prices.

5.1.2. Interest rates

Interest rates represent the cost incurred by borrowers for using capital provided by lenders. Interest rates are one of the crucial factors that influence the overall growth and development of an economy.

A decrease in interest rates has a positive impact on stock price indices. This is because when the cost of capital is lower, companies can more easily raise funds to carry out investment projects. It also reduces costs for companies that use financial leverage, ultimately improving a company's profitability and increasing its stock price. On the contrary, an increase in interest rates has a negative effect on the overall economy. Rising interest rates lead to higher borrowing costs for consumers, reducing their spending and consumption. This, in turn, affects production and business operations, a company's profitability, and makes stocks less attractive in the market.

Mahmudul and Salah Uddin (2009) conducted a study on the relationship between interest rates and stock prices in both developed and developing countries. The results of their research showed that interest rates had a negative impact on stock prices in 14 countries (Australia, Bangladesh, Canada, Chile, Colombia, Germany, Italy, Jamaica, Japan, Malaysia, Mexico, South Africa, Spain, and Venezuela), with the exception of the Philippines. Other studies have also reported similar findings regarding the adverse effect of interest rates on stock prices, such as those conducted by Fama (1981), Mohammad and colleagues (2009), Christopher Gan (2006), Rahman, Sidek, and Tafri (2009), and Nadeem Sohil and Zakir Hussain (2009).

5.1.3. Money supply

Money supply refers to the amount of money injected into the economy to meet various needs such as payment methods and the storage requirements of economic agents. Various measures of money supply include:

- M0: It consists of physical currency, which is the banknotes issued by the central bank that circulate outside the banking system.
- M1: It includes M0 and demand deposits, which are deposits that can be withdrawn at any time upon request, often held in checking or current accounts.
- M2: It encompasses M1 and time deposits at banks, such as savings accounts and certificates of deposit.
- M3: It includes M2 and various types of financial institution deposits outside traditional banks.
- L: The broadest measure, which includes M3 and other financial instruments like treasury bills, commercial paper, and bank acceptances.

Economic theories suggest that monetary policy has an impact on stock price indices. When an expansionary monetary policy is implemented, injecting more money into circulation, it tends to lower interest rates for borrowing and discount rates. This, in turn, increases the demand for financial assets, including stocks. On the other hand, when lending interest rates decrease, it can reduce the discount rate of stocks, thereby raising expectations and income for investors. Conversely, when a contractionary monetary policy is put in place, leading to higher interest rates due to a decrease in the money supply compared to previous conditions, it can increase the cost of capital, reducing investment in stocks and causing stock prices to fall.

Authors Maxwell Ogbulu and Peter Chinyer conducted a study in 2011 to investigate the long-term impact of monetary policy factors, including money supply, interest rates, exchange rates, and inflation, on stock prices in Nigeria. Prior to their study, other authors had also found the impact of money supply on stock prices, such as Chen Shaoping (2008), who argued that an increase in money supply in the market has a positive effect on stock prices, with stock prices rising correspondingly. The results of the Error Correction Model (ECM) showed that in the short term, the M1 money supply has the strongest impact on stock prices, M2 has some influence, and M0 money supply has less impact on stock prices.

5.1.4. Exchange rates

An exchange rate is the rate at which one currency can be exchanged for another, typically at a fixed ratio. There are two methods for quoting exchange rates: direct and indirect, and the choice of method depends on the country and the type of foreign currency involved.

According to economic theories, exchange rates can impact stock prices in two different directions. When the exchange rate increases through direct quoting, it means that the domestic currency has depreciated, and a stable investment environment can attract foreign capital seeking profit opportunities due to the currency differential. However, from another perspective, an increase in the exchange rate can have a negative effect on the stock market. An adjustment in the exchange rate can impact export activities and indirectly affect economic growth and corporate production, subsequently affecting a company's profitability and reducing stock prices.

Authors Noel Dilrukshan Richards and John Simpson conducted research on the interaction between stock prices and exchange rates in Australia. Through correlation tests and Granger modeling, the authors identified the level of interaction between exchange rates and stock prices. Their observations from the period 2003-2006 showed that, in the short term, an increase in exchange rates had a positive impact on the stock market in Australia. Furthermore, when testing for long-term relationships, the results also indicated a long-term impact of exchange rates on stock prices. However, in some other studies, the results were contradictory. For instance, Rahman and Uddin (2009) studied the impact of exchange rates on stock price indices in some developing countries like Bangladesh, India, and Pakistan. Their findings suggested no long-term relationship between exchange rates and stock prices in these countries.

5.1.5. Industrial GDP

The industrial GDP is a comprehensive indicator that reflects the results of production and business activities in the industrial sector over a specific period. It serves as the basis for evaluating the industrial development of a country.

When the industrial GDP experiences growth, it indicates that the economy is in a phase of development, with efficient and profitable companies contributing to increased earnings for shareholders. This makes company stocks more appealing, leading to an increase in stock prices and stock market indices.

Author George Filis (2009) conducted a study to explore the relationship between stock prices and the industrial GDP value. Through a VAR model, the author found that the industrial GDP value had a positive impact on stock prices, although the impact was relatively low. However, another study by author Ahmet (2009) yielded contrasting results. Ahmet analyzed the impact of various economic variables, including the industrial production index in Turkey, and found that the industrial production index had a negative impact on stock prices in the Turkish stock market.

5.1.6. Foreign Direct Investment

According to the Wikipedia encyclopedia, foreign direct investment (FDI) is a long-term investment form by individuals or companies from one country into another country by establishing production or business facilities. The capital for such direct investment can be in the form of money or other assets to carry out investment activities.

Research by author Sarbapriya Ray (2013) on the topic "The Impact of Foreign Direct Investment on Indian Stock Prices: A Granger Causality Approach" found the impact of foreign direct investment on stock prices. The author discovered a positive impact of foreign direct investment on stock prices in India, although this impact was relatively small. The reason for this is that the level of foreign direct investment into India is limited.

VI. CONCLUSION

In conclusion, the six macroeconomic factors, which are Industrial GDP, inflation rates, interest rates, exchange rates, money supply, and Foreign Direct Investment (FDI), play crucial roles in influencing Vietnam's stock market.

- Industrial GDP reflects the health of the manufacturing and industrial sectors, has a positive influence on stock prices. When industrial production is on the rise, it indicates economic growth and robust business activities, making stocks more appealing to investors.
- Inflation rates impacts the stock market in both positive and negative ways. While moderate inflation can be seen as a sign of a growing economy, high and unstable inflation can erode purchasing power and negatively affect stock prices.
- Interest rates have a profound effect on stock prices. Lower interest rates make stocks more attractive as they reduce the cost of capital, encouraging investment in stocks. Conversely, higher interest rates can deter investment and lead to lower stock prices.

- Exchange rates, when managed appropriately, can attract foreign investment, bolstering the stock market. However, rapid or unfavorable changes in exchange rates can hinder exports, potentially affecting the growth of the stock market.
- An increase in money supply, when managed in moderation, can stimulate economic activity and positively influence stock prices. However, an excessive money supply can lead to inflation and a potential devaluation of stocks.
- FDI can have a positive impact on the stock market, but its effect may be limited by the volume of investment. When foreign investors show confidence in the Vietnamese market, it can lead to higher stock prices and an influx of capital.

In summary, the performance of Vietnam's stock market is intricately linked to these macroeconomic factors. Investors, policymakers, and market participants need to monitor and manage these variables effectively to ensure a stable and prosperous stock market environment. Understanding the interplay between these factors is essential for making informed investment decisions and for promoting economic growth and stability in Vietnam's financial markets.

PROMOTING INFORMATION CAPACITY TIN THE PRIVATE ECONOMIC SECTOR TO PROMOTE RAPID AND SUSTAINABLE DEVELOPMENT

PhD.Nguyen Ngoc Anh[1], MSc.Nguyen Thi Hanh[2], PhD.Pham Tuan Anh[3]

Abstract: From the summary of experience in developing information capacity in the private economic sector, identifying the nature and characteristics of the problem of developing information capacity, the article focuses on clearly analyzing the role of information capacity for the private economic sector, the current status of the information skills development process in this economic sector, thereby proposing solutions to create motivation for the development of information capacity in this economic sector. private economic sector in the coming period in a dynamic, creative and sustainable way.

Keywords: Information capacity, private economy, rapid development…

1. INTRODUCTION

"In all economies, regardless of the country's level of economic development, the private economy always exists. The difference is only the position and role of the private sector in the economy"[4]. Since the 12th Party Congress, it has been affirmed that the private economy is an important driving force of the socialist-oriented market economy. To develop the private economy quickly and sustainably, it is necessary to promote the innovation power of this sector. Improving information capacity and innovation is unlimited potential, so the private economic sector needs to consider this as the core driving force as a premise for development in new conditions.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES:

In the current strong development trend of the economy, we realize that promoting information capacity in the private economic sector is an important content to promote rapid and sustainable development, so , from the beginning we have determined the importance of information capacity in the private economic sector, advantages and things to keep in mind when developing information capacity in the private economic sector today. Therefore, there have been studies on this content by domestic and foreign researchers to most effectively resolve the relationship between information capacity and the private economic sector in current conditions.

In general, it can be divided into 3 main groups:

Regarding theory, we can mention the works: "Initially understanding the relationship between information knowledge and information technology", Proceedings of the 6th Scientific Conference of Information and Library Students of Hanoi National University by author Tran Bich Diep, Proceedings of the International Conference on Information Literacy: "Information Literacy with Higher Education" by Author Nghiem Xuan Huy... Presented articles Presenting the content of information capacity and clearly stating the role of information capacity in the current era.

Some scientific works have also discussed this issue such as: Master's thesis in library science: "Information knowledge of students at Thai Nguyen College of Education" by author Nguyen Thi Hang, article " Information knowledge with the training of human resources in the

information and library industry" in the Proceedings of the scientific conference: Information - library industry in the information society by author Do Van Hung, article "The role of capacity information resources for university students" in the National Library Workshop "Information and communication technology platforms in information activities Libraries serve the innovation of university and college education in the integration period by author Tran Duong... The authors have focused on deeply analyzing the content of information competency with specific target audiences, students, and the learning and knowledge acquisition process of learners in the classroom. Market economic conditions are currently very volatile.

In addition, recently, Dr. Nguyen Dinh Cung - former Director of the Central Institute for Economic Management Research wrote an article "Focus on unlocking resources and promoting the endogenous capacity of the private economic sector." " and said that it is necessary to focus on unlocking resources and promoting the endogenous capacity of this economic sector, creating the majority of jobs for workers.

Regarding assessment of the current situation and research: the article "The content of information knowledge and its application at specialized library and information training institutions" by author Nguyen Thi Kim Thanh published on the Scientific Workshop Study: Information industry - librarianship in the information society; The article "Online information literacy training in university libraries in Vietnam" by author Ngo Thanh Thao and the article "The current state of information capacity of young people in today's market economy" by author Ngo Thanh Thao. Author Nguyen Huu Vien also published in Vietnam Library Magazine. Studies have carefully examined issues related to the practicality of information capacity as well as its impacts on the formation and development of each person's skills, keeping up with the need for labor selection. increasingly strict in businesses in general as well as in the currently developing private economy in particular.

Evaluation of solutions and recommendations in Promoting information capacity in the private economic sector to promote rapid and sustainable development has also been mentioned by many scientists at different levels. Notable examples include: the article "Some measures to ensure security and safety of military information networks in the new situation" by Hoang Dat Bao, the article "Information knowledge - the amount of necessary knowledge for people in the market economy in Vietnam today" by Tran Thi Quy, the article "Promoting research and dissemination of information knowledge in Vietnam" by Le Van Viet in the Journal of Information and Data. Based on a survey of the current state of information capacity of the entire society in the context of a developing country, the authors have proposed solutions on the one hand to stabilize and preserve information security, and on the other hand to promote and Propose necessary information knowledge as a tool to support people in today's increasingly developing social conditions.

Thus, the above studies all emphasize the importance of information capacity in current conditions. However, few studies focus on clarifying the role of information capacity in the private economic sector in Vietnam today.

3. METHODOLOGY AND PROPOSED MODEL

The data used in this study are mainly secondary data collected from reliable sources. Firstly, secondary data are articles and studies on information capacity and the current private economy collected from reputable sources, such as prestigious domestic specialized magazines in the list of specialized journals. section of the State Council for Professorships. Second, secondary data are data, policy documents, reports, and plans collected from international agencies, organizations, and official Vietnamese agencies and organizations, including Documents , Resolutions, Laws, plans, decrees, circulars, Decisions of the Prime Minister...

This article mainly uses secondary document research method; Text analysis methods; Compare and contrast method; and Method of analysis - synthesis... selectively, suitable for exploiting information of each content in the article.

4. INFORMATION CAPACITY AND ITS ROLE FOR THE PRIVATE ECONOMIC SECTOR

Information capacity is a concept that was first defined about 50 years ago by President of the American Information Industry Association - Paul Zurkowski in 1974. At that time, due to the rapid development of information as well as community's needs for using information resources, information capacity is seen as "techniques and skills in using various information tools as well as basic resources in establishing information solutions to user problems"[1]. However, since 1989, when the final report of the American Library Association was published, the concept of information literacy has received special attention from most educational agencies. They argue that information literacy is an understanding and a set of abilities that enable individuals to "recognize when information is needed and to be able to locate, evaluate, and use the needed information quickly and efficiently"[2].

According to UNESCO (2005): "Information capacity is the combination of knowledge, understanding, skills and attitudes that each member needs to fully integrate in the information society. Whenever individuals are competent, they develop the ability to select, evaluate, use and present information effectively". This means that information competent people must use information ethically. Access, use and dissemination of information must be in accordance with the law. According to the American Library Association ALA (2000): "Information competency is the ability to recognize one's own information needs, as well as the ability to locate, evaluate and effectively use the information found".

The Information Competency Institute of Australia and New Zealand believes that a person's information competency is the ability to identify one's own information needs; Determine the scope of information you need; appraise information and its sources actively and effectively; classify, store, manipulate and reproduce collected or created information sources; turn selected information sources into a knowledge base; Use information to effectively learn, create new knowledge, solve problems, and make decisions; Access and use legal and ethical sources of information; Use information and knowledge to exercise civil rights and social responsibilities; Experience information literacy as part of independent learning as well as lifelong self-study.

For Vietnamese people, information capacity is sometimes also called information skills; That is the ability to receive information, analyze information, evaluate information and disseminate information. In this article, we consider information competency to be more of a practical skill than a theoretical one. Based on the study of related documents, we can see that most authors have one thing in common: considering intellectual capacity as the ability to recognize information

needs, the ability to identify, search, and evaluate information, use of information as well as a willingness to share information with the community.

Today, with the rapid attack of the Internet communication network, a huge amount of information with a rapid growth rate is available anytime, anywhere, in diverse and rich forms. Information competency is a key skill, necessary in researching any field. The problem here is no longer whether information is provided sufficiently or not, but rather that information is currently provided too much, too massively and in a mixed manner. Testing the quality and reliability of information requires each person to have the ability to screen and respond appropriately to inappropriate, poor quality and unreliable sources of information. The ability to access and use information, referred to as information capacity, is the ability or skill of each person in meeting their own information needs. Information capacity is very important for improving professional qualifications and helping people develop independent and creative thinking capacity. That is the foundation and necessary capacity in all fields, working and learning environments for everyone.

The private economic sector in Vietnam is an economic sector, including enterprises, production and business establishments that are not based on state ownership of the factors of the production process, but are privately owned. , including private enterprises, limited liability companies, joint stock companies of different sizes and individual business households.

Training and developing information capacity in the private economic sector can originate from both internally and externally. Increasingly modern technology creates new supply challenges to meet the needs of previously traditional markets. The need to perceive new information for production and consumption, changing consumer expectations, requiring businesses to change production, sales, design, marketing and product distribution methods. Pressures stemming from the need to maintain and develop make the private economic sector need to innovate. The fourth industrial revolution (Industrial Revolution 4.0) has changed many traditional production methods, new labor tools and new production methods have been born. New business methods are also being formed to replace old-style business models (e-commerce, sharing economy, online management) that require people's information capacity on these issues. keep up with market developments.

In fact, Vietnam's private economic sector currently includes about 2 million individual business households and about 700,000 enterprises (98% are small and micro enterprises). The private economic sector is contributing 40% of gross domestic product (GDP), and is predicted to increase to about 70% in the next 10 years. However, to achieve this goal, the private economic sector must improve its competitiveness by updating its information, management, and market data analysis capabilities and constantly changing its capabilities. innovation, this will also help accelerate the process of industrialization and modernization of the country according to the Party's policies and guidelines. When the private economic sector develops, the socialist-oriented market economic dynamics are initiated and accelerated, creating the ability to increase scale and promote growth of the entire economy.

5. CURRENT STATUS OF INFORMATION CAPACITY IN THE PRIVATE ECONOMIC SECTOR

The expansion of the private economic sector in recent years has caused the structure of economic sectors to shift in a positive direction, increasing dynamism and using resources effectively. In the private economic sector, large businesses have been aware of the need to invest in improving information capacity to gain a better understanding, go deeper into the market, and create competitive advantages in the integration process. and develop. Large corporations and businesses have gradually linked up with universities and research institutes to promote the development of information skills in research and development activities. Some large corporations have established their own. Set up universities or research institutes to create a closed ecosystem within the system.

Small and medium-sized enterprises and micro-enterprises have begun to realize the role of information capacity and market analysis, which will bring competitive advantage to survive and develop. However, to effectively implement information capacity, small and medium-sized enterprises need human resources not only with good professional qualifications but also with financial information skills to carry out research activities. and development in the field of operation.

The private economic sector is determined to be in the early stages of development, production activities are still mainly processing and assembling. To be able to participate in the stages of creating greater added value, businesses in the private economic sector have gradually invested in depth in techniques and technology. According to data from the General Statistics Office, from 2018 to 20121, the proportion of investment spent on training, research, and experience activities to improve information capacity in Vietnamese businesses has increased, but only reached the threshold of 1% of total revenue, lower than the average level in developed countries in ASEAN (Singapore, Malaysia, Thailand...) of at least 6% of total revenue.

It can be seen that if information capacity in the private economic sector is promoted, it will promote economic growth and create a breakthrough for the country, ensuring harmony between economic growth and equity. society towards human development. Everyone is allowed to contribute equally and share benefits derived from economic growth in accordance with socialist orientation.

6. UNLEASH THE MOTIVATION TO DEVELOP INFORMATION CAPACITY IN THE PRIVATE ECONOMIC SECTOR

The viewpoint of creating motivation to promote information capacity, creating a premise for innovation to develop the private economic sector quickly and sustainably to contribute to building a socialist-oriented market economy has been Thoroughly grasped from the Resolution of the 5th Central Committee, Session XII. The private economic sector is allowed to invest and do business in areas that are not prohibited by law, meaning that the scope of activities of the private economic sector is relatively wide. The achievements of information capacity development in the private economic sector will be realized through private ownership, this is a sustainable pillar to promote private economic development. Therefore, it is necessary to focus on fulfilling the following requirements:

Firstly, promote the role of associations in exchanging information in each field of production and business. The combination of businesses with the same scope of information in the same field will overcome the problem of limited resources of the private economic sector. In the current period, industry associations should be a bridge between businesses in the industry to jointly conduct research and development activities. Results from information capacity development activities will serve research and development throughout the industry. Each association of each industry needs to promote information exchange according to the principle of “both convergence and dispersion”; Information, experience, and resources of businesses will be “converged” by the whole association to carry out research and development activities; Results from research and development will be distributed to businesses to conduct information analysis based on the unique characteristics of each business.

Second, the State's investment and support policies for information capacity development need to have a specific application address and need to be transferred to the private economic sector for application, appropriate to the scale and needs of this area, including individual business households. Organize short-term training to improve the quality of human resources in the private economic sector, update information and analyze the market. The achievements from the transfer results will create a stimulus for the private economic sector to have the motivation to focus resources and proactively carry out innovation activities in the next cycle.

Third, build creative public-private partnership (PPP) models in information exchange to connect the state economic sector, which plays a leading role, and the private economic sector, which is important driving force of the economy. The state economic sector currently has many advantages in terms of resources, which can be a platform to support the private economic sector in taking the first steps of gathering information and generating ideas. Creative achievements from the private economic sector may be transferred to the state economic sector. This process will create a bond between the two types of business, thereby creating important strength for the country's economic development.

Fourth, each individual participating in the private economic sector needs to self-advocate to improve their information capacity in many different ways. Self-motivation is the most important factor in the development process. That process is summarized in the process by which each individual in the private economic sector works, interacts with partners, and participates in domestic and foreign markets. Each working environment, each work situation will allow each person to learn basic information skills to enrich their own information capacity over time. Proactively exploiting information, connecting, learning and receiving new knowledge through different channels of the private economic sector with other economic sectors will be the key to ensuring the success of each individual. development ladder of the private economy.

Fifth, the private economic sector needs to actively access information sources about the achievements of the Industrial Revolution 4.0 and new trends. The Prime Minister has approved the Project to promote the sharing economic model. The focus of the Project is to encourage and prioritize strengthening the information capacity of businesses in general and the private economic sector in particular, placing businesses at the center of the information system. The disadvantages of the private economic sector such as small scale, limited resources, and low level of cohesion can be overcome if the achievements of the Industrial Revolution 4.0 are applied to develop new forms of economic development. new business suitable to the characteristics of the private economic sector.

CONCLUSION

Developing the private economic sector in conjunction with developing information capacity in today's era will not only ensure rapid and sustainable economic growth, but also create revenue for the state budget, in addition to It also participates in solving a series of social problems, such as creating high-quality human resources, increasing job opportunities, eliminating hunger and reducing poverty, and developing human resources.

LOGISTICS ACTIVITIES OF VIETNAMESE ELECTRONICS SUPERMARKET CHAINS

Associate Prof. Dao Thi Minh Thanh[1] , Pham Dao Thuy Linh[2]

Abstract: Logistics activities in retail supermarkets encompass a wide range of operations. The logistics efficiency of electronics supermarket chains is influenced by various factors. Enterprises dealing in electrical goods of different sizes require different logistics activities. The intent of this article is to examine the present circumstances and offer potential remedies for enhancing the logistics activities of electronics supermarket chains in Hanoi, Vietnam. The article delves into three primary subjects: (1) The fundamental principles of logistics in the retail sector, (2) Logistics operations of Vietnam electronics supermarket chains, and (3) Proposals for optimizing logistics activities within Vietnamese electronics supermarket chains.

Keywords: Electronics supermarket, logistics activities

INTRODUCTION

In the era of globalization and digitalization, the phenomenon of e-commerce has emerged as a novel business trend and sales method that cannot be overlooked by traditional retailers. Retailers in the electronics sector, which deals with products that possess high demand and rapid innovation, are increasingly engaging in e-commerce endeavors in order to expand their market share and customer base. However, the success of e-commerce heavily depends on the quality of logistics activities. Improving logistics efficiency not only results in cost savings and revenue growth, but also serves as a vital tool for retail supermarkets to better meet customer demands. Hence, the effective optimization of logistics operations within retail supermarkets, particularly electric supermarket chains, is of utmost importance in the current circumstances.

1. THE FUNDAMENTAL PRINCIPLES OF LOGISTICS IN THE RETAIL SECTOR

1.1 Theoretical framework and significance of logistics in retail businesses

1.1.1 The conceptualization of logistics in retail enterprises

The term logistics is frequently mentioned in the realm of business, particularly in the context of the global market. When the economy is not developed, logistics activities encompassed the storage, warehousing, and transportation of goods from manufacturing firms to end consumers. In the present day, logistics has emerged as a prominent field of business and is increasingly demonstrating its indispensability to both manufacturing businesses and retail businesses. Consequently, the operational aspect of logistics is receiving attention not only from the Center for Studies in Trade and Business Logistics, but also from all parties with vested interests. Various perspectives exist regarding the concept of logistics in the retail sector:

According to Gilbert (1999), "*Retail logistics includes functions related to the movement of goods, storing goods at storage points, ensuring the quantity of goods needed to meet consumer*

---

1 Email: daominhthanh@hvtc.edu.vn, Academy of Finance.

2 An Viet Trading & Investment Joint Stock Company

demand, managing and operating the distribution system." The concept mainly refers to three main aspects of logistics operations including warehouse operations, ascertaining the quantity of merchandise to replenish at each warehouse, and managing a distribution system.

Kotzab (2012) provides a definition for retail logistics as an integral component of business logistics, encompassing various tasks such as order management, storage, warehousing, transportation, and the efficient delivery of goods to the store. Moreover, this concept entails the transportation and provision of goods to the store system in order to fulfill customers' needs in a timely manner.

According to Sithole (2015), retail logistics assumes responsibility for the movement of goods from the manufacturer or intermediary to the retail enterprise's warehouse, while also organizing transportation to the retail unit until the goods are eventually sold and delivered to the customer.

There are a variety of perspectives. however, the concepts all maintain that retail logistics is an ongoing process executed at retail establishments, encompassing the movement of goods and associated information from the supplier to the retail network and ultimately to the consumer.

As the social division of labor developed, logistics became a service industry that helped optimize the production process, distribute resources, and create a foundation for the economies of countries to develop effectively. A country with a well-developed logistics system will enhance the movement of goods within both domestic and international supply chains. According to Banomyong (2008), the national logistics system includes: logistics service providers, customers utilizing logistics services, legal institutional frameworks, and logistics infrastructure. In the context of this article, the authors focus on logistics activities at retail electronics supermarket chains, focusing on three basic contents: warehousing and inventory activities, freight operations throughout the entire chain, and logistics activities conducted within member supermarkets. These mentioned activities are considered to be the most crucial in the logistics operations of electrical supermarket chains.

1.1.2 The significance of logistics in retail businesses

Business logistics and logistics activities of retail enterprises play an important role in addressing the challenge of optimizing both input and output costs for enterprises. By streamlining the costs associated with warehousing, transportation reserves, and sales, retail chains are not only able to minimize expenses, but also enhance their competitive advantage.

For retail enterprises, the function of logistics is to provide support for the processes of product consumption, ensuring the timely delivery of products to meet customer needs. Customer satisfaction is often evaluated based on the availability of goods, the ability to offer services, and the quality of service.

Logistic operations serve as an additional role in optimizing the effectiveness of goods transportation, from the point of importation the point when goods become accessible at member supermarkets., specifically:

(1) Optimizing business costs, enhancing competitiveness for retail enterprises. Practice has demonstrated that there exists a strong correlation between the expense of storing goods and the expense of transporting them. If storage costs increase, transportation costs decrease and vice versa. Therefore, the calculation to determine the minimum quantity of goods in reserve and the quantity and location of the general warehouses should be of particular concern to logistics managers of

the chains. When merchandise is able to respond promptly to sales, the revenue generated will increase accordingly. Simultaneously, cost optimization will guarantee that retail supermarkets implement numerous initiatives aimed at enhancing the quality of customer service. This, in turn, will serve to heighten the competitiveness of electrical and electronics supermarket chains within the market.

Dao Thi Minh Thanh, Nguyen Quang Tuan (2018), in order to optimize costs, retailers must design a logistics system that ensures minimal cost reduction to achieve defined business goals. To assess the reasonableness of cost levels, the following formula can be employed.

$$D = T + FW + VW + S$$

Where:

D: Total cost of the logistics system

T: Total transportation cost

FW: Total fixed warehousing cost

VW: Total variable warehousing cost

S: The total opportunity cost of sales loss due to delayed distribution

Therefore, when storage costs increase, transportation costs will decrease. Based on the above equation along with the delivery timeframe demands imposed by customers in each market to determine the optimal cost for the entire logistics system.

(2) Enabling retail enterprises to efficiently transport goods and services to customers. By accurately assessing the average stock of goods in various warehouses, it ensures that the supermarkets within the chain consistently possess an adequate supply to meet customer demands, thereby enhancing customer satisfaction and bolstering the supermarket's reputation in the eyes of the consumers.

(3) *Assisting managers in making informed decisions regarding the supply and quantity requirements of their stores*. the advent of logistics service enterprises has facilitated the manager's decision-making process regarding the relocation of reserves, the minimal inventory requirements, and the optimization of transportation expenses throughout the entire system.

1.2. Logistics activities in the super chain of electronics

1.2.1. Overview of electronics supermarkets

Decision No. 1371/2004/QD-BTM of September 24, 2004 issuing The Regulation on Department Stores and Trade Centers of the Ministry of Trade introduced the concept of supermarkets as: "*Type of modern store; general or specialized business; have a diverse structure of maple goods and ensure quality; meet the standards of business area, technical equipment and qualifications of management and business organization; have civilized and convenient service methods to satisfy the shopping needs of customers*." [4].

According to Dao Thi Minh Thanh and Nguyen Quang Tuan (2018), a supermarket is a type of self-service store that is relatively large in size, featuring low sales costs and catering to a wide range of consumer needs. These establishments are designed to offer various products, including food items, washing powders, detergents, clothing, fabrics, and other household utensils. Specialized stores, on the other hand, are establishments that focus on the sale of specific types of goods while maintaining a vast selection. Examples of such stores include clothing outlets, sports equipment vendors, furniture retailers, and electrical appliance suppliers [3].

Overal, it is possible to draw the concept of electronics supermarket as a large-scale specialized store with the method of self-service customers. According to the provisions of Decision 1371/2004/QD-BTM, the classification standard for specialized supermarkets is based on two criteria: (1) Business area and (2) Number of product names on the list of business goods. Based on this classification criterion, electronics supermarkets can be classified into 1st (I), 2nd (II) and 3rd (III) class supermarkets, as elucidated in table 1.1.

Table 1.1: Classification criteria of specialized supermarkets

Specialized supermarkets	Minimum Business Area	Minimum number of business items
I	1000m2	2000
II	500m2	1000
III	250m2	500

1.2.2 Fundamentals of logistics operations in the electrical retail chain

Warehousing and reserve activities

The promptness of product delivery is contingent upon the quantity of goods stored and the efficiency of warehouse management.

Warehouse management:

Logistics managers need to determine the number of storage points needed to accomplish defined business objectives. Typically, a greater number of storage facilities enables prompt fulfillment of consumer demands; however, the associated storage costs are typically substantial. To preserve and store goods, the electronics supermarket chain can either utilize its own warehouses or lease storage spaces from warehouse trading enterprises (warehouse rental services).

When electronics supermarkets store goods in their own warehouses, this will significantly enhance its ability to tightly regulate the operations within said warehouse. This, in turn, mitigates the potential risks associated with warehoused goods. However, the construction of proprietary warehouses necessitates a substantial amount of capital investment and lacks flexibility. This is due to the inherent difficulties that arise when attempting to relocate the warehouse location. Conversely, when utilizing a leased warehouse, the retailer is afforded a multitude of options for selecting suitable warehouse location and configuration. In this case, the average storage cost per product is usually higher when utilizing a warehouse owned by the business itself.

Inventory management

The inventory level of goods is a crucial decision in logistics management at electronics supermarket chains as electrical goods are bulky which occupy substantial space and have high unit prices. In addition, the level of commodity reserves also significantly impacts the satisfaction of customer demands. If business maintains an excessively large stock of goods, it will cost a lot of money. Conversely, a low reserve level will impede the ability to promptly respond to customer requests.

The greater the average level of stock of goods, the higher the cost of reserves, which includes storage costs, costs of capital mobilization, insurance, depreciation and amortization intangible costs. Managers who want to increase the amount of inventory need to substantiate that a substantial quantity of goods held in reserve will yield a surplus of profits surpassing the expense of additional reserves. To enhance the effectiveness of inventory management, electronics supermarket chains are making efforts to transition from make to stock to stocking based on demand.

To improve business efficiency, logistics managers in electronics supermarket chains exhibit particular concern towards amplifying sales at member supermarkets rather than diminishing inventory levels. Specifically, their primary focus lies in promptly catering to customer requirements rather than curtailing expenses.

The transportation of merchandise in electronics supermarket chains

The cost of transporting merchandise of electronics supermarket chains depends on the type of transportation used. The choice of carrier significantly impacts the cost (selling price), the ability to deliver punctually, and the condition of the goods upon arrival. All of these factors greatly influence the level of customer satisfaction.

Various means can be employed for the transportation of goods. Electronics supermarket chains must carefully evaluate the trade-off between delivery speed and shipping costs in order to determine the most efficient combination or selection of transport modes. When considering a mode of transport, it is imperative to take into account factors such as velocity, frequency, degree of reliance, capacity, and transportation expenses for each vehicle. Concurrently, the assessment of efficiency between self-transportation and rental must be conducted to make a rational choice.

Transportation costs at electronics supermarket chains include the cost of transporting products from suppliers to warehouses of supermarket systems; and the cost of transporting them from the chain's warehouse to the warehouses of the member supermarkets, and finally, the cost of delivering the goods to the customers.

The efficiency of logistics operations in the electronics supermarket chain is determined by conducting a cost analysis. In conducting such analysis, it is imperative to concentrate on the underlying principles that pertain to the economics of transportation and warehousing. This particular framework treats the act of transporting and storing goods as a distribution system that possesses the ability to curtail expenses archieving business objectives. Consequently, electric supermarket chains must be cognizant of the fact that achieving the lowest possible savings in logistics systems does not necessarily entail incurring exorbitant costs in transportation or warehousing. At the very least, the aim should be to reach an optimal level of expenditure that ensures the utmost satisfaction of customer expectations, thereby attaining the prescribed business objectives.

2. LOGISTICS OPERATIONS OF VIETNAM ELECTRONICS SUPERMARKET CHAINS

To evaluate the logistics situation of Vietnam electronics supermarket chains, the authors conducted a survey among managers of electronics supermarket chains with store systems across the country. However, due to time constraints, it is recommended to focus on surveying owners of Vietnam electronics supermarket chains that already have member supermarkets in Hanoi.

2.1. Warehouse activities of Vietnam electronics supermarket chains

Warehouse operations

At Vietnam electronics supermarket chains, warehousing involves three stages: receiving, warehouse operation and shipment. During the phase of receiving, most enterprises ensure the level of mechanization in the loading and unloading process, as well as the implementation of information technology in the overall management of the warehouse. Most of the goods at the Vietnam electronics supermarket chain are stored in a centralized warehouse, before being distributed to individual supermarket members based on their specific receiving requirements.

The survey results show that there are certain differences in the selection of storage facilities of Vietnam electronics supermarket chains. Some of these chains build their own warehouses, which encompass two distinct categories: the chain's warehouses and storage within member supermarkets. Such a practice is usually adopted by large supermarket chains such as Dien May Xanh, The gioi Di dong. On the other hand, other electronics supermarket chains adopt a combination of rental warehouses and self-built warehouses. Typically, large-scale warehouses serving the entire business chain tend to utilize rental warehouses, transfer warehouses, and warehouses located within member supermarkets as their designated storage facilities.

Reserve operations:

One of the crucial demands of Vietnam electronics supermarket chains is to guarantee the availability of products to fulfill customers' needs immediately after their purchase. Therefore, an immediate stock of goods is necessary at the point of sale. This stock of goods is primarily stored in the storage, on shelves, stalls, and counters in the sales areas of each member supermarket. Additionally, when Vietnam electronics supermarket chains employ transit warehouses, the goods are also stored there and subsequently transferred to member supermarkets within the optimal distance, as stipulated by the regulations of each chain. In order to optimize their reserves operation, these chains often strive to push their stock towards the supply side. However, this requires close collaboration between the chain and its suppliers. In reality, the retail market in Vietnam as a whole currently faces deficiencies and weaknesses in these aspects. Consequently, all Vietnamese electrical retail chains in the surveyed sample (100%) still manage and conduct their inventory of goods.

Vietnamese electronics supermarket chains always adopt a proactive approach in managing the optimal level of stock to ensure timely receive and deliver of goods with the assistance of computer systems. Regarding imports, the computer system automatically generates additional orders when the quantity of goods on the shelves falls below the predetermined reserve standard or is based on sales data recorded at the checkout. The import procedure is illustrated in Figure 2.1.

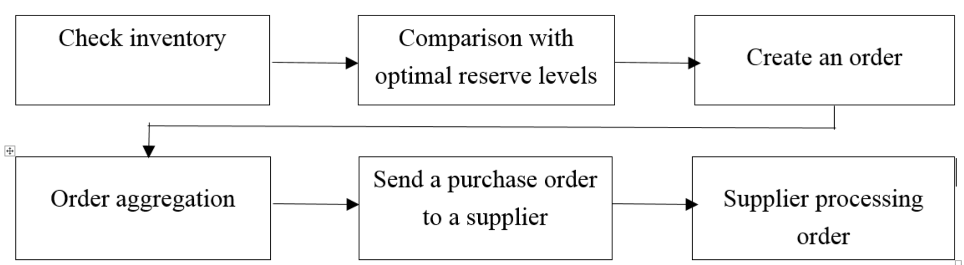

Figure 2.1 Reserve management model at Vietnam Supermarket Chains

Source: Description based on interview results

According to Decision No. 1371/2004/QD-BTM of the Minister of Trade: " Issuing the Regulation on department stores and trade centers", it is necessary for supermarkets to satisfy the demands of customers by ensuring the appropriate number of merchandise categories based on their classification. Specialized supermarkets are required to offer a range of goods between 500 and 2,000 items. The survey results show that certain large electronics supermarket chains such as Dien May Xanh, Tran Anh, The gioi Di dong,... following a business model that entails both physical store sales and online catalog sales, satisfied the conditions of first-class specialized supermarket.

Based on the survey findings, there exists considerable disparity in reserve requirements, product varieties, and consumption capacity among Vietnam electronic supermarket chains Consequently, each chain must establish specific reserve policies for each category of goods. The managers of these chains must calculate an appropriate inventory level to satisfy customer demands until the subsequent replenishment cycle. Presently, many electronic supermarket chains in Vietnam have only achieved a moderate level of efficiency in inventory management optimization. This deficiency can be attributed to the challenge of accurately determining the optimal inventory level, which heavily relies on sales forecasts for each supermarket within the chain. Precisely predicting future demand poses a formidable challenge, as electronics supermarket chains presently rely primarily on past sales figures and account for future promotional programs, without analyzing the influence of macro and micro factors on market demand.

2.2. The transportation operations within Vietnam electronics supermarket chain

In fact, the transportation of goods of Vietnamese electronics supermarket chains is conventionally managed by suppliers. Subsequently, the responsibility of transporting these goods to the chain' warehouses or delivering them directly to the member supermarkets of each chain falls upon the supplier. The objective of the Vietnamese electric and mechanical supermarket chain is to continue delivering goods from its warehouses to its network of supermarkets. Vietnam electronics supermarket chains on a smaller scale characterized by a limited network of supermarket systems and reliance on supermarket warehouses, prefer direct shipping. Conversely, larger-scale chains, boasting a network of supermarkets across various provinces, prefer centralized transportation methods. Incoming goods are transported to the warehouse with the intention of monitoring the caliber of imported products and guaranteeing the provision of merchandise to all establishments within the supermarket network. The process of arranging transportation for the electrical and electronic supermarket chains in Vietnam is elucidated in Figure 2.2.

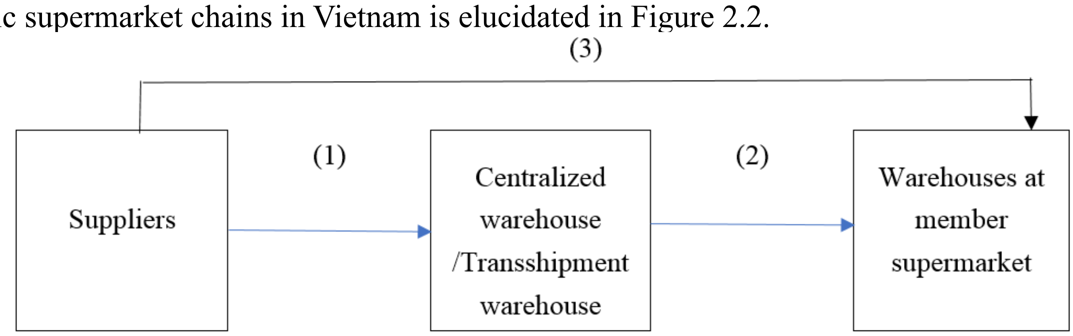

Figure 2.2 Input transportation organization of Vietnam electronics supermarket chains

(Source: Survey Results)

According to the findings of the survey, 60% of electronics supermarket chains employ a direct transportation system to centralized warehouses, whereas 40% opt for transporting goods to warehouses located within member supermarkets. This outcome aligns well with the distinctive characteristics of the electrical goods industry.

Nonetheless, certain prominent chains, which possess numerous points of sale within a province or city, typically adopt a strategy of shipping products to a centralized feeder warehouse and subsequently distributing them to individual member supermarkets. This approach was chosen by 40% of the surveyed supermarkets. Although this mode of transportation incurs higher transportation costs for the Vietnamese electrical retail chain, it ensures a higher level of product quality and guarantees compatibility in terms of the quantity of goods supplied to each supermarket and the customers' demands. Consequently, this method minimizes the occurrence of discounted items resulting from slow sales.

2.3. Direct logistics operation at member supermarkets

The direct logistics operations at member supermarkets are conducted through a series of four primary stages. Firstly, the receipt stage, wherein goods are obtained directly from suppliers or warehouses. During this stage, the goods undergo a thorough inspection to ensure they meet the required standards of quantity, quality, and type. Once the receipt stage is complete, the goods are then transferred to the storage area. The duration of storage differs depending on the type of goods. Subsequently, the goods are prepared for launch and displayed on booths for sale. Finally, the goods are transported to the customers.

According to the survey, the application of the aforementioned processes varies due to differing business characteristics. Typically, supermarket chains that specialize in electrical and electronic goods, particularly those that integrate online sales, have a dedicated shipping stage for customers with specific interests.

When evaluating the level of development in direct logistics, the investigation reveals that logistics activities at member supermarkets are relatively satisfactory. However, in certain chains of electronic supermarkets in Vietnam, the delivery of goods to customers lacks uniformity in terms of service quality.

Given the unique nature of Vietnam electronic supermarket chains are having member supermarkets scattered across the country, each with a large size, the volume of goods in circulation is substantial. Simultaneously, some retailers providing warehouse and transportation services fail to meet the requirements set by Vietnam electronic supermarket chains. Consequently, most of these chains opt for partial outsourcing, such as warehouse services or specific transportation stages, or undertake all their own logistics operations. This approach can lead to an increase in the logistics costs incurred by Vietnam electronic supermarket chains.

3. PROPOSALS FOR OPTIMIZING LOGISTICS ACTIVITIES WITHIN VIETNAMESE ELECTRONICS SUPERMARKET CHAINS

3.1 Warehouse and Inventory solutions

Solutions for warehouse operations and management

The development of indicators to assess the efficiency of warehouse management plays a crucial role in reducing costs, enhancing the ability to address customer demands promptly, and establishing the inverse relationship between warehousing and transportation expenses.

Measuring effectiveness and evaluating the expenses associated with warehouse operations are essential prerequisites for businesses to gauge the efficacy of warehouse management during each period. The indicators used for this purpose include storage duration, utilization rate, and warehouse costs, as well as delivery time.

The integration of warehouse management software with additional technologies enables effective warehouse management, particularly in terms of managing the flow of goods (i.e., import, storage, internal movement, and dispatch) and monitoring the progress and timing of deliveries among stakeholders. Based on this, the calculation of storage costs is performed by either utilizing the warehouses of the Vietnamese electronic supermarket chains or renting external warehouses.

Enhancing the centralization of warehouses is a strategy to optimize shipping costs while maintaining prudent warehousing expenses.

Optimizing reserve operations

Optimization of reserve operations is accomplished by the application of information technology to minimize the quantity of goods held in reserve while still satisfying customer demands in a timely manner. To determine the most optimal level of reserve for Vietnamese electronic supermarket chains, it is imperative to rely on pertinent data, including average import time, maximum delivery time as per customer requirements, sales figures of each supermarket in the chain, and other relevant factors. Additionally, it is essential to analyze the potential impact of future influencing factors on the aforementioned aspects. This necessitates a combination of information systems, automation, and artificial intelligence throughout the Retail Businessman's Supply Chain Management process. However, the survey results indicate that no Vietnam electronic supermarket chains in the sample have implemented these measures in a synchronized manner. Therefore, to optimize the inventory, Vietnam electronic supermarket chains need to employ a synergy of information systems, automation, and artificial intelligence in supply chain management, spanning from procurement to distribution to the end consumers. When determining the ideal quantity of goods to keep in reserve, it is crucial to clearly define the following: the amount of goods stored at each warehouse in the chain, the quantity of goods held at each member supermarket, and the quantity of goods in transit (including the amount received, the amount en route, and the amount pending delivery from suppliers). The optimal stock quantity refers to the quantity of goods that ensure the optimization of transportation and storage costs, while still effectively meeting the demands of customers and each member supermarket.

3.2 Solutions to optimize transportation operations

To ensure the efficacy of transportation operations, it is important for Vietnam electronic supermarket chains to meticulously select the appropriate means of transportation, regularly monitor and assess the quality of outsourced transportation services. This is particularly crucial for Vietnam electronics supermarket chains that primarily trade items with high unit transportation costs, as well as items that necessitate installation services and user manuals for customers. Consequently, the selection and regulation of transport units become pivotal and obligatory in this scenario. The decision to employ a transportation company or a chain of electronic supermarkets in Vietnam for the purpose of transporting and delivering goods to customers should be made based on the ability to control and the requirements to ensure the quality of goods during transportation.

If the Vietnam electronics supermarket chain decides to conduct its own large-scale transportation operations, the manager may contemplate utilizing Transportation Management software to strategize, implement, and optimize the transportation of goods.

In order to optimize shipping expenses, specific measures are indispensable to enhance orders in which the supplier provides free shipping to the chain's warehouse, and more importantly, to the warehouse of each member supermarket.

3.3 Recommendations

For the State: it is fundamental to establish mechanisms that facilitate the advancement of infrastructure for logistics activities and the proliferation of logistics service enterprises such as transportation services, warehousing services, consulting services, and others. Additionally, it is crucial to enact effective management, inspection, and supervision of logistics activities as a whole and logistics service enterprises specifically, to ensure the wholesome development of this market. This entails dealing strictly with any violations that may arise. Furthermore, it is essential to adopt a policy that attracts investors, notably foreign investors, to participate in Vietnam's logistics services market.

For retail supermarket chains in Vietnam: it is essential to formulate a financial plan that enhances the efficiency of logistics operations within the chain. Particular attention should be given to allocating funds for the application of information technology and artificial intelligence, among others. Additionally, there exists a solution to entice competent logistics personnel to join the chain.

For logistics service businesses: it is imperative to prioritize the enhancement of service quality to mitigate risks for electrical and electronics supermarket chains in Vietnam. Warehouse businesses must guarantee the quality of warehoused goods and implement technological advancements in warehouse management to minimize import and export duration for electronic supermarket chains. In addition to ensuring timely delivery of goods, transportation services should also prioritize the safety of transported goods and provide training to delivery personnel to cultivate a positive customer-oriented mindset.

Conclusion: Logistics operations are a pivotal element that holds significance in enhancing the efficacy and competitiveness of electronic supermarket chains in the Vietnam market. The optimization of logistics efficacy not only aids Vietnam electronic supermarket chains in cost reduction and profit augmentation but also contributes to the enhancement of customer satisfaction, thereby establishing a reputable image, gradually fostering brand development in the market, and heightening competitiveness.

FACTORS AFFECTING NIGHT-TIME ECONOMIC DEVELOPMENT IN THE SOUTH CENTRAL PROVINCES OF VIETNAM

Ph.D Nguyen Thi Le Huyen[1], Ph.D Nguyen Thi Phuong Ngoc[2], MA. Nguyen Thi Quynh Duyen[3]

Abstract: *The study's objective is to analyze factors affecting the development of the night-time economy in the South Central provinces of Vietnam. The study conducted Cronbach's Alpha testing, EFA, and regression analysis based on data collected from 435 valid survey forms (representatives of local management agencies, representatives of businesses/households, and local people). Research results show that seven factors, including policy mechanism, infrastructure, human resources, product and service diversity, linkage and cooperation between localities, communication and promotion strategy, and awareness, positively impact the development of the NTE in the South Central provinces of Vietnam. Based on the research results, the authors have some proposals to improve the effectiveness of night-time economic development in the region.*

Keywords: *night-time economic development, South Central Provinces, Vietnam*

1. INTRODUCTION

The night-time economy (NTE) is a critical economic development strategy for many countries worldwide. In Vietnam, on July 27, 2020, the Prime Minister issued Decision No. 1129/QĐ-TTg on Approving the Project to develop the NTE in Vietnam with the hope that in addition to making a significant economic contribution to the economy, the NTE can create significant changes for the domestic service and tourism industries, creating new momentum for economic recovery, especially after the downturn caused by the impact of the Covid-19 pandemic. Several types of night economy have been deployed recently in big cities in Vietnam, concentrated in some areas such as Ta Hien (Hanoi), Bui Vien (Ho Chi Minh City), and Ba Na Hills (Da Nang). However, in general, night-time economic activities in Vietnam have recently only been exploited on a small scale, individually and fragmented in some areas, and have yet to make a mark.

Considering the South Central region of Vietnam alone, this region has 07 provinces and one central city, including Quang Nam, Quang Ngai, Binh Dinh, Phu Yen, Khanh Hoa, Ninh Thuan, Binh Thuan, and Danang City. These are lands favored by nature, converging many conditions to develop the NTE, especially tourism. However, most of these localities do not yet have attractive mechanisms and financial policies to encourage businesses, organizations, and households to participate in night services. Meanwhile, the trend of integration, globalization, and fierce economic competition requires countries to strive to find and create new competitive advantages, and The NTE promises to be a new driving force for growth, which helps improve long-term competitive advantage in Vietnam in general and the South Central provinces in particular. In the world, many studies on the NTE related to the following aspects: measuring the NTE's development and the NTE's negative impacts. However, quite a few studies analyze factors affecting the NTED. In Vietnam, many authors have researched the factors affecting the NTE's development in some

[1] University of Finance and Accountancy, Email: nguyenthilehuyen@tckt.edu.vn.

[2] University of Finance and Accountancy.

specific provinces/cities, such as Bac Giang, Hanoi, and Ho Chi Minh. However, there needs to be research on this issue specifically for the South Central region.

Starting from the above gap, the research focuses on identifying factors affecting the NTED, testing the factors' impact, thereby providing appropriate recommendations to help provinces/cities in the South Central region make changes and adjustments to develop the NTE effectively in the coming time. The content of the research article will include the following parts: (1) Introduction; (2) Theoretical basis and Research Model; (3) Research methods; (4) Research Results and Discussion; (5) Conclusion and Policy Implications.

2. THEORETICAL BASIS AND RESEARCH MODEL

2.1. Theoretical basis

2.1.1. Night-time economy

"Economy" is a widely recognized term for all production, distribution, exchange, and consumption activities of a community or country's goods and services. "Night" is the time of day, usually from sunset to sunrise. The scope of the NTE in each country can be broad or narrow depending on night-time consumption trends and behaviors between countries and the diversity and dynamism of each country's culture, society, and economy.

In the world, "Night-time economy" is a term (or an idea) that appeared in entertainment in urban areas after the 1960s. At that time, scholars called this phenomenon many different names, such as: "cultural economy" (Scott, 2000), "fun services" (Hannigan, 1998), or simply "urban entertainment" (Hollands and Chatterton, 2003).

In 1978, a term with a similar meaning also appeared: "the 24-hour city" (Melbin, 1978) referring to the integration of emerging entertainment industries in the capital market, creating a new trend/a new type of economy and consumer culture - where new policies and regulations are put to the test to encourage alcohol-related activities and entertainment activities at night. Since then, the term "24-hour city" has been used to describe the exciting economic and social opportunities a "non-stop" city can offer.

In their studies, authors (Robert et al., 2006) and Tabbot (2006) define the NTE as a concept that refers to economic activities during the period from 6:00 pm the previous night to 6:00 am the following day and spreads across many fields, including transportation, private sector criminal justice, services . Thus, the daytime economy stops from 6:00 pm the previous night to 6:00 am the following day, giving way to the NTE.

In the publication "A Guide to Managing Your NTE" (Sound Diplomacy & Andreina Seijas (2020), the NTE is divided into two parts: the evening economy ranges from 6:00 am to 12:00 pm and the late-night economy from 12:00 am to 6:00 am the following day – when the morning rush hour begins. According to this division, some cities are determined to develop according to the 24-hour city model (for example, New York, Amsterdam) and allow businesses to operate around the clock.

In Vietnam, the term "Night-time economy" is officially mentioned in Decision No. 1129/QĐ-TTg approving the Project to develop the night economy in Vietnam dated July 27, 2020 (from now on, abbreviated is Decision No.1129/QĐ-TTg), according to which: "The NTE is not a separate part of the economy. In the immediate future, developing the NTE aims to promote domestic consumption and develop tourism by developing cultural, entertainment, food, shopping, and travel services from 06:00 the previous evening to 06:00 am the next morning".

There are many different definitions and understandings of the NTE. Within the scope of this research, it can be understood that "The NTE is a part of the economy, including cultural, entertainment, food service, shopping and tourism activities that take place" from 6:00 pm the previous night to 6:00 am the following day.

2.1.2. Night-time Economic Development

According to Decision 1129/QĐ-TTg, "Development of the NTE must be based on respect and harmony of supply and demand in the market, without imposing the subjective thinking of management agencies. Accelerate piloting towards a 24-hour economy for cities/urban areas with great potential for night-time economic development. At the same time, improve the awareness and capacity of localities, businesses, and people about the NTE, thereby promoting the participation of the residential and business community" and "Do not encourage the development of night economic activities after 10 pm on a large scale, but develop with focus and emphasis."

According to (Lin et al., 2022), the development of the NTE plays an essential role in local development. Among them, the most significant and direct impact of night-time economic development is taking advantage of public places and commercial establishments at night to increase employment opportunities for people (Bianchini, 1995). In addition, promoting the development of the NTE also helps promote the development of related industries (service, catering, transportation, retail, and consumer promotion) (Heath, 1997; Hobbs et al., 2005). Regarding economic significance, Chew (2009) affirms that the economic benefits brought by the NTE are enormous, including: "industrial restructuring, reducing environmental pollution, creating jobs to a large number of people, regenerate and develop urban areas, create favorable conditions for domestic consumption, and bring in revenue from local taxes." It can be seen that the majority of studies on night-time economic development focuses on an "economic" perspective; however, it is also necessary to carry out studies that evaluate both the economic impact and the social impact of urban nightlife (Bianchini, 1995).

Regarding social significance, Yao et al. (2022) believe that although there are many positive impacts, such as diverse entertainment activities creating jobs for local people, Night-time economic development also comes with alcohol consumption and many other social impacts. According to Chew (2009), "If the level of negative impact on society of the NTE is excessive, then developing it is unreasonable even though it brings significant economic benefits."; Furthermore, the NTE's social impacts vary between countries and regions within each country. Clearly, "Not only tourists, if local people see the excitement of urban nightlife, they will be more open to participating in entertainment activities after work" (Heath, 1997).

Environmentally, the encroachment of night entertainment activities can lead to noise and dust pollution from late-night traffic activities, affecting residents in night entertainment areas. Similarly, Shaw (2010) argues that there have been many concerns about violence and health from the impact of nightlife. According to Son et al. (2023): "Sustainable night-time economic development is evaluated according to the following aspects: economy, society, environment, safety and security, urban planning and design, and politics and regulations. When these aspects are balanced, the development of the NTE can contribute to the community's common good, enhancing local attractiveness and thereby supporting long-term economic growth."

Synthesizing the views of previous studies, harmonizing with the opinion in Decision 1129/QĐ-TTg, the authors approach the view of developing the NTE in the study as follows: "Development of the NTE is economic development simultaneously meets economic, cultural, social and environmental requirements, ensuring harmony of interests of entities participating in economic activities, based on exploitation and use local resources reasonably and aim to build a 24-hour economy". According to this perspective, the assessment of night-time economic development includes three aspects: (1) Economic growth, (2) Preserving and promoting core traditional cultural and social values, and (3) Raising environmental awareness by meeting the needs of local people and tourists. Night-time economic development must aim at efficiency, ensuring that the overall efficiency of the local economy is greater than the total costs, ensuring economic growth associated with sustainable development.

2.2. Research Model

Policy mechanism (PM)

A policy mechanism is a system of documents (laws, regulations, resolutions, development strategies) issued to harmonize the rights and responsibilities of individuals and organizations in a social order toward the synthesis of community interests. In night-time economic development, the State's policy mechanism plays a vital role - it is a guideline to help localities have clear directions in development, creating an overall sustainable NTE regionally and nationally. According to Roberts and Eldridge (2009), the development of the NTE must be connected to relevant Government policies. The role of the policy is shown in the fact that night entertainment venues (restaurants, bars, clubs) are not allowed to stay open until late without a government license. In addition, government policies are also related to supporting the provision of public transport, security, protection, and environmental services to ensure the maintenance of night-time economic development (Hobbs et al., 2003). In Vietnam, Son et al. (2023) believe that the legal framework and policies to promote the development of the NTE need to be made available in Vietnam, based on the results: "If institute and environment increase by 1%, then NTE in Hanoi will increase by 0.152%".

H1: Policy mechanisms have a significant impact on night-time economic development

Infrastructure (IN)

Infrastructure is the physical, technical, and social institutional conditions that serve production activities and human life. Research on the impact of infrastructure on night-time economic development by Son et al. (2023) shows that "If infrastructure and safety increases by 1%, then the NTE in Hanoi will increase by 0.157%". The infrastructure mentioned by the authors here includes transportation systems, roads, electricity, water, restaurants, shops, and motels. In addition, according to Tai et al. (2022), "the variable Infrastructure and public utility services have the second decisive influence on Developing night-time economic services in Bac Giang (standardized Beta = 0.231). So, infrastructure must be invested in and developed for the NTE to develop synchronously and exploit Vietnam's tourism, culture, and art potential. On the other hand, the types connected in a synchronous and tight infrastructure will create conditions for transparent and precise management, avoiding potential risks.

H2: Infrastructure has a significant impact on night-time economic development

Resources (RE)

Depending on geographical location, natural conditions, history of formation, and development, each locality and region will have different economic development resources. Resources for developing the NTE can include natural landscapes, cultural heritages, historical sites, cultural events, traditional art forms, and local products... These resources will determine the advantages the locality can exploit (or, in some cases – bring certain disadvantages). The results of the study by Son et al. (2023) show that "If natural resources increase by 1%, then the NTE in Hanoi will increase by 0.099%". In Shaw's study (2014), the author mentions the significant impact of this factor on the sustainable development of the NTE.

H3: Resources have a significant impact on night-time economic development

Human resources (HR)

Human resources play an essential role in economic development in general, especially the NTE. The night-time economic activities are mainly experiential activities at night about entertainment, arts and culture, and cuisine, with the target audience being domestic and foreign tourists. This requires a human resource with skills and knowledge in tourism, accommodation, tour guides, etc., and passion and enthusiasm. According to Hobb et al. (2003), "Night labor – although widely agreed to be an important aspect of the political economy of the night – remains an area often neglected by many scholars". Similarly, Chew (2009) mentions that "Night-time labor deserves scholarly attention as the sizes of night-time economies worldwide continue to grow." According to Tai et al. (2022), "the variable human resources have a positive influence on night-time economic services development in Bac Giang" with the standardized beta factor = 0.186.

H4: Human resources have a significant impact on night-time economic development

Product and service diversity (PS)

Products and services are the core factors of economic activities and NTE, in particular. Products and services serving the development of the NTE include (1) Cultural and entertainment activities, (2) Catering services, (3) Shopping services, (4) Travel services. Products and services also affect visitors' return ability and willingness to recommend a destination to relatives, friends, and colleagues. Furthermore, local people are also potential customers when products and services are diverse and attractive enough to make them leave the house at night. Therefore, diversifying products and services to develop the NTE will help localities quickly succeed in forming a NTE. The authors proposed the Product and service diversity variable and received high consensus when consulting experts.

H5: The diversity of products and services has a significant impact on the development of the NTE

Linkage and cooperation between localities (LC)

According to experts, if the provinces/cities in the South Central region carry out joint activities on developing the special economic zone, it will positively impact the development of the NTE in both the region and each locality. Each locality in the region has yet to form its mechanisms, policies, and development orientations for the NTE. Therefore, regional integration to increase the night-time economic development capabilities and opportunities has not received adequate attention. The authors propose the LC variable as one of the factors that can potentially impact the development of the NTE in the South Central region of Vietnam. After consulting, some experts have proposed additional scales for this variable.

H6: Linkage and cooperation between localities have a significant impact on the development of the NTE

Communication and promotion strategy (CP)

Communication, advertising, and promotion activities are propaganda, promotion, and advocacy activities aimed at finding customers and promoting opportunities, thereby increasing benefits. In the modern economic context, almost all economic activities - including the NTE - are challenging to reach potential customers, investors, and partners without effective communication and promotion strategies. According to Dupeyras and MacCallum (2013), social media provide an essential source of information and, therefore, significantly impact consumer decision-making in the digital era. The results of the study by Son et al. (2023) showed that "if promotion and sharing increases by 1%, then NTE in Hanoi will increase by 0.23%" and determined that this is the factor that has the most significant impact on the development of the NTE in Hanoi.

H7: Communication and promotion strategies have a significant impact on the development of the NTE

Awareness (AW)

To develop local economic activities, it is necessary to understand the impact of cognitive factors on the ability to accept, support, and join hands in local people's and management agencies' economic activities. Suppose the perception leans in a negative direction; it will have an adverse impact, creating negative actions and protests from local people. Besides, many management agencies have the mindset of "if you cannot manage it, then ban it," so, with easily noticeable negative impacts from this type of NTE, it is easy for localities to "ignore" opportunities from the night economy. In their study, Son et al (2023) determined that one of the main reasons why night-time economic activities in Vietnam and Hanoi are underdeveloped is due to limited awareness of its importance and role, and many concerns and reservations remain when planning economic development policies at night. According to Tai et al. (2022), the group of factors belonging to the participation of the local community in night economy development influences night economic development; however, the level of influence is not high (standardized Beta coefficient of 0.121). In this study, the authors expect to find a positive impact of awareness on night-time economic development.

H8: Awareness has a significant impact on night-time economic development

From the above hypotheses, the research model is proposed as follows:

$$\boldsymbol{Y(NTED) = \alpha + \beta_1 PM + \beta_2 IN + \beta_3 RE + \beta_4 HR + \beta_5 PS + \beta_6 LC + \beta_7 CP + \beta_8 AW + \varepsilon}$$

In there:

- Y (Dependent variable): Night-time Economic Development (economic, social, and environmental aspects) in the South Central provinces of Vietnam (NTED)

- Independent variables (X_i): Policy mechanism (PM); Infrastructure (IN); Resources (RE); Human resources (HR); Product and service diversity (PS); Linkage and cooperation between localities (LC); Communication and promotion strategy (CP); Awareness (AW)

- Slope coefficient (k=1, 2, … 8)

α: Intercept coefficient of the regression function

$\beta_1, \beta_2, \ldots \beta_9$: Coefficients show the influence of the independent variable on the dependent variable

ε: Random error

3. RESEARCH METHODS

3.1. Research scales

The summary scale is referenced by the author from the studies of Tai et al. (2022), Son et al. (2023), and Nam (2023). However, the research problem is still relatively new, especially for the South Central region of Vietnam. Therefore, the expert method was chosen to record comments on the content and relationships between factors in the proposed research model. Based on the summary scale, the study conducted semi-structured interviews with 20 experts (10 experts from local management agencies and 10 lecturers at universities and research institutes). The experts selected for the survey met the following criteria: (i) Have knowledge about NTE; (2) Have appropriate professional qualifications (bachelor of economics or higher); (iii) Have ever participated in night-time economic activities or tourism in the South Central provinces; (iv) Working in departments/ agencies, universities, and research institutes related to the field of economics.

The interview results showed that all experts (20/20) agreed on the eight independent variables in the proposed research model. In addition, experts propose adding measurement scales for some factors in the model. The official scale after consulting experts is in the Appendix.

Table 1: Factors affecting the development of the NTE

Variable	Factor	Source
X1	Policy mechanism (PM)	(Hobbs et al., 2003); Roberts and Eldridge (2009); Tai et al (2022); Son et al (2023); Nam (2023)
X2	Infrastructure (IN)	Tai et al (2022); Son et al (2023); Nam (2023)
X3	Resources (RE)	Shaw (2014); Son et al (2023)
X_4	Human resources (HR)	(Hobbs et al., 2003); Chew (2009); Tai et al (2022); Nam (2023)
X_5	Product and service diversity (PS)	Suggested by the authors, with expert consultation
X_6	Linkage and cooperation between localities (LC)	Suggested by the authors, with expert consultation
X_7	Communication and promotion strategy (CP)	Dupeyras and MacCallum (2013); Son et al (2023)
X_8	Awareness (AW)	Tai et al (2022)
Y	Night-time Economic Development (NTED)	Chew (2009); Shaw (2010); (Yao et al., 2022), (Lin et al., 2022); Tai et al (2022); Son et al (2023); Nam (2023)

Source: Suggested by the authors, with expert consultation

3.2. Data

According to Hair et al. (2010), the minimum sample size for exploratory factor analysis (EFA) is 50. At the same time, to ensure reliability, the ratio of observations to 1 analyzed variable is 5:1 or 10:1. The scale has 43 measurement variables, so the minimum scale is 430 samples (ratio 10:1). To ensure the representativeness of the research sample, based on consultation with experts, the number of survey samples is as follows:

Table 2: Distribution of survey questionnaire samples for each South Central province

No	Place	Number of representing local management agencies survey forms	Number of enterprise/ business household survey forms	Number of local people's survey forms	Add
1	Danang City	10	15	35	60
2	Khanh Hoa	10	15	35	60
3	Binh Dinh	10	15	35	60
4	Quang Nam	10	15	35	60
5	Binh Thuan	10	15	35	60
6	Phu Yen	10	15	35	60
7	Ninh Thuan	10	15	35	60
8	Quang Ngai	10	15	35	60
Total		80	120	280	480

Source: Compiled from survey results by the authors

The survey was conducted directly in 04 provinces/cities: Danang City, Quang Ngai, Binh Dinh, Khanh Hoa, and via email for the remaining 04 provinces. The locals surveyed were mainly people currently living where night-time activities occur. For localities not directly surveyed, the authors distributed and received questionnaires through representatives of management agencies. In total, 458 survey forms were collected, of which 435 were valid. Of the 435 valid surveys, 80 were obtained from representatives of local management agencies (100%), 112 were obtained from representatives of enterprises/business households (93.33%), and 243 survey forms were obtained from local people (86.79%).

4. RESEARCH RESULTS AND DISCUSSION

4.1. Testing reliability and validity

Based on the collected data, the authors encoded and entered data into SPSS26.0 software and performed necessary testing. The inspection results are as follows:

4.1.1. Cronbach's Alpha test

Table 3: Cronbach's Alpha test results

Independent variables	Symbol	Number of scales	Cronbach's Alpha
Policy mechanism	PM	05	0,873
Infrastructure	IN	05	0,825
Resources	RE	05	0,833
Human Resources	HR	05	0,901

Product and service diversity	PS	05	0,877
Linkage and cooperation between localities	LK	05	0,792
Communication and promotion strategy	CP	05	0,891
Awareness	AW	05	0,766

Source: Compiled from calculation results with the support of SPSS26.0

The test results show that Cronbach's Alpha of the dependent and independent variables is more than 0.7. Thus, the independent variables are retained to perform the following analysis steps. The test results show that the scales are suitable, reliable, statistically significant, and can be used for EFA exploratory factor analysis.

The Cronbach's Alpha test results show that the highest Cronbach's Alpha coefficient belongs to the variable "Human resources" (0.901); The variable with the lowest Cronbach's Alpha coefficient is "Awareness" (0.766). In addition, the model's independent variables all have Cronbach's Alpha coefficients greater than 0.7. Thus, the scale is considered reasonable, appropriate, and reliable enough to conduct EFA exploratory factor analysis (Hulland, 1999).

4.1.2. EFA exploratory factor analysis

After testing reliability using Cronbach's Alpha, the authors conducted an EFA exploratory factor analysis; the results were as follows:

Table 4: Results of KMO and Bartless's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0,803
Bartlett's Test of Sphericity	Approx, Chi-Square	15.117,236
	Df	1.298
	Sig.	0,000

Source: Compiled from calculation results with the support of SPSS26.0

According to the KMO table and Bartlett's Test, we have the coefficient KMO = 0.803 > 0.5 with Sig. = 0.000 is less than 0.05, so the variables are correlated in the population, and the EFA analysis for the independent variables is significant. In addition, nine factors are extracted in the extracted variance table according to the standard Eigenvalue>1. The total variance extracted is 60.295% (more significant than the standard level> 50%), which means eight groups of factors explain 60.295% of the variation of the data. (Hair et al., 2010). Thus, the EFA exploratory factor analysis results ensure the discriminant and convergent validity standards and are qualified for further analysis.

4.2. Regression analysis

Table 5: The appropriateness of the regression model

Model Summary					
Model	**R**	**R Square**	**Adjusted R Square**	**Std, Error of the Estimate**	**Durbin - Watson**
1	0,764[a]	0,652	0,695	0,12295	1,837
a. Predictors: (Constant), PM,IN,RE,HR,PS,LC,CP,AW					

Source: Compiled from calculation results with the support of SPSS26.0

The results of measuring the model fit show that the selected model is appropriate with adjusted R squared = 0.695 - meaning independent variables explain 69.5% of the variation of the dependent variable (Night-time economic development). Besides, Durbin – Watson value = 1.837

(range from 1.5 to 2.5); therefore, the model does not violate the first-order serial autocorrelation assumption (Qiao, 2011).

Table 6: ANOVA analysis of variance

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	43,629	8	6,728	118,279	0,000[b]
	Residual	11,828	322	0,156		
	Total	55,457	309			
a. Dependent Variable						
b. Prredictors: (Constant), PM,IN,RE,HR,PS,LC,CP,AW						

Source: Compiled from calculation results with the support of SPSS26.0

The results of testing the suitability of the regression function through the F statistic from the ANOVA table show that the model is suitable (the Sig level of the test is minimal, 0.000).

Table 7: Results of regression analysis

Model B		Unstandardized Coefficients		Standardized Coefficients	t	Sig. Tolerance	Collinearity Statistics	
		Std. Error	Beta				VIF	
1	(Constant)	0,372	,109		0,221	,642		
	PM	0,184	,112	0,359	4,827	,000	,629	1,392
	IN	0,135	,034	0,336	2,723	,000	,539	1,295
	RE	0,101	,022	0,197	3,372	,311	,720	1,038
	HR	0,148	,011	0,229	1,828	,000	,791	1,167
	PS	0,193	,021	0,325	3,992	,000	,620	1,102
	LC	0,035	,026	0,134	2,162	,000	,520	1,182
	CP	0,144	,033	0,234	4,891	,000	,610	1,018
	AW	0,088	,036	0,188	3,391	,004	,606	1,263
a. Dependent Variable: NTED								

Source: Compiled from calculation results with the support of SPSS26.

The regression results table shows that the multicollinearity problem does not appear in the model. Specifically, the VIF variance magnification factors are all less than level 10 (the level determined to have multicollinearity that needs to be handled).

Besides, the RE variable has Sig.=0.311 (>0.05), which is not statistically significant. The remaining variables (PM, IN, HR, PS, LC, CP, AW) have values of Sig. < 0.05., statistically significant. Among them, policy mechanism (PM), infrastructure (IN), and product and service diversity (PS) are the three variables that have the strongest impact on the development of the NTE in the region (the regression numbers respectively are 0.359, 0.336, and 0.325). The weakest impact on night-time economic development belongs to the variables Linkage and Cooperation between localities (LC) and Awareness (AW), with regression coefficients of 0.134 and 0.188, respectively. The linear regression equation according to the standardized Beta coefficient is as follows:

NTED = 0,359*PM + 0,336*IN + 0,229*HR + 0,325*PS + 0,134*LC + 0,234*CP + 0,188*AW

The research results are consistent with previous studies, the author's expectations, and expert opinions. Specifically, the analysis results show similarities with the investigations of Tai et al. (2022), Son et al. (2023), and Nam (2023) on the need to focus on perfecting the NTE: policy mechanisms, infrastructure development and diversification of nighttime products and services. In addition, unlike previous studies, this study also found several other factors that positively impact the development of the region's NTE, such as linkage and cooperation between localities, promotional communication strategy, awareness of local people, and management agency representatives.

5. CONCLUSION AND POLICY IMPLICATIONS

Based on the research results, the authors have some suggestions as follows:

Firstly, research and develop policy mechanisms to encourage investment and extend the NTE.

Policy mechanisms are essential for local authorities to continue supporting the NTE's development. First, it is necessary to develop preferential tools and policies on taxes, fees, charges, and credit policies to support businesses and business households setting the NTE. After that, research and create a type of tourism combined with casinos to diversify tourism products and services, meeting market needs in the new context, especially for localities that meet the primary infrastructure and human resources conditions and available tourism platforms such as Da Nang and Khanh Hoa.

Second, complete infrastructure to serve the development of the NTE.

Local authorities need to call for investment and use socialized capital to build and improve infrastructure to meet the needs of people and tourists. At the same time, prioritize public investment resources to invest and focus on completing infrastructure items in areas planned for night-time economic development, creating motivation for accelerating local economic development.

Third, Develop human resources to serve the NTE.

Some possible solutions to develop human resources include focusing on training according to the needs of the labor market on night economic development activities; Organize training and fostering knowledge and skills in managing and operating night economic activities for state management advisory staff in related fields; Strengthen cooperation and linkages between prestigious universities and colleges to open training and retraining courses on the development of night-time economic activities for participants in night-time economic development.

Fourth, organize the exploitation and development of products and services to serve the development of the night economy.

In the coming time, localities must continue investing in expanding and deploying products and services to develop the night economy. (i) Cultural and entertainment activities: Establish walking streets with various night-time activities and services such as sightseeing, check-in, entertainment, cuisine, shopping, and street art. Upgrade the scale and increase the organization of music programs gathering famous domestic and foreign artists, especially on weekends and holidays. (ii) Food and beverage services: There is a plan to renovate and upgrade existing night food streets, focusing on exploiting local specialties and dishes with regional characteristics. (iii) Shopping services: There is a plan to upgrade, renovate, and improve the quality of operating night markets, diversifying products but still focusing on developing typical goods and products of the locality. (iv) Tourism services: Developing community tourism products associated with night-time economic development; Investing in construction works that create highlights at night in squares, central parks, and landscape areas.

Fifth, strengthen cooperation to develop the NTE.

Localities in the region need specific linkage policies such as developing coordination policies between sectors, creating favorable conditions for developing the NTE, creating linked products and services, and building separate brands for each locality and brand connection for the whole region. In the linkage strategy, it is necessary to identify the specific factors of each locality and the combination in the region's linked value chain to create a system of attractive night-time economic destinations for tourists and local people.

Sixth, strengthen promotion, advertising, and cooperation in developing the night economy.

In the current era of information explosion, promotion, advertising, and cooperation activities is essential. This activity not only helps strengthen the connection between those involved in night-time economic activities but also means disseminating official information with reliable sources about night-time economic activities of the South Central provinces of Vietnam. To promote the development of the NTE, it is necessary to attach the characteristics of each locality to night-time economic activities. Based on this foundation, localities deploy communication and promotion campaigns on multiple platforms in many different forms.

Finally, raise awareness about night-time economic development.

The NTE brings both positive and negative impacts. Therefore, raising awareness about the development of the NTE is an urgent issue that needs to be implemented promptly through specific activities such as collecting ideas and contributions from people and tourists through different reception channels, promoting propaganda, and dissemination of night-time economic activities to local people, encouraging them to participate in night-time economic activities as service providers as well as experience participants.

Although the study has identified the factors and levels of impact on the development of the NTE and made recommendations to develop the NTE in the region shortly, the research still has many limitations because of limited time and resources. The study's most significant limitation is that the survey subjects have not included tourists visiting, traveling, and experiencing nightlife services in localities in the South Central region. The lack of diversity in the survey sample could partly skew the research results. Therefore, the authors will add more tourists to the survey sample in upcoming studies on this issue.

APPENDIX

Factor	Observed variables	Symbol
Policy mechanism (PM)	The State has views and policies to support investment in developing the NTE	PM1
	Localities proactively develop policies to promote night-time economic development	PM2
	State management of night-time economic development is focused	PM3
	Have policies to mobilize and allocate resources for night-time economic development	PM4
	There are policies to support investors, business households, and businesses providing night-time services	PM5
Infrastructure (IN)	Transport infrastructure (airport system, docks, stations, roads) meets the needs of operating and developing the NTE	IN1
	Complete and modern medical system	IN2
	Information technology infrastructure meets the needs	IN3
	A complete and rich system of hotels, restaurants, entertainment, shopping, and entertainment venues	IN4
	The system of information channels serving tourists operates 24/7	IN5
Resources (RE)	Diverse and unique natural landscape	RE1
	The local cultural heritage, historical sites, and artistic architecture are impressive and unique.	RE2
	The locality organizes regular and diverse cultural events, sports, and traditional festivals.	RE3
	Traditional art and local folk culture are unique and attractive	RE4
	Local products, unique traditional handicrafts	RE5
Human resources (HR)	The locality has a strategy to develop human resources to serve the NTE	HR1
	The locality has policies to train, foster, and attract human resources to serve the NTE	HR2
	Safe and healthy night working environment	HR3
	There is a team of quality management staff for night-time activities	HR4
	The quality of human resources of business households/enterprises providing night-time services meets the requirements	HR5
Product and service diversity (PS)	Accommodation facilities in night-time economic development areas are diverse and fully equipped	PS1
	Attractive and wealthy night-time entertainment and entertainment activities	PS2
	There are many attractive nightlife destinations	PS3
	Foodservice, unique local cuisine	PS4
	There are diverse means of transportation at night to meet the needs of tourists.	PS5
Linkage and cooperation between localities (LC)	There are regional linkage policies in developing the NTE	LC1
	Localities cooperate in exploiting tours, routes, and sightseeing spots (both day and night)	LC2
	Localities cooperate in using and developing human resources to serve the NTE	LC3
	Implement infrastructure links to serve the development of the NTE	LC4
	Linking to diversify and individualize night-time economic products of each locality	LC5
Communication and promotion strategy (CP)	Regularly implement communication and promotion strategies about the NTE	CP1
	Well exploit traditional markets, expand new markets	CP2
	Organize night programs and events	CP3
	Promote new products and services	CP4
	Communicate and promote the characteristics of the local NTE	CP5
Awareness (AW)	Local people actively participate in night economic development activities	AW1
	Local people are friendly and hospitable	AW2
	Local people create conditions and support night-time economic activities	AW3
	Management agencies are aware of the importance of developing the NTE	AW4
	Management agencies have activities to facilitate the development of the NTE	AW5
Night-time Economic Development (NTED)	The locality develops the night economy in terms of economic aspects	NTED1
	The locality develops the night economy in terms of cultural and social aspects	NTED2
	The locality develops the NTE in terms of the environment	NTED3

CORPORATE FINANCIAL ANALYSIS TOOLS IN THE DIGITAL TECHNOLOGY AGE

MA. Bui Thi Yen[1]

Abstract: Financial management in businesses today is greatly influenced by the development of digital technology. Financial analysis requires a change to adapt to digital platforms, digital finance. Modern financial analysis tools were born to meet the needs of assessing the financial situation of enterprises that traditional financial analysis tools couldn't.

The article systematically provides an overview of corporate financial analysis tools, shows the current status of using financial analysis tools in businesses and organizations in Vietnam today to realize the results. and limitations, thereby offering solutions to increase the use of corporate financial analysis tools in today's digital age.

Keywords: tools, financial analysis, digital technology

1. INTRODUCTION

Corporate financial analysis is the performance of an assessment of the financial position of a business. The information from the results of financial analysis is a scientific basis to help business managers as well as other interested parties make appropriate decisions related to their own interests. Especially when the market economy is developing more and more, it becomes more and more necessary to properly evaluate the financial activities and economic efficiency of enterprises. And corporate financial analysis becomes a concern not only for business managers, but also necessary for investors, state agencies, creditors...

Financial analysis tools play an extremely important role for analytical activities. They can explain a business's financial activities and business position in a meaningful way. Therefore, analysts need to understand the financial analysis tools, the application cases and the advantages and disadvantages to be able to use them reasonably and flexibly to meet the analysis purpose. The article points out the tools of corporate financial analysis and the trend of using these tools in financial analysis in Vietnam today.

2. OVERVIEW OF CORPORATE FINANCIAL ANALYSIS TOOLS IN THE DIGITAL AGE

2.1. Concept of corporate financial analysis tools

Financial analysis tools are different ways of evaluating and interpreting a business's financial statements for different purposes such as planning, investing and operating, some of which are financial tools. The main ones most commonly used based on their usage and requirements are general size reporting (vertical analysis), comparative financial statements (comparison of financial statements), ratio analysis (quantitative analysis), cash flow analysis and trend analysis.

Taking advantage of the development of the 4.0 revolution, analysts not only use traditional financial analysis tools, but also use modern financial analysis tools for their analysis reports. Therefore, today's corporate financial analysis tools are not only simple indicators, but also include complex aggregate models, even specific statistical methods, aggregate data. with a "huge" scale,

1 Email: buithiyen233@gmail.com, University of Finance and Business Administration.

playing an important role when measuring the company's performance and financial management in the enterprise.

2.2. Corporate financial analysis tools in the digital age

**** Traditional financial analysis tools***

- Analysis table tool

This is the first financial analysis tool used by analysts when assessing the financial position of a business. This tool will mostly reflect the report of the overall size of the business, showing how the company's financial resources have been used and allocated in the process of production and business activities.

The analysis tool has the advantage of being easy to use, easy to implement to monitor trends, evaluate periodic performance in the business, etc. However, it has the disadvantage of ignoring the impact of factors outside the report, high reliance on financial information, which can be manipulated to make analysis less accurate.

- Ratio analysis tool

In 1919, Alexander Wall proposed a ratio analysis tool, providing a more complete analysis system for businesses. Ratio analysis is the most commonly used financial analysis tool in the market. Ratio analysis helps analysts assess profitability, solvency, financial potential strength, effective and efficiency of capital use...

Using a ratio analysis tool has the advantage of helping analysts to forecast future income and cash flows of the business, assess the flexibility of financial policies, and effectively manage the business. as well as comparisons with industry competitors and industry averages.

However, when evaluating individually, financial ratios are not useful, it is necessary to evaluate and compare different indicators to draw conclusions. Besides, this tool can only be implemented based on past information, almost can only evaluate the impact of the available factor in the formula, but cannot evaluate it. external influences such as inflation, market, management, etc.

- Dupont model

Dupont model was created by American Dupont in 1910, also known as segmentation analysis method. This is a technique often used by financial people to analyze the profitability of a company, to identify the causes of the current situation based on the quantitative relationship between financial indicators.

The advantage of the Dupont model is that the calculation is quite simple and through this model, everyone can easily access basic knowledge about the factors that affect business results.

Using the Dupont model as an analysis tool also reveals many limitations. The accuracy of this technique completely depends on the hypothesis and input data provided by the accountant. This tool does not mention the cost of capital in the analysis process and does not determine the level of influence of the factors.

**** Modern financial analysis tools***

- Graphical analysis

When doing financial analysis, instead of presenting with ordinary data tables, financial professionals have a variety of images and colors performed by graphic software. The most common visualizations of this tool that can be seen are presented in the form of a histogram, depending on the case, using a column chart, pie chart, line chart, word chart or all. integrated to reflect the overall financial situation.

This tool allows to compare the performance and financial structure over time, supports a wide variety of graphical images and also allows the conversion of digital data to images to help communicate. information to users effectively.

However, with graphic images, it requires the analyst to explain more about the representation image to help readers understand. In addition, the displayed image is prone to errors if the ability to use graphics is weak.

- Regression analysis

Regression analysis helps financiers predict the relationship between financial variables in a business. This tool needs data types available for empirical analysis, time series data, cross-spatial data, panel data. Linear regression is relatively complicated, involving many computational procedures, analysts need to master the models (ECM, GLS, FEM, REM, GMM,) and then apply the appropriate model. into the analysis. The advent of software PcGive, SAS, STATA, Shazam, Eviews, and many others make the implementation of data regression models quite easy.

Although regression analysis is favored in applied research and is increasingly available, it is not really suitable in all situations, requiring very large and complex statistical data. Regression models raise some estimation and inference problems because the data reflect both spatial and temporal factors.

- Data analysis tools

Today's popular data analysis tools can be mentioned as Exel, Microsoft Power BI, R Programming, Tableau, Python, Sas, RapidMiner ... They are software, programs or programming languages, capable of modeling data visualization, using cloud-based services that enable analysts to perform in-depth analysis and forecast the future of the business. Businesses use this tool to monitor competitor activity, control commodity prices, and analyze the market to study consumer behavior, helping to stay competitive.

However, some software is only available for a few users and cannot be used by outsiders. The use of software must also meet the compatibility with the operating system of the computer.

3. METHOD

The necessary data for the research content is collected through a survey questionnaire based on surveys by Nguyen Thu Trang (2019), Nguyen Phuong Anh (2021) and MIT Technology Review Insights (2021). The surveys focus on corporate financial analysis activities within the units and the financial analysis techniques used for analysis activities. Research conducted in Vietnam includes commercial banks, securities trading companies and large businesses and corporations. Other data are collected from articles published in reputable scientific research and journals.

4. CURRENT SITUATION OF USING FINANCIAL ANALYSIS TOOLS IN ENTERPRISES TODAY

4.1. Currentsituation of using corporate financial analysis tools

In Vietnam today, financial analysis of enterprises has not been paid proper attention. The research team of Faculty of Economics and Management - Hanoi Polytechnic University has conducted a survey in more than 100 enterprises in manufacturing industries nationwide. The survey results show that the proportion of enterprises participating in financial analysis is 42%, usually only focusing on large companies, state-owned enterprises and foreign-invested companies. The remaining 52% do almost no analysis. In addition, commercial banks and securities companies regularly conduct business financial analysis to serve business activities and provide services.

**** At commercial banks***

Corporate financial analysis plays a very important role in the decisions made by commercial banks. The important activities of commercial banks are associated with credit - lending, investment, and other business activities. Commercial banks in Vietnam now regularly conduct financial analysis to assess the financial potential of their customers, thereby reducing risks in lending activities.

The results of the survey conducted by Nguyen Thu Trang in 2019 showed that the analysis of joint stock commercial banks was still simple, the analysis content was not comprehensive, the tools used in the analysis were not accurate. diverse and less flexible.

Table 1. Financial analysis toolsof commercial banks in Vietnam

Traditional analysis tools	Usage rate	Modern analytical tools	Usage rate
Analysis table	100%	Graphical analysis	11,7%
Ratio analysis	96,7%	Regression model	0%
Dupont Model	81,7%	Data analysis	0%

Source: Nguyen Thu Trang (2019)

Through a survey of the current situation of financial analysis at commercial banks in Vietnam, it can be seen that the tools used in the analysis are mainly traditional analytical tools.

- About "Analysis table" tool. According to the survey conducted, 100% commercial banks use this tool to perform financial analysis in businesses. This tool is used to apply the comparative method, the division method to evaluate the fluctuations of the criteria on the financial statements of the enterprise for many consecutive years. Here, commercial banks evaluate the change in both the absolute and the relative numbers of the indicators on the financial statements, thereby making judgments about the direction, speed, trend, and trend of changes of the indicators compared to that of the financial statements. base year. Analysis activities are used by commercial banks in a long time series (mainly the last 3 years of the enterprise) to provide long-term trends of changes in indicators. This tool serves analysis contents such as: analyzing business results; analyzing changes in assets and capital sources; analyzing the solvency and cash flow of the business

- In terms of "Rate analysis" tool. According to the survey results, most commercial banks synchronously calculate financial ratios as a basis for assessing the financial situation of corporate customers (ratio 96.7%). Each group of financial ratios provides a financial perspective, a financial aspect to the process of corporate financial analysis of bank staff.

However, some banks (accounting for 3.3%) only conduct preliminary analysis of corporate financial situation, all data is transferred to the appraisal center of the bank's headquarters, so this tool cannot be used

- About "Dupont Model" tool. This tool is used to apply factor analysis method in analysis. In fact, commercial banks mainly use the Dupount model method in assessing the impact of factors on return on working capital (ROA) targets and return on equity (ROE) targets of the enterprise.

Summary of the survey results shows that 46.7% of the respondents frequently use Dupont model in business financial analysis, 13.3% answered very often, but also 25% answered. rarely use this tool. This shows that although the use of “Dupont model” allows to identify factors that directly affect the profitability of enterprises (through 2 indicators, ROA and ROE), a part of commercial banks not really interested and used this method.

In addition to using traditional tools in analysis, commercial banks have gradually approached, become familiar with and initially used modern financial analysis tools for financial analysis of specific businesses.

- About “Graphic analysis tool”. The use of this tool for analytical activities of commercial banks is still simple, mainly using images of column charts, line charts and pie charts for corporate financial analysis reports. According to the survey results, only 11.7% of banks use this tool based on the integrated features of Word and Excel software without using other intelligent software to develop analytical images. The tool helps banks track the development, change, speed and trend of the analysis indicators, in addition, it also supports the method of forecasting the financial situation of the business.

- The tools “Regression Modeling” and “Data Analysis” are currently not used for financial analysis activities in commercial banks. This causes the analysis results to have no link between business activities, profits, stock market value, etc. to the financial situation.

**** At securities companies***

Besides joint stock commercial banks, securities companies in Vietnam also continuously perform financial analysis activities to serve the investment needs of both individual and corporate customers. as well as the operation of an investment fund managed by the company.

According to a survey by Nguyen Phuong Anh (2021), in order to ensure the efficiency of their business operations, securities companies that are members of the Vietnam Stock Exchange perform financial analysis. The results of the analysis help to strengthen the risk management of these companies’ business operations.

Table 2. Financial analysis tools of securities companies

Traditional analysis tools	Usage rate	Modern analytical tools	Usage rate
Analysis table	100%	Graphical analysis	27%
Ratio analysis	100%	Regression model	0%
Dupont Model	67%	Data analysis	0%

Source: Nguyen Phuong Anh (2021)

Similar to commercial banks, securities companies tend to use traditional financial analysis tools.

- About “Analysis table “ tool. The survey results show that 100% of securities companies use the analysis tool. This tool helps securities companies evaluate the total size of business capital, revenue, costs and profit in the business. Thereby, assess the growth prospects of businesses in the future.

- About “Rate analysis” tool. All securities companies in the sample use this tool to assess the financial performance and financial capacity of enterprises. Thereby comparing with other businesses in the same industry or in the economy to make the right investment decisions, bringing profits to the company and customers.

- About "Dupont Model" tool. Up to 67% of companies use this tool to analyze the factors affecting profitability ratios in businesses. This is one of the important indicators to evaluate the efficiency of capital use and the ability to meet the expected return rate for investors.

Looking at Table 2, we can see that the situation of using modern financial analysis tools for corporate financial analysis in securities companies is still very limited.

- About "Graphic Analysis" tool. In order to make analytical reports clear, complete, easy to see and understand, securities companies have increased the use of this tool for analysis. Up to 27% of businesses responded using images and charts to show financial results such as revenue, costs, and profit of the business. Besides using Word and Excel, some analysts in securities companies have used software such as Microsoft Power BI to represent trends and change rates of indexes with drawings and colors. variety of colors.

- However, the tools "Regression Modeling" and "Data Analysis" have not been used by companies for analysis yet.

**** At large enterprises and corporations***

According to a survey by MIT Technology Review Insights of 255 business leaders and administrators in October 2021. The financial analysis carried out by these enterprises is a combination of the use of traditional and modern financial analysis tools.

Survey results indicate that 100% of businesses use traditional financial analysis tools.

- About "Analysis table" tool. The purpose of using this tool is to help businesses assess the overall size of their financial situation, of which up to 48% of businesses use it regularly. The method used by enterprises here is mainly the comparative method.

- About "Rate analysis" tool. In order to comprehensively assess the financial situation, enterprises must combine comparative methods with other methods such as detailed indicators, factor analysis, etc. The purpose of enterprises when performing financial analysis. to use for long-term business goals, control management activities, profitability. Therefore, most use this tool for analysis. Enterprises will self-assess their investment situation and results, efficiency of capital use, efficiency of production and business activities and profitability. These are all top concerns of business managers.

- About "Dupont Model" tool. The leaders and managers in the survey all said that ROA and ROE indicators accurately reflect the financial efficiency in the process of using capital of the business. They always try to find all ways to promote the increase of these indicators. Analytical activities in enterprises use "Dupont Model" to explain the change of ROA, ROE, find out the causes and thereby overcome limitations in production and business activities of enterprises.

When asked about issues related to modern financial analysis tools used in financial analysis of enterprises.

- About "Graphic Analysis" tool. 45% of respondents said they only use images, color charts that reflect their financial situation to have basic understanding of their business and make decisions. The purpose of financial analysis of enterprises is to bring value and achieve important business results, so businesses have diversity and flexibility in the application of graphic analysis software.

- The tools "Regression Modeling" and "Data Analysis" are currently not applied in the analysis process of enterprises. These two tools can solve problems related to factors affecting financial situation as well as build relationships in production and business and financial forecasting in enterprises. A market impact can also have a big impact on an enterprise's business, even bankruptcy.

In addition, the financial analysis in enterprises is almost not according to the process, leading to low quality of financial analysis, lack of flexibility in analysis, and inaccurate and untimely results

4.2. Assess the current status of using corporate financial analysis tools

**** Obtained result***

Current financial analysis tools are used diversely and flexibly to meet the analysis needs of units and organizations. Therefore, many analytical methods are applied to evaluate the size and efficiency of enterprises.

Commercial banks, securities companies and some businesses are aware of the importance of digital technology, along with the introduction of a series of software and applications for financial analysis. Analysts of these organizations and units initially had a combination of using traditional analytical tools and modern analytical tools for their analysis reports.

Business managers today are increasingly aware of the importance of financial analysis tools. According to a survey by ACCA, up to 46% of businesses are aware of the importance of improving skills. ready-to-invest financial functionality at an advanced level, thereby reducing manual analysis and increasing the use of modern analytical tools.

**** Limitations and causes***

Through surveys, it can be seen that most enterprises in Vietnam today focus a lot on using traditional financial analysis tools, but have not paid enough attention to modern analytical tools. Therefore, mainly using relatively simple analytical methods, not many new methods have been applied to make multi-dimensional and more effective assessments.

Reasons for preferring using traditional analytical tools in Vietnam today:

- Analytical activities in enterprises and organizations are not aware of the importance and application of financial analysis tools. Not yet grasping the outstanding advantages of modern financial analysis tools compared to traditional analytical tools.

- The financial analysis at the units is still very sketchy, unfocused, many contents and methods of analyzing enterprises have not been approached, the database and analysis process have not been paid attention by enterprises. fully collected.

- The qualifications of financial analysts have not met modern financial knowledge. Therefore, they prefer to use methods to calculate traditional financial ratios that are simple and easy. Meanwhile, to be able to apply the "regression model" or "data analysis" tool, a large amount of data about businesses, markets, and customers is required. The data collection process can be difficult in the era of the data economy, the information collected may not be correct, creating misleading results in the analysis report.

- Use traditional financial analysis tools without using complicated software that costs a lot of money. In case the information is missing, it can be replaced by another method (For example, there is not enough data on capital used directly for business activities, which can be replaced by working capital). Meanwhile, modern analytical tools require users to be competent, qualified and knowledgeable in the field of information technology and digital technology.

5. SOLUTIONS TO INCREASE THE USE OF CORPORATE FINANCIAL ANALYSIS TOOLS IN THE DIGITAL AGE.

Traditional analytical tools are now commonly used and have had positive effects, accurately reflecting the financial position of enterprises in the past. However, this tool mainly uses financial statements as the basis for analysis, limitations and delays of financial statements will affect the results of financial analysis. Traditional analytical tools will not be able to detect factors that are not reflected in financial statements such as economic, political, social factors, industry cycles, technological innovation, human resources, etc.

Nowadays, with the development of digital technology, many important information cannot be provided in reports but exists outside of financial statements. Modern analytical tools are used to evaluate the operating conditions of the business, find out the remaining problems, and then guide the business decision policy. These tools help analysts, business managers transform in the form of digital data, digital financial analysis presented in the form of tabular data. Besides, the role of enterprise financial analysis is forecasting, helping managers make decisions about the future direction of the business. Therefore, information that predicts the future development of the business is extremely practical and valuable.

Digital technology is a key industry in national development and international economic integration. Digital finance is a component of corporate finance, using disruptive technology, data, and people to enhance the role and function of financial management. Modern financial analysis tools are programmed by software algorithms to perform continuous analytical processes, support analytical work for financial professionals, increase analytical capabilities and support business. These software solutions provide benefits in terms of cost, quality, and predictability in terms of risk and business growth. However, these tools are currently used very limited, it is necessary to have mechanisms and measures to promote the combination of using traditional and modern analytical tools to improve the quality of analysis, help businesses sustainable growth and development. Solutions to enhance the use of business financial analysis tools can focus on the following directions:

Firstly, for businesses, financial companies and financial analysts, more attention should be paid to the analysis process and content. Raise awareness about the importance of financial analysis tools and their pros and cons. Invest, foster and improve analytical skills for individuals and departments responsible for financial analysis.

Secondly, on the part of the content analysis. Besides the financial analysis of some basic criteria, the analyst needs to further improve the efficiency of the analysis process. Using a variety of analytical methods, enhancing financial forecasting and forecasting activities in the business.

Thirdly, in terms of the data source. It is necessary to combine data collection inside and outside the financial statements. Especially data related to industries, business fields, technology, human resources, and markets. Collected data can be in the form of tables, using analytical software tools, impact assessment, level of influence from which the analysis process is detailed, specific and accurate.

Fourthly, regularly update enterprise data analysis technology, develop an overall strategy on development and application of digital technology in business financial analysis activities. Associate with information technology enterprises to build a technology system. Automation software can shorten the time companies spend manipulating table data, allowing users to interact directly with the data.

IMPROVING THE QUALITY OF ACCOUNTING AND AUDITING SERVICES TO PROMOTE THE DEVELOPMENT OF VIETNAM'S PRIVATE ECONOMY IN THE CONTEXT OF DEEP AND WIDE INTERNATIONAL INTEGRATION AND DIGITAL TRANSFORMATION

Dr. Duong Thu Minh[1]

Abstract: Accounting and auditing services in Vietnam in recent years have made strong development and contributed significantly to the country's economic development in general and private economic development in particular. In the new context today with the increasing requirements of international economic integration, enhancing the application of information technology and digital transformation, accounting and auditing services have many opportunities to develop. However, along with that, the new context also poses many difficulties and challenges for this service. Through the analysis of the current situation, the author proposes some solutions to improve the quality of accounting and auditing services to promote the development of Vietnam's private economy in the new context.

Keywords: Service, accounting, auditing, private economy, Vietnam, new context.

1. INTRODUCTION

The private sector plays an important role in creating growth, innovation and competitiveness of the national economy. However, the private sector in Vietnam still faces many difficulties and limitations, such as lack of transparency, non-compliance with legal regulations, lack of professionalism and efficiency in business operations... Accounting and auditing services are one of the important factors for the development of the private sector in Vietnam. In the context of deep and wide international integration and digital transformation, the demand for accounting and auditing services is increasing, requiring enterprises to comply with the regulations and standards on accounting and auditing according to the law and international organizations. At the same time, improving the quality of accounting and auditing services also contributes to enhancing the trust of investors, customers, partners and state management agencies in the business activities of private enterprises. Therefore, it is necessary to have appropriate solutions and strategies to improve the quality of accounting and auditing services, thereby contributing to promoting the development of the private sector in Vietnam in the context of international integration and digital transformation.

2. THE CURRENT SITUATION OF ACCOUNTING AND AUDITING SERVICES IN VIETNAM

Accounting and auditing are important economic management tools that have the function of creating a system of information on economic, financial and budgetary matters to meet the requirements for economic management and decision making of the state as well as of each unit, organization and enterprise. Therefore, it is necessary to improve and enhance the quality of the accounting and auditing information system in a transparent, public, truthful and complete manner, reflecting the economic and financial data in the national economy (Prime Minister, 2022). The accounting and auditing service activities in Vietnam in recent years have been developing strongly and continuously improving in quality. This service brings many benefits to the economy, finance

1 Email: minhdtketoantueba@gmail.com, Thai Nguyen University of Economics and Business Administration.

and enterprises. Not only playing a role in providing information for managers to make business decisions, accounting and auditing services also contribute to supporting effective economic and financial management and are an indispensable part of the national economy.

The accounting and auditing service market of Vietnam has developed in both quality and scale of operation over time, thereby contributing to improving the quality, making healthy and enhancing the transparency and publicity of economic and financial activities of all units, organizations in the socio-economic system. The legal environment is basically regulated relatively fully, clearly, suitable for the conditions of Vietnam, customs, principles and international standards, thereby creating favorable conditions for the formation and development of the accounting and auditing service market provided by accounting and auditing enterprises at home and abroad (Vu Duc Chinh, 2021).

The accounting and auditing service market with its efforts to develop and innovate in recent times has achieved important achievements. To create a legal environment for accounting and auditing service activities, Vietnam has continuously reformed the accounting and auditing legal system. Specifically, the National Assembly passed the Independent Audit Law No. 67/2011/QH12 dated March 29, 2011; Amended Accounting Law No. 88/2015/QH13 dated November 20, 2015 with the content containing issues of accounting and auditing in integration conditions. At the same time, the Government also issued Decision No. 480/QD-TTg dated March 18, 2013 on approving the "Vietnam Accounting - Auditing Strategy to 2020, vision to 2030"... Accordingly, Vietnam's goal is to establish a complete accounting and auditing system that is suitable for the management mechanism of the Vietnamese State and develop accounting and auditing professions in the region and the world to meet information requirements for management, operation and inventory, control of economic resources, economic-financial activities of the country... (Prime Minister, 2013). Vietnam has many policies to create favorable conditions for the formation and development of a system of accounting-auditing service enterprises.

After 10 years of implementing the Accounting-Auditing Development Strategy to 2020, vision to 2030 issued under Decision No. 480/QD-TTg dated March 18, 2013 of the Prime Minister, Vietnam's accounting-auditing system in general and accounting-auditing service market in particular have achieved remarkable development and progress. Up to now, it has gradually developed an accounting-auditing service market according to criteria, both in terms of quality and scale; thereby contributing to making healthy and enhancing transparency and publicity of economic-financial activities of units, organizations in the socio-economic system. Accounting-auditing service activities both help enterprises create economic-financial information according to state regulations and contribute to national economic growth. At the same time, it plays an important role in advising businesses and investors on legal, financial, accounting regulations as well as preparing, recording accounting books, preparing financial statements, calculating taxes... (Duong Thi Thieu, 2021).

To enhance the development of accounting and auditing services, the Vietnamese government has also had many policies and initiatives to innovate and improve the quality of training human resources for accounting and auditing in line with the new requirements of global integration and information technology application. In addition, to ensure the transparency, publicity and quality of economic and financial information, the Ministry of Finance and the State Securities Commission have strengthened the organization of inspections and supervision of the quality of accounting and auditing services to timely detect and handle violations.

3. OPPORTUNITIES AND CHALLENGES FOR ACCOUNTING AND AUDITING SERVICES IN THE NEW CONTEXT

International integration and digital transformation are two irreversible trends in the present era. To adapt to the new situation and take advantage of the opportunities brought by the fourth industrial revolution, on September 27, 2019, the Central Executive Committee issued Resolution No. 52-NQ/TW on some guidelines and policies to proactively participate in the fourth industrial revolution, which emphasizes the urgent requirement to accelerate the process of digital transformation (Central Executive Committee, 2019). Based on that, on June 3, 2020, the Prime Minister signed Decision No. 749/QD-TTg approving the national digital transformation program until 2025, with a vision to 2030. Accordingly, Vietnam becomes a digital country, stable and prosperous, pioneering in testing new technologies and models; fundamentally and comprehensively innovating the management and administration activities of the Government, the production and business activities of enterprises, the way of life and work of people, developing a safe, humane and widespread digital environment. The National Digital Transformation Program aims at a dual goal of both developing a digital government, digital economy, digital society, and forming Vietnamese digital technology enterprises with global capabilities, with some basic indicators (Prime Minister, 2020). The new context brings many opportunities for all sectors and fields in general and accounting and auditing services in particular, but also comes with many difficulties and challenges.

3.1. Opportunities of the new context for accounting and auditing services

In the context of international integration and digital transformation, accounting and auditing services have many new opportunities, specifically as follows:

First, with the achievements of advanced and modern science and technology, accounting and auditing services can be performed in a computerized environment. This makes the work of accountants, auditors, and consultants simpler, faster, and more efficient.

Second, accounting and auditing service providers have more opportunities to access and expand the supply of products and services suitable for different types of customers (Mai Ngoc Anh, 2020).

Third, in the context of international integration, management agencies, professional associations, and enterprises have the opportunity to access effective accounting and auditing models from developed countries in the world. This contributes to improving management capacity, management quality, and helping the State to complete the legal system, standards, meeting international requirements, as well as helping service providers to refer to and learn from international experience to apply to Vietnam's reality.

Fourth, with the application of big data centers (Big data), data analysis and management in accounting and auditing services become more convenient. Collecting, analyzing, and processing big data will contribute to creating new knowledge, as well as supporting decision-making quickly and effectively, thereby reducing costs and creating competitive advantages for service providers.

Fifth, the advances from industrial networks 4.0 and digital transformation are the driving force for domestic accounting and auditing service companies to develop and compete with advanced companies and groups in the region and in the world. This contributes to enhancing competitiveness and improving service quality provided by domestic companies.

Sixth, the requirements of the new context also affect the awareness and actions of staffs and employees working in accounting and auditing services. It sets out requirements for each individual to constantly strive to improve their professional skills and foreign languages, science and technology, apply technical advances to improve labor productivity and work quality. At the same time, each individual needs to regularly update information, new issues to be able to innovate, create, and adapt to new requirements.

3.2. Difficulties and challenges of the new context for accounting and auditing services

In addition to many opportunities, accounting and auditing services in Vietnam face many difficulties and challenges in the current new context.

First, the new context requires the management agency to complete the legal framework for accounting and auditing services that are compatible with the context of international integration and transformation. The state management agency faces many challenges related to many contents, among which quality control of accounting and auditing services is one. In terms of legal basis, there are some standards and contents that have not changed according to international practice, so it takes time and a suitable roadmap to change (Mai Ngoc Anh, 2020).

Second, the new context poses new requirements for the quantity and quality of staffs and employees working in accounting and auditing services. In the context of digital transformation, if accountants, auditors, and service providers do not understand technology, they will face many difficulties in performing professional tasks. To solve the limitations of the level and capacity of staffs and employees and arrange work reasonably is not an easy problem for accounting and auditing services.

Third, the development of technical technology brings new opportunities for accounting and auditing services, but also poses many challenges in preventing network security risks and protecting the confidentiality of customer information and business information. Information security is a very important issue in accounting and auditing services. It requires effective measures to protect software, hardware, and data of enterprises and customers using services. In the process of applying the results of digital transformation, the requirement is that accounting and auditing service providers must manage the changing contents and ensure that the services are safe and secure while deploying new services (Vu Duc Chinh, 2021).

Fourth, in the context of deep and wide international economic integration, competitive pressure on the market of accounting and auditing services will be fiercer for Vietnamese enterprises when foreign enterprises enter. This means that if domestic enterprises do not improve themselves, they will face many risks such as bankruptcy, dissolution, or shrinking scale and scope of operation... (Tran Ngan Ha, Vu Thi Thao, 2022).

Fifth, a big challenge for accounting and auditing services is to invest in developing equipment and infrastructure to be able to adapt to the advances of digital science and technology. Investing in advanced and modern technologies will bring many benefits but the investment cost is a matter of concern for service providers and the whole industry.

4. SOME SOLUTIONS TO IMPROVE THE QUALITY OF ACCOUNTING AND AUDITING SERVICES IN THE NEW CONTEXT TO PROMOTE THE DEVELOPMENT OF THE PRIVATE ECONOMY

Accounting and auditing services in Vietnam have made important progress in recent years. However, in the current new context, besides many opportunities and advantages, there are many difficulties and challenges for accounting and auditing services. Improving the quality of accounting and auditing services is one of the key factors to promote the development of the private economy. Some solutions to improve the quality of accounting and auditing services in the new context are proposed as follows:

- Training and improving the capacity of accounting and auditing staffs: This is the most important solution to ensure the quality of accounting and auditing services. Accounting and auditing staffs need to constantly update their knowledge, skills, and regulations on accounting, taxation, financial reporting, auditing... In addition, they also need to be equipped with tools and software to support accounting and auditing work effectively and accurately.

- Enhancing transparency and responsibility in accounting and auditing activities: This is a solution to create trust for partners, customers, and management agencies about the quality of accounting and auditing services. Accounting and auditing firms need to strictly comply with professional standards, legal regulations, and ethical principles. They also need to disclose and transparent information related to their accounting and auditing activities, such as customer list, financial statements, audit reports...

- Expanding the market and diversifying accounting and auditing services: This is a solution to increase revenue and profit for accounting and auditing firms. They need to seek and exploit new markets, such as small and medium enterprises (SMEs), startups, foreign direct investment enterprises (FDIs)... They also need to diversify their accounting and auditing services to suit the needs and requirements of each type of customer, such as tax consulting services, investment project preparation services, risk management services...

5. CONCLUSION

Vietnam is participating in many free trade agreements and deep and wide international integration, requiring to improve the quality of accounting and auditing services to meet international standards and enhance transparency, responsibility in business activities. This is a key factor to promote the development of the private sector in Vietnam, especially in the context of digital transformation that is taking place strongly around the world. High-quality accounting and auditing services not only help private enterprises grasp their financial situation, but also contribute to enhancing their reputation, trust of partners, investors, management agencies and society. To achieve this goal, it requires the efforts of the entire accounting and auditing industry in Vietnam, from training high-quality human resources, constantly updating the latest knowledge, applying modern information technology, to complying with professional ethics and legal principles. This is an important topic and needs more attention in the future, as it not only affects the transparency and efficiency of business activities of private enterprises, but also relates to the reputation and image of Vietnam in the world.

DIGITAL TRANSFORMATION - ESSENTIAL FOR SUSTAINABLE DEVELOPMENT OF VIETNAMESE REAL ESTATE ENTERPRISES

Associate Professor. PhD. Nguyen Ho Phi Ha, M.A Vu Thi Phuong, M.A Nguyen Thi Kieu, My Lan Huong, MSc. Nguyen Xuan Truong, MSc. Le Quang Vinh, Hoang Hai Diep

Abstract: *Digital transformation is a trendy and comprehensive change of individuals and organizations in the way of living, working and producing based on digital technologies. Digital transformation is increasingly popular in social life. Businesses around the world from retail, healthcare, manufacturing, finance to public administration units are currently participating in digital transformation to improve business efficiency. The application of technology to all business activities (including real estate businesses) will completely change the way of operations, increase productivity, quality, efficiency and bring benefits, and bring value to customers. It can be said that digital transformation is an inevitable trend. However, implementing digital transformation is also a challenge for many real estate businesses in Vietnam in the current context.*

In this article, the authors research the current status of operations of Vietnamese real estate businesses in the context of digital transformation, thereby pointing out opportunities, challenges and proposing some solutions to help real estate businesses develop sustainably in the future.

Key words: *digital transformation, real estate businesses, necessity, challenges.*

1. INTRODUCTION

Digital transformation is business innovation driven by the explosion of artificial intelligence (AI), cloud computing and Internet of Things (IoT) technologies, providing new ways to understand, manage, monitor and transform business activities in businesses in general and real estate businesses in particular. In other words, digital transformation is integrating digital technologies and solutions into the core nature of each business, profoundly changing the way the business operates, thereby creating new production processes, maximizing customer experience and improving organizational culture. This process contributes to the creation of new working methods to meet the expectations of comprehensive market changes, thereby helping to increase productivity during work, minimize costs, and bring benefits to customers and creating a new developed working space as well as creating new values in addition to existing traditional values.

Digital transformation is in fact an inevitable trend of the times for all businesses in general and real estate businesses in particular. Whether we like it or not, the digital transformation process will still take place strongly. Life is constantly changing and moving. Each business will also need to constantly change itself, find ways to adapt, otherwise it will certainly be left behind.

2. METHODOLOGY

In this study, the statistical approach was employed. After that, data were synthesized and analyzed to answer 5 research questions as follows:

1. What are some advantages of Vietnamese real estate businesses?
2. What are some disadvantages of Vietnamese real estate businesses?
3. How important is Digital transformation in real estate businesses in Vietnam?
4. What are some challenges in applying Digital transformation to real estate businesses?
5. What are some solutions to applying Digital transformation to real estate businesses?

3. FINDINGS OF THE STUDY

3.1 Current status of real estate businesses in Vietnam

3.1.1 Size of real estate businesses

The number of domestic real estate businesses has been growing. Many businesses have enough professional and financial capacity to carry out large-scale projects on a regional level.

(Source: Annual report of the Department of Business Registration Management)

From 2006 to 2020, the number of real estate businesses annually increased by nearly 50%. As of 2020, the number of real estate businesses is 6,694, increased nearly 6 times compared to 2006.

3.1.2 Capital size

Many real estate businesses do not have enough financial potential, so they often suffer from great risks when the market fluctuates. The number of businesses with capital from 200-500 billion VND only accounts for nearly 6% of the total number of businesses. The number of businesses with capital of 500 billion VND or more accounts for only 3%. The majority are businesses with small capital and are unlikely to be able to carry out large projects without the support of banks or some other channels of mobilizing financial resources.

Table 01: Number of real estate companies basinh on capital size (to 31 December 2022)

(unit: companies)

Quantity of real estate companies	From 10 to 50 Billion VND	From 50 to 200 Billion VND	From 200 to 500 Billion VND	Over 500 billion VND
4223	1267	1246	250	136

(Sources: Department of Statistics)

3.2 Advantages of real estate companies

3.2.1 Attractive investment environment

Vietnam attracts investors thanks to its young workforce of more than 96.3 million people, stable political environment and one of the fastest growth rates in the world. All factors show that the investment environment is quite attractive. This is an opportunity for Vietnamese real estate businesses to call for foreign investment capital through cooperation and joint ventures.

(Source: World bank, 2021)

Vietnam ranked 69th out of 190 countries with a good business environment, ahead of Indonesia (ranked 73rd), the Philippines (ranked 95th) and Myanmar (ranked 165th).

3.2.2 Investment capital from abroad

It can be clearly seen that most domestic investors' capital capacity is limited. Through FDI, industrial parks, large urban and entertainment areas with international standards have been created. Thanks to FDI, the infrastructure has changed a lot and many high quality real estate products have been built. Although recently foreign investment capital has decreased, this is still an effective capital mobilization channel in providing capital for our country's real estate market.

(Source: According to Report of the Ministry of Planning and Investment in 2016-2020)

3.2.3. Increasing diversification and expansion of investment partners

As usual, the main partners investing in Vietnam were traditional foreign investment enterprises such as Japan, Korea, Singapore. Now investment partners are more diverse because Vietnam is establishing diplomatic relations with 178 countries around the world. In addition to investors, there are countries in the Asian region, such as: Japan (accounting for 22%), Singapore (accounting for 14%), Korea (accounting for 21%), Thailand (accounting for 11%), Hong Kong (accounting for 11%). Vietnam's real estate market is increasingly attracting more real estate investors around the world. Especially since Vietnam has a policy to attract FDI into the real estate market, there have been many investors in different countries, such as Accor group, InterContiential Hotel group etc. Big investors from the Middle East such as IFA, Kingdom Hotel have invested in large real estate projects in Vietnam.

3.2.4. Various opportunities to improve business efficiency:

New Free Trade Agreement (FTA): Vietnam joins free trade agreements with developed economies to turn from exporting low-value goods to high-value goods; along with that is to exchange science and technology with developed countries.

The Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) officially signed in January 2019 will help Vietnam's GDP grow by 1.32% by 2035, thereby strongly promoting economic growth.

The Vietnam-European Union - EU Free Trade Agreement (EVFTA) signed in June 2019, eliminated 99% of customs duties between Vietnam and the EU. With this historical agreement, Vietnamese real estate businesses will have a lot of opportunities and advantages in business.

3.2.5 Many advantages to transform high-value industries of real estate companies

Industry 4.0 and smarter manufacturing

Industry 4.0 is spurring countries globalized. Vietnam is not an exception. Strategy and legal framework for industry 4.0 policy in business and industry should be proposed.

Prospects and transformation of high-value industries

Vietnam's industrial real estate segment is growing on the momentum of a 10-fold increase in FDI capital over the past decade. Vietnam needs to carefully choose upcoming projects for growth. Many industrial developers offer ready-built factories (RBFs) and built-to-suit factories (BTS) to tenants.

This trend quickly entered the market and met well with small and medium-sized enterprises, as well as manufacturers using small areas from 500 - 5,000 m2. Ready-built factories and custom-built factories create opportunities for investors and industrial developers to keep up with the demands of the industrial market and operate production, focusing on attracting lease terms from 3 years to 10 years. The increase in the number of investors has led to the expansion of industrial park areas in the form of joint ventures with local businesses and the transfer of real estate use rights. This transformation has contributed significantly to increasing chain value, increasing competitiveness and sustainable development for Vietnamese real estate businesses.

3.3 Difficulties of real estate companies

3.3.1 Competition in size and capital

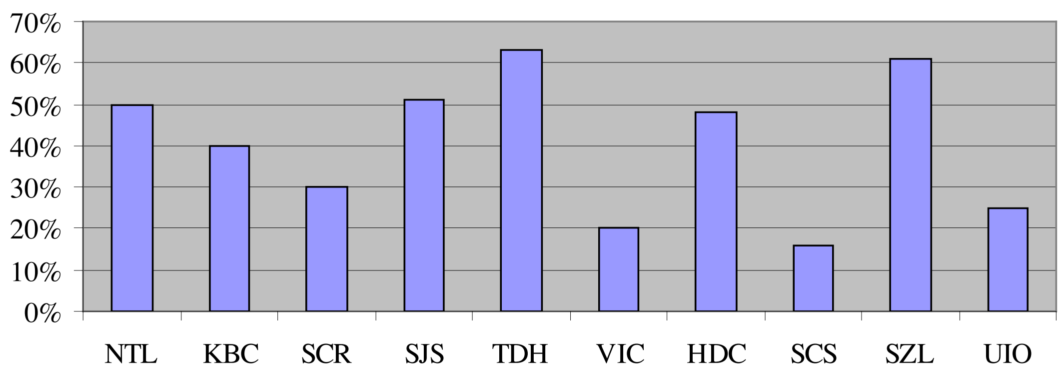
In the context of globalization, Vietnamese real estate businesses must face fierce competition against corporations and reputable real estate businesses from countries around the world.

One challenge for Vietnamese real estate businesses is competition for capital. In fact, most Vietnamese real estate businesses have a relatively small capital, the main source of development capital is bank loans and mobilized from customers.

<u>Chart 04</u>: Demand for capital of real estate companies *(Unit: billion VND)*

The owner's capital of real estate businesses only is under 13% (equivalent to 24,065 billion VND). Meanwhile, investment demand is increasing, real estate businesses are not only waiting for owner's capital contributions but continue to mobilize other capital channels such as issuing shares, etc.

Chart 05: Owner's Capital compared with total capital of real estate companies (In 2020)



Note: NTL (Tu Liem Urban Development Joint Stock Company); KBC (Kinh Bac Urban Development Joint Stock Company); SCR (Saigon Thuong Tin Real Estate Joint Stock Company); SJS (Song Da Joint Stock Company); TDL (Thu Duc Housing Development Joint Stock Company); VIC (Vincom Joint Stock Company); HDC (Ba Ria-Vung Tau Housing Development Joint Stock Company); SCS (Construction Joint Stock Company No. 5); SZL (Sonadezi Long Thanh Joint Stock Company); UIC (IDICO Urban Housing Development and Investment Joint Stock Company).

It can be seen from chart 05 that in addition to big real estate business in Vietnam such as Thu Duc House (TDL), Sonadezi Long Thanh Joint Stock Company (SZL), Tu Liem House (NTL) with owner's capital of 61%, 60% and 50% respectively, most real estate businesses have a relatively limited amount of equity and a low level of financial autonomy, so the proportion of equity compared to total capital is quite small.

3.3.2 Competition on management level and application of scientific and technological advances in production and business

In addition to the challenge of competing in capital and financial potential, Vietnamese real estate businesses also faces competition in terms of management experience and business experience and application of scientific and technical advances and achievements, etc.

3.3.3 Low market transparency

Low market transparency is also a challenge for real estate businesses, especially in the current period. Investment activities, real estate creation to buying, selling, transferring, and leasing transactions still reveal many limitations. Speculation is also common, especially in large urban areas, making real estate market operations a lack of sustainability and stability, thereby greatly affecting real estate enterprises.

3.3.4 Marketability

Vietnam's real estate market has some drawbacks:

(i) The competitiveness of the real estate market is still low, especially for the primary market. Although the land auction and project bidding mechanism has been stipulated in a number of legal documents, its application in practice is still limited, and there are even issues that have not been implemented

(ii) The real estate market still has many paradoxes and inadequacies. The number of underground transactions which are not registered with state agencies still accounts for about 70%. Most of the respondents answered that the administrative procedures of the relevant units are too cumbersome, troublesome, time-consuming and costly

(iii) Land use planning, urban development, and residential area development are still scattered, only focusing on master planning, lacking detailed planning and often having to be adjusted (iv) The legal system is not synchronized and overlaps with the real estate market. The real estate registration system is fragmented, unqualified for open and transparent management, etc. All of the characteristics create also a challenge for Vietnamese real estate businesses to develop sustainably in the current context.

4. APPLICATION OF DIGITAL TRANSFORMATION FOR VIETNAMESE REAL ESTATE BUSINESSES TODAY

4.1 The importance of digital transformation for Vietnamese real estate businesses

Technology application is said to be a trend that creates a rapid change in real estate business models in Vietnam. Data analysis, artificial intelligence, Internet of things, virtual reality technology and block chain will change the way to invest and control the real estate market in the future. The management of project, customer information or common documents is all proactively carried out on common software, which creates synchronization in the entire system. This helps information exchange take place more coherently and give better faster customer service. Furthermore, as everything is controlled by the land registry, digitized land transactions will create more transparency in the market. For real estate businesses, digital transformation will benefit in the following ways:

(i) Changing awareness and perspective of work management and organization culture: The application of advanced technology to work operations requires managers to really change their awareness and perspective. They need to be proactive in their work, explore new working methods and allow the storage of data, business information, and product information on a third-party cloud space. By that way, business managers will not spend too much time directly monitoring working employees and can still grasp the company's operating situation. Furthermore, digital transformation will help strengthen the connection between departments and teams within the organization. Departments have related jobs, goals, and tasks and they can easily grasp common work thanks to information on the system. As a result, it helps increase transparency and rationality in the organization and optimize the performance of all members in the organization.

(ii) Minimizing operating costs: With the digital transformation process, many work tasks in the traditional working model will no longer exist and will gradually be replaced by other types of modern technology, thereby saving time, effort and costs.

(iii) Enhancing the comparative advantage of real estate businesses: Digital transformation has now become one of the vital issues in the 4.0 industrial era. This is not simply a matter of choice; it is a must-to-do thing if businesses want to maintain a comparative advantage in the market.

(iv) Providing information and data quickly: When organizations and businesses carry out digital transformation, all information and data will be uploaded on a cloud computing cloud account. This helps business managers to easily track, monitor and update information to quickly make accurate decisions about their businesses and organizations. In addition, business employees can also easily access information to work effectively, quickly, and promptly at anytime and anywhere.

(v) Creating convenience for customers: Storing customer data and information is an extremely important issue in the digital transformation process of real estate businesses. From specific information such as transaction history, real estate segments, and services that customers are interested in, sales staff can advise on the types of products or services that are good and suitable for their needs. In addition, thanks to regularly updated information, companies can offer many customer care programs such as sending messages of congratulations on birthdays, holidays, etc., thereby making a good impression and creating customer sympathy for the business.

4.2 Benefits of digital transformation for real estate companies

In today's digital age, digital transformation is playing an increasingly important role for real estate businesses in Vietnam. The application of digital technologies and digital transformation helps improve operational performance, optimize work processes, enhance customer experience and create new opportunities in the real estate sector. Some benefits are listed below:

(i) Asset management

Digital technology allows real estate businesses to manage asset information more effectively. They can create and manage property databases, including detailed information about apartments, real estate, location, value and legal status. This enhances asset management and tracking capabilities, thereby enhancing the ability to make smart decisions and optimize asset utilization.

(ii) Work procedure optimization

Digital transformation allows real estate businesses to optimize their work processes through the use of project management software, CRM (Customer Relationship Management) systems, and customer information management systems, contract management system, planning and monitoring project progress, and managing financial resources. This helps reduce risks and increase employee efficiency and productivity.

(iii) Customer experience improvement

Digital transformation brings significant improvements in customer experience. Real estate businesses can use technology to provide online services, such as virtual apartment viewing, 360-degree photography, online consultancy, and detailed project information sharing. This saves customers time and effort, increases convenience and reduces the need for in-person visits. In addition, technology also helps increase interaction and create personalized experiences for customers by providing information and answering questions quickly and accurately.

(iv) Data analysis and forecasting

Digital transformation allows real estate businesses to collect and analyze data to better understand the market, predict trends and make strategic decisions. Technology such as artificial intelligence (AI) and machine learning can be applied to analyze and forecast real estate value, market demand and economic situation. This helps businesses obtain strategic information to enhance competition and make the right decisions about investment and development.

(v) For online marketing and sales

Digital transformation opens up new opportunities to reach customers more widely and effectively through online marketing and sales. Real estate businesses can create websites and mobile applications to introduce products, provide detailed information, images and videos about their real estate projects. They can use social media channels and digital marketing tools to reach potential customers, increase engagement, and drive sales.

In summary, digital transformation plays an important role in enhancing operational efficiency by providing better customer experience, improving work processes and creating new opportunities for real estate businesses.

4.3 Challenges for Vietnamese real estate businesses with application of Digital transformation

Besides the benefits that digital transformation brings to businesses, there are many challenges and difficulties for businesses. Because real estate business is an economic industry with very specific products and processes, digital transformation is a difficult process for real estate businesses.

Firstly, it is difficult to change awareness and thinking. Real estate businesses in Vietnam are facing many opportunities and challenges in the race for digital transformation. In Vietnam, digital transformation models are also creating useful services for people and effectively taking advantage of society's idle resources. However, it also creates conflicts due to fundamental changes to the traditional business model. New technological strengths are helping many startups gain an advantage. This trend creates important changes in the value chain of industries as well as the global supply chain.

However, digital transformation in the Vietnamese real estate market is still slow because not everyone participating in the real estate market in general and personnel operating in real estate businesses in particular is fully aware of it. For example, when building a building, house, or project, digital transformation only helps in saving energy and applying green materials. It can't help choose suitable higher technologies in the process of investment development, operation. Therefore, in the context of the current digital economy, real estate businesses and organizations with traditional models are required to have a strong change in thinking, especially the perspective of managers - thinking to understand difficulties, challenges and accompany the whole process of implementing digital transformation.

The second one is regarding human resources and scientific and technical qualifications. In fact, digital transformation will help businesses shorten time, costs, and human resources in the process of researching, buying and selling real estate. Specifically, digital transformation will help customers find the most suitable real estate products at the most reasonable prices; help with quick capital turnover and market stability; connect supply and demand; helps the market circulate and increase liquidity. Furthermore, there are many information technology applications in real estate in Vietnam such as: Propzy, Homebase, Infina, Revex... However, currently many businesses are gradually closing and orders are being closed. The rest are also facing many difficulties to survive, even though the size of the market is very large. Revenue in the early stages for real estate technology businesses is very low, making it difficult to help businesses survive. Therefore, many businesses are very cautious about applying digital transformation technology. The reason is because there are too many difficulties related to people and technology.

Thirdly, they have difficulties in funding. Most real estate businesses in Vietnam are small and medium-sized enterprises with limited capital size. This is also a barrier for businesses when they want to apply digital transformation.

Finally, there are some other difficulties due to nature of this industry. For example, customers do not like to pay through banks because the transaction value is quite large, online payment fees are very high. So most pay in cash. The management of land use rights issued to new owners has enough basis to deploy asset management solutions, digitization in asset management that businesses cannot do etc.

4.4 Solutions to promote digital transformation to promote sustainable development for real estate businesses in Vietnam in the future

To improve business performance as well as the competitiveness of businesses, applying digital transformation is a must for businesses. To promote digital transformation for real estate businesses in Vietnam, it is necessary to combine a synchronous system of solutions.

Firstly, there needs to be participation and support from the government system to businesses. The state needs to have policies to support businesses in all aspects because real estate is a valuable asset. Buyers usually find it difficult to make a decision when they visit the real estate in person. Therefore, it is more difficult for them if they only depend on information on the internet. This requires real estate encryption to monitor market fluctuations. In addition, the government also needs codes for trading floors and each broker. It will make the government's management better and more effective, and thereby make the digital transformation of participating businesses and units more convenient. In general, successful digital transformation must be a process involving the entire system, especially creating a technology ecosystem for real estate is very necessary and indispensable for sustainable development.

Secondly, there needs to be a gradual change in thinking and awareness of participants (business leaders, employees, as well as customers and investors...) about the role of technology applications. First of all, you must let customers clearly understand your products. Furthermore, it is necessary to play a leading role in the market, ensuring relationships between suppliers and real estate businesses, brokerage floors. In addition, changing business habits and practices is considered a big barrier, causing businesses to come to a standstill. Most employees in real estate businesses do not have the mindset to use system software because of their fear of change, busy work and huge number of documents. In addition, too many complex processes are another difficulty in real estate digital transformation, because it involves many parties, not all of which have compatible platforms. Using too many platforms in a group of procedures among many parties will cause difficulties and even reduce speed compared to the traditional way.

In fact, many businesses have applied digital transformation software, but employees and workers have difficulty applying it or only partially applying it, causing the business's digital transformation to fail to achieve the expected success. Therefore, the core issue is the need for a change in thinking and awareness of the participants.

In addition, most customers today are familiar with traditional sales methods, so changing sales methods to new technology requires time for them to learn and promptly adapt. In addition, the psychology of Vietnamese real estate buyers is that they want to come to see the products in person because if they only view the products online, they still do not trust enough to sign a sales contract.

Thirdly, real estate businesses themselves need to invest in this activity. Businesses need to prepare funds to invest and apply many different technologies in business. For example, technologies are should be invested to increase the experience and bring the most authentic feeling to customers. Business should apply technology to search, compare, and transact real estate, thereby creating convenience and flexibility, cost saving in real estate transactions (smart technology applications help customers look up information about real estate segments through VR, AR technology, etc.).

Fourthly, the participants themselves also need to change their thinking and habits, improve their ability to use and apply information technology, and adapt to the digital transformation environment. In particular, businesses need to focus on fostering and training high-quality personnel and information technology experts. Conventional real estate businesses themselves currently operate in a traditional style and invest little in innovation, creativity and digital transformation.

5. CONCLUSION

Digital transformation in the real estate sector is an inevitable trend and helps the market develop healthily and sustainably. If a business proactively adapts and has an appropriate digital transformation strategy, it will expand the market, increase accessibility and experience for customers, thereby increasing the revenue and brand value of the business rapidly. On the contrary, if a business is slow and does not have a suitable digital transformation strategy, it will soon be eliminated from the market.

AN INVESTIGATIVE STUDY ON DECISIONS TO DEPOSIT MONEY IN PERSONAL ACCOUNTS: EMPIRICAL EVIDENCE AT VIETINBANK BRANCH IN AN GIANG PROVINCE

Ph.D Nguyen Thanh Nha[1]

Abstract: *The study aimed to determine factors affecting the decisions of individuals to deposit in their accounts at the VietinBank branch in An Giang Province. In this study, a questionnaire was prepared and used to investigate 250 individuals who have or have not done transactions at the An Giang branch of VietinBank. The estimated results derived from the Probit model showed that the deposit decision is largely governed by the deposit interest rate, quality of customer services, business location, promotion, and individual's level of education, age and income. In addition, the Tobit model suggested that the deposit interest rate, quality of customer services, business location, and individual's age are the most influential factors in affecting the deposit amount.*

Keywords: *deposit amount, deposit decision, personal customers, VietinBank branch in An Giang Province.*

1. INTRODUCTION

Capital mobilization in general and deposit mobilization in particular are traditional operations of commercial banks and are one of the foundations ensuring the development of banks. They are important business activities that have decisive impacts on the bank's performance. Customer-oriented business strategy is crucial for commercial banks. Attracting new personal customers while strengthening the relationship with existing customers has become an effective business measure to bring high efficiency. It is of utmost importance for the bank's success that the bank endeavours to best satisfy customers who already made deposits to their accounts with the bank. Moreover, the bank should have regular follow-ups with existing customers to ensure that they remain loyal to their deposits to the banks. To achieve the desired outcomes from the strategy, the banks should have measures coordinating their efforts with support from the Government, State Bank, and other agencies. Therefore, in this study, empirical evidence collected from the An Giang branch of VietintBank was investigated to determine factors affecting the decisions of personal customers to deposit in commercial banks, thereby proposing solutions to enhance effective deposit attraction.

2. LITERATURE REVIEW AND METHOD

2.1. Literature review

The Theory of Reasoned Action (David et al., 1989) was applied to study the decision of personal customers to make savings deposits to their bank accounts. According to Shappard et al. (1988), an individual will make a savings deposit once the following three conditions are satisfied. Firstly, the behaviour of personal customers toward savings deposits is not entirely under their control; instead, the deposit decisions are influenced by deposit interest rates, service quality, etc. Secondly, the circumstance poses choices such that customers have only options to deposit in this bank and not the others. Lastly, personal customers can't make a sound decision on whether they

[1] Email: nhatdg@ufm.edu.vn, University of Finance - Marketing.

should deposit to their savings accounts, due to insufficient information on the interest rate, the bank quality, or products from other banks. Therefore, this study uses the Theory of Reasoned Action to explore factors affecting the decision of personal customers to deposit in commercial banks.

Deposit decision of personal customers at commercial banks is of interest to many researchers. According to literature, the deposit decision can be influenced by the following factors:

Deposit interest rate: The deposit interest rate represents the payment that the bank makes to customers for using their capital. The deposit interest rate has a significant impact on the amount of deposits to commercial banks, in particular savings deposits because personal customers are interested in comparing the savings interest rate to the slippage rate of the currency as well as the profitability of other forms of investment. Based on the information, the customers decide whether to deposit, how much the deposit is and under what form. A bank that has a high deposit interest rate is likely to attract more customers because they tend to consider the interest rate as an essential factor when making the deposit decision. By studying Maskan Bank branches in Iran, Mohammadi and Shilan (2015) found that the deposit interest rate is the most decisive factor in attracting customers to make savings deposits. Vezifehdoost et al. (2015) and Mushtaq and Siddiqui (2017) demonstrated the positive correlation between the deposit interest rate and the deposit decisions of personal customers.

Quality of service: The quality of deposit service is measured as the capability of the bank to satisfy the needs of the customers. In other words, it represents the gaps between the customers' expectations and their experience when using the deposit service of the bank. High-quality services will therefore satisfy and attract more customers to choose the services of the bank. Phan et al. (2015) and Jaber and Manasrah (2017) studied factors affecting customer satisfaction at the Agribank branch in Vinh Long province. They found a positive relationship between the service quality and the deposit decisions of customers.

Business location: The business location of the bank represents the convenience for customers to access the bank. The closer the bank is to the customers' home address, the better their experience. Duong (2013) shows the longer distance to the bank has negative impacts on the deposit decisions of customers.

Transaction time: The transaction time is among other factors representing the professionalism in the services of the bank. It is measured as the time required for the bank to satisfy the needs of customers fully. The study of Phuong (2010) demonstrates that a longer waiting time while making deposits has a negative influence on the deposit decision.

Education level: Customers with high education levels have increased awareness of savings and investment. By studying the deposit decisions of households in the Mekong River Delta, Nguyen (2011) found a positive correlation between the education level of customers and their deposit decisions.

Age: Young people prefer investment rather than savings because they believe investment is more profitable. On the contrary, elderly people tend to save money to prepare for their retirement. The study of Nguyen (2011) shows that, for selected households in the Mekong River Delta, the age of customers and the deposit decision are positively correlated.

Income: The customer income measured as the monthly average income represents the customer's wealth. Customers with higher incomes have more money available and are more likely to deposit to their savings accounts, compared to customers with lower incomes. Using households in the Mekong River Delta as the research sample, Nguyen (2011) shows the positive correlation between the income of customers and their deposit decisions.

Promotion: In the banking sector, promotion aims to encourage, attract the customers' attention, and enhance their positive attitudes towards the bank when comparing it against other competitors offering similar services in the same conditions. The customers prefer to use services of the banks that have promotions or offers, rather than those without promotion programs. According to the studies of Duong and Nguyen (2016), Mokhlis et al. (2008), Alqasa et al. (2013), and Pham and Pham (2010), the promotion has a positive impact on the deposit decisions of customers.

2.2. Research Methodology

2.2.1. Regression model

This study uses the Probit model to analyze factors affecting the customers' decision to deposit to the VietinBank branch in An Giang province. In addition, the Tobit model was selected to study factors affecting the amount of deposits.

The Probit model is defined as: $y = \beta_0 + \sum \boldsymbol{\beta}_i + x_i + u_i$ (1),

where:

- y : is the dependent variable representing the customer's decision to deposit to the An Giang branch of VietinBank; y=1 means the customer decides to deposit to the bank, while y=0 means the customer decides to another bank;
- βi : are the regression coefficients of the Probit model given in (1);
- x_i : are the independent variables as described in Table 2.

The Tobit model is defined as:

$$y_i = \begin{cases} y_i^* = \beta x_i + u_i & \text{nếu } y_i^* > 0 \\ 0 & \text{nếu } y_i^* \leq 0 \end{cases} \quad (2)$$

where:

- y is the dependent variable representing the amount of deposit made by personal customers;
- x_i are the independent variables as described in Table 2.

Outcomes of the regression models are verified by the Pearson correlation, Durbin Watson and multicollinearity tests.

2.2.2. Data

Data used in this study was randomly sampled, including in total of 250 personal customers who have or have not made transactions at the An Grang branch of VietinBank. An interview was then conducted with two groups of customers who have or have not made savings deposits to the branch.

The number of samples (or customers) per group is given in Table 1. Further details of the data were provided in the Appendix.

Table 1: Research sample

Criteria	Research sample	
	Number of samples	Percentage
Customers who have made transactions at VietinBank	145	58%
Customers who haven't made transactions at VietinBank	105	42%
Total	250	100%

(Source: Analysis results)

(***, ** represents the statistical significance level of 1% and 5%, respectively)

The results obtained from the Probit model demonstrate that the deposit decision of personal customers at the An Giang branch of VietinBank is affected by the deposit interest rate (X1), service quality (X2), business location (X3), educational level (X5), age (X6), income (X7) and promotion (X8).

The deposit interest rate (X1) has a positive correlation with the dependent variable at the statistical significance level of 5%. The higher the deposit interest rate, the more the deposit to the bank. Specifically, given that all other factors remain unchanged if the deposit interest rate grows by 1% per year, the likelihood that the customers' deposit to the bank will increase by 0.119%. This observation agrees with other studies by Mohammad and Shilan (2015), Vezifehdoost et al. (2015) and Mushtaq and Siddiqui (2017), all of which found a positive correlation between the deposit interest rate and the deposit decision of personal customers.

The quality of services (X2) was found to have a positive correlation with the dependent variable at the statistical significance level of 1%. The higher the service quality, the more the deposit to the bank. Given that all other factors remain the same, by improving the service quality by 1%, the probability that a customer will deposit to the bank will increase by 0.82 times. Similar to what was previously pointed out in other studies by Phan et al. (2015) and Jaber and Manasrah (2017), this study shows the presence of a positive correlation between the quality of service and the deposit decision of personal customers.

The business location of the bank (X3) is inversely correlated with the dependent variable at the statistical significance level of 1%. The customers are less likely to deposit to distant banks. If the distance between a bank and the customer's living address increases by 1 kilometre, the likelihood of the customer depositing to the bank diminishes by 0.024 times. As expected from a similar study by Duong (2013), the business location of the bank (or the distance from the bank to the customers' home address) has negative impacts on the deposit decisions of customers.

The educational level (X5) is positively correlated with the dependent variable at the statistical significance level of 1%. Customers with higher educational levels are more likely to make savings deposits to the bank. Given that all other factors remain unchanged, if the educational level of a customer is one level higher, the probability that the customer will deposit to the bank will increase by 0.767 times. This observation agrees with a similar study by Nguyen (2011), which confirms the positive correlation between the educational level and deposit decisions.

Age (X6) was found to have a positive correlation with the dependent variable at the statistician significance level of 1%. Elderly people are more likely to make savings deposits to the bank. If a customer is one year older, the likelihood of them depositing to the bank will increase by 0.04 times. This result is similar to the study by Nguyen (2011) where the customers' age is positively correlated with the deposit decision.

Income (X7) has a positive correlation with the dependent variable at the statistical significance level of 1%. It is more likely for customers with higher incomes to make savings deposits to the bank. Specifically, if the monthly income increases by 1 million VND, the probability that the customer deposits to the bank will be 0.475 times higher. As expected from a similar study by Nguyen (2011), this study shows a positive correlation between the customers' income and the deposit decision.

Promotion (X8) was also found to be positively correlated with the dependent variable at the statistical significance level of 1%. Given that all other factors remain the same, a bank with active promotions will increase the probability of customers making deposits by 0.612 times. This observation is agreed by the similar studies of Duong & Nguyen (2016), Mokhlis et al. (2008), Alqasa et al. (2013), and Pham and Pham (2010), all of which show that promotion positively influences the deposit decision.

The results of the Tobit model show that the amount of deposit made by personal customers to the bank is influenced by the deposit interest rate (X1), service quality (X2), age (X6) and business location of the bank (X3).

The deposit interest rate (X1) is positively correlated with the amount of deposit to the bank at the statistical significance level of 1%. A higher deposit interest rate will attract more deposits to the bank, and vice versa. Given that the other factors remain the same, for every 1% increase in the deposit interest rate, the deposit amount will increase by 0.998 million VND. This observation demonstrates the fierce competition in the current banking sector. However, the operation of the banks must comply with the general regulations of the State Bank. This study is in agreement with other studies by Mohammadi and Shilan (2015), Vezifehdoost et al. (2015) and Mushtaq and Siddiqui (2017), confirming the positive correlation between the deposit interest rate and the deposit decision.

The service quality (X2) was found to be positively correlated with the amount of deposit to the bank at the statistical significance level of 5%. The higher quality of banking service tends to attract more customers making deposits to the bank. If the service quality rating reviewed by the customers increases by one level, the total amount of deposit will increase by 0.564 million VND. This observation agrees with what was expected from other studies of Phan et al. (2015) and Jaber and Manasrah (2017), which confirms the positive correlation between service quality and deposit decisions.

The business location of the bank has an inverse correlation with the amount of deposits to the bank at the statistical significance level of 5%. The further the distance between the customers' home address to the bank, the less likely the customers will make deposits to the bank, and vice versa. The customers will feel inconvenienced in travelling and making transactions at distant banks. The study shows that for every one kilometre of the distance increased, the total amount of deposit to the bank will decrease by 0.403 million VND. This observation which is similar to the other study of Duong (2013) confirms the negative correlation between the business location of the bank (the distance between the bank and the customers' home address) and the deposit decision.

Age (X6) was found to be positively correlated with the amount of deposits to the bank at the statistical significance level of 1%. The elder people are more likely to make savings deposit to the bank, and vice versa. This also demonstrates that the elder customers tend to have more saving assets than the younger customers, which aligns with the current trend. The regression analysis shows that if the customers are one year older, the total amount of deposits will increase by 0.925 million VND. This result agrees with the study of Nguyen (2011) and indicates the positive correlation between the customers' age and the deposit decision.

3. CONCLUSIONS AND RECOMMENDATIONS

Currently, commercial banks always look for solutions to attract deposits from personal customers. However, this capital still increases slowly because, besides the deposit interest rate, there are other factors affecting the customers' decision to deposit to the An Giang branch of VietinBank. According to predictions of the Probit model, this study showed that the deposit decision of personal customers depends on the following factors: the deposit interest rate, service quality, business location, educational level, age, income, and promotion. While the business location of the bank was found to be inversely correlated with the deposit decision, there is a positive correlation between the decision and the remaining factors. In addition, the study applied the Tobit model to determine other factors affecting the deposit amount to the bank. The most influential factors comprise the deposit interest rate, service quality, business location, and age. The correlation predicted by the model between the most influential independent variables and the dependent variables is as expected.

The results of this study show that the An Giang branch of Vietinbank needs to be proactive and focus on improving the quality of customer service, building and developing banking culture and diversifying promotion policies and deposit interest rates, to attract more deposits from personal customers. Some recommendations are elaborated as follows:

Firstly, the customer service quality should be improved. Customers have an influential role in sales based on their perception of the quality of products and services. Therefore, the Vietinbank branch in An Giang province needs to pay more attention to managing the quality of customer service, ensuring uniformity in the service quality at all times. Besides, the bank needs to have a system for handling errors or either verbal or written customer complaints. To improve competitiveness, the An Giang branch of Vietinbank should build qualified staff by training employees to enthusiastically support customers through procedures in a considerate and thoughtful manner to create a comfortable and joyful environment for customers, and by organising external training for staff in professional skills, IT and foreign languages to diversify banking services and modernise banking technologies.

In addition, the branch should focus on developing the IT system, making Mobile Banking a main channel to improve the convenience and accessibility for customers who cannot use services at the branch.

Secondly, the branch should focus on building and developing the banking culture. Human factors play an integral role in business development. For the banking sector which is part of the financial service sector, it is important to combine human factors and cultural factors. A suitable corporate culture will enable employees to understand the purposes of the work, be more productive, feel proud to represent the bank and increase their loyalty to the bank. Besides, customers perceive and evaluate the banking culture through the behaviours of employees. Therefore, to develop and manage professional and efficient banking cultures, the organisational structure of the bank needs to have an apartment dedicated to plan, monitor and evaluate activities related to developing a new banking culture.

Thirdly, the branch needs to diversify promotion policies and deposit interest rates. Promotions and interest rates are two important factors affecting the deposit decision of customers as well as the capital mobilisation of the bank. Thus, the An Giang branch of Vietinbank should focus on diversifying promotional policies on holidays and develop incentive plans for customers with large deposits or long-time customers. Besides, it is necessary to consider adjusting the interest rate for short-term deposits (between 3 and 6 months) which account for a large proportion of the total deposits to the bank.

FACTORS AFFECTING THE QUALITY OF TAX CONSULTING SERVICES: THE CASE OF THE DELOITTE VIETNAM TAX ADVISORY COMPANY LIMITED

Tran May Linh[1], Assoc.Prof.Dr. Ly Phuong Duyen[2]

Abstract: The article examines the factors affecting the quality of tax consulting services of Deloitte Vietnam Tax Consulting Co., Ltd. when providing consulting services to corporate customers in Vietnam as well as FDI enterprises and businesses. multidisciplinary, multinational worldwide. It analyzes the correlation between tax consulting service quality and customer satisfaction estimates; At the same time, evaluates the influence of these factors on the basis of surveying the opinions of businesses that have been and are currently customers of the company. The research uses the SERVQUAL model to analyse data from 300 customers including companies in Vietnam and companies with facilities in Vietnam. Based on entering and coding into SPSS v20.0 software for analysis, the research has determined that among the five factors given for analysis include: (i) Responsiveness, (ii) Reliability, (iii) Tangibility, (iv) Assurance, (v) Empathy. Among them, 3 variables have a positive linear relationship with customer satisfaction including Assurance, Tangibility, Emphathy. Eliminate two variables: Responsibility (RES) and Reliability (REL).

Keywords: Consulting Service, Customer Satisfaction, Influencing Factor, Service Quality, Tax Consulting.

1. INTRODUCTION

The definition of tax has been around for generations. Taxes are the main source of state revenue, helping to create and mobilize resources for the national budget, creating a decisive premise for realizing socio-economic development goals and improving people's living standards, strengthening national security, which is considered one of the top political tasks. Tax consulting services is a concept that has appeared for a long time in the tax administration of advanced countries in the world. It is a fundamental part of the operation of countries and businesses. Tax policies need to be clearly formulated and actively managed by governments and businesses alike. From a business perspective, tax management is an increasingly prioritized issue because of increasingly complex laws. Tax consultants work with clients to establish tax policies and procedures to ensure that tax compliance responsibilities are fulfilled and the appropriate alignment with markets and government agencies. In this way, business management can ensure good tax management and continue to focus on business management. Although it has been developed for a long time in the world, in Vietnam, the concept of tax advice has become popular in recent years. In fact, there are many businesses that really understand the tax, as well as the tax obligations that they have to perform, leading to many problems that arise not actively when the tax inspection and examination agencies step in. In particular, in the context of the country's rapid development, the period of economic integration and innovation, the enhancement and strengthening of the effectiveness of national tax administration is increasingly tightened, and the updated and renewed for stricter management. That explains the pressure to optimize tax management in every business in Vietnam. If enterprises want to grow and develop as well as integrate around the world, this task needs to be implemented synchronously, drastically, and effectively. Therefore, the development

1 Email: Maylinh912@gmail.com, Deloitte Vietnam Tax Advisory Company Limited.

2 Academy of Finance.

of tax-related services is a natural factor.

Present in Vietnam since 1991, formerly known as VACO auditing company, Deloitte Vietnam is famous as one of the four largest auditing and consulting firms in the world with extremely rich strengths and resources in the field of auditing and tax consulting. Deloitte develops its extensive international customer network, so Deloitte's customers are diverse and spread all over the world. In Vietnam, Deloitte Vietnam Tax Consulting Co., Ltd with a team of experienced staff and proven professional competence has always strived to provide high-class tax consulting services to large clients in Vietnam. Vietnam. However, facing the competitive pressure of the market and the needs of customers, improving the quality of tax consulting services is extremely important. Realizing the urgency of the topic, authors decided to choose the topic Factors affecting the quality of tax consulting services at Deloitte Vietnam Co., Ltd. Appropriate recommendations can help the company find a suitable direction for itself, thereby gradually developing and growing stronger in Vietnam.

2. LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

2.1. Service Quality

Service concept

Service is a fairly broad and popular concept that has been around for a long time in life. There are many different definitions of services as follows: In the study of Glenn Parry and the authors, they said: "There is no perfect definition to separate goods from services, although scholars been trying for a very long time. In attempting to define the differences between goods and services, their similarities are often overlooked. However, Gronroos asserts: "Service is one or a series of non-essential intangible activities or interactions between customers and service personnel, physical resources or goods. or service delivery system." In the words of Kotler and the authors in their paper: "A service is any activity or benefit that one party can provide to another, that is essentially intangible and does not result in ownership anything. Its production may or may not be tied to a physical product.". In summary, from the many concepts mentioned above, the author gives the most general definition of service: it is the interaction and exchange between service providers and service users to meet customer needs.

The nature of services can also be considered as goods but they are not material. The nature of a service business is to provide solutions to solve problems.

Some features of the service include:

Firstly, ***Invisibility***: All types of services cannot be seen by the senses before they are traded. That is, verifying it directly is not possible.

Secondly, ***Inseparability***: This is quite easy to distinguish when compared to physical goods, physical goods will be hunted, then stored, then sold and consumed. In stark contrast, services are sold first, and then production and consumption take place at the same time shortly after. Therefore, services will be inseparable from their suppliers. For example: Beverage service provided by the waiter…

Thirdly, ***Heterogeneity (diversity)***: The quality of the service provided to the customer can vary depending on many different factors and it is quite difficult to make an absolute assessment of the level of quality. For example, real estate brokerage consulting services will depend on the experience and knowledge as well as soft skills of the consultant, which leads to different quality of advice.

The fourth is ***Inability to store:*** The Service cannot be archived for future use. Therefore, inventory purposes for services are difficult to achieve. For example, a dental service cannot be stored for later use, it can only be provided and experienced at the time the customer uses it.

Finally, ***Non-transferable***: A service cannot be separated from the consumer and the person providing it. Food service in a restaurant cannot be done without the customer and the chef.

The concept of service quality

There are many studies on the concept of service quality over the years as follows. In 2007, the same author stated succinctly: "Quality is the perception of customers about what they receive." That is, "service quality is a measure of how good a service is: the degree to which it is delivered in line with customer expectations. Because quality service means matching customer expectations on a consistent basis." _according to Lewis et al. (1983). Thus, in a nutshell, service quality from the perspective of the manufacturer is the assurance of providing the service according to the scenario with the high professional skills of the supply staff and the management team.

From the customer's perspective, service quality is the level of customer satisfaction in the consumption process, is the overall service of the business that brings a chain of benefits and fully satisfies the expected needs of customers commensurate with the cost to be paid by the customer.

Customer satisfaction

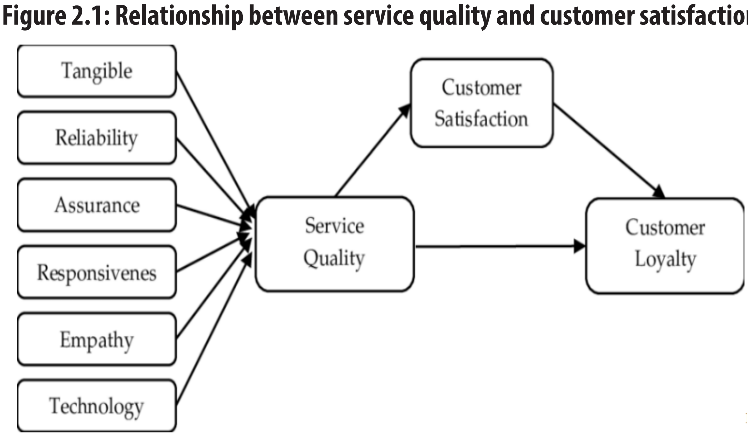
The more the world develops, the more businesses need to play a role not only to bring profits to sellers, but also to bring commensurate value to customers. Therefore, for a long time, the concept of customer satisfaction has become an important factor that businesses want to have. Fazal and Kanwal (2017) mention that customers are the core of every successful company.

Over time, the world has changed, the market has changed, and the marketing environment has also changed (Kotler, 2017), so businesses are facing difficult challenges to achieve their goals of ensuring value to customers (Shamsudin et al., 2018b) and their satisfaction (Hasan, 2019). Thus, customer satisfaction is determined through measuring or comparing customer satisfaction before purchasing and after using a product or service. This measurement is based on psychological factors, that is, the feeling of satisfaction of needs, from which the conclusion is satisfied or dissatisfied.

The relationship between service quality and customer satisfaction.

Customer satisfaction or loyalty and competitiveness are difficult-to-control variables that have been present in many global multidisciplinary studies. Academic debates on this topic are quite lively with high practicality such as the Swedish customer satisfaction barometer (SCSB; Fornell, 1992), or in the US the ACSI index.; Fornell et al., 1996). According to Zeithaml (1998), service quality is often located through customers' evaluation of the superiority of the whole service delivery process.

Figure 2.1: Relationship between service quality and customer satisfaction



Source: Atif Mahmood et al 2018

In summary, service quality is an important factor affecting customer satisfaction. A good service experience from customers will bring a lot of sustainable value to the business and vice versa.

2.2. Tax consulting service.

Tax consultant definition

Taxes are a fundamental part of the functioning of countries and companies. More and more businesses, large and small companies are established. Meanwhile, tax policy in any country is increasingly tightened with many legal regulations being issued. Therefore, tax policy always needs to be clearly formulated and managed accurately, transparently and flexibly. This leads to a consequence that tax-related issues are always difficult problems for almost every individual or business. From the business point of view, tax management is an increasingly prioritized issue in the current renovation period. Stabilizing the management process and optimizing tax obligations is a prerequisite in the process of building sustainability and transparency in business. This directly affects the need for a third party with sufficient professional and professional knowledge in tax and legal aspects. That is the reason why the tax consulting service was born in the context of social development and integration in Vietnam. Tax consulting is one of the important areas of legal services. The tax consulting industry brings value to customers by helping them save tax costs and find opportunities to optimize the amount of tax payable and avoid cases of being penalized by the General Department of Taxation. Tax consulting service can be considered as a service that provides long-term solutions on tax obligations and legal responsibilities for businesses, this helps businesses comply with and obey the law, creating trust in the hearts of customers people and peace of mind to build a sustainable business strategy.

Classify of tax consulting service

When businesses seek tax consulting services, their needs will include support for services on 8 current tax types in the Vietnamese tax system with more than 100 types of fees and charges. Fees are centrally managed. Typical taxes include: Corporate income tax, Personal income tax, VAT, Import-export tax, Special consumption tax, etc. Tax services that Deloitte Vietnam Tax Consulting Company Limited shares according to each period of each customer company. Depending on the business situation and business needs of customers, Deloitte accompanies businesses in the process of entering the market, supporting optimal operations, restructuring and transformation, and exiting the market. Additionally, support linked transactions, Global trade planning to optimize supply chains to achieve the most efficient customs duties, Support dispute resolution and work with authorities,…

The role and necessity of tax advice for businesses in Vietnam

Currently, there are many businesses facing tax difficulties, leading to large losses when paying taxes. The reason is that most businesses in Vietnam do not have a deep understanding of tax laws and procedures. Although any business has its own accounting department, which can carry out normal tax declaration and calculation procedures, it still requires tax advice on professional issues. profound and complex, requiring a deep understanding of the law. Tax consulting services are expected to support businesses in all stages of the organization including establishment, operation and even in the cancellation process.

In Vietnam, tax services are provided mainly by the following groups: (i) Auditing companies; (ii) Accounting service enterprises; (iii) Tax service businesses (collectively referred to as tax agents)

From 2018 until now, the number of tax agents has increased slowly. According to the General Department of Taxation, the number of tax agents as of January 2022 is 817. Compared to the number of newly registered businesses every year (about 30,000 - 40,000 newly registered businesses annually), the growth rate is very high. big. taxes are very low. In particular, with the need to use tax services in particular and tax services in general of businesses in the economy, the number of tax agents is still very small. Currently, the country has about 700,000 operating businesses, of which 98% are micro, small and medium enterprises (of which, about 90% are small and micro enterprises).

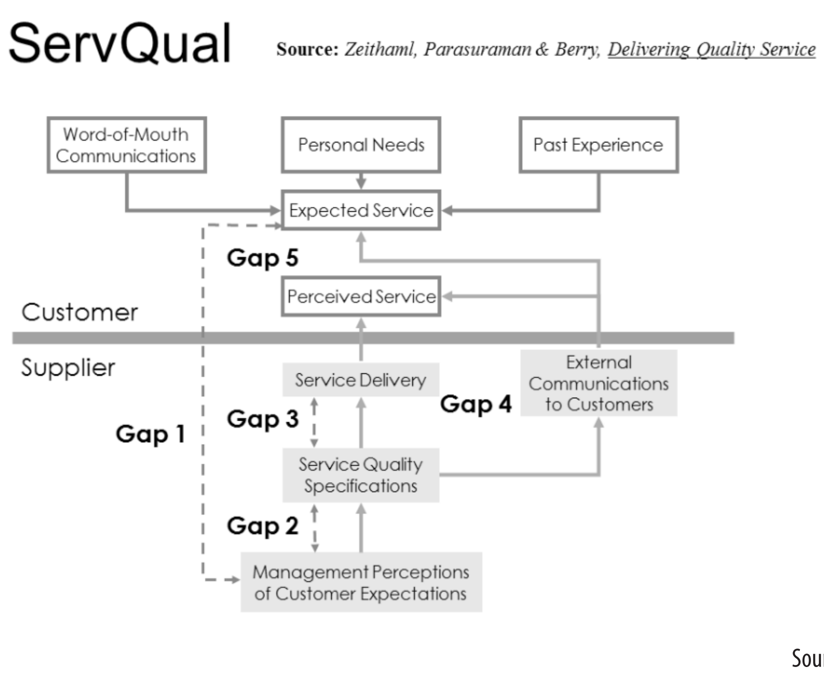
However, looking comprehensively at the development of tax services in Vietnam, we can see that the most obvious weakness in the development of tax services in Vietnam is that the number of tax agents is still small, not fully exploiting the demand. , potential for tax service in the economy. While many businesses are still confused when carrying out tax procedures, improper implementation of tax procedures due to lack of in-depth understanding of tax laws (inadvertently violating the law) leads to administrative sanctions. about tax. Based on annual data, there are tens of thousands of problems sent to the websites of tax authorities at all levels, questions in document discussion conferences asking tax authorities to answer. It can be seen that the demand in the market is extremely large and the potential of the tax consulting service industry is also highly appreciated.

2.3. Research related to the research topic.

2.3.1. Model 5 quality gaps SEVQUAL, Parasuraman et al (1998)

Implemented by American experts A. Parasuraman, Valarie Zeithaml and Leonard Berry in 1988, the instrument is a scale that is considered highly reliable and accurate, widely used in quality research. Industry services such as banks, restaurants, hospitals, schools, etc. The SERVQUAL model considers the difference between the expected and actual value perceived by the customer. The scale includes 21 variations measuring 5 parts of service quality including: Reliability, Responsiveness, Assurance, Tangibility, Empathy.

Figure 2.2: SERVQUAL quality 5-gap model



Source: Parasuraman 1988

2.3.2. Hyphotheses

Based on and theoretical framework presented in part 2.1 of the study, within the scope of the research, the authors will apply SERVQUAL model to analyze the quality of tax consulting services of the Company. Deloitte Vietnam Tax Consulting Co., Ltd.

Based on the SERVQUAL model and related studies, the research hypothesis is detailed as follows:

Reliability: The reliability of tax consulting services is demonstrated through the full and correct implementation of the consulting contract signed with the client. It is the commitment and implementation of the best possible support, including the difficulties that arise during the performance of the service, the company limits the risks of errors that may occur. go out.

The level of customer satisfaction is directly proportional to the level of satisfaction from them. From there, the first hypothesis of the study is stated as follows:

H1: Reliability will positively affect customer satisfaction when using tax consulting services for Deloitte Vietnam Tax Consulting Co., Ltd.

Responsines: From the results of qualitative research, the customer's response will depend on whether the customer is interested and willing to help or provide relevant necessary solutions in a timely manner. When customers receive the feedback from the supplier as expected, they will feel satisfied.

The second hypothesis is stated as follows:

H2: Level of feedback positively affects customer satisfaction when using tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd.

Assurance: As for the assurance factor, the aspects that are concerned include the professional qualifications of the staff, the improvisation and handling of situations quickly and accurately during the service process... ensure a professional customer experience that will score in the hearts of customers.

Therefore, the third hypothesis is stated with the following content:

H3: Assurance positively affects customer satisfaction when using tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd

Empathy: Service attitude of service staff will directly affect customer loyalty. To achieve this, employees need to pay attention to the needs and know how to put themselves in the shoes of service users to understand what the value customers require.

Customers will be extremely satisfied when they receive the value they deserve from someone who understands their psychology.

Thus, the sympathy hypothesis is stated:

H4: Sympathy positively affects customer satisfaction when using tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd

Tangibility

The tangible factors mentioned in this study include factors that are difficult to determine such as brand value, reputation of the company's image, the guarantee of the company's name. Customers will feel more secure when choosing a company that provides reliable coverage and guaranteed quality.

This is also a factor that is assumed to have an impact on customer satisfaction, especially in specific areas such as tax and legal.

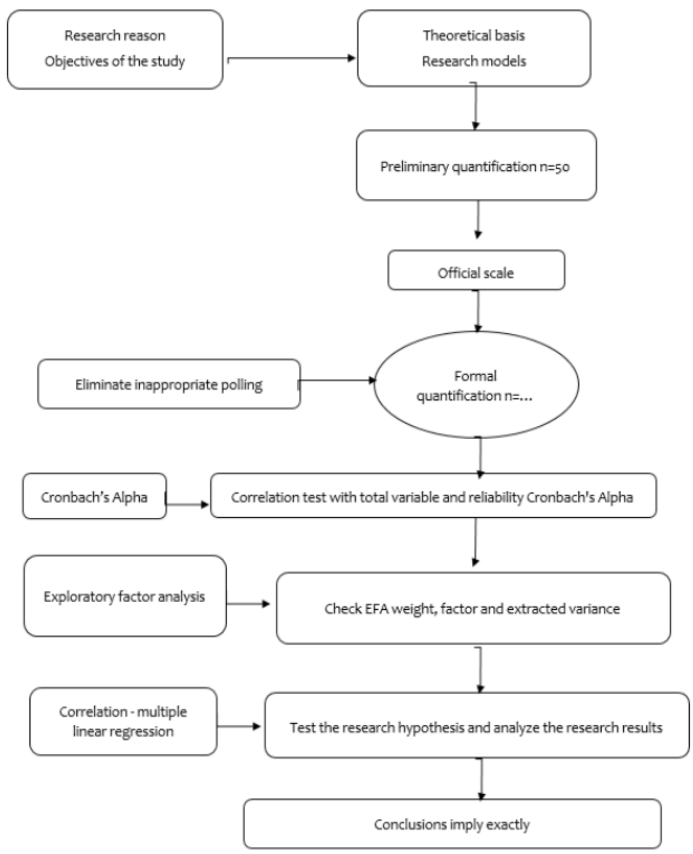
H5: Tangibility has a positive effect on customer satisfaction when using tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd.

3. RESEARCH METHODOLOGY

3.1. Research process

In order to provide a practical basis for the topic, the authors will do research by combining the use of qualitative research methods and quantitative research methods. The specific research process is presented below:

Figure 3.1: Research Process



3.2. Building survey scales and questionnaires

The scales are built and developed based on theory and empirical studies related to SERVQUAL model. The scale used in the study is the Likert scale with 5 levels specified as follows: "1 - completely disagree; 2 – disagree; 3 - puzzled; 4 - Agree; 5 - totally agree.

The survey questionnaire was carried out in 2 steps. The first step will be to form a preliminary questionnaire based on theory and research needs. In the second step, the authors will hold preliminary interviews with customers who are companies that have signed contracts and are provided with services by Deloitte Vietnam Tax Consulting Co., Ltd. This interview helps to detect questions that are unclear or do not reflect reality to adjust the questionnaire so that it can be used in a formal interview. In order to serve the purpose of analysis at a later stage, the factors will be coded corresponding to the question codes and the number of sentences as follows:

Table 3.2: Variable name in model and question

No.	Factor	Corresponding code	Number of questions
1	Reliability	REL1, REL2, REL3, REL4, REL5	5
2	Responsiness	RES1, RES2, RES3, RES4, RES5	5
3	Assurance	ASS1, ASS2, ASS3, ASS4	4
4	Empathy	EMP1, EMP2, EMP3, EMP4, EMP5	5
5	Tangibility	TAN1, TAN2, TAN3, TAN4, TAN5, TAN6	6
6	Satisfaction	HL1, HL2, HL3	3

The coded elements of each variable will correspond to the content of the 28 questions in the questionnaire sent to the survey.

The object of the study is how customers have been using tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd. This target group is mostly large and medium-sized enterprise customers in Vietnam market.

The survey collection method is through a google form questionnaire sent to chief accountants and CEOs or managers of the client company (who carries out a tax consulting contract with Deloitte). After conducting surveys and research, the study has collected 350 soft word tables (google forms). The authors conducts check to eliminate incomplete answer sheets and inconsistent answer sheets. As a result, 40 results were eliminated, leaving only 300 results for analysis.

4. RESEARCH RESULTS AND DISCUSSION

4.1. Descriptive statistics of the study sample

Table 4.1: Summary of descriptive statistics of the study sample

Case Processing Summary						
	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
No.	300	45.7%	356	54.3%	656	100.0%
Gender	300	45.7%	356	54.3%	656	100.0%
Age	300	45.7%	356	54.3%	656	100.0%
Where is the client company?	300	45.7%	356	54.3%	656	100.0%

From the above results, we can see that with the Initial Score attribute, we can study. N is the sample size: 300. Standard deviation of the variable Std. Deviation. The smaller this number, the smaller the difference between the values, and vice versa, if this value is high, it means that the number of points in the sample has a large difference.

4.2. Check the reliability of the scale

4.2.1. Check the scale

First, the scales will be tested for reliability through Cronbach's Alpha coefficient. This coefficient indicates the degree of correlation between the observed variables in the questionnaire and is used to calculate the change of each observed variable and the correlation between the variables. Specifically, the scales will be selected if the Cronbach's Alpha coefficient is > 0.6 and the observed variables must have a correlation coefficient with the total variable from 0.3 or more.

Table 4.2: Summary table of Cronbach's Alpha test results

No.	Factor	Symbol	Number of observed variables	Cronbach's Alpha	Correlation coefficient with the lowest sum	Result
1	Reliability	REL	5	0, 930	0,733	Obtain
2	Responsiness	RES	5	0,946	0,803	Obtain
3	Assurance	ASS	4	0,922	0,761	Obtain
4	Empathy	EMP	5	0,921	0,736	Obtain
5	Tangibility	TAN	6	0,957	0,847	Obtain
6	Dependent variable	HL	3	0,837	0,617	Obtain

The table provides the test results of Cronbach's Alpha coefficient, which are eligible to conduct exploratory factor analysis. Thus, at this time, keeping the number of 25 variables representing 5 variables eligible to conduct exploratory factor analysis.

4.2.2. Reliability test

Similar to the test criteria of the group of independent variables. The dependent variable needs to satisfy the necessary and sufficient conditions to be able to proceed to the next steps of the research. The test results show that the Cronbach's Alpha coefficient of the satisfaction scale is 0.837 > 0.6 and the lowest correlation coefficient with the total variable is 0.617 > 0.3, so the satisfaction scale is basic enough to perform the analysis steps.

4.3. Exploratory factor analysis

After evaluating the reliability of the scale, the study continued to perform exploratory factor analysis (EFA). EFA will show more specifically whether the above scales are separated into new factors or excluded factors. This helps to evaluate the scale more accurately, while eliminating unsatisfactory variables, the purpose is to make the scales ensure uniformity. The exploratory factor analysis method requires the model to satisfy certain conditions. According to Hair et al. (2008), the KMO coefficient must be between 0.5 and 1 and the model's significance coefficient according to Bartlett's test must have statistical significance of 5%. Or according to Gerbing and Anderson (1988), the model's scales are only accepted when the total variance extracted is greater than 50%. In addition, according to Hair et al. (1998), observed variables with loading coefficient must reach the minimum level of 0.30 or more; greater than 0.40 is considered important and greater than 0.50 is considered to be of practical significance. Besides, Hair et al. (1998) also give the empirical rule to choose the load weight according to the sample size as follows: If the load weight is > 0.3, the sample size should be at least 350, if the sample size is about 100 then the sample size should be at least 350. Should choose the standard of loading weight greater than 0.55, if the sample size is about 50, then Factor loading must be greater than 0.75.

4.3.1. Factor analysis explores a group of variables related to service quality

The study conducted exploratory factor analysis for 25 factors representing 5 variables of the model.

Table 4.3: Summary table of exploratory factor analysis results 1

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		**.949**
Bartlett's Test of Sphericity	Approx. Chi-Square	11745.112
	df	300
	Sig.	.000
	Extraction Sums of Squared Loadings	76.449%
Extraction Method: Principal Component Analysis.		

The results of the EFA times showed: KMO = 0.949 > 0.5, sig Barlett's Test = 0.000 < 0.05, so the EFA exploratory factor analysis is appropriate. Only 1 factor is extracted, the matrix cannot be rotated, so the scale is guaranteed to be unidirectional and the observed variables of the dependent variable converge quite well. The Eigenvalue criterion is greater than 1 with a cumulative total variance of 76.449%.

4.3.2. Factor analysis explores customer satisfaction when using tax consulting services.

The EFA results of the customer satisfaction factor scale when using tax consulting services have the KMO coefficient of 0.696 and the significance level (Sig.) of the Bartlett's test of 0.000, showing that these three variables are correlated with each other and fully conform to EFA. At the same time, this observed variable has a factor loading factor greater than 0.5. At extraction level eigen>1, we have only one factor extracted with 1 observed variable with a total variance extracted of 76.449%, this shows that this variable reflects the evaluation level of customer satisfaction when using tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd.

4.4. Cronbanh's Alpha test results after EFA

After EFA 25 observed variables of 5 factors affecting customer satisfaction when using tax consulting services at Deloitte Vietnam, there are 25 observed variables. Therefore, it is necessary to test Cronbach's Alpha for all 5 variables of the study. The results of this retest are shown in the table, which shows that this scale also meets the requirements for reliability. Therefore, the analyzed scales are accepted and will be included in the next analysis.

Table 4.4: Summary table of Cronbach's Alpha test results after EFA

No.	Factor	Symbol	Number of observed variables	Cronbach's Alpha	Correlation coefficient with the lowest sum	Result
1	Reliability	REL	5	0, 930	0,733	Obtain
2	Responsiness	RES	5	0,946	0,803	Obtain
3	Assurance	ASS	4	0,922	0,761	Obtain
4	Empathy	EMP	5	0,921	0,736	Obtain
5	Tangibility	TAN	6	0,957	0,847	Obtain

4.5. Correlation matrix analysis

Before analyzing multiple linear regression, it is necessary to consider the linear correlation relationships between the dependent variable and the independent variables. If the correlation coefficient between the dependent variable and the independent variable is large, it shows that there is a relationship between them and regression analysis is suitable.

Table 4.5: Check the goodness of fit of the regression model

Correlations

		HL	REL	RES	ASS	EMP	TAN
HL	Pearson Correlation	1	.854**	.863**	.858**	.875**	.871**
REL	Pearson Correlation	.854**	1	.962**	.937**	.932**	.960**
RES	Pearson Correlation	.863**	.962**	1	.937**	.934**	.955**
ASS	Pearson Correlation	.858**	.937**	.937**	1	.928**	.924**
EMP	Pearson Correlation	.875**	.932**	.934**	.928**	1	.935**
TAN	Pearson Correlation	.871**	.960**	.955**	.924**	.935**	1

**. Correlation is significant at the 0.01 level (2-tailed).

The results of the correlation coefficient matrix analysis show that there is a positive relationship between the variables RES, TAN, REL, EMP with the significance level of 1%. In which the asset variable has the highest and positive correlation with a correlation coefficient of 0.962. This can initially identify the factors of feedback, reliability, tangibles, assurance, sympathy that have a positive relationship with customer satisfaction when using private services. tax advice. However, this is only a preliminary assessment, in order to be able to draw accurate conclusions, it is necessary to conduct in-depth analysis with multiple regression models and necessary testing procedures to have a more accurate conclusion.

4.6. Analysis of multiple regression models

Based on the results of the correlation analysis, the study builds a multiple linear regression model with the following form:

$HL = \beta0 + \beta1RES + \beta2TAN + \beta3REL + \beta4ASS + \beta5EMP + u$

In there:

- RES : Responsiness
- TAN : Tangibility
- REL: Reliability
- ASS : Assurance
- EMP : Empathy
- $\beta0 – \beta5$: regression coefficient
- u : Error

The method of selecting the Enter variable is carried out. Besides, the assumptions of the linear model will also be tested.

4.7. Check the goodness of fit of the regression model

The fit of the regression model was tested by looking at the F-statistic from the analysis of variance (ANOVA) table. The results in the table below show that the F-statistic of the regression model is equal to … and the significance level of the statistic is 1% (sig = 0.000), which shows that the multiple linear regression model is suitable for data. In other words, the independent variables (RES, TAN, REL, EMP, ASS) have a linear relationship with the dependent variable HL with a confidence team of 99%.

Table 4.6: Multicollinearity test

Model Summary[b]					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.923[a]	.852	.838	.38942	1.953

The adjusted coefficient R2 represents the fit of the multiple linear regression model because the value of this coefficient does not depend on the number of variables included in the research model. Accordingly, the model's adjusted R2 coefficient is 0.838, which represents the regression model that explains 83.8% of customer satisfaction when using tax consulting services at Deloitte Vietnam. Through the model with 5 independent variables including: Reliability, Responsiness, Assurance, Empathy, Tangibility explained 83.8% of the variation in customer satisfaction.

4.8. Regression coefficient test

The research results of Table 4.9 show that the following factors: Reliability, Responsiness, Assurance, Empathy, Tangibility have statistical significance at 5% significance level (Sig. <=0.05). In other words, these four variables show a linear relationship with statistical significance for customer satisfaction using tax consulting services at Deloitte Vietnam Co., Ltd. with 95% confidence.

The variable RES (Responsibility) (=0.224) and REL (Reliability) (=0.267) is not enough to conclude a linear relationship with customer satisfaction using tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd.

Table 4.7: Coefficient test

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients		Sig. Lower	95.0% Confidence Interval for B	
B		Std. Error	Beta		t	Bound	Upper Bound	
1	(Constant)	.506	.110		4.613	.000	.290	.721
	REL	-.140	.115	-.144	-1.218	.224	-.367	.086
	RES	.126	.113	.126	1.111	.267	-.097	.349
	ASS	.187	.082	.198	2.282	.023	.026	.348
	EMP	.390[a]	.091	.375	4.305	.000	.212	.569
	TAN	.324	.099	.354	3.272	.001	.129	.519
Dependent Variable: HL								
Independent Variable: REL, RES, ASS, EMP, TAN								

4.9. Hypothesis testing of the regression model

4.9.1. Checking for multicollinearity

One of the assumptions of the multiple linear regression model is that the independent variables do not have a strong correlation with each other, if this assumption is violated, the model has multicollinearity, Hoang Trong and Mong Ngoc (2008) said that one of the ways to detect the existence of multicollinearity in the model is to use the variance exaggeration factor (VIF), if VIF >= 10, the regression model there is a phenomenon of multicollinearity. The above table occurs multicollinearity in the following variables: REL1, REL3, RES3, ASS3, EMP5, TAN4, TAN5.

Table 4.8: Coefficientsa

(Constant)	REL2	REL4	REL5	RES1	RES2	RES4	RES5	ASS1	ASS2
VIF	5.168	5.687	5.902	5.949	5.789	7.957	5.465	4.611	6.329
(Constant)	ASS4	EMP1	EMP2	EMP3	EMP4	TAN1	TAN2	TAN3	TAN6
VIF	4.505	4.497	7.174	5.669	3.050	7.011	5.889	5.170	7.431

a. Dependent Variable: HL

b. Independent Variable: REL2, REL4, REL5, RES1, RES2, RES4, RES5, ASS1, ASS2, ASS4, EMP1, EMP2, EMP3, EMP4, TAN1, TAN2, TAN3, TAN6

Proceed to remove those variables and retest for multicollinearity for the second time, the results of model testing when removing variables REL1, REL3, RES3, ASS3, EMP5, TAN4, TAN5 give VIFs <10. Therefore, the regression model does not have multicollinearity.

4.9.2. Check the phenomenon of self-correlation

The assumption that there is no correlation between the residuals can be tested using Durbin-Watson statistics.

In fact, when conducting the Durbin-Watson test, the following rules can be applied (Hoang Trong and Mong Ngoc, 2010):

- If 1 < D < 3, then the model has no autocorrelation
- If 0 < D < 1, then the model has positive autocorrelation
- If 3 < D < 4, then the model has negative autocorrelation

The results in the table above show that the Durbin-Watson coefficient is 1.944, so it can be concluded that the regression model has no autocorrelation.

4.9.3. Checking for the phenomenon of variance of variable error

One of the assumptions when performing multiple linear regression is the assumption of constant variance (also known as uniform variance). If the phenomenon of variance occurs, the results of the regression equation will be inaccurate, deviating the results from reality, thereby causing the researcher to misjudge the quality of the linear regression equation.

To assess whether the regression model violates this assumption or not, the study uses the Spearman rank correlation test between the normalized residuals and the independent variables. If the Spearman correlation sig value between the standardized residuals (ABSRED) and the independent variables is greater than 0.05, then it can be concluded that there is no variable variance phenomenon, the case has at least 1 value. sig value is less than 0.05, then the regression model violated the assumption of constant variance.

Table 4.9: Checking for the phenomenon of variance of variable error

			ABSRED	REL	RES	ASS	EMP	TAN
Spearman's rho	ABSRED	Correlation	1.000	.050	.021	-.037	.034	.160**
		Coeffeicient Sig. (2-tailed N)	.	.384	.722	.520	.560	.005
	REL	Correlation	.050	1.000	.849**	.805**	.858**	.853**
		Coeffeicient Sig. (2-tailed N)	.384	.	.000	.000	.000	.000
	RES	Correlation	.021	.849**	1.000	.839**	.867**	.858**
		Coeffeicient Sig. (2-tailed N)	.722	.000	.	.000	.000	.000
	ASS	Correlation	-.037	.805**	.839**	1.000	.835**	.771**

		Coeffeicient Sig. (2-tailed N)	.520	.000	.000	.	.000	.000
	EMP	Correlation	.034	.858**	.867**	.835**	1.000	.841**
		Coeffeicient Sig. (2-tailed N)	.560	.000	.000	.000	.	.000
	TAN	Correlation	.160**	.853**	.858**	.771**	.841**	1.000
		Coeffeicient Sig. (2-tailed N)	.005	.000	.000	.000	.000	.

**. Correlation is significant at the 0.01 level (2-tailed).

All sig values of the rank correlation between ABSRED with independent variables are greater than 0.05, so residual variance is uniform, the assumption of constant variance is not violated, so the model can be concluded regression has no change in variance.

4. DISCUSS AND CONCLUSION

4.1. Discuss

With the tests, all conditions are satisfied and there are enough grounds to ensure that the estimate is not different. Therefore, the regression results are used to discuss the factors affecting the quality of tax consulting services at Deloitte Vietnam Tax Consulting Co., Ltd. including the following variables: Assurance (ASS), Empathy (EMP), and Tangibility (TAN). Eliminate two variables: Responsibility (RES) và Reliability (REL).

4.2. Conclusion

Based on the research objectives, the thesis has synthesized a theoretical basis and related studies to analyze the impact of tax consulting service quality on customer satisfaction. The basis of this goal is that tax consulting services are increasingly expanding and developing in Vietnam. This invisibility has created fierce competition between businesses. In addition, to constantly tighten legal requirements, the needs of hired consulting businesses are not only in regular consulting but also in the level of response and compliance with the law. With the theoretical foundation from the SERQUAL model from the research of Parasuraman, Zeithaml, and Berry proposed in 1988, the author surveyed customers when using tax consulting services at Deloitte Vietnam Tax Consulting Company Limited to evaluate how the price and quality of tax consulting services affect customer satisfaction? With 5 variables representing service quality including (i) Responsiveness; (ii) Reliability; (iii) Tangibility; (iv) Warranty; (v) Empathy; The study conducted a survey of 350 customers using tax consulting services at Deloitte Vietnam. Data were analyzed according to the multiple linear regression model, research results showed that 3 variables all have a positive linear relationship with customer satisfaction including Guarantee, Tangibility, empathetic. The research results also confirm the correlation between tax consulting service quality factors and customer satisfaction in the model. This is one of the important arguments as a basis for proposing solutions to improve the quality of tax consulting services at Deloitte in particular and in Vietnam in general.

RISK MANAGEMENT OF LOGISTICS SERVICE ENTERPRISES LISTED IN VIETNAM

Assoc. Prof. From Van Ninh[1], Dr. Nguyen Thi Thuy Dung[2]

Abstract: *Trading in logistics services is a type of business that bears a lot of risks because the internal and external environment is constantly changing and according to the speed of economic development, especially for countries with low-income and growing economies as Vietnam. Logistics service businesses not only face risks and manage them when setting up a business, but also throughout the business operation. If risk management is implemented effectively, business opportunities will be fully exploited.*

This article is to show how risk can be managed in the transport business according to the ISO 31000:2018 risk management model. The method used in the research article is comparison, evaluation and application. Risk management as well as handling of each crisis situation has its own and unique nature, associated with different circumstances, implemented in different conditions and associated with different event contexts. The resolution of each crisis situation requires practical experience and special expertise in different fields.

Keywords: *Risk management, ISO 31000:2018, Listed Logistics Service Enterprises*

1. INTRODUCTION

According to the Agility 2022 ranking [10], the market Vietnam logistics market is ranked 11th in the group of 50 emerging logistics markets globally. The compound annual growth rate (CAGR) in the period 2022-2027 is forecasted to reach 5.5%, along with the strong recovery of the economy after the Covid-19 pandemic. Vietnam is currently the leading country in ASEAN countries in terms of the number of logistics service businesses licensed by the US Maritime Administration (FMC). The contribution of the logistics sector to annual GDP is at 4-5%. In addition, e-Logistics (electronic logistics) has pushed Vietnam's logistics industry to improve service quality more professionally and effectively.

Globalization has increased the consumption of media, tourism and information services. The increasing specialization of businesses has led to close cooperation with external service providers. The current phenomenon of the economy is the attempt by businesses to acquire activities that have hitherto been carried out by themselves. Many businesses have realized that it is better to specialize in a particular area and other activities to be more effective in it. It is a logical consequence of the increasing complexity of markets and competition. These activities include transportationdownload (Buganova & Luskova, 2011) [2]

Transportation contributed significantly to the creation of today's modern world. Life today would be unthinkable without it, so each country seeks to build its own perfect transportation system. The goal of each transport service provider is to optimize its services for efficiency, quality and to meet the needs of customers.(Dvorak, Leitner, & Novak, 2012)[5] Mark (2013) [9]

Logistics service enterprises make a great contribution to the economy because they help the movements of goods, services and people for economic development in general, however, there are not many studies that go into analyzing the risks of this group of enterprises in a scientific way.

[2] University of Transport and Communications.

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization. (ISO guide, 2009) [11]

This study will study the risks of logistics service businesses in Vietnam today and use the risk management model given by ISO to provide solutions.

2. LITERATURE REVIEW

Many studies suggest that risk management must be considered in all aspects of management and marketing, but there are also risks that will be attempted to be transferred to risk management agencies from the outside. (Hittmar & Striss, 2001)[6]

Business risk management is the assumption that business risks will be properly identified, assessed and managed and that business opportunities will be fully exploited. Risk management can be described as a rational behavior in a situation where a risk cannot be avoided in order to protect and enhance a company's current and future assets through detailed risk analysis and make important management decisions. Risk management in small and medium enterprises cannot operate in isolation, separate from the company's operations, it needs to be included in the system The application of risk management in small and medium enterprises contributes to part that maintains or increases the company's value to its owner. It leads to higher quality of strategic management, increased stability, faster response to changing market conditions, and reduced potential for errors and fraud.(Belas, et al., 2014) [1], (Maris, 2013)[8]

Risk management can be applied to the entire company or to several areas of business activity, at some specific level or function. In particular, the advantage for the company is that the transition from passive management to active management allows to minimize potential losses. One of the factors for successful risk management in a transportation company is its integration into the strategic framework (Mark, 2013)[10]

Strategic risk management ensures that risk information is adequately reported and used as a basis for decision-making at all key levels of the company. Many studies analyzed the internal and external connections of the business – factors of internal and external business environment, relationships with stakeholders, company culture, and more. can have a significant impact on the structural proposal.

- ❖ Establish a risk management policy
- ❖ Demarcation of responsibilities, powers,
- ❖ Integrate risk management into shipping processes
- ❖ Allocate necessary resources to
- ❖ The establishment of internal communication mechanism
- ❖ Set up an external connection mechanism

A book about the challenges of running an effective business in the context of globalizationDixon, J. R, Nanni, A. J, & Vollmann. T. E. (1990) [4] can be considered as one of the foundational books for effective financial management in the context of constantly changing society. Many books will go into analysis of both qualitative and quantitative factors related to the resource development of businesses. It can be mentioned as the book of Cokins, G. (2009)[3] With a study of more than 150 pages, the author has made a relatively comprehensive assessment of financial indicators and approaches to evaluate the efficiency of capital use in an enterprise in terms of safety and risk avoidance. . The study not only deals with the simple aspects of financial numbers but also puts the numbers in the context of a real business and motivates businesses to develop their resources through both policies on human resources, on the relationship between directors and employees, on short-term and long-term orientations to develop resources,

Marie Pavlakova Docekalova, Alena Kocmanova (2015)[7] The study presents a model to evaluate the performance of manufacturing companies using financial and non-financial indicators related to corporate sustainability. Sustainability is a generic concept because it is based on a balance between core environmental, social and economic issues. It is difficult to assess sustainability because it is represented by many variables, most of which are non-financial variables. Analysis using data based on the assessment of inputs consumed by output produced and the estimation of the production possibility frontier; it computes a scalar measure of efficiency and identifies potential improvements of inputs and outputs without requiring explicit specification of the functional relationship between inputs and outputs and setting weights of variables. Based on the calculations of the super-efficient DEA model CCR, companies are divided into four groups: sustainable, social, environmental and unsustainable companies. The results of the model allow the user to evaluate a particular company and reveal the company's performance weaknesses, so the model can serve the user as a basis for decision making and management. efficiency.

3. DATA AND METHODS

***Database:** The author selects 58 logistics service companies whose stocks are traded on HOSE, HNX and UPCOME stock markets and analyzes the actual risk situation of these businesses.

The ISO risk management standard is given as a basis for assessing and analyzing the existing risks of logistics service businesses to provide solutions.

***Methods:** The method used in the research article is comparison, evaluation and application

4. RESEARCH RESULTS

4.1. Overview of the risks of listed logistics service companies in Vietnam.

Types of risks in logistics activities in Vietnam

To manage risks in logistics effectively, it is important that we understand what types of risks will arise in logistics activities.

According to analysis of reports from logistics companies listed on the Vietnamese stock market and disseminated on public exchanges, every company has a section where they assess the risks, difficulties, possibilities, and future prospects of their particular business. As it is based on actual business operations, this is a significant source of knowledge.

There are 7 types of risks in logistics activities, specifically as follows:

4.1.1 Transport risks

Transport risks are inevitable in the logistics chain

Some transportation risks that often arise during logistics activities are as follows:

- Damage and accidents to machines or working vehicles.
- Problems in finding spare parts for machines or working vehicles, repair and maintenance equipment is not suitable.
- External conditions affecting the routes prevent transportation.
- There is no plan to use fuel.
- Do not ship according to product specifications or the documentation used in shipping or installation is incorrect.
- The incident of theft when loading or unloading or transporting.
- Incidents such as outages or business outages make shipping untimely.
- Failure to comply with laws or regulations during transportation.
- Transportation personnel have poor physical or mental health or do not get enough rest.
- The supplier is in financial difficulty.
- Problems arising from information technology

4.1.2. Inventory risk

The risks that can be encountered in the process of inventory management can be listed as follows:

- Excessive inventory investment.
- Inadequate customer service.
- Profit and loss due to unplanned inventory management.
- Repository is not suitable for storage capacity.
- Software problem.
- Subjective in inventory management.
- Staff is not trained, turnover rate is too high.
- Production department halted due to lack of raw materials.
- Preserve uneven product input and output.
- If there is a lot of damage, waste and loss.
- Excess amount due to fluctuating demand.
- Theft, fire, natural disaster.
- Security system error, warning system error.

4.1.3. Risks of customer service management

Some risks may arise in the process of serving customers:

- Incorrect sales or incorrect orders.
- Lack of information systems, security problems or errors.
- Pass information about customers to competitors.
- Staff are not trained or customer service staff do not learn, change to meet the needs of guests.
- Budget shortfall.
- The reality is that survey studies are not conducted correctly.
- Slow delivery.

- High shipping cost.
- Customers cannot accurately express their wants and needs.
- Failure to maintain continuity in customer service.
- Loss of customers due to failure to demonstrate a distinct relationship with loyal customers.

4.1.4. Risks of reverse logistics management

The risks occurring in the reverse logistics process can be summarized as follows:

- Shipping costs are very high.
- Quality problems during operation.
- Inappropriate customer service practices.
- Failure to perform cost-benefit analysis, financial resource issues.
- Storage problems.
- Disruption in the supply chain.
- Difficulty in reproduction.
- Packaging issues.
- There is no strategic plan.
- The mismatch of the information system and technology that the business is using with the development of the business.
- Insufficient human resources.
- Quality problem of the returned product.

4.1.5. Risks when processing customer orders

The risks associated with customer ordering activities can be listed as follows:

- Problems caused by product characteristics.
- Management issues in product diversity.
- Change in demand.
- Software problem.
- The problem of sharing information between departments.
- Employee training issues.
- Failure to prepare orders on time.
- Insufficient tools and equipment needed to prepare the order.
- Costs incurred in connection with order processing.

4.1.6. Warehouse management risks

Warehouse management risks come from:

- Product returned, product pending.
- Delays due to product density between floors in the warehouse.
- Store at the place where the product is shipped.
- Sovle problems.
- Incorrect/incomplete delivery/delivery documents.
- The product does not have a barcode.

- Insufficient means of transport.
- The warehouse system lacks security.
- Error in the selection of warehouse location.
- Because the shelf price does not match the product characteristics.

4.1.7. Purchasing management risk

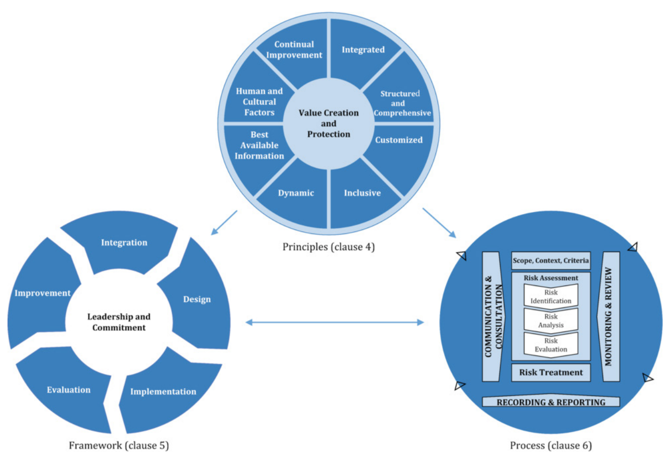
The risks that may arise in purchasing activities include:

- Risk of inactivity due to product functionality.
- Risk of product damage affecting human health/other products.
- Financial risk of the entity.
- The risk arises that the product being bought/sold will not follow the local culture.
- If the purchased product does not match the customer's expectations.
- In the process of returning products, there is a risk of repair and replacement of defective products.

4.2. ISO standards

Follow the guidelines (STN ISO 31000:2011, 2011).

Figure 4.1 ISO 31000:2011



4.2.1 Principle (4)

The principles outlined provide guidance on the characteristics of effective and efficient risk management, value communication, and explain the intent and purpose of risk management. These principles are fundamental to risk management and should be considered when establishing an organization's risk management framework and risk management processes. These principles should enable the organization to manage the effect of uncertainty on its objectives.

4.2.2 Framework (5)

General (5.1)

The purpose of a risk management framework is to assist an organization in integrating risk management into its operations and critical functions. The effectiveness of risk management will depend on integrating risk management into the organization's operations, including decision-making. This requires support from stakeholders, especially top management.

Leadership and commitment (5.2): Top management is accountable for risk management and oversight is accountable for risk management oversight.

Integration (5.3):Integrating risk management into an organization is a dynamic, iterative process and needs to be customized to the needs and culture of the organization. Risk management should be an integral part of the organization's purpose, operations, leadership and commitment, strategy, goals and operations.

Design (5.4)

Understanding the organization and its context (5.4.1):When designing a risk management framework, an organization needs to consider and understand its internal and external context.

Affirm commitment to risk management (5.4.2): Top management and oversight, where applicable, should demonstrate and articulate their ongoing commitment to risk management through policy, statement or other means of clear communication. the organization's objectives and commitment to risk management.

Assign roles, authority, responsibility and accountability within the organization (5.4.3): Top management and oversight, if any, should ensure that the authority, responsibility and accountability of the positions are related to risk management.

Resource Allocation (5.4.4): Top management and oversight, where applicable, should ensure appropriate allocation of resources for risk management

Establishment of communication and consultation (5.4.5): The organization should establish an approved approach to communication and consultation to support the risk management framework and facilitate effective application of risk management.

Application (5.5): A properly designed and implemented risk management framework will ensure that the risk management process is part of all activities throughout the organization, including decision making and changes. internal and external contexts will be fully captured.

Review review (5.6): To review the effectiveness of the risk management framework, the organization should: periodically measure the performance of the risk management framework against its objectives, implementation plan, indicators and behaviors expected; determine whether the risk management framework remains appropriate to support the achievement of the organization's objectives.

Adjustment (5.7.1): The organization needs to continuously monitor and adjust its risk management framework to address internal and external changes. In doing so, the organization can enhance its value.

Continuous Improvement (5.7.2): The organization needs to continually improve the suitability, adequacy and effectiveness of the risk management framework and the way in which the risk management process is integrated.

4.2.3. Process (6)

General (6.1):The risk management process requires the systematic application of policies, procedures and practices to communication and consultation activities, setting the scene and assessing, handling, Monitor, review, record and report on risks.

Information exchange and consultation (6.2): The purpose of communication and consultation is to assist stakeholders in understanding the risks, the bases for decision making, and why specific actions are needed. Communication is geared towards promoting awareness and understanding of risk, while consultation requires obtaining feedback and information to support decision making. Close coordination between the two will make the exchange of information practical, timely, factual, accurate and understandable, taking into account the reliability, integrity of information as well as the privacy rights of individual.

Scope, context and criteria (6.3)

General (6.3.1): The purpose of setting scope, context and criteria is to customize the risk management process,

Define scope (6.3.2)

The organization should define the scope of its risk management activities.

Since the risk management process can be applied at different levels (e.g. strategic, operational, program, project or other levels), it is important to clearly state the extent to which it is viewed. considered, relevant objectives should be considered and their alignment with the organization's objectives.

Internal and external context (6.3.3): The internal and external context is the environment in which the organization aims to define and achieve its objectives.

The context of the risk management process should be established from an understanding of the internal and external environments in which the organization operates and should reflect the specific operating environment in which the risk management process is located. ro is applied.

Determination of risk criteria (6.3.4): The organization should specify the amount and type of risk it is allowed or not allowed to accept, relative to its objectives. The organization also needs to define criteria for assessing the severity of risks and to support decision-making processes. The risk criteria should be consistent with the risk management framework and tailored to the specific purpose and scope of the activity under consideration. Risk criteria should reflect the organization's values, objectives and resources and be consistent with the risk management policy and statements.

Risk Assessment (6.4)

General (6.4.1) Risk assessment is the overall process of risk identification, risk analysis and risk assessment. Risk assessment should be conducted in a systematic, iterative and collaborative manner, drawing on the knowledge and perspectives of stakeholders. The best available information should be used, supplemented by broader requirements as needed.

Risk identification (6.4.2): An organization can use a variety of techniques to identify uncertainties that may affect one or more objectives.

The organization should identify risks, whether or not the source of the risk is under the organization's control. It should be noted that there can be many types of outputs, which can lead to a variety of tangible or intangible consequences.

Risk Analysis (6.4.3): The purpose of risk analysis is to understand the nature of the risk and the characteristics of the risk including the degree of risk, as appropriate. Risk analysis requires detailed consideration of uncertainty, risk sources, consequences, likelihood, events, scenarios, controls and their effects. An event can have many causes and effects and can affect multiple goals.

Risk norms (6.4.4): The purpose of risk assessment is to support decisions. Risk assessment entails comparing the results of a risk analysis with established risk criteria to determine when additional action is needed.

Risk handling (6.5)

General (6.5.1): The purpose of risk treatment is to select and implement options to deal with the risk.

Risk treatment related to an iterative process includes: planning and implementing risk treatment; evaluate the effectiveness of such treatment; decide whether the residual risk is acceptable; If not acceptable, carry out further processing.

Selection of risk treatment options (6.5.2): Risk treatment options are not necessarily mutually exclusive or appropriate in all circumstances. Risk treatment options may include one or more of the following:

Tackling risk by deciding not to start or to continue an activity that increases risk; accept or increase risk in order to pursue an opportunity; change the likelihood; change the consequences; risk sharing (eg through contracts, buying insurance); Manage risks by making the right decisions.

Prepare and implement risk treatment plans (6.5.3):Treatment plans should be integrated into the organization's management plans and processes in consultation with appropriate stakeholders.

Monitoring and review (6.6): The purpose of monitoring and review is to ensure and improve the quality, effectiveness of the design, implementation and results of the process.

Making records and reports (6.7):Reporting is an integral part of the operation of the organization and it should improve the quality of dialogue with stakeholders, support top management, supervisors in the implementation of responsibilities. their.

5. CONCLUSION

+ Companies promote risk awareness for their staff: the company can learn from experience from foreign units, hire consultants, organize training sessions, send training in professional training institutions, using internal training, ... to build a comprehensive top-down systems thinking on industry-specific risks. The contents of training or consulting will need to be highly specialized, going into the specifics of the company as well as going into the specifics of business products in the current context.

Several steps can be taken:

Step 1: Complete the content framework on the types of risks that may occur with the current business type of the company in a macro context like Vietnam

Step 2: Classify the level of risk and damage level of each type of risk

Step 3: Evaluate the probability of occurrence of each type of risk

Step 4: Develop scenarios to deal with each type of risk

(1) Disaster risk: actively monitor and closely follow the announcements and warnings of the hydrometeorological agencies of each region to which the logistics roadmap is related.

(2) Risk of fire and explosion: respecting the design of means of transport and storage, minimizing arbitrarily expanding and installing parts outside the design to increase exploitation capacity. Periodic repair and maintenance of spare parts in a timely manner. In addition, train operators on skills to deal with fire and explosion risks periodically.

(3) Risk of theft: tighten the monitoring process and attach direct responsibility to each activity at each stage of the process. Specifically for large value orders, it is required to strengthen order

tracking through the creation of package tracking tools like location chips. It is also necessary to have ways to use high technology on identifying the package that does not present at the appropriate time and location.

(5) Risk of information disclosure: strengthen information security and train employees to be more alert to the fact that information can be changed, causing damage to customers.

(6) Misinformation: Use reputable tracking software and monitor the rate of misinformation to adjust the process as well as the use and update of the software.

Disseminate and train all employees with in-depth knowledge about company-specific characteristics and risks to raise awareness, limit the occurrence of risks and proactively deal with incidents when there is an incident.

+ Companies need to maintain and expand insurance purchases

Although the insurance will cost a fee, it will ensure that the capital flow of companies is not too deep, especially in times of crisis such as the Covid pandemic. The Covid pandemic also showed companies the importance of insurance packages, when the pandemic occurred, activities stopped, companies had to proactively cope and bear all the damage without support from them. third parties such as insurance.

+ Companies need to actively and proactively make provisions

The current provisions in companies are still very short and weak, many provisions have not been made up to the required level of provision and many provisions account for only 1/20 of the debt value the ability to protect the financial ability of companies when the risk is still low.

In addition to setting aside according to regulations on accounting, companies need to proactively allocate resources to deal with risks, treat them as a fixed amount that needs to be maintained and do not specifically account for any item of the company. accounting work, only belongs to the management strategy of the enterprise.

DEVELOPING THE PRIVATE SECTOR ECONOMY IN THE CONTEXT OF INTERNATIONAL ECONOMIC INTEGRATION IN VIETNAM TODAY

Ph.D Ho Thi Ha[1], Ph.D Pham Thi Le Ngoc[2]

Abstract: *In recent years, the private sector has played a great role in Vietnam's socio-economy. Along with the change in economic policy, there have been many economic groups, including large regional corporations. The private sector not only contributes greatly to the country's GDP but also contributes to creating jobs for a large number of workers. In the context of such deep international economic integration, the private sector also reveals some existence. Therefore, the core issue is to change thinking and development management methods while innovating policies, management mechanisms and allocation of effective use of State resources to ensure that the private sector is developed in an equal environment, bring into full play dynamism, creativity and movement in accordance with the laws of the market economy.*

Keywords*: Economy, economic sector, private economy, private sector, economic integration.*

1. INTRODUCTION

In the current era of globalization, particularly with the ongoing process of global economic integration, significant opportunities and challenges have emerged for Vietnam's economy. Vietnam has been taking measured steps towards constructing a market-oriented socialist economy while actively engaging with the world. These steps involve harnessing internal resources and capitalizing on external resources through the active participation of various economic components. Among these components, the role of the private sector in the private economy cannot be overlooked, as it is an integral part of the overall national economy. The contributions made by the private sector to the economy have been substantial in recent years. The private sector not only makes a substantial contribution to the nation's GDP but also significantly contributes to creating employment opportunities for a large workforce. However, within the current context of profound global economic integration, the private sector faces numerous difficulties, challenges, and opportunities. Part of the reason for this lies in our country's low starting point, and limited and imperfect policies of the Party and the State. Additionally, it is attributed to a mindset of dependency, outdated thinking rooted in centralized planning mechanisms, and incorrect perceptions held by some segments of state officials toward the private sector. Consequently, there is an urgent need for appropriate measures to promote the private sector rapidly and sustainably in the foreseeable future.

2.1. General Theories on the Private Economy

2.1.1. The Essence of the Private Economy

Since the 6th National Party Congress, the Party's direction has allowed for the development of a diverse range of economic components, various forms of ownership, and types of enterprises

---

[2] Nguyen Van Cu Cadre training school.

to enhance the productive forces and create favorable conditions for the revival and development of the private economy. The Party's viewpoint on the private economy has remained consistent and has continued to evolve and improve with each Party Congress. On June 3, 2017, the Central Committee adopted Resolution 10 - NQ/TW on the development of the private economy, officially designating the private economy as a significant driving force in the market-oriented socialist economy. This resolution emphasized the clear directive to eliminate all barriers and prejudices, creating favorable conditions for the healthy and oriented development of the private economy. The issuance of a separate resolution for the development of the private economy provided a unique opportunity for the private sector to demonstrate its influence on the national economy, particularly within the context of Vietnam's heavy dependence on foreign direct investment (FDI). In such conditions, the domestic private economy truly became a lever for development, contributing to enhancing the competitiveness of the Vietnamese economy and enabling it to take off.

The private economy is a form of economic activity based on private ownership rights over production materials, closely linked to the labor of the owner and wage laborers.

The private economy emerges, exists, and develops under specific socio-economic conditions, driven by the development of productive forces. Therefore, the essence of the private economic form is based on private ownership rights over production materials. Those who own the production materials are the owners, and they tend to maximize their own profits, often at the expense of exploiting the labor of others.

The concept of a private capitalist market economy always accompanies the formation and development of the capitalist mode of production. The process of economic reform in our country, marked by the emergence and development of various forms of private enterprises, did not coincide with the return of capitalist society and the capitalist class. These private enterprises operate according to the business laws of the Socialist Republic of Vietnam and were established and developed under the leadership of the socialist Party. Furthermore, the private enterprises and the pool of entrepreneurs in our country emerged and developed in a new context, without having a class nature or inherent capitalist characteristics as in a capitalist society. This is evidenced by the presence of many entrepreneurs who are members of the Communist Party. The private enterprises in our country represent a new productive force, serving as one of the driving factors for economic growth and the development of the market-oriented socialist economy.

2.1.2. The Role of the Private Sector in the Economy

The private economy, in the broadest sense, refers to the economic sector outside of the state-owned sector, encompassing businesses both within and outside state ownership, where private ownership constitutes over 50% of the capital investment. The private economy comprises all production and business entities that do not rely on private ownership of the factors of the production process. In a narrower context, the private economy refers to the economic sector closely associated with private ownership, including individual enterprises, cooperatives, and privately-owned capitalist enterprises that are based on private ownership of production materials. The private economy exists in various forms, including private enterprises, limited liability companies, joint-stock companies, and individual business households.

The 5th Plenum of the 12th Central Committee of the Communist Party of Vietnam, held in May 2017, passed a new resolution aimed at promoting the private economy as a crucial driving force for the market-oriented socialist economy. This resolution outlined specific goals, as articulated in Resolution 10: By 2020, there should be at least one million private enterprises; by 2025, more than 1.5 million private enterprises; and by 2030, at least two million private enterprises. Additionally, the contribution of the private sector to GDP is targeted to reach approximately 50% by 2020, around 55% by 2025, and between 60-65% by 2030.

The prominent characteristic of Vietnam's private economy is that the majority of enterprises are small, with limited resources and low competitiveness. They often operate with relatively short lifespans amidst challenging business environments that are prone to various inherent risks. The Law on Support for Small and Medium-Sized Enterprises, passed on June 12, 2017, which became effective on January 1, 2018, is seen as a breakthrough step to facilitate smoother operations for the non-state sector, particularly for small and medium-sized enterprises (SMEs). SMEs constitute over 95% of the approximately 600,000 businesses nationwide and contribute to more than 10% of the GDP, while also providing employment for over 7 million workers. Therefore, the private sector has become a vital driving force for the socio-economic development of our country.

Firstly, the private sector has unlocked a significant portion of the nation's potential, bolstering the labor force and contributing to the development of the national economy.

Secondly, the private sector has made positive contributions to stimulating growth and restructuring the national economy. The average GDP growth rate of the private sector is equivalent to and on par with the overall economic growth rate. The robust development of the private economy has significantly contributed to the economic growth and development of the nation.

Thirdly, the private economy has played a role in mobilizing a substantial workforce and training new human resources to enter the labor market. The private sector has an advantage in terms of its capacity to provide employment opportunities. In general, the private sector excels in providing a diverse and abundant labor force, ranging from unskilled to highly skilled labor, spanning all regions and sectors of the country. Consequently, the private economy contributes significantly to job creation. In addition to addressing unemployment, private businesses must also effectively manage labor and maintain strict labor discipline to foster a professional workforce. This has contributed to the training of skilled labor with professionalism. Moreover, during its development phase, the private sector can be seen as a platform for nurturing future business leaders and as the primary economic foundation for reforming state-owned enterprises.

Fourthly, the private sector has played a role in promoting the process of international economic integration. For Vietnam to achieve high growth, it is necessary to engage in regional and international economic integration, attract capital, and adopt advanced technologies for the country's economic development.

2.2. Status and Solutions for Developing the Private Economy in the Context of Global Economic Integration

2.2.1. The Recent Development Situation of Vietnam's Private Economy

Since the 6th National Party Congress in 1986, with a change in perception by the Party and the Government regarding the private economy, the private sector has experienced significant growth and has made substantial contributions to the overall economic development of the country. Policies such as credit development, land use, capital, and taxes have been implemented to promote the development of the private economy and have played a pivotal role in transforming the landscape of the private sector.

On average, during the period from 2010 to 2021, more than 100,000 new businesses were established each year. Notably, from 2018 to 2022, there were over 130,000 new businesses established annually. Correspondingly, the registered capital reached over 500 trillion VND (Vietnamese dong) annually. During the 2018-2022 period, the newly registered capital exceeded 150 trillion VND annually.[1]

Up to now, the private sector has formed and developed several large-scale private enterprises[2] that are gradually diversifying their business activities and becoming significant players in the economy. Additionally, some private sector enterprises[3] are export-oriented and have achieved success, establishing their own brands. The community of entrepreneurs is growing stronger, with an entrepreneurial spirit, creativity, and an aspiration for growth, contributing to a sense of community, responsibility, and cultural refinement that continues to spread.

The rapid development of the private sector can be attributed to the government's enactment of the Private Enterprise Law in 1990, which marked the beginning of rapid growth in the scale of the private economy. The Enterprise Law, which took effect on January 1, 2000, was a turning point that stimulated the robust development of the number of enterprises in the private sector.

The achievements of the private sector in contributing to the country's economic development can be seen in the following aspects:

Firstly, during the period from 2010 to 2021, the contribution of the non-state sector (including the private sector and collective economy) consistently accounted for over 50% of the national GDP (50.55% in 2019, 50.56% in 2020, 50.04% in 2021, including the cooperative economic sector) and had the highest proportion among the three sectors (state, private, and FDI).[4]

Secondly, the non-state economic sector (including the non-state sector in industry, trade, services, excluding individual income) has continuously increased its contribution to the central budget during the period from 2010 to 2021, reaching 11.7% in 2011 to 18.48% in 2021. Especially, since 2017 until now, the contribution ratio to the state budget of the private economic sector has exceeded the state-owned enterprise and FDI business sectors.[5]

Thirdly, the private economy has gradually joined regional and global production networks and supply chains through vertical integration with the FDI sector. By 2021, the private economy has a relatively high proportion in the production of some items, accounting for 91.27% of sea salt production, 88.45% of sugar production, 48.69% of NPK fertilizer production, 44.64% of cement production, 39.21% of iron and steel in ingot or other crude forms, and 49.91% of rolled steel production.[6]

Fourthly, private sector investment continues to increase, and the proportion of private sector investment in the total state investment has surpassed the state-owned and FDI sectors. During

[4] General Statistics Office: Statistical Yearbook for the year 2021, 2022, p. 194, p. 206

[5] General Statistics Office: Statistical Yearbook for the year 2021, 2022, p. 258, p. 263

[6] Dual high-speed expressways Ha Long - Van Don and Van Don - Mong Cai, Van Don International Airport, Cam Ranh - Khanh Hoa International Airport, Deo Ca Tunne

the period from 2010 to 2021, the proportion of private sector investment increased from 44.6% in 2010 to 59.5% in 2021.[7] Thanks to this, although public investment has been reduced, the total infrastructure investment has still increased. In particular, during the period from 2010 to 2022, a series of large infrastructure projects undertaken by the private economic sector were initiated, completed, and put into operation.[8]

Fifthly, private sector companies have maintained a relatively stable capital turnover ratio, fluctuating between 0.7 to 0.78 times during the period from 2010 to 2017. This ratio is lower than that of FDI companies (ranging from 0.84 to 1.08 times) but significantly higher than that of state-owned enterprises (ranging from 0.36 to 0.59 times).

Sixthly, the private economy plays a positive role in the recovery of public investment capital during times when public investment must be cut. In the period from 2010 to 2021, the proportion of public investment in total investment reached its highest at 36.1% (in 2012) and its lowest at 24.1% (in 2019). However, the high growth rate of private investment, including attracting foreign investment, has helped stabilize the economy.

Seventhly, the private sector significantly contributes not only to the economy but also to society in terms of labor and employment. During the period from 2010 to 2021, although the proportion of the working-age population (15 years and older) in the private sector gradually decreased from 86.3% in 2010 to 82.6% in 2021, this sector still provided employment for over 80% of the labor force in the economy. The average growth rate of the labor force in the private economic sector from 2011 to 2018 was over 3.6%, and private sector companies alone achieved a growth rate of nearly 5.4%.

In addition, the private sector still faces several drawbacks:

- The political system's perception of the private economy, despite undergoing changes, still exhibits bias and discrimination, particularly among some officials, civil servants, and even party members towards the private sector. Lack of unity and, in some cases, inappropriate views regarding the interests of the private sector within the framework of a market-oriented socialist economy.

- The legal system, institutions, and policies still contain numerous obstacles, drawbacks, and inconsistencies that do not genuinely facilitate the development of production and business activities of economic entities, especially private enterprises. Tax policies are not always suitable, and there remains inequality in budget allocation for different economic regions. Policy implementation often overlaps, and market protection policies, anti-smuggling, and anti-trade fraud measures lack synchronization and have various shortcomings.

- Policies have many limitations, especially concerning the implementation of low-quality and ineffective mechanisms and policies. There are insufficient mechanisms and policies to promote the innovative development of the private sector and enhance its competitiveness on the international stage. Administrative procedures are cumbersome and complicated in many places, and support activities are often dispersed, occasionally lacking clear objectives, target groups, and resulting in low efficiency.

- The number of economic entities in the private sector has increased rapidly, mainly due to the registration of newly established businesses. However, the rate of businesses terminating their business activities, dissolution, and bankruptcy remains relatively high. The quality and efficiency of operations in the private sector have not significantly improved, primarily focusing on limited business activities and industries.

- Economic entities in the private sector are primarily small and medium-sized enterprises, with a relatively high proportion falling into the micro-enterprise category. In terms of the number of employees, in 2017, approximately 74% of private sector businesses had a small-scale workforce (compared to 63% in 2010). Only slightly more than 1% of state-owned enterprises had a workforce of around 200 employees or more. Among these, the proportion of businesses with fewer than 10 employees in the FDI sector was 30%, while in the state-owned sector, it ranged from 7.7% to 13.4%.

- The technological level and competitive capacity of the private economy, in general, remain low, with the majority of businesses being small-scale private enterprises or individual businesses. Notably, 95% of private enterprises are small-scale, have low development levels, limited financial capacity, and low economic efficiency. The connectivity among private sector components is weak, and their ability to participate in domestic and international supply networks is limited.

- The average labor productivity of the private sector is lower than the national economic average.

- Limited financial capabilities lead to small market scales, and private enterprises often lack the ability to compete in the international market.

2.2.2. Opportunities and Challenges for the Development of the Private Economic Sector.

Opportunities:

The process of participating in regional and global trade agreements brings numerous opportunities for the private business sector in Vietnam. The Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTTP) and the recently signed EU-Vietnam Free Trade Agreement (EVFTA) are expected to provide significant opportunities for expanding the import and export market share for the community of private businesses in Vietnam. With the ongoing globalization efforts, Vietnam is considered one of the most promising locations to attract foreign investors in the Asia-Pacific region, primarily due to advantages such as cost-effective labor, favorable demographic factors, a convenient geographical location, and political stability. Recent statistics indicate that foreign investors increasingly value and trust Vietnam.

The government continues to vigorously promote the divestment and restructuring of state-owned enterprises, creating numerous opportunities for the private economic sector. In the coming years, billions of dollars in capital and assets will change ownership and be transferred to the private economic sector, further facilitating the growth and expansion of businesses within Vietnam's private economic sector. Opportunities for the private economic sector will also expand as public infrastructure projects, which were previously reserved for state-owned enterprises, are now open to private businesses. This includes investments in the development of projects such as airports, highways, bridges, ports, and power plants.

The Fourth Industrial Revolution and the platform economy bring significant opportunities for private businesses. The utilization and exploitation of big data, the use of new algorithms, and cloud computing will create a new digital economy without national boundaries. Private enterprises will have significant opportunities to emerge as large corporations based on knowledge and technology, becoming regional and global players in a shorter time frame without the need for substantial initial capital. These opportunities will be even more significant for the Vietnamese private business community because most of the current Vietnamese businesses have small-scale operations and limitations.

Furthermore, the entrepreneurial spirit of the Vietnamese people is growing strongly and is actively supported by the government and various information and communication programs. This spirit is a crucial factor in harnessing the enormous potential (in terms of human resources, material resources, and financial resources) of the private economic sector for production and business, thus fostering stronger economic development.

Challenges:

Limited access to credit, business informality, and regional disparities, which include shortages of high-quality labor, inadequate road and infrastructure, tax administration, customs procedures, and trade issues. Significant differences in the development of private enterprises compared to state-owned enterprises and foreign direct investment (FDI) companies.

The development of the private economic sector is influenced by the diversity of industries and sectors through various support programs, often implemented through multiple state organizations. This leads to an uneven allocation of projects and support programs, affecting the progress and outcomes of their implementation. Many small and medium-sized enterprises in the private economic sector do not fully understand the current situation of the business support programs being organized and the registration methods for participation in these programs.

Small and micro-enterprises in the private economic sector primarily rely on existing resources, which are decreasing and include abundant but low-cost labor and scarce resources. Their management and technological innovation capabilities remain limited."

2.2.3. Some Solutions to Promote the Private Economic Sector in the Context of International Economic Integration in Vietnam Today

Firstly: Eradicate societal self-esteem issues and the discriminatory attitudes held by some individuals within state agencies toward the private economic sector.

Some policy and legal planning, as well as practical implementation, should objectively assess the private business model. In practice, state-owned enterprises have significant advantages in terms of land and credit compared to private businesses. In the future, it is essential to clearly distinguish between public utility services and goods, which require appropriate operational and administrative regulations.

Develop an economic mechanism that maximizes the country's competitive advantages, linked to the construction and improvement of a market-oriented economic management mechanism. Simultaneously, enhance the macroeconomic management role of the state through economic tools to leverage positive factors and address the shortcomings of the market mechanism. This should aim to perfect the socialist-oriented market economy in our country.

Widely disseminate the Party's and the State's policies regarding the private economy to all citizens through mass media channels, especially to key leaders in local governments. They need to correctly understand that the development of the private economy is vital for the economic development of each locality and immediately eliminate any discrimination between economic components.

Secondly: Enhance the legal environment to create favorable conditions for enterprises.

Although the state has issued several policies and regulations to facilitate the development of the private economic sector, the fundamental institutional and legal framework for the private economic sector remains incomplete and lacks consistency. Some documents do not align with the provisions of business laws and need significant investment for improvement. Deficiencies in the implementation of administrative reforms and institutional changes remain obstacles to the development of the business community. Some enterprises still complain about provincial People's Committees issuing documents that are beyond their authority and contrary to business laws. Delays in the issuance of legal documents, such as guidelines for granting legal certificates to private practitioners, persist. Many of the Party's policy directions for encouraging the development of the private economy have not been specified and implemented correctly. In numerous cases, state agencies draft legal documents that do not originate from the needs of private enterprises but are driven by subjective considerations and their own interests.

Clearly defining management responsibilities and delegating functions will enhance the effectiveness of state management tasks within each state administrative agency. Economic policies must be carefully considered and aligned with reality, tailored to the specific requirements of each economic entity. It is essential to ensure fairness across all economic components, both in economic and political aspects. Achieving this requires the state to formulate a unified policy among various economic components. Economic policies and organizational management structures must follow the principles of systematization and consistency, avoiding differentiation based on economic components. When constructing the management apparatus of enterprises, it is crucial to ensure that all relevant factors positively influence the overall economic growth process.

Thirdly: Enhance the competency of the workforce in the market economy in general and enterprises in particular.

In tandem with the changes in the education and training system and the state's positive investment in human resource development, every enterprise needs to proactively plan and provide training for its employees. This ensures that learning and education remain lifelong endeavors for each individual, with a focus on acquiring practical knowledge that translates into effective job performance within their designated roles and responsibilities.

Localities and enterprises should establish policies that support education and elevate understanding of the Party's principles, the state's policies and laws. Improve the professional competence and ethical conduct of business owners toward their employees. For business leaders, it is crucial to emphasize education and training, promote a sense of professionalism, social responsibility, ethical integrity, maintain professional ethics, uphold trust, and serve as role models in adhering to the Party's policies and state laws, ensuring the well-being and safety of their employees within the enterprise.

Fourthly: Leverage the core role of business associations.

Create opportunities for businesses to develop their production and trade on a multinational scale. Enhance cooperation and collaboration among enterprises to ensure a unified voice in the market, avoiding situations where businesses are pressured in terms of supply and pricing. Encourage each business association to develop contingency plans according to their respective industries.

The socialist-oriented market economy model in Vietnam is relatively new and has no precedent worldwide. It has undergone a period of construction, development, and experience accumulation. Some inherent imperfections in the system, legal framework, and their incompatibility with regional and global standards are inevitable. However, with the determination of the Communist

Party and the Government, this model will undoubtedly continue to evolve based on the socialist-oriented market economy, proactively integrating deeply and broadly with other countries in the region and the world. The Party's viewpoint and the state's leadership and management role are to always create the most favorable and convenient conditions for business development in general and private enterprises in particular.

Enterprises must strive for self-renewal, adopting management methods that align with the available workforce, which is patriotic, highly skilled, multilingual, and adept with advanced technology. This is how high-quality, cost-effective products with diverse designs, suitable for the varied needs of people in different countries, can be created.

Efforts should be made to establish credit guarantee funds for small and medium-sized enterprises, in line with the guidance provided in Government Decree No. 90/2001/ND-CP dated November 23, 2001, aimed at supporting small and medium-sized enterprises.

Encourage the formation of science and technology organizations with the goal of supporting and sharing experiences that help businesses develop science and technology, as well as disseminate scientific knowledge. Expand the network of scientific research activities for private enterprises. Localities should implement measures such as organizing short-term classes to disseminate scientific and technological knowledge to business owners and private enterprises, providing support for enterprises to rent or purchase information technology equipment to improve technology and implement efficient protection of intellectual property rights. Encourage individuals and businesses to apply new technologies with successful results.

III. CONCLUSION

Under the management of the state, the private economic sector has made significant contributions to the development of physical and technical infrastructure, driving the rapid process of industrialization and modernization in our country. It has played a vital role in advancing the national economy. The role and position of the private economy have been increasingly recognized, and it has made substantial contributions to the overall economy. The private economy faces both favorable conditions and challenges stemming from various external factors and internal dynamics within the private economic sector. These challenges pose significant obstacles for the state as it seeks to foster the development of the private economic sector. Economic integration is an inevitable and natural process that has presented both opportunities and challenges to the Vietnamese economy as a whole and to private enterprises in particular. Therefore, it is essential to implement appropriate solutions to maximize favorable opportunities, overcome difficulties, and address new challenges in order to achieve sustainable economic development.

FACTORS AFFECTING THE FINANCIAL CAPABILITY OF LOGISTICS SERVICES COMPANIES IN VIETNAM STOCK MARKET

Hoang Thi Thuy Hang[1]

Abstract: The study's main focus is on the factors affecting the financial capacity of logistics service companies. The study is based on a survey of 80 financial professionals and managers from educational institutions and businesses in the industry. The survey content was designed according to the 5-level Likert scale and put into testing the EFA factor discovery model to find out the outstanding factors that affect the financial capacity of listed logistics services companies. The research results show that a number of prominent factors such as the economic infrastructure environment, the ability to cope with risks, the growth of total industry assets, and experience in dealing with them are among the most important factors that have a prominent influence on the capital growth of logistics service companies in Vietnam today.

Keywords: financial capacity, listed logistics services companies

1. INTRODUCTION

Financial capacity is a fairly broad concept, including the ability to mobilize capital, the capacity to use capital and the capacity to ensure capital adequacy. There are many studies in the world that have gone into studying the financial capacity of enterprises for different groups in different markets. Research results show many similarities but also show many differences due to the influence of industry specificity and research market specificity.

The logistics service business group is considered one of the key industries of the modern economy, especially the boom of e-commerce after the Covid pandemic, however, how to expand and develop faster and stronger the logistics service business, it is necessary to have studies on the financial capacity of this industry group in Vietnam.

The following study will delve into the topic of factors affecting the financial capacity of logistics service enterprises in Vietnam and the study is divided into the following parts: part 2 is Literature review, part 3 is Research methods and research data, then part 4 Research results. Part 5 Conclusions and suggestions will end the study with some comments on the factors affecting the financial capacity of listed logistics service companies in Vietnam.

2. LITERATURE REVIEW

A lot of research has been done on different capital mobilization markets such as bond market, stock market or bank loans and the factors affecting the mobilization of such capital. Among those capital sources, raising equity capital, which is considered low risk and suitable for long-term business growth, also receives a lot of attention. Some typical studies can be mentioned as the study of Mark Maffett, Anya Nakhmurina, Douglas J. Skinner (2022) [5], the study analyzed nearly 7,000 active campaigns of stock investors across the world, 56 countries and shows that the activity of equity investors is now a global phenomenon. The analysis of the study provides evidence on the factors that explain the development of international investment activity. First, the study measures

1 Email: hangtano@tanogroup.com.vn, Postgraduate Academy of Finance.

the extent to which national governance regulations facilitate shareholder participation, a necessary condition for performance, and shows that measures of governance regulation of shareholders explains the shift in investment activity. Second, research shows that changes in these regulations also affect outcomes for companies facing a high operational threat but that is not a matter of concern. in particular, including increased profits, higher payouts and reduced investment. These effects are most pronounced in countries with weak minority shareholder rights, where previous performance is relatively unimportant.

A number of studies have analyzed the factors affecting the capital mobilization of enterprises, with the strong support and influence of social networks, making the investment channel through capital mobilization more effective. Equity activity from investors becomes stronger such as research Ziaul Haque , Aimin Qian , Md Rakibul Hoque, Suraiea Akter Lucky (2022) [8], A unified framework for exploring the determinants of online social networks (OSNs) on institutional investors' capital market investment decision. Online social networks (OSNs) are information dissemination platforms for investors in the capital markets. This study aims to determine the factors that influence the equity market investment decisions of investors and the extent to which each factor influences their decisions. A questionnaire was used to conduct the survey and 285 capital market participants in Bangladesh. The data were analyzed using structural equation modeling (SEM). Proposed factors (e.g., institutional pressure and cost-benefit size), as well as usefulness, are strong predictors of ability to make investment decisions. Indirect influences include a different hypothetical construct (e.g. context) and personal perception. The decision to enter the capital markets is greatly influenced by the intention to use the OSN. It is worth noting that the predictive relationship between situational context and cognitive ability, as well as the relationship between cognitive ability, are both significant. Surprisingly, perceived risk did not affect OSN adoption.

Michela C. Mason et al (2015) [6], based on a sample of 300 small and medium enterprises (SMEs) in the Province of Udine (Northeast Italy) and the Kärtner Region (Southern Austria), the study analyzes the impact of Entrepreneurship Orientation (EO) on SMEs. The study develops a model in which the dimensions of the EO are adjusted for leverage. The results suggest that leverage can play a significant role through interactions with the EO dimension.

Ayşegül Güner (2016) [1] conducts a comparative test between the trade-off theory and pecking order theory using firm-level data of 131 publicly traded Turkish companies from 2008 to 2014. The study also attempts to exploit differences between capital structure decisions for degrees of freedom of float in different markets. According to the empirical results, although pecking order theory seems to better describe the capital structure of firms, some determinants are consistent with the trade-off theory. The research results also reveal that firms with a free float ratio of 50% to 75% have lower levels of leverage and different degrees of leverage for different market values of companies. Many studies are interested in capital structure in general, such as the study of Marius Sikveland et al. [4], the study of the factors affecting capital structure in hotel service businesses.

A lot of research on risk management and capital safety, such as when approaching financial capacity from the perspective of capital efficiency of enterprises from the perspective of capitalists, Ian C. Macmillan et al (1985) [3] developed a questionnaire for one hundred venture capitalists to identify the most important criteria they use to decide to fund new ventures. The most important finding is that research has found a problem frequently made by the venture capital community that above all is the human factor expressed through the business plan. In a business plan, there is usually very little information about the planner, but a savvy investor will see the planner's ability to transform through the strategies he develops, situations, his way of planning and contingencies.

Factor analysis of the results indicates that venture capitalists seem to systematically evaluate ventures for six types of risk that can be managed. They are: Risk of losing the entire investment; The risk of not being able to guarantee; the risk of not realizing the joint venture idea; Competition risk; risk of management failure; and the risk of leadership failure.

Hailiang Yang (2003)[2] builds a new risk model for a company whose volatility is quite sensitive to credit quality. The modified Jarrow, Lando and Turnbull model (Markov chain model) was used to construct the credit rating model. Recursive equations for finite time probabilities and time distributions are derived. The combined Volterra systems of integral equations for final probability, severity of impact and general residual distribution before and after impact are also obtained.

Many studies have been conducted recently, such as Qi Liu & Jiejie Wu (2022) [7], assess the impact of strict financial regulation on corporate risk taking through the issue of capital control policy. Using an experiment from real businesses, the study found that tight financial regulation lowers both agency costs and also reduces managers' risk aversion, making them more willing to participate. in high-risk investments. Research results provide evidence that tight financial regulation promotes more risk-taking.

3. RESEARCH METHODS AND RESEARCH DATA

Based on statistics from existing studies, the factors affecting the financial capacity of listed logistics services companies on the Vietnamese stock market are classified into groups of subjective factors, objective factors and in each category, the group of factors, again divided into factors affecting the mobilizing capacity, the capacity to use and the capacity to ensure capital safety.

After analysis, to ensure that the groups of factors are described in a general and distinctive manner, the groups of factors are divided into 6 groups (03 groups belong to objective factors and 03 groups belong to human factors). subjective factors) and at the same time affect the financial capacity as follows:

Group 1: Macroeconomic environment

Group 2: Policy environment

Group 3: The vibrancy of the industry

Group 4: Quality of company's human resources

Group 5: Company characteristices

Group 6: The company's risk management ability

The groups of factors after being redesigned are detailed through the indexes in the following table:

Table 3.1 Factors affecting financial capacity

The objective factors				
Group 1	Macroeconomic environment	1	GDP	ME1
		2	Technical infrastructure of the economy	ME2
		3	The level of development of the free market economy	ME3
		4	The level of development of the capital market	ME4

Group 2	Policy environment	5	Industry related policies	PE 1
		6	Policies related to supporting industries	PE 2
		7	Policy for related industries	PE 3
		8	Fiscal policy such as taxes, fees, fees	PE 4
		9	Monetary policy such as raising and lowering interest rates	PE 5
Group 3	The vibrancy of the industry	10	The growth of the number of companies in the industry	VOI1
		11	The growth in total assets of companies	VO2
		12	Overall profitability of the industry	VOI3
The subjective factor				
Group 4	The quality of the company's human resources	13	Quality and quantity of highly qualified senior staff	HR1
		14	Quality and quantity of company's human resources	HR2
		15	Quality and quantity of training programs	HR3
Group 5	Company characteristices	16	From a state-owned company	CC 1
		17	Age of life	CC 2
		18	Asset size	CC 3
		19	ROE	CC 4
		20	ROS	CC 5
		21	LONG	CC 6
		22	EPS	CC 7
		23	Possibility to raise new shares	CC 8
		24	Ability to accumulate retained earnings after tax	CC 9
		25	Possibility to receive joint venture capital	CC 10
Group 6	The company's ability to manage risk	26	Insurance	AR1
		27	Provisions	AR 2
		28	Experience in dealing with risks	AR 3

3.2 Survey of experts and managers

Description of the survey:

The survey was conducted based on collecting opinions from managers of listed logistics services companies in the Vietnam stock market and financial experts from universities, academies, etc.

Survey content:

The assessment of managers and financial experts on the level of influence of factors on the financial capacity of companies according to the 5-level Likert scale, in which, level 1 means little influence, level 2 is low influence, level 3 is moderate influence, level 4 is highly influential, and level 5 is extremely influential.

Number of votes: Total number of votes issued: 80 votes for managers and 40 votes for financial experts, total 120 votes. Number of valid votes received: 62 votes for managers and 40 valid votes for experts, total number of votes is 102, accounting for 85%

After collecting and processing data on excel, all data are entered into SPSS testing software for processing and giving results.

4. RESEARCH RESULTS

4.1 Evaluate the reliability of the scale.

Evaluation of internal consistency, i.e. assessing whether the observed variables in a scale are strongly correlated with each other, explain the same concept and Cronbach' Alpha is a measure this internal consistency. If a scale in which the observed variables are positively correlated, the more consistent that scale is, the higher the Cronbach's Alpha coefficient will be. According to Nunnally (1978), a good scale should have Cronbach's Alpha reliability of 0.7 or higher. Hair et al (2009) also suggested that a scale that ensures unidirectionality and reliability should reach Cronbach's Alpha threshold of 0.7 or higher, however, as a preliminary exploratory study, the threshold is Cronbach's Alpha of 0.6 is acceptable. The higher the Cronbach's Alpha coefficient, the higher the reliability of the scale.

Testing the appropriateness of the answers for 6 groups of factors and the appropriateness of all the answers is shown in the following tables:

Table 4.1 Test results of Cronbach's Alpha coefficient of 6 factor groups

Reliability Statistices		
	Cronbach's Alpha	**N of Items**
Group 1	0.716	4
Group 2	0.668	5
Group 3	0.620	3
Group 4	0.763	3
Group 5	0.859	10
Group 6	0.716	3

Table 4.2 Conformity of the responses to the entire sample

Reliability StatistiPE		
Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.809	.819	28

Based on the Cronbach's Alpha test, the test results show that the Cronbach's Alpha coefficient for each factor group is greater than 0.6 and this coefficient for the whole sample is up to 0.819, showing the suitability of the set. data is very high.

4.2 Using the EFA exploratory factor model to discover groups of factors that have a statistically significant influence on the financial performance of companies.

*** Analysis through KMO coefficient and Bartlett test:**

KMO coefficient (Kaiser-Meyer-Olkin) is an index used to consider the appropriateness of factor analysis. The value of KMO must reach a value of 0.5 or more ($0.5 < KMO < 1$) is a sufficient condition for factor analysis to be appropriate. If this value is less than 0.5, then factor analysis is likely not suitable for the research data set.

Bartlett (Bartletts test of sphericity) used to see if the observed variables in the factor are correlated with each other or not. The necessary condition for applying factor analysis is that the observed variables reflecting different aspects of the same factor must be correlated with each other. This point is related to the convergence value in the EFA analysis. Therefore, if the test shows no statistical significance, then factor analysis should not be applied to the variables under consideration. Bartlett's test has statistical significance (sig Bartletts Test < 0.05), showing that observed variables are correlated with each other in the factor.

Table 4.3 KMO and Bartlett Test Result

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.801
Bartlett's Test of Sphericity	Approx. Chi-Square	3685.836
	df	153
	Sig.	.000

Thus, according to the test results, the coefficient **SME=0.801** and **Sig** of the coefficient **Barlett's Test = 0.000** shows that the factors that are suitable for the research data set as well as the observed variables are correlated with each other in the research data set.

*** Analysis using Eigenvalue, total variance extracted observed factor loading factor:**

Eigenvalueis a commonly used criterion to determine the number of factors in EFA analysis. With this criterion, only factors with Eigenvalue 1 are kept in the analytical model.

Total Variance Explainedgreater than 50% indicates that the EFA model is appropriate. Considering the variation as 100%, this value shows how much % of the extracted factors are condensed and how many % of the observed variables are lost.

Factor Loading Also known as the factor weight, this value represents the correlation relationship between the observed variable and the factor. The higher the factor loading coefficient, the greater the correlation between that observed variable and the factor and vice versa. According to **Hair & ctg (2009,116), Multivariate Data Analysis, 7th Edition** then:

Factor Loading at ±0.3: Minimum condition for the observed variable to be retained.

Factor Loading at ±0.5: The observed variable has good statistical significance.

Factor Loading at ±0.7: The observed variable has very good statistical significance.

Table 4.4 The results of the factor analysis

Total Variance Explained									
Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	8.472	47.065	47.065	8.472	47.065	47.065	4.103	22.792	22.792
2	2.297	12.761	59.826	2.297	12.761	59.826	3.911	21.727	44.520
3	1.853	10.296	70.123	1.853	10.296	70.123	3.096	17.199	61.718
4	1.257	6.985	77.107	1.257	6.985	77.107	2.106	11.699	73.417
5	1.001	7.617	80.714	1.001	7.617	80.714	1.875	10.307	80.714
6	1.011	5.617	83.724	1.011	5.617	83.724	1.675	9.307	83.724

7	.578	3.210	91.301						
8	.557	3.094	94.395						
9	.281	1.564	95.958						
...	...	...	...						
28	.005	.030	100.000						
Extraction Method: Principal Component Analysis.									

Thus can be seen:

Initial Eigenvalues>1 appears in 6 factors representing 6 groups, so these 6 factors summarize the information of 28 observed factors to be included in the EFA analysis in the best way.

The total variance extracted by these 6 factors is 83.724% (Cumulative = 83.724%) >50%, which means that these factors explain 83,724 data variations of the observed variables participating in EFA.

The results of the rotation matrix used to gather the influencing factors into groups (only the load factor greater than 0.5) is shown in the following

Table 4.5 Matrix after rotation

Rotated Component Matrixa						
	Component					
	1	2	3	4	5	6
ME2	0.894					
ME3	0.802					
ME1	0.741					
ME4	0.727					
PE1		0.892				
PE2		0.891				
PE3		0.879				
PE4		0.876				
PE5		0.792				
VOI 2			0.754			
VOI 1			0.698			
VOI 3			0.565			
HR3				0.861		
HR2				0.841		
HR1				0.828		
CC4					0.833	
CC5					0.721	
CC3					0.711	
CC1		0.772			0.688	

CC2					0.672	
CC6					0.665	
CC7					0.632	
CC9					0.612	
CC8					0.517	
CC10					0.506	
AR3						0.885
AR2						0.823
AR1						0.734

According to the rotation matrix, there is a variable CC1 (derived from a state-owned company) that is uploaded in two factors: factor group 2 (state policy) and group 4 (company characteristices). We need to rely on the difference in the load factor in the two factors of each variable to make a decision whether to exclude this variable from the model or not. According to Matt C Howard (2015), if an observed variable loads up in 2 factors but the load factor is less than 0.2, it should consider removing this observed variable.

Above, for the variable CC1, the difference of the two load factors is 0.772-0.668= 0.104. Therefore, this variable should be removed from the group of factors because this variable is showing unclear characteristices of any group of factors. After removing that variable, the remaining 28 variables are combined into 6 main groups that affect the financial capacity of companies, specifically analyzing each group 1 as follows:

Table 4.6 Group 1- Factors related to the environment

Factor group	STT	Content	Sign	Order of influence
Macroeconomic environment	1	Technical infrastructure of the economy	ME2	1
	2	The level of development of the free market economy	ME3	2
	3	GDP	ME1	3
	4	The level of development of the capital market	ME4	4

The factor that is considered to have the most significant influence on the industry in the macro environment is the technical infrastructure of the economy. The specificity of the group of companies dealing in logistics services is that they have to move through many geographical areas and the current transportation system is revealing a lot of inadequacies, causing difficulties and increasing time and costs for logistics companies, which reduces the satisfaction of the passenger experience as well as the protection of the packages, such difficulty and inconvenience will be evident when compared to the traffic and transportation situation in other countries, where the transport system is invested and built, the traffic is planned, the technical parameters such as road surface smoothness, the width of the road, the level of regional connectivity of the roads, ... are scientifically calculated to ensure the transportation and business of logistics services.

Then it can be seen that the development of the free market, the current trade and trade is a golden opportunity for the development of logistics services, but free trade also means that companies develop. Foreign logistics services also penetrate the market and compete directly with Vietnamese companies. The GDP growth rate is fast, but no matter how large the market is, if a reasonable logistics service system is not quickly built, the market will be acquired by foreign companies.

Although the level of development of the capital market is influential, the main problem of logistics services lies in the operating process rather than in capital, there are many domestic and foreign organizations willing to invest money for Logistics companies in Vietnam because they see the potential of the industry, banks as well as the stock and bond markets also have a positive attitude towards financing this industry group. Many new companies continuously start up and develop in the industry group, showing strong investment from the market, however, the investment efficiency is not really as expected, the companies have only met a market demand.

Table 4.7 Group 2 – Factors related to the policy environment

Factor group	STT	Content	Sign	Order of influence
Policy environment	1	Industry related policies	PE1	1
	2	Policies related to supporting industries	PE2	2
	3	Policy for related industries	PE3	3
	4	General monetary policy such as raising and lowering interest rates	PE4	4
	5	General fiscal policy such as taxes, fees, charges	PE5	5

The logistics industry has now been classified as one of the priority groups for development. Especially in the period when companies are heavily affected by the Covid pandemic, the policy of reducing electricity prices for warehouses, extending the payment of taxes and fees, and receiving a reduction in warehousing fees of logistics services, subsidized petrol prices with transport companies, etc. Industry-related policies are of great significance to the development and response to crises of companies in the industry.

The supporting industries for the main logistics service businesses are all production and business companies that do not have their own logistics system and need to connect to a large-scale logistics network to save costs. Unlike manufacturing industries that need specific materials or machines, the logistics service business will develop well if companies or trading floors use the services of these companies. The development of logistics companies is highly dependent on other companies in the economy and during the research period, especially during the Covid period, the recession and freeze of general production made logistics companies strongly influenced. The policies for companies are generally only temporary support.

Industries related to the logistics industry can be mentioned such as the petroleum industry, the manufacturing industry and domestic production of means of transport such as shipbuilding, automobile manufacturing, traffic construction industry, and construction of bridges and roads , ports, ... are all industries that are not the strength of Vietnam's economy and although there are many supportive policies, due to the requirement of too large production resources, these groups of industries still have not really promote to meet actual needs.

General policies such as monetary policy, fiscal policy applied across the economy have a general effect on the development and recovery of companies and will indirectly affect the activities of the industry of services of Logistics.

Table 4.8 Group 3 - Group of factors related to the excitement of the industry

Factor group	STT	Content	Sign	Order of influence
The vibrancy of the industry	1	The growth in total assets of companies	VOI2	1
	2	The growth of the number of companies in the industry	VOI1	2
	3	Overall profitability of the industry	VOI3	3

In this group, the size of assets of companies will most clearly reflect the excitement of the industry according to experts, whether the number of companies is small or the overall profitability of the industry has not yet been established, most clearly reflects the excitement of the industry by the size of the industry's assets. However, this assessment will probably only be true for the logistics service industry in its infancy like this industry in Vietnam today, the development and application of information technology is still limited, the improvement of the ability to exploit Maximizing the use of existing resources is still limited, so when companies want to increase their ability to serve customers, they will mostly increase their assets, purchase additional equipment and means of transport. Over time, when the level of science and technology improves, the growth of the industry will come from the strong application of science and technology to make the most of existing resources, and then to asset growth.

The overall profitability of the industry is not always a criterion to reflect the excitement of the industry because there is a phenomenon that when companies grow to near saturation, there will appear a phenomenon of narrowing of the average profit margin because companies are competing fiercely with each other on price and must sacrifice profits to gain market share.

Therefore, to assess how the excitement of the industry affects the financial capacity of companies in the industry, one can look at the development of the total asset size of the companies in the industry and the total size of the industry. Larger can imply a higher ability to serve the market.

Table 4.9 Group 4 – Group of factors related to the quality of human resources

Factor group	STT	Content	Sign	Order of influence
The quality of the company's human resources	1	Quality and quantity of training programs	HR3	1
	2	Quality and quantity of company's human resources	HR 2	2
	3	Quality and quantity of highly qualified senior staff	HR 1	3

The quality and quantity of training programs will show more about the long-term vision and scale of human resource development than the current quality of human resources as well as the quality and quantity of highly specialized and professional staff. Only through training, both in school, practical training and continuous training in the working process, can the human resources of the industry be stable and developed. With the demanding needs of the market today, the current team needs to be professionally developed at a faster, stronger, and continuously developed pace to be able to keep up with the demand for logistics services.

Table 4.10 Group 5- Factors related to company characteristices

Factor group	STT	Content	Sign	Order of influence
Company characteristics	1	ROE	CC4	1
	2	ROS	CC5	2
	3	Asset size	CC3	3
	4	From a state-owned company	CC1	4
	5	Age of life	CC2	5
	6	ROA	CC6	6
	7	EPS	CC7	7
	8	Ability to accumulate retained earnings after tax	CC9	8
	9	Possibility to raise new shares	CC8	9
	10	Possibility to receive joint venture capital	CC10	10

Factors related to specific company characteristices will strongly affect the financial capacity of that company, but according to experts, ROE can be considered as the most important factor because it is the strength of the company. return on equity, the source of equity is the capital formed from the owner's contributed capital and the residual profit after tax of the companies and is the active resource of the companies, if after each year the source is expanded at the same time as ROE is increased, the company's ability to sustainably grow thanks to equity will be significant in the long run.

Other factors that reflect aspects such as profitability on sales, size of assets, return on assets or profitability per share all reflect a part of the company's profitability but has not shown the stability of self-financing and sustainable development as ROE

Asset size or whether the company comes from a state-owned company will partly affect the ability to expand and develop financial capacity for companies because of its large scale as well as its prestige and business. With many years of experience coming from long-standing state-owned companies, it is easier for companies to find and persuade customers, thereby increasing the ability to exploit the market and expand the financial capacity of the company. However, this is not an absolute competitive advantage because many companies, although young and coming from private companies, have a professional logistics operation system and are direct competitors of foreign companies. State-owned company with many years of experience. This comes from the specificity of the logistics industry, which involves a lot of use of technology to calculate routes and optimize costs as well as the management system of delivery points and these factors are often updated sector, with investment support from foreign investors, than in the public sector.

Table 4.11 Group 6 – Factors related to the company's risk management ability

Factor group	STT	Content	Sign	Order of influence
The company's ability to manage risk	1	Experience in dealing with risks	AR3	1
	2	Provisions	AR2	2
	3	Insurance	AR1	3

Experience in dealing with risks can be considered as the factor that has the most significant influence on the financial capacity of companies because of the constant variability of the types of risks that can be found in the process of industry activities. . Companies with leadership teams with experience in dealing with risks will have better visibility to minimize the chance of risks occurring as well as establish risk reduction channels for the company. Dealing with risks as well as the question "prevention is better than fire", provisions and insurance can reduce the negative and unexpected effects of a risk, but experience in dealing with risks can ring safe production and business strategies, ensure the safety of business capital, maintain and improve financial capacity for companies.

5. CONCLUSIONS AND SUGGESTIONS

The following sets of solutions are advised and are anticipated to have a direct impact and indirectly favorably affect the efficacy of risk management, in the order of the level of influence assessed in the preceding section and the examination of the reasons leading to the factors being listed in that manner.

*** For factors belonging to the Economic Environment group:**

In order of the impact level assessed in the above section, the following steps should be taken:

+ Logistics infrastructure system: Exploiting the current logistics infrastructure system is not synchronized, lacks the connection between components in the system: Multimodal transport to combine the advantages of each mode of transport has also not developed effectively in Vietnam. Connectivity between modes of transport continues to be limited. The effect of poor infrastructure and limited exploitation is the increased cost of transport operations and the long run.

+ The level of development of the capital market has not met the needs of the market: The capital market still has many disadvantages, especially the development level of the capital market has not met the market demand. Some disadvantages can be mentioned such as: market size is still quite small compared to other countries in the region and lack of stability; products are few, not diversified; professionalism is not high, transparency is low, sanctions are not enough deterrent; infrastructure limitations lead to order congestion, affecting confidence in the market; the risk of bubbles in the market due to the lack of capital from new investors, a lot of knowledge about the stock market; unsustainable investor base...

+ Free economic development leads to increased competition: Although domestic companies are superior in number, they only account for about 30% of the market share, the rest of the market share belongs to foreign companies because Vietnamese companies are mainly small in scale and limited.

*** For factors related to the policy environment for the industry**

In order of the impact level assessed in the above section, the following steps should be taken:

Although the logistics industry receives the attention of many levels of government and there are many documents related to supporting this industry The company's logistics management system is inefficient, causing trouble and time-consuming for companies in completing related procedures.

*** For factors related to the vibrancy of the industry**

In order of the impact level assessed in the above section, the following steps should be taken:

The logistics industry is currently considered to be very active, but in fact, the number of companies is largebur the scales of companies are not reakky big. The number of small and medium-sized companies accounts for the majority and 90% of the registered companies have capital of less than 10 billion VND; In terms of service types, logistics companies operate in many different service areas.

*** For factors related to the quality of the company's human resources**

Quality and quantity of training programs is the most important thing for improving the company's human resources. The industry's human resources are considered to be both lacking in quantity and weak in capacity and need more active actions such as coopration between university and companies in training the employees.

*** For factors related to company characteristics**

In order of the impact level assessed in the above section, the following steps should be taken

+ Scale of assets increases slowly, most of which come from small-scale companies: the companies in the industry, although growing very fast, are growing in number of companies rather than in asset size as well as growth in market coverage

+ The age of most is young: Newly equitized state-owned companies account for only a small part of logistics companies, a strong boom comes from private companies with both domestic and foreign investment capital

+ The ability to set financial goals is still weak: The companies continuously fails to achieve the set targets even though the targets have been adjusted according to the actual market situation, this is a consequence of the ability to diversify products, lower costs and poor competition...

+ The possibility of issuing new shares occurs in many companies, but the size of the issued capital is low and the frequency is not frequent: The company's capital will create conditions to push up its financial capacity, but in the group of companies studied, the increase of capital through this form does not really receive positive attention from the market.

+ The possibility of receiving capital contribution to the joint venture is not high: If companies in the industry form a chain of joint ventures to take advantage of the idle resources of the parties or simply link up to form a group capable of providing better services, it will create strength for the logistics industry in Vietnam.

*** For factors related to the company's risk management ability**

In order of the impact level assessed in the above section, the following steps should be taken:

+ Experience is mostly young:

Stemming from the low age of the companies and the limited human resources in the industry, the risk handling experience of the companies is still weak, leading to the continuous incurring of related costs, which reduces the risk company's expected profit

+ The provisioning has not yet followed the reality

The provisions of companies in the industry have not been built closely with the company's possible risks because the characteristics of the logistics service industry have many different risks and the activities of companies.

SUSTAINABLE DEVELOPMENT OF BANKQUE POUR LE COMMERCE EXTERIEUR LAO PUBLIC (BCEL)

Weo Phouangsavath[1]

Abstract: *Sustainability is not a mere buzzword in the banking industry now but rather a key concept that will shape the direction of the industry in the years to come. Thus, the study aims to ascertain various sustainable banking practices at a Laos. It also intends to identify the existing framework developed for assessing the performance of sustainable banking.*

The study makes use of exploratory and descriptive research design and is based on secondary sources of data collection. The dimensions of sustainable banking have been identified as environmental, social and governance (ESG). The research further highlights that sustainability issues focused by banks primarily involve "environmental" and "social" considerations, however, the "governance" aspect has not yet been considered by many. Moreover, the study reveals that there are no guidelines specified by the Bank of Lao PDR (BOL) for sustainable banking practices in Lao to date. The insights gained from the study would enrich the existing literature on sustainable banking in Lao. The findings would also help in developing a new framework for assessing the performance of sustainable banking practices.

Key words: *Sustainable, Development, Bank*

1. INTRODUCTION

It can be said that in the modern economy, along with the extensive development of the financial economy, financial conditions are "loosened", causing an increase in new types of risks in the operations of banks. (Crisised in America). These risks can spread strongly to the economies of countries along with the financial liberalization process. This is also a negative factor affecting the development of the bank.

Clearly, BCEL is contributing a huge role in Laos' economic development. However, this bank is facing new challenges: competition and increased risks in the process of international economic integration. Choosing which direction to survive and develop in a competitive environment while promoting its role in the economic development of Laos is an urgent issue for this bank.

In the world and in Laos, sustainable development is being mentioned and receiving the attention of many audiences. Sustainable development is about satisfying current human needs without harming the needs of future generations (This concept was first mentioned at the United Nations in 1970).

Sustainable development (which includes sustainable development of the commercial banking system - sustainable development of commercial banks is stable development in the present but does not affect future development in the relationship with the business environment) is always the goal of any country.

In addition, sustainable development tends to start inside the bank, arising through the need to set core goals and create their brand value, aligning and balancing the benefits of their stakeholders, create goodwill, build consumer base and market share, attract financial partners thereby increasing profits in short and long term.

[1] Email: chalaphonep@gmail.com, Academy of Finance.

In Laos, the development of sustainable banking is at an early stage. Some banks are interested in this. However, the implementation of sustainable development of banks is not equal, many banks do not have environmental and social risk management system. Solutions are lacking and legal procedures for sustainable development are incomplete. In the trend of globalization, the system of commercial banks must integrate deeply. Therefore, sustainable development helps to improve the competitiveness of the banking system and is an indispensable trend in line with the trend of international integration.

Currently, the commercial banking system in Laos is being restructured in association with bad debt handling to ensure the safety, health and sustainability of the credit institution, thereby creating a firm premise to curb inflation. developing and innovating growth models aimed at sustainable economic development.

Because of its urgency and its applicability to sustainability in the future, PhD candidate decided to choose "Sustainable development of Bankque Pour le Commerce Exterieur Lao Public". to assess sustainability and propose solutions for sustainable development of BCEL in the trend of international integration.

1. OBJECTIVE

Research situation of sustainable Development of Bankque pour le Commerce Exterieur Lao Public (BCEL);

Proposing solution and recomendations for Bankque pour le Commerce Exteureur Lao Public (BCEL)

2. REVIEW OF THE PREVIOUS STUDIES

Thaddeus. C. Trzyna, in the work (2001), "Sustainable World", sustainable development requires the penetration of many specialties, fields and subjects. It forces us to move beyond the previous method of thinking narrowly in each field and to consider the relationship between ecological, economic and social fields. Sustainable development is a social process. First of all, this is an ethical principle.

Stephen Viederman in his work (2001), "What knowledge do we need for sustainable development" writes "Sustainability is not a technical problem that needs to be solved but a vision into the future, ensuring us a roadmap." and help us focus on a set of logical and ethical values and principles that guide our actions as individuals, as well as in our relationships with organizational structures. organizations that we contact such as government organizations, non-governmental organizations and other related works...". According to the author, sustainable development needs to focus on the following issues: quality of actions, use of a systemic approach, clear concern for future generations, sustainability and equity, concern for Pay attention to mobility, inequity, mixture and discontinuity.

"Sustainable development" is also accepted by many scholars around the world such as: David Munro in the work (2006) "Is sustainability a rhetoric or a reality", sustainable development is any or all activities activity or process that increases the capacity of people or the environment to meet human needs or to improve the quality of life. The product of development is that people are healthy, well-nourished, clothed, housed, engaged in productive work for which they are well trained, and able to enjoy their leisure time. Leisure and entertainment are something we all need.

Development is a complex combination of activities, some with social goals, some with economic goals, some based on physical resources, some based on intellectual resources, All enable people to achieve their full potential and enjoy a good life. For development to be sustainable, it must continue forever, or its benefits must be maintained indefinitely. That means sustainable development must be worth doing, must meet the above mentioned socio-economic goals.

Denis Goulet, in his work (2006), "Is true development sustainable development", sustainable development includes four aspects: economic, political, social and cultural. Political stability ensures that all members of society have choices in their existence, which can only be achieved when all enjoy freedom, human rights, protection and faith in The political system is strengthened. This system pursues the common good, not simply individual self-interest calculations. Based on sustainable social and cultural development, community foundations and symbolic meaning systems need to be protected. The right development strategy will be oriented towards economic development where production products focus on basic needs, creating jobs.

Nguyen Thanh Phuong (2012), said that: A sustainable commercial bank is a bank that operates at a level of profitability according to the requirements of its owners in a safe state. Banks need to maintain a balance between profitability and safety over a long period of time. Besides, banking activities need to serve the interests of customers, increase benefits for the community, society and the environment.

Nguyen Hong Son et (2015) summarized the views and criteria for evaluating sustainable bank development. The authors assessed the development of Vietnam's commercial banking system and restructured in line with international practices, which also provided solutions for the sustainable development of the Vietnamese commercial banking system. However, the content of the study focused on assessing the realities of banking system development and restructure, mainly based on criteria for assessing the stability and soundness of the banking system. This study đin't elaborate on the situation of sustainable development of the commercial banking system in line with international practices on environmental and social factors affecting banking operations.

In general, studies on sustainable development of commercial banking system in the country are not much, especially studies on sustainable banking models. Domestic studies focued on assessing the performance of commercial banks, there were very few researches on sustainable development of commercial banks. Research directly related to the topic of dissertation is a study by Nguyen Hong Son et al. (2015). This study analyzed the development status of commercial banks associated with the restructuring of the banking system. However, this study analyzed the sustainable development of the banking system, which did not integrate environmental and social issues into the bank's operations - these are considered important elements of sustainability.

Tran Thi Hoang Yen (2016) applied a linear regression model to examine the relationship and impact of independent variables: corporate social responsibility to the bank's financial results through variables Dependencies are ROA and ROE. In this study, the author clarified theories of corporate social responsibility. This was the core theory of social responsibility of organizations.

Bui Khac Hoai Phuong (2019) "sustainable development of commercial banks in Vietnam", the results of the study show that based on the results of the situation analysis as well as the assessment of the sustainable development of commercial banks in Vietnam, the dissertation proposes solutions for the sustainable development of Vietnam's commercial banking in line with the trend of international integration. Firstly, commercial banks need to improve consistently and soundly, including raising capital adequacy to protect shareholders, investors and customers, and improving the quality of their assets and improving operational efficiency. Secondly, complete the ESMS system consists of three stages: the first building internal environmental management system, the second environmental and social risk management in the lending and investment activities, providing sustainable financial products.

Saxena, D., Dhall, N., & Malik, R. (2021), "Sustainable banking: A roadmap to sustainable development", the study suggested that sustainable banking includes ESG dimensions and all other aspects are derived from ESG. Banks aim to achieve the sustainable development and thus sustainable banking can help achieve sustainable development. Moreover, it has been revealed that foreign banks and private banks are performing well in regard to sustainable banking than the public sector banks and RRBs. It has been brought to the notice that for public sector banks it is not easy to change the policies due to the regulatory framework and also sustainability is considered as a secondary issue rather than a primary issue. Thus, based on the in-depth interviews conducted with the banking professionals, it can be stated that there is a connection between sustainable banking and sustainable development.

3. RESEARCH METHODOLOGY

Comparative statistics, using time series data and at a point in time to compare vertically, the performance indicators of Bankque Pour le Commerce Exterieur Lao Public through periods of development. Statistical functions such as frequency, proportion, average, growth rates is applied for comparative analysis.

Therefore, in order to ensure that the business operation of the bank is consistent with international standards, BCEL emphasizes the financial services that takes into account responsibility for sustainable business operation in order to be trusted by our customers as well as all stakeholders underlying longterm value in alignment with environmental, social, and governance principles which are considered key indicators of bank's sustainable growth.

4. RESEARCH RESULTS

Establishment

Banque Pour Le Commerce Exterieur Lao Public (BCEL) was established in accordance with the Decision on Bank Establishment No. 129/BOL dated 01 November 1989 issued by the State Bank (The Bank of the Lao PDR today). At that time "Banque Pour Le Commerce Exterieur Lao" was the name of BCEL. The origin of BCEL, however, commenced in 1975 when Lao PDR was established. During 1975-1989, BCEL started from being a Division of the State Bank, in charge of international settlement, loans and foreign aid management. Responding to the new economic mechanism of the Party and the demands of businesses in new era, the government has agreed to transform BCEL into a full state-owned commercial bank on 1 November 1989 as per the said Decision of the State Bank.

The transformation has been the significant commencement of comprehensive banking business operation of BCEL, which has a variety of banking services such as deposit, loan, letter of credit, collection, and domestic and international settlement. This was the crucial condition that made BCEL developed gradually and became a strong state-owned commercial bank and achieved all criteria and conditions as the first commercial bank to be listed in Lao Stock Exchange. On 23 December 2010 BCEL accomplished IPO and renamed to Banque Pour Le Commerce Exterieur Lao Public according to the Enterprise Registration License No.0061/ ERO dated on 10 January 2011 issued by the Department of Enterprise Registration and Management, Ministry of Industry and Commerce of the Lao PDR. The Ministry of Finance representing the Government held 80% of the total shares. On 15 July 2011, the Ministry of Finance sold 10% of the total ordinary shares to its strategic partner named Compagnie Financière de la BRED (COFIBRED) which is a subsidiary of BRED, the largest banking society in the Banque Populaire Group a French group of cooperative banks.

In 2017, BCEL succeeded the recapitalization by public offering and right offering to the existing shareholders in accordance with a permission granted by the Lao Securities Commission Office on 17 August 2017. This made BCEL increase its registered capital in the amount of 355.728.500.000 LAK (71.145.700 shares) according to the certificate from the Lao Securities Exchange No. 01/LSX, dated 15 September 2017. Accordingly, the BCEL's registered capital was increased from 682,88 to 1.038,62 billion LK.

In order to develop BCEL further, the government has offered more room for the general public and investors to jointly own BCEL by reducing the government shares in BCEL and offering to the public and the existing shareholders. On 11 October 2019 the Lao Securities Commission Office granted a permission for this offering. On 29 November 2019, the Lao Securities Commission Office issued certificate endorsing the offering completion of 10% of BCEL's holders.

Register Capital

The registered capital of BCEL as at 31 December 2022 was 1.038.617 million Kips (1.038.617 million Kips as at 31 December 2021).

Shareholder Structure

The shareholders structure of BCEL as at 31 December 2022 was the following:

Shareholders	Number of shares	Percentage
Government (represented by theMinistry of Finance)	124.634.021	60%
Strategic Partner (COFIBRED)	20.772.359	10%
Local Investors (including employees ofBCEL) and Foreign Investors (*)	62.316.920	30%
Total	**207.723.300**	**100%**

(*) Each individual person or entity is allowed to hold a maximum of 2% of the total shares.

Principal Business

The principal activities of BCEL are to provide banking services including fund mobilization and deposit-taking for short-term, medium-term, and long-term from organizations and individuals. The bank also provides loans for short-term, medium-term, and long-term to business units and individuals based on the loan purposes and the capability of the bank in lending; foreign exchange transactions, international trade financial services, purchase discounts of trading instruments, bonds and other valuable documents and other banking services allowed by the Bank of the Lao PDR.

Location and network

The Bank's Head Office is located at No.01, Pangkham Street, Ban XiengNheun, Chanthabouly District, Vientiane, Lao PDR. As of 31 December 2022, the Bank has 01 Head Office, 06 joint venture companies, 20 branches, 97 service units, and 11 exchange units all over the Lao PDR.

Vision

BCEL has adopted a vision and applied to its business development to achieve its goal and objective of "becoming a strong and modern bank moving toward international standards".

Mission

In order to make BCEL a strong and modern bank moving toward international standards, the key missions of BCEL include development of strong corporate governance by focusing on: development of banking services which embraces changes in each period of time; creation of a strong culture of risk management and compliance with the BASEL II principles; increase in business operation capacity; creation and development of a capable, comprehensive, accurate and punctual management information system (MIS); utilization of modern technology; and upgrade of knowledge and expertise of the employees as of regional and international levels.

Core Values

BCEL firmly maintains 5 core values below:

1. Customer centrism;
2. Intergrity;
3. Work effectiveness;
4. Embracing changes;
5. Social responsibility.

BCEL's Sustainable Development

Sustainability is one of the key success factors in banking industry. Therefore, in order to ensure that the business operation of the bank is consistent with international standards, BCEL emphasizes the financial services that takes into account responsibility for sustainable business operation in order to be trusted by our customers as well as all stakeholders underlying longterm value in alignment with environmental, social, and governance principles which are considered key indicators of bank's sustainable growth.

BCEL takes into account minimizing negative impacts and creating net positive impact in improving business performance by integrating the international sustainable development principles including corporate governance, internal control, risk management as well as conducting business in facilitating governmental policy operations, supporting national digital infrastructure development and so on. Furthermore, the bank actively conducts its business with responsibility and strictly complies with laws and regulations in developing products and services contributing to sustainability in terms of Environmental, Social, and Governance (ESG). In other words, the bank commits to preserve natural resources, to enhance good quality of life for employees, customers and communities, and to promote working under sound corporate governance that effectively communicates to internal and external stakeholders.

Current status of sustainable development of BCEL

Sustainability is one of the key success factors in banking industry. Therefore, in order to ensure that the business operation of the bank is consistent with international standards, BCEL emphasizes the financial services that takes into account responsibility for sustainable business operation in order to be trusted by our customers as well as all stakeholders underlying longterm value in alignment with environmental, social, and governance principles which are considered key indicators of bank's sustainable growth.

BCEL takes into account minimizing negative impacts and creating net positive impact in improving business performance by integrating the international sustainable development principles including corporate governance, internal control, risk management as well as conducting business in facilitating governmental policy operations, supporting national digital infrastructure development and so on.

Furthermore, the bank actively conducts its business with responsibility and strictly complies with laws and regulations in developing products and services contributing to sustainability in terms of Environmental, Social, and Governance (ESG). In other words, the bank commits to preserve natural resources, to enhance good quality of life for employees, customers and communities, and to promote working under sound corporate governance that effectively communicates to internal and external stakeholders.

Fund Mobilization size

BCEL always determines that fund mobilized is the foundation for business expansion in the period 2018 - 2022, focusing on fund mobilization strategies, thoroughly grasping the spirit of self-reliance in mobilizing maximum domestic capital with the motto " Modern, Quick reliable". The capital source of BCEL in the period of 2018-2022 has continuously grown over the years to meet the lending needs to develop the economy, especially the production and trade sectors. The average total fund mobilized growth over the years is 29,86%, reaching the set target, the absolute increased by 55.476,92 billion LAK.

Strengthening the attraction of foreign currency fund: in the period 2018-2022, in order to meet the increasing demand for foreign currency loans, BCEL always focuses on mobilizing foreign currency fund. Through promoting payment activities, interest rate policies and flexible forms of fund mobilization for foreign currency capital, at the same time, introducing a mechanism to manage capital and fees to break even internally, preferential usage rates Using capital appropriately, BCEL has made a leap in attracting foreign currency, foreign currency capital increased by an average of 44,59%, the absolute increase was 58.729,13 billion LAK.

Thus, the capital scale of BCEL is increasingly expanding. In particular, this is the bank with the largest capital scale in Laos. In recent years, despite being affected by the COVID-19 pandemic, fund mobilization has decreased in recent years but still ensures an increase and average growth of the industry.

BCEL's fund mobilized grew steadily and steadily because during the year the whole system always attached importance to fund mobilization, especially medium and long-term fund. The bank has applied diverse forms of fund mobilization to promote marketing, better implement customer policies, persevere with the policy of fund mobilizing from the population, creating a healthy balance between demand and loan.

In addition, the bank also constantly improves and enhances the quality of traditional fund mobilization products, while also developing new products and services and forms of fund mobilization for each customer group. Focus on applying and introducing diverse fund mobilization products suitable for each stage:

Fund Mobilization Structure

In terms of fund mobiliztion structure: BCEL's fund mobilization in the period 2018-20122 accounts for the largest proportion, with deposits accounting for over 90% of the total capital. Total deposits are mainly non-term deposits. Demand deposits increase on average annually by 36,20%/year, the absolute increase is 39,078.06 billion LAK, the proportion of demand deposits reaches 65,86% in 2022 (increased 7,43% compared to 2018). In which, the proportion of term deposits in 2018 reached 41,58%, decreasing to 34,14% in 2022. The fund mobilization structure mentioned above does not change much. Thus, BCEL's capital structure is relatively reasonable because bank's capital is a cheaper source of capital than other deposits used by banks as the main source of capital to conduct business activities.

Table 1: BCEL's Fund Mobilization

Unit: Billion LAK

Details	2018	2019	2020	2021	2022
Total fund mobilization	36.958,13	44.455,08	51.757,38	66.104,84	92.135,05
1. By sectors	36.958,13	44.455,08	51.757,38	66.104,84	92.135,05

(Sources: BCEL annual report 2018-2022)

By economic sector: Capital structure by economic sector of BCEL in the period 2018 - 2022, reflected through Table 1

BCEL pays special attention to fund mobilization, considering this a top task, gradually restructuring capital sources in the direction of gradually increasing stable capital sources such as residential fund, term deposits, limit accepting demand deposits and loans from other credit institutions, gradually increasing medium and long-term capital sources to meet credit needs for socio-economic development. Residential deposits increase from 21.137,08 billion LAK in 2018 to 59.449,35 billion LAK in 2022, the absolute increased by 38.312,33 billion LAK, an average growth rate of 36,25%/year, accounting for 70% of total deposits in 2018 and 73% in 2022.

Capital market share: BCEL's capital market share is always higher than the top 3 largest commercial banks in Laos. In 2022, BCEL's market share in terms of capital is 54,54%% of the total capital of the economy, much higher than the capital sources of other banks: LDB: 9,37%, JDB: 6,53%, LVB : 5,85% and other 43,55%.

Table 2: Capital market share

Unit: Billion LAK, %

Name of Bank	Fund Mobilization	Proportion
Bankque Pour le Commerce Exterieur Lao Public (BCEL)	92.135,05	54,54 %
Lao Development Bank (LDB)	15.828,53	9,37 %
Joint Stock Development Bank (JDB)	11.026,45	6,53 %
Lao Viet Bank (LVB)	9.883,92	5,85 %
Other Bank	40.042,74	43,55 %
Total	168.916,70	100%

(Sources: BCEL annual report and Bank of Lao Statistic)

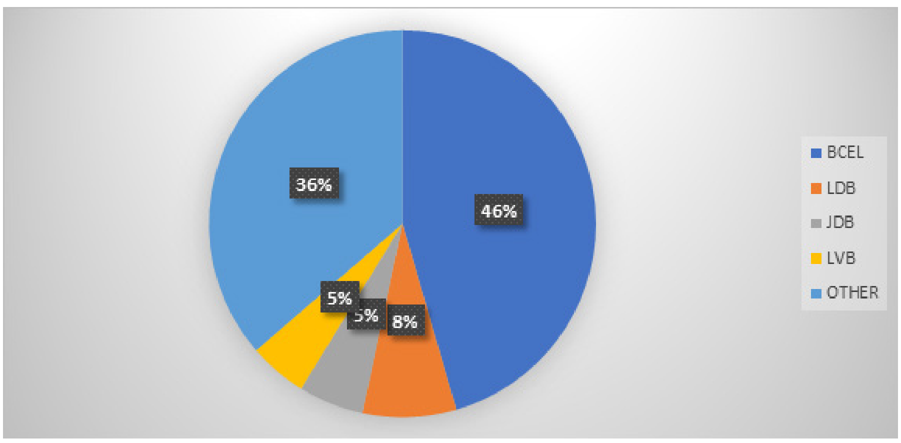

Figure 1: BCEL's capital market share

BCEL is the bank with the largest market share in capital mobilized from residents and economic organizations of the entire banking system in Laos. In 2022, BCEL's market share of fund mobilized from residents and economic organizations is 54,54%, LDB's market share mobilized from residents and economic organizations is 9,37%. JDB's market share of fund mobilized from residents and economic organizations is 6,53%, LVB's market share of fund mobilized from residents and economic organizations is 5,58% and its other bank is 43,55%.

Status of scale and growth rate of loan items

Table 3: Credit expansion

Unit: Billion LAK

Items	2018	2019	2020	2021	2022
Total loans	24.845,27	28.141,03	29.152,52	30.080,97	42.808,80
1. By term	24.845,27	28.141,03	29.152,52	24.845,27	28.141,03
Short term loan	1.825,03	1.581,90	2.541,42	2.714,30	4.560,76
Midium loan	14.431,80	16.311,13	16.009,86	17.234,24	24.929,59
Long term loan	8.588,44	10.248,00	10.601,24	10.132,33	13.318,45
2. By currency	24.845,27	28.141,03	29.152,52	30.080,97	42.808,80
Domestic currency	10.988,47	12.649,12	12.717,79	10.920,25	12.763,47
Foriegn currency	13.856,80	15.491,91	16.434,73	19.160,72	30.045,33

(Souces: BCEL annual report 2018-2022)

As of December 31, 2018, total loans and advances to customers reached 24.845,27 billion LAK, accounted for 64% of total assets on the balance sheet, accounted for 83% of total deposits and 36% of total bank loans in Laos. In which medium and long-term loans accounted for 92% of BCEL's total loans. Although Laos is an importing country, foreign currency lending is essential to import production equipment, industry materails, electrict nd post equipments etc., resulting in a foreign currency loan balance that is larger than a domestic currency loan.

By 2019, outstanding loans reached 28.141,03 billion LAK, an absolute increase of 3.295,76 billion LAK, an increase of 13% compared to 2018. Outstanding loans accounted for 60% of total assets, accounted for 63% total deposits and accounted for 38% of total bank loans in Laos. Medium and long-term loans accounted for 94% (of which medium-term loans accounted for 58%).

By 2020, outstanding loans will reach 29.152,52 billion LAK, an absolute increase of 1.011,49 billion LAK, an increase of 3% compared to 2019 with a low increase in outstanding balance due to the impact of the COVID-19 pandemic. Outstanding loans accounted for 60% of total assets, accounted for 63% of total deposits and 38% of total bank loans in Laos. Outstanding loans accounted for the largest proportion, medium and long-term loans accounted for 91% (of which medium-term loans accounted for 55%).

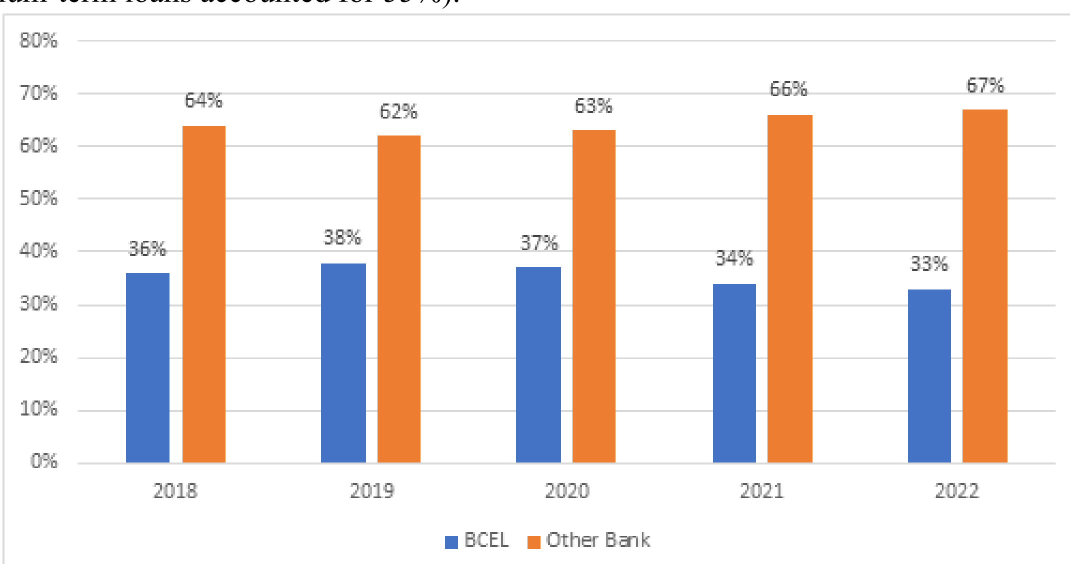

Figure 2: BCEL's credit market share compared to 41 banks

By 2021, outstanding loans will reach 30.080,97 billion LAK, an absolute increase of 928,45 billion LAK, equivalent to 3% compared to 2020; outstanding loan increased slightly due to the impact of the COVID-19 pandemic. From the beginning of 2020 to the beginning of 2022, it greatly affects the production and business development of customers. Outstanding loans accounted for 44% of total assets, 45% of total fund mobilization and 34% of total bank loans in Laos. Of which medium and long-term loans accounted for 91% (of which medium-term loans accounted for 58%).

By 2022, outstanding loans reached 42.808,80 billion LAK, an absolute increase of 12.727,87 billion LAK, equivalent to 42% compared to 2021. Outstanding absolutely increase because COVID-19 have been controled, production and business activities started again. Outstanding loans accounted for 49% of total assets and 46% of total deposits and accounted for 35% of total bank loans in Laos (of which, medium and long-term loans accounted for 89%).

The safetly of BCEL's business activities:

Non perfoming Loan

Item	2018	2019	2020	2021	2022
NPL/Loans overdue	742.874	827.346	862.915	1.158.117	1.652.420
NPL/Total loans	2,99%	2,94%	2,96%	3,85%	3,86%

(*Sources: BCEL annual report 2018 – 2022)*

BCEL's bad debt ratio in recent years has gradually increased over the years since 2018, bad debt was 742,87 billion LAK, equivalent to 2,99% of BCEL's total outstanding loan and accounting for 1,08% of outstanding loan all the bank in Laos. By 2022, bad debt was 1.652,42 billion LAK, equivalent to 3,86%, of BCEL's total outstanding loans, increased 0,87% compared to 2018 and accounting for 1,37% of the outstanding loans of all the bank in Laos . Bad debt increased due to the impact of COVID-19 pandamic, causing the business activities of loan customers to stop, and some customers even went bankrupt.

Profitability of BCEL

BCEL's income, expenses and profits fluctuated unevenly in the past period. 2018 was the year of the highest profit after tax in the period of 2018 -2022, after-tax profit in 2018 reached 353,65 billion LAK and in the following years, business results decreased year by year and fell to the lowest level in the year 2021, the profit is only 35,44 billion LAK due to the impact of the COVID-19 pandemic affecting the production and business activities of businesses in general and BCEL's borrowers in particular face many difficulties in business, making bad debts increase, leading to an increase in provision for credit risks. By 2022, after-tax profit will reach 228,19 billion LAK, an absolute increased of 192,75 billion LAK, equivalent to 544% compared to 2021. In general, BCEL's profit in 2022 seems to be very good, but when we Looking back at the business results in the three funds in 2022, all of them were nagative, but by the end of the year, the profit increased, according to the assessment, it could be due to the debt restructure.

Income

BCEL's net income grew very modestly in 3 years from 2018 -2020 compared to the previous year at 10%, 6%, 5%. By 2021, income reached 1.232,15 billion LAK, respectively (171,48 billion kip) decreased equivalent to -12,22% compared to 2020. By 2022, income will skyrocket to 228,19 billion LAK, an absolute increased of 522,88 billion LAK, equivalent to 42,44% compared to 2021. In 2021, the decrease in income due to the impact of the COVID-19 pandemic makes BCEL's borrowers face many difficulties, leading to customers having to freeze debts, freeze interest, and reduce interest for customers.

BCEL's income accounts for the largest proportion as interest income accounts for an annual proportion of over 70% of total income. 2021 only is the most difficult year for the economy in general and the banking industry in particular. BCEL is also one of the most affected banks in Laos, leading to a decrease in interest income to 61%, specifically, the proportion of net income over the years 2018 - 2022 is 73%, 72%, 77%, 61%, 82%. Next is service income, which has increased unevenly over the years but still ensures over 15% of total income, specifically service income over the years 2018 - 2022 is 19%, 16%, 15% , 22%, 17%. While payment and cash service fees are increasing with a proportion of over 50% of total service fee income, fee collection from guarantee services is decreasing with the proportion of 14% in 2018 to more than 5% annually 2021. This shows that BCEL's underwriting activities have not been focused on guarantee service. Foriegn currencies exchange, there is a tendency to gradually decrease even by 2022, the income from this activity is negative -38,15 billion LK.

Expenses

BCEL's total expenses increased steadily over the years from 2018 to 2022, specifically 2018 reached 1.808,53 billion LAK. By 2019 the cost increased by 280,27 billion LAK, equivalent to 15% compared to 2018. In 2020 expenses increased by 319,08 billion LAK, equivalent to 15% compared to 2019. By 2021, operating expenses will continue to increased 344,19 billion LAK with an equivalent increase of 14 % compared to 2020. The increase in total expenses is due to an increase in interest expenses and a very rapid increase in provisioning costs for credit risks because these two costs account for the largest proportion of total expenses that the proportion of interest expense over the years 2018-2022 is 55%, 57%, 55%, 54%, 52%, this expense has an annual increase of 12%, 19%,13%, 10%, 24%. Interest expense increased because fund mobilization has increased over the years despite the COVID-19 pandemic, but BCEL's fund mobilization continues to increase very high because people and businesses reduce investment in production and business during the year. The two-year period by disease control makes the production and business process very limited in both production, transportation and export and import.

The second is the cost of provisioning for credit risks, accounting for 12%, 15%, 20%, 23%, 25% of the cost of provisioning for credit risks, which increased steadily and had a very repidly growth rate compared with other types of expenses, specifically, the cost of provisioning for credit risks increased in turn from 2018 to 2022, by the year increased of 19 billion LAK, 93 billion LAK, and 159 billion LAK, 174 billion LAK, 263 billion LAK and equivalent increase over the years 9%, 42%, 50%, 37%, 40% of these expenses increased due to high increase in bad debts such as newly arising bad debts, bad debts converted into higher-risk debt.

In third is the staff salary cost in the period 2018-2022 with a decrease, employee salary expenditure in 2019 was 300,62 billion LAK, decrease 31,16 billion LAK, equivalent to 9% compared to 2018. But by 2020 this cost increased by 324,02 billion LAK, an absolute increased of 23,4 billion LAK, equivalent to an increase of 8% compared to 2019. By 2021, this cost will decrease by -18,21 billion LAK equivalent to decrease of -5% compared to 2020 and by 2022 this cost is increase 7% compared to 2021. Employee salary costs accounting for total costs over the years, 18%, 14%, 13 %,11%, and 9%.

Other expenses including administration costs, service fees and depreciation accounted for 14%, 13%, 13%, 11%, 13% of BCEL's total cost over the years.

Profit

Profit after tax has a negative growth fluctuation in 2018, 2019, 2020 and 2021 as follows: In 2019 decreased by -7% compared to 2018, but by 2020 and 2021, the profit strongly negative -26% compared to 2019 and -85% compared to 2020 due to the COVID-19 pandemic affects the production and business activities of banks in general and BCEL in particular.

Profit after tax on total assets (ROA) and profit after tax on equity (ROE) each year respectively: ROA in 2018 reached 0,99% and in 2019 reached 0,71% compared to In 2018, return on assets strongly decreased for the next two years, in 2021 reaching only 0,05%, but in 2022 this indicator increase again to reach 0,24% compared to the previous year. 2021 and ROE decrease gradually over the years from 2018 to 2021 respectively as follows: 18%,11%, 2% but this indicator increases again in 2022 to reached 10% compared to 2021. In these years, BCEL's risk provision increased dramatically, affecting ROA and ROE. In contrast, 2022 marks an increase in profit after tax. In general, the growth rate of profit after tax on assets and profit after tax on equity, although increased, was still lower than the average growth rate of the whole industry in the period 2018-2022 over the years (ROA: 0,80% ; 1,74% ; 0.62% ; 0,65% ; 1,35% and ROE: 10,89% ; 25,02% ; 11,96% ; 11,65% ; 15,84).

Capital adequacy

BCEL's equity ratio (CAR) decreased over the years during the research period from 2018 to 2022, the CAR over each year was 10%, 10, 8%, 7% and 6,29%. It can be said that BCEL's CAR decreases year by year, especially in 2021 and 2022, this criteria is lower than the minimum level prescribed by the bank of Lao. However, Laos commercial bank have a very clear division in terms of CAR as larger banks usually have a lower ratio than smaller banks. And indeed in the case of BCEL- which is the only equitized and largest-scale bank in Laos, the equity ratio fluctuates around the minimum, the highest level achieved by the bank is 10,64% in 2018. It shows that, with a high proportion of capital in the market, BCEL needs to actively increase its CAR to be able to avoid all kinds of risks in operations, such as credit risk, operational risk and market risk.

Criteria for assessing social sustainability

Employee benefits

Employee treatment policies include compensation policies, good employee benefits, training activities to improve the quality of human resources, provide career development opportunities for workers, and promote gender equality, creating fairness, paying attention to the lives and well-being of workers, human rights issues such as labor-related activities, etc.

Socail responsibility

BCEL takes part in social support in various aspects including donation application called "BCEL OneHeart" which is among key projects in promoting and further continue BCEL's Corporate Socail Responsibility or CSR which is a product that optimize the bank's advantages of technology and innovation in social support by acting as an intermediary channel that facilitate the donors and targeted recipients in fund mobilization. Moreover, the application is easy, convenient, quick, and transparent tool that can check donation information that entrusting both donors and targeted recipients. With this application, several sectors can easily participate more in improving the living conditions, life quality as well as the better society.

As of 2022, BCEL OneHeart comprises 82 projects amounted over 6.650 million LAK and BCEL has contributed to the society through various forms of support including medical equipment for hospital during COVID-19 pandemic, helping the underprivileged people and funding the schools construction in rural areas, other supports strataled 78 projects amounted over 0,60 million LAK.

Criteria of for assessing environmentally sustainable banks

BCEL adopts sustainable development as a model for bank's practice through providing opportunities to employee attending seminar titled "Dialogue on Responsible Business Practice in Lao PDR" to perceive the sustainable economic growth as well as human rights and environment protection. Furthermore, the employees are frequently assigned to attend other seminars related to environment management.

BCEL takes part in environment protection by utilizing digitalization including applying advanced technology in banking service and at work in order to reduce paper usage.

Educate employees in strictly emphasizing environment protection by issueing a saving policy covering mainly the energy saving as well as putting stickers about reducing environmental impact of materials on water closet walls and other places, notice on energy saving awareness and recycling.

Participates in several activities for cleaning up as well as planting on special occations.

Liquidity criteria

The liquidity of commercial banks is evaluated based on two criteria: the efficiency of fund mobilized and the ratio of highly liquid assets.

The loan/deposit ratio (LTDR) of commercial banks according to international practices is usually from 80% to 100%. Currently, Lao commercial banks have two ways to calculate the loan-to-deposit ratio, that is: according to the calculation method of the world when the total deposit includes only customer deposits (LTDR); The second calculation method is according to the decision No. 296/BOL of the State Bank of Laos when the total deposits in addition to customers' deposits also include deposits of credit institutions and the issuance of valuable papers (LTDR1). If applied according to the first calculation method, the LTDR ratio of BCEL in the research years is relatively low, from 2018 to 2022. Thus, the bank's ability to raise capital is developing very well in the first market.

Loan to total assets (LAR) shows how much money the bank will use with 100 LAK of assets to lend directly to customers. Typically, this percentage will range between 70% and 80%. Accordingly, BCEL's LAR in the research years from 2018-2022 almost always has this rate below 70%. This shows that BCEL has not improved the efficiency of using its own assets in the supply of capital in the market, and when compared with the results obtained by BCEL over the years, it shows the efficiency of capital use of the company. BCEL is relatively low.

Achievements:

BCEL is the largest commercial bank in Laos in terms of total assets by the end of 2022, reaching 94.493,01 billion LAK, accounting for 1/3 of the total assets of the whole banking system (272.330,54 billion LAK) in Laos. With its efforts, BCEL has gradually increased its credit rating with competitors in the economy, thereby attracting more customers. BCEL is the first bank, a pioneer in Laos in innovation in applying modern science and technology in the operation process and offering diversified and modern products and services to meet the needs of customers. BCEL is the only bank that implements Basel II, which regulates criteria according to international regulations and has built a regulatory risk management model. In addition, BCEL's staff is professionally trained both domestically and abroad, capable of absorbing new knowledge and applying modern technology well.

Limitations and Reasons

Limitations:

Although, BCEL is a large bank in Laos, but its relatively low equity (2.357,96 billion LAK) accounted for 0,87% of total capital (total assets 94.493,01 billion LAK) very business activities has a reputation and has more advanced technology than other banks, but too low equity can affect the bank's operational safety. And BCEL's asset size increased dramatically, but when assessing income and profit, it was found that the results achieved were not commensurate with the growth rate of assets. Regarding service activities, a variety of credit products and services have not been built and developed to limit risks and not focus too much on large customers.

Reasons

The period 2018-2022 is the period when the world economy is facing a global financial crisis due to the trade war between the US and China and the impact of the COVID-19 pandemic on the global economy growth slows down. Laos's economy is especially difficult when inflation reaches a very high level of 49% from the end of 2021 to the beginning of 2022, negatively affecting the operations of businesses - the main customers of commercial banks.

Laos's capital market is still weak, making it difficult for BCEL in particular and the banking system in general to increase equity capital. Besides the capital market, Laos's bad debt trading market has not yet been formed, from now on, handling collateral assets to recover bad debts becomes more difficult for BCEL.

People's consumption and spending habits. In Laos, there are many people who have mobile phones but do not have accounts opened at banks. The reason may be due to geographical conditions that prevent them from accessing the bank's services and products. Another reason is that these people have the habit of using cash transactions and payments;

The number of BCEL employees is continuously increasing but unevenly across branches and transaction offices. There is also a gap in the quality of staff between branches. Although some branches and transaction offices have a large number of counters, the structure between transactions is different

BCEL's equity capital accounts for too small a proportion of the bank's total assets (less than 5% in the years studied). The equity/total assets (ETA) ratio also tends to decrease over the research period, showing ineffectiveness in increasing BCEL's equity capital.

Solutions:

Measures to increase the size of equity

BCEL's equity to total capital is relatively low, to ensure operational safety, the bank can increase equity by: (1) issuing more shares to existing shareholders or shareholders strategic investment at home and abroad, but this measure is only implemented when the bank operates effectively. (2) stock dividend will help the bank increase its own capital from retained earnings, but this measure is often contrary to the wishes of some shareholders. (3) issuance of bonds and certificates of deposit

Measures to improve the quality of lending activities

BCEL has two main customer groups: economic organizations; and groups of individual and other customers. Thus, banks need to have separate measures for each of their customer groups in providing banking services and products.

First, for the group of customers of economic organizations: (1) divide them by type, field, industry, and profession, (2) by type of enterprise with state-owned enterprises and limited companies, joint stock company, foreign-invested enterprise, (3) By industry, there are agriculture, forestry and fishery, manufacturing and processing industry, build, Consumer loans……

Measures to improve the quality of investment activities

The first is to complete and standardize documents regulating investment activities of the bank, taking that as the basis for implementing investment processes and procedures. Risk regulations in investment activities should also be specified in these documents. Along with that, diversifying investment channels will help BCEL both reduce risks in investment, increase profits in investment activities, and increase liquidity.

Measures to improve risk management capacity

First, BCEL needs to perfect the system of general credit risk management documents for its entire banking system, from the head office to branches and transaction offices. Procedures and processes in credit risk management need to be completed and specifically guided, from regulations on credit products and corresponding interest rates for each customer group, to the lending process, how to decentralize approval authority; the roles and responsibilities of the relevant actors should also be specified in detail; and finally the regulation of the bank's internal rating system.

Measures to improve service quality

For payment services: First of all, BCEL needs to offer a variety of payment products and services to help people improve their cashless habits. The bank needs to upgrade its core banking system in the process of diversifying its services and products to make the payment and transaction process faster and safer. As mentioned in the previous solution, BCEL also needs to actively cooperate with Fintechs to provide more services and products for customers and the economy. In addition, the developed economy has appeared a lot of foreign transactions. To support its customers in cross-border transactions and payments, BCEL needs to expand its network of operations to countries, can open foreign currency accounts at banks of countries, or can open its own branch.

For foreign currency trading services: BCEL needs to have an appropriate pricing policy in spot foreign currency trading or foreign currency derivatives. Buying and selling in large quantities at a competitive price will sometimes bring unimaginable profits to the bank.

Solutions to improve the quality of human resources:

Although currently, high technology is used, human resources also play an equally important role as an important factor determining the existence of the bank. Thus, it is necessary to train and improve the number of human resources such as standardizing job titles and improving skills in using modern technology.

CONCLUSION

The paper assessed the sustainability development of BCEL, in particular, assessments of customer marketing capabilities, market share about fund mobilization, outstanding loans, profitability and paymentability.

The results of the study show that BCEL is interested in and committed to sustainable development, but there are many obstacles in the implementation process, including obstacles that need to be resolved quickly. Only with these barriers can the successful implementation of a safe, effective and sustainable development strategy for the commercial banking system, such as the completion of a legal framework for sustainable development, improve quality human resources and capacity building, and improvement of environmental and social risk management systems.

Based on the results of the situation analysis as well as the assessment of the sustainable development of BCEL, the paper proposes solutions for the sustainable development of BCEL in line with the trend of international integration. Firstly, commercial banks need to improve consistently and soundly, including raising capital adequacy to protect shareholders, investors and customers, and improving the quality of their assets and improving operational efficiency.

The article deeply evaluates the current state of BCEL's operations in the period 2018-2022. Using statistical methods, comparisons, analysis and evaluation, the article highlights achievements, while pointing out basic weaknesses and limitations of BCEL for sustainable development.

Based on the above causes and problems, the article has built groups of solutions for sustainable development of BCEL. That is a system of solutions: Solutions to improve the quality of human resources, increase risk management capacity, modernize information technology to develop digital banking, diversify products and services, and solution groups. exploiting capital sources, market and customer solution groups

With the above basic content, the article has completed the proposed research goal. The research on this topic is important in both helping BCEL systematically approach development theory and proposing specific solutions for BCEL for sustainable development.

Although the topic of research is not new, sustainable development is mentioned many times in industries and fields, but there are no standards for sustainable development for the commercial banking system in Laos, so the article does not avoid from certain shortcomings. The author hopes to receive comments from teachers, economists, readers and colleagues to improve the article.

STRENGTHENING THE MANAGEMENT OF BALANCING THE STATE BUDGET TO CONTRIBUTE TO CURBING INFLATION IN VIETNAM IN THE COMING TIME

PhD. Nguyen Thi Kim Lien[1]

Abstract: *The State budget plays a very important role in all soci-economic, security, defense and foreign affairs activities of Vietnam, which is a tool for the State to exercise macro control and macro balance of the economy, because the State Budget is the State's largest centralized monetary fund. Through the State Budget, financial sources focused on the State in the form of tax collection, fees, charges... will be used by the State to carry out its functions and tasks. In particular, when the inflation rate has positive and negative impacts on the economy and society, strengthening the management of balancing the state budget closely associated with curbing inflation is an urgent requirement. Vietnam has proactively implemented many solutions to manage the State budget reasonably and effectively, contributing to curbing inflation and promoting the country's economic growth and development. However, the implementation process is also facing some challenges and risks. The article offers a number of recommendations to improve management of the State budget balancing in order to contribute to stimulating growth, curbing inflation, and achieving equality and social progress.*

Keywords: the State budget balancing, management of the State budget balancing, inflation.

1. INTRODUCTION

The State budget is an important part of the national development. Managing the State budget appropriately and effectively is a special issue that receives special attention in any country, especially in a context where the global economy is experiencing major fluctuations such as: rising high oil prices, the Russia - Ulraine conflict, the financial crisis in the US..., inflation occurring in many countries around the world. Therefore, the issue of controlling inflation is extremely urgent, requiring financial management measures to ensure the effective implementation of strategic goals on socio-economic development, at the same time, to properly resolve the relationship between economic growth and current inflation control in Vietnam. With the above way of posing the problem, within the scope of this article, the author would like to mention the following contents:

2. RESEARCH OVERVIEW AND RESEARCH METHODS

The study on renovation of the State budget balancing has been mentioned quite a lot in articles and researches, both at home and abroad. The issue of the management of balancing the state budget is an indispensable, if not decisive, content in the process of innovating the state budget management. Martin, Lawrence L., and Kettner (1996) when studying the evolution of theories of state budget over time, such as: from itemized budgeting to task-based budgeting, program-based budgeting, to output-based budgeting compared and showed progress in the above budgeting theories in the study "*Measuring the Performance of Human Service Programs*" - Measurement measure the performance of human service programs, and show the superiority of the results-based budgeting approach. The implementation of the output budgeting approach answers the question that public finance managers always have to ask: "*how should I decide how to allocate X dollars to activity A instead of to activity B*" [3]

[1] Email: kimlien788@gmail.com, Hanoi University of Mining and Geology.

In the Textbook "Public Economics", J. Stiglitz (1995), Public Economics, Science and Technology Publishing House, believes that the State should spend its budget to provide public goods and support the health, education, national defense, implementation of some social security policies..., but it is necessary to choose reasonable solutions based on the historical circumstances, because the goals of efficiency, fairness and stability that the State pursues may conflict with each other [4].

The article "*Fiscal Austerity and Public Investment*" - *tightening finance and public investment* (2011) by Wolfgang Streeck and Daniel Mertens, surveyed the public investment practices of three countries: the U.S., Germany and Sweden from 1981 to 2007 and concluded that these three countries tended to increase investment in education, research and development, support for families, and labor market policies. In this study, the authors also pointed out the relationship between public investment and investment in social policies, in limited financial conditions, how public investment should be made to achieve high efficiency, limit public debt and State budget deficit [2].

In Vietnam, recently, before the requirements of supplementing and amending the State Budget Law, there have been many research works on the state budget in each aspect of revenue, expenditure, and decentralization of the state budget... in the form of scientific works at ministerial and academy levels, theses and scientific articles published in specialized journals. However, separate research on the impact of state budget management on inflation has not received much attention from research and management agencies; sporadically, some authors have paid attention to research on the budget cycle. State budget follows the approach of researching each process area such as the process of preparing, executing and paying, finalizing the state budget, auditing the state budget with inflation in the form of scientific articles published in specialized journals or posted on websites, specifically:

The author Cao Ngoc Xuyen, Deputy Chairman of the Finance and Budget Committee, National Assembly Standing Committee (2011) in the Article *"Improving the process of budget decision by the National Assembly"*, said that the National Assembly Standing Committee has promulgated the Regulations on making, verifying and submitting to the National Assembly for making the decisions on the state budget estimates, central state budget allocation plans and approving the state budget settlements, which prescribed the order, deadlines, responsibilities, forms for making and sending the state budget estimates and finalization reports [7].

The Article: *"The relation between the preparation and implementation of the state budget and inflation"* (2011) is implemented by Dr. Vu Si Cuong, who is the member of the policy advisory group, the Ministry of Finance and posted on www.sbgov.vn/wcm/conect/ [1]. In this article, Dr. Vu Si Cuong has a preliminary assessment of the state budget estimation and implementation in association with the current inflation situation in Vietnam. Maybe due to the framework of an article, the author does not have the conditions to analyze the advantages and disadvantages of the current state budget process in Vietnam.

The above topics and research projects have built scientific bases and drawn practical experience on some basic contents of state budget management, especially the scientific basis of process establishment. State budget management, state budget allocation, improving the efficiency of state budget management, as well as providing diverse solutions to improve the efficiency of state budget management at the national level. .. However, there has not been a long-term research project in the form of a separate scientific topic on the impact of state budget management on inflation from a theoretical perspective as well as assessing the current situation. From the current status of research on inflation, it shows that implementing research on balanced state budget management to contribute to curbing inflation is extremely necessary to contribute to *stimulating growth, stablizing economics, and implementing the equality and social progress.*

In order to achieve the above goal, this study uses mainly qualitative research methods to analyze and synthesize theories and previous studies on state budget, state budget management, and conclusions, combining the research on theoretical issues with assessment of the actual situation of inflation in order to clarify the effects of state budget management on inflation in Vietnam, and on that basis form a scientific basis for proposing come up with solutions to strengthen balanced management of the state budget, contributing to curbing inflation in Vietnam in the coming time.

Some general issues about management of the State budget balancing

The State budget balancing

Viewed from the perspective of its nature, the State budget balancing is the balance between the revenue sources that the State mobilizes and focuses on the State budget in a year and the distribution and use of that revenue source to satisfy the needs of the State spending in that year.

– From an overall perspective, the State budget balancing reflects the relationship between revenue and expenditure in a fiscal year. It is not only the correlation between total revenue and total expenditure but also shows the reasonable allocation between the structure of revenues and the structure of expenditures of the State budget.

– In terms of the State management decentralization, the State budget balancing is the balance of revenue allocation and transfer between budget levels, between central and local levels and between localities to carry out the assigned tasks and functions. From the above, we can simply understand that the State budget balancing is an important part of fiscal policy, reflecting the adjustment of the interactive relationship between State budget revenues and expenditures to achieve the socio-economic goals that the State has proposed in each specific field and area.

The role of the State budget balancing

The State budget balancing is an important tool for the State to intervene in the national socio-economic activities. With that decisive role, the State budget balancing in the market economy has the following roles:

– Firstly, the State budget balancing contributes to the macroeconomic stability. The state implements the State budget balancing through tax policy, annual spending policy and determines the specific level of overspending, which has many impacts on economic activities as well as the international trade balance. Thereby, it contributes to stabilizing the implementation of macroeconomic policy goals such as: growth of average income in the economy, reduction of unemployment rate, inflation which is maintained at a stable level and can be estimated.

– Secondly, the State budget balancing contributes to the effective allocation and use of financial resources. To ensure this role, right from the time of preparing the state estimate, the State has chosen to present the reasonable priorities in the State budget allocation and the close connection between socio-economic development strategies and budget planning.

– Thirdly, the State budget balancing contributes to ensuring social equity and minimizing inequality between localities. In Vietnam, each region has a different socio-economic condition and there are regions with very difficult socio-economic conditions that affect people's income and quality of life, and there are regions with very favorable and developed socio-economic conditions for the people's income and lives. The State can mobilize resources from high-income people and economically developed regions.

The State budget balancing in Vietnam

During the process of transforming Vietnam's economy under the market mechanism with the State management following the Socialist orientations, the operations of the State budget in general and the State budget balancing in particular have undergone gradual changes in quality.

Revenues from taxes, fees, charges and other revenues as prescribed by law are fully summarized and the State budget balancing, in principle, is not tied to specific spending tasks. The promulgation of budget collection policies must ensure the principle of budget balance in the medium and long term and implement commitments on international integration. The State budget is balanced on the principle that total revenue from taxes, fees, and charges must be greater than total regular expenditures and contribute to increasing accumulation for development investment spending; In case there is still overspending, the overspending amount must be smaller than the amount spent on development investment, aiming to balance budget revenues and expenditures; In special cases, the Government submits them to the National Assembly for consideration and decision. In case of budget surplus, it will be used to pay principal and interest on State budget loans

Loans to offset State budget deficits can only be used for development investment, not for regular expenditure.

3. RESEARCH RESULTS

During the period 2016 - 2020, the economy was strictly regulated so the inflation rate was always stable at 4%. The year 2020 is the time when the Covid - 19 pandemic had complicated changes, strongly affecting the growth of different fields and industries.

In 2021, despite being affected by the Russia - Ulraine conflict and global supply chain bottlenecks during the Covid-19 pandemic, Vietnam's inflation was still well-controlled with an inflation rate of 1.84%. Currently, Vietnam is among the few countries with an average inflation rate of 4-6%.

Entering the year 2022, Vietnam's inflation will increase by 3.15% compared to the average rate in 2021, ensuring the inflation control target set by the National Assembly, but still higher than the 5-year average inflation rate for the period 2017 - 2021 (2.98%). Among them, some product groups had very high increases compared to the 5-year average increase such as transportation, beverages, household appliances, culture and entertainment; Some product groups had strong deceases, mainly product groups under the State management such as healthcare and education [6]

In 2022, although inflation was still under control, it was higher than the 5-year average inflation rate for the period 2017 – 2021; this caused a number of positive and negative effects on the economy and society, specifically:

Regarding positive effects: When commodity prices increase, typically gasoline prices increase, the revenue for the State budget is supplemented through increased revenues from oil, revenue from import and export taxes... .The revenue from crude oil will reach 77 trillion VND in 2022, an increase of 72.5% compared to 2021, mainly due to higher oil prices compared to estimates (on average reaching about 105 USD/barrel, an increase of 45 USD/barrel compared to estimates); Besides, import and export activities increased sharply, along with rising commodity prices, so the balanced revenue from import and export activities also increased, estimated at 280 trillion VND, an increase of 29.7% compared to 2021.

Regarding negative effects: Inflation has impacts on the economy such as:

(i) Reduction in State budget revenue: Oil prices and prices of raw materials and fuel inputs for production increased, causing impacts on domestic production and business activities. Commodity prices increased sharply while income had not yet been adjusted, causing income to fall. Consumers' real income decreases, reducing the purchasing power of the economy, causing a significant impact on economic growth and State budget revenue.

(ii) Effects on public debt: When commodity prices, interest rates and inflation increase, it becomes difficult to mobilize government bonds and increases public debt mobilization interest rates due to increased interest expenses of the State budget. In the long term, if prices and inflation increase, it can worsen the difficult situation of the global and domestic economies, causing macroeconomic instability and affecting major balances of the economy…., including State budget revenues and expenditures and ensuring public debt sustainability...

(iii) Impact on the reallocation of State budget expenditures for socio-economic development tasks: The National Assembly passed the Resolution No.43/2022/QH15 in 2022 on fiscal and monetary policies to support the socio-economic recovery and development program, including adjusting and reducing value added tax (VAT), reducing environmental protection taxes; extending, exempting, reducing taxes, fees, charges and rent of the land... to limit the negative effects of rising commodity prices and contribute to controlling inflation . The Government has made cost savings, cut some unnecessary expenses, and has not implemented some expenses such as adjusting the base salary increase to be able to mobilize resources to implement the Socio-economic Recovery and Development Program with the goal of giving priority to solving economic difficulties.

In 2022, rising commodity prices also had impacts on the implementation of development investment spending and implementation of public investment projects. The sharp increase in raw material prices and costs reduced the profits of contractors and many investment projects had to recalculate options, waiting for the stabilized prices.... leading to a situation where many projects could not be implemented or were delayed.

(iiii) The State's price administration and management is affected: Price management is always in a proactive state, closely monitoring and ready to respond to any arising situations, especially for many important items under State management such as textbook prices, prices of agricultural product supplies, energy... Besides, the management of gasoline prices must closely follow market price developments, to make appropriate adjustments. In 2022, the joint ministries of Finance - Industry and Trade issued 34 price adjustment documents, of which the price of A95 gasoline decreased by 2,590 VND/liter; E5 gasoline price increased by 2,580 VND/liter and diesel price increased by 4,030 VND/liter.... [10].

The cause of inflation in Vietnam in recent times can be attributed to the following main reasons:

- Inflation due to a sudden increase in consumer demand causes prices to increase.

- Inflation can also occur when the prices of production factors such as salaries, indirect taxes and raw material prices increase.

- Inflation occurs due to imports: Prices of imported goods often increase due to increased tax costs or increases in the world market, from which the selling price of goods will increase.

- Inflation occurs due to changes in demand: The relationship between demand and supply changes, leading to a situation where suppliers have a monopoly on providing a certain type of goods with unstable price policies and continuous price increases.

- Inflation is due to State budget management not being close to the actual situation in recent times. In the management and administration of the State budget, the impact of inflation has not yet been fully evaluated, so public investment is still too large and ineffective. Regular expenditures are not closely monitored, so they are still wasteful, and handling of State budget overspending is still not drastic. ....

Thus, among the causes of State budget inflation in recent times in Vietnam, the reason that the State budget management is not close to the inflation situation is one of the important causes. Therefore, in order to contribute to curbing inflation, in addition to the measures to curb inflation that the Government and other ministries are implementing, the issue of strengthening the management of the State budget balancing is extremely urgent and very important..

4. RECOMMENDATIONS

To contribute to curbing the current inflation in Vietnam in the coming period, a number of financial management measures to the State budget balancing should be implemented, including:

Firstly, it is necessary to implement drastic State budget revenue management solutions such as promoting administrative procedure reform, applying information technology, modernizing tax and customs management, State Treasury..., striving to complete the assigned revenue estimates at the highest level on the basis of continuing to perfect institutions and legal policies on State budget revenue, strengthening State budget revenue management Water ensures the principle of correct and sufficient collection. Focus on restructuring and improving the operational efficiency of state-owned enterprises, focusing on state-owned corporations and corporations; Accelerate the progress of equitization and divestment of state capital in enterprises, ensuring State budget revenue estimates. Besides, it is necessary to step up the fight against loss of revenue, transfer pricing, trade fraud, and tax evasion; Urging the collection of outstanding tax debts and reducing the rate of outstanding debts.

Secondly, State budget expenditures should be managed strictly, economically and effectively within the budget decided by the National Assembly, implementing the cuts in spending tasks that are not really necessary, slow in implementation, reducing the regular spending, increasing the development investment spending, with the priority given to investment spending to develop important socio-economic infrastructure projects.

Thirdly, it is necessary to ensure the budget balance at all levels; to strictly control overspending, public debt, contingent debt obligations of the State budget, local government debt, to ensure national financial safety, to improve the efficiency of loan use... aiming to reduce State budget deficit compared to estimates and reports to the National Assembly.

Fourth, it is necessary to strengthen inspection, examination, supervision, and improve financial and budgetary discipline in the performance of public duties to ensure openness and transparency in the management of State budget revenues and expenditures. water, public assets, land, resources... It is necessary to complete the legal corridor and inspection and supervision mechanism to ensure the stable and safe operation of the financial market and financial services; Strictly handle violations and promote fair competition among economic sectors.

Fifth, it is necessary to increase the application of information technology and strong digital transformation with the goal of moving towards digital finance towards an open, transparent and sustainable finance. It is necessary to build an integrated, public, transparent, and effective tax management information system that serves people and businesses well, ensuring synchronization in the direction of e-Government and digital transformation; Building integrated platforms and big data platforms to provide information for executive direction and information connection between tax authorities and state management agencies; Applying technology of the 4.0 Industrial Revolution to automate a number of tax management business processes and analyze big data to serve policy planning, revenue forecasting, and propaganda to support payers tax, risk management, compliance management and tax inspection, examination, investigation...; Developing information technology technical infrastructure, advanced, modern, synchronous equipment, ensuring smooth continuous, effective operations, information security and data security. The agencies such as: State Treasury, Taxation Departments, and Customs Departments can change the current service method from pre-audit to post-audit - risk management, reducing time and trouble for businesses and reducing costs for businesses, bringing benefits to society.

5. CONCLUSIONS

In a modern market economy, the State budget plays a particularly important role not only as a financial resource to meet the needs of operating the State's management apparatus, but also in influencing production, consumption and macroeconomic stability. Therefore, the State budget management is increasingly respected, contributing to socio-economic efficiency. However, this is a complicated process, requiring meticulous and thoughtful research and efforts not only from financial agencies but also the consensus and determination of all agencies. management agencies and beneficiaries of the State budget so that the State budget truly becomes a macroeconomic management tool of the State, contributing to orienting production development, regulating the market, contributing to stabilizing prices and stabilizing the state. stabilizing life, ensuring social security... contributing to curbing inflation, promoting growth and economic development of Vietnam./.

PRIVATE ECONOMY - AN IMPORTANT DRIVING FORCE OF VIETNAM'S ECONOMY

PhD. Vu Thi Thanh Tinh[1], MA. Vu Thi Thuy Hang[2]

Abstract: *Private economic development is an issue of profound theoretical and practical significance for our country. From the mindset of abolishing the private economy, our Party now affirms that the private economy is an important driving force of the economy. The practical movements of economic sectors during the transition period to socialism have proven that private economic development brings breakthrough achievements to the country's economic development, contributing to ensuring security. social welfare, improving the quality of life for the people. The article focuses on clarifying the Party's perception of the role of the private economy, pointing out the contributions of the private economic sector in 35 years of comprehensive reform of the country, thereby proposing a number of solutions. solutions to continue developing this economic sector in the coming time.*

Keywords: *Private economy, role of the private economy, socialist-oriented market economy.*

RESEARCH RESULTS

1. THE DEVELOPMENT OF THE PARTY'S AWARENESS OF THE ROLE OF THE PRIVATE ECONOMY

The private economy, as an economic sector, has been raised to a new level in the Documents of the 12th Party Congress. That is an important result of the whole process of innovation and developing the Party's awareness of this economic sector.

In Resolution 16 of the VI Politburo (July 15, 1988) and the Resolution of the Central Conference During the 6th Central Committee, Session VI, our Party affirmed: The private economy is developed without restrictions on location, scale, and industries that are not prohibited by law.

The Resolution of the 9th Party Central Committee's 5th Plenum (March 2002) continues to affirm that the private economy is an important component of the national economy. The development of the private economy is a long-term strategic issue in the development of a multi-component socialist-oriented economy, making significant contributions to the successful fulfillment of the central task, which is the development of the economy, industrialization, modernization, and enhancing the country's internal strength in the process of international economic integration.

At the 10th Party Congress (April 2006), the private economy was officially recognized as an economic component based on the integration of two economic elements: individuals and small owners and private capital. It was clearly defined as follows: "The private economy plays an important role and is one of the driving forces of the economy".

The congress has approved a very important decision to allow party members to be a private economy. The role of the private economy continues to be confirmed at the XI Congress (January 2011) with the thesis: "The private economy is one of the drivers of the economy".2

At the 12th Party Congress, a new development in the Party's perception of the private economy was officially recognized. It stated: "Improve mechanisms and policies to encourage and create

---

[2] Academy of finance.

favorable conditions for the strong development of the private economy in most sectors and fields, becoming an important driving force of the economy" 3. This is one of the latest points in the documents of the 12th Party Congress. It reflects the Party's continuous innovation in economic thinking to align with the practical development of the economy.

The 13th Party Congress affirmed that strongly developing the private economic sector in terms of quantity, quality and efficiency "truly becomes an important driving force in economic development"4. This is the Party's major and consistent policy of promoting the private economy to continue to develop; while promoting the role of this economic sector in socio-economic development and strengthening national security and defense in the new situation.

2. THE ROLE OF THE PRIVATE ECONOMY AFTER 35 YEARS OF COMPREHENSIVE REFORM OF THE COUNTRY

2.1. Developing the private economy helps shorten the transition period to socialism

Marxism-Leninism has pointed out that during the transitional period, it is necessary to utilize non-socialist economic components for the purpose of constructing socialism. Regarding the construction of production relations during the transition to socialism, V.I. Lenin affirmed: "One cannot directly transition to socialism; it must be achieved indirectly, not hastily or abruptly, without adequate preparation." V.I. Lenin clearly stated the need to build new production relations through the indirect path of state capitalism: "To transition to communism, it is necessary to go through intermediate stages such as state capitalism."6.

The transitional steps through state capitalism are reflected in the new economic policies, which require temporary and partial concessions to capitalism in order to develop productive forces and gradually socialize production in practice. V.I. Lenin pointed out some forms of state capitalism such as concessions, agencies, leasing enterprises, mining districts, and so on7.

Thus, in both theory and practice of building socialism in Soviet Russia, V.I.Lenin also instructed that during the transition period it is necessary to use non-socialist economic sectors such as capitalism. State capital and private capital for the purpose of developing productive forces. V.I.Lenin considered it the optimal measure to arouse motivation, liberate production capacity, increase labor productivity, thereby solving post-war economic difficulties, and gradually building physical bases for socialism.

For Vietnam, our market economy is defined as an economy with "multiple forms of ownership and multiple economic components." The equal economic components, recognized as important integral parts of the economy, are developed in a long-term, cooperative, and healthy competitive manner, in accordance with the law.

General Secretary Nguyen Phu Trong affirmed: "The transition to socialism is a long, extremely difficult and complicated process... Vietnam moved to socialism from a backward agricultural country, ignoring the capitalist regime, The production force is very low, and after decades of war, the consequences are very severe, hostile forces often seek to sabotage, so it is even more difficult and complicated, and it is necessary to go through a long transition period with many steps and many intertwined forms of socio-economic organization"8.

Reality also shows that the imposition of production relations that are far ahead of the level of the backward production forces has become a drag. The driving force of production is not promoted, production power is not stimulated, which leads to stagnation not only for the productive forces but also distorts the purpose of perfecting production relations. When the private economy still has room to develop during the transition period, rushing to eliminate it is a mistake in both theory and practice. What needs to be done is to create a mechanism for the private economy to develop, or in other words, to stimulate, promote and use it for the purpose of modernizing the productive forces and building the material basis for socialism.

2.2. Contribution of the private economy to the process of socio-economic development and strengthening national security and defense.

During more than 35 years of the reform period, the private economy in our country has gradually developed, truly becoming an important material force in the economy. The development of the private economy contributes to realizing the goals of the transition period to socialism. The Party and State have guidelines and policies to encourage the private economy to develop without limiting scale and quantity. The role of the private economy in building the material and technical basis for socialism is enormous. The private economy has created a strong attraction for resources in the economy, creating a "rebound" in technology levels, vocational training for workers, increasing the ability to absorb capital and technology. Modern technology, promoting increased labor productivity. More importantly, the development of the private economy has contributed to perfecting modern economic and social infrastructure. These are the physical infrastructure that socialism needs.

Under the Party's leadership, the private economy has developed widely throughout the country; making an important contribution to economic development, mobilizing social resources for production and business, creating more jobs, improving people's lives, increasing the state budget, contributing to maintaining political stability, the country's social security.

Private economy in Vietnam has consistently maintained a relatively high growth rate, accounting for around 39-40% of GDP. It attracts approximately 85% of the labor force in the economy and plays a significant role in mobilizing social resources for investment in production and business development, economic growth, economic restructuring, state budget revenue, job creation, improving people's lives, and ensuring social security9. That helps workers and disadvantaged groups in society ensure stable livelihoods, even in the face of risks from natural disasters, epidemics as well as the impact of the Covid-19 pandemic.

We can see that large corporations such as Sun Group, Vingroup, Thaco, Masan, FPT, and others have been successful in various sectors that were previously only undertaken by state-owned enterprises, such as building airports, seaports worth billions of dollars, automobile manufacturing, and the aviation industry. A notable example is Sun Group investing in three major projects: Van Don International Airport, which was built in less than two years and received two awards for "Asia's Leading New Airport 2019" and "World's Leading New Airport"; Ha Long International Passenger Terminal and the Ha Long-Van Don Expressway. Companies like Thaco and VinFast are turning the ambition of "Made in Vietnam" automobiles into reality. Private Economic Groups such as Sun Group and Vingroup have created unique tourism projects, services, and products with international standards, such as Ba Na Hills, the Golden Bridge, Vinpearl resorts; the Danang International Fireworks Festival; and Carnival street festivals in various provinces and cities such as Hanoi, Ha Long (Quang Ninh), Sam Son (Thanh Hoa), and Danang, creating a strong boost for Vietnam's tourism industry.

Alongside the "significant achievements" in the economy, the position of private enterprise is increasingly elevated in political and social life. Currently, legislative documents related to the economy are required by the National Assembly and the Government to seek the opinions of the private business community through the Vietnam Chamber of Commerce and Industry (VCCI) before issuance.

In terms of national defense, the development of the private economy in recent years has directly or indirectly contributed to strengthening the people's heart position, stabilizing the socio-political environment, enhancing the potential political - spiritual strength, economic potential, scientific - technological potential of the all-people national defense. The widespread development of private economy, especially in rural areas, remote and border regions, and islands, has directly contributed to improving the overall national defense posture and gradually meeting the regular and unexpected needs of the armed forces. Individual economic household owners, small business owners, and private enterprises across the country have effectively implemented numerous military support policies, "repaid debts of gratitude" to the families of wounded soldiers, martyrs, and revolutionary contributors, and supported the activities of the people's military and self-defense forces. This demonstrates the significant potential, role, and value of private economy in the construction and defense of the nation. The viewpoint that private economy is "an important driving force of the economy" has been objectively reaffirmed by the 13th National Party Congress as a scientific and popular consensus.

3. SOME SOLUTIONS TO PROMOTE THE ROLE OF THE PRIVATE ECONOMY IN THE COMING TIME

To fully implement the viewpoint of the 13th National Party Congress on the development of private economy and create favorable conditions for its development in the direction of socialism, with greater contributions to socio-economic development and strengthening national security in our country, it is necessary to effectively implement the following fundamental measures:

Firstly, it is necessary to improve the work of ideological understanding and unify the perception of the role of private economy in the construction and defense of the nation. Enhancing awareness and correctly understanding the Party's policy of promoting the development of private economy as a strategic, consistent, and long-term issue in the development of a socialist-oriented market economy. This involves applying the laws of the compatibility of production relations with the level of productive forces in our country correctly. At the same time, there is a need to unify the understanding that recognizing and affirming the contribution of private economy, no matter how important it is to the economic and social development in our country today, is not a basis for "taking private economy as the center" or asserting that private economy plays the role of "the leading force of the national economy". From there, it is necessary to overcome both skepticism and illusions about the development of private economy. Raise the spirit of vigilance and struggle against the plots and tactics that exploit the Party's policy on the development of private economy to incite the privatization of our country's economy, with the aim of diverting the socialist orientation in the country's development.

Second, in the strong integration trend, the State needs to focus on reforming economic institutions in a synchronous manner, including: Compatible economic institutions and compliance with international integration commitments (adjustments, perfect economic law in accordance with integration commitments); defense institutions to protect legitimate interests and minimize unfavorable impacts when implementing integration commitments (anti-monopoly, protection of fair competition, technological and environmental standards, support support vulnerable subjects,etc); Supporting institutions to take advantage of opportunities and benefits of international integration (encourage competition, creativity, technological innovation,etc).

Continuing to improve the legal system, which is the focus on the Law on Defense, the Investment Law, the Law on Enterprises, the Militia Law,… to create a stable legal corridor for business entities operating. In particular, there must be sanctions that specify the obligations and interests of private enterprises for the cause of national defense consolidation; Strengthen the supervision and strict handling of cases of evading obligations to the cause of national defense. Create all opportunities for businesses to exploit and have an equal, public and transparent environment for all businesses. After all, it is also the best implementation of the economic role of the State. Regarding the management function, there also needs to be further innovation. Up to now, world practice has proven that there is no better way to handle the problem of the relationship between the state and the market than by formula: "The market is everywhere, the state is where it is needed". With such a state, it will certainly strongly promote the private economy to become the driving force for the development of our country's economy.

Third, promote support for the development of private enterprises, specifically focusing on effective support for two groups of businesses: startups and small and medium-sized enterprises.

For startup enterprises, it is important to have regulations and supportive policies regarding capital, technology, management, and other favorable conditions. These measures aim to facilitate the administrative establishment of businesses, their entry into competitive markets, and the development and consumption of new products.

For small and medium-sized enterprises, the largest and most dynamic force, with undeniable contributions to the economy and society, but also a vulnerable area, policies are needed. Specific support is clearly defined by law, eliminating all informal burdens, is easily accessible and allows effective exploitation of national resources.

DISCUSSION AND CONCLUSION

The development and contribution of the private economy have proven that the development of the private economy not only does not abandon the goals of socialism but, on the contrary, we utilize it as a necessary instrument during the transitional period to develop productive forces and increase material resources for the goals of socialism. The Party's policies and perspectives on the development of the private economy as an important driving force for the economy are correct and consistent with the laws of developing productive forces during the transitional period towards socialism.

DEVELOPING THE CORPORATE BOND MARKET IN VIETNAM: AN APPROACH FROM THE BOND SUPPLY PERSPECTIVES

PhD. Tran Thi Viet Thach, PhD. La Thi Lam[1]

Abstract: *The corporate bond market (CBM) plays a very important role in the development of the financial market and the economy in each country. The supply of corporate bonds (CBs) is one of key factors contributing to the development of the market. On the basis of clarifying the role of corporate bond supply, the article focuses on evaluating the corporate bond supply of the Vietnamese corporate bond market (VCBM) in the period of 2019-2022, thereby proposing recommendations for developing the supply for the VCBM in the coming years.*

Keywords: *Corporate bond market, Corporate bond market in Vietnam, Bond supply, Corporate bond supply, developing corporate bond supply.*

1. CORPORATE BOND MARKET AND THE SUPPLY OF BOND MARKET.

Corporate Bond Market

A corporate bond is a debt security that a company issues in order to raise capital. The corporate bond market is the marketplace for exchanging corporate bonds. CBM is divided into 2 levels primary markets where new bonds are issued and secondary markets in which existing securities can be traded. The primary markets helps companies mobilize capital for their business operations and the secondary market creates liquidity for CBs. Therefore, operations of the primary market help develop the secondary market and vice versa.

CBM is an important component of national financial markets and plays a vital role in the development of financial markets and the economies, including:

Firstly, the CBM is an important channel for capital mobilization. CBM helps businesses to raise medium and long-term capital, reduce costs and time of capital mobilization and others obstacles which preventing them aproaching bank loans. When CBM operates effectively, it also helps reduce the burden of providing capital for commercial banks. Therefore, CBM contributes to stability and effectiveness of national financial market.

Secondly, CBM helps provide capital resources effectively in the economy. With strict requirements on information disclosure and transparency of CBM, participants are those who evaluate and monitor the issuers. Bonds of the reputable and strong financial companies are more attractive. So, the financial resources in the economy will be allocated to effective usage areas to improve productivity, jobs and added value for the economy.

Thirdly, CBM helps improve financial literacy and accelerate financial inclusion. When investors buy or sell bonds, they have to study and evaluate issuers' financial capacity. On the CBM, moreover, brokers and consultants are always willing to advise or provide useful information for investors. Therefore, investors have opportunities to understand financial instruments and financial markets in particular and improve financial literacy in general, thereby accelerating financial inclusion.

1 Email: Tranvietthach@gmail.com, Academy of Finance.

The supply of Corporate Bond Market

Supply is the quantity of particular goods or services that sellers are willing and able to provide to the marketplace during a given of time. Demand is the quantity of a certain good that consumers are willing and able to purchase at various prices during a given time. In the marketplaces, supply and demand will together determine the price of goods or services. A transaction is established when the price satisfies both the buyer and the seller, matching supply with demand. If demand is higher than supply, the prices increase and the opposite occurs if demand is lower than supply. Along with the demand factor, the rich, diverse and quality supply is very crucial factor that increases the demand, thereby price of goods or services are effective.

On the CBM, bond supply is considered as the quantity of bonds available to the investors. Bond supply plays a fundamental role of the soundness of the market. CBs are financial instruments and quality of CBs depend on financial capacity of CB issuers. Indeed most investors, especially individual investors, their knowlegde is insufficient to understand and evaluate financial capacity of companies. In case the market has good and attractive supply sources, it will attract more investors, push demand of CBs, and the CBM will operates more effectively. On the contrary, the market lacks supply resouces, It operates ineffectively.

2. EVALUATING BOND SUPPLY ON CORPORATE BOND MARKET IN VIETNAM.

CBM in Vietnam (VCBM) was formed in the 1990s and started to develope in the 2000s. Since 2017, with a boom of internal life insurance market, VCBM has recorded a better growth and gradually became an channel for medium and long-term capital mobilization.

Along with development of the VCBM, the corporate bond supply have improved, types and quantity of bonds have significantly increased, specifically as follows:

2.1 The supply for the primary corporate bond market in Vietnamese

The first, the value and number of CB issuances have witnessed a robust increase in 2019-2021 and sudden drop in 2022.

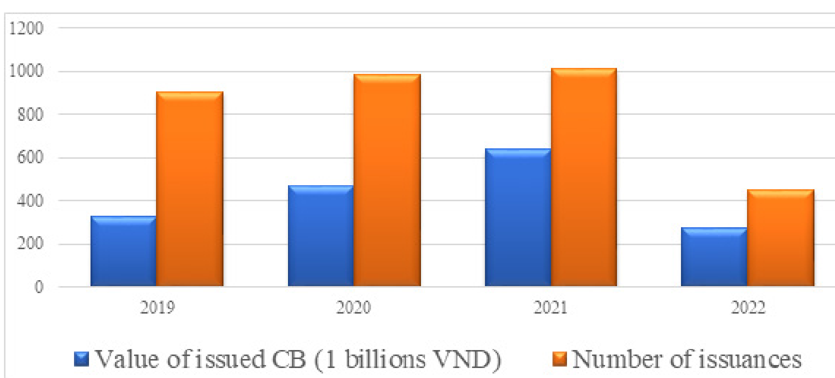

Chart 2.1: Value and number of CB issuances in the period of 2019- 2022

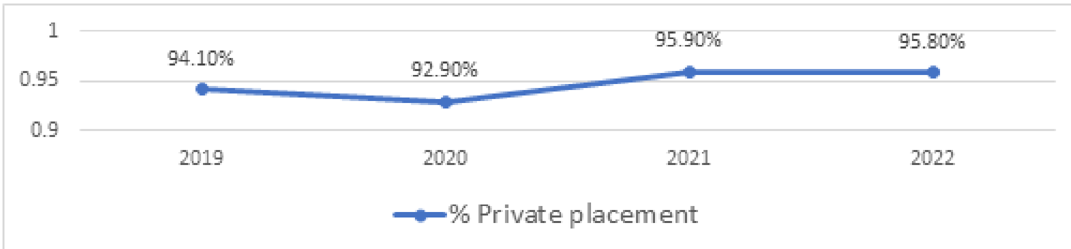
Sources: Report of VCBM 2019-2022

The value of issuances has experienced a staggering growth in the years of 2019-2021, and a deep plummet in 2022. During the years of 2020 and 2021, it has been remarked as a period of explosive growth of the primary market. On the side of the number of issuances, each year in the period 2019-2021, the number of issuances witnessed an upward trend, in 2021, the number of issuances reached a peak at 1012 issuances with the top-hitting value at 637,000 billion VND. In

2022, the issuance scale saw a tremendous decline, only 450 issuances with a marginal value of 270 billion VND.

The second, most of issuances took the form of private placement

Chart 2.2: The percentage of private placement bonds

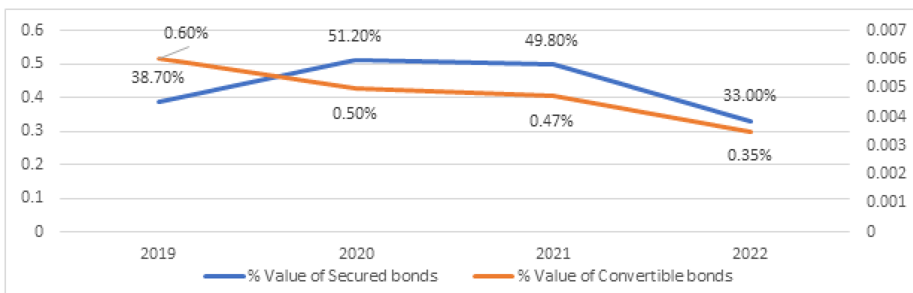


Sources: Report of VCBM 2019-2022

Most of issuers considerably took the private placement form to increase capital in the period 2019-2022 thank to the easier conditions of private offering. The value of private issuances always accounts for over 90% of the total value of issuances in each year. In 2021, 2022, the rate reached over 95%.

The third, bond supply were undiversified and unattractive.

Chart 2.3: Issuances of convertible bonds and secured bonds



Sources: Report of VCBM 2019-2022

In terms of the security, the percentage of secured bonds increased from 38,7% in 2019 to 51,2% in 2020. After 2020, secured bond issuances declined substantially and only reached 33% of total value of issuances in 2022. Besides, a large number of bonds got secured by the issuers' shares which didn't really protect investors.

In terms of the convertibility, non-convertible bonds issuances were recorded to be dominant during 2019-2022, the rate of issuance of convertible bonds are alway less than 1% of total value of issuances.

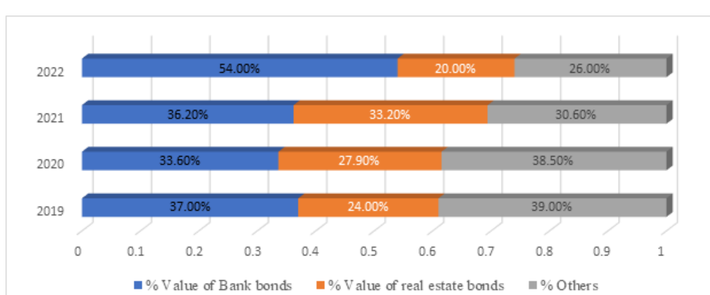


Chart 2.4: Sectoral structure of bond supply

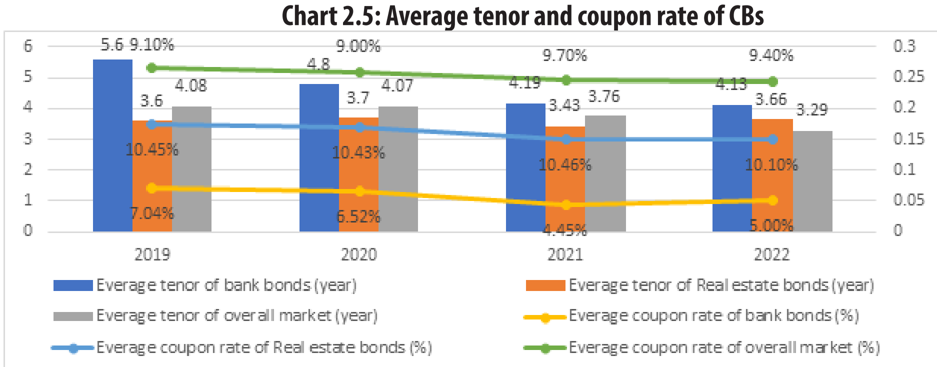
Sources: Report of VCBM 2019-2022

In terms of the issuer, over 60% of the bond value were issued by Banks and real estate companies. In 2022, total insuance value of Bank and real estate sector accounted for 69,4%. Commercial banks made up a significantly higher proportion than that of real estate companies. In 2021, it was considered a boom year for issuing real estate bonds, with 33.2% of the total insuance value. In 2022, the real estate sector showed signs of recession, bond issuances of the sector significantly reduced, accounted for only 20% the total insuance value. Meanwhile, commercial banks steadily remained the biggest issuers.

Chart 2.5: Average tenor and coupon rate of CBs



Sources: Report of VCBM 2019-2022

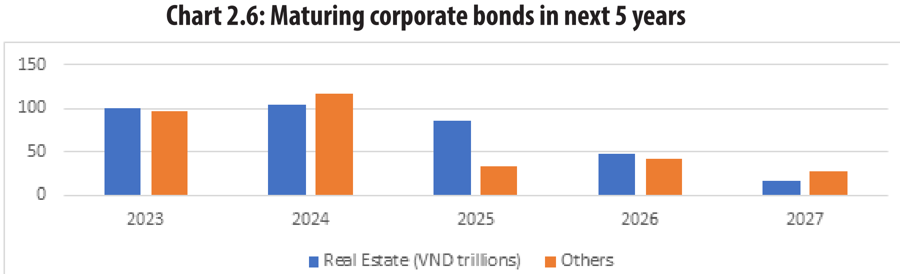
In terms of the tenor and coupon rate, the average tenor of overall market has gradually decreased in the period 2019-2022. In 2019, average tenor was 4,08 years and in 2022 was only 3,29 years. Everage rate of overall market has slightly raised in the period of 2019-2022, the rates went up from 9,1 % to 9.4% per year.

In general, bank bonds had a longer tenor and lower interest rates in comparing with others. Real estate bonds constantly held short terms and highest interest rates in the market.

The fourth, defaulted bonds increased.

According to the report of FiinRatings, there were 54 defaulted issuers at early Jan 2023. As of 17 March 2023, 69 issuers was unable to meet debt obligations with defaulted value of 94,43 VND trillions, representing 8,15% of total outstanding bond value, of which 43 issuers was real estate companies. In fact, the bond supply from real estate businesses have seriously threaten to the quality of supply in VCBM. Infact, about over 80% of real estate corporate bond value belongs to unlisted companies with little information transparency. According to experts' predictions, the real estate companies are going to cope with dificulties and challanges with down sales, scarce capital as Vietnam's real estate market remains quiet in the coming years. Meanwhile, the number of maturing real estate corporate bonds will still be quite big in the coming years.

Chart 2.6: Maturing corporate bonds in next 5 years



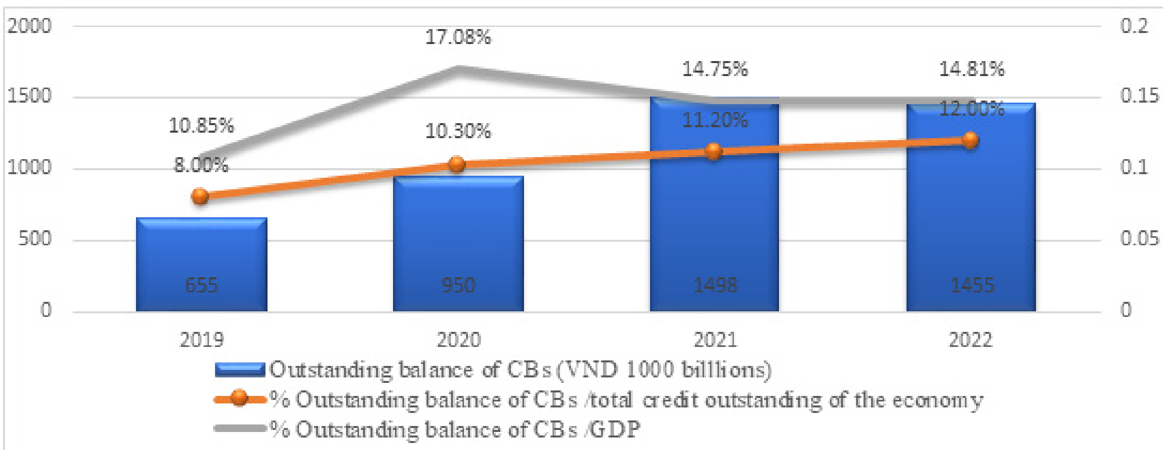
Sources: Report of FiinRating.

2.2. The supply for the secondary corporate bond market

The secondary VCBM divided into 3 channels: Listed bonds in Hochiminh Stock Exchange (HOSE) and Hanoi Stock Exchange (HNX) ; Trading platforms offered by institutions (banks and securities companies); and Direct OTC transactions. From the year 2023, all listed bonds have been traded in HNX according to the plan of reorganising the Vietnam stock exchange market.

The first, the supply of secondary VCBM was small.

Chart 2.7. Outstanding balance of CBs

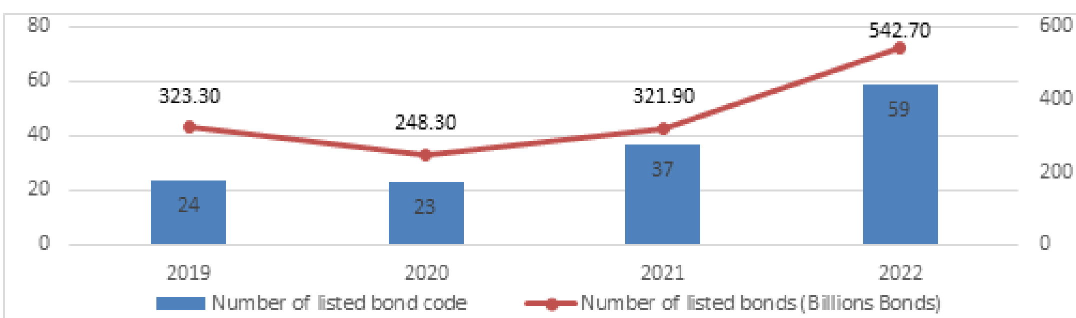


Sources: Report of VCBM 2019-2022

The VCBM size has increased considerably in the period of 2019-2022, achieved at 1.455 VND trillions, equivalent to 14,75% of GDP and accounted for 12% of total credit outstanding. However, in comparison to Southeast Asian countries, the VCBM size still limited at minimal fraction of GDP (in 2022, Malaysia: 54.3% of GDP, Singapore: 34.3% of GDP, Thailand: 25.5% of GDP).

The second, there was a few of listed bonds

Chart 2.8: The listed bonds in VCBM



Sources: Report of VCBM 2019-2022

Listed bond code increased during the years of 2019-2022. In 2019, 24 codes were recorded, of which 22 codes were listed on HOSE and the remaining 2 on HNX. In 2021, 2022 the number of listed codes saw a sharp leap , achieving 37 codes in 2021 and 59 codes in 2022.

The above analysis show that the CB supply in VCBM was considerably small, undiversified and low quality. This is an obvious explanation as well as concrete answer for quiet trading of the market, reducing investors' confidence and hindering market development in recent years.

3. RECOMMENDATIONS FOR DEVELOPING BOND SUPPLY IN THE COMING YEARS.

The first, enhancing the role of commercial banks for developing bond supply.

Bonds of Vietnam commercial banks are high-qualified supply sources. Currently, safety limits setting on commercial banks' operations have been tightened and international standards are applied gradually, especially with the reduction in the ratio of short-term capital for medium and long-term loans, Vietnam commercial banks are under pressures to mobilize medium and long-term capital. Besides, issuing subordinate bonds help bank to increase bank's tier 2 capital for complying the Basel Accord 2. Thus, issuing bonds by commercial bank in Vietnam both improves banks'capital and helps increase a quality supply for VCBM. In the coming time, banks should continue to issue bonds as follows:

- Commercial banks need to re-evaluate the scale, structure of mobilized capital sources and requirements of medium and long-term capital sources in the coming years. Thereby, banks should establish plans for medium and long term capital mobilization which must ensure: (i) The scale and term of capital mobilization must be consistent with the scale and term of loans and invesments in each specific period; (ii) Determining the channels for mobilizing with low costs, exploiting advantages of current customers; (iii) Offering attractive "combo" products based on characteristics of target customers.

- In case of issueing bonds for tier 2 capital: Since the VCBM has not really recovered, banks should choose the bonds with characterictics: (i) term of about 10-15 years; (ii) Floating interest rate based on 12-month term deposits at the bank; (iii) allowing to convert to common stocks or sell back to the issuers after at least 5 years of holding bonds.

- Banks should strengthen services related to CB issuance such as consulting and agents. At the same time, the State Bank needs to strengthen inspection and supervision to ensure that the bank's service provision always comply with regulations.

The second, Improving the efficiency of handling defaulted bonds

Defaulted bonds are considered to be a great and serious concern of investors. Therefore, to strengthen investors' confidence, these bonds are necessarily to be quickly and effectively handled. The issuers must prioritize repayment of matured bonds. Issuers need also to decrease costs and handle assets to strengthen cash flow for debt payments. For the secured bonds, issuers should prioritize selling secured assets and their other assets for repayment. For issuers with weak cash flow, it is necessary to enhance negotiations with investors for solutions such as changing to bond terms and conditions; repaying by assets other than cash; converting debt into capital. For the bonds held by commercial banks, banks should consider to allow issuers to extend the due date if issuers have plans for effectively restructuring their debts.

The commercial banks should review their bond portfolios and loan portfolios to control credit risks. On that basis, Banks should consider to support issuers through restructuring the issuer's debts, funding new loans...

The third, improving new bond issuances

In fact, the demand for bond issuance is remained remarkably high in the economy. To enrich good quality supply, it is necessary to improve the quality of new bond issuances, including:

- The Ministry of Finance should review regulations on corporate bond issuance, continue to amend CB issuance conditions. Especially, conditions for private placement should be seriously controled on issuers' financial capacity and repayment ability. Greater attention should be paid to all amendments in order to create more favourable enviroments for businesses with strong financial capacity and effective plans for using capital to expand bond issuances.

- Companies should improve the efficiency of internal management, business operations and push up digital transformation to promote their reputation, thereby taking full advantage to reduce costs and increase the efficiency of bond issuances.

The fouth, strengthening inspection and supervision of CB issuances and strickly handling violations of issuances.

The Ministry of Finance need to strengthen inspection and supervision of issuance activities, early detect violations to protect investors' rights and interests. Violating issuances have to be strickly addressed to improve the transparency and soundness of the market and investor confidence.

4. CONCLUSIONS

Supply plays an crucial factor on the market. In order to gain a stable development for the VCBM, the bond supply needs to be abundant, diverse and good quality. Therefore, paralleling with handling defaulted & violated bonds to consolidate current supply, The VCBM should promote new bond issuances with good quality. The solutions need to be synchronized, including strengthening legal framework for CB issuance and trading in secondary market, tightening inspection and supervision of issuance activities and effectively establishing and complementing plans for bond issuances from companies./.

TRADE BARRIERS OF THE EUROPEAN UNION FOR VIETNAM'S SHRIMP

MA Nguyen Vu Minh[1]

Abstract: Research on trade barriers has never been more urgent than it is today as the globalization process becomes increasingly stronger. In Vietnam, as the economy develops more and more, the impact of trade barriers on export activities becomes more and more complicated. One of Vietnam's main export products that is significantly affected by these trade barriers is shrimp.

In recent years, the European Union (EU) market has tended to impose many strict trade barriers on seafood from exporting countries, which will cause many difficulties for Vietnam's shrimp. In recent years, although Vietnam's shrimp export activities to the EU have achieved great achievements and contributed significantly to Vietnam's GDP, they still reveal many limitations and difficulties, mainly difficulties in responding to EU trade barriers. The article focuses on analyzing the impacts of EU trade barriers on Vietnam's shrimp products and Vietnam's responses to these barriers.

Keywords: trade barriers, shrimp exports, European Union, tariff barriers, non-tariff barriers

1. OVERVIEW OF STUDIES ON TRADE BARRIERS FOR VIETNAM'S SEAFOOD PRODUCTS

In Vietnam, there have been studies on trade barriers that have been mentioned a lot in studies with rich and diverse content.

Research by Dinh Van Thanh and colleagues (2005) used research methods to solve the following issues: (1) system and analysis of regulations related to international trade barriers in various documents to better serve the research, teaching and practical activities of State management agencies and businesses. (2) research and forecast the possibility of these types of barriers appearing as well as solutions for Vietnam

Research by Bui An Binh (2013) has shown: (1) the current situation of trade barriers for Vietnamese seafood products in the US market, (2) the successes and shortcomings of seafood Vietnam in overcoming trade barriers to penetrate the US market during the period (1994 - 2012) since the US removed the trade embargo against Vietnam; (3) propose some solutions to help Vietnamese seafood overcome trade barriers in this market

Research by Tran Thanh Long (2013) used statistical methods to describe trade warnings and the number of lawsuits to clarify the effects of trade barriers on exports, including positive effects such as increasing costs, strict procedures, diverting trade activities and also positive effects such as motivating businesses to increase investment, increasing experience in responding to barriers . However, these research results are only based on the author's experience and arguments, the research does not have quantitative results.

Through the studies mentioned above, it can be summarized into the following main contents: Firstly, the studies have generalized the development of trade barriers in international trade, serving as a basis for the development of trade barriers in international trade, recognize the nature of trade barriers as a manifestation of new protectionism. Second, trade barriers have a huge impact, limiting international trade, but they can also be used as an effective tool to protect domestic

[1] Email: nguyenvuminh@hvtc.edu.vn, Academy of Finance.

production. Third, the trend of increasing trade barriers in the world and in the European Union market is an objective reality, associated with the development of the world economy. Besides the research results mentioned above, related research projects still have many gaps that have not yet been researched and clarified. That is: lack of studies that deeply and fully address the current situation and impact of the European Union's trade barriers on Vietnam's shrimp exports recently, lack of evaluation studies on factors limiting the ability of the Vietnamese seafood industry to respond to trade barriers. Therefore, the article focuses on analyzing the current situation of the European Union's trade barriers against Vietnam's shrimp exports and Vietnam's response measures, evaluating the results and shortcomings in the process implementation.

2. EUROPEAN UNION TRADE BARRIERS FOR VIETNAM'S SHRIMP

Due to its geographical location and harsh climate, moreover, the EU's seafood resources are below biosafety limits, forcing the EU to apply measures to limit exploitation and fishing while consumer demand still increasing rapidly. Therefore, to meet consumer demand in the bloc, the EU is forced to import seafood from American and Asian countries, including Vietnam. In terms of the structure of seafood products exported to the EU, shrimp is the product with the highest export turnover. For the last 3 consecutive years, shrimp has always been the leading key product in the seafood export structure to the EU market.

Vietnam's seafood exports to the EU have gradually decreased in the years 2017-2020, after increasing from 1.22 billion USD in 2016 to nearly 1.5 billion USD in 2017. In 2020, Vietnam's seafood exports Vietnam to the EU only reached 958.7 million USD, down about 26% compared to the previous year, this is the largest decrease in the period 2017-2020. One of the main causes of this decline is the impact of increasingly strict trade barriers from the European Union on Vietnamese shrimp.

Tariff barriers

The European Union – Viet Nam Free Trade Agreement (EVFTA) with major tax incentives has been helping Vietnam's shrimp initially take advantage of opportunities and boost exports to EU. However, most of these items are still subject to tax over a period of 3-7 years.

For shrimp products: since EVFTA comes into effect, the export tax of some shrimp products to the EU will immediately return to 0%, there are still some products that are still subject to export tax of 5 - 7 years with tax rates gradually adjusted from 18 - 20% to 0% such as shrimp code HS 03061794, shrimp code HS 16052110, ...

Non-tariff barriers

- Quantitative restrictions: These are measures that directly limit the volume or value of goods imported into a country. Therefore, it is highly protective, including import bans, quotas and non-automatic import licensing.

- Price management measures: Measures to manage import prices or selling prices in the EU market through regulating maximum prices, tax prices, fees and surcharges can have a direct impact. or indirectly to Vietnam's shrimp exports to the EU.

- Technical barriers and sanitary and epidemiological measures: measures to protect the environment, human and animal health, prevent bad actions,... that the EU considers appropriate , provided that such measures are not applied in a manner that constitutes arbitrary discrimination or unreasonable restrictions on international trade. The most common technical standard regulations used by the EU include: (1) Regulations for health and food safety; (2) EU standards on quality management; (3) EU regulations on environmental and resource protection (ISO 14000, EMAS, IUU, EU regulations on social responsibility).

- Temporary trade protection measures: including safeguard measures, anti-subsidy and anti-dumping measures. Recent trends show that the EU uses these measures quite often to restrict seafood imports into the EU market.

- Administrative management measures: Payment regulations, deposit regulations, goods size regulations, advertising regulations, customs clearance positions, ...

The EU currently applies a variety of barriers to control the flow of imported goods, protect domestic consumers and the environment. Since 2010, shrimp products imported into the EU must comply with IUU regulations (Illegal unreported and unregulated fishing). Accordingly, shipments must have information from the name of the fishing vessel, the name of the ship owner, the fishing means and the fishing area, the type of product and weight, the declaration of shipment at sea, in the port area, and the ship. receiving or receiving unit in the port... Thus, to export to the EU, businesses cannot use shipments of unknown origin or insufficient documents. The EU's imposition of the IUU yellow card in 2017 on Vietnam's seafood exports is one of the main reasons why shrimp export turnover to the EU market has fluctuated a lot in recent years.

3. CURRENT STATUS OF VIETNAM'S SHRIMP EXPORTS TO THE EU

Vietnam's seafood exports to the EU have gradually decreased in the years 2017-2020, after increasing from 1.22 billion USD in 2016 to nearly 1.5 billion USD in 2017. In 2020, Vietnam's seafood exports Vietnam to the EU only reached 958.7 million USD, down about 26% compared to the previous year, this is the largest decrease in the period 2017-2020. The cause of the decline in turnover in 2020 is due to the UK leaving the EU market, while this is the bloc's large seafood import market with import turnover from Vietnam ranging from 280 - 340 million USD/year. . Besides, the cause comes from the impact of the COVID-19 pandemic in the EU. In August 2020, the EVFTA Agreement took effect, which is important in promoting the export of Vietnam's seafood to the EU market.

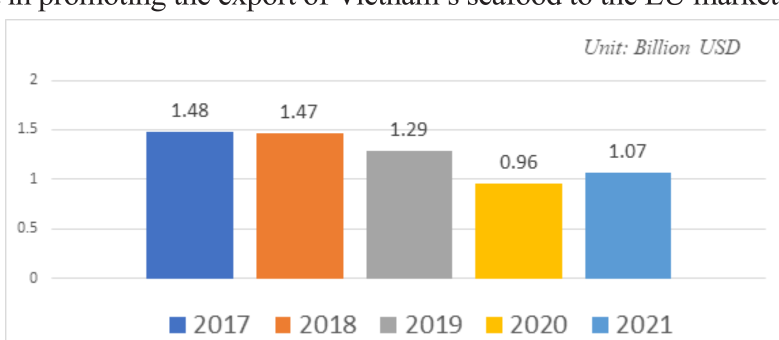

Figure 1: Seafood export turnover to the EU market in the period 2017 – 2021

Source: VASEP's Vietnam seafood export report for the years 2017 – 2021

In 2021, Vietnam's seafood exports have reached 8.9 billion USD (up 5.8% over the same period in 2020). Of which, Vietnam's seafood export turnover to the EU is about 1.077 billion USD, an increase of 12.3% compared to 2020, making the EU the third largest export market after the US and Japan. This is a positive result in the first year of Vietnam implementing the EVFTA, businesses have taken good advantage of the preferential conditions brought by this Agreement. This number could be even higher if Vietnam's seafood production in the third quarter of 2021 is not interrupted by the COVID-19 pandemic.

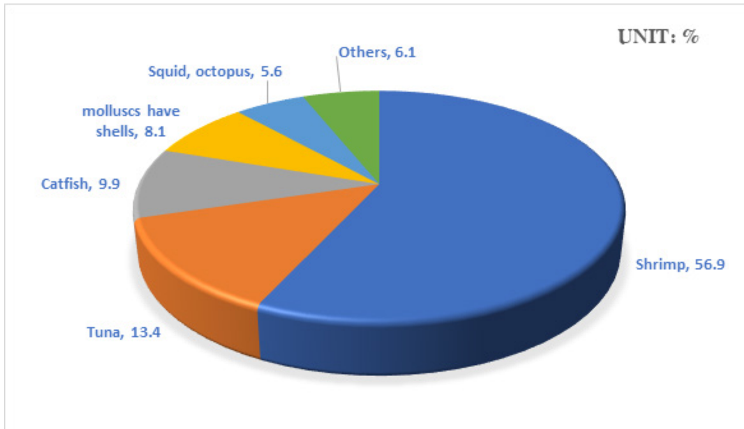

Figure 2: Structure of seafood products exported to the EU in 2021

Source: VASEP's Vietnam seafood export report in 2021

In recent years, shrimp has always been the leading key product in the structure of seafood exports to the EU. In 2017, shrimp exports to this market reached over 862.8 million USD, an increase of 43.7% over the same period in 2016 and the EU became the largest import market for Vietnamese shrimp (accounting for 22.2% of the total export value). Exports to the Netherlands increased by 70.5% to 224.2 million USD; followed by the UK and Germany with growth rates of 55.5% and 52.1%, respectively. In 2021, shrimp exports have reached 613,136 million USD, an increase of 18.6% compared to 2020 (517,108 million USD). Of which, exports to the Netherlands increased by 10%, to Germany increased by 25% and to Belgium increased by 19%.

Ranked second in this structure is tuna, with a proportion of 13.4% in 2021, an increase of 6.4% compared to 2020. Catfish still maintains its position as one of the main products exported to the EU (accounting for nearly 10% of the proportion).

4. VIETNAM'S RESPONSE TO EU TRADE BARRIERS

To respond to trade barriers from the EU and support businesses exporting, the Vietnamese Government has issued policies to guide, support and promote shrimp export businesses.

Policies to support traders to take advantage of incentives from the EVFTA to promote exports to the EU market

Immediately after EVFTA took effect on August 1, 2020, the Vietnamese Government along with relevant ministries and branches issued a series of guiding documents and EVFTA implementation plans. After one year of the Agreement taking effect, 19 ministries, branches and 57 provinces and cities across the country have issued EVFTA implementation plans.

The Government has issued a Project to promote the export of agricultural, forestry and fishery products to 2030 according to Decision No. 174/QD-TTg dated February 5, 2021. The Prime Minister assigned the Ministry of Finance to preside and coordinate with other ministries, relevant sectors review and supplement policies to encourage and support enterprises exporting agricultural, forestry and fishery products.

The Ministry of Agriculture and Rural Development has also issued a plan to implement the EVFTA according to Decision No. 3233/QD-BNN-HTQT August 22, 2020. Accordingly, the tasks of propagating and disseminating information about the EVFTA to relevant subjects, including businesses exporting shrimp to the EU, and building laws and institutions: amendments, supplement legal documents, improve competitiveness of the Agriculture sector, including fisheries.

EU market development policy to promote shrimp exports

The Ministry of Industry and Trade has issued a plan to implement sustainable export development solutions in the last months of 2021 and early 2022 (Decision No. 1993/QD-BCT dated August 20, 2021). Accordingly, the Ministry of Industry and Trade directs units to implement the following requirements:

- Strengthen the provision of market information and trade promotion activities aimed at markets with room for development such as Eastern European and Northern European markets, etc.

- Promote coordinated activities with major e-commerce platforms in the world such as Amazon, Alibaba, etc. The formation and development of e-commerce platforms is a fundamental solution for businesses to access markets easily and quickly and improve the ability to take full advantage of the opportunities brought by the Free Trade Agreement.

In addition, the Ministry of Industry and Trade has deployed many online trade promotion activities to support Vietnamese businesses in promoting products in general and exported shrimp products in particular. The Ministry of Industry and Trade is also continuing to strongly implement solutions to promote exports to the EU market. In particular, focus on organizing the exploitation and taking advantage of opportunities from EVFTA, removing barriers in transportation, warehousing, logistics,... to create favorable conditions for businesses. At the same time, prioritize implementing export promotion activities in markets that recover quickly after the pandemic.

Policy for exported shrimp aims to meet EU market regulations

- *Policy to ensure technical and epidemiological hygiene requirements*

On February 9, 2021, the Ministry of Agriculture and Rural Development issued Official Dispatch No. 859/BNN-QLCL on enhancing the effectiveness of quality control and aquatic food safety. Accordingly, the Ministry requires export shrimp processing enterprises to immediately implement the following solutions:

Firstly, proactively research and fully update import market regulations on quality and food safety to implement during the production process.

Second, in the context that Vietnam has signed and implemented a number of new generation free trade agreements (CPTPP, EVFTA, UKVFTA, VN-EAEU FTA,...), Comprehensive Economic Partnership Agreement region (RCEP) offers many tariff incentives. However, businesses need to establish and effectively implement a traceability system throughout the entire production process from raw materials to finished products before being sold to the market strictly comply with rules of origin and tax obligations according to market regulations to avoid investigations on tax evasion, origin fraud, etc.

Third, proactively establish information channels between importers, businesses and management agencies to promptly handle difficulties and problems in export, especially issues related to quality and safety food.

- *Product brand development policy*

Project to promote agricultural, forestry and fishery exports to 2030 according to Decision No. 174/QD-TTg dated February 5, 2021, the Prime Minister assigned the Ministry of Finance to preside and coordinate with relevant ministries to review Control and supplement policies to encourage and support enterprises exporting Vietnamese branded products. The Government aims to promote the growth of export turnover of agricultural, forestry and fishery products (AFF), comprehensively and sustainably participate in the global AFF supply chain; Improve the quality and value of Vietnam's exported AFF products to meet the regulations of import markets; continue to position and develop brands for Vietnamese AFF products in the international market

Looking at Vietnam's export turnover to the EU market, we can see Vietnam's efforts in responding to EU trade barriers. Shrimp export turnover is continuously increasing while trade barriers in the EU market are increasingly complex and sophisticated, proves that Vietnam's seafood industry in general and shrimp products in particular have had successes in dealing with these barriers.

APPLICATION OF PPF AND DEA IN FINANCIAL ANALYSIS: FACTORS INFLUENCING THE EFFICIENCY OF ANALYSIS IN COMMERCIAL BANKS

Ph.D Luu Huu Duc[1], Ph.D Cao Minh Tien[2]

Abstract: This research explores the influence of various factors on the effectiveness of financial analysis methods and processes employed by enterprises in commercial banks. Financial analysis plays a crucial role in assessing the health and performance of businesses, making its efficiency of paramount importance. Through a combination of qualitative and quantitative research methods, this study investigates internal and external factors that may impact the efficacy of these processes. Key findings indicate that technological advancements, the competency of analysts, the size of the bank, regulatory environments, and organizational culture significantly sway the effectiveness of financial analytical processes. Recognizing and understanding these factors can enable commercial banks to refine their financial analysis practices, resulting in more accurate assessments and better-informed decision-making..

Top of Form

Keywords: Financial analysis, Commercial banks, Effectiveness, Analytical methods, Organizational culture, Technological advancements

1. INTRODUCTION

Financial analysis remains a cornerstone in the banking sector, particularly for commercial banks tasked with assessing the fiscal health and credibility of businesses. This vital function determines not only the bank's lending decisions but also informs enterprises of their financial standing, shaping their strategic and operational choices. While the fundamental principles of financial analysis remain unchanged, the methods and processes have evolved over the years. This evolution is driven both by internal advancements within banks and external shifts in the broader financial landscape.

The importance of an effective financial analysis process cannot be understated. Inaccuracies or inefficiencies in this domain can lead to misguided lending decisions, misallocation of resources, and potential financial losses. For enterprises, an inaccurate financial analysis might result in missed opportunities or misguided strategic decisions. As such, understanding the factors that influence the effectiveness of these methods and processes becomes paramount.

This research delves into the myriad of factors that impact the efficacy of financial analysis methods within commercial banks. By scrutinizing both traditional practices and contemporary challenges, the study aims to provide a holistic view of the current landscape, with the goal of highlighting areas for potential refinement and innovation.

The subsequent sections will shed light on the theoretical underpinnings of financial analysis, detail the research methodology employed, and discuss the findings and their implications for the commercial banking sector.

2. LITERATURE REVIEW

The literature on the effectiveness of financial analysis methods and processes in commercial banks is vast and multifaceted. This review aims to encapsulate the prominent themes and findings that have emerged in this domain over the past few decades.

1. Historical Evolution of Financial Analysis: Jones et al. (1995) provided a comprehensive history of financial analysis, tracing its origins and its evolution. Traditional methods primarily

---

[1] Email: luuhuaduc@hvtc.edu.vn, Academy of Finance

[2] Academy of Finance.

focused on ratio analysis, trend analysis, and comparative financial statements. However, as industries diversified and globalized, these methods began to show their limitations.

2. Technological Advancements: With the advent of technology, the nature and speed of financial analysis have transformed dramatically. Smith & Johnson (2008) highlighted how software tools and digital platforms have streamlined the financial analysis process. These tools offer automated calculations, predictive analytics, and visual representation of financial data, adding depth and dimension to the analysis.

3. The Role of Analysts: Human expertise remains at the heart of financial analysis. Williams (2011) emphasized the importance of the competency of analysts. While technology aids the process, the interpretation and understanding of results rely heavily on the analyst's skills and experience.

4. Regulatory Impact: The regulatory environment has profound implications for financial analysis. Davis & Thompson (2014) discussed how regulations, such as the Basel Accords, have affected risk assessment and financial reporting methods in banks. The need for transparency, consistency, and adherence to these regulations has reshaped the financial analysis landscape.

5. Organizational Culture and Structure: The culture and structure of a bank can greatly influence its analysis methods. Brown & Mitchell (2017) found a significant correlation between a bank's organizational culture and its approach to financial analysis. Banks that foster innovation and continuous learning often employ more advanced and effective analytical methods.

2. ANALYSIS METHOD

To evaluate the impact of various factors on the financial analysis methods and processes for small and medium-sized enterprises (SMEs) of commercial banks, based on actual survey results and research application of some models: the Production Possibility Frontier (PPF) and boundary analysis method; the Data Envelopment Analysis (DEA) method.

2.2. The Production Possibility Frontier (PPF) method and the Boundary Analysis method:

Farrell (1957) introduced the idea of using the Production Possibility Frontier (PPF) as a criterion to evaluate the (relative) efficiency among companies in the same industry. Accordingly, companies that reach the frontier are considered to be efficient (more so) and those that do not reach the PPF are considered to be less efficient (compared to the other companies). Specifically, in Figure 1, the DMUs B, C, and E have TEB = TEC = TEE = 1; while DMU A and D have TEA = 0A/0A' < 1 and TED = 0D/0D' < 1.

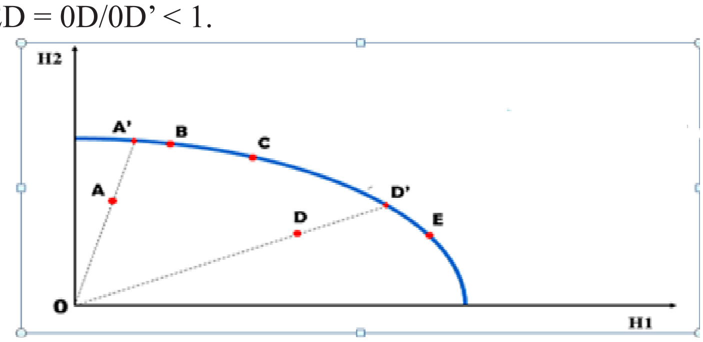

Figure 1. Production Possibility Frontier corresponding to two goods H1 and H2.

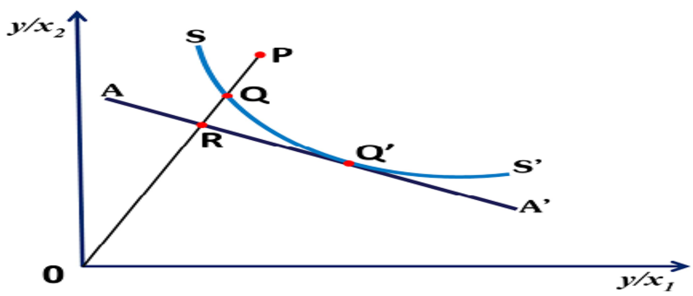
Source: Farrell (1957)

The PPF for the case utilizing 2 input factors (x1 and x2) to produce 1 output factor (y) can be represented as an isoquant in Figure 2. Accordingly, a DMU producing at position Q is considered efficient (TEQ = 0Q/0Q = 1), whereas if it produces at position P, it is deemed inefficient (TEP = 0Q/0P < 1). Note that Figure 2 assumes that for a given output y, SS' is the isoquant representing the minimum combination of x1 and x2, and thus, Figure 2 applies the input-minimization model (input-orientation). If the input remains constant and the highest possible output level can be achieved, then the PPF will have a similar form as in Figure 1, applying the output-maximization model (output-orientation).

Figure 2. PPF in the case of input-minimization.



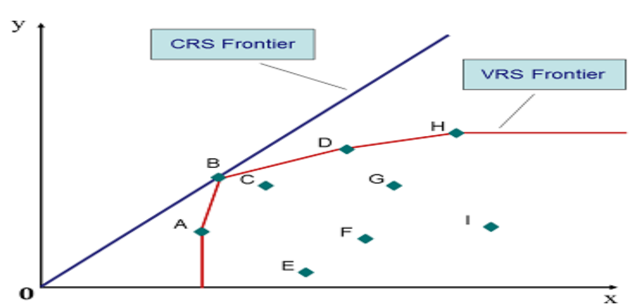
Source: Farrell (1957)

Another noteworthy point in Figure 2 is that when combined with the isocost line AA', it can be observed that Q' is the optimal point, not Q. Therefore, if a DMU produces at Q, it might be technically efficient (TEQ=1) but inefficient in resource allocation (Q lies on the isocost line AA'). As such, QR represents allocative efficiency. Concisely, we have: Economic (overall) efficiency = Technical efficiency x Allocative efficiency 0R/0P = 0Q/0P x 0R/0Q

In the boundary analysis method, another commonly encountered type of graph represents the relationship between total inputs and total outputs (Figure 3).

(Note: DMU stands for Decision Making Units. The notations TEQ, 0R/0P, etc., are assumed to be efficiency values or measurements based on the given context.)

Figure 3. Scale invariant/variable efficiency and the PPF enveloping boundary.



Source: Farrell (1957)

The method to determine the total input and output values will be elaborated on in the subsequent section. Here, the author wants to highlight the distinction in determining the PPF under conditions of constant returns to scale (CRS) and variable returns to scale (VRS). Accordingly, the CRS PPF is a straight line connecting the origin of coordinates and the DMU with the highest efficiency

(TE = y/x) (TE = 1). The CRS PPF, thus, does not account for scale differences among DMUs but simply compares efficiency ratios (TEi = yi/xi) between using input xi to generate output yi. On the other hand, the VRS PPF takes into account the scale factor, so its shape resembles an envelope surrounding other less efficient DMUs (The CRS PPF is also a type of envelope, but more "loose"). This is the origin of the name Data Envelopment Analysis method.

(Note: DMU stands for Decision Making Units. The notations TE, y, x, etc., are assumed to be efficiency values or measurements based on the given context.)

2.3. The Data Envelopment Analysis (DEA)

Data Envelopment Analysis (DEA) is a non-parametric method used to determine the efficiency of various units, especially in situations where the output quality is multi-dimensional. This technique, originating from Farrell's work in 1957, focuses on technical and allocative efficiency. Farrell's model, however, faced challenges related to assumptions on constant returns to scale and strong disposability of inputs. Fare and colleagues, in subsequent years, addressed these challenges by introducing more flexible non-parametric methods.

In essence, DEA constructs an efficiency frontier, reminiscent of the production function, in the input-output space. This frontier acts as a benchmark to evaluate the efficiency scores of individual firms. DEA offers a relative efficiency assessment by comparing firms against each other based on their positions in the multi-dimensional input/output space. This frontier is formed using multiple linear programming problems, resulting in straight lines connecting the most efficient points and defining a convex production set.

The primary advantage of DEA is its ability to handle constraints in determining production forms and its applicability to numerous distribution methods for residuals. It delivers a boundary closer to reality by estimating the production frontier based on existing results, making it suitable for sectors like education, healthcare, finance, and more.

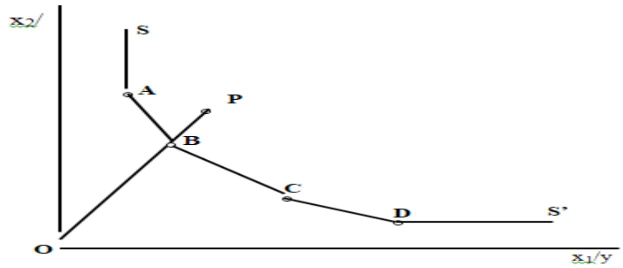
However, there are concerns regarding DEA. Since it's non-parametric, traditional statistical tests can't be applied. Also, DEA predominantly considers the supply side, potentially neglecting demand and market aspects. It's essential to recognize these limitations when interpreting results derived from DEA.

In summary, DEA is a versatile tool applicable across various sectors to evaluate efficiency. It has evolved considerably from its initial conception, with continuous research to mitigate its limitations and broaden its application scope.

2.4. The Data Envelopment Analysis (DEA) based on the input minimization model.

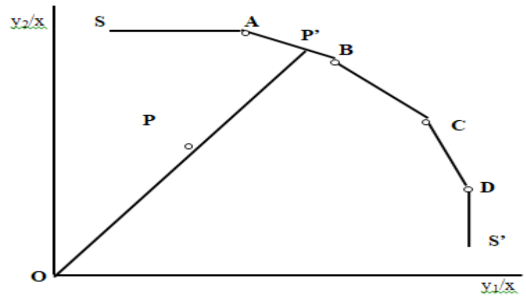
The Data Envelopment Analysis (DEA) based on the input minimization model. To illustrate this issue, consider a hypothetical example with two inputs, x1 and x2, and one output, y (as shown in figure 1.1). Enterprises A, B, C, and D lying on the efficiency frontier SS' are considered efficient. The degree of technical inefficiency is reflected by the distance from B to P. The Technical Efficiency (TE) ratio = OB/OP represents the technical efficiency of enterprise P, meaning that the input costs of enterprise P can be reduced without affecting the output. By definition, these efficiency levels range from 0 to 1.

Figure 4: DEA Model for Input Minimization and the Data Envelopment Analysis Approach for Output Maximization Model.



Technical efficiency is perceived as the capacity of an industry to produce maximum output given certain input conditions. In the case of the DEA output maximization model, consider a hypothetical example with two outputs, y1 and y2, and one input, x (as depicted in Figure 5). Enterprises A, B, C, and D located on the efficiency frontier SS' are deemed efficient. The degree of technical inefficiency is reflected by the distance from P to P'. The Technical Efficiency (TE) ratio = OP/OP' represents the technical efficiency of enterprise P, indicating that it's possible to maximize the output of enterprise P without affecting its input. By definition, these efficiency levels range between 0 and 1.

Figure 5: DEA Model for Output Maximization



2.5. Unaffected Scale Production Model DEACRS and Scale-Affecting Production Model DEAVRS

The DEA (Data Envelopment Analysis) methodology establishes a unique best practice frontier for each sector. Measuring technical efficiency typically relates to overall technical efficiency. The residual of overall technical inefficiency represents all causes leading to inefficiency, encompassing both observable and unobservable factors. Estimating overall inefficiency corresponds to inefficiencies due to objective causes such as industry scale, weak management capability, or unobservable factors like estimation errors.

The original DEA model proposed by Charnes and associates is the model where scale doesn't affect production results, known as Constant Return to Scale (CRS) or DEACRS. In 1984, Banker and colleagues considered the DEA model under the assumption that scale affects production outcomes, known as Variable Return to Scale (VRS) or DEAVRS.

The DEA approach can be applied to analyze the efficiency of production activities of companies, farms, or production households. Based on prior studies, Coelli et al. (2005) established the DEA analysis model. The objective of DEA analysis is to construct a non-parametric efficient convex hull, such that observed points will not lie above the production efficiency frontier.

The input minimization model, unaffected by production results (CRS), with basic steps will be outlined below. Assume we have data of I companies, each using N inputs and producing M outputs. For the i-th company, input data is represented by column vector xi and output by column vector yi. Consequently, input and output data for all companies are represented by matrix X (N rows, I columns) and matrix Y (M rows, I columns).

The method using "ratios" is considered a visual descriptive method for data envelopment analysis (DEA). For each company, we measure the ratio of the total quantity of output products over the total quantity of used inputs (u′yi/v′xi) where u is the output quantity vector (M rows, 1 column); v is the input quantity vector (N rows, 1 column). The optimal input and output quantities for the i-th company are determined by solving the following mathematical model: ..."

$$\max_{u,v} (u'y_i/v'x_i)$$
$$\text{St: } u'y_j/v'x_j <= 1 \qquad j = 1,2,3\ldots I \qquad (1)$$
$$u,\ v >= 0$$

From this problem, we can determine the input and output quantities for company i such that its efficiency coefficient (total output/total input) is maximized, under the condition that its efficiency coefficient is always less than or equal to 1. A potential difficulty that may arise is that there could be multiple solutions to the above problem (for example, if u* v* and 2u* 2v*are solutions, then u và 2u* 2v* are also solutions). To avoid this, we impose the constraint v'xi = 1.

The change in notation from u and v to μ and ν respectively suggests that we are considering a different, yet similar, linear mathematical model

$$\max \mu\nu\ (\mu' y_i),$$
$$\text{st} \quad \nu' x_i = 1,$$
$$\mu' y_j - \nu' x_j \le 0,\ j= 1,2,\ldots, N \ (2)$$

The DEA model as in (2) is considered a fractional linear programming model. Using the duality property of linear programming, we can develop a corresponding data envelopment analysis model as follows:

$$\begin{aligned} \min_{\theta,\lambda}\ & (\theta), \\ & -y_i + Y\lambda \ge 0, \\ & \theta x_i - X\lambda \ge 0, \qquad (3) \\ & \lambda \ge 0 \end{aligned}$$

θ is a scalar quantity, representing the efficiency level of the firm;

λ is an Nx1 vector of constants.

The problem (3) is solved N times, meaning once for each firm. Thus, the solution value q is determined for each firm. If q = 1, it means the firm is efficient; if q < 1, the firm is not efficient. Inefficient firms can be projected onto the efficiency frontier, and we then obtain the linear combination (Xl, Yl) - the hypothetical reference firm's position. For firms that are inefficient (θ < 1), an objective can be set to reduce the input factors by a quantity of q while still maintaining the same output values.

The DEA model oriented towards input minimization with scale influencing production outcomes (DEAVRS) (2) is established based on (1) with an additional constraint N1λ = 1.

$$\begin{aligned} &\min_{\theta,\lambda} (\theta), \\ &-y_i + Y\lambda \geq 0, \\ &\theta x_i - X\lambda \geq 0, \\ &N1\lambda = 1 \\ &\lambda \geq 0 \end{aligned}$$

θ is a scalar quantity, representing the efficiency level of the firm;

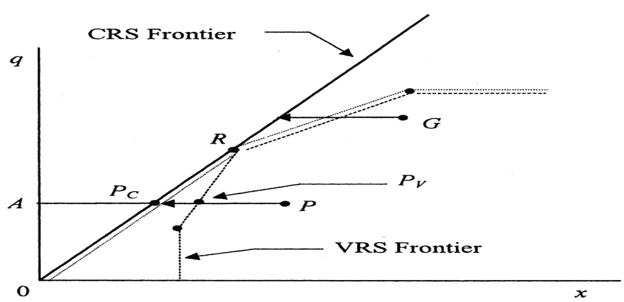
λ is an Nx1 constant vector;

N1 is a unit Nx1 vector.

The models (DEACRS) and (DEAVRS) oriented towards output maximization are constructed similarly.

2.6. Measuring scale efficiency – SE using the DEA method

Figure 6. Scale Efficiency in the Direction of Minimizing Inputs



To measure scale efficiency – SE using the DEA method, we compare CRS - DEA and VRS – DEA. If there's a difference between CRS – DEA and VRS – DEA for a specific enterprise, we conclude that there's scale inefficiency.

Given that: TECRS = TEVRS x SE

APc/ AP = (APv/ AP) x (APc / APv)

→ SE = TECRS/TEVRS hay: SE = APc / APv

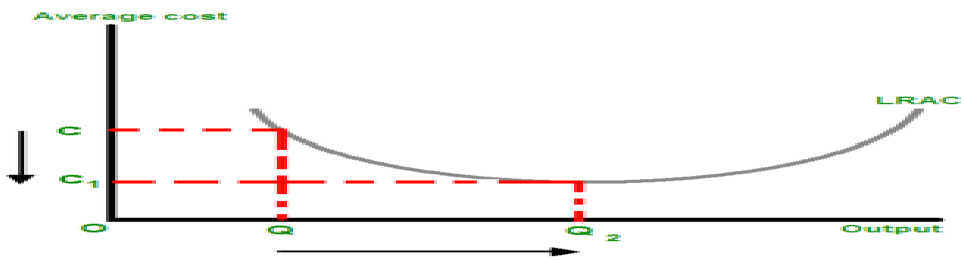
Where efficiency coefficients TECRS, TEVRS, and SE in the input-minimizing data envelopment analysis model always lie between 0 and 1. Similarly, SE in the direction of output maximization has efficiency levels ranging from 0 to 1.

In this context, input efficiency means minimizing inputs without reducing outputs, and output efficiency refers to maximizing outputs with unchanged inputs when the production doesn't change according to CRS scale and the VRS scale affecting the output results.

Scale efficiency here implies that an enterprise operates at an optimal scale. Not every enterprise operates at this optimal scale due to constraints like capital, government regulations, etc. Scale economies characterize a production process wherein an increase in product quantity results in a reduced average cost per product. Such scale economies exist in most industries and can be utilized both at the plant level and at a firm comprising multiple plants. It arises due to reasons like:

The ability to leverage scale economies can be limited for various reasons. In certain sectors, the nature of the product, processing, or technology might curtail scale economies even at modest outputs. From the demand side, the market might not be large enough for a firm to reach its efficient scale, or the firm might be too small. Consumer demand for diverse products (diversity of demand) can hinder standardization and long-run production. When scale economies are crucial across industries, it leads to a trend of high seller concentration.

Figure 7: Long-Run Average Cost Curve



LRAC: The U-shaped long-run average cost curve characteristic of a plant. Output: production output Average: average cost

As output increases from Q1 to Q2, the cost decreases from C to C1. In the graph, Q2 is the optimal production level, where the average cost is at its lowest. Beyond this point, economies of scale decrease and eventually reach a level where they are no longer beneficial.

4. THE IMPACT OF VARIOUS FACTORS ON THE EFFECTIVENESS OF FINANCIAL ANALYSIS METHODS AND PROCESSES FOR BUSINESSES IN COMMERCIAL BANKS CAN BE DESCRIBED AS FOLLOWS

- **Staff and Skills**:

Positive Impact: Highly skilled and experienced staff can evaluate finances accurately, enabling the bank to make informed investment decisions.

Negative Impact: Improperly trained or inexperienced staff can lead to wrong decisions, causing losses for the bank.

- **Technology and Information Systems:**

Positive Impact: Using modern information systems and technology aids in quick, accurate, and reliable data analysis.

Negative Impact: Over-reliance on technology without cross-checking can lead to decisions based on inaccurate data.

- **Processes and Standards:**

Positive Impact: Clear financial analysis processes and standards ensure consistency and accuracy.

Negative Impact: Overly rigid or outdated processes might cause the bank to miss opportunities or face unnecessary risks.

- **Culture and Leadership Style:**

Positive Impact: An open culture that encourages innovation and learning can propel the bank towards continuous improvement in its financial analysis processes.

Negative Impact: A guarded culture that discourages feedback can hinder innovation and improvements.

- **Relationship with Customers and Market:**

Positive Impact: Understanding customer needs and market expectations helps in refining analysis processes.

Negative Impact: Failing to update market information might result in missing new trends and making inaccurate decisions.

- **Laws and Regulations:**

Positive Impact: Clear regulations help banks understand their responsibilities and reduce legal risks.

Negative Impact: Excessive or frequently changing regulations can complicate compliance and process updates.

5. CONCLUSIONS:

The effectiveness of financial analysis methods and processes in commercial banks is influenced by a myriad of intertwined factors. These range from the competence of the staff, the tools and technology available, to the prevailing culture and external regulatory environment. It's evident that for a bank to remain successful in its financial assessments, it should maintain a balance by continuously training its workforce, updating its technology, and being responsive to the market and regulatory changes. Moreover, fostering a culture that promotes innovation and feedback can act as a bedrock, ensuring that the bank remains agile and accurate in its financial evaluations. While challenges abound, understanding these influencing elements offers banks a clearer path to navigate the complex realm of financial analysis.

Financial analysis processes in commercial banks are pivotal for decision-making, risk assessment, and strategic planning. The effectiveness of these processes is contingent upon a multitude of variables, both internal and external.

Human Resources Competence: The expertise, experience, and training of the personnel involved directly influence the accuracy and reliability of financial analyses. A knowledgeable workforce that's continually updated on the latest trends, tools, and methodologies is essential for accurate financial assessment.

Technological Infrastructure: The tools, software, and systems utilized for financial analysis need to be up-to-date, robust, and secure. The more advanced the technology, the better equipped a bank is in handling complex data sets, running simulations, and deriving insightful analyses.

Organizational Culture: A culture that promotes continuous learning, innovation, and feedback can be the backbone of effective financial analysis. When employees are encouraged to question, innovate, and collaborate, it often leads to more thorough and insightful analyses.

Regulatory Environment: Commercial banks operate within stringent regulatory frameworks. Compliance with these regulations is not only mandatory but also influences the way financial analysis is conducted. Changes in regulations can necessitate adjustments in methodologies and approaches.

External Market Dynamics: Economic conditions, industry trends, and competitive pressures also play a significant role. An effective financial analysis should be contextual, considering these external dynamics to provide relevant and actionable insights.

Feedback Mechanisms: A dynamic feedback mechanism ensures that the financial analysis process is continuously refined. By revisiting past analyses and comparing them with actual outcomes, banks can refine their models and assumptions for improved accuracy in the future.

SUPERVISING CADRES IN USING PUBLIC FINANCE IN VIETNAM

Master. Nguyen Thi Thanh[1]

Abstract: The article analyzes the role, content, and value of Ho Chi Minh's ideology on controlling officials in the use of public finances to serve the implementation of functions of the Party and State and meet the needs and common benefit of economic entities in society. By textual research, generalization, comparison, and statistics, the author has systematized and analyzed: (1) Ho Chi Minh's ideology on controlling officials using public finances; (2) Current status and some issues raised in controlling officials using public finances and public assets for economic development in Vietnam; (3) Requires continuing to creatively apply Ho Chi Minh's ideology to develop a number of solutions to control officials and prevent corruption of power. Based on the research results, the author discusses and evaluates the value of Ho Chi Minh's ideology on controlling officials using public finances to create institutions and scientific institutions, contributing to boost Vietnam economic develops.

Key word: Supervise, officials, supervising official, public finance

1. RAISING AN ISSUE

Public finance plays an important role in the organization and activities of the Party and State. Ho Chi Minh addressed the subject of party finances in the Summary Charter of the Communist Party of Vietnam (1930), and he mandated that the collection and handling of party funds be routine and consistent with party committee levels and local authorities, local ministry organizations. Upon becoming the governing party, the Party established economic ties with the State as well as other societal groups. Ho Chi Minh saw that if financial inspection and supervision were not implemented in order to create reasonable spending regime, it would be the reason of the possibility and risk of profiteering by officials in power, leading to stagnation of the Party's work and the Government, creating barriers for the development of economic sectors. Thence, Ho Chi Minh requested that the Party must lead the State in building a spending regime, strictly supervising officials in the use of public finances to practice savings policies, anti-waste and establish a regime of officials' personal responsibility to people and the Party, serving the country's socio-economic development.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

The issue of controlling officials, especially controlling officials in the use of finance and public assets, is a basic and central content for controlling the power of the Communist Party of Vietnam. Below, the author would like to summarize some research projects related to the above issue:

Firstly, on inspection, supervision, and control of the Political Party: *In the The Aristotle's article has name The Politics* (2011) (translated by Nong Duy Truong), Aristotle identifies power control as necessary for politics, which focuses on people with power, which he often uses the terms "official control", "observant supervision". His approach laid the foundation for the issue of checking, supervising, and controlling the power of political parties by checking and supervising its team of officials.

In the book: "*LKY on Governance*" (2016) (translated by Nguyen Phan Nam An) by author Janie Tay . The issue of power control mentioned in this book is the issue of self-control of those in power.

---

[1] Email: ntthanh3@daihocthudo.edu.vn, Hanoi Metropolitan University.

Lee Kuan Yew said that the principle of rulership is that we are entrusted with the destiny of the people. The first duty of a leader is to fulfill that trust even at his personal risk, otherwise he should not accept that position.

In the book: *Controlling power in our country through inspection, supervision and party discipline* (2019) by Mai Truc [9]. The author presented and analyzed the views of Marxism-Leninism, Ho Chi Minh's ideology, the Vietnamese Party and State on controlling power through inspection, supervision and party discipline. The work also contributes to identifying some manifestations of power corruption in a number of fields. In the financial sector, this study clearly shows that acts of abuse of power, abuse of power, abuse of power... in the financial sector are manifested through problems, events, and information of officials, Party members may violate directives, resolutions, regimes, policies of the Party and State laws on the financial sector. Therefore, identifying the corruption of power in the process of creating, distributing and using monetary funds of the Party, the State, businesses and socio-economic entities is very important for develop the country…

Secondly, the issue of inspection, supervision, and control of officials in the use of public finances and assets. Article: *Controlling and preventing abuse of power in financial and public asset management* (2022) by author Le Hoa [10]. The article commented that in the period 2016-2020, the State Audit promptly detected violations, abuses of power, waste, and negative acts such as: Spending beyond authority, exceeding standards and norms; deciding on investment policies, making investment decisions beyond the authority... of units and individuals... Reviewing and handling cases showing signs of violating the law through audit activities, thereby contributing to deterring threaten and prevent abuse of power in the management of public finances and public assets. From there, the author affirms the need to continue promoting the role of the Party and State in monitoring and controlling the use of public finances and assets with related individuals and organizations.

Article: *Controlling assets and income of officials and civil servants to make corruption "impossible" (2021)* by Nguyen Dinh Quyen [11]. The author affirms that controlling assets and income is the most important tool in preventing corruption; Vietnam has a gap in this issue, so it is necessary to develop synchronous and comprehensive regulations on power control, with cross-control between institutions in the implementation of tasks and powers, authority related to the responsibility to control assets and income of government official, civil servants, and high-level manager. From there, contributing to promote economic entities and the country to enter a new period of development.

Article: *Highlights in private economic development in Vietnam during the renovation period (from 1986 to present)* (2023) by author Nguyen Thi Luyen [12]. This study has clearly shown the phenomenon of "tham nhũng vặt", "chung chi" to circumvent the law, distort guidelines and policies, businesses have to pay unofficial fees to officials, and discrimination. Many large-scale business households do not want to register to establish businesses due to concerns about compliance costs, informal costs and implementing tax policies and financial policies... which has hindered the development of private economy. Accordingly, solution from the State side focus on building a team of officials with good quality and capacity to improve the quality of institution building and implementation, focusing on enhancing openness, transparency, ensuring equal access of private economic entities to business opportunities, information and development resources, especially financial resources and land, creating motivation for the private economy develop...

Beside the typical works above, there are also studies from different angles on the issue of controlling Party officials. In general, with the achievements that the author evaluates as above, there are still aspects in the research that have not been mentioned in depth: *Firstly*, the works mainly research the issues of inspection, supervision, and control. Controlling the Party's power in general, there have been no direct studies of Ho Chi Minh's ideology on inspection and supervision of officials using public finances; *Secondly*, the works focus on clarifying basic points about economic development and the private economy, applying Ho Chi Minh's ideology to promote the control role of the Party and State to prevent cadres from corruption and negativity. There has been no in-depth research on the issue of awareness and application of Ho Chi Minh's ideology on inspection and supervision of officials using public finances to control officials, prevent corruption of power, and contribute to create motivation for Vietnam's economic development. Therefore, awareness and clarification of the above issue is the purpose and scientific task of this article.

3. RESEARCH METHOD

The research applies the methodologies of Marxism-Leninism, interdisciplinary and specialized research methods and specific scientific research methods. Methods of analysis, synthesis, generalization, prediction... are applied to clarify Ho Chi Minh's ideology on controlling officials using public finances, the current situation of controlling officials, preventing corruption, wastefulness and negativity in the use of public finances; Some issues raised in controlling officials using public finance and economic development in Vietnam and requirements for continuing to apply Ho Chi Minh's ideology to identify some solutions to control officials , prevent corruption of power, build an open and transparent political-legal environment to improve the efficiency of Vietnam's economy.

4. RESEARCH RESULTS

4.1. Ho Chi Minh's ideology on supervising officials in the use of public finances - the basis for preventing corruption of State power in Vietnam

Firstly, inspection, supervision and officials control in paying party fees and using state budget. In the collection of party fees, Ho Chi Minh made the following statement on the collecting of party dues: "Paying party dues, which is the responsibility of each party member, is to aid the Party in term of financial. Additionally, it is to ensure that every party member constantly remembers the Party" . These rules had to be scrupulously followed by every cadre and party member, and Ho Chi Minh used this as one of the key criteria for choosing, vetting, overseeing, and rating group members. In term of the state budget, he required officials to use it appropriately, and at the same time resolutely eliminate the situation of black funds in localities and agencies. So: "What is a black fund? It is a private fund, which is not included in the State's control: Revenue is used to spend less and declare more to cut into public funds. The limbs are buzzing and buzzing. What a shady way of doing things - as its name suggests, it is a "black fund"!... He criticized: is it "the "patronage" of some local leadership agencies? Because some of our officials still maintain a family-style working style. They said in the boss's voice: "It's all about housework! Black funds or white funds are all used for common work, there's no need to be afraid of losing anything!". Then, emphasizing the need to build: "The State's spending regime creates "binding"... It binds wasteful people and people who like to show off. It binds even those who only do not have the long-term thinking, who only know their benefits and forget the common affairs of the whole country...

It repairs gaps and keep our wealth. We are willing to try the best to combat wrong activities. We must be stricter in using our savings to move to a full and prosperous life for everyone .

Secondly, to discourage individuality, cadres should be inspected, supervised, and controlled as they practice thrift and battle waste. These are measures to reduce consumption, particularly when it comes to the utilization of public resources like labor and materials. Additionally, officials must constantly support efforts that boost productivity. labor, maintaining machinery, tools, and raw resources... to increase output and create industry; The State must know how to put capital into the most important industries, such as iron, steel, electricity, coal, mechanics... So that, the Party, State, and people will accumulate abundant capital for the country's industrialization. On the other hand, he specifically condemned the circumstance, saying that "there are officials and party members who still do not have the feeling of saving money in utilizing public resources, such as certain high officials who wish to "save" for themselves and use automobiles. The family's firewood is transported by state vehicles. That is individualism, State cars are to serve officials going to work, not to serve the housework of high-ranking official's family!" . Ho Chi Minh underlined the necessity for all levels, branches, cadres, and party members to further develop a feeling of accountability when employing the human and material resources of the people. Therefore, in addition to the necessity of establishing a State spending regime that "leaves no loopholes," it is also necessary to monitor and check on officials, stop public theft, embezzlement, and the chaotic working methods of some agencies of local leaders, Ho Chi Minh emphasized building a personal responsibility regime for officials, especially senior officials, in using public assets and public finances to decimate individualism with symbols: group interests, abuse of power, arbitrariness and against the public interests.

The solutions for monitoring and controlling cadres that Ho Chi Minh emphasized are: education by implementing the Party's organizational principles, especially self-criticism and criticism, combined with perfecting and practicing strict discipline, ensure the strictness of the law; Promoting the personal reputation of the leader, the active supervision of the people, the Inspection Committee, party organizations, and judicial agencies against offending cadres to "create a public atmosphere around them." They are indignant and morally boycotted." There must be no one to pat them on the shoulder or gently nudge them anymore!" . At the same time, it is necessary to check and supervise regularly, systematically, from top down, from bottom up, combined with inspection, supervises cadres inside and outside the Party to implement the policy: "Intellectualize workers and farmers, that helps the Party resolve class relations, consolidate, and expand the ideological foundation of the working class in the Party and society, and overcome the bureaucratization of cadres. These methods are applied by the Party and State to control officials in the use of public finances to prevent abuse of power, personal profiteering and build a regime of personal responsibility for officials when performing their duties.

4.2. Present situation and some matters mentioned in relation to policing officers' usage of public funds

4.2.1. Current situation of controlling officials, preventing corruption, waste, and disadvantages in the use of public finances

Ho Chi Minh highlighted the necessity of enforcing rigorous control over the Party's financial assets, revenue, and outlays as well as the establishment of a fair spending regime to have an impartial, unbiased inspection and monitoring system in place for the exercise of power chosen by the staff. Using the aforementioned perspective, the Party confirmed the policy in the 6th Congress (1986): "In thought as well as in action, we must thoroughly fight against corruption, against special privileges. With the conscience of communists, each cadre and party member should seriously consider whether they are living a healthy life, living by their own labor or not? Thoughts and actions of chasing money, selfishness, acts of violating socialist property, infringing on the people's interests, stealing public property, taking public property to give away, indulgence, "internal distribution", must be criticized and strictly handled." [17]. At the 8th Congress (1996), the Party underlined and made clear the demand: "Strictly inspect the use and expenditure of the state budget... continue to innovate public asset management in state agencies... Release the income and property declarations of party officials and public personnel from the top down to all levels [18]. At the 11th Congress (2011), the Party affirmed that it must "Effectively implement the declaration and disclosure of assets and income of officials and civil servants according to regulations" [19] associated with "Increasing Strengthen the audit, inspection, examination and supervision of the authorities [20]". In 12th Congress (2016), The Party clearly pointed out that promoting the prevention of corruption, waste and negativity requires strictly handling the responsibility of the leader when "cadres and civil servants violate the disregard their disclosures of assets and income [20]. "The 13th Congress (2021) highlighted "Effective control of assets and income of high-ranking people [20].

The results: Regarding the outcomes of the battle against bad effects, particularly the battle against corruption: Since the start of the 12th Congress, the Central Steering Committee on Anti-Corruption has Investigated, prosecute, and adjudicated 126 cases (637 defendants) that are serious, complicated, and of public concern; 3 defendants to be under death sentences, 13 prisoner serving life sentences, 8 people punished by 30-year sentences, 20 people punished by imprisonment from 20 to less than 30 years, and 546 have received sentences ranging from 12 months to less than 20 months and 16 cases of non-custodial reform. Typically, cases occurred at Vietnam Shipbuilding Industry Corporation (Vinashin); VN Pharma Joint Stock Company; Vietnam National Oil and Gas Group; The cases of Phan Van Anh Vu, Dinh Ngoc He, Nguyen Van Duong, and Phan Sao Nam; the case of Pham Cong Danh and his accomplices; AVG case; the case at Phuong Nam Bank; case at Hai Thanh Company, Navy case and a case related to project 8/12 Le Duan, District 1, Ho Chi Minh City; case at BIDV Bank, … In 2016, the asset recovery rate in corruption cases reached 26%. In 2017, it increased to 29.4%. In 2018, it decreased to 19%. In 2019, it reached 47.32%. In 2020, it went down to 38.43%. From the beginning of the term until now, in serious and complicated economic corruption cases that have been monitored and directed by the Central Steering Committee, more than 84,000 billion VND has been frozen and recovered [23]. Authorities uncovered 49 corruption cases (an increase of 63.3%) and 72 persons (an increase of 80%) in the first half of 2023. 7 of these cases and 14 individuals were found through internal inspection actions of these; 26 instances and 45 persons were found through inspection and examination efforts; By addressing grievances and accusations, 13 cases and 13 people related to corruption were discovered [24].

Regarding the outcomes of organizing and auditing the Party's finances and assets in budget revenues, expenditures, production, and business, including party committee finances, administrative unit finances, career unit finances, production units, and business units, as well as auditing the use of funds and assets that result in loss, waste, and the recovery of corrupt funds and assets. When there were indications of infractions during the 11th Party Congress, inspection committees at all levels inspected 55,250 party members; including checking 2,957 party members for signs of corruption and intentional wrongdoing and checking 263 party organizations on practicing thrift and combating waste, of which 1,143 party members were disciplined for corruption violations and intentional wrongdoing. The allegations of corruption and willful misconduct against 1,303 party members as well as six organizations that promote thrift and waste reduction have been settled by inspection committees at various levels. Many party members were sanctioned for their transgressions. Regarding inspection of party finances, budget revenues and expenditures and production and business, the 11th term inspected 7,825 party organizations, of which violations included losses due to embezzlement, corruption, and waste of VND 1,113 billion, leaving 1,493 billion VND out of accounting books, spending 970.145 billion VND incorrectly and recovering over 87 billion VND and other violations of 316.903 billion VND. Proposal to disburse over 87.312 billion VND, re-account 991.607 billion VND and assign the unit to handle 205.552 billion VND, of which 4.355 billion VND has been disbursed and recovered. Through inspection, there were 267 party members who committed financial violations, of which 40 had to be disciplined and 11 comrades had been disciplined [25]

The Inspection Committee examined 29,021 organizations' collection, payment, management, and usage of party fees at the start of the 12th Party Central Committee, as well as the financial activity of 2,693 party organizations in terms of budget revenue, spending, output, and business. Following inspections of six party organizations, the Central Inspection Committee suggested recovering about 112 billion VND from the budget and contributing more than 7 billion VND to the party budget; assigned units to consider and handle over 84 billion VND. The Inspection Committee of localities and units examined 2,687 party organizations for budget revenue and expenditure, production, and business, and 19,015 organizations for collection, remittance, management, and use of party fees; 122 organizations and 31 party members were found to have exceeded 386 billion VND in infractions, and they were asked to pay out and recover over 125 billion VND [26]. During the term, inspection committees at all levels regularly review and perform the task of inspecting party finances in association with preventing and combating corruption and recovering money and assets. In 2019, inspection committees at all levels looked at the production, business, and budgetary health of 3,163 party organizations, as well as the collecting, management, and usage of party fees at 33,604 organizations. 235 organizations were identified via inspection to have breached budget revenues, expenditures, production, and business to the tune of 396 billion VND, and they were asked to pay and reclaim more than 349 billion VND [27]. In the first half of 2012, inspection committees at all levels examined the budget revenue, expenditures, production, and business of 879 party organizations. They found 21 organizations to be in violation and demand payment, and they recovered nearly 2.5 billion VND. In 2021, Inspection Committees at all levels examined the revenue, payment, management, and use of party fees for 3,004 party organizations in terms of revenue, budget expenditure, production, and business (an increase of 23.7% compared to 2020) and 31,427 party organizations in terms of revenue, payment, and management of party fees (an increase of 10.7% compared to 2020) [28]. But it is still challenging to recover the assets of dishonest public officials.

According to the Party's summary, the financial transgressions of organizations and party members often fall under categories like disregard for management guidelines, use of state funds for capital projects, remuneration, and settlement. Site clearance, procurement of public assets, expenses for business trips, conferences, receptions, visits, and telephone calls: account for 60.8% of the total amount to be recovered; Violating regulations on party budget management in production, business, collection, payment, management and use of party fees, business travel, conferences, receptions, visits, phone calls...: accounting for 17.1% of the total amount to be recovered; Violating regulations on management and use of unit funds or contributions from collectives and individuals: accounting for 4.9% of the total violation amount to be recovered; Violations of regulations on management and use of other sources of money: accounting for 17.1% of the total amount of violations that must be recovered [29]. According to the Government Inspectorate's report, during the first six months of 2023, inspections uncovered 404 hectares of land and over 179,000 billion VND in economic violations, of which 148,000 billion and 14 hectares should be reclaimed. There were 27 instances where corrupt behavior by leaders was discovered, and 18 people received disciplinary action [30].

4.2.2 Some issues in supervising cadres in using public finance and economic development in Vietnam

Firstly, it is important to increase the effectiveness of supervising officials to combat corruption, consequences, and the issues of economic entities' truth, especially the private economy, in the government. According to the Papi Report 2022, the corruption control index in the public sector measures people's feelings and experiences about the effectiveness of preventing and fighting corruption at all levels of government. The four components of the Index include: Control of corruption in local government; Control corruption in public service provision; Fairness in recruiting human resources into the public sector; Determined to fight corruption of local authorities. Among them, the most notable trend is that the effectiveness of controlling corruption in the public sector of local governments at all levels will decrease in 2022, after continuously increasing in the period from 2015 to 2021. Although the anti-corruption campaign has been strongly implemented throughout the country, less than 75% of respondents in all provinces/cities thought that local authorities were serious in preventing and combating corruption. In 42 provinces/cities, this rate is below 50% . Besides, like the results of previous years, the situation of 'sharing expenses' to get a job in the state sector is still quite common in all provinces/cities. This problem is still common in poor provinces. Faced with the harassment of officials and civil servants, people only started reporting when the amount of money being solicited amounted to about 20 million VND to 43 million VND. This reflects the people's level of "tolerance" for corruption. Therefore, the requirement is to strictly inspect and supervisor officials, develop the effectiveness of anti-corruption for officials in the political system and senior officials at all levels; On the other hand, it is crucial to educate the official to be civil servants, self-control to prevent negative effects when working with common people.

Second, it is necessary to improve the effectiveness of supervising officials, highlight the responsibility of performing public duties and "untying" the private economy. In reality, this is a requirement for building democratic mechanisms and supporting the development of the private economy. The "Vietnam 2035: Towards prosperity, creativity, equity and democracy" report made the point that Vietnam's present institutions and structures continue to create difficulties to the private economy's activities. Currently, businesses in the private economic sector have obstacles when trying to acquire resources and face unofficial charges. In addition, these businesses also face difficulties in accessing information, capital, land and support from the Party and Government, especially the need for support in terms of human resources and capital. From Ho Chi Minh's perspective on strengthening supervision of cadres to improve their performance in serving the people, the requirement is to improve responsibility and set example of discipline, morality, and the dynamism of officials in doing duty, especially when working directly with people and businesses, to build businesses' truth in the Party's guidelines and the government policies. Solving this problem will clear institutional bottlenecks, innovate the national policy framework, minimize delays in implementing policies for the private economy, and support businesses in terms of capital and technology, investment opportunities in projects of providing public services. Therefore, a business environment will be built to ensure fair, equitable and healthy competition for the private economic sector, especially for small and medium enterprises.

4.2.3. Some solutions in supervising officials, preventing corruption of power, building a public and obvious political-legal environment creating motivation for Vietnam's economic development.

First, completing the Political Platform, Party Charter, Laws, State policy and regulations system, assigning strictly about controlling the power of officials. Regulations on preventing and combating negativity, declaring assets and income of officials and party members are fully regulated by the Party, contributing to limiting the situation of "internal distribution". But violations of regulations on management and use of state budget in capital construction, compensation for clearing the ground, procurement of public assets, party budget in production, business, collection, payment, and management the usage of party fees, business trips, conferences, visits, and telephone calls account for over 70% totally. The results of recovering finances and assets of corrupt officials are still difficult due to institutional limitations, leading to low efficiency. To solve this problem, Ho Chi Minh strongly emphasized and required the Party to resolutely eliminate the situation of "Black Funds" and "patronage" in localities and agencies by building a "Regime". State spending to create "binding" and close holes and loopholes to eliminate officials' private funds, funds that are beyond the control of the Party and State. At the same time, to provide an example and inspire people to imitate patriotism and provide financial support to the Party and state, the Party should also adopt regulations on the inspection and supervision of cadres and party members with regard to the practice of thrift, anti-waste, and patriotic emulation; Create the best conditions for party organizations, the media, and the public to monitor the use of officials' funds and public resources in order to develop a transparent and democratic work environment for officials by implementing regulations to do so. Moreover, the Party and State must develop a salary regime according to the job position and work performance of officials to prevent violations by officials.

Second, promoting the role of the Inspection Committee to improve the effectiveness of self-control of cadres in the political system. To ensure that the Audit Committee completes its political tasks, in addition to increasing the authority of the Audit Committee, the Party also needs to improve the power control mechanism in the political system, along with supplementing and amending regulations on rewards. and party discipline to protect the rights of officials, especially the Inspection Committee and officials doing inspection and supervision work. The Party needs to strengthen direction to improve the State's legal system so that the Inspection Committee has a legal mechanism to strongly and resolutely implement "requesting and recommending that party organizations and competent agencies amend and supplement, annul, and revoke documents that contravene the Party's regulations and State laws" contributing to minimizing the case of officials taking advantage of their position and authority to promulgate documents that contravene regulations, and building inspection institutions. It is important to Investigate and supervise officials scientifically and fairly, maintain the Party's order and discipline, prevent violations, wrongdoing, personal profiteering of party members, or collusion for group interests of the organization and party's members. The power of the People's Procuracy to inspect and supervise officials and party members in the political system needs to be strengthened, especially in the legislative and executive fields; The Procuracy needs to coordinate with Inspection Committees proactively and flexibly to early identify and prevent the corruption of power and seeking profit of officials.

Third, each officer establishes a personal reputation and communicates their obligations to the Party and the public; honestly and proactively declare their income and assets, as well as those of their family members; establishing a self-control plan, having measuring indexes, quantifying job quality to gauge one's own degree of accomplishment of tasks, and reporting to superiors honestly. According to specific measurement results each month and each year, cadre need to self-adjust for development. Besides, officials proactively learn and educate themselves about legal knowledge and warn themselves about the harm and results of corrupting power and profiteering from public finances. When organizing and implementing professional activities and performing tasks, be serious and know how to creatively apply guidelines and policies of the Party and State, and legal regulations in each situation, condition, and subject. Self-examination of legal requirements to determine whether one is acting legally compliantly, self-criticism to manage one's own conduct, optimal support for businesses in accessing finance and technology, and ensuring that rules, policies, and laws are applied fairly, seriously, and consistently.

Fourth, ensuring the independence of the judiciary. The Party's leadership and determine to build the National Judicial Council to protect party discipline, the Constitution, State law and judicial independence, and it is a valuable breakthrough solution for the Party to affirm its power and improve legal effectiveness in the fight against corruption of power. First, the law needs to have regulations on people's rights in building institution in organizations and operations of judicial agencies, combined with strengthening supervision of elected people and party unions of state-owned enterprises, the legal environment in private economy, especially receiving and resolving complaints and denunciations from citizens and degraded officials. Mechanisms and instructions need to be specific for the people to contribute, comment and receive people's feedback on judicial activities. Judicial independence must go along with a system of liability in the judicial system. First, it is necessary to train independent judges who depend only on the law with high promotions, long-term tenure, and high responsibility to prevent judges from being induced, threatened, or corrupted. At the same time, we need to build a team of truly talented judicial officers.

5. DISCUSSION AND CONCLUSION

According to Ho Chi Minh's ideology, supervising cadres in the usage public finances contributes to preventing corruption of cadres' power and educating cadres to work scientifically and willing to serve the people, therefore, the class problem can be solved by building a scientific and strict cadre control institution, granting economic subjects in society equal and democratic access, with the aim of building balanced institutions, appropriate political and legal corridors for economic development, encouraging private economic development, ensuring socio-economic activities within the proper framework, legality and efficiency society. However, currently, the situation of officials harassing and causing trouble for people and businesses in handling work has not been effectively prevented. In addition, self-inspection, and detection of corruption within agencies, organizations and units are still limited. Hence, to control officials in using public finances more effectively, the Party and

State must follow the principles of explicitness, openness, and objectivity in the performance of tasks of monitoring subjects to build professional, creative, and responsible groups, creating a strong motivation to promote sustainable development of Vietnam's economy.

CYBERSECURITY ISSUES IN CASHLESS PAYMENTS IN VIETNAM

Assoc. Prof. Dr. Ha Minh Son[1], MSc. Nguyen Thi Thuong Giang[2], MSc. Mai Thi Trang[3], MSc. Pham Thu Hanh[4]

Abstract: The article mentions the impacts of the fourth industrial revolution and digital banking on the development of non-cash payments at commercial banks. Research shows that non-cash payments are affected by cybersecurity issues in the new context, requiring changes to adapt. Analyzing the current situation, limitations and causes, the article mentions directions and solutions to improve quality and solve challenges to ensure that the digital banking development process is an issue for everyone, and with the Vietnamese banking industry.

Keywords: Non-cash payment, Cyber security

1. INTRODUCTION

In the context of the fourth industrial revolution, which is taking place increasingly strongly. Transforming into a digital bank is a sustainable development direction for Vietnamese commercial banks. Non-cash payment is an inevitable development trend, used by most Vietnamese people instead of cash payment. Therefore, applying digital technology to payment activities plays an extremely important role in helping banks compete and pursue development goals. However, an extremely painful problem today is the situation of property appropriation fraud targeting customers using digital banking services. To solve this problem, banks must always find ways to ensure maximum security, safety, and confidentiality for customers.

2. RESEARCH CONTENT AND RESULTS

2.1. Theoretical basis

Non-cash payment is a payment service activity performed by using payment methods/instruments to transfer money out of the account and money limit from the payer to the beneficiary's account. The way of mutual clearing of operations is through the payment service provider.

Non-cash payment appeared long ago in history. However, it only truly develops and is constantly improved in the market economy. Today, in any country, non-cash payments through payment intermediaries are widely applied, accounting for a large proportion of the total payment volume and tending to increase. Compared to cash payment, ATM is a payment method that brings many conveniences and outstanding advantages. With the development of digital banking, information technology, the emergence of new and modern payment means and services such as payment via internet, mobile phones, e-wallets, QR codes, wireless payments, etc. Contactless payment... makes payment processing activities increasingly convenient and easier for payment participants. However, the issue of network security has become a significant challenge.

Cyber security is the practice of protecting computers, networks, software applications, critical systems, and data from potential digital threats. Organizations are responsible for data security to maintain customer trust and meet regulatory compliance. They use cybersecurity tools and measures to protect sensitive data from unauthorized access and prevent business disruptions caused by unintended cyber activity. Organizations implement cybersecurity by streamlining digital defense across people, processes, and technology.

Information technology security: Protect data where it is stored and when it moves across information networks. While cybersecurity only protects digital data, information technology security holds the responsibility of protecting both digital and physical data from unauthorized intruders. Cybersecurity is a subset of information technology security. Cyber security ensures that digital data on networks, computers and personal devices is protected from illegal access, attack, and destruction.

2.2. Status of non-cash payments and cybersecurity issues in Vietnam

With the close guidance of the Government, non-commercial payment centers in Vietnam have been developing very actively. According to a report by the State Bank of Vietnam, in 2020, the number of payment transactions via the Internet reached nearly 374 million with a value of more than 22.4 million billion VND (an increase of 8.3% in quantity and 25,000 billion VND). 5% in transaction value compared to the same period in 2019). The number of payment transactions via mobile phones also reached nearly 918.8 million with a value of nearly 9.6 million billion VND (an increase of 123.9% in quantity and 125.4% in value over the same period). last year).

Infrastructure and technology serving non-cash payments, especially electronic payments, continue to receive investment attention, improving quality, better meeting the growing payment needs of society and adapting to modern developments. international economic integration process. The interbank electronic payment system is operated safely, effectively, and smoothly. The automatic electronic clearing system serving retail payment transactions with real-time payment capabilities, multi-channel and multi-media transaction processing is being tested to be officially put into operation. Serving the needs of money transfer, retail payment transactions, and payment of utility services. According to statistics from the Payment Department, State Bank of Vietnam, as of August 2021, in Vietnam there are 77 organizations implementing payments via the internet, 45 organizations providing payment services via phone. mobile; 30 banks deploy QR codes, 90,000 points accept QR code payments; 37 organizations providing payment intermediary services (including electronic payment gateway services, collection and payment services, and e-wallet services); 34 organizations providing electronic payment gateway services; 9 organizations providing electronic money payment services; has installed nearly 19,600 ATMs (AGB, VCB, CTG, BIDV and TCB are the leading banks in the number of installed ATMs), 280,418 POS/EDC (led by banks: VCB, CTG, BIDV, AGB); 16.92 million e-wallets have been activated...

Payment channels: New, modern technology in payment such as applying fingerprint authentication, facial recognition, using quick response codes (QR Code), card information encryption, contactless payment, mPOS technology... is researched, cooperated, and applied by banks, especially payment by QR Code associated with promoting payment via mobile phones in accordance with the development trend in the world and Consumer behavior. Non-cash payment activities through new payment channels such as mobile phones and the internet have grown by leaps and bounds. After 4 years (from August 2016 to August 2020), the number of payments via mobile phones increased by 980.9%; Payment value increased by 793.6% (in which: BIDV, MBB, STB are the banks recognized to have the highest transaction value via mobile phones among Vietnamese commercial banks). Payment services (money transfer, phone top-up, online bill payment...) via the internet at banks are deployed to varying degrees. Payment via POS is mainly carried out by most large banks (VCB, CTG, MSB, STB...). Small banks such as VIB, TPB, EIB... but focus on developing electronic banking services, have POS equipment infrastructure systems invested in and distributed for use in many locations. POS payment sales are quite large. For payment via ATM, large-scale banks, leading in providing electronic banking services such as AGB, CTG, VCB, STB, MBB, TCB... are banks with a few items and Transaction value accounts for a high proportion.

The State Bank of Vietnam licenses the operation of organizations providing intermediary payment services, focusing on the features of phone top-up, payment via QR code, and payment of phone service bills. mobile phones, electricity and water bills, internet, financial loans... ATM and POS systems continue to receive investment attention and improve quality.

Non-commercial payment methods are constantly increasing. Account opening and use by individuals continues to increase. According to statistics, Vietnam currently has about 30 million people using the banking payment system every day, and the growth rate of mobile banking services in recent times is 200%. To date, there have been over 76 payment service providers deploying payment services via the Internet and 41 organizations providing payment services via mobile phones.

However, according to a survey by the Vietnam Information Security Association, more than 50% of cyber-attacks are aimed at financial institutions and banks. Meanwhile, according to statistics from the Department of Information Security (Ministry of Information and Communications) in the first half of 2020, this agency recorded 2,017 cyber-attacks on information systems in Vietnam; Of which, there were 805 phishing attacks, 788 defacement attacks and 296 malware installation attacks. These surveys also show that the banking industry is facing a few cybersecurity challenges: Hackers attack the banking data system through the banking partners; Directly attack the website, change the interface to extort money and get data; Penetrating the system to execute money transfer orders to appropriate information and assets of commercial banks and customers; setting up websites impersonating commercial banks to scam customers... Thus, all three entities participating in the digital banking space: banks, customers and affiliated partners of commercial banks can all become “gateways” for criminals. cyber attack

While commercial banks pay special attention to ensuring network security, their partners do not place much importance on this issue; and in many cases there is insufficient information security capacity and infrastructure. In fact, there have been cases where commercial banks were attacked just from promotional emails that they hired a third party to perform. If to overcome the commercial bank’s security system, hackers must have a certain level of skill, then attacks from banking service users are much simpler, with tricks... like hitting the heart. Greed and ignorance of customers. Many recent incidents have occurred in the form of customers being lured into logging into fake websites of commercial banks and declaring security information to receive gifts and money sent from abroad... Most recently, TCB discovered Fraudsters take advantage of the need to borrow money from people who have lost their jobs or have reduced income due to the Covid-19 epidemic, impersonating commercial bank employees and soliciting loans through a form they have devised: liquidating loan documents.

Many people are not aware that personal information is also an asset that needs to be protected. Because personal information such as identity card number, bank account number, phone number, or date of birth... they often easily leave on social networks, through purchases, Online shopping has become a guide for crooks looking for fraud.

2.3. Some limitations need to be overcome

Although there have been many positive changes in developing and promulgating policies to promote payment through banks for public services (taxes, electricity, water, tuition, hospital fees and social security programs), Developing payment means and infrastructure to serve non-cash payments... but the scale of non-cash payments is still limited compared to other countries in the region and the world.

During the period 2011 - 2020, the cash/GDP ratio in Vietnam increased from 13.3% to 19.84% (the global average is at 9.6%, the Asian region is between 5% - 10%.); The ratio of payment in cash/total means of payment is almost unchanged (fluctuating between 11.33% and 12.3%), not reaching the set target (by the end of 2020, the ratio of non-cash payment is less than 10% of total means of payment).

Crime in the fields of high technology and electronic payment has recently had complicated developments with new, more sophisticated behaviors and tricks. Therefore, measures to ensure security and safety for payment services based on high technology platforms need to continue to be of concern to banks, strengthening their control capacity.

2.4. Cause of limitation

Some main reasons leading to limitations in non-commercial payment methods in Vietnam are:

First: there are still shortcomings in the legal system controlling financial technology activities in the banking sector, especially with new financial services. The rapid development of technological advances has rapidly changed online payment methods, but legal regulations have not kept up. Currently, Vietnam does not have a specific legal framework for exploiting, sharing, and storing cloud computing data, blockchain and some online products; There are no regulations requiring commercial payment for transactions of great value such as real estate, cars...; There is no regulation on the minimum sales ratio that requires non-commercial payment for large-scale retail businesses.

Second: investing in non-cash payment infrastructure with modern technology is quite expensive, so commercial banks also need to consider and calculate to ensure operational efficiency. In addition, a part of the human resources team at commercial banks has not met the professional requirements of electronic banking services, does not have access to advanced and modern technologies, and has not mastered the knowledge of information technology.

Third: the non-cash payment infrastructure system in rural, mountainous and island areas is still small, people do not have access to modern payment services and utilities. Currently, on average, in rural and mountainous areas there are only about 2.2 transaction points/administrative area (the Northern mountainous region has only 0.7 transaction points/district); Meanwhile, this number in districts, towns and cities is approximately 40 transaction points. The number of installed ATMs is mainly concentrated in 5 big cities: Hanoi, Ho Chi Minh, Hai Phong, Da Nang, Can Tho (accounting for nearly 50%).

Fourth: The level of integration of banking infrastructure and applications with other industries and service fields also has limitations, requiring continued coordination to improve the efficiency and operating capacity of the systems. To apply electronic payments for public services (electricity, water, healthcare, traffic fees, etc.), relevant parties need to have a mechanism to share data and customer information, building an open programming application communication system (Open IPI) connecting with relevant ministries and branches to create a smooth payment mechanism. However, this problem has not been completely resolved due to information security requirements and problems in the way and ratio of income/cost allocation between suppliers and information sharing.

Fifth: people's cash usage habits, especially older consumers; Concerns about the level of safety in electronic payments, the costs to pay when accepting to use modern payment services (fees for using e-banking services, fees for purchasing hard token devices) ...) are also reasons hindering the development of non-commercial payment centers in Vietnam.

3. ORIENTATION FOR THE DEVELOPMENT OF RETAIL BANKING IN VIETNAM

Starting from the importance of non-cash payments, the opportunities brought by the 4.0 technology revolution, population situation and market demand, reducing the rate of cash payments, improving the quality of non-cash payments services is the trend. inevitable in the development of non-commercial payment centers in Vietnam. To achieve this goal, the following directions need to be implemented:

First: Continue to innovate and apply 4.0 technology achievements, prevent risks, and network security in non-cash payment activities. In the current strong digitalization of banking activities, in 2021 Vietnam currently has more than 97 million people, about 70% of the Vietnamese population uses the internet, nearly 60% of the population has social network accounts, on 5 million subscribers use smart phones, the trend of online shopping is increasing, especially since the emergence of the covid-19 pandemic...

Second: Continue to deploy and expand new, modern payment services such as QR code, mPOS, Ecom, card payment encryption technology (tokenization), contactless payment on mobile devices mobile wallets, mobile money... thereby contributing to gradually changing people's cash payment habits and increasing the non-cash payment rate.

Third: Promote non-commercial payment methods in the public sector and public administration. Review, reorganize, and improve the quality of the card acceptance device network; Developing non-commercial payment centers in rural, mountainous, island, and remote areas associated with the national strategy on comprehensive financial development.

4. SOLUTIONS TO ENSURE NETWORK SECURITY WHEN DEVELOPING CURRENT PAYMENT CENTERS

4.1. On the side of the State and the State Bank of Vietnam

Amend and complete the legal corridor, guiding documents, and detailed regulations on digital identification methods (digital ID), electronic user identification procedures (e-KYC), and operations management. E-banking operations are safe, effective and prevent risks. Clearly define the rights and responsibilities of the entities participating in payment, on that basis, control legal risks appropriately, in accordance with international standards and practices approved by financial institutions, recommended international currency, or commonly applied in many countries around the world. There are effective measures in monitoring, detecting, and handling fraud; Strengthen the work of ensuring security and safety in electronic payments. The State Bank needs to continue to improve the legal framework for new products and services; create a legal environment that promotes innovation of Fintech organizations, encouraging safe and effective Fintech solutions.

Adding regulations that large value transactions (such as 100 million VND or more) require commercial settlement; Large-scale retail businesses must ensure a minimum percentage of revenue paid by bank transfer according to regulations. This ratio can be determined differently according to the size of the enterprise, according to the business area and gradually increases according to a certain roadmap.

Promulgate a data sharing mechanism, build an open programming application communication system (Open IPI), complete the system connecting the electronic payment infrastructure of commercial banks with the infrastructure of tax authorities, Customs, and state treasury to serve the request for coordination of state budget collection electronically. Develop synchronous and unified national information communication and payment technology infrastructure among financial institutions and payment intermediaries.

Research and apply international standards and practices on information system security and safety into legal documents regulating IT application activities of credit institutions and payment intermediaries.

Applying an IT risk assessment framework according to international practices to improve the quality of inspection and compliance with safety and security regulations at credit institutions and payment intermediaries.

Supervise and urge credit institutions to complete the implementation of the Plan to apply safety and security solutions in online payments and bank card payments; Promote the implementation of the plan to convert magnetic cards to chip cards.

Direct credit institutions to strengthen their specialized information security apparatus. Continue to promote the activities of the banking industry's IT security incident response network.

Coordinate with authorities of the Ministry of Information and Communications, Ministry of Public Security, Ministry of National Defense, and organizations providing IT infrastructure services... to share information and support safety activities, cybersecurity of the banking industry.

Continue to promote communication work and raise awareness for officials and employees in the banking industry and the people in identifying and minimizing the risks of banking activities in cyberspace. Propagate, guide, and have a mechanism to encourage non-commercial payment for collection of taxes, fees, and public services through banks, encourage individuals, businesses... to pay periodic bills in the form of non-commercial payment, Promote payment of pensions and social insurance benefits through banks.

4.2. Regarding commercial banks and payment service providers:

Continue to innovate and apply modern technology in banking activities towards developing digital banking. Complete the bank's transaction processing process towards digitalization, automation, safety, and convenience.

Regularly update and apply advanced measures to ensure security and safety for the payment system.

Banks need to promote the development of internal security policies, password setting mechanisms, and develop post-disaster troubleshooting procedures; Focus on investing in tools and software programs to support information system security to minimize cases of system intrusion, data loss, malicious code attacks...

Developing non-commercial payments, especially electronic payment channels, requires each bank to have a large payment environment.

Developing a roadmap and plan to develop payment settlement services of payment service providers needs to target the poor, low-income people, rural residents, remote areas, and businesses. small and micro enterprises following the policy of comprehensive financial development.

Develop and apply modern payment and money transfer models that are easy to use and suitable for conditions in underdeveloped economic areas and disadvantaged groups.

To promote non-cash payments in rural, mountainous, island, remote and remote areas, it is necessary to strengthen the combination between banking and telecommunications based on using the existing networks of banks, post offices and organizations. Providing intermediary payment services.

Review, complete and organize the implementation of IT security policies and IT risk management policies in compliance with State legal documents and regulations of the State Bank of Vietnam

Develop a plan to complete and implement the tasks specified in documents of the State Bank of Vietnam

Develop a roadmap to apply international security standards for the system.

IT as well as online payment and card payment services (ISO 27001, PCI/DSS).

Strictly review the registration and activation processes for using e-banking services to ensure service provision to the right customers.

Deploy review, risk assessment and security solutions for the entire life cycle of an information system.

Equipped with systems to support electronic transaction monitoring, fraud investigation, gradually synthesize and analyze customer data and develop a set of rules to detect and prevent fraud early; Develop criteria and software to identify unusual transactions based on time, geographical location, transaction frequency, transaction amount, number of incorrect logins attempts or unusual signs. other.

Build a cyber security operations center to track, monitor and promptly prevent cyber intrusions and attacks. Regularly evaluate weaknesses and vulnerabilities of IT systems. Develop and deploy rehearsals of processes and scenarios to respond to network information security incidents.

Strengthen the IT apparatus at all levels towards specialization, mastering technology, and limiting dependence on external partners. Build a team of specialized information security officers who are ethical and disciplined to prevent collusion with cyber criminals.

Develop, update scenarios, and organize internal drills on responding to security and order incidents at least once a year.

Strengthen internal audit work to ensure the safety of professional operations and IT infrastructure.

Strengthen communication to customers about the tricks of cyber criminals and measures to protect personal information in using e-banking services and card payments.

Set aside a certain financial resource for investment in technical infrastructure and application of modern science and technology, including security technology.

Information sharing between banks also needs to be enhanced to limit the risk of being attacked. Because there are very simple vulnerabilities, you only need to warn each other to be able to handle the error, but there is currently no exchange mechanism or handling method to deal with emergency situations.

4.3. On the customer side

Absolutely do not provide confidential information about electronic banking services (access password, OTP, password to access personal e-mail address) to anyone and in any form (texting), answering the phone, revealing directly...). Personal information indicator unless proactively calling the hotline (1900545413) for assistance and the bank requires coordination in providing customer identification information.

Avoid visiting untrustworthy websites, or clicking on any links that ask to provide or update personal information and electronic banking service information. After finishing using the service or completing online payment transactions, you must log out of your account. Absolutely do not choose to save your Internet Banking login password on shared devices, public computers, etc.

Users need to protect and regularly change passwords to access electronic banking services, cards, e-mail, and password settings to ensure safety principles. Priority is given to using a personal computer with updated anti-virus software installed to access the bank's electronic banking services.

Regularly update new operating systems and software from suppliers, avoid updates from fake sources.

With credit cards: In addition to not letting others borrow the card and storing the card carefully, customers should not leave too much money in the ATM card or set the lowest possible limit for the credit card. In addition, cardholders should proactively deactivate Internet Banking services when they do not need to use them and reactivate them when needed; Register for SMS Banking service to promptly capture arising transactions. This is also an effective measure to protect your account.

5. CONCLUSION

Developing non-commercial payment centers is an inevitable trend in countries, of which Vietnam is no exception. To achieve this goal, it is necessary to synchronously apply solutions at both the macro and micro levels. Technology plays an important role in banks' long-term strategies to improve operational efficiency and manage risks. risks and thereby have more opportunities for development. Obviously, investing in technology is necessary, but above all it is also a matter of responding to security issues and enhancing network security. When solutions to minimize risks when using digital banking products and services, banks are interested in investing in; Improved people's knowledge will gradually eliminate people's fear when using banking products and services, thereby promoting non-cash payments.

DEVELOPING CREDIT GUARANTEE ACTIVITIES FOR SMALL AND MEDIUM ENTERPRISES: INTERNATIONAL EXPERIENCE, CURRENT SITUATION AND RECOMMENDATIONS FOR VIETNAM

MA. Pham Tien Dat[1], MA. Dao Quang Truong[2], MA. Nguyen Thi Thu Hien[3], MA. Tran Thi Bich Thuan[4], MA. Luu Nguyen Phu, MA. Trinh Quoc Hoa[5]

Abstract: Accessing credit capital for small and medium-sized enterprises in Vietnam still faces many difficulties due to lack of collateral, information transparency as well as management quality. Credit guarantee was born with the goal of helping businesses access credit more effectively by providing debt repayment guarantees on behalf of businesses. This model has now developed in many countries around the world with positive impacts recorded, especially in Japan and Korea. The article focuses on analyzing the current situation of credit guarantee activities in Vietnam, thereby finding the causes, combining with international experience to propose policy recommendations.

Keywords: Credit guarantee, credit institutions, small and medium enterprises

1. INTRODUCTION

Basically, credit guarantee is an activity in which a guarantee organization confirms that it will replace the guaranteed party (borrower) to fulfill its obligations to a third party (lender). This activity has the participation of at least 3 parties: credit institutions (CIs), credit institutions (in Vietnam, credit institutions) and customers (small and medium enterprises - SMEs). After the Credit Union Fund has fulfilled the debt payment obligations to the Credit Institution for the customer, the customer will need to accept the debt and repay the Credit Union organization the amount paid by the Credit Union organization as well as related fees to guarantee.

Credit Code has a positive impact on all three main entities involved: SMEs, credit institutions, mainly commercial banks; Government and economy. (i) For businesses, credit guarantees help reduce guarantee transaction costs, increase insurance payout capabilities (including reducing transaction costs, increasing discount amounts and improving recovery levels); overcome problems in mobilizing capital for SMEs and be effective in stimulating growth; (ii) For commercial banks, risk sharing will help increase opportunities to expand lending capacity and create better relationships with businesses; (iii) For the Government, Credit Code is an effective tool to narrow the gap between supply and demand in the finance of SMEs, contributing to diversifying the financial system and market, and is a premise for mobilizing resources. power of other financial institutions and contribute to the country's economic growth.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

One of the pioneering studies on this issue is Beck and colleagues (2010). The author presented data on 76 credit guarantee programs in 46 developed and developing countries.

The results showed that government has an important role in financing and management, but less in risk assessment and remediation. Thus, this is one of the (empirical) evidence of the formation of guarantee funds with the participation of the government. However, the way funds operate differs in different countries.

Later, some Vietnamese authors such as Vu Thi Phuong (2017) focused on analyzing and evaluating the current state of operations of the Credit Guarantee Fund to support SMEs in Vietnam during 2015 - 2017 based on the aspects of providing services for the enterprises and the number of services provided. Authors Dang & Chuc (2019), Dang Thai Binh (2020) also believe that SMEs account for a large number and play an important role in creating jobs and the development for a country. However, SMEs also encounter many difficulties, the most challenging being the difficulty in accessing capital. To help SMEs overcome this difficulty, many countries around the world use Credit Guarantee as an effective tool to support SMEs more easily in accessing capital and promoting development.

In his doctoral thesis, author Dang Thai Binh (2017) used quantitative research to evaluate the relationship between credit guarantee and financial indicators of enterprises and Hungary's macroeconomic indicators have shown that credit guarantee plays a positive role for financial institutions by helping to share risks with banks, also helping banks expand lending, reduce costs in the lending process and reduce banks' capital requirements. From a macro perspective, credit guarantee has a significant effect on stabilizing the economy and is a contributing factor to GDP growth and job guarantee.

Research by Ngo Thi Lan Phuong (2018) on perfecting the legal framework on the organization and operation of the SME Credit Guarantee Fund has evaluated the current status of the process of creating and developing the legal framework for establishment, organization and operations of the Credit Guarantee Fund for SMEs in Vietnam. On that basis, the topic has proposed solutions to improve the legal basis. However, the topic focuses on perfect legal solutions for credit guarantee funds for SMEs, not mentioning solutions for credit institutions and SMEs in creating the development of credit guarantee activities, so the comprehensiveness of the solution is not guaranteed. At the same time, the thesis has been implemented since 2017, so the effectiveness of the implementation process of *Decree No. 34/2018/ND-CP of the Government dated March 8, 2018 on the establishment, organization and operation of Credit Guarantee Funds for medium and small enterprises (effective from March 8, 2018)* has not been evaluated.

3. RESEARCH RESULTS

3.1 International experience in developing credit guarantee activities for SMEs

Japan and Korea are two countries that have built effective systems of credit guarantee funds, contributing greatly to the development of SMEs as well as the economy. In Japan, as of 2018, loans guaranteed by credit guarantee organizations accounted for more than 10% of the total value of loans to SMEs. While in Korea, credit guarantees cover 1/3 of SMEs, the value of guaranteed loans accounts for 15%.

In Japan

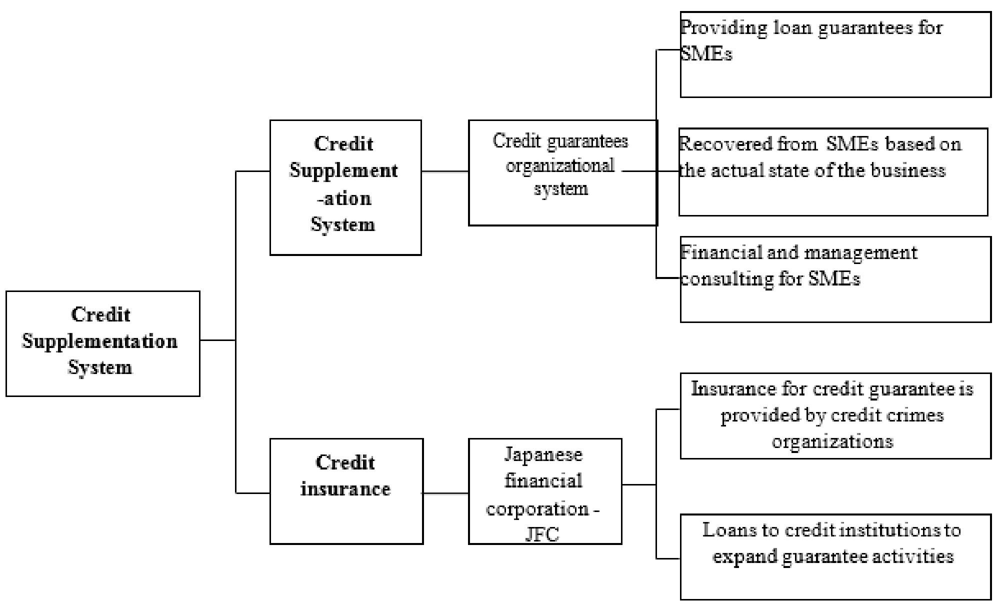
Japan is the leading country in solving capital difficulties for SMEs. Although it is a country with the world's leading economy, with thousands of economic corporations and multinational companies operating, up to 99% of all operating Japanese businesses are SMEs. SMEs in Japan mostly belong to traditional industries, but always have a combination of traditional national characteristics with modern techniques and technology. SMEs in Japan act as the backbone of the economy, creating jobs for about 70% of the total workforce, contributing to social stability.

Until 2018, of the approximately 250 trillion yen of outstanding loans to SMEs, guaranteed loans accounted for more than 10%, equivalent to 26 trillion yen.

Operational organization model

In Japan, the credit system is strictly organized in a common model for all relevant financial institutions. This model is called "Credit Supplementation System - credit support system". This system includes: Credit Guarantee and Credit Insurance.

Figure 1: Japan's credit support system



(Source: Ngo Thi Lan Phuong, 2018)

In the above system:

(i) The Credit Union carries out the activities of a system of guarantee organizations for SMEs to borrow capital from credit institutions, and at the same time provides financial and technical support to these organizations. The credit support system in Japan consists of a credit system operated by 51 companies established throughout Japan. The credit guarantee system and the credit insurance system work together to enable the credit replenishment system in Japan to fulfill the important task of facilitating the provision of business capital to SMEs.

(ii) Credit insurance, under the responsibility of Japan Financial Corporation (JFC). Japan Financial Corporation is a comprehensive policy-based financial institution wholly owned by the Government of Japan that reinsures secured debt provided by credit guarantee corporations.

Credit guarantee conditions

Enterprises are eligible for Credit Guarantee when determined to be small and medium sized. In Japan, the classification of businesses is based on two main criteria: charter capital and number of employees. The division also depends on the field of production and business activities.

Subjects of credit guarantee in Japan are expanded to most SMEs. In fact, according to the criteria, only businesses that satisfy the conditions for SMEs can be eligible for a guarantee. This increases support for businesses in this country. This is a very open and fair approach for businesses. The fact that businesses have different financial targets will determine the guarantee costs they pay to guarantee organizations.

Credit guarantee fee

The guarantee fee rate is determined as a percentage of the loan value and is determined by reviewing the risk guarantee database system for SMEs (CRD). The high or low guarantee fee rate depends on the credit risk level of businesses as assessed by the Credit Union organization. Accordingly, the guarantee fee will range from 0.45-1.9% with 09 different levels of normal guarantees.

Guarantee fees are paid annually or according to the contract signed between the SME and the guarantee organization. In case an SME cannot repay the loan from a credit institution and the credit institution must subrogate the right to pay on its behalf, the SMEs, instead of paying the guarantee fee, will have to pay the loan interest (on the amount paid by the guarantee organization). for credit institutions) with interest rates fluctuating between 14-15%/year.

About credit insurance

To create a legal corridor for insurance activities, Japan has issued the Law on Credit Insurance for SMEs (in addition to the Law on Credit Guarantees and the Law on Support for SMEs). Credit insurance mechanisms and processes are specifically stated in the content of the Law on SME Credit Insurance. After signing Credit Guarantee contracts with SMEs and credit institutions, Credit Guarantee funds can sign insurance contracts (for the guaranteed amount for SMEs). In case the guaranteed person fails to pay loans at credit institutions, credit institutions will notify the Credit Guarantee Fund, and the Credit Guarantee Fund will replace the right of businesses to pay loans to credit institutions. The value of these payments will then be covered by insurance at a rate of 70-90% of the value of the loan. The Credit Guarantee Fund will then recover the loans from businesses, and at the same time must be responsible for paying JFC an amount (equal to the amount received from the business multiplied by the percentage of insurance balance received after loan recovery).

In Korea

The number of Korean SMEs accounts for 99% of the total number of businesses (more than 3.5 million businesses), 88% of the total number of employees, and 1/3 of the total export output of the entire economy of this country. According to statistics, thanks to KODIT's credit guarantee, the number of SMEs receiving loans increased significantly, from 35.7% in 1975 to 76.7% in 2015. During the period 2017-2021, Credit guarantees in Korea continue to grow strongly. By the end of 2021, the accumulated guarantee value reached more than 66 billion USD, an increase of more than 1.5 times compared to 2017.

Up to now, the credit guarantee system for SMEs is divided into 3 main channels including: (i) Korea Credit Guarantee Fund (Korea Credit Guarantee Fund - KCGF, now KODIT): operating under the Law on Credit Guarantee Fund No. 2696 dated December 21, 2019. 1974 ; (ii) Korea Technology Credit Fund (KOTCH); (iii) Local Credit Guarantee Fund: established by local governments and operates according to their own resolutions. The guarantee system is very closely organized and managed from central to local levels. For example, the Korean Credit Guarantee Fund and the Technology Credit Guarantee Fund are supervised by the National Finance Committee, while the local Credit Guarantee Fund is managed by the SME management board.

Guarantee conditions

All profit-seeking business entities or their organizations are eligible to receive credit guarantees unless they are in ineligible industries including: (a) hotel business, entertainment condominium , (b) luxury restaurant business, (c) financial services, (d) real estate brokerage services. Ineligible companies include (a) companies that are inactive, (b) companies that are delinquent on bank loan payments, (c) companies that submit false documents, (d) companies that are regulated issued by the person responsible for payment under the guarantee.

Guarantee fee structure

Before 1998, KODIT still applied a fixed guarantee fee rate for borrowers, accordingly for SMEs it was 1.0% and for large enterprises it was 1.5%. However, after that point, KODIT built a guarantee fee system tied to the applicant's credit rating. The basic fee rate ranges from 0.5% to 3.0% of the guarantee amount calculated according to the respective rating of the applicant. The final fee is determined by adding or subtracting a certain percentage from the base fee, depending on the applicant's current situation or the type of guarantee product. For a large company, an additional 0.5% is added to the final fee.

Guarantee rate

KODIT calculates the weights according to the company's credit rating, guarantee cycle, and guarantee receipt period. However, KODIT also stipulates the maximum guarantee level for guarantees. Normally the guarantee rate ranges from 50-80%. The maximum guarantee level can be calculated according to revenue or equity. Accordingly, the maximum guarantee level ranges from 1/6 - 1/2 of annual revenue. Meanwhile, according to equity capital, the guarantee level is about 3 times the equity capital. In fact, the maximum guarantee is about 2.7 million USD (in special cases the guarantee can be up to 6.3 million USD). The average guarantee level reaches 180 thousand USD.

3.2 Current status of credit guarantee activities in Vietnam

In Vietnam, the Credit Guarantee Fund to support SMEs in Vietnam is currently implemented according to Decree No. 34/2018/ND-CP dated March 8, 2018 of the Government (replacing Decision No. 58/2013/QD-TTg dated March 8, 2018). October 15, 2013 of the Prime Minister on promulgating the Regulations on the establishment, organization and operation of the Credit Union Fund to support SMEs (Decree 34) is an off-budget state financial fund organized in the local, established by the People's Committee of provinces and centrally run cities; operating not for profit, preserving and developing capital; Perform the function of issuing credit cards to support SMEs according to the law.

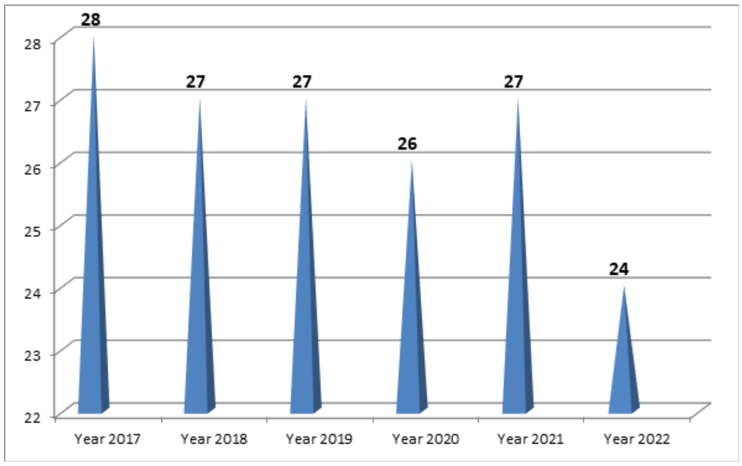
Some indicators reflect credit crime activities in Vietnam, specifically:

Regarding the number of Credit Union Funds

Since Decree No. 34 was issued, the Credit Guarantee Fund's operating model has been more clearly defined than before. Currently, the funds operate under the model of a one-member limited liability company with 100% charter capital held by the state. According to the report of Credit

Guarantee Funds, as of December 31, 2022, the whole country has 30 provinces and centrally run cities that have established Credit Guarantee Funds for SMEs. By the end of 2022, the number of Credit Guarantee funds in localities is 24 funds (Figure 2).

Figure 2: Number of localities establishing Credit Guarantee Funds or having credit guarantee activities over the years



(Source: Compiled from Credit Guarantee funds)

The Fund's operating method is chosen flexibly. Accordingly, there are 05 funds operating independently, 11 funds entrusting the local state financial fund, 8 funds assigning tasks to the local state financial fund.

Regarding the financial resources of the Credit Union Fund

The financial resources of the Credit Guarantee Funds are mainly support from the local budget to provide initial charter capital and additional charter capital. In addition to support from local budgets, the Credit Guarantee Fund's financial resources are supplemented from income from interest on deposits at commercial banks, trust capital from economic agencies and organizations or from investment activities on capital. principles of development and capital preservation. By the end of 2022, the total capital of the fund system will reach more than 1,570 billion VND.

Until December 31, 2022, a number of provinces and cities have paid attention to arranging local budgets to provide charter capital and additional charter capital to create more financial resources for the Fund. Of the total 24 Credit Guarantee Funds, 11/24 Funds (accounting for 40.7% of the total Credit Guarantee Funds) have a minimum charter capital of 100 billion VND. Besides, some localities have not met the minimum capital regulations, these funds have charter capital from 4 - 80 billion VND (accounting for 59.3%).

About Credit guarantee activities

The guarantee turnover of the entire fund system reaches 4,272 billion VND in the period 2002-2022, an average per year of 214 billion VND, so the average annual guarantee fund is about 9 billion VND.

The number of credit deeds/contracts issued in the period 2018-2022 is 2,146 units, with an equivalent amount of VND 2,614 billion, the number of valid deeds at the end of 2022 is 1,305 units, with a value of 2,614 billion VND. equivalent to 1,833 billion VND.

In fact, the guarantee activities of Credit Guarantee Funds reached their highest level during the implementation period under Decision No. 193/2001/QD-TTg, Decision No. 58/2013/QD-

TTg. From 2018 onwards, when Decree No. 34 was issued, Credit Guarantee Funds focused on organizational structure, supplementing charter capital, and implementing according to the provisions of Decree No. 34, so the operations of Credit Guarantee Funds reduce.

Some difficulties and problems

Firstly, support policies are not commensurate with the contributions of the system of SMEs and lack uniformity. In fact, in recent times the Government has recognized the contribution of SMEs in the economy, accordingly issuing many support policies, such as policies on credit, science and technology, and market development. However, policies are not really commensurate with the systemic contributions of SMEs.

The introduction of support policies but accompanied by (strict) conditions made the support policies ineffective. In fact, the 2% interest rate support policy, SME support fund, and Credit Guarantee fund for SMEs are all considered difficult to access for businesses. The fact that more than 55% of businesses surveyed have difficulty accessing credit is proof of the above statement (VCCI, USAID, 2023).

Another issue that also needs to be mentioned is that policies are not synchronized. Regarding the credit guarantee fund for SMEs, the lack of promulgation of regulations on credit insurance for guarantee activities makes this activity not closed, cohesive, and does not ensure uniformity and completeness. Therefore, when implemented, it does not bring maximum efficiency.

The experience of countries such as Japan and South Korea shows that, since the 60s and 70s of the 20th century, these countries have been aware of the large role of the system of small and medium enterprises, so the design of policies at highest level (Law) with synchronization, commensurate with the position of businesses. Guarantees are based on trust, capital is created from the budget as well as other mandatory and regular sources, making capital mobilization activities highly effective. In addition, the parallel development of the credit guarantee insurance system enables funds to deploy and expand business support activities.

First, there is a lack of effective capital mobilization mechanism, especially the lack of participation of commercial banks

Currently, according to regulations, the capital of the Credit Union Fund is formed from the local budget and other sources such as receiving support, aid, mobilization from credit institutions, and receiving management from localities. However, Decree 34 does not stipulate that credit institutions, businesses, professional associations and individuals contribute capital to the fund. Some credit institutions have previously contributed capital to the fund according to Decision 193 and Decision 58. Withdraw capital from Credit guarantee funds.

According to experience in Korea and Japan, financial resources for credit union organizations are provided directly from the Government, local authorities or indirect capital sources from credit union associations (in localities in Japan). Japan), insurance companies (Japan Financial Corporation). In Korea, capital sources for the operations of KODITs are specifically stipulated in the Law from 03 sources: State budget, contributions from credit institutions and from other organizations and individuals. Mobilizing capital for funds is legalized, making financial contribution regulations mandatory for credit institutions, so mobilized capital is also higher. In Korea, commercial banks contribute capital from loans with interest (mandatory). In 2022, capital from commercial banks will account for 70% of funds in this country.

The allocation of capital from localities is still limited. The reason is said to be due to some localities not being drastic in exercising their rights and responsibilities in developing and maintaining the fund's operations, the ability to apply Decree No. 34 is still limited...

Second, the model of organizing credit funds in localities causes funds to be dispersed, limiting the ability to concentrate capital

The organization of funds in localities makes the Credit Union Funds small. The modest scale and capacity of the Credit Guarantee Fund does not really meet the needs of SMEs in guaranteeing loans to serve production and business activities; The role of connecting capital with commercial banks has not yet been demonstrated.

In countries with effective credit risk fund models, this fund is often organized according to the central model (can be combined with regional and local models) such as Korea, Japan... This allows Funds can support large projects that have a high impact on the business community. In addition, the organization according to the central model will ensure professionalism in operations, and the quality of business appraisal and evaluation activities will be promoted and improved.

Organizing according to the local model makes it difficult for some localities (small localities with limited funding) to mobilize enough funding for the operating fund. Therefore, the guarantee fund organization model does not meet the capital requirements of businesses.

The limited ability to mobilize capital, along with local organization, leads to dispersed capital sources, making the guarantee value for businesses limited. According to a survey by Pham Tien Dat and colleagues (2023), up to 78.42% of businesses surveyed assessed that low guarantee value is a high level obstacle (level 4-5, the 2 highest levels in the survey). The level assessment scale is built) when they access credit, in which the proportion of businesses assessing this as a low level obstacle (level 1-2) is only 5.03%.

Third, the requirement to have collateral limits the access of businesses

According to regulations, the fund's guarantee must have collateral - while this is a limitation for SMEs. Compared to directly borrowing capital from banks, borrowing capital through the guarantee activities of the Credit Guarantee Fund requires SMEs to meet additional requirements in terms of documents, procedures and related fees.

According to the results of a survey by OECD (2021) and a survey by Pham Tien Dat and colleagues (2023), SMEs evaluate requiring collateral as a major obstacle in accessing credit. Up to 87% of businesses surveyed rated this obstacle at a high level (level 4-5). This makes it difficult for SMEs to access information. Some businesses responded that there was almost no information about the Credit Guarantee Fund. The proportion of businesses that had ever applied for a guarantee was only 17%.

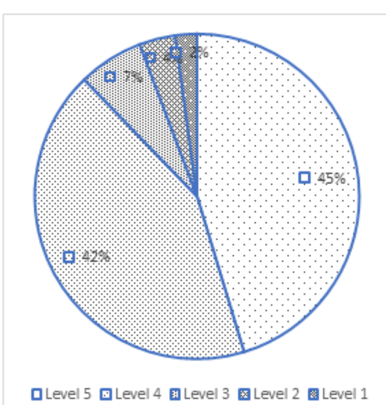


Figure 3: Assessment of SMEs on collateral issues

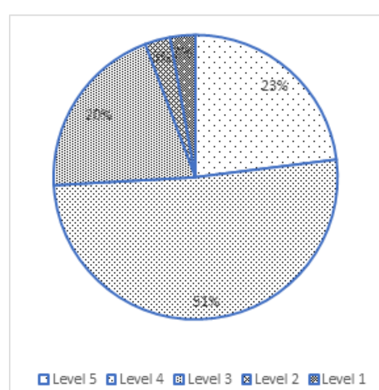

Figure 4: Evaluation of SMEs on consulting and support from staff

(Source: Pham Tien Dat et al, 2023)

Fourth, the guarantee fee regulations lack flexibility

Currently, the guarantee fee regulations are fixed, not based on the guarantee value, risk level of the guarantee, credit rating of the business, or field of operation of the business. This will discourage attracting businesses with financial potential and good financial capacity to the fund. At the same time, businesses are not encouraged to improve the quality of corporate governance to enjoy lower guarantee fees.

According to the experience of other countries (Japan, Korea), the regulation of guarantee fees is based on factors such as guarantee value, risk level or credit rating of businesses. The low risk level and high credit rating of the business mean lower guarantee fees and vice versa. This creates a driving force for businesses to improve their management and operations and contribute to the overall development of the country's economy.

According to the results of Pham Tien Dat and his colleagues (2023), the proportion of businesses evaluating high guarantee fees and lack of flexibility as obstacles in accessing credit at a high level (level 4-5) is 74.1. %, while the proportion of businesses that think this is a less important issue (level 1-2) is only 5.8%

Fifth, the quality of the fund's human resources is still limited.

Currently, human resources at the funds are still working part-time, the qualifications of staff are uneven, and experience in supporting credit crimes is limited. Especially skills related to assessment and appraisal of investment projects, credit appraisal, and financial reporting of businesses.

According to the results of Pham Tien Dat and colleagues (2023), the proportion of businesses evaluating consultants as not giving full and clear instructions on the guarantee process and appraisal activities accounts for 75.5%, while Only 8.6% of businesses think this has been done well.

4. DISCUSSION AND CONCLUSION

First, improve the ability to mobilize capital for funds

There are solutions to attract more participation from the non-budget sector, especially credit institutions, in creating capital for the fund. In the long term, it is necessary to research and build a legal framework at the highest level to create a premise for the operation of Credit Guarantee funds (Law level): Law on Credit Guarantee for SMEs. Accordingly, when creating capital of the Credit Union Fund to support SMEs, a certain percentage of the profits of commercial banks is deducted. This is the experience of some countries that have succeeded in developing this model such as Japan and Korea. In Korea, commercial banks will deduct 0.3% of the capital loaned to the economy to contribute to the fund.

In the short term, ensuring the fund's capital will be realized when interested localities arrange in their budget estimates to provide enough capital for the Credit Union fund; At the same time, strengthen inspection and supervision of the implementation and management of the credit fund, promoting local socio-economic development. Local governments need to have a proper awareness of the role of Credit Guarantee funds for local sustainable development. There needs to be more mechanisms to support commercial banks in contributing to the fund, as well as being active in lending activities to SMEs.

In addition, it is possible to allow the Credit Union Fund to mobilize capital from foreign funds to increase charter capital, thereby creating resources for the development fund and providing practical support to SMEs (through trust).

Second, aim to establish a model of Credit Guarantee fund focusing on national and regional scope

The establishment of a national Credit Guarantee fund will facilitate the consolidation of resources towards local funds such as branch systems and have mechanisms to supplement resources from reserve funds and refinance to increase capital scale. charter, helping the fund system operate more effectively. You can refer to the Korean Credit Guarantee Fund (KODIT) model to implement this fund.

This guarantee fund is unified nationwide and may be directly affiliated with the Government or a ministry or branch. Associations are the organizations closest to businesses, while 4.0 technology has allowed the collection of credit rating information, the results, and who can be guaranteed and guaranteed. to what extent.

Third, remove problems regarding guarantee conditions for collateral

Resolving these problems is an important prerequisite to promote credit crime activities. Accordingly, amendments should be considered in the direction of not requiring SMEs to use existing assets or reduce the proportion of mortgage value/total loan value to implement security measures at the credit guarantee fund.

Based on the reputation and credit rating of SMEs, funds can offer mortgage rates lower than the loan value. This will help businesses promote their ability to mobilize capital and remove difficulties for businesses.

Based on the reputation and credit rating of SMEs, funds can offer mortgage rates lower than the loan value. This will help businesses promote their ability to mobilize capital and remove difficulties for businesses.

This solution will also come with recovery risks. Therefore, setting up risk reserve funds and diversifying capital mobilization channels for funds is necessary to maintain the stability of capital sources of these funds.

Fourth, guarantee fee regulations are flexible.

The collection of guarantee fees is based on a number of factors, the important of which is related to the credit rating of SMEs and the credit profile of these businesses. Besides, it also depends on the funds' ability to mobilize capital. During operation, the collection of guarantee fees must be public and transparent for all SMEs when accessing the fund. For example, the fee is from 1.5-2.5% per year, there must be a maximum limit (2% is reasonable at the present time).

Fifth, improve the quality of the fund's human resources

Organizing retraining for the fund's human resources is very necessary. The person in charge of managing these funds must have management capacity and should not concurrently hold many different positions. Regarding salaries for employees, a special salary regime based on performance should be applied to encourage them in their work. In addition, it is necessary to organize forums/seminars to connect SMEs and banks to provide information and advice to businesses on products and loan procedures./.

DETERMINANTS OF CAPITAL STRUCTURE OF LISTED PHARMACEUTICAL ENTERPRISES IN VIETNAM

Dr. Bui Thi Ha Linh, Du Thi Nhung[1], Tran Hà Anh[2]

Abstract: Capital structure plays an important role since it contributes to the overall stability of a company. This study, thus, aims to analyze the firm-specific factors influencing the capital structure of pharmaceutical businesses listed on the Vietnamese stock market. This paper studied 12 pharmaceutical firms that have been listed on the Ho Chi Minh City Stock Exchange (HOSE) and the Hanoi Stock Exchange (HNX) in the period 2013 – 2022. Regression model analysis with panel data was used to find out the determinants of the company's capital structure in 6 independent variables (profitability, growth, size, tangibility, liquidity, and non-debt tax shields). Research findings have demonstrated a statistically significant negative correlation between profitability, growth, and liquidity and the capital structure measured by the debt ratio. Although it also decreases with non-debt tax shields, this variable does not have statistical meaning with the dependent variable. Size is the only variable with a positive correlation coefficient, but no statistical significance was found either. The results of the study can help these firms build a reasonable capital structure to enhance their intrinsic value.

Keywords: determinants, capital structure, listed pharmaceutical enterprises.

1. INTRODUCTION

The pharmaceutical industry actively contributes to the advancement of human health associated with the development of the society as a whole in Vietnam. According to the assessment of IQVIA Institute, Pharmerging Markets is a group of 17 countries with the highest growth in the pharmaceutical industry in the world and Vietnam is ranked in the 3rd group of 12 countries with a growth rate of 14% - just behind Argentina, Pakistan. In the long term, the pharmaceutical industry has a lot of growth potential due to the sizable of Vietnam's population and the rapid growth of the aging population as evidenced by more than 12% of the population in 2021 is the number of people aged 60 and over. Additionally, there is a proportional increase in overall health care spending and pharmaceutical use per person as customer incomes and awareness of health care issues rise. By 2031, Fitch Solutions estimates that Vietnam's healthcare spending might total $37.7 billion by 2031 and reach 2.1 million dong per person in 2026.

However, the outbreak has revealed that the urgent weakness of Vietnam's pharmaceutical industry today is the dependence on 80-90% of imported production materials, of which China and India are the two main suppliers. During the pandemic, the price of most raw materials has increased due to API shortage as well as the exorbitant transportation and distribution costs. Moreover, the complicated developments of the Covid-19 epidemic caused restrictions on movement, which hampered the progress of the cooperation between Vietnamese pharmaceutical enterprises and foreign partners. In addition, because of the ongoing conflict between Russia and Ukraine, some ingredients and drugs imported from Europe are at risk of shortage.

In general, the pharmaceutical sector in Vietnam has a great deal of potential for growth, but recent economic changes in the country, particularly the complicated COVID-19 pandemic, have had a significant impact on the capital structure of the pharmaceutical enterprises.

Depending on the characteristics of each enterprise's position, the industry in which they operates, as well as the effects of macroeconomic fluctuations of the economy and culture, businesses need to determine what kind of capital structure is going to help them be successful and achieve their objectives. Determining whether or not a decision to use a loan or a company's equity is appropriate based on the relationship between the factors influencing the use of financial leverage and the capital structure, subsequently make recommendations for improving the effectiveness of using financial leverage, thereby increasing asset value for businesses.

2. LITERATURE REVIEW

It is undeniable that determining the firm-level optimal capital structure is one of the fundamental issues that must be faced and attracts a lot of attention from managers and scholars throughout the globe. As a result, several empirical researches on the factors influencing capital structure have been carried out over the years using various research methods with a variety of sectors and industries.

(Sikveland & Zhang, 2020) investigated the factors that affect the capital structure of all corporates in the highly cyclical Norwegian salmon farming industry. Based on a single panel data set over 14 years from 2001, they concluded that profitability has a positive effect on liquidity but a negative effect on short-term debt and total debt. They also further found that listed companies have a higher liquidity and less total debt than private companies, which helps them lessen their risk of bankruptcy but may result in lower profitability.

Despite being the same study in Norway but distinct from the study above in the aquaculture industry, the paper of (Marius et al, 2022) focuses on the capital structure of 5474 hospitality industry during the period of 2008– 2018. Regarding the industry's feature of seasonality, the research result revealed that it increases the proportion of long-term debt in the capital structure. Besides, the higher the geographical concentration of hospitality companies, the greater their dependence on short-term debt. More specifically, a region's high concentration of businesses intensifies the harsh rivalry that depletes cash and necessitates the use of short-term debt as a replacement.

In the Indian contex, the research of (Anshu et al., 2014) opted to analyse the key factors that affected the capital structure of listed companies between 2001 and 2010 that included both government and private sector firms. The authors have discovered seven out of ten independent variables through regression analysis that profoundly affect the leverage structure of 870 publicy listed corporations. These elements consist of profitability, growth, asset tangibility, size, cost of debt, tax rate, and debt serving capacity.

As opposed to the (Anshu et al., 2014)'s study, (Zahid et al, 2021) has demonstrated that Pakistan's manufacturing and service sectors do not perceive the tax rate to be a main contributor of capital structure. The study constructed a database of 30 companies and then analyzed through correlation and multi megression analysis. Furthurmore, the authors declared that the common point of both fields is that tangibility materially unfavorable associated with leverage. Taking into account the differences, leverage has an adverse impacts on profitability and growth in the manufacturing sector while it presents a non-significant positive effect in the service sector. In the manufacturing sector, size and leverage have a positive non-significant relation; nevertheless, in the service sector, they have a positive significcant relationship.

The same viewpoint was shared by (Zahid et al, 2021), (Miroslav et al, 2012), and (Huang and Song, 2005), which all supported the existence of a subtantial and negative association between profitability and leverage in their papers. (Miroslav et al., 2012) examined the capital structure of 3175 small and medium-sized enterprises (SMEs) from seven Central and Eastern European (CEE) countries during the period 2001–2005 whereas (Huang and Song, 2005) employed a sample of more than 1200 listed companies in China for a period of 10 years, between 1994 and 2003. Moreover, (Huang and Song, 2005) further confirmed that firm size, non-debt tax shield, and tangible assets rise in the same direction in tandem with leverage.

As in other countries, particularly in Russia, where (Maria, 2014) concentrated on financial capital structure in the pharmaceutical sector. This study has used data from 2006 to 2011 of 144 private pharmaceutical firms. The key findings proved that profitability, size, assets structure, and short-term liquidity are negatively linked to capital structure. Additionally, the stability of the macroeconomic system and institutional environment is another crucial external factor that influences the decision of capital structure.

Another study in the pharmaceutical industry with consideration of corporate governance of Pakistan-listed firms was carried out by (Saeed et al, 2014) over the period of 2004 – 2011. The results indicate that, aside from size and tangibility, the remaining five explanatory variables (profitability, growth, liquidity, earning volatility, non debt tax shields) relating to business characteristics, are at the capital structure-specific significance level. Besides, except than CEO duality, two corporate governance factors (CEO tenure and board size) have a sharply influence on the company's leverage.

In addition, numerous studies have been undertaken using Vietnamese evidence. In order to analyse the factors affecting capital structure of businesses in emerging markets, (Vo, 2017) applied the GMM estimator based on a dataset from companies listed on the Ho Chi Minh City Stock Exchange between 2006 and 2015. Although the positive growth opportunity coefficient is significant in the regression describing the ratio of long-term debt to short-term debt, it is not significant in regressions for both long-term and short-term leverage.

With aspect to tangible assets, (Vo, 2017) and (Dzung Nguyen, 2012) both proposed its opposite direction in relation to short-term and long-term leverage. To be more precise, it is positively correlated with long-term leverage and negatively correlated with short-term leverage. The contrary perspective, according to (Nguyen Thi Phuong Nhung, 2017), is that tangible ratios have a favorable impact on short-term leverage.

The factors influencing the capital structure of real estate enterprises are the subject of research by Nguyen Thi Phuong Nhung (2017). From 2010 to 2015, a sample of 34 real estate businesses registered on the Ho Chi Minh City Stock Exchange was gathered. The authors informed that real estate companies typically employ debt to finance their investments and also highlighted the significant positive effect of asset structure, which in the same vein as Tran and Ramachandra (2006). Both the long-term and the short-term debt ratio are negatively impacted by net income. The non-debt tax rate is useless for determining the short-term debt ratio but it aids businesses in lowering the long-term debt ratio.

(Dzung Nguyen, 2012) evaluated the capital structure components of 116 non-financial companies listed on the Ho Chi Minh Stock Exchange or the Hanoi Stock Exchange in the period

2007-2010 through the GMM approach. The findings exhibit that leverage is positively linked to profitability and liquidity while negatively linked to state ownership and growth. Similar to the directiom in tangibility previously indicated, firms size increases with short-term leverage and decreases with long-term leverage.

(Thu Minh Thi VU, 2020) concentrated on researching how corporate governance influences the capital structure selections of 336 Vietnamese companies registered on the Ho Chi Minh City Stock Exchange between 2015 and 2019. Then, the regression was established and tested by utilizing a variety of statistical method approaches, including the pooled OLS, the fixed effects model. This paper could not find any proof that management ownership and board independence are related to company capital structure. Besides, board size, state ownership, and concentrated ownership all positively affect the capital structure, but foreign ownership appears to have the opposite effect.

Regarding the pharmaceutical sector, (Thanh & Trang, 2021) obtained information of 23 pharmaceutical and medical corporations with shares are listed on the Ho Chi Minh Stock Exchange (HOSE) and the Hanoi Stock Exchange (HNX) between 2016 and 2020. The authors then ran a number of analyses on this data, including the Pooled OLS Model, Fixed Effects Model (FEM), Random Effects Model (REM), and Feasible Generalized Least Square Model (FGLS). The outcomes suggest that capital structure has a positive association with growth opportunity but it has a negative association with profitability, tangible assets, business size, and liquidity. Nevertheless, it is discovered that there is no statistically significant relationship between debt ratio and firm age and pluralist executives.

In conclusion, the determinants of capital structure have drawn the attention of numerous scholars worldwide, providing corpus of study across different areas and also producing a range of outcomes, sometimes even contradictory ones. The authors have evaluated various variables related to firm characteristics (profitability, growth opportunities, firm size, fixed assets, age, non-debt tax shield, liquidity) and corporate governance elements (CEO duality, CEO tenure and Board size). Moreover, they have taken into account various external factors, such as macroeconomic factors and industry-specific factors. Therefore, the different paper results could be a result of different industry traits, variable choices, temporal and spatial scales, or estimation analysis methods.

3. RESEARCH AND METHODOLOGY

This paper is an investigation into the components of the capital structure of businesses with shares listed on Vietnamese stock markets. To begin with, gathering information from the audited financial statements of the Vietnam-listed pharmaceutical businesses over the period of 2013-2022.

Based on previous studies, the following four techniques were used in this study to evaluate hypotheses: pooled ordinary least square (Pooled OLS), the fixed effects (FEM), the random effects (REM), and the feasible generalized least square (FGLS). The most appropriate regression method is determined by utilizing the Wald, Breusch-Pagan, and Hausman tests.

With the respect to research model, this study employed a linear regression model to evaluate the hypotheses regarding capital structure and determinants impacting it. In order to be consistent with the development situation as well as the features of pharmaceutical firms listed on the Vietnamese stock market and public information on the financial statements of these companies, this research has inherited, adjusted and given the following regression model: The dependent variable is the

Debt ratio (Total debts/Total assets)and the independent variables contain Profitability, Growth opportunity, Firm size, Tangible assets, Liquidity, Firm age, and Non-debt tax shields. Therefore, the detailed model is:

- ***Pooled OLS model***

$TD_{it} = \beta_0 + \beta_1 PROF_{it} + \beta_2 GROW_{it} + \beta_3 SIZE_{it} + \beta_4 TANG_{it} + \beta_5 LIQ_{it} + \beta_6 AGE_{it} + \beta_7 NDTS_{it} + \varepsilon_{it} + \mu_{it}$

- ***Fixed effects model***

$TD_{it} = \beta_0 + \beta_1 PROF_{it} + \beta_2 GROW_{it} + \beta_3 SIZE_{it} + \beta_4 TANG_{it} + \beta_5 LIQ_{it} + \beta_6 AGE_{it} + \beta_7 NDTS_{it} + \varepsilon_{it} + \mu_{it}$

- ***Random effects model***

$TD_{it} = \beta_0 + \beta_1 PROF_{it} + \beta_2 GROW_{it} + \beta_3 SIZE_{it} + \beta_4 TANG_{it} + \beta_5 LIQ_{it} + \beta_6 AGE_{it} + \beta_7 NDTS_{it} + \varepsilon_{it} + \mu_{it}$

In which:

TD_{it}: Capital structure of company i in year t

$PROF_{it}$: Profitability of company i in year t

$GROW_{it}$: Growth of company i in year t

$SIZE_{it}$: Size of company i in year t

$TANG_{it}$: Tangible assets of company i in year t

LIQ_{it}: Liquidity of company i in year t

AGE_{it}: Age of company i in year t

$NDTS_{it}$: Non-debt tax shields of company i in year t

$\varepsilon_{i,t}$: Stochastic error term of company i in year t

μ_{it}: Error term of company i in year t

The study has synthesized and offered hypotheses to examine the association between debt ratio and seven independent variables on the basis of capital structure concepts and findings from reviewing the available literature.

Profitability (PROF)

Profitability is reflected in this study is return on assets (ROA). Theoretically, profitability has a positive effect in the trade-off analysis and the opposite effect in the pecking order analysis. On the one hand, the trade-off argument suggests that profitable businesses should take on additional debt in order to safeguard their profits from taxes. Jensen (1986) and Williamson (1988) define debt as a management tool to ensure that managers pay out profits rather than expand their empires. On the other hand, pecking order theory states that an organization is more likely to replace debt with internal funds if it has substantial internal financing (i.e. retained earnings). The company will turn to issue bonds and equity if such capital is insufficient to avoid dilution control. Profitable firms hence typically use less debt in this situation. Despite the theoretical controversies, the majority of empirical investigations support the negative correlation between ROA and debt ratio: Titman and Wessels (1988), Huang and Song (2005), Miroslav et al (2012), Maria (2014), Saeed et al, (2014), Vo (2017), Sikveland & Zhang (2020), Zahid et al (2021), Thanh & Trang (2021). Therefore, the hypothesis is:

H1: Profitability has a negative relationship (-) with debt ratio

$$PROF = \frac{Net\ profits}{Total\ Assets}$$

Growth opportunity (GROW)

The direction of the link of the relationship between growth and capital structure is not consistent according to different theories. Under the agency cost model, financial covenants and restrictions put in place by lenders hinder organizations' ability to pursue investment opportunities, causing firms with high growth opportunities to neglect debt. In accordance with the trade-off theory, companies with higher prospects for growth tend to possess lower debt ratios since growth-oriented investments could pose a significant level of risk. However, it is discovered that there is a favorable correlation between capital structure and growth opportunity. This result is supported by pecking order theory, businesses with promising future growth prospects are probable to borrow more money. Several studies conducted in Vietnam indicate that firms finance their growth with debt: Tran & Ramachandran (2006), Biger và cộng sự, 2008), Vo (2017) and (Thanh & Trang, 2021). Therefore, the hypothesis is:

H2: Growth opportunity has a positive relationship (+) with debt ratio

$$GROW = \frac{Total\ Assets(t) - Total\ Assets(t-1)}{Total\ Assets(t-1)}$$

Firm size (SIZE)

The natural logarithm of the company's total assets is used to calculate its size. The pecking order theory proposes a negative one while the trade-off hypothesis predicts a positive association. With regard to the pecking order theory, larger organizations with less asymmetric information concerns have a tendency to own equity rather than debt, ultimately resulting in lower leverage. Agency theory, like trade-off theory, conveys a positive relation between size and agency costs, with large enterprises having higher agency costs than small firms (Jensen & Meckling, 1976). This theory holds that due to the conflict between shareholders and managers, large companies tend to take on greater debt as the terms of the loan agreement control the behavior of managers. In addition, larger companies are often more accessible and affordable for debt as a result of corporate diversification and the ability to derive tax benefits. Likewise, Rajan & Zingales (1995) also claim that large firms with better transparency from higher disclosure requirement have have a lower degree of asymmetric information leading to a lower financing cost. Hence, lenders prefer to to lend to larger enterprises given their higher credit ratings and perceived lesser risk and bankruptcy risk (Bevan ,2002). Most empirical studies confirm this positive relationship: Rajan & Zingales (1995), Huang and Song (2005), Tran and Ramachandran (2006), Biger et al (2008), Miroslav et al (2012), Saeed et al. (2014), Dung & Thanh (2019). Therefore, the hypothesis is:

H3: The size of firms has a positive relationship (+) with debt ratio

SIZE = Ln(Total assets)

Tangible assets (TANG)

Tangible asset is a variable reflecting the structure of assets of the enterprise, determined by the ratio of fixed assets to total assets of the enterprise. Based on the theory of agency costs and trade-off costs, owning a lot of fixed assets can assist it easier for firms to obtain loans because of their security. Thus lowering the creditor's risk of suffering such agency costs of debt. This implies a positive relationship between debt ratio and tangibility. Therefore, the hypothesis is:

H4: Tangible assets have a positive relationship (+) with debt ratio.

$$TANG = \frac{Fixed\ Assets}{Total\ Assets}$$

Liquidity (LIQ)

Short-term solvency plays a crucial function in terms of enhancing company value. In this study, the current ratio is utilized as a measure of liquidity. In accordance to the trade-off theory, businesses with high liquidity typically have greater debt ratios since they can guarantee their contractual obligations on time, which shows a favorable connection between liquidity and capital structure. In contrast to the trade-off theory, the pecking order theory reveals that corporations frequently favor using internal capital from retained earnings over external capital. This means that outside financing will not be required if corporations can generate more retained earnings with their assets sufficient for investment usage. Therefore, this shows that there is a negative relationship between liquidity and debt ratio. Therefore, the hypothesis is:

H5: Liquidity has a negative relationship (-) with debt ratio

$$LIQ = \frac{Current\ Assets}{Current\ Liabilities}$$

Firm age (AGE)

Based on the trade-off theory, younger firms may not be profitable enough to pay the cost of debt. In other words, this theory indicates that firm age has a positive effect on leverage ratio. In contrast, the pecking order theory suggests that older companies will use less debt than younger companies because these older companies have more time to attract, collect and accumulate funds. They are, thus, easier to finance at a lower cost because of their reputation and repayment history. REPORT Therefore, the hypothesis is:

H6: Firm age have a negative relationship (-) with debt ratio

Non-debt tax shields (NDTS)

Depreciation scaled by total assets is employed to define non-debt tax shields. Titman and Wessels (1988) and Thharmalingam et al (2016) have the same view that the non-debt tax shield has a negligible effect on leverage. However, according to a study by Saeed et al. (2014), non-debt tax shield is strongly connected with tangibility and also discloses a favorable correlation with leverage. Contrary to this conclusion, Wald (1999), Deesomsak et al (2004), Huang and Song (2005) and Biger et al (2007) provide evidence that leverage decreases with non-debt tax shields. The trade-off theory foretells that the primary rationale for choosing debt over equity is to cut down on corporation tax. However, firms can use non-debt tax shields such as depreciation to reduce corporate tax. Thus, a higher non-debt tax shield reduces the potential tax benefit of debt and hence it should be inversely related to leverage. Therefore, the hypothesis is:

H7: Non-debt tax shields have a negative influence (-) on debt ratio

4. EMPIRICAL RESULTS

Table 4.1: Descriptive statistics of variables

Variable	Obs	Mean	Std. dev.	Min	Max
TD	120	.3573629	.2275981	.0096549	.9706117
PROF	120	.0990183	.0696936	.0032114	.2693029
GROW	120	.1672888	.8371662	-.4475544	9.125333
SIZE	120	27.71113	.9494824	25.71591	29.90804
TANG	120	.1999885	.1177621	.0049418	.5719393
LIQ	120	2.78763	1.39697	1.01335	8.406104
AGE	120	9.225	4.253446	0	17
NDTS	120	.0230665	.0123341	.0007562	.0522423

The findings of the regression analysis are presented in this section. First, table 4.1 summaries statistics on capital structure and independent variables over the entire sampling period. Debt ratio is the dependent variable and seven independent variables including profitability (ROA), company growth (GRO), company size (SIZE), tangible assets (TANG), liquidity (LIQ) and non-debt tax shields (TAX). These attributes are obtained from 12 pharma companies listed on HOSE and HNX over a 10-year period from 2013 to 2022, i.e. 120 observations.

According to table 4.1, the debt ratio, i.e. total debt/total assets, of the firms in the sample ranges from 0.96% to 97.06% with an average of 35.74%. It appears these enterprises are unlikely to have a preference for utilizing debt or equity as a source of financing. The gap between the maximum debt ratio and the minimum debt ratio is 96.1%, indicating the diversity in capital structure among firms.

Analyzing the independent variables, it was discovered that the profitability, growth, and tangibility ranged significantly while the remaining potential determinants such as size, age, liquidity and NDTS did not. Specifically, the average value of profitability during ten year period is roughly 10%, with a range of 0.32% to 27%, indicating the significant variation in performance across companies. A substantial gap around 57% is shown in tangibility, with the average of approximately 20%. Most businesses possess considerable fixed assets, which renders them to enhance debt financing by using these fixed assets as collateral. Moreover, the average growth value of 0.167 displays the impressive growth rate of most companies over the study period due to the minimum growth value of –0.447% and maximum value of 9,125. This can be attributed to the robust rebound following the Covid epidemic. Meanwhile, the size and age ranges from are 25.71 to 29.09 and 0 to 19 respectively, along with the averages of 27.71 and 9.22. This insignificant difference results from the fact that the majority of the businesses in the data are medium- and large-sized businesses in the pharmaceutical sector. Furthermore, liquidity has a maximum value of 1.01 and a minimum value of 8.4, suggesting that the examined entities have generally acceptable current ratios and are much less probable to suffer from liquidity risk.

To ensure the effectiveness of the study, the VIF test was performed to test the phenomenon of multicollinearity. VIF value in the range from 1.07 to 3.26 and the mean VIF = 2.02 value which are lower than 10. Thereby, the regression model does not have multicollinearity.

For the purpose of ascertaining the determinants of the capital structure of listed pharmaceutical companies, this paper adopts three different methods to estimate the panel regression model including the pooled ordinary least square method, fixed effects, and random effects models.

Pooled Ordinary Least Square (Pooled OLS) model

Based on the Pooled OLS model results, Prob > F = 0.0000 denotes the significance level of the F-test with the hypothesis H0 (the independent variables are zero), here the hypothesis H_0 is rejected and the model is statistically significant. Adjusted R-squared value of 0.6463 reveals that the model's independent variables account for around 64.63% of the variation in the dependent variable.

It can be seen in the regression table that four explanatory variables (PROF, GROW, TANG and LIQ) are all negative significant associated with the dependent variable at the 5% level because there are negative and less than 5% p-values. To be specific, the coefficients of PROF and GROW are -0.5419 and -0.0476 respectively meaning that when PROF or GROW increases by one unit, the company's TD reduces by 0.5419 units in terms of other factors remain unchanged. Similarly, when TANG or LIQ rises by one unit, the TD will decrease to 0.5331 units or 0.0938 units, respectively, regardless of other independent variables staying constant. On the contrary, there is no correlation between the dependent variable and the three variables (SIZE, AGE, and NDTS) that have p-values greater than 5%.

Fixed Effects Model (FEM)

F test that all u_i=0: F(11, 101) = 9.69 Prob > F = 0.0000

When compared to OLS, the FEM outcomes reflect a certain difference. Compared to the OLS model, the FEM contains fewer statistically significant variables. In particular, TANG has no statistical significance with the dependent variable in the study model with a p-value of 0.497, which is in excess of 5%. Along with the SIZE, TANG also has a positive association with TD in the FEM analysis despite having a negative relationship with TD in the Pooled OLS model. With a coefficient value of 0.1507, it may be assumed that an increase in tangible assets will lead to a rise in the debt ratio of 0.1507 units under all other independent variables are kept constant.

The overall R^2 value of 0.5303 reports that all seven explanatory variables in the model contribute to 53.03% of the variance in the debt ratio.

Additionally, the correlations value between error terms and regressors (corr(u_i, Xb) = 0.1323) , showing that under the fixed effects model, errors $\mu_{it}\mu_{it}$ are associated with the regressors. Given the value of rho 0.6397, the differences between panels in the sample's sample account for 63.97% of the variance.

F-test is performed to decide between Pooled OLS model and FEM. The hypothesis H_0, which posits that all individual intercepts are zero (Fixed effects = 0), is rejected based on Table 4.3, where Prob > F = 0.0000 i.e p-value = 0.0000 < 5%. As a result, FEM is the preferred model.

Random Effects Model (REM)

Table 4.4: Regression result following Random Effects Model

```

_cons	-.3458037	.7735465	-0.45	0.655	-1.861927	1.17032
sigma_u	.06918041					
sigma_e	.09942693					
rho	.32620266	(fraction of variance due to u_i)				

The random estimated findings depicted in Table 4.4, which are consistent with the FEM results, further proof that TD correlated with PROF, GROW, and LIQ instead of with SIZE, TANG, AGE, and NDTS. Additionally, FEM analysis exhibits that GROW and TANG have negative and positive effects on the dependent variable, respectively. However, opposite results is shown in the FEM which means that GROW has a positive effect and TANG has a negative effect on the debt ratio.

Table 4.5: Breusch and Pagan Lagrangian multiplier test

```
Breusch and Pagan Lagrangian multiplier test for random effects

        TD[FIRM,t] = Xb + u[FIRM] + e[FIRM,t]

        Estimated results:
                        |       Var     SD = sqrt(Var)
                ---------+-----------------------------
                      TD |   .0518009       .2275981
                       e |   .0098857       .0994269
                       u |   .0047859       .0691804

        Test: Var(u) = 0
                             chibar2(01) =    48.23
                          Prob > chibar2 =   0.0000
```

In this case REM is more effective than Pooled OLS because Prob > chibar2 = 0.0000 is less 5%.

Hausman test is applied in order to select an efficient in the panel model between FEM and REM. The Hausman test results below shows prob > chi2 = 0.0000 < α with α = 5%. Therefore, H_0 hypothesis is rejected and H_1 is accepted with the significance level of 5%. As a result, the panel data regression was analysed by the fixed effects model in this study.

Table 4.6: Hausman test

    chi2(7) = (b-B)'[(V_b-V_B)^(-1)](b-B)
            =  57.47
Prob > chi2 = 0.0000
(V_b-V_B is not positive definite)
```

Wooldridge test is applied to test the phenomenon of correlated errors through Stata command xtserial for the FEM with the relevant hypothesis:

From the outputs, with Prob > F = 0.0000, which means the p-value is 0.0000 < 5%, H_0 is rejected. Thus, the model has autocorrelation.

Heteroskedasticity is the phenomenon in which the residual plots have different distributions, and the variance values are not the same. The Modified Wald test is utilized to assess the the presence of this phenomenon for the FEM.

Following the Modified Wald test findings, reject H_0 and conclude that there is significant evidence of unrestricted heterokedasticity with prob >chi2 = 0.0000 < α (α = 5%).

To overcome these phenomenon (i.e autocorrelation and heteroskedasticity), this paper carried out Feasible Generalized Least Squares method (FGLS).

Table 4.7: Regression result following FGLS

AGE	-.0004988	.002833	-0.18	0.860	-.0060514	.0050537
NDTS	-1.047132	.7261005	-1.44	0.149	-2.470263	.3759988
_cons	.4057416	.4246821	0.96	0.339	-.4266201	1.238103

Regression results from the FGLS model in Table 4.11 exhibit that with significance level 5%, Prob > chi2 = 0.000 < 0.05, this model has statical meaning. Further, it also shows that PROF, GROW and LIQ have negative significant influence to the debt ratio. Whereas, the four remaining explanatory variables (SIZE, TANG, AGE and NDTS) have no statical meaning, indicating that there is no correlation between these components and the capital structure of the observed companies in this study. Further, PROF has a strongest correlation with the dependent variable due to the highest the absolute value of the correlation coefficient (0.6385). Therefore, the regression model is rewritten as follows:

$$\mathbf{TD_{it} = 0.4057416 - 0.638583PROF_{it} - 0.0354914GROW_{it} - 0.0582227LIQ_{it} + \varepsilon_{it}}$$

5. CONCLUSIONS

The principal objective of this study is to shed further light on internal forces driving capital structure decision of listed Vietnamese pharmaceutical firms with the profitability, growth, size, tangibility, and non-debt tax shields as determinants.

Empirical evidence reveals that pharma firms' debt ratio decreases with profitability, growth and liquidity and shows a statistically significant relation. In particular, corporations prefer internal financing over external financing to avoid cost asymmetries supported by the negative effect of profitability and debt level. In addition, companies with brighter growth opportunities and more liquid assets tend to use lower leverage. It can be reported that the empirical results on profitability and growth affirm the pecking order theory. However, although the coefficients of tangibility and non-debt tax shields support the trade-off theory, there is also no evidence to claim that these variables significantly impact the debt utilization of these investigated pharmaceutical firms. Therefore, the findings of this study show that implementation of the pecking order theory is more suitable to the context of listed Vietnamese pharmaceutical companies based on the relevant internal determinants.

To determine the optimal capital structure, it is better for pharmaceutical companies to put an emphasis on profitability, growth, and liquidity. Considering the inverse link between profitability and debt ratio, it follows that pharma firms with high profitability are frequently able to generate significant free cash flow from retained earnings. Therefore, they need to pay close attention to taking advantage of available domestic resources to lower import costs, promoting the use of science and technology to improve the efficiency of medicine production, and diversifying their product lines to enhance fertility. Besides, financial managers should balance the interests of shareholders and capital efficiency by taking the dividend payout ratio and retained earnings into account.

Although this study identified certain factors affecting the capital structure of companies, it still has some limitations that require updating, supplementing, and extending further investigations. Firstly, because the paper mainly focuses on pharmaceutical businesses listed on HOSE and HNX, the sample size and duration are relatively small compared to other studies in Vietnam.

Secondly, the decision on capital structure is not only a consideration of the firm's characteristics but also the combination of corporate governance and external variables. However, this study did not include firm-level governance factors (board size, state ownership, ownership concentration, foreign holding, etc.) and macroeconomic factors (GDP, interest rate, inflation, industrial elements, etc.).

BUILDING MODERN NATIONAL GOVERNANCE CONTRIBUTE TO PROMOTING PRIVATE ECONOMIC GROWTH AND DEVELOPMENT

Dr. Dang Thi Thu Giang, Dr. Pham Quynh Trang[1], M.A Dang Minh Chau[2]

Abstract: This article aims to analyze the birth of national governance, the principles and factors affecting national governance. Through the construction of a modern, effective national governance system, it will contribute to improving the state's governance capacity in creating a favorable business environment for all economic sectors, including the private economy growth and development. The article uses an interpretive method and uses data from the World Bank's survey research on global governance capacity.

Keywords: National governance, private economy

1. INTRODUCTION

At the 6th Central Conference, the 13th Party Central Committee issued Resolution No. 27-NQ/TW dated November 9, 2022 on continuing to build and perfect the Vietnamese socialist rule of law state in the new period. In which, national governance is considered one of the strategic solutions to meet the requirements of rapid and sustainable development of the country, becoming a high-income developed country with socialist orientation by 2045. Debates in Vietnam in recent times have shown that the proposed measures to build and perfect the socialist rule-of-law state have been fully understood, but efforts to build or apply these measures have not been fully realized has not yet yielded clear results. The basic reason is that Vietnam has not yet established a suitable and modern national governance environment, helping efforts to improve the rule of law go further and catch up with world standards. Therefore, perfecting the socialist rule of law state to create a favorable business environment for businesses in general and private businesses in particular will be difficult to succeed if not accompanied by strong improvement efforts governance of the country.

2. METHODOLOGIES

2.1. Research Methods

The study was conducted using research methods including: data analysis, data synthesis, comparison and contrast to clarify the current state of national governance in Vietnam as well as evaluate indicators this number. From there, propose solutions to exploit strong indicators and improve the quality of the remaining indicators.

2.2. Data

Secondary data is taken from reliable sources, mainly from World Bank reports on Global Governance assessment index, state-level scientific research works, and articles published in magazines specialized in administrative capacity and some research works published through the website.

3. CONTENT

3.1 Modern, effective and efficient national governance - an important criterion of the rule of law

Building a modern, effective and efficient national governance system is an objective and indispensable requirement for each country in the development process. In Vietnam, this is also an important and urgent content in the process of building and perfecting a socialist rule-of-law State of the people, by the people, for the people.

Previously, governance or national governance was rarely mentioned. However, the idea of national governance was formed long ago in history, becoming a doctrine since the late 20th century and growing strongly in many countries around the world.

In the world, the concept of "national governance" has received special attention and much discussion since the late 20th and early 21st centuries until now and has gradually replaced the use of the concept "governance". Most scholars believe that the transition from governance to national governance represents a new trend of the 21st century, reflecting a major change in the perception and way of exercising political power in countries. The monopoly position of the state apparatus is challenged by new democratic institutions and subjects. In essence, this is a redistribution of power from the political elite in the state apparatus to the people, through the formation and development of social movements and organizations as well as the decentralization of power, decentralization from Central to localities.

Simply put, national governance is the process of making decisions and organizing the implementation of decisions to resolve political, economic, cultural, social, and environmental issues to ensure that the country sustainable development, in accordance with set goals. A good governance must ensure the full implementation of basic criteria: participation, consensus orientation, accountability, transparency, timeliness, effectiveness and efficiency, equality and does not exclude any subject and adheres to the rule of law.

When it comes to national governance, the state will play a prominent role as the subject that orients, leads and controls the movement and development of society in accordance with objective laws through setting out regulations. strategies, policies, planning, plans or providing directional information, linking subjects in society, so that these subjects can participate, choose and decide on implementation to achieve the ultimate goal the best. At the same time, the state also boldly transfers part or possibly all of the tasks that were previously undertaken by the state to other subjects in society through decentralization, decentralization, authorization, etc. legal.

According to the World Bank (WB), there are 6 indicators to evaluate the quality of national governance, including: Voice and accountability; political stability and Absence of Violence; Government effictiveness; Regulatory Quanlity; Rule of law; Control of corruption. Accordingly, good governance requires three elements: Power control mechanisms or rules that limit abuse of power in the public apparatus; Feedback from people and society on the effectiveness and efficiency of national governance; There is an equal competitive environment.

Openness and transparency are fundamental and indispensable signs in modern national governance. This not only ensures that the public apparatus operates effectively and that the monitoring mechanism is effective. Through which, social resources are mobilized and used effectively, contributing to creating a favorable business environment for benefit-seeking activities to be promoted.

3.2 Assess the current state of national governance in Vietnam

The process of building and perfecting national governance towards modernity, effective and efficient operations in Vietnam is always associated with the process of building and perfecting the people's socialist rule of law State, by the people, for the people. In order for the State to operate effectively and efficiently, it is first necessary to fundamentally transform the model, functions and tasks of the State in accordance with each stage of development. Through the process of construction and improvement, Vietnam's national governance capacity has made great progress, shown in the data in the following table:

Table: Assessment of Vietnam's national governance index period 2017-2021

Targets	2017	2018	2019	2020	2021
Voice and Accountabilily	10,34	8,21	11,59	11,59	13,04
Political Stability and Abssence of Violence/Terrorism	54,76	49,53	48,11	45,28	44,81
Governemnt Effectiveness	53,85	53,37	54,33	62.02	62,02
Regulatory	35,58	37,50	38,94	43,27	37,98
Rule of Law	55,29	52,88	52,40	48,56	48,56
Control of Corruption	31,25	37,02	33,17	42,79	47,12

Source: [5]

According to the data from the table, it can be seen that in the 5-year period 2017-2021, there are 2 indexes with strong increases: the Government Effectiveness Index and the Control of Corruption index. One index that increased slightly was the Regulatory quality. The 3 indexes that decreased in score were Voice and Accountability, Voice and Accountability, Rule of law.

At the same time, there is one index scoring above the average: Government effectiveness (62.02/100 points by 2021). The remaining indexes are all below average scores, especially the Voice and accountability have very low scores, 13.04/100 points

Vietnam's Control of corruption index is a highlight in the overall picture of national governance assessment, this index has increased from 32.25/100 points in 2017 to 47.12/100 points in 2021. Vietnam's Control of corruption score is higher than that of low-middle-income countries (33.98/100 points in 2021) and higher than that of upper-middle-income countries (44.44/100 points 2021) [5].

Along with this index is the Regulatory quality reaching 35.58/100 points in 2017 to 43.27/100 points in 2021. This result is due to a series of administrative procedures has been reduced, creating favorable conditions for people and businesses... The legal system, mechanisms and policies continue to be improved, people's participation and information transparency are given more importance, Indicators measuring the quality of public administration in localities are regularly evaluated. The World Bank's 2019 Business Environment Report ranked Vietnam 69th out of 190 economies (in terms of business environment), better than some countries in the region (such as Indonesia, Philippines, Laos, Cambodia, Myanmar, India) and improved compared to the ranking in the 2018 report (Vietnam ranked 68th). Especially the work of preventing and combating corruption has achieved many positive results in recent years.

Another indicator with a lot of progress is the Governance effectiveness in Vietnam, in which the most concentrated indicator is the strong innovation in the organization and operation of the government. Among the national governance assessment indexes, the Governement effectiveness index has seen major changes (increased by 8.17 points from 2017 to 2021), and is the index with the highest evaluation score in the 6 index (reaching 62.02/100 points in 2021). This index is also higher than that of high-middle-income countries (45.98/100 points in 2021) [5].

According to the results of the 2022 United Nations survey on value, Vietnam's e-Government Development Index (EGDI) reached 0.6787 points, classified as a group of countries with developed e-Government. EGDI is at a high level and higher than the average EGDI index of the world (0.5988), the Asian region (0.6373), as well as the Southeast Asian region (0.6321) [3]. In the Southeast Asia region, Vietnam continues to maintain 6th position out of 11 countries, maintaining the same position as in 2020. In 2022, 5 countries with higher positions than Vietnam have changed, including: Singapore, Malaysia, Thailand, Brunei and Indonesia.

After more than 30 years of innovation, despite many achievements in socio-economic development, the quality of Vietnam's national governance has also improved, but limitations still exist. Vietnam's national governance assessment indicators are only at an average level compared to the Asian region, higher than Laos, Cambodia, Myanmar and much lower than Singapore and Brunei. Documents of the 13th National Congress stated that we are only initially transitioning from "management" to "administration", so the level of governance still has certain limitations and inadequacies. Tools mainly serving administrative activities are not synchronized.

Specifically, World Bank evaluates aspects of governance such as Voice and accountability, the quality of Vietnam's regulations as very low (13.04/100 points) and with relatively slow improvement in about the last 5 years (10.34 points in 2017 and 13.04 points in 2021). Political stability and absence of violence is one of the important indicators reflecting the quality of national governance, but this index only reached 54.76/100 points in 2017, down to 44.81. /100 points in 2021 (below the average of 50/100 points). Our country's business environment still has burdens of administrative procedures, inspections and examinations by state agencies. Domestic enterprises are still bearing the burden of unofficial costs; not to mention duplication and harassment when handling administrative procedures.

Good regulations can help make the business environment more favorable and open, overcome market "defects" and ensure a fair competitive environment. However, a complex and overlapping regulatory system can also create burdens and hinder business activities of businesses; At the same time, it is a favorable environment for corruption and policy profiteering to arise.

The implementation of decentralization and decentralization of power between the Central and local levels has not been synchronous, thorough, and responsive to requirements, and has not fully promoted the role, responsibility, and initiative of the grassroots level, especially the local government in the field of economics, resource management, anti-corruption and negativity. The accountability of agencies within the state apparatus to the people is still formal in some places. Although the role of the information system and the press is given more importance, information processing and information responsibility in resolving some cases and matters are not clear, and some cases and matters are even not transparent.

3.3 Proposal to improve modern, effective and efficient national governance in Vietnam in the coming time

- Build an administrative apparatus that operates transparently and is accountable to the public.

Strongly apply and expand e-government and digital government in all areas to minimize and modernize administrative procedures, limit corruption, increase transparency and receive feedback from the people. Urgently collect and build an open database to increase people's access to information for the decision-making process; Unify the process of handling electronic administrative procedures, avoiding inconsistency between state agencies in the application of regulations.

Establish continuous dialogue mechanisms to monitor public administration and remove barriers and inadequacies that appear in the policy implementation process. It is necessary to create a dialogue mechanism through interactive websites and official web 2.0 tools of the Government, so that people can participate in the policy planning and criticism process to monitor public policy public policy and policy implementation process. On that foundation, build an e-democracy model, increasing opportunities for all individuals and communities to interact with the government, eliminating barriers of geography, social status and disadvantage factors other, bringing together individuals and communities previously excluded from this process.

Strengthen to ensure the principle of independent operation of departments, such as audit, inspection, central bank, statistics... in the state apparatus. Publicize audit and financial reports of ministries, branches and local authorities for people to monitor.

- Build an effective public service system.

It is necessary to reform the public service delivery model towards increasing the participation of the private sector and the community. Since the early 1990s, many countries around the world have applied the "New Public Management" model, emphasizing the need to streamline the state apparatus, promote market principles, and apply business leadership methods for public organizations and encourage private companies to participate in providing public services to reduce the burden on the government...

To satisfy the increasing and diverse service needs of the people, it is necessary to introduce market mechanisms and create a business-like government in the following directions: i) Empowering public service providers, ensuring giving these organizations high autonomy in terms of apparatus, people and finance; ii) Empower employees to increase employee enthusiasm and creativity; and iii) Empower customers as citizens to choose service providers, control and evaluate the quality and price of services.

- Improve the dispute resolution and adjudication system.

This helps create conditions for protecting property rights (including "hot" issues in Vietnam today such as land ownership and intellectual property), and conducting business bankruptcy procedures industry...Good governance emphasizes the spirit of respect for the law. Therefore, it is necessary to ensure that the principle of independent courts takes effect in practice. At the same time, it is necessary to change the perception of the court, considering it not only as a judicial agency but also as a justice protection agency. Besides, it is necessary to continue to diversify and expand services, such as lawyers, business consultants, arbitrators...

- Design an industrial policy that focuses on upgrading the technological base and developing the private economic sector.

To achieve the goal of shortened development, East Asian economies such as Japan, South Korea and Taiwan have undergone a process of "technological decolonization": starting with acquiring advanced technology from other countries. Developed countries, apply, gradually improve and combine with domestic science and technology; from manufacturing and assembling components, gradually innovating, improving capacity and developing high-tech technology.

It is necessary to grasp the start-up wave of technology businesses and have policies to help private businesses overcome barriers in capital, risk, human resources... to realize creative ideas in business projects. Develop a financial system that supports the absorption and application of technology and promotes innovation. The State needs to focus on building and perfecting policy mechanisms to facilitate the establishment and operation of Venture Capital Funds; implementing many forms of public-private partnerships, combining State support capital with private investment capital to provide finance for start-up businesses.

4. CONCLUSION

Despite achieving many achievements in socio-economic development after more than 30 years of innovation, Vietnam has still not established a suitable and modern national governance environment and the quality of national governance of the country Vietnam is improving very slowly. To improve national governance, Vietnam needs to: build an administrative apparatus that operates transparently and is accountable to the public; build an effective public service system; perfect the dispute resolution and adjudication system; design an industrial policy that focuses on upgrading the technological base and developing the private economic sector. This creates a favorable environment to promote Vietnam's economic growth in the coming period.

UPAS L/C AT VIETNAM COMMERCIAL BANKS IN THE CONTEXT OF DIGITAL TRANSFORMATION

MSc. Duong Duc Thang[1], MSc. Nguyen Huu Quang[2]

Abstract: Industrial Revolution 4.0 with core elements of artificial intelligence, internet connection and big data has been opening up many methods and providing many means in digital transformation of the economy. in general and the commercial banking system in particular; In particular, Blockchain technology has become the foundation for the development of UPAS L/C in international payments. To clarify the content of the article, the author used the method of data collection and evaluation based on secondary data, combined with analysis to clarify some characteristics and current status of UPAS L/C implementation. in Viet Nam. On that basis, build and propose some solutions to deploy UPAS L/C at a higher level at Vietnamese commercial banks in the context of digital transformation.

Keywords: Commercial bank, L/C, UPAS L/C, Usance payable at sight L/C

1. INTRODUCTION

In the years 2012 and 2013, when the deferred Letter of Credit with immediate payment value (UPAS L/C - Usance Payable at sight Letter of Credit) was deployed as a pilot at some banks, commercial banks (commercial banks) in Vietnam, in the past few years, especially in the period 2020 - 2022 in the context of the Covid 19 pandemic, UPAS L/C has become one of the outstanding trade finance products. , attracting many business customers to use regularly in import and export trading transactions with international partners as well as domestic trade with domestic partners. Most Vietnamese commercial banks have deployed this trade finance product and have had certain effectiveness. However, in order for the implementation of UPAS L/C to progress further in the near future, it is necessary to identify potential risks and then have appropriate recommendations and implementation directions.

2. LITERATURE REVIEW

UPAS L/C has appeared since 2014. However, there is little research in Vietnam on this issue, because at that time the use of this payment method was still very limited. Only in recent years, this method has been used more and received the attention and discussion of a number of researchers.

The master's thesis of Le Thi Ha Thanh (2014) mentioned L/C UPAS product development solution at Saigon Thuong Tin Commercial Joint Stock Bank. The master's thesis has described an overview of the documentary credit method, which is the deferred L/C allowing immediate payment, as well as the current situation of applying this product at Thuong Tin Commercial Joint Stock Bank. Nevertheless, the research's contributions are still relatively limited on how to use UPAS L/C as well as analyzing the advantages and disadvantages of this method.

Dang Hoai Linh (2022) gave some recommendations in implementing UPAS L/C operations of commercial banks in Vietnam today, Banking Review. The study is based on the results of HSBC

1 Email: duongducthang@hvtc.edu.vn, Academy of Fiance.

2 Saigon-Hanoi Commercial Joint Stock Bank – Ha Thanh Branch.

(2021) on the characteristics of UPAS L/C and the implementation process of the Joint Stock Commercial Bank for Foreign Trade of Vietnam. From there, the author evaluates the benefits and impacts of implementing UPAS L/C on importers, exporters as well as the relevant banking system.

3. RESEARCH METHODS

The study mainly uses secondary data from publications of the State Bank of Vietnam and some commercial banks. Regarding research methods, use economic statistics and comparison methods to make appropriate judgments and analysis.

4. RESEARCH RESULTS AND DISCUSSION

4.1. Overview of UPAS L/C

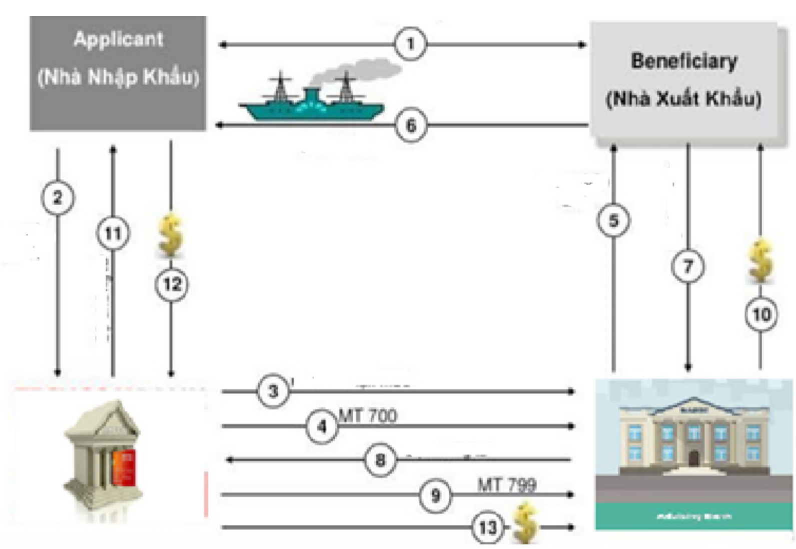
a. UPAS L/C concept

Currently, in international payment transactions, the form of Letter of Credit (L/C) is quite commonly used. Besides, the concept of UPAS L/C is no longer strange to the market and businesses, bringing many benefits to import and export customers with international partners as well as domestic trade with partners. domestic.

UPAS L/C is a deferred payment method of documentary credit, also known as a deferred letter of credit but can be paid immediately. This means that the seller (exporter) can receive immediate payment through capital advance from the bank and the buyer (importer) will have to bear the derivative interest rate for this early payment. This method really ensures security, avoiding some risks for the buyer such as the case of goods not being delivered as committed or the seller not delivering the goods. In fact, UPAS L/C also helps businesses as buyers reduce financial costs by 20 - 50%.

b. Payment process by UPAS L/C

Figure 1: Basic business process of UPAS L/C payment



Source: Author compiled from the UPAS L/C implementation process of some commercial banks

Step 1: The importer and exporter sign a foreign trade contract, including regulations on the use of UPAS L/C

Step 2: The importer opens a UPAS L/C at the issuing bank; The issuing bank, based on the L/C opening application, makes a decision to open a UPAS L/C

Step 3: The Issuing Bank contacts the Discounting Bank to check the discount limit applied to the specific UPAS L/C transaction

Step 4: Issuing bank sends MT700 to the discounting bank/Notifying bank

Step 5: After receiving the UPAS L/C notice, the Notifying Bank shall notify the exporter.

Step 6: The exporter proceeds to deliver the goods

Step 7: After delivering the goods, the exporter prepares a set of documents according to the requirements of the UPAS L/C and presents them to the advising bank/designated bank in the UPAS L/C (usually the discounting bank).)

Step 8: The discounting bank checks the documents and sends them to the issuing bank, and at the same time sends a request to accept payment to the issuing bank.

Step 9: Issuing bank sends MT799 to the discounting bank, notifying the documents of acceptance for payment and fees (if any)

Step 10: Discounting bank pays the exporter

Step 11: The issuing bank returns the documents to the importer

Step 12: On the bill of exchange maturity date, the importer pays the L/C value to the issuing bank

Step 13: The Issuing Bank pays the discounting bank or the Discounting Bank debits the Issuing Bank's Nostro account opened at the Discounting Bank (if any)

(Processes at commercial banks may be slightly different when separating/combining one or more steps)

c. Characteristics of UPAS L/C

- Firstly, regarding the applicable currency: UPAS L/C can be applied to all currencies agreed by the L/C issuing bank with the exporter or importer or with the correspondent bank.
- Second, about the term of UPAS L/C: this depends on the regulations of commercial banks; In practice there is usually a maximum term of 12 months
- Third, regarding the UPAS L/C payment method: businesses can choose to pay using their own capital or legal capital to comply with the requirements on the L/C. However, lending often requires collateral. In fact, the loan level applied at each bank is different, depending on the time level and depends largely on the value of the contract.
- Fourth, because it is issued with deferred payment terms, the issuing bank allows the discounting bank to immediately give the discount to the beneficiary.

Table 1: Comparison of L/C at sight with bank loan and UPAS L/C

Criterion	**L/C open loan with immediate payment**	**UPAS L/C**
When the beneficial is paid	Immediately upon presenting a set of valid document	Immediately upon presenting a set of valid document
The time when the L/C opener must make payment	Time of maturity of the loan to open L/C at sight	Bill of exchange maturity date
Source of payment to beneficiary	Capital from the issuing bank	Capital from discounted bank
L/C financing method	Bank loans	Equity capital
Service prices	-Fees related to international payment activities according to the bank's fee schedule -Interest	-Fees related to international payment activities according to the bank's fee schedule -Bill of exchange fee (significantly lower than loan interest)

Source: Author compiled from regulations on L/C payment of commercial banks

d. Multidimensional benefits of implementing UPAS L/C

- Firstly, benefits for importers

First, UPAS L/C helps importers pay for goods quickly and securely at a reasonable cost and is guaranteed by a third intermediary, Commercial Bank. Therefore, importers can avoid risks such as goods not as committed, not in the right quantity, quality...

Along with that, compared to traditional L/C, when using UPAS L/C, importers often receive lower prices, so the payment value by UPAS L/C is often smaller than the payment value by L/ C normally for the same lot. This legally reduces tax costs for importers (such as import tax, value added tax, etc.)

If using traditional L/C, businesses often have to borrow money from banks to pay L/C immediately upon receipt of documents or deferred L/C when payment is due. With UPAS L/C, the importer Exporters only have to pay service fees without having to take out loans, thus helping to improve debt repayment ability and assess the importer's debt level.

- Second, benefits for exporters

UPAS L/C is really a way to ensure that the importer will complete all contract costs. Because of the bank's participation, payment is guaranteed, even if the importer does not comply with the commitment, the bank will still pay. In addition, the contract implementation can take place immediately without any additional costs, helping the seller have capital to rotate production without having to borrow from banks or other credit institutions.

With the same benefit of being able to sell goods and receive payment immediately, exporters can sell goods at more competitive prices, instead of traditional L/C often having to wait 90 to 180 days, when the price is usually normal. tends to increase.

- Third, the benefits that commercial banks gain

Firstly, for the bank issuing UPAS L/C

The introduction of UPAS L/C helps diversify the bank's products and services, better meeting customers' foreign currency loan needs at reasonable costs. UPAS L/C also helps banks finance transactions for customers without having to spend capital, because the actual payment is made by the designated bank on the basis of the guarantee of the issuing bank.

Along with that, the issuing bank can benefit from the interest rate difference between the nominated bank's interest rate and the interest rate applicable to its customers. On that basis, the issuing bank has the conditions to maintain and expand market share, improve domestic and international payment reputation, increase service fees and international payment turnover.

Second, for designated banks

The designated bank will benefit by collecting service fees including acceptance and discounting of deferred drafts.

- Fourth, benefits to the economy

UPAS L/C has supported trade between domestic businesses and foreign businesses to take place more smoothly and safely, avoiding many risks compared to some other forms of L/C. In addition, this type of L/C also helps the exporter's production and operation process not be interrupted, because the money is made immediately without having to wait 90 or 180 days. Thanks to that, the speed of money flow in the economy has increased.

4.2. Current status of UPAS L/C implementation in joint stock commercial banks in Vietnam in the context of digital transformation

4.2.1. Some results were achieved

In recent times, the UPAS L/C product has contributed to diversifying trade finance products as well as international banking cooperation of Vietnamese commercial banks. Besides traditional products, UPAS L/C has contributed to diversifying choices and better meeting customer needs. The implementation of UPAS L/C is also becoming more and more complete, considering the following aspects:

Firstly, the legal corridor of UPAS L/C is increasingly being improved, specified in regulations in documents such as:

- Law on Credit Institutions dated June 16, 2010 and Law Amending and Supplementing a Number of Articles of the Law on Credit Institutions dated November 20, 2017
- Foreign Exchange Ordinance dated December 13, 2005 and Ordinance on amending and supplementing a number of articles of the Foreign Exchange Ordinance dated March 18, 2013
- Decree No. 70/2014/ND-CP dated July 17, 2014 of the Government detailing the implementation of a number of articles of the Foreign Exchange Ordinance and the Ordinance amending and supplementing a number of articles of the Foreign Exchange Ordinance
- Circular No. 21/2012/TT-NHNN dated June 18, 2012 of the Governor of the State Bank regulating lending and borrowing activities; buying and selling valuable papers with term between credit institutions and foreign bank branches; Circular No. 01/2013/TT-NHNN dated January 7, 2013 and Circular No. 18/2016/TT-NHNN dated June 30, 2016 on amending and supplementing a number of articles of Circular No. 21/2012/ TT-NHNN
- Circular No. 14/2017/TT-NHNN dated September 29, 2017 of the Governor of the State Bank regulating interest calculation methods in deposit receiving and credit granting activities between credit institutions and customers
- The State Bank and the Ministry of Finance have taken steps to tighten foreign currency loans, especially for businesses that do not have foreign currency revenues. That makes using UPAS L/C even more meaningful for businesses

Second, the number of banks and the number of UPAS L/C products have both increased

Currently in Vietnam, more and more commercial banks are deploying UPAS L/C products, including State-owned commercial banks and other banks. Products are also increasingly improved, perfected and diversified in both services and processes to better meet customer requirements such as: adding domestic UPAS L/C type (seller has can be paid immediately or after a certain period of time upon presentation of appropriate documents according to the requirements of domestic UPAS L/C); Deffered UPAS L/C (L/C installment payment/deferred payment/post payment) or has regulations allowing customers to pay before due date, diversifying financing structures with agent banks...; Modify the UPAS L/C product structure, not requiring import customers to accept bank debt on the date the sponsoring bank makes payment to the L/C beneficiary; Switch from collecting interest to collecting UPAS L/C service fees; Financing in JPY for UPAS L/C issued in USD; fixed UPAS L/C service fees with customers based on floating interest rates of sponsoring banks; Maximum support for document processing time, with simple and convenient procedures and a wide network of partner banks around the world...

One of the advantages of UPAS L/C for businesses is finding a reliable payment address to be proactive in business plans. As for banks, banks will earn UPAS L/C service fees with income equivalent to foreign currency lending services to customers, promoting international payment activities, foreign currency trading and other services. However, from a business perspective, this is really a good financial solution for import businesses that do not have foreign currency revenue, and can proactively operate production and business activities in a fluctuating economic context. and competition today.

Table 2: Blockchain application situation in L/C transactions of Vietnamese commercial banks

Bank	Transaction scope	Time
BIDV	International L/C transactions: L/C issuance stage	09/2020
HD Bank	International L/C transactions: L/C issuance stage	11/2020
Vietinbank	International L/C transactions: L/C issuance stage	11/2020
MB Bank	International L/C transactions: L/C issuance and presentation of documents prepared by the exporter	12/2020
Vietcombank	Domestic L/C transaction: L/C issuance stage, document presentation	12/2020

Source: Tran Nhi Quang (2021)

Third, some banks have pioneered the application of Blockchain in UPAS L/C payments

Blockchain is not a new payment method in commercial transactions but a new technology used in the process of implementing payment methods to bring about a difference for the better compared to transactions. previous tradition. Applying Blockchain in L/C transactions means performing L/C transactions on the Blockchain technology platform.

Theoretically, the L/C transaction model through Blockchain includes all parties as in a traditional L/C transaction but without the participation of SWIFT and courier companies because banks have information and payments can be exchanged on Blockchain and paper documents do not need to be transferred but instead are digital documents. The Government, Central Bank and ICC are also not involved in Blockchain but still play the role of promulgating legal regulations, supervision, support and advice. In addition, this model has the participation of a company providing Blockchain technology. These are large corporations with networks including a number of banks using Blockchain technology. Therefore, using Blockchain actually increases the speed of transactions. Unlike traditional L/C transactions performed on many different technology systems, all steps of an L/C transaction via Blockchain are performed on a single technology platform with the participation of all parties, each party plays the role of a node participating in the Blockchain network. If SWIFT technology and technologies used in traditional L/C transactions allow two parties to transmit information and perform transactions in pairs, Blockchain technology allows all participating entities to transmit information, monitor and control each other's transactions at any time. In a L/C transaction using Blockchain, the participating parties will agree on a smart contract. Smart contracts are programmed on Blockchain in accordance with the agreements specified in commercial contracts and the terms and conditions of L/C. L/C transactions on Blockchain make payments through the self-executing feature of smart contracts, smart contracts can also record the transfer of ownership.

In Vietnam, Military Commercial Joint Stock Bank is a pioneer in applying Blockchain in UPAS L/C payments since 2019. According to the bank's assessment, Blockchain is truly a technology that can change the speed, operation and cost savings compared to transactions using the traditional SWIFT system

4.2.2. Some problems in implementing UPAS L/C in Vietnam

Firstly, Vietnamese commercial banks themselves have not yet boldly transformed digitally

Applying Blockchain technology to perform L/C transactions in general as well as UPAS L/C in particular is the right direction in the current context of strong digital transformation. However, although Contour offered free of charge to many Vietnamese commercial banks, only 5 banks agreed to test this new technology in L/C transactions. L/C transactions on Blockchain have not yet completed all the steps in a closed L/C transaction process. Of the 5 transactions that have been piloted at banks in the first phase (and as of February 2021), only the L/C issuance and notification stage is done methodically on Blockchain. That shows that banks are not really interested in this issue. The application of Blockchain in L/C transactions has only completed the pilot phase and has not been widely deployed. There are no instructions on applying Blockchain technology to perform letter of credit transactions. Currently, in Vietnamese commercial banks, there is only MB system that applies Blockchain in a relatively comprehensive manner for L/C payments.

Second, credit risk in L/C payment

The maximum use of UPAS L/C is reducing customers' need for regular loans, especially for commercial banks that have excess capital but still receive funding with a total cost (all in fee) below the deposit interest rate. mobilize capital. Some commercial banks only collect fees like normal L/C, without adding the differential interest rate to compensate for the risk of late payment financing, or they collect fees but are not significant, lower than the interest rate. Regulate capital and mobilized interest rates at the same time.

Third, there is no specific legal corridor governing L/C transactions in general and UPAS L/C in particular on the Blockchain platform.

In particular, there are currently no regulations related to electronic documents while documents are the core point of this transaction. Along with that, the technology infrastructure has not created the necessary conditions for banks to boldly apply Blockchain technology in L/C transactions. Only when the Blockchain network is truly large enough to connect subjects in countries around the world can transactions proceed smoothly and completely. Vietnamese commercial banks themselves do not really believe in the ability to apply this new technology model and have not invested properly because the application is only in the testing phase and is not yet complete and still under consideration. Cost issues when deploying Blockchain applications in international payments and trade finance.

4.3. Notes when implementing UPAS L/C and proposed recommendations to ensure adaptation to the digital transformation context in Vietnam

4.3.1. Notes in implementing UPAS L/C at commercial banks

In the UPAS L/C payment process, there are regulations on interbank credit limits, so for UPAS L/C to operate, banks must first sign an agreement on the form of interbank credit. for the purpose of specialized financing for UPAS L/Cs.

Along with that, the issuing bank and the importer must have an agreement to issue UPAS L/C in accordance with the terms and conditions of the signed interbank credit limit and issuance fees. arising related to UPAS L/C. From a legal perspective, Vietnamese commercial banks when issuing UPAS L/C must fully comply with the content of Decision No. 711/2001/QD-NHNN dated

May 25, 2001 of the Governor of the State Bank on promulgate Regulations on opening letters of credit for import of deferred payment goods. In particular, in foreign trade contracts signed by exporters and importers, there must be payment terms stating whether to pay immediately or use UPAS L/C. This provision in the foreign trade contract serves as a basis for the importer to apply to the bank serving him or her to issue UPAS L/C.

4.3.2. Some recommendations are proposed to effectively deploy UPAS L/C in the context of digital transformation in Vietnam

Firstly, complete the legal basis for UPAS L/C payment activities; especially Blockchain application in L/C payments in general and UPAS L/C in particular

L/C transactions are mainly governed by international practices and customs of the ICC. Basically, L/C has a set of necessary rules regulating documentary credit transactions. To create a legal corridor for the application of Blockchain in L/C transactions, the ICC needs to focus on rules that ensure banks allow acceptance of electronic documents and data. ICC revised and released eUCP version 2.0 in July 2019 guiding the electronic presentation of documents under L/C along with additional instructions. In addition, the ICC has drafted a draft of the Uniform Rules for Digital Trade Transactions (URDTT) to provide rules and obligations related to the use of electronic documents for processing. manage digital trade transactions. That is an important legal basis for presenting and checking electronic documents in L/C transactions on Blockchain. Therefore, the ICC needs to update and complete the eUCP and officially release the URDTT. At the same time, ICC needs to produce clear guidelines on how to automate document checking using new technologies such as artificial intelligence, machine learning... In addition, support and regulations Legal regulations from the State Bank are also very important for the operation of Blockchain technology in international payment and trade finance activities in Vietnam.

Along with that, from the perspective of the State Bank, it is necessary to continue to stabilize monetary policy and control inflation. Implement a prudent, firm, proactive, flexible, and effective monetary policy using exchange rate, interest rate, credit growth, and priority order tools; Mobilize commercial banks to reduce lending interest rates in some priority areas. The State Bank also needs to consider controlling UPAS L/C issuance conditions to limit potential risks. There needs to be a mechanism to control issuance conditions more strictly, specifically: (i) the UPAS L/C deferred payment period is suitable for the customer's production and business cycle (no more than 180 days); (ii) the sponsored item is not prohibited goods according to the provisions of law; (iii) customers have internal credit ratings, no bad debts and debt group 2 or higher at credit institutions within the most recent 01 year; no bad debts, debts that have been resolved risks, debts sold to VAMC and other credit institutions in the last 2 years; The customer has no suspicious signs in the transaction, has at least 1 successful L/C transaction for the item, the partner requests to open the L/C within 1 year.

Second, applying Blockchain in L/C payments in general and UPAS L/C in particular requires a synchronized solution from many groups of subjects.

- In addition, the L/C transaction model on the Blockchain platform is only complete when two issues are resolved: (i) There is full and effective participation of participating parties based on the principle of consensus; (ii) Implement a complete closed L/C transaction process from L/C issuance, presentation and verification of documents to payment on the same Blockchain network. To overcome these two problems, there needs to be synchronized solutions from participating parties, which are:

- Vietnamese businesses need to proactively learn information about Blockchain and applications of this technology in L/C transactions. Besides, businesses need to boldly innovate traditional L/C transaction methods to transactions on Blockchain. To do so, businesses need to have a specialized department to carry out L/C transactions, which can proactively perform the information declaration and input data related to the transaction. The application of Blockchain in L/C transactions is suitable for large-scale businesses, which often choose to pay by L/C in foreign trade contracts and have a large level of commercial transactions.
- Vietnamese commercial banks need to boldly test and deploy widespread application of Blockchain in L/C transaction activities, and implement the following solutions: (i) Build a project to apply Blockchain in payment activities international and trade finance, which regulates how to operate, organize and manage support resources effectively; Start implementing with L/C transactions and then apply to other transactions; (ii) Introduce the L/C product on the Blockchain platform to customers, and conduct a survey on the level of understanding and demand of businesses about this new product; (iii) Invest in technology infrastructure, select and work with Blockchain technology supply companies; (iv) Disseminating knowledge about the application of Blockchain technology in L/C transactions to employees; (iv) Develop business processes and issue guiding documents for L/C transactions on the Blockchain platform.
- Stakeholders including customs authorities, transportation companies, insurance companies, and goods inspection and certification authorities need to boldly participate in L/C transactions on the Blockchain platform. To do so, these organizations need to research methods for issuing and circulating electronic documents as well as mechanisms for authentication and data security. Currently, some commercial documents have been issued in digital form such as electronic bills of lading (eB/L), electronic certificates of origin (eC/O) but are not yet popular in Vietnam. . The General Department of Vietnam Customs has also used a system for issuing electronic customs declarations for businesses. The problem is to find a way to connect all parties to a blockchain and issue electronic documents to this same system.

Third, some recommendations on the business side

Take timely action to overcome exchange rate risks

To prevent exchange rate risks, businesses can also choose banks with good trade financing capabilities and use derivative financial tools such as forward foreign currency trading and swap contracts. (SWAP), ensuring that import and export activities are scientifically planned.

Improve competitiveness

It is necessary to develop products and services of enterprises and increase export goods for export enterprises. For import companies, maximizing domestic resources, finding alternative partners, especially domestically, and gradually reducing dependence on imports will also help avoid exchange rate risks.

CONCLUSION

The strong development of the digital economy with many new technologies has been opening a potential door for changing international payment models and applying new products. Currently, Vietnamese commercial banks are increasingly implementing UPAS L/C on many platforms, thus requiring continued research; Especially when the L/C operation is always a complicated operation, especially for a new product like UPAS L/C.

SUSTAINABLE INCOME ENHANCEMENT SOLUTIONS FOR LPBANK

MA. Kim Minh Tuan[1]

Abstract: *LPBank a relatively young joint-stock commercial bank, has identified its direction as being a market-responsive leader. To effectively compete with domestic and international counterparts, LPBank requires sustainable business solutions to increase income. This article provides an overview of asset and income scale growth, potential capital sourcing from organizations, credit quality, non-credit investment expansion, reducing reserve ratios, sustainable business solutions spanning management, operations, product and service diversification, cost minimization, and improving the quality of human resources.*

Keywords: *Income, Profit, Services, Digitization.*

Abbreviations: LPBank

1. INTRODUCTION

LPBank is one of the largest private joint-stock banks in Vietnam. To maintain a strong presence in the competitive market, LPBank needs to enhance its business efficiency by increasing its income to meet the standards of a regional and global financial institution. This requirement is crucial for LPBank 's survival in the market. Based on these actual business operations and demands, the research aims to assess the current challenges and, subsequently, propose solutions to increase income for LPBank.

To meet this requirement, in addition to the research abstract, the report will present (i) Introduction to the context, significance, objectives, and structure of the paper. (ii) A brief overview of the issue and previous research results. (iii) Methodology and the proposed research framework. (iv) Presentation of research results through textual descriptions and supporting data. (v) Discussion and conclusions that analyze the research findings, compare them with prior studies, and offer insights.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH EVALUATION

The topic of business efficiency has been extensively studied by numerous domestic and international scholars. For instance, research on the business efficiency of commercial banks has been undertaken, such as the thesis "Business Efficiency of Commercial Banks Post M&A" by Nguyen Quang Minh, defended in 2016 at the National Economics University; the thesis "Enhancing Business Efficiency of Joint Stock Commercial Bank for Foreign Trade of Vietnam" by Ta Thi Kim Dung, defended in 2016 at the Institute of Development Strategy - Ministry of Planning and Investment; and Lê Thị Thúy's study in 2020 on "Enhancing Business Efficiency at the Joint Stock Commercial Bank for Investment and Development of Vietnam," which was defended at the Academy of Finance.

However, in-depth research on solutions under the conditions of digital transformation for commercial banks has not been extensively explored. Furthermore, there has been no research

[1] Email: tuankm1909@gmail.com, Lien Viet Post Joint Stock Commercial Bank

conducted directly at LPBank on this topic. Through research at LPBank, proposed solutions for sustainable income growth can be applied to both LPBank and the entire system of Vietnamese commercial banks."

3. METHODOLOGY AND PROPOSED MODEL

To investigate LPBank 's income enhancement, several crucial methods were employed:

Historical Data Analysis: This involved studying LPBank 's income history and financial fluctuations to understand trends and underlying causes. Statistical analysis tools and techniques were utilized to evaluate data from 2015 to 2022.

Cost and Performance Analysis: This method Evaluated LPBank 's operational costs and identified strategies to minimize them.

Product and Service Research: exploring the development of new products and services to attract customers and generate additional income.

Risk Assessment: analyzed potential risks in its operations to ensure effective risk control measures.

4. RESEARCH RESULTS

Establishment by Collaboration of Business Entities and Visionary Leadership

LPBank was born from the exceptional vision of business leaders. LPBank was established in 2008 amidst the Southeast Asian financial crisis, thanks to the credibility and entrepreneurial potential of its founding shareholders. Leaders from companies such as Him Lam Corporation, Saigon Trading Group (SATRA), Tan Son Nhat Airport Services Company (SASCO), Postal Savings Service Corporation (VPSC), and other talented leaders played pivotal roles in LPBank 's rapid establishment and consolidation of its position. [4].

Period 2015-2022, LPBank has actively expanded its market share and diversified its business lines. Financial capacity meets operational requirements, and ensures liquidity, and profits after tax increases annually. LPBank 's relentless efforts resulted in numerous awards for its brand and technology.

Asset Rapid Growth but Unstable revenues

LPBank 's growth rate and asset quality increased rapidly but income appeared to be unstable. In 2022, LPBank 's total assets stood at VND 327,745 billion, three times higher than VND 107,587 billion in 2015. Asset quality remained stable, with a low non-performing loan ratio, consistently below 1%. LPBank 's credit risk management and asset quality control measures, including loan portfolio assessment and post-lending handling, have proven effective. In contrast, the banking industry witnessed a continuous rise in non-performing loans during 2015-2017. However, during this period, LPBank 's non-performing loan ratio declined. In 2022, LPBank 's total income, including interest income, increased by 120% compared to 2015, and post-tax profits surged by 157%. [3].

LPBank 's financial results increased and the trend shifted to income from services, but slowly. LPBank 's income exhibited substantial growth over the years, with 2022 income being 2.8 times that of 2015. Most of LPBank 's income is derived from interest. Total income sources experienced significant growth, with a 2.56-fold increase in 2020 compared to 2015. The proportion of income from service activities has been on an upward trend. In 2017, income from credit activities only accounted for 45.4% of total income, but this ratio declined in subsequent years, hitting its lowest point in 2018 and gradually increasing in 2019 and 2020. Income from service activities began to rise towards the end of 2015, but in 2020, it still accounted for only 3.5% of total income. [3].

Potential grows from limitations

Some of LPBank 's unstable business portfolios can be leveraged to increase income. LPBank 's efforts will yield greater results if it can address certain limitations. During the period from 2015 to 2022, LPBank faced persistent challenges that needed resolution. These included rapid credit growth, heavy reliance on lending for income, hidden credit risks, and some inefficient services. To achieve its goal of being among the top 5 largest joint-stock commercial banks in Vietnam and comply with Basel 2 banking regulations, LPBank must strategize and implement specific measures to enhance its business operations effectively.

In the period 2017-2022, there was a decline in customer deposits while bond issuance increased. This skewed structure indicates an imbalance. At the end of 2017, bonds accounted for 83.9% of LPBank 's funding, but by 2021, this figure had decreased to over. Additionally, Customer deposit stability remained higher than bond issuance on the market and borrowing from major credit institutions. The bond interest rates always exceeded average savings deposit rates. Efficient use of savings deposits was seen due to the alignment with deposit balance growth. Bonds, on the other hand, often constituted a large but difficult and immediately utilized funding source. The cost of bond issuance and utilization was consequently higher than savings deposit costs, leading to reduced income.

LPBank 's asset growth rate was not consistently aligned with its business activities in foreign exchange, securities, and non-interest income. In 2015, LPBank 's asset growth rate was 6.7%, but it surged to 31% in 2016. However, in 2018, this rate dropped to a mere 0.9%. Similarly, foreign exchange and gold trading yielded losses of over VND 10 billion in 2015 but turned into profits of VND 137 billion in the following year. Securities trading followed a similar pattern, with losses in 2015 and 2016 (VND 244 billion and VND 324 billion, respectively), but profits of VND 384 billion and VND 137 billion in 2017 and 2020, respectively.

Potential for capital sourcing from other organizations. Government debt grew by 253% in 2015 compared to 2014, but it was reduced by 95% in 2016. In 2017, it surged by 329%, but by 2018, it reached a growth rate of 452%. By 2020, government debt decreased to just 21%. Deposits and borrowings from other credit institutions also exhibited irregular fluctuations, with a 13% decline in 2015, and a 6.6% increase in 2019, followed by a significant 159% decrease in 2020.

LPBank has the potential to increase income if it stabilizes the quality of its loans and risk-prone debt groups. The State Bank of Vietnam regulates the provisioning and utilization of risk provisions according to asset classifications. [1]. Three groups of debt: requiring attention debt, substandard debt, and doubtful debt also have uneven increases and decreases to be set aside. The required attention debt increased by 181% in 2015 but decreased by 24% in 2018. The substandard debt saw a growth rate of 165% in 2018 but declined by 44% in 2019. The doubtful debt increased by 234% and 324% in 2018 and 2019, respectively. That leads to higher provision costs.

The opportunity to increase income is assessed based on the ROA ratio. ROA stands for Return on Total Assets, which is a metric that measures profitability. [2]. LPBank 's ROA witnessed fluctuations and instability, with positive growth in most years except for 2018 and 2020 when it recorded negative growth rates of 0.29% and 0.3%, respectively. However, ROA remained below 1% in all years, indicating that LPBank 's business efficiency has room for improvement.

The potential to expand income from LPBank 's non-credit investments is still substantial. Non-credit investments accounted for nearly 30% of LPBank 's total assets in 2015, but this percentage decreased to 0.1% by 2019 and eventually to 0% by 2020. This suggests that LPBank abandoned securities trading and investment activities, in contrast to other banks that continued to maintain significant proportions in this category. Therefore, income from investments could potentially be substantially increased.

The efficiency of LPBank 's business operations comes from reducing the reserve ratio. The cash balance portfolio at LPBank increased from 0.4% in 2015 but increased to 1.4% in 2020. This shows that the efficiency of capital use is not high. Because cash reserves are not a profitable asset, if this ratio increases, it will reduce income.

Appropriately managing credit growth at LPBank will lead to a reduction in provisioning costs for risk. LPBank 's rapid credit growth has been a hotbed of potential risk, which was often accompanied by increased risk costs and a decrease in future income. Addressing these limitations and fine-tuning various aspects of its operations can help LPBank unlock its full potential for income generation and sustainable growth. It can be said that the growth of lending in various economic sectors represents overheated growth. In 2016, the highest growth rate reached 41%. The relatively low growth rate of LPBank in 2018 and 2019 also reached 18%. This is a rather hot credit growth rate for LPBank compared to the general debt growth rate in the industry. The excessive increase in credit often comes with the cost of risk, which reduces future income.

Sustainable Business Operations solutions

LPBank aims to achieve sustainable business efficiency. To operate successfully, the LPBank Board of Directors and Executive Committee need to establish a clear business strategy. Strategy is the roadmap and development approach for a bank. Therefore, formulating a strategy is crucial as it determines the bank's success or failure. Building a strategy depends on financial capabilities, professional expertise, and the ability to engage with the right customer segments in the market. Once the strategy is defined, a guide system needs to be built to execute it, involving the entire workforce in the system's understanding. Moreover, processes and operations must be developed, monitored, and evaluated. Business process efficiency significantly impacts a bank's performance. Based on the above analysis, it is evident that business processes must align with modern, customer-friendly products and services, from card services and payments to new services such as advisory, investment, and customer information provision.

The LPBank Board of Directors is directing the bank's operations with flexibility and safety as their top priorities, ensuring income economic uncertainties, and complex disease outbreaks. They are committed to maintaining high levels of asset growth and income for LPBank. Additionally, LPBank is transitioning its model to follow modern trends in banking management. LPBank has shifted from a decentralized risk management model to a centralized one, spreading risk management throughout its entire structure. This centralized approach has reduced the potential risks associated with decentralized risk management. LPBank has adopted and implemented common credit risk measurement models to assess and mitigate risks effectively.

Simultaneously with solutions related to management, operations, and product services, LPBank needs to strongly implement information technology applications. LPBank has made significant strides in applying information technology. In its business operations, LPBank has actively integrated advanced software solutions. LPBank consistently ranks among banks with efficient technology applications. It has established and efficiently implemented an information technology infrastructure, offering various digital banking services such as E-banking, mobile banking, and e-wallets for both corporate and individual customers.

In its business operations, LPBank needs to prioritize the analysis, and forecasting of economic, social, and pandemics. However, analyzing the economic, social, and industry trends still faces limitations. Analyzing business trends of businesses helps LPBank determine business activities in the right direction. Accurate forecasting is vital, as incorrect predictions about macroeconomic factors like exchange rate fluctuations and interest rates can significantly impact business efficiency.

LPBank's business efficiency and income will come from effectively conducting internal inspection and control activities. One significant internal challenge at LPBank is that they haven't fully maximized the potential of their three lines of defense. The first line of defense consists of business units, sales, customer relations specialists, branches, and headquarters operations. The second line includes risk management, compliance, risk operation, and legal units. The third line is the internal audit department. Effective risk management depends on proper risk control implementation.

LPBank has identified the need to expand its investment activities and operating scale

To broaden investment activities, LPBank must review regulations related to investment activities, including the investment process, risk management for investment activities, the responsibilities of individuals and related departments in investment activities, and the reward and compensation for investment activities. LPBank also aims to diversify its investment channels. Investment activities at LPBank have declined significantly from 2015 to 2022. To expand investment activities, LPBank plans to invest in high-yield areas such as securities, bonds, and partnerships with economic organizations. LPBank also needs to explore opportunities to invest in financially strong businesses with growth potential to generate additional income.

Increasing the scale of shareholder equity and the safety ratio of the LPBank system is a priority for the LPBank Board of Directors and leadership. Shareholder equity, though relatively small compared to total assets and liabilities, is crucial for any banking institution. It acts as a leverage to protect against risks faced during operations, increase the scale of operations, and enhance the safety of the bank. According to Basel II standards, LPBank 's shareholder equity has been consistently increasing each year. However, LPBank also needs to take steps to increase its charter capital through share issuance or even mergers and acquisitions, as exemplified by the successful merger with the postal system. Additionally, the bank should consider timing its equity offerings in domestic and international markets to boost its income as its operations grow.

Expanding digital lending and credit risk management

The digitization of banking has opened up new avenues for lending. Commercial banks can leverage their digital platforms to streamline approval processes and initiate loans efficiently. Credit scoring, digital document submission, and online loan applications can reduce operating costs and enhance customer experiences. Banks can also explore peer-to-peer lending and online marketplace lending models to generate income from initial fees and interest income.

Credit risk management and improving loan quality to generate income from lending activities are ongoing priorities for LPBank. To achieve this, LPBank is standardizing regulations and processes for credit risk management. Regulations regarding customer segments, products, and business areas are being adjusted according to internal credit ratings. LPBank is also overhauling its lending process, clearly defining roles and responsibilities. The bank is transitioning from primarily managing loans based on size and category to risk management based on industry and customer. LPBank has developed an early warning system for credit risk at all times, providing timely updates and alerts for credit information, which helps maintain sustainable income.

Credit operations always generate non-performing loans, which are challenging to recover. LPBank has addressed non-performing loans by acquiring all bad debts from the Vietnam Asset Management Company (VAMC). Resolving non-performing loans primarily involves maintaining the quality of credit operations and improving the bank's financial capacity. LPBank focuses on the root causes when dealing with non-performing loans:

(i) For non-performing loans with objective reasons where customers have the potential to recover, LPBank restructures by adjusting repayment terms or extending loans, giving customers time to resolve financial difficulties. During the restructuring period, LPBank may also waive or reduce interest for customers.

(ii) For non-performing loans with objective reasons but no or limited recovery potential, LPBank identifies customers facing bankruptcy. The bank tries to recover the principal and interest in various ways.

(iii) For non-performing loans with subjective reasons, such as credit officers violating lending regulations or customers engaging in fraud or misusing funds, LPBank applies appropriate measures for debt recovery, from selling assets to legal actions.

(iv) LPBank uses risk provision reserves to cover loan losses. These provisions are established according to the regulations of the State Bank of Vietnam (SBV). After resolution, LPBank continues to monitor loans to ensure timely updates on credit information, allowing for low-risk, sustainable income generation.

LPBank is committed to maintaining high levels of asset growth and income, effectively managing risks, and adapting to modern trends in banking management. The bank is focused on developing clear business strategies, optimizing its workforce, enhancing customer-centric product offerings, and expanding investment activities. LPBank is also leveraging digital technologies and improving credit risk management to generate sustainable income and ensure its long-term success in the banking industry.

Diversifying Digital Banking Services

LPBank needs to provide a solution for diversifying its product and service offerings. Since its inception, LPBank has actively offered diverse products and services to the market. However, customer demands have continued to diversify, and LPBank 's products do not fully meet the needs of all customer segments. LPBank 's products lack differentiation and fail to impress in terms of delivery time and quality. LPBank has not fully explored opportunities with large, diverse potential customer segments. For corporate clients, LPBank should develop services tailored to each industry and business field, including suitable capital sources and lending products. They should also provide special incentives for large-scale, financially capable clients and foster and expand customer relationships. For individual clients, LPBank should focus on potential customers in rural and mountainous areas with transaction points. LPBank should also collaborate with investors to develop products for home, apartment, and land purchases, expand its study abroad and foreign exchange services, and create products tailored to each individual's business sector, supporting customers more effectively during the loan application process.

To diversify its product and service offerings, LPBank is expanding into digital lending, aiming to create a broader range of financial solutions. This expansion begins with credit operations, which encompass payment transactions and foreign exchange activities, thereby establishing customer relationships. Through partnerships with major retailers and public service providers, LPBank offers payment cards and bill payment services. These services provide LPBank with the necessary conditions to offer credit services.

One of the most effective ways for commercial banks to increase income in the digital age is by diversifying their digital banking services. While core services like savings accounts and checking accounts are essential, banks can expand their offerings to include asset management, investment advisory, and robo-advisory services. By providing a wider range of financial products, banks can attract a larger customer base and generate more income from fees. Although LPBank 's income from these services has increased over the years, it still constitutes a relatively small portion of its total revenue. Therefore, expanding and enhancing the quality of these services is essential for sustainable income generation.

Personalization is a key element of modern banking. LPBank can leverage data analysis and artificial intelligence to better understand customers' needs and preferences. By tailoring products and services to individual customers, LPBank can not only increase customer satisfaction but also cross-sell and upsell more effectively.

Provide Premium Digital Services. To serve high-net-worth individuals and businesses, LPBank can introduce premium digital services. These services might include dedicated relationship managers, exclusive investment opportunities, and specialized assistance. By charging fees for these services, LPBank can target wealthier customers and increase their income while providing added value.

Collaborate with FinTech Partners: Rather than viewing fintech companies as competitors, LPBank can collaborate with them to harness advanced technologies and services. Such partnerships can enable LPBank to offer advanced solutions like mobile payment platforms, digital wallets, and blockchain-based services. By integrating these technologies into its offerings, LPBank can attract tech-savvy customers and generate income through transaction fees and fintech partnerships.

To achieve this, LPBank needs to take several steps

Expand the Network of Agency Banks and Open Foreign Currency Accounts: Collaborating with agency banks can strengthen LPBank 's international relationships, particularly in terms of international payments, remittances, and borrowing relationships.

Ensure Information Security and Cybersecurity: LPBank must maintain and enhance its capabilities to ensure the security of information, data, and network security. As digitalization progresses, cybersecurity becomes increasingly crucial, as customers expect their financial data to be safe and secure.

5. DISCUSSION AND CONCLUSION

Discussion

Increasing income for a commercial bank is a multifaceted challenge. It involves a holistic approach that considers risk management, compliance, asset management, technology adoption, market strategy, customer relationships, economic factors, and the overall reputation of the bank. Additionally, it includes cost reduction, revenue maximization, and personnel development.

Minimizing interest payments on capital mobilization and operating Costs

The efficiency of a commercial bank business operation is heavily dependent on the cost of capital mobilization. Because capital mobilization constitutes a significant portion of the total capital for business operations, the associated expenses are substantial. Capital sourcing plays a pivotal role as an input factor in commercial bank business operations. To enhance business efficiency at LPBank, it is necessary to aggressively expand the acquisition of low-cost capital from various components of the economy to save on input costs. In addition to interest expense reduction, LPBank needs to diversify capital mobilization products that suit different customer segments. These deposit products should be diverse and secure for customers, such as linked deposit accounts with payment account and flexible savings accounts with varying deposit periods.

To effectively carry out capital mobilization, LPBank frequently assesses and compares its capital mobilization products with those of other commercial banks. Interest rates on time deposits are directionally competitive. The interest rate flexibility, dictated by market conditions, ensures LPBank ‘s stable market share of capital sources.

Operating costs also have a significant impact on the business results of commercial banks. Therefore, LPBank aims to enhance business efficiency by minimizing operating expenses. To reduce operating costs, LPBank considers cutting expenses related to salaries, administrative costs, and management costs without affecting business plans. These expenses need to be calculated with maximum efficiency.

Furthermore, LPBank minimizes contingency risk expenses. To limit provisioning for contingency expenses, LPBank needs to enhance credit quality. This includes improving customer access capabilities, strengthening the quality of credit assessment, monitoring, recovery, and debt resolution processes.

Enhancing the Quality of Human Resources at LPBank

The prerequisite solution for LPBank ‘s effective business operations is the quality of human resources. While LPBank has seen rapid workforce growth, the staff’s qualifications have not kept pace. Most employees hold bachelor’s degrees from domestic universities, with limited proficiency in foreign languages and information technology. Younger employees have struggled to apply diverse and extensive knowledge effectively.

To achieve sustainable operational effectiveness, LPBank must focus on enhancing the quality of its human resources. From training activities to fostering a culture of continuous improvement, the bank needs to encourage and reward competence and contributions from its employees.

LPBank should organize workshops and training sessions to improve professional and market analysis skills among its workforce. Practical experiences should be shared, and competitions can be held to motivate employees to learn and develop their skills further. Encourage knowledge sharing and skill enhancement through programs that facilitate interaction among employees across the organization. These programs help create a collaborative and knowledge-driven work environment.

Developing detailed job position descriptions for each role is essential. Additionally, LPBank should invest in high-quality training for newly recruited staff. Continuous training and refreshing the skills of recruits, standard practices in commercial banking.

While training is essential, LPBank should be mindful of its training costs. In-house training by experienced staff can be a cost-effective way to equip new employees with the necessary knowledge and skills. Furthermore, LPBank should consider other training methods, including basic job skills, task-specific training, and research activities.

LPBank should acknowledge that there is an opportunity for improvement in terms of knowledge and skill levels when compared to advanced banks worldwide. To bridge this gap, LPBank should aim to absorb industry-leading practices and technological expertise from external sources. International collaboration programs can facilitate this process and align LPBank ‘s leadership and employees with global banking trends.

Conclude

In the digital age, commercial banks must adapt and innovate to increase their income while remaining competitive. By diversifying services, enhancing personalization, embracing partnerships, expanding digital lending, offering premium digital services, investing in cybersecurity, and exploring open banking opportunities, LPBank can thrive in the digital service landscape. Success in this context demands a customer-centric approach and a willingness to embrace technological advancements. Ultimately, LPBank changes effectively will be well-positioned to increase income and sustain long-term growth.

SITUATION OF CURRENT REGULATIONS ON FAIR VALUE IN ACCOUNTING

Dr. Bui Thi Hang[1], M.Phil. Pham Thi Xinh[2], MA. Bui Thi Bich Thuy[3]

Abstract: The Vietnamese accounting system was built in accordance with a market economy orientation from the 1990s until 2001. The Accounting Law and Vietnamese accounting standards both stipulated that historical costs were used as the basis for calculating costs. However, to ensure that Vietnam's accounting system is compliant and compatible with other countries' accounting systems, it is necessary to research and use other pricing bases in addition to the original price. Therefore, replacing the original price model with other pricing models such as: net realizable value, current price, fair value... is absolutely necessary, in which fair value should be calculated. Legalized by Article 28 of the 2015 Accounting Law and guiding circulars, accordingly, fair value has been officially applied in the Vietnamese accounting system since January 1, 2017. Research on the current situation of regulations on fair value aims to come up with appropriate solutions.

Key words: *fair value, accounting, current regulations.*

1. PROPOSAL

Since 2005, the International Accounting Standards Board (IASB) has officially implemented the project to build and promulgate an International Financial Reporting Standards System (IFRS) to replace the accounting standards system. current international standards (IAS), along with the implementation of this project, the IASB also made important changes in its approach to accounting and financial reporting in the direction of shifting from an accounting perspective based on historical costs and focusing on business accounting on revenues and expenses based on transactions to an approach based on the principle of recording assets and liabilities at fair value and recording revenue and expenses according to fluctuations in the value of assets and liabilities.

Fair value was first mentioned by the International Accounting Standards Board (IASB) in International Accounting Standard 16 (IAS 16) – Property, Plants and equipment that "Fair value is an asset assets that can be exchanged between knowledgeable, willing parties in a comparable transaction. Then the IASB published a draft Standard on the measurement of Fair Value - considered as the value that would be received when selling an asset or the value paid to transfer a liability in an organized transaction. .

In May 2011, the IASB released International Financial Reporting Standard 13 (IFRS 13) – Fair value measurement. According to IFRS 13, fair value is the amount that would be received to sell an asset or the amount paid to transfer a liability in a structured transaction between market participants at the measurement date. The concept of fair value in this standard emphasizes that fair value is determined on the basis of market price, not the enterprise. Therefore, the introduction of IFRS 13 on Fair Value is an important step forward, affirming the significance of fair value in improving the consistency of global financial information.

In Vietnamese accounting, fair value is used mainly in initial recognition such as: Initial

[1] Email: hangkt@hvtc.edu.vn, Academy of Finance.

[2,3] Academy of Finance.

recognition of fixed assets, revenue, and other income; initial recognition reports monetary items denominated in foreign currencies… Fair value was first defined in VAS 14 – Revenue and other incomes, in which fair value is defined as the value of assets that can be exchanged the amount or value of a debt voluntarily settled between knowledgeable parties in a comparable exchange.

In the amended and supplemented Accounting Law No. 88/2015/QH13, one of the important additional contents is the regulation of accounting principles related to fair value. This is considered a strong step forward, but the applicability is still patchy, there is no clear direction on the use of fair value, and it has not been specifically included in Accounting Standards.

2. RESEARCH METHODS

- Method of analyzing and synthesizing theories: Analysis refers to studying different documents and theories by analyzing them into parts to find out about the subject. Synthesis is to link each aspect and each part of information analyzed to create a new complete and profound theoretical system about the selacted subject.

- Classification method and theoretical systematization: Classification is the arrangement of scientific documents according to each aspect, each unit, each problem with the same nature and the same direction of development. Systematization is the arrangement of knowledge into a system based on a theoretical model to make understanding of the subject more complete.

3. RESULTS AND DISCUSSION

3.1. Current legal regulations on fair value in Vietnamese accounting

3.1.1. Regulations on the basis of price calculation in Vietnamese accounting

In Vietnam, from 2001 onwards, the Vietnamese accounting system mainly uses historical prices, except for cases of asset revaluation according to State regulations. According to the provisions of Clause 5, Article 3 of the Accounting Law 2015, "Original price is the initially recorded value of an asset or liability. The original price of the asset is calculated including the costs of purchasing, loading, transporting, assembling, processing and other directly related costs according to the provisions of law until the asset is put into a ready-to-use state". Accounting information reflected through historical prices ensures reliability due to reliable evidence (shown through accounting documents), thus being useful to information users in making decisions.

However, the use of historical prices in accounting at businesses in Vietnam also reveals some limitations, especially when there are large fluctuations of some assets on the market or in low-income economies. With high inflation, the existence of a large gap between the original price and the market price has caused the accounting information to incorrectly reflect the financial situation of the entity, then the actual asset value of the unit at the time The point of preparation of financial statements can be much higher than the value on the report or vice versa. Experiencing many changes and facing many challenges, the impact of the accounting environment, accounting under the historical cost model has revealed many limitations, requiring consideration and adjustment to suit specific conditions to improve High quality of accounting work and usefulness of information presented on financial statements.

3.1.2. Regulations on legal transactions according to the Vietnamese Accounting standards system

The Vietnamese accounting standards system includes 1 general standard and 25 specific standards, of which 13 standards require or allow directly or indirectly the application of fair value in accounting, 10 standards require requires the application of fair value in accounting when initially recording assets and liabilities, 6 standards allow the application of fair value in accounting when presenting and disclosing information on financial statements.

Regarding the concept of fair value in accounting, the accounting standards are different and inconsistent. In general, the definitions are not complete and clear, and the terms used cannot be fully explained, thus it shall be very difficult for users to apply when transactions related to legal transactions arise in accounting.

As currently the Ministry of Finance has not issued accounting standards nor circulars related to fair value in accounting, fair value is only mentioned in some standards to record initial transactions in cases where it is not possible to determine the original price. In fact, up to now, there are still many debates surrounding the use of legal values in accounting (the most debated issue is the reliability and method of determining legal values in accounting).

3.1.3. Regulations on fair value of other legal documents

In addition to the provisions of the Vietnamese accounting standards system, fair value in accounting is also stipulated in many other relevant legal documents including:

+ Circular 117/2005/TT-BTC dated December 19, 2005, the Ministry of Finance issued guidelines for determining market prices in business transactions between affiliated parties (effective from 2006-2009) .

+ Circular 66/2010/TT-BTC dated April 22, 2010, the Ministry of Finance issued guidance on determining market prices in business transactions between affiliated parties (replacing Circular 117/2005/TT- BTC mentioned above and effective from 2010 onwards).

+ On December 20, 2013, the Ministry of Finance issued Circular 201/2013/TT-BTC guiding the application of advance agreement on the method of determining taxable prices (APA) in tax administration.

+ Circular 78/2014 dated June 18, 2014 guiding the implementation of Decree No. 218/2013/ ND-CP dated March 26 of the Government regulating and guiding the implementation of corporate income tax law.

+ Circular 146/2014 dated October 6, 2014 of the Ministry of Finance guiding financial regimes for securities companies and fund management companies.

+ Circular 200/2014/TT-BTC dated December 22, 2014 of the Ministry of Finance on guiding corporate accounting regime.

+ Circular 210/2014/TT-BTC dated December 30, 2014 of the Ministry of Finance guiding accounting applicable to securities companies.

+ Circular No. 126/2015/TT-BTC dated August 20, 2015 of the Ministry of Finance promulgating Vietnam Valuation Standard No. 08 - Market approach; Vietnam valuation standard No. 09 - Cost approach; Vietnam valuation standard No. 10 - Income approach takes effect from January 1, 2016, replacing 6 valuation standards according to Decision No. 129/2008/QD-BTC dated December 31, 2008 of the Minister of Finance expires from the effective date of this Circular.

+ Official dispatch No. 12568/BTC-CDKT dated September 9, 2015 of the Ministry of Finance explaining the content of Circular 200/2014/BTC.

+ Circular No. 334/2016/TT-BTC dated December 27, 2016 of the Ministry of Finance amending, supplementing and replacing Appendix 02 and 04 of Circular 210/2014/TT-BTC dated December 30, 2014 on accounting guidance applicable to securities companies.

+ Decree 20/2017/ND-CP dated February 24, 2017 of the Government on tax management for enterprises with affiliated transactions effective from May 1, 2017

+ Official Dispatch 4196/BTC-CDKT dated March 30, 2017 on guidance on legal limits and calculating corporate income tax when applying legal limits.

+ Circular 41/2017/TT-BTC dated April 28, 2017 of the Ministry of Finance guiding a number of articles of Decree 20/2017/ND-CP.

3.2. Current situation of legal regulations on fair value in accounting

Circular No. 200/2014/TT-BTC guiding the corporate accounting system has a number of regulations on fair value, specifically:

- For trading securities:

Trading securities must be recorded in accounting books at their original cost, including: Purchase price plus (+) purchase costs (if any) such as brokerage, transaction, information provision, taxes, fees and banking fee. The original price of trading securities is determined according to the legal value of payments at the time of the transaction.

- Fixed assets:

Circular No. 200/2014/TT-BTC further clarifies VAS 03 on determining the original price of tangible fixed assets acquired through purchase, including: In case the purchase of fixed assets is accompanied by additional equipment and spare parts, it must be determined and recorded separate from equipment and spare parts at fair value. The original price of purchased fixed assets is the total costs directly related to bringing the asset into a ready-to-use state minus the value of equipment and replacement parts.

- For investments: In case of dissolution of a subsidiary and merger of all assets and liabilities of the subsidiary into the parent company: Recording a decrease in the book value of the investment; Record all assets and liabilities of the dissolved subsidiary at fair value at the merger date. The difference between the cost of the investment and the fair value is recorded in Financial Revenue or Financial Expenses.

- For revenue and expenses: "Revenue is determined according to the fair value of the amounts entitled to receive, regardless of whether money has been collected or will be collected." "Revenue must be recorded in accordance with its nature rather than its form."

Regarding the method of determining fair value in accounting, so far there has been no official and unified guidance on the method of determining fair value in accounting. Currently, the Ministry of Finance has issued Circular 126/2015/TT-BTC of the Ministry of Finance dated August 20, 2015 on promulgating Vietnam Valuation Standards No. 08, 09 and 10, which stipulates quite specific valuation methods such as market method, cost method, income method, however, how to apply these methods in accounting is still in consideration.

4. CONCLUSION AND SOLUTIONS

Application of fair value in the Vietnamese accounting system is considered as an important reform step in the process of integrating the accounting system with world accounting practices, ensuring the implementation of Vietnam's commitments to with signed bilateral and multilateral agreements. However, the application of fair value in accounting also poses great challenges for accounting policy makers as well as those involved in accounting work, training activities, and accounting practices. Therefore, we offer some ***proposals to improve fair value in accounting according to the roadmap to convert Vietnamese accounting standards to International Financial Reporting standards.***

4.1. The necessity to convert Vietnamese accounting standards to international financial reporting standards

Fair value according to international accounting standards

The International Accounting Standards Board (IASB) has mentioned fair value as a basis for calculating costs in accounting since the late 1990s, expressed through international accounting standards, such as: Assets , buildings and equipment (International Accounting Standard No. 16 - IAS 16); Investment real estate (IAS 40); Leases (IAS 17); Measurement and recognition of financial instruments (IAS 39),... Therefore, fair value is the basis for determining the value after initial recognition or fair value is the price at which an asset can be exchanged between parties with complete information in a completely arm's length transaction. However, some issued international accounting standards do not provide complete instructions on how to determine fair value. Some standards have detailed instructions but lack consistency in the relationship (specifically, are IAS 16 and IAS 17).

Therefore, in 2013, an independent IFRS standard was officially issued by the IASB to guide the measurement or determination of fair value, and at the same time promulgate requirements on the disclosure of fair value in financial statements. In IFRS 13 - "Fair value is the price that would be received to sell an asset or paid to transfer a liability in an arm's length transaction between market participants at the measurement date". According to the standard, it can be seen that fair value is the price determined on the basis of market price or transfer value without the assessment of the enterprise.

Fair value has the following outstanding aspects: (1) Specific assets and liabilities are the subject of measurement; (2) For non-financial assets, the basis for valuation must be appropriate for measurement; (3) The primary market for the asset or liability and (4) Valuation techniques must be appropriate for measurement, such as the availability of an input reference base that represents the assumptions for Market participants to use, when evaluating an asset or liability, the level of the fair value scale on which the inputs are classified.

In January 2021, Deloitte Vietnam published a publication converting Vietnamese accounting standards to international financial reporting standards, listing 10 standards requiring the application or allowing fair value in a number of specific case.

Table 1: Connection between IFRS - 13 and other standards

	Required	Allowed	Intepretation
IFRS 3- Business consolidation	x		The fair value at the acquisition date of the value of investments and assets and liabilities acquired.
IFRS 5 - Long-term assets held for sale and intermittent operations	x		Use fair value, deduct costs for sale, for groups of long-term assets for sale and assets to be liquidated.
IFRS 9 - Impairment in value	x		Fair value will be used with different types of financial instruments.

IAS 28-Accounting for Investments in Associates and IFRS 11 - Agreements	x		Enterprises have the right to evaluate investments in subsidiaries, affiliated companies and business cooperation activities at fair value.
IAS 16 - Tangible fixed Assets		x	Enterprises have the right to choose to re-evaluate assets at fair value.
IAS 19 - Employee Benefits	x		Determine the future benefits payable to employees determined at fair value.
IAS 36 - Asset losses	x		Use the fair value minus related selling expenses to determine the residual value.
IAS 38 - Intangible fixed assets	x		Enterprises have the right to reevaluate the fair value of intangible assets.
IAS 40 - Real estate investments	x		Right to determine the value of assets at their fair value
IAS 41- Agriculture	x		Biological and industrial assets are determined at their fair value

Source: Deloitte (2021) and data compiled by the author

Thus, IFRS Standard No. 13 on fair value determination has a major impact on the preparation and presentation of financial statements, including: balance sheet, comprehensive income statement, income statement. business operations and financial statement disclosures. In addition, IFRS 13 only applies to assets and liabilities whose values are determined at fair value.

Fair value according to Vietnamese accounting standards

Among the standards and regulations in Vietnamese accounting are mentioned in some accounting standards VAS 02, 03, 04 and VAS 14. Some main points are mentioned, such as: (1) Fair value is mainly used in initial recognition of: formation of fixed assets, revenue and other income, initial recognition and reporting of foreign currency monetary items, determination of business combination costs; (2) Fair value is used to evaluate after initial recognition of: revaluation of assets, revaluation of monetary items denominated in foreign currencies at the end of the fiscal year; (3) Fair value is used as a basis for recording asset price decline.

Table 2. Vietnamese accounting standards require the application of fair value.

Standards VAS	Subjects and contents
VAS 01- General standards	- Asets
VAS 03 - Tangible fixed assets	- Tangible fixed assets purchased in the form of exchange - Tangible fixed assets are sponsored or donated
VAS 04 - Intangible fixed assets	- Intangible fixed assets are formed from the exchange of assets related to the capital ownership of the unit - Intangible fixed assets are formed during the merger process. - Intangible fixed assets granted or donated by the state - Intangible fixed assets purchased in exchange for dissimilar assets
VAS 05 - Real estate investments	- Real estate investments - Revenue from the sale of investment real estate is recorded according to legal values - Present on the financial statements the following contents: Fair value of real estate investments at the end of the accounting year, preparing financial statements
VAS 06 - Asset leasing	Leasing financial asets

VAS 07 - Investments and affiliate companies	The purchasing an investment, any positive or negative difference between the original cost of the investment and the investor's equity share of the identifiable net assets of the associate is appropriately accounted with VAS 11
VAS 10 - Effects of exchange rate change	Non-monetary items of foreign currency origin are initially recorded at the fair value
VAS 11 "Business consolidation"	Business consolidation fees
VAS 14 "Other revenue and income"	Revenue: determined according to the fair value of accounts receivable or collected

Source: Data compiled by author

Vietnam has gradually updated its accounting work according to the fair value method (Accounting Law 2015), but up to now, the role of the fair value valuation basis is still quite inadequate and there is still no clear instruction. There are many limitations in standards and regulations related to accounting according to legal principles, such as: inconsistent concepts; the use of fair value for initial recognition instead of historical cost; There is a lack of specific standards regulating the measurement of fair value. Meanwhile, IFRS 13 provides 3 levels of determining fair value.

4.2. Orientation for applying fair value in accounting according to the roadmap for converting Vietnamese accounting standards to International Financial Reporting standards

Listed companies need to choose a transformation roadmap to ensure they complete their goals in the most favorable direction. Listed enterprises should study standard No. 13 from the beginning, choose a plan to apply legal regulations based on the actual status of the enterprise, important milestones and the destination of the implementation roadmap in sync with Decision No. 345/QD-BTC dated March 16, 2020 and accounting - auditing strategy for the period 2021 - 2030 of the Ministry of Finance.

Developing human resources for accountants and controllers through on-site training and online training, including: (1) Innovating content and training programs for chief accountants; Develop content and programs to periodically update professional knowledge and skills according to international practices. (2) Enhance the sense of discipline and professional ethics of accountants and controllers integrated with training programs to update specialized knowledge and professional skills. (3) Business leaders have remuneration policies, pay attention to high-quality accounting human resources, serve the needs of businesses in the context of increasingly deeper accounting integration and aim to apply comprehensively by 2025. (4) Promoting the role of professional accounting consulting organizations in the process of applying fair value, supporting businesses, including: consulting to identify key accounting issues that need to be implemented according to fair value, training sessions for accountants.

It is necessary to acquire international accounting practices, evaluate the results of implementing the accounting implementation roadmap according to legal regulations on the basis of provisions of accounting law. It is also important to reflects problems and difficulties in the process of implementing fair value accounting. In addition to current legal documents related to accounting, accounting regulations and standards in the context of international accounting integration need to be reviewed and strengthened to be appropriate and timely.

In addition, state management agencies need to introduce policies to encourage, give incentives, and support listed enterprises in training accounting human resources to achieve expertise, vision, and professional ethics. It is important t0 strengthen control activities to ensure compliance with accounting regulations from accounting standards to guiding documents.

Changing management thinking in accounting of managers: Leaders of listed businesses need to have certain knowledge in the field of accounting to control financial and legal risks stemming from accounting activities. Improve the understanding of accounting through consulting from accounting professional associations and consulting organizations, as well as regularly updating changes in accounting policies. In addition, managers need to invest in developing and changing accounting human resources in the entity in a systematic way to promptly adapt to changes and integration of accounting policies.

IFRS requires the application of many financial models to determine the value of assets and liabilities according to fair value, recoverable value, value in use, time value, intrinsic value, etc. Therefore, financial information provided on the IFRS platform will help listed businesses evaluate their financial situation at the time of reporting as well as help the Board of directors get better information for forecasting. It is necessary to report future operating results and cash flows, thereby providing a basis and tools to carry out management and operations in accordance with the actual situation.

DIGITAL TRANSFORMATION OF TAX MANAGEMENT CONTRIBUTING TO PROMOTING THE ACTIVITIES OF ENTERPRISES IN VIETNAM

Dr. Pham Nu Mai Anh[1]

Abstract: Digital transformation is an inevitable trend in the current period in both the public and private sectors. Especially since the Prime Minister approved the "National digital transformation program to 2025, orientation to 2030" in Decision No. 749/QD-TTg dated June 3, 2020, the issue of promoting digital transformation in the operations of agencies and organizations in the public and private sectors has become very urgent in the current period and in the coming time. Especially from the perspective of the public sector, the management activities of tax authorities not only ensures the correct collection of the full amount of revenue for the state budget but also makes an important contribution to creating favorable conditions and promoting the development for the private sector. This article studies the achieved results of digital transformation in the Tax authorities which contribute to a positive impact on production and business activities of enterprises, while also point out the challenges, and show some solutions to promoting digital transformation in tax management, aim to form conditions for the development of businesses in the coming time in Vietnam.

Keywords: digital transformation, tax management, business development

1. INTRODUCTION

Digital transformation is a global issue in the context of the strong development of the scientific and technological revolution. Digital transformation helps organizations in the economy quickly catch up with the current inevitable development trend, and not fall behind in the constant movement and change of activities in the socio-economy. This is an important issue that is recommended to be applied to governments and businesses in all departments because this can impact changes in the management of operating cycles within organizations. Organizations and units undergoing digital transformation will even impact relationships with partners outside the organization such as customers, individuals, and other organizations that have cooperative transactions. In particular, digital transformation will contribute to increasing the value and image of the units and organizations implementing the transformation, contributing to the general trend in the modern time.

The tax authority is one of the units that plays an important role in tax collection management for the state budget. In the context of the development of the 4.0 scientific and technological revolution, the tax authority has promoted the digital transformation process through administrative reform and information technology application to facilitate tax administration agencies as well as for people and businesses in implementing public services, contributing to promoting economic growth and social development. The positive impact of digital transformation applications in tax management is increasing transparency in tax administration through the shift to digital payment methods and administrative procedures being carried out openly and transparently. Through the use of digital platforms, it contributes to enhancing the reliability and flexibility of the tax system; maintain data security, promote tax registration, tax payment, payment and dispute resolution activities, clarify processes, ensure that all payments are traceable to meet deadlines taxpayers' expectations.

---

1 Email: Phammaianh@hvtc.edu.vn, Academy of Finance.

The application of modern and advanced machinery and information technology contributes to shortening time and saving costs for taxpayers. The process of carrying out administrative procedures for people and businesses takes place anywhere, at any time instead of having to go to the headquarters of tax agencies. Digitizing tax declarations makes tax declaration activities easier and more convenient. This contributes to minimizing people's tax compliance risks. In particular, in the open economy, the implementation of digital transformation in tax management activities of tax authorities will contribute to bringing about a number of positive impacts, contributing to promoting the expansion of transactions commerce of businesses on the basis of minimizing procedures and documents that need to be stored, improving the quality of public services, and also creating favorable conditions for businesses to further promote digital transformation activities. Besides, it is more convenient for businesses to participate in international trade activities, save time and costs, thereby promote import-export activities in Vietnam.

2. LITERATURE REVIEW

In the trend of globalization, along with the strong development of the 4.0 technology revolution, digital transformation is considered an inevitable trend, a vital issue for countries, organizations, businesses and individuals in all over the world.

According to Demirkan and partner (2016), digital transformation is the profound and rapid transformation of business activities, processes, capabilities and business models to take advantage of changes and opportunities due to technological advances. According to Hess and partner (2016), digital transformation involves changes in digital technology that can bring new business models, create new products and services, or change the basis organizational structure to automating processes. These changes can be observed in the growing demand for Internet-based media, leading to changes in entire business models.

Necessary digital transformation activities are carried out in both the public and private sectors of the economy. From the perspective of the public sector, implementing digital transformation helps state management agencies promote the process of modernizing management, improving the quality of service to the people, and creating convenience for the people in administrative procedures, ensuring speed, convenience and accuracy in collecting and rendering information for management activities, contributing to improving management quality and efficiency. Many countries around the world have made significant efforts to exploit digital technologies to provide better services and eliminate gaps in taxpayers' tax compliance.

As is the case in Chile, digital transformation activities in tax administration in Chile are carried out on the country's existing digital ecosystems and the available capacity of the tax authorities. (Reyes – Tagle, Gerardo and partner, 2021). On the other hand, the practice of conducting digital transformation activities has shown that digital transformation in tax administration does not fundamentally change its nature and elements but involves procedural and potential issues. The capabilities of digital technology are demonstrated through the use of technology applications based on blockchain, big data, artificial intelligence, cloud technology, internet of things (IoT) as technological tools to organize tax relations and tax administration to improve the service quality and facilitate taxpayers' operation (Natalia Pantielieeva, 2022).

Thus, it can be seen that many countries have focused on digital transformation activities in tax management. Digital transformation not only meets the requirements of modernizing tax administration but also promotes digital transformation activities in businesses, creating conditions for the development of businesses in the open economy. It is important to realize that the process of digitalization and application of information technology to tax administration data processing requires countries to determine the current status of digital transformation activities, thereby promoting digital transformation to contribute to improving tax management efficiency and creating a favorable business environment for businesses in the coming time.

3. CURRENT STATUS OF DIGITAL TRANSFORMATION IN TAX MANAGEMENT OF TAX AUTHORITIES

The Tax authorities belong to the Finance sector, directly managing tax issues to ensure correct and sufficient collection of revenue for the state budget. In the Tax System Reform Strategy to 2030 approved by the Prime Minister, the goal has been determined: “Building a modern, streamlined, efficient and effective Vietnam Tax industry; The management of taxes, fees and charges is unified, transparent, in-depth and professional according to the risk management method, promoting the application of information technology, simplifying administrative procedures, reducing compliance costs; At the same time, the focus of tax management is based on the electronic tax platform and three basic pillars: complete, synchronous, modern and integrated tax management institutions; professional human resources, integrity, innovation; modern, integrated information technology, meeting tax management requirements in the context of the digital economy.” Therefore, the Tax authorities have always been ready and proactively deployed many digital transformation activities throughout the industry. The practice has shown that the General Department of Taxation is one of the state agencies that has performed excellent digital transformation in recent times.

In order to improve operational quality and create favorable conditions for taxpayers in fulfilling their tax obligations to the State. The Tax Industry has developed and upgraded many free applications for people and businesses recently. Typical applications include:

In the first place, the General Department of Taxation has maintained the website system of the General Department of Taxation to operate stably, fully and promptly provide legal policy information and tax agency activities. In addition, the General Department of Taxation has coordinated with professional units to enhance information disclosure on the websites of the General Department of Taxation and local tax departments. The Electronic Information Portal of the General Department of Taxation and the Electronic Information Portal of 63 local Tax Departments continuously update legal documents on taxes and new tax policies; Documents answering taxpayers’ problems; Write news and articles to reflect the activities of tax authorities, and at the same time closely follow and update information on the activities of the Tax industry on the website to let the business community and people know, which creates consensus in the society.

In 2022, the General Department of Taxation electronic information portal posted 907 news/ articles, 361 documents, 164 question and answer situations about Tax; On the websites of 63 Tax Departments, more than 53,000 news/articles/photos/videos/documents about tax policies and administrative procedures have been published and the industry’s outstanding activities are reelected as well.[4]

Secondly, the General Department of Taxation has provided online public services of electronic tax declaration, payment, and refund applications for business groups.

* Regarding electronic tax declaration: The electronic tax declaration system has been deployed in 63/63 provinces and cities and 100% of affiliated Tax Departments with 99.5% of

businesses participating in using electronic tax declaration services. According to statistical results by 2022, the number of electronic tax declaration documents received from January 1, 2022 to November 15, 2022 has reached 16,934,078 documents.[4]

* Regarding electronic tax payment: Coordinate with 55 commercial banks (which have completed connecting electronic tax payment with the General Department of Taxation) and 63 Tax Departments to deploy electronic tax payment services and propagate and mobilize businesses participate in using the service. In 2022, businesses paid taxes through 3,346,667 electronic tax payment transactions with an amount of over 765,817 billion VND and 55,853,591 USD.[4]

* Regarding electronic tax refund: On August 4, 2017, the system was expanded to provide services to taxpayers in 63 provinces and cities nationwide. Statistics in 2022, the total number of businesses participating in electronic tax refund is 7,938 out of 8,016 tax refund businesses, reaching a rate of 99%. The number of received documents is 18,627 out of a total of 18,732 documents, reaching a rate of 99.4%; The total number of refunded system documents is 17,603 with a total refund amount of VND 131,321 billion.[4]

In addition, the Tax Industry has implemented electronic invoices and electronic stamp management applications in tax administration to create a basic foundation for collecting information to meet management requirements in this situation, and at the same time promote the process of implementing digital transformation at businesses to adapt to the requirements of state management agencies.

Electronic invoices are digital documents which play an important role in recording economic transactions which are actually performed. Pursuant to the provisions of the Law on Tax Administration No. 38/2019 and Decree No. 123/2020/ND-CP, the Ministry of Finance has approved and issued decisions and official dispatches to organize and implement the application of legalization electronic application according to the 2-phase roadmap. In November 2021, the General Department of Taxation deployed phase 1 in 06 provinces/cities (Hanoi City, Ho Chi Minh City, Quang Ninh, Binh Dinh, Phu Tho, Hai Phong). In April 2022, the General Department of Taxation continues to implement phase 2 in the remaining 57 provinces and cities according to the roadmap approved by the Ministry of Finance. From now, 63 provinces and cities nationwide have officially deployed the electronic invoice system. As of December 12, 2022, the total number of invoices received and processed is more than 2.311 billion invoices, of which: Invoices with code: 618.32 million invoices; Uncoded invoices sent with full data to tax authorities: 666.52 million invoices; Uncoded invoices sent according to tax authorities summary table: 1,025.78 million invoices; Invoices by time they arise: more than 558 thousand invoices[4]. The implementation of electronic invoices creates a basis for forming a large data source to serve tax management activities, and through the management of electronic invoices, tax authorities can confirm invoices, the nature of the transactions and the corresponding value of the transactions, from which appropriate management decisions can be made. In addition to electronic invoices in general, businesses, households, and individuals doing business that pay taxes according to the declaration method provide goods and services directly to consumers according to the business model (shopping centers commerce; supermarkets; consumer goods retail; dining; restaurants; hotels; western medicine retail; entertainment services and other services) are selected to use electronic invoices initiated created from a cash register connected to electronic data transfer with the tax authority. The electronic invoice system with code initialized from the cash register has been officially deployed since December 15, 2022. As of June 2023, there have been 21.4

thousand businesses and individuals registered to use electronic invoices with tax authority codes created from cash registers.

In addition, the General Department of Taxation has completed the construction and implementation of an electronic stamp management system that meets the regulations of Circular No. 23/2021/TT-BTC. Accordingly, the electronic stamp management system meets contract management, management of import/export/sale of stamps on the electronic stamp system and reports. The electronic stamp management system connects to the electronic invoice system to support tax officials in creating electronic invoices with the tax authority's code when selling stamps.

The digital transformation process based on increasing the application of science and technology products in management activities has brought many positive results in tax management of tax authorities, while also creating many advantages for the operations of businesses, contributing to improving the operating environment for entities in the economy and enhancing national competitiveness. In recent times, many information technology applications have been introduced into the operating system of the Tax industry, reducing and simplifying many stages in the management process and creating more room to reform administrative procedures, creating more favorable conditions for businesses and people in fulfilling their obligations to the State Budget. In 2022, the General Department of Taxation has proposed to announce 01 reporting regime to replace 04 reporting regimes and abolish 03 reporting regimes; Review, reduce and simplify tax administrative procedures in 2022 according to the assigned tasks in Resolution 68/ND-CP dated May 12, 2020 of the Government, thereby cutting 70 administrative procedures (down from 304 down to 234 procedures), a decrease of 23% compared to the end of 2021. At the same time, continue to implement the integration of online public services levels 3 and 4 into the National Public Service Portal, specifically: completing Electronicize 103 procedures and integrate 97 procedures into the National Public Service Portal.

Thanks to the results of tax reform achieved, in the Administrative Procedures Compliance Cost Index (APCI) Report released by the Administrative Procedures Reform Advisory Council with support from the Development Agency The United States International has recorded quite positive opinions and experiences of businesses regarding the process of handling administrative procedures by state agencies, including tax authorities. The APCI 2022 report can be used as one of the measures of the effectiveness of administrative procedure reform efforts at the central level (policy issuance level) and local level. The APCI scores of the tax administrative procedures group over the years have been very high. Most tax administrative procedures are now 100% carried out electronically and compared to 2021, the proportion of businesses submitting online applications has increased.

On the other hand, Digital Transformation has helped the Tax industry perform propaganda functions, better support taxpayers, optimize the capacity of tax agencies to provide public services, and reduce tax compliance costs taxpayers, thereby contributing to improving the voluntary compliance of taxpayers in fulfilling their obligations to the state. As of 2020, the General Department of Taxation has completed the integration of 150 tax procedures into the Translation Portal. National Public Service at the address: https://dichvucong.gov.vn/, exceeding 161% (150/93 administrative procedures) according to the Plan in Decision No. 683/QD-BTC dated April 28, 2020 of The financial. At the same time, the General Department of Taxation has established an eTax System including 479 information channels to support taxpayers uniformly from the General Department of Taxation to 63 Tax Departments and 415 Tax Branches, operating regularly, continuously and smoothly 24/7[3].

The tax authorities' efforts in digital transformation activities have contributed to promoting digital transformation activities at businesses in Vietnam. In the 2022 Enterprise Digital Transformation Annual Report, an analysis of the readiness level of businesses (mainly small and medium enterprises) was conducted, showing that businesses in most industries are ready for the transformation change to digital environment. Businesses have made progress in applying digital technologies in marketing, distribution, and multi-channel sales to help increase experience and better customer care. Digital technology is also more commonly applied in some operations such as inventory management, production lines, and purchasing management. Many businesses have digitized data and standardized processes to move towards digital transformation on a broader and more consistent scale, contributing to improving production and business efficiency and business competitiveness.

However, in a world that is always moving and constantly changing, there are many factors that have greatly impacted the digital transformation activities of tax authorities. Technology changes at a rapid pace with the introduction of a series of new technologies such as blockchain, cloud services, API, Machine learning, computer vision, which will make some of the technologies currently applied by the Tax industry quickly become outdated if do not regularly update and upgrade applications. On the other hand, many new types of businesses are formed, exist and develop, especially the emergence of business activities of new products such as cryptocurrencies, e-commerce, and fintech, which have posed many difficulties and challenges for tax authorities in controlling activities and implementing appropriate tax administration for these target groups with specific activities.

In the process of implementing digital transformation, the Tax industry is also affected by many challenges within the industry. For digital transformation activities to be carried out effectively, a large enough data source is required. However, the current data of the Tax industry is still scattered and fragmented, the operating data is not timely, not flexible according to management needs and the synthesis, sending and receiving of reports has not been completed, which takes a lot of time and effort. In addition, the challenges in implementing investment, procurement and information technology infrastructure deployment processes throughout the industry are still bound by many processes and procedures, which are not flexible enough to meet the needs of the industry respond to the rapid change and development of technologies under the impact of the 4.0 industrial revolution. On the other hand, specialized human resources that are sensitive and meet management requirements in the new period and information technology human resources in terms of quality and quantity are also one of the big challenges for the Tax industry. The current information technology human resources in the Tax industry are very low compared to information technology human resources at tax agencies of some countries. The number of civil servants working in information technology at tax agencies at all levels of the Vietnam Tax sector by the end of 2022 reached about 1,420 out of a total of 37,000 tax sector civil servants (accounting for 3.84%) while this ratio in New Zealand it is 6%, in Australia it is 8% and in Singapore it is 12%[3]. So, mobilizing and supplementing information technology resources for the Tax industry is an urgent need.

Therefore, in order to promote digital transformation activities in tax management of tax authorities, it is necessary to be aware of the importance of digital transformation and the challenges posed to digital transformation, from which appropriate solutions for implementing digital transformation can be given throughout the Tax industry, in accordance with the digital transformation orientation set out by the Finance Industry and the Government.

4. DISCUSSION

With the goal of improving the quality of tax management, cutting management implementation costs and tax compliance costs, creating convenience and increasing satisfaction and high consensus for people and businesses in to fulfill tax obligations to the State, the Tax industry needs to determine the appropriate digital transformation orientation. Accordingly, the Tax Industry needs to continue providing digital tax services and electronic data to facilitate taxpayers, contributing to improving Vietnam's ranking in terms of tax simplicity and convenience. On the one hand, the application of artificial intelligence technology to tax management stages is an important direction in digital transformation of the Tax industry as clearly stated in the Tax System Reform Strategy to 2030. Accordingly, the General Department of Taxation The Tax Department needs to gradually research and test the application of AI technology in management stages, especially in analyzing taxpayers' compliance risks. On the other hand, the Tax Industry needs to build a data platform to serve tax management and smart tax services and deploy technical infrastructure to ensure safety and security for the Tax industry's information technology system following the digital transformation orientation of the Finance Industry.

With the motto of putting taxpayers at the center of management activities, promoting the implementation of digital transformation above will bring great efficiency in reforming tax administrative procedures and promoting the digital transformation process. The Tax sector in particular, actively contributes to implementing the National digital transformation strategy in general. Some solutions for digital transformation activities in tax management of tax authorities in the coming time as follows:

Firstly, pay attention to building big data because data is the heart of digital transformation. The Tax authorities needs to implement data management throughout the industry in the direction of: Completing mechanisms, policies, processes and standards to create a legal basis for creating, sharing and exploiting data throughout the industry; Implementing data infrastructure improvements based on building and operating an integrated data sharing platform, data analysis and processing platform, and shared data warehouse providing master data and reference data, serving timely and highly effective tax management decisions; Upgrading equipment infrastructure to have a large industry database storage facility.

Secondly, the Tax industry needs to aim to build a system that unifies all tax management applications, tax management content, and implements data convergence to make analysis, forecasts, and management decisions timely tax. This system requires the simultaneous application of specific existing digital technology platforms: have a big data platform to synthesize and analyze data, provide complete, accurate, and timely operating reports; Cloud platform helps the system easily work anytime, anywhere, on any device as long as the right person is authorized to use the system; AI technology platform helps the system work smarter and more efficiently and blockchain platform ensures safety, security and anti-counterfeiting.

Thirdly, it is necessary to always raise awareness and innovate the concept of developing digital human resources in the direction of ensuring quality and quantity to meet job requirements.

Fourthly, there needs to be coordination between the Tax sector with other agencies in the state management apparatus and with other agencies and organizations abroad on the basis of learning from experience, sharing, supporting and provide information for management activities.

Last but not least, Learn and exchange digital transformation experiences that have been successfully implemented in other countries on a number of topics that Vietnam has not yet implemented. Through the process of researching digital transformation experiences in a number of countries around the world, it has been shown that the digital transformation process in many countries around the world has made further and longer strides than Vietnam. Learning from foreign experiences will create many opportunities but also put a lot of pressure on the Vietnamese Tax industry, which needs to constantly strive to promote digital transformation to meet the requirements of the country's digital transformation strategy of government and more suitable for the international environment.

5. CONCLUSION

Digital transformation activities in tax administration cannot be implemented effectively in just a short time, but requires an implementation roadmap and the creation of important foundations so that when implementing digital transformation, it will be effective bringing positive results in management activities, bringing high consensus in implementation coordination among management objects. Digital transformation activities in tax management of the Tax agency, when there is appropriate direction and appropriate solutions in implementation, the tax management activities of the Tax industry will become increasingly modernized, which promotes transformation activities for other fields in the economy, aimsto implement the Digital Government according to the identified orientations of the Party and State, at the same time, creates conditions and opens up new opportunities for the development of the system businesses in the economy.

FACTORS AFFECTING THE START-UP ECOSYSTEM OF THE PRIVATE ECONOMY

PhD. Nguyen Thi Nhung[1], MA .Nguyen Linh Phuong[2], MA. Vu Hong Nhung[2]
PhD. Nguyen Thi Phuong Ngoc[3], MA. Pham Thi Bich Ngo[4]

Abstract: The research aims to examine the factors affecting the success of the private economy's startup ecosystem. The article combines qualitative and quantitative research methods with 346 survey samples indicating various factors and explaining the success of the private economy's startup ecosystem. The results also depict that success on the startup ecosystem has a positive impact from high to low level on 5 factors consisting of risk-taking culture; technological and industrial conditions; abundant capital, incubators and startup companies; and government support.

Key word: ecosystem, startups, private economy

1. INTRODUCTION

By 2023, Vietnam is expected to have more than 1,400 organizations being capable of supporting startups, including 196 co-working zones, 69 business incubators and 28 business promotion organizations established. There are 108 venture capital funds that consider Vietnam as a target market or have operations in Vietnam, of which 23 funds have Vietnamese legal entities and 23 purely Vietnamese funds. These numbers have continuously increased in recent years, which illustrate the active participation of the community in developing the startup ecosystem. According to the assessment organization Startup Blink, in 2022, this ecosystem of Vietnam was ranked 54th in the world, 12th in the Asia-Pacific region. A report by the World Intellectual Property Organization (WIPO) recognized that Vietnam was among the group of countries that had attained the greatest progress in the startup ecosystem over the past decade. The 2022 Global Innovation Index (GII) report published by WIPO also reveals that Vietnam ranked 48/132 countries and economies, holding 3rd place in Southeast Asia, after Singapore (7th) and Thailand (43rd).

With approximate 800 thousand active businesses, the private economy is contributing nearly 45% to the country's GDP, one third of state budget revenue, more than 40% of investment capital for the whole society, and creating numerous jobs for 85% of the country's workers. In addition, the private economy plays a vital role in Vietnam's international trade activities, accounting for 35% of total import turnover and 25% of total export turnover. Moreover, capital from the private economic sector contributes greatly to socio-economic development, increasing from 51.3% in 2016 to 59.5% in 2021. Apparently, promoting the strength of the private economy is a determination of the government to successfully build e-government, towards digital government and digital economy. However, the startup development environment in Vietnam still has many difficulties, especially investment policies, issues related to divestment, loans, capital and venture capital, making investors feel hesitate, and startups lose valuable

business opportunities.

In reality, researching factors affecting the success of the private economy's startup ecosystem will remove strenuousnesses and promote the role of the private economy in the country's development.

2. RESEARCH OVERVIEW

Undoubtedly, entrepreneurship is becoming increasingly critical for economic development and innovation in the modern world (Krueger et al., 2000). Entrepreneurship is not just a simple idea, but also an important factor contributing to the economic development of each country, having a positive impact on the economy by creating new jobs, promoting innovation and enhancing competitiveness in the labor market (Barba-Sánchez et al., 2022). Previous studies illustrate that the private economic sector had a higher ability to start a business and their entrepreneurial intention could be predicted in advance (Krueger et al., 2000, Che, 2022). According to the Organization for Economic Cooperation and Development (OECD), the startup ecosystem is "a synthesis of formal and informal links between: startup entities; start-up organizations; relevant agencies and the startup process directly impact the local startup environment" (Mason, C. & Brown, R., 2014).

Dollinger (1995) believes that: entrepreneurship is the creation of a creative economic organization (or organizational network) for the purpose of profit or growth in conditions of risk and uncertainty. Scarborough (2012) clarifies that: entrepreneurship is the creation of a new business by an entrepreneur in the face of risks and uncertainties with the aim of achieving profits and growth by identifying opportunities and gathering the necessary resources to take advantage of those opportunities.

In reality, industrial Revolution 4.0, entrepreneurship and innovation are closely related to each other to help businesses boost up operational efficiency from product-oriented business models to new models oriented to creating and capturing new sources of value (Akbar, 2020). Actually, changes from the 4.0 Industrial Revolution affect all people, especially the young who are preparing to enter the labor market with many unique and trendy business ideas (Minhas, 2019). The 4.0 Industrial Revolution also opens up opportunities for startup ideas, increasing competitiveness, and reducing costs and working time (Chen and Tian, 2022; Fossen and Sorgner, 2021).

3. LITERATURE REVIEW

Apparently, a startup ecosystem is a collection of startups (playing a central role, leading and leading the startup ecosystem) and other stakeholders (playing a supporting role), including but not limited to supporting organizations, capital sponsoring organizations, large businesses, universities, service providers, etc. Those genres have an organic relationship, coexistence with sustainable development. In fact, the state has a crucial role in supporting and creating a legal environment for the startup ecosystem to develop. The strength of the startup ecosystem depends on the close "cohesion" of the components within the startup ecosystem.

In reality, the position and growth of private economic resources are increasingly being affirmed, especially in contributing to realizing the goals of industrialization and modernization, changing the "appearance" of the country, creating impression, enhancing Vietnam's position and reputation in the international arena. Therefore, forming a startup ecosystem for the private economic sector plays a vital role in the development of the national economy.

Based on the analysis of the origins of the startup ecosystem, the authors researched 6 factors that affect the success of the private sector's startup ecosystem, including: risk-taking culture; technological and industrial conditions; abundant capital, incubators and startup companies; government support.

3.1. Risk-taking culture

It is a risk-taking culture that is the foundation for the birth of new and breakthrough ideas, helping businesses develop new business activities and improve competitiveness in the market (Isenberg, 2010). Every investment opportunity always carries potential risks. In some investments, a certain type of risk may dominate, and other risks may be secondary. A full understanding of the major types of risk is necessary to take calculated risks and make informed investment decisions. Furthermore, Careful Risk Taking is about making the right decisions by maximizing opportunities while mastering risks. This requires businesses to find the appropriate level of risk that can be accepted within the company's risk tolerance, avoiding being too cautious or too careless, so that opportunities can be seized in the future, at the right time and bring the best results for enterprises, customers and stakeholders.

3.2. Techonological and industrial conditions

According to Reboud, Mazzarol, and Soutar (2014), leaders must invest or adopt new technologies quickly to keep up with the market. These tools enable sustainable innovation and ensure long-term solutions for companies. In addition, most of the goods and products created today are associated with scientific and technological achievements. Science and technology as a part of the business environment externally impacts the business model of an enterprise in two main aspects:

Initially, the speed of development of external science and technology expressed through invention and application into practice makes technology inside the enterprise quickly become outdated.

Secondly, science and technology are considered the main cause for the occurrence of potential competitors. These are business rivals that have substitute products or superior products to the products that the business is trading.

Apperently, the level of science and technology is a factor that greatly affects economic growth, determining changes in labor productivity and product quality. New technological inventions and inventions applied in production have helped workers relieve heavy and harmful labor and create rapid growth, contributing to promoting the development of the startup ecosystem of the private economic sector.

3.3. Abundant capital

With production and business activities in general, and startup activities in particular, capital plays an important, even core role in the ability to maintain and develop an enterprise. Nevertheless, starting a business means entering a business for the first time, which is a disadvantage for businesses in accessing loan capital. As åessult, creating loan capital to support startup models is significant to the survival of startup businesses (Reboud, Mazzarol and Soutar, 2014). There is no doubt that capital is a factor that plays an extremely crucial role in the production and business process of the private economy, making a major decision on expanding or contracting investment, or applying modern science and technology to the production and business process. Additionally, lack of capital is a difficult problem for the private economic sector. Especially in the context of international economic integration, businesses need to promote production scale and enhance quality to meet increasing market demands and upgrade competitiveness.

3.4. Incubator and startup companies

Deeb G., 2017 believes that incubator organizations and startup companies are further promoting interaction with each other; effectively utilize resources; attract the participation of startups, investors, consultants, service companies, startup support organizations, policymakers, universities and laboratories; bringing highly applicable research projects closer to businesses and customers. As a result, incubators and startups provide and can closely link components in the startup ecosystem to create powerful resources for creative startups. Moreover, constructive policies such as innovation incubators or many programs and solutions in finance, education, and environment can be imposed to create conditions for incubators to develop.

Undoubtedly, startup companies play an critical role in the startup ecosystem, they not only have financial support but also a wide range of other things. They bring a wealth of experience, mentorship and a vast network that can boost up the startups to the next level. In reality, startup companies with appropriate policies help private businesses overcome challenges such as scaling their business, expanding into new markets, and complying with regulations or standards.

3.5. Government support

Government can aid through effective policies to nurture the startup ecosystem, form cooperative programs and projects with ministries, branches and local agencies, to create favorable conditions for startup businesses, especially accessing capital, support on legal issues, procedures, etc. In fact, when the legal environment is guaranteed to create a level playing field, there is no longer discrimination between economic sectors, thereby creating driving force for economic sectors to develop. The private economic sector, when developed in a healthy competitive environment, creates incentives for all economic sectors to develop within the legal framework. At the provincial level, locally decentralized policies are extremely important in promoting or inhibiting private economic development. When the State promulgates policies, local governments are not only the place to concretize State policies but also to optimize those policies in accordance with their socio-economic conditions.

4. RESEARCH METHODOLOGY

Official research data were collected using a non-probability quota sampling method by region - the North, South, and Central regions of Vietnam, responding to the call for recent studies on geographic diversity. geographical location (Khai, 2015; Ha et al., 2019; Nguyen et al., 2019a; Van Huy et al., 2019). Additionally, enterprises participating in the survey came from the three largest cities representing three regions, including Hanoi, Ho Chi Minh Cit, and Da Nang. The authors chose these places because these locations include the majority of small and medium-sized enterprises.

Regarding the minimum sample size required for PLS-SEM analysis, Hair et al (2014) proposed a 10-fold rule to determine the minimum sample. The authors conducted a survey with 350 businesses, resulting in 347 responses, equivalent to a response rate of 99.1%. After checking the returned questionnaires, one questionnaire was not a valid questionnaire. The remaining 346 questionnaires were used for data analysis. Specific sample results are as follows: there are 125 businesses (accounting for 36.1%) in the Hanoi, 112 businesses (making up 32.4%) in Ho Chi Minh City and 109 businesses (accounting for 31.5%) in Danang.

In the study, SPSS and Smart-PLS software were used to process collected data, descriptive statistics, test hypotheses and the model's suitability with market information.

5. RESEARCH RESULT

In a socialist-oriented market economy, private economic development is a factor that not only ensures the maintenance of high GDP growth rates and creates revenue for the state budget, but also participates in tackling a series of social issues such as job creation, hunger eradication, poverty reduction, human resource development, and so on. The private economy continuously maintains a good growth rate, accounting for 40-43% of GDP; attracting about 85% of the workforce, making an important contribution to mobilizing social resources for investment in production and business development, economic growth, economic restructuring. Moreover, it help to enhance state budget revenue, create jobs, improve people's lives, and ensure social security.

The study's measurement model was evaluated using a repeated observed variable approach. In reality, the measurement scale of the first-order component variables (first-order latent variables) is expressed in the form of results, so when using PLS-SEM to evaluate the outcome measurement model, Hair et al. (2016) utilize 3 criteria to evaluate include: reliability, convergent validity and discriminant validity.

The data processing results in Table 1 indicate that all scales have Cronbach's Alpha coefficient greater than 0.7. The composite reliability (CR) of the scales is greater than 0.7 and the external loading coefficient of the scale is greater than 0.7. All observed variables are large at 0.7 except for variables VH2 (0.544) and NV4 (0.672). Hence, these two observed variables do not meet the required conditions and will be removed from the model.

Table 1. Results of appraising the outcome measurement model of the first construct

Observed variables	External loading factor (OL)	Cronbach's Alpha coefficient	Composite reliability (CR)	Average variance extracted (AVE)
Risk taking culture (VH)		0.782	0.875	0.706
VH1	0.923			
VH2	0.544			
VH3	0.923			
Technological and industrial condition (CN)		0.872	0.922	0.797
CN1	0.816			
CN2	0.905			
CN3	0.845			
Abundant capital (NV)		0.736	0.834	0.558
NV1	0.874			
NV2	0.742			
NV3	0.776			
NV4	0.672			
Incubators and startup companies (VU)		0.836	0.901	0.753
VU1	0.916			

VU2	0.842			
VU3	0.865			
Government support (CP)		0.754	0.859	0.670
CP1	0.771			
CP2	0.821			
CP3	0.862			
Start-up ecosystem (KN)		0.865	0.908	0.712
KN1	0.817			
KN2	0.872			
KN3	0.827			
KN4	0.857			

(Source: Result of data processing)

After removing the two observed variables VH2 and NV4 from the model, the model was tested again for the second time. Table 1 reveal the results after removing the variables. It is indicated that the observed variables have fluctuating external loading factors from 0.742 to 0.916 (all greater than 0.7). Moreover, composite reliability ranges from 0.842 to 0.94 (all greater than 0.8) and the average extracted variance AVE value of the observations is greater 0.5. Therefore, the measurement scales in the model are highly reliable and meet the requirements for convergent validity. Moreover, all observed variables are meaningful in the model.

Table 2. Results of appraising the outcome measurement model of the secondary construct

Observed variables	External loading factor (OL)	Cronbach's Alpha coefficient	Composite reliability (CR)	Average variance extracted (AVE)
Risk taking culture (VH)		0.782	0.875	0.706
VH1	0.923			
VH3	0.923			
Technological and industrial condition (CN)		0.872	0.922	0.797
CN1	0.816			
CN2	0.905			
CN3	0.845			
Abundant capital(NV)		0.736	0.834	0.558
NV1	0.874			
NV2	0.742			
NV3	0.776			
Incubators and startup companies(VU)		0.836	0.901	0.753
VU1	0.916			
VU2	0.842			
VU3	0.865			
Government support(CP)		0.754	0.859	0.670
CP1	0.771			
CP2	0.821			
CP3	0.862			
Startup ecosystem(KN)		0.865	0.908	0.712
KN1	0.817			
KN2	0.872			
KN3	0.827			
KN4	0.857			

(Source: Result of data processing)

The authors conduct bootstrapping analysis for the model with 5,000 repeated samples and PLS Algorithm analysis. Hence, the results in table 2 indicate that the VIF coefficients of the observed variables are all small (below the threshold of 5), so the situation of multiplicity does not occur collinearity between observed variables. Simultaneously, the Outer Weights p-value of the observed variables is less than 0.05, so these variables are statistically significant, except for the RR variable with p-value > 0.05. Nonetheless, the outer loading coefficients are all greater than 0.5, so the observed variable RR is still retained to evaluate the model (Hair et al., 2011). In other words, all observed variables are significant in the model.

Table 3. Result of appraising the causal measurement model of secondary constructs

Observed variables	VIF	Outer Weights	p-value (by OW)	Out loading
VH	3.739	0.242	0.007	0.805
CN	3.553	0.009	0.927	0.767
NV	2.326	0.317	0.002	0.87
VU	2.344	0.556	0	0.941
CP	2.212	0.324	0	0.868
YD	2.054	0.304	0	0.847

(Source: Result of data analysis)

6. CONCLUSION

The government aims to have 1.5 million private enterprises by 2025 and 2 million private enterprises by 2030. Therefore developing private economic forces, improving the business environment as well as stimulating entrepreneurial spirit with reform efforts and effective support, helping to “elevate” the position of the private economy in the country’s economy are increasingly emphasized. What’s more? The government is suggested to enhance the effectiveness of propaganda and dissemination of the Party and State’s guidelines and policies related to startups, thereby arousing trust and the spirit of creative entrepreneurship. It should build and form a creative startup culture, be willing to accept risks, cultivate the young generation’s aspirations, construct persistent will, and optimism to overcome all strenuousness and challenges. Moreover, promoting policies to support creative startup networks to connect startups with universities, research institutes, consultants, startup incubators, state and community support funds, venture capital funds and creating a brand and connect the startup ecosystem should be executed in reality.

KNOWLEDGE SHARING IN VIETNAM VETERINARY MEDICINE MANUFACTURING AND TRADING ENTERPRISES

MA. Tran Van Dung[1]

Abstract: *The research purpose of the article is to identify activities related to knowledge sharing of Vietnamese veterinary medicine manufacturing and trading enterprises. Based on the research results, the author provides management implications to help business administrators as well as policy makers propose specific solutions to increase the effectiveness of knowledge sharing in organizations. To help improve the competitiveness of Vietnamese drug manufacturing and trading enterprises.*

Key word: knowledge, knowledge sharing, veterinary medicine

1. INTRODUCTION

In Vietnam, many studies are focusing on the issue of knowledge, knowledge sharing and knowledge sharing have occupied a central position in the fields of planning and management of organizations and institutions. Because right from the time of participating and integrating deeply into the world economy, managers and policymakers have seen that the vital resource for the sustainable development of every organization is knowledge. Moreover, the Industrial revolution network and fierce business competition have had a great impact on the resources, capabilities, strategies, missions and visions of production and business organizations, which are the principles for organizations to develop according to their depth. In reality, Vietnam's economic integration into the regional and world economy is increasingly deepening, which opens up many potentials and opportunities to promote the development of Vietnam's economy in general and the manufacturing industry in particular, especially in the field of veterinary medicine.

Apparently, the current veterinary medicine manufacturing industry in Vietnam is developing strongly due to the development of the livestock industry, increasing the demand for veterinary medicines. In addition, large quantities of veterinary medicine for livestock and poultry and the growing demand for pet raising increase veterinary medical examination and treatment facilities, which also contributes to the development of the veterinary medicine industry today. According to the newspaper of the Southern Center for Rural Policy and Strategy (SCAP), by the end of 2022, the total value of the veterinary medicine production industry in our country includes vaccines, chemicals, biological products... reached about 3,280 billion VND. In which, the costs for cultivating industries such as pigs, poultry and cows were about 2,140 billion, 920 and more than 200 billion VND respectively. Furthermore, according to the newspaper, next year, the cost of veterinary medicine will enhance due to the increasing need for livestock development. To attain such impressive numbers, the role of know-how, and knowledge plays a vital role for companies the production industry. Moreover, employees working in the veterinary medicine manufacturing industry have to come into contact with a lot of chemicals, bulky machinery, and even disease-causing microorganisms, etc. These are potential dangers that can cause serious health problems,

1 Email: dungtrangv39@gmail.com, PhD Candidate, Graduate Academy of Social Sciences.

risks at work such as poisoning, injury, and even death. Therefore, requiring safety training before performing work is necessary for this industry group to create the most comfortable and safe working environment for employees. Starting from the reality of the veterinary medicine manufacturing and trading industry, sharing professional knowledge is to manufacture the most competitive products and simultaneously sharing knowledge is to minimize risks for people. In order for each employee's knowledge to turn into an organization's intellectual asset that can be jointly exploited and used for common development, it actually requires a management mechanism for development, storage and sharing knowledge at the organization smoothly and synchronously.

Today's world is continuously being developed and shaped by new thinking and innovative approaches (Iebra Aizpurúa, Zegarra Saldaña, & Zegarra Saldaña, 2011). Additionally, in the perspective of some researchers, knowledge itself is being considered an essential element of an emerging knowledge society (Prieto & Easterby-Smith, 2006). Some researchers also emphasize the intangible value of knowledge. For instance, some scholars believe that knowledge is widely considered to add value to organizations rather than material things (Akhavan, Jafari, & Fathian, 2006). More importantly, knowledge is becoming increasingly critical in a competitive environment and becomes an important resource to help enhance the competitiveness of businesses (Nguyen Hoang Lap, 2014). In another aspect, knowledge creates competitive advantages for organizations in today's volatile and fiercely competitive market economy (Davenport & Prusak, 1998). Therefore, knowledge plays a vital role in contributing to achievements and progress in many areas in the overall development of an organization.

In addition, creating knowledge also belongs to the category of management and is a difficult task, but sharing knowledge also plays an vital role. Actually, sharing knowledge will help improve work efficiency with more knowledge that needs to be cultivated in life as well as in daily work. Because only having a lot of knowledge and solid knowledge can help people develop and perfect themselves. That is not the result of the work of a single individual, but the result of labor cooperation of an entire group of workers. Hence, each employee working in the industry needs to have a sense of cooperation, information sharing, and knowledge sharing with each other to be able to complete the job well and increase customer trust.

To further emphasize, author Grant (1996) affirmed that knowledge is the most crucial resource to implement an organization's strategy. Focusing on knowledge has many merits, including reducing time in the work process, reducing costs, improving customer service, adapting to change, creating a learning environment, thereby contributing to increased productivity and efficiency (Skyrme, 2003). These benefits demonstrate the importance of knowledge in gaining an advantage in a competitive environment. Therefore, knowledge sharing can be acknowledged as an important factor in organizational growth, employee improvement and it is vital for organizations to put in place all management strategies to implement a successful knowledge management system.

2. LITERATURE REVIEW

It is knowledge that is a difficult concept to define and measure. It is regarded as one of the factors that make organizations become successful and knowledge management becomes the most effective and important competitive strategy (Grant, 1996). According to Turban and Aronson (1998), knowledge is information that is organized and analyzed to make it easy to understand and apply to problem solving or decision making. Beckman (1997) defines knowledge as inferred from information and data to facilitate implementation, problem solving, decision making, learning and teaching. Furthermore, it is known as an intangible and valuable asset of businesses (Le, 2021).

Undoubtedly, knowledge sharing is a stage of the knowledge management process, especially tacit knowledge (Bouthillier & Shearer, 2002) and shareable knowledge (Bartol & Srivastava, 2002; Wang & Noe, 2010). In reality, sharing is a process involving a giver and a receiver, whereby resources are transferred from the giver to the receiver. In fact, knowledge sharing is the process of transferring, exchanging, or disseminating knowledge from one person/group of people to another (L. T. K. Le & Le, 2021). According to Nguyen Hoang Lap (2014), knowledge sharing is the process of transferring knowledge (especially tacit knowledge) from one person to another, at the individual level (exchange) or collective level (training, coaching). This is an important stage of the knowledge management cycle, ensuring the success of knowledge management, because due to it, tacit knowledge (accounting for the majority of knowledge resources) can be captured and shared to all people in the company. According to Gupta and Govindarajan (2000), knowledge sharing is the core foundation of knowledge management. It is critical because it creates links between individuals and organizations by shifting knowledge from the individual level to the organizational level. Thanks to it, knowledge is converted into economic value and competitive advantage for organizations (Hendriks, 1999). Von Krogh, Ichijo, and Nonaka (2000) said that knowledge sharing is also crucial in creating new knowledge values and leveraging them to enhance business performance.

In addition to knowledge sharing, work efficiency from the sharing process also needs to be considered. Efficiency in the knowledge sharing process is a decisive factor in the success of knowledge human resource management, giving organizations the opportunity to share and apply valuable new knowledge into practical innovation and create competitive advantage. Lei, Gui, and Le (2021) define monetary policy as the process of exchanging data, information, know-how, skills, experience, and professional knowledge among employees to help them complete their individual tasks well and obtain organizational goals. Thus, knowledge sharing is a key component of knowledge management, related to the process by which individuals in an organization share knowledge with other individuals (G.-W. Bock, Zmud, Kim, & Lee, 2005). In fact, knowledge sharing is a process by which individuals within an organization share knowledge, contributing to knowledge application, innovation, and ultimately the company's competitive advantage (Jackson, Chuang, Harden, & Jiang, 2006; Wang & Noe, 2010). In fact, organizations increasingly focus on building knowledge sharing mechanisms, seeing it as an effective competitive advantage. Along with the trend of globalization, the distance in time and space is gradually narrowing, the speed of information transmission is increasing, and the role of knowledge sharing becomes more important.

3. RESEARCH METHODOLOGY

Qualitative analysis was used to discover and interpret the research problem through in-depth interviews with workers and a number of a number of leaders in veterinary medicine manufacturing and trading enterprises with predetermined questionnaires. Qualitative analysis methods can be used from in-depth interview data using group discussions with questions parallel to quantitative questions. The results of qualitative analysis help answer research questions or hypotheses that cannot be answered by quantitative analysis. Questions for in-depth interviews use open-ended questions and "why" questions to help gather maximum information.

Table 1. Research sample statistics

Group	Quantity	Percentage (%)
Gender

4. RESEARCH RESULTS

According to the newspaper published by the Center for Southern Rural Policy and Strategy (SCAP), the total value of our country's veterinary medicine production industry (including vaccines, drugs, chemicals, biological products, etc. reached about 3,280 billion VND. Meanwhile, the cost of veterinary medicine for pig farming is about 2,140 billion VND, about 920 billion VND for poultry and 220 billion VND for cows. In the future, the cost of veterinary medicine will increase significantly due to the increasing need for livestock development. Regarding the field of veterinary medicine trading, the country currently has more than 17,700 stores and agents. Stores and agents all ensure facility requirements; Of these, 93.6% of establishments have certificates of eligibility to trade veterinary drugs. In the management of veterinary medicine trade, there is currently a lack of human resources with deep expertise in the field of veterinary medicine production, especially veterinary vaccines. The whole country does not have a clean animal farm or a separate center for testing veterinary drugs, so it is difficult to research and produce new vaccines.

In addition, inspection of veterinary drug trading establishments is still lacking in uniformity across localities; There are still violations in the veterinary drug trade, especially violations in the quality of veterinary drug products and product labeling that is not consistent with the registered content; Trading in smuggled veterinary drugs, banned drugs not on the list of permitted circulation... The cause comes from the awareness of human resources in the veterinary drug production and business industry. As a result, knowledge sharing activities are seen as an issue that businesses in the industry have paid great attention to in recent years.

Currently, in Vietnamese veterinary medicine production and trading enterprises, the issue of employees sharing knowledge with each other has not been studied much. Most employees are busy with work, so sharing experiences between employees at the unit may not happen much. Or there is knowledge sharing but employees are not aware that they are sharing, leading to low efficiency. To analyze and evaluate knowledge sharing activities in veterinary medicine manufacturing and trading enterprises, the author conducted a survey on a total of 500 employees working at Vietnamese veterinary medicine manufacturing and trading enterprises. The result was 498 votes, reaching 99.6%, after screening, the number of valid votes for analysis was 475 votes, reaching 95%.

Box 1. Interview with a middle-level leader in Y.S.P Vietnam Company Limited about corporate culture for knowledge sharing activities.

We have many ways to encourage and support employees in sharing knowledge. Initially, we organize regular internal meetings and events to create opportunities for employees to discuss and share ideas. In addition, we have a reward and recognition system for those who contribute significant ideas and knowledge. Employees who share knowledge are recognized and rewarded. We always focus on maintaining and developing this organizational culture. This starts with the recruitment process, where we select candidates who fit our values and organizational culture. Moreover, we organize periodic training and seminars so that employees can understand and participate in the organizational culture. Our company always comprehend employees' opinions and adjusts and improves organizational culture based on that.

PVS. Nguyen Van L., 48 years old, low-level manager at the Company.

Source: Interview from the author

Similarly, today the physical factor of Information Technology plays an extremely important role. Employees can learn independently through the network to broaden their knowledge and thereby exchange and share with each other to improve knowledge sharing activities. After conducting an interview with an employee at Ha Thanh Veterinary Medicine Nutrition Company Limited, the results indicate that Information Technology has a positive influencing role.

Box 2. Interview with a sales staff in Ha Thanh Veterinary Medicine Nutrition Limited Company about information technology infrastructure for knowledge sharing activities.

We have a robust intranet system that allows employees to share information and documents easily via internal email, internal applications, and even over the networkLAN. This helps us quickly access and share knowledge with colleagues without interruption. I would recommend that companies invest heavily in IT infrastructure that suits their needs. This includes using information management software, project management software, and building a reliable intranet system. Simultaneously, ensure that employees are trained to use these tools effectively.

PVS. Nguyen Linh M., 36 years old, sales staff at the Company.

Source: Interview from the author

Although the quantitative results do not depict a positive relationship between Knowledge Sharing Attitude and Knowledge Sharing Activities. Nonetheless, from the results of in-depth interviews, the results are somewhat different. This is also a new research hypothesis that needs to be conducted in future studies. The results in Box 3 show that a common attitude helps sharing activities become better.

Table 2. Appraise on knowledge sharing attitude

No	Assessment criteria	Average
1	Sharing my knowledge will help other members of the organization solve problems.	3,63
2	Sharing my knowledge will create new business opportunities for the organization.	3,55
3	Sharing my knowledge will improve work processes in the organization.	3,72
4	Sharing my knowledge will increase productivity in the organization.	3,58
5	Sharing my knowledge will help the organization attain its operational goals	3,50

Source: Results of analysis using SPSS 20.0

To truly take advantage of teamwork activities in sharing information and knowledge, the Unit needs to create working principles, as well as sharing within the group and between work groups. The principle in the working and sharing process of employee groups that needs to be respected the most is the respect of group members for each other, the attention to listening and receiving the opinions of each member in meetings, and exchanging knowledge and experience. To implement this well, throughout the process of group formation and operation, discipline and fairness in assigning work, expressing and criticizing opinions all need to be fully demonstrated.

Table 3 Appraise on group activities

No.	Assessment criteria	Average
1	Colleagues try to implement group goals	3,63
2	Colleagues always share work in group	3,70
3	I will do my job more successfully if I cooperate with colleagues in my team	3,62
4	My personal experiences can become big ideas when working in a team	3,60
5	Group members always listen to each other's opinions	3,72
6	The knowledge of each team member is combined to perform the job	3,64

Source: Results of analysis using SPSS 20.0

With the above results, an organization that wants to upgrade employee engagement with a veterinary medicine manufacturing company should take necessary steps to create opportunities for fun, entertainment and activities that help employees to be attached to each other and attached to the unit. As a result, it will create motivation for employees to easily and comfortably exchange and share knowledge at work with each other, helping the employee system have a solid foundation of knowledge to contribute to the development of both capability and knowledge system for veterinary medicine production companies.

Table 4. Appraisal on belief

No	Assessment criteria	Average
1	Colleagues will not take advantage of me when I share knowledge with them	3,44
2	I am sure that the knowledge I share with my colleagues will not be exploited	3,18
3	My colleagues are always honest when sharing knowledge with me	3,19
4	My colleagues are responsible and trustworthy when sharing knowledge with me	3,07
5	I believe that my colleagues will not take advantage of the knowledge I share with them to confront me	3,38
6	My colleagues often consult me at work	3,45

Source: Result of data analysis

In order to effectively carry out knowledge sharing, regularly organizing seminars and discussions is extremely necessary. This not only has a practical effect in sharing knowledge, but also contributes to positive communication and connection between staff. Vietnamese veterinary medicine production and trading enterprises should periodically conduct knowledge exchange sessions in departments, divisions, and in general for all Vietnamese veterinary medicine production and trading enterprises. Timing can be executed monthly, on the last Saturday and Sunday of each month, thereby creating a regular, continuous scientific activity schedule for employees.

Table 5. Appraise Corporate culture

No.	Assessment criteria	Average
1	Changes in the business you are working in are considered natural and necessary	3,63
2	The business you work for considers employees as valuable assets and always appreciates their dedication	3,70
3	The business you work for appreciates the experiments and discoveries of its employees	3,40
4	The business you work for encourages and values the diverse perspectives of its employees	3,51
5	Employees in your business always respect each other’s opinions and contributions	3,52
6	Problems are discussed openly and equally among employees	

Source: Results of analysis using SPSS 20.0

In reality, it is necessary to create a friendly working environment to increase the openness of employees such as: providing private spaces so employees can regularly exchange with each other, organizing community events so employees understand each other better, creating a comfortable working atmosphere to reduce stress for employees, stimulating employees to regularly come up with new ideas and think about problems from different aspects.

Table 6. Appraise about information technology

No.	Assessment criteria	Average
1	A fully equipped IT system will promote effective knowledge exchange and sharing	3,71
2	I feel comfortable and easy to apply available technology devices in the workplace to share knowledge.	3,66
3	At my company, the IT system supports and improves employees’ skills	3,55
4	My administrator proficiently uses IT to share knowledge with employees	3,51
5	Teamwork software system allows knowledge sharing among employees	3,75
6	The intranet system allows finding and sharing ideas and important documents	3,63

Source: Result of data analysis

Apparently, science and technology are increasingly developing. Information technology is one of the important prerequisites that determine the success of an organization's activities. For teaching at universities today, information technology factors have become more vital than ever. To appraise employee satisfaction with knowledge sharing at work in Vietnamese veterinary medicine manufacturing and trading enterprises, the author evaluates through table 7 below:

Table 7. Appraise about the managers' incentive

No	Assessment criteria	Average
1	Administrators believe that sharing knowledge with colleagues will benefit the organization and employees	3,29
2	Administrators strongly encourage creativity, innovation, sharing, and application of knowledge	3,34
3	Administrators always create the necessary conditions to support knowledge sharing among employees	3,12
4	Administrators respect and recognize employees' contributions when participating in knowledge sharing	3,34
5	Administrators are always committed to supporting knowledge sharing activities	3,55
6	Administrators are very actively involved in knowledge sharing activities	3,45

Source: Result of data analysis

5. CONCLUSION

Each individual and organization must always renew themselves to be able to develop personally and the organization can survive and be competitive. Hence, the role of knowledge sharing in this current period always plays a critical role. Knowledge sharing first originates from the university system and after graduating, students will become employees of organizations. In fact, sharing knowledge is also a way to cultivate knowledge. Research on knowledge sharing among employees at Vietnamese veterinary medicine manufacturing and trading enterprises is an urgent issue because with the development and vastness of knowledge treasures, the issue of knowledge sharing is seen as a useful way to help reduce difficulties and time consuming in learning and absorbing knowledge.

To truly take advantage of teamwork activities in sharing information and knowledge, the Unit needs to create working principles, as well as sharing within the group and between work groups. Without teamwork skills, it is easy to cause conflicts due to conflicting opinions among group members. At this time, creating consensus is very crucial for the group to work towards common benefits. In addition to conducting exchange sessions, Vietnamese veterinary medicine manufacturing and trading enterprises also need to have exchange sessions and collective activities among employees such as cultural and artistic activities and sports activities, entertainment. These collective activities are effective in creating good cohesion within the Unit. Undoubtedly, it is necessary to create a friendly working environment to boost up the openness of employees such as: providing private spaces so employees can regularly exchange with each other, organizing community events so employees understand each other better, creating a comfortable working atmosphere to reduce stress for employees, stimulating employees to regularly come up with new ideas and think about problems from many different aspects.

THE EFFECT OF FDI INFLOWS ON PRIVATE INVESTMENT IN ASIAN DEVELOPING ECONOMIES

Ph.D Nguyen Van Bon[1]

Abstract: *Foreign direct investment (FDI) plays a crucial role in Asian economies because it brings physical capital, technology transfer, and creation of innovation,… to the host countries. Meanwhile, private investment is a necessary input in economic growth. Does FDI crowd out private investment? For the answer, this paper employs the system and difference GMM Arellano-Bond estimators to study the impact of FDI on private investment for a sample of 32 Asian developing economies from 2002 to 2021. The results indicate that FDI promotes private investment. Furthermore, economic growth increases private investment, while inflation and infrastructure reduce it. These findings suggest some implications for Asian economies' governments in attracting more FDI inflows to boost the private sector's investment.*

Keywords: FDI, private investment, Asian developing economies

JEL codes: E22, F21, F23

1. INTRODUCTION

The influence of FDI inflows on private investment remains a controversial theme among economists due to the crowd-in/crowd-out hypotheses. Inspired by Agosin & Machado (2005), a large strand of studies has tested this influence to determine complementarity/ substitutability between them. FDI inflows are an exogenous but crucial factor to both developing and advanced economies. The significant contribution of FDI inflows to the economy in host countries is expressed by technology transfer, know-how acquisition, innovation capacity, and capital accumulation (Agosin & Machado, 2005). Therefore, most developing countries, especially developing economies in Asia, are trying to adjust regulations and policies to attract more FDI inflows. Private investment is an endogenous factor in the economy. It has importance over the course of economic growth and development. Khan & Reinhart (1990) highlight its crucial role in promoting economic growth, creating more jobs, and keeping social stability.

Most developing countries have a low level of economic development and living standards. These economies do not have enough capital to promote economic growth, create more jobs, and improve people's income. FDI inflows are one of the solutions to make up for the lack of investment capital in these countries. Institutional reform and improvement for better access to FDI inflows are what most developing economies in Asia are looking forward to. Do FDI inflows positively affect private investment in Asian developing economies? This paper looks for the answer as a little contribution to the literature.

In short, developing economies in Asia need more capital to promote economic growth and development. Both FDI inflows and private investment contribute significantly to the economic goals of these economies. However, attracting more FDI inflows can adversely affect private investment. Given these facts, the paper applies the onestep and twostep GMM estimators to study the impact of FDI inflows on private investment for a panel dataset of 32 developing economies in Asia between 2002 and 2021.

[1] Email: nv.bon@ufm.edu.vn, University of Finance – Marketing.

The paper has the following structure. Section 1 is the introduction that looks at the motivation, while Section 2 is the theoretical background and literature review that focus on the influence of FDI inflows on private investment. Section 3 is the empirical equation and data, while Section 4 is the result and discussion. The final section (Section 5) concludes and suggests some policy lessons.

2. THEORETICAL BACKGROUND AND LITERATURE REVIEW

2.1 Theoretical background

Given the relevance of the topic, depending on different conditions, FDI inflows have opposite effects on private investment. FDI inflows can enable private investment via cooperation opportunities. For example, foreign enterprises can carry out joint-venture projects with domestic companies. Furthermore, domestic companies can provide raw materials or do outwork for foreign investors; vice versa, FDI enterprises can transfer advanced technology to domestic companies. It is the crowding-in effect of FDI inflows on private investment (Agosin & Machado, 2005). By contrast, if FDI enterprises access domestic credit to finance their investment projects, high pressure will be put on domestic interest rates, which causes domestic companies to drop their business operations due to high interest rates. It is the crowding-out effect of FDI inflows on private investment (Delgado & McCloud, 2016).

2.2 Literature review

The topic "the effect of FDI inflows on domestic/private investment" is a main line of research in the literature. Some studies present that it is negative, while others indicate that it is positive. Furthermore, some studies provide mixed evidence about this relationship.

Szkorupová (2015), Eregha (2012), Mutenyo et al. (2010), Titarenko (2005), and Kim & Seo (2003) report that FDI inflows crowd out private investment. Wang (2010) indicates that FDI inflows hinder domestic investment, while cumulative FDI inflows increase it using the fixed effects model, random effects model, and GMM estimator. Meanwhile, Pilbeam & Oboleviciute (2012) note a crowding-out impact of FDI inflows on domestic investment for 14 EU countries between 1990 and 2008 using the onestep GMM estimator. Recently, Elheddad (2019) discovers that FDI inflows do not encourage private investment in six GCC economies from 2003 to 2013 using the fixed effects model and FE-IV estimator.

However, several studies note the crowd-in hypothesis for the FDI inflows – domestic investment nexus (Prasanna, 2010; Ang, 2010; Ang, 2009; Ndikumana & Verick, 2008; Tang et al., 2008; Desai et al., 2005). Al-Sadig (2013) shows that FDI inflows enhance private investment by applying the system GMM estimator for 91 developing economies over the period 1970-2000. The finding in this research confirms that the crowding-in impact of FDI inflows in low-income economies is conditional on the supply of human capital in host countries. Similarly, Munemo (2014) notes that the complementary nexus between FDI inflows and domestic investment depends strongly on the regulations of business start-ups in host countries for a balanced panel dataset of 139 economies from 2000 to 2010 using the twostep difference GMM estimator. In addition, he emphasizes that improving these regulations can promote this complementary nexus. In the same vein, Tan et al. (2016) note that FDI inflows crowd in domestic investment in the long run for 8 Asean economies from 1986 to 2011 using PMG estimation. Meanwhile, Boateng et al. (2017) provide evidence to confirm the crowding-in impact of FDI inflows on domestic investment for

16 sub-Saharan African economies between 1980 and 2014 by employing the fixed effects model, pooled OLS regression, and FMOLS estimation. Recently, Jude (2019) discovers that FDI inflows increase domestic investment for 10 Eastern and Central European economies from 1995 through 2015 by applying the onestep system GMM estimator. Lately, Nguyen (2021a) reports that FDI inflows increase private investment in the Southeast region of Vietnam between 2005 and 2019 by applying the panel quantile regression, difference GMM estimator, and FE-IV estimation.

Notably, some studies show mixed evidence on FDI inflows – domestic investment nexus (Ahmed et al., 2015; Onaran et al., 2013; Apergis et al., 2006; Agosin & Machado, 2005; Mišun & Tomšk, 2002). Lin & Chuang (2007) find that FDI inflows promote domestic in large enterprises and decrease it in the small ones from 1993 to 1995 and from 1997 to 1999 using Heckman 2SLS estimation. Meanwhile, Chen et al. (2017) note a neutral nexus between FDI inflows and private investment in China between 1994Q1 and 2014Q4 by applying the ARDL estimation. However, regarding the entry mode of FDI enterprises, they discover that joint-venture FDI inflows increase private investment, but wholly foreign-funded FDI inflows reduce it. More recently, Nguyen (2021b) notes that FDI inflows crowd in private investment in developing economies, but crowd out it in developed ones using the twostep difference and system GMM and PMG estimators for 25 developed and 72 developing countries from 2000 to 2013.

3. EMPIRICAL EQUATION AND DATA

3.1 Empirical equation

Following Al-Sadig (2013), we suggest the empirical equation as follows:

$$PIN_{js} = \theta_0 + \theta_1 PIN_{js-1} + \theta_2 FDI_{js} + H_{js}\theta' + \sigma_J + \tau_{Js} \quad (1)$$

$$PIN_{js} = \theta_0 + \theta_1 PIN_{js-1} + \theta_2 FDI_{js} + H_{js}\theta' + \sigma_J + \tau_{Js} \quad (1)$$

where j, s denote the country index, time index respectively. PIN_{js} is the private investment (% GDP), PIN_{js-1} is the initial level of private investment, FDI_{js} is the foreign direct investment, net inflows (% GDP). H_{js} is a vector that contains economic growth, inflation, and infrastructure (control variables). σ_j is fixed effects, τ_{js} is the error term, θ_i is parameters. Following the literature, we select and use economic growth (Erden & Holcombe, 2005; Dreger & Reimers, 2016; and Muthu, 2017), inflation (Ang, 2010; Wang, 2010; Delgado & McCloud, 2016), and infrastructure (Ndikumana & Verick, 2008).

Some severe problems in econometrics arise from estimating Equation (1). Firstly, inflation and economic growth may be endogenous regressors that may correlate with σ_j, leading to the endogenous phenomenon. Secondly, some unobserved fixed effects like culture and customs that exist in σ_j may correlate with the independent variables. Thirdly, the lagged variable PIN_{js-1} can lead to a high serial correlation. Finally, the panel dataset contains a large unit of economies (M = 32) and a short length of observation (L = 20). These problems can make the OLS regression biased. The random effects model (REM) and the fixed effects model (FEM) could not handle serial correlation as well as endogenous phenomena. The IV-2SLS estimator needs some suitable instruments out of independent variables in the empirical model. Following Judson & Owen (1999), we apply the system and difference GMM estimators.

Holtz-Eakin et al. (1988) are the first to propose the general method of moments (GMM) Arellano & Bond (1991). Two kinds of GMM estimators are developed: the difference and the system. The past values of persistent regressors in the empirical models do not provide information for their changes, making their lags become weak instrumental variables in the difference GMM estimator. Therefore, SGMM (system GMM estimator) is better than DGMM (difference GMM estimator) (Arellano & Bover, 1995).

For estimation, the twostep SGMM/DGMM (2SGMM/2DGMM) can be more efficient than the onestep SGMM/DGMM (1SGMM/1DGMM). However, employing 2SGMM/2DGMM in small research samples like our sample has a problem (Roodman, 2009). It is the instrumental variable proliferation that quadratically rises as the dimension of time increases, which causes the number of instruments to be larger than the number of panel units. The solution is to employ the thumb rule to keep the number of panel units more than or equal to the number of instruments (Roodman, 2009). The study uses Arellano-Bond, Sargan, and Hansen statistics to test the instruments' validity in the S-GMM. The Arellano-Bond test AR (2) searches the serial correlation of errors in the first difference, while the Sargan and Hansen tests detect endogenous phenomena.

3.2 Research data

The dataset includes private investment (% GDP), net FDI inflows (% GDP), real GDP per capita, inflation (%), and mobile phone subscriptions (per 100 people). These variables are collected from IMF and World Bank databases. The research sample consists of 32 developing economies[1] over the period of 2002 – 2021.

Table 1 shows the description of dataset, and Table 2 reports its descriptive statistics. Meanwhile, Table 3 notes the matrix of correlation and Table 4 indicates the stationary tests. The results in Table 3 present that FDI, economic growth, and infrastructure are positively associated with private investment, while inflation is linked negatively with it. Furthermore, correlation coefficients among regressors are lower than 0.8, which rules out the colinearity between them. Notably, the stationary tests in Table 4 show that private investment, FDI, economic growth, inflation, and infrastructure are stationary at the significance level of 1%, which ensures that all variables have integration of zero-order I(0).

Table 1. Data description

Variable	Definition	Type	Source
Private investment (PIN, %)	Gross fixed capital formation (% GDP)	%	IMF
FDI (FDI, %)	Foreign direct investment, net inflows (% of GDP)	%	World Bank
Economic growth (GDP, USD)	GDP per capita (constant 2010 US$)	log	World Bank
Inflation (INF, %)	Inflation, consumer prices (annual %)	%	World Bank
Infrastructure (MOB, value)	Mobile cellular subscriptions (per 100 people)	log	World Bank

4. EMPIRICAL RESULTS AND DISCUSSION

4.1. The two-step GMM estimates

Table 5 presents the estimated results. The first and second columns in Table 5 show the results corresponding with 2SGMM and 2DGMM, respectively. In the estimation procedure, the paper detects the endogeneity of inflation in empirical equations, so it uses inflation as an instrumented regressor in gmm style and remaining regressors like private investment, FDI, economic growth, and infrastructure as instrumental variables in iv style. The results across empirical models show FDI inflows crowd in private investment. Besides, economic growth promotes private investment, while inflation and infrastructure reduce it.

The crowding-in impact of FDI inflows on private investment in this paper supports the "crowd-in hypothesis", which is similar to the previous studies like Nguyen (2021a), Jude (2019), Boateng et al. (2017), Tan et al. (2016), Munemo (2014), Al-Sadig (2013), Prasanna (2010), Ang (2010), Ang (2009), Ndikumana & Verick (2008), Tang et al. (2008), Desai et al. (2005). Asia is a region that has had a relatively high rate of economic growth in the past ten years. Most developing countries in this region need more capital to promote economic growth and development, so FDI inflows become one of the channels to attract capital. The horizontal and vertical spillovers of FDI inflows benefit the private sector in this region: (i) FDI investors can make joint ventures and cooperate with domestic companies to expand investment and production; (ii) The private sector can supply necessary raw materials for the production input of FDI enterprises; (iii) FDI enterprises can transfer advanced production and management technologies to help domestic enterprises improve productivity; (iv) FDI investors can help some domestic companies become auxiliary suppliers for their production activities. Therefore, FDI inflows crowd in private investment in Asian developing economies. This finding implies that governments in Asian developing countries should formulate and implement regulations and policies to attract more FDI inflows. However, in practice, some FDI inflows with outdated technology can cause harm to the natural environment, so these policies and regulations need to look at these problems.

The positive impact of economic growth on private investment stems from the fact that economic growth benefits the investment and production of the private sector: (i) Economic growth increases income, thereby increasing savings, which will be used for the private sector's investment; (ii) Economic growth increases the stimulus to consumption, which boosts the production of goods and services by the private sector; (iii) Economic growth offers good prospects for the private sector to expand investment and production to supply goods and services to the market. This finding can be found in Erden & Holcombe (2005), Dreger & Reimers (2016), & Muthu (2017).

The negative impact of inflation on private investment in this paper is consistent with Wang (2010) and Delgado & McCloud (2016). Inflation increases transaction costs and decreases business profit, reducing the private sector's investment. In addition, inflation increases the price level of goods and services, so it will reduce purchasing power, which causes production to decrease due to a decline in consumption. This result reminds governments in Asian developing countries should control inflation effectively to limit its adverse impact on the private sector's investment activities.

This paper discovers that infrastructrue reduces private investment. It can be explained partly for the case of developing economies. In developing countries, most infrastructure projects are financed by governments due to the large investment costs and long payback period (i.e., bridges, roads, telecommunications, etc.).

In addition to investment projects that bring general benefits to both people and businesses, there are still many investment projects that do not consult people and businesses, so the benefits of infrastructure projects do not serve people and businesses. It means that developing economies should improve the transparency of the institutional environment to ensure that the efficiency of infrastructure projects financed by governments does not adversely affect the private sector's investment.

Table 5. FDI – private investment: 2002 – 2021 (the twostep GMM estimator)

Dependent variable: Private investment (%)

Variables	2SGMM	2DGMM
Private investment (-1)	0.833***	0.340***
	(0.012)	(0.051)

Sargan test	0.101	0.620
Hansen test	0.785	0.613

Note: ***, **,* note significance level at 1%, 5%, 10% respectively

4.2 Robustness check

For the robustness of 2SGMM/2DGMM estimates, the paper applies 1SGMM/1DGMM to test. Similar to 2SGMM/2DGMM, the estimation procedures by 1SGMM/1DGMM also detect that inflation is endogenous, so the paper uses it as an instrumented regressor and the remaining variables as instrumental regressors in the empirical equations. The results are shown in Table 6. In line with 2SGMM/2DGMM estimates, Table 6 reports that FDI inflows crowd in private investment. Furthermore, economic growth promotes it. These results confirm the reliability of 2SGMM/2DGMM estimates.

Table 6. FDI – private investment: 2002 – 2021 (the onestep GMM estimator)

Dependent variable: Private investment (%)		
Variables	1SGMM	1DGMM
Private investment (-1)	0.817^{***}	0.085
	(0.022)	(0.196)
FDI inflows	0.107^{***}	0.983^{***}

Sargan test	0.110	0.479

Note: ***, **, * note significance level at 1%, 5%, 10% respectively

5. CONCLUSION AND POLICY LESSONS

Developing economies in Asia have enjoyed impressive economic growth rates in recent years. These economies need more capital to enhance domestic economic activities. Therefore, FDI inflows are always welcomed by these economies as a source of filling the capital shortfall. However, these inflows can have positive impacts on private investment due to the crowd-in effect. Given these facts, the paper studies the effect of FDI inflows on private investment for 32 developing economies in Asia over the period 2002 – 2021 by using the onestep and twostep GMM estimators. The results report that FDI inflows crowd in private investment. Besides, economic growth promotes it, while inflation and infrastructure reduce it.

The findings in this paper provide some policy lessons for developing economies in Asia. Accordingly, governments in these economies should:

(1) reform and improve regulations and policies to attract more FDI inflows. However, they should limit the low-quality FDI inflows with outdated technology, causing harm to the environment.

(2) promote economic growth through different solutions because economic growth benefits private sector investment and the whole economy as well.

(3) control inflation because inflation reduces private investment and increases living costs, which is harmful to the economy.

(4) reform regulations related to infrastructure development through public projects. Governments should collect people's and domestic companies' ideas before implementing these projects. Furthermore, people should be invited to monitor these projects.

Institutional quality plays a decisive role in the course of economic development in most countries. In particular, a good institutional environment can attract more high-quality FDI inflows. Therefore, future studies should consider the role of institutional quality in the FDI inflows – private investment relationship.

EFFECT OF CORPORATE GOVERNANCE COMPOSITE FACTORS ON FINANCIAL DISCLOSURE TRANSPARENCY: EXPIRICAL EVIDENCE OF RESEARCH IN VIETNAM

M.A Truong Thao Nghi[1], Ph.D Ngo Nhat Phuong Diem

[2]*Abstract: The research examines the effect of corporate governance composite factors on financial disclosure transparency in Vietnamese listed firms based on three components that are Earnings Aggressiveness – EA, Earnings Smoothing – ES, and Loss Avoidance - LA. Based on 353 listed firms in HOSE and HNX during 2013-2021, this study conducts panel regression analyst to examine and evaluate this evidence. The outcome for this study demonstrated that corporate governance composite factors has significant relationship with financial disclosure transparency according to earning smoothing and loss avoidance models.*

Keywords: Loss avoidance; earning smoothing; earning aggressive; financial disclosure transparency; corporate governance composite factors.

1. INTRODUCTION

Some financial fraud scandals in the world, for example, Enron, Worldcom, Xerox, Tyco, Adelphia Communications, and BMY… made investors concentrate on corporate insider misbehavior that is relevant to information transparency (Chih et al., 2008), therefore, to improve information transparency and protect investor's advantages, the Sarbanes-Oxley was created (Sarbanes & Oxley, 2002). In Vietnam, the Bong Bach Tuyet, and Duoc Vien Dong financial fraud scandals are relevant to distorting financial information that influenced investor's beliefs.

The relevance and trustworthiness of corporate operation information are the features of information transparency (Bushman et al., 2004), and some previous evidence believed that information transparency is beneficial for corporations to improve effective markets and investment decisions, attract fund resources, and reduce conflicts based on (Nair et al., 2019). This evidence will examine financial disclosure transparency based on the level of trustworthiness, economic efficiency, and financial statements. Corporate firms have a responsibility according to legal policies, and requirements to maintain protection for investor advantages (Nair et al., 2019). The stock market had the most reflected in the Vietnamese corporate environment for 20 years of market development. However, the information transparency responsibility, especially the Vietnamese financial statement is still not concentrated accurately. As a result, Vietnamese corporate firms need to improve their responsibility to be more transparent in corporate information and create investor and partner beliefs.

Reducing conflicted individuals' misbehavior and improving the relationship between managers and investor advantages are monitored based on agency theory that researched conflict between managers and supervisors (Filatotchev & Boyd, 2009). Through the above research, many representative factors affecting information transparency when considered from different angles such as geography, economy, politics, and culture, will have different impacts on each group of representative factors, even the opposite. These studies all examined the impact of individual

2 University of Finance - Marketing.

corporate governance characteristics (BOD size, independent board members, board financial expertise, audit committee size, and audit committee expertise) ...) on information transparency. At the same time, inheriting the research outcome of Carcello et al. (2006) on the representative factor of corporate governance affecting profit management, there are six characteristics: (1) the size of the board of directors, (2) the independence of the Board of Directors, (3) Size of the Control Board, (4) Independence of the Control Board, (5) Shareholder rights and (6) Organizational ownership. T. C. Hoang (2014) and Ngo Nhat Phuong Diem (2019) studied the composite factor representing the diversity of the Board of Directors affecting the quality of profits. Currently, in the world in general and Vietnam in particular, the topic of financial information transparency is not new, but there has been no research examining the impact of the composite factor representing corporate governance on transparency or transparency of financial information. Instead of that, previous studies only studied individual representative factors. Therefore, the new point of this study is that it is necessary to have a study on the representative factor of corporate governance that affects the transparency of financial information in the context of an emerging economy like Vietnam.

2. PREVIOUS EVIDENCE AND HYPOTHESIS DEVELOPMENT

Corporate governance was defined as the features of trustworthiness and responsibility to manage information and organizations, and there were some previous studies to demonstrate corporate governance factors and financial disclosure transparency (Agyei-Mensah, 2017; Ho & Taylor, 2013) . Other evidence believed that when corporate governance management is more effective, it could improve investor confidence when they make decisions to invest in corporate firms (Mohamed Saeed Al Mubarak & Mohammed Mousa Hamdan, 2016) . Besides, the lack of financial information transparency demonstrated weak corporate governance management, according to the agency theory explanation, which could demonstrate low effective corporate governance management (Salehi et al., 2022). Other evidence from Lemmon et al. (2003) concluded that corporate governance has a significant positive relationship with corporate information transparency. In addition, corporate governance could maximize distributed resources, improve market information disclosure transparency, and develop economics (Dhaliwal et al., 2011).

According to agency theory, the company valuation was improved by timeliness, and level of corporate information disclosure according to corporate individual and organizational responsibilities, the transparency for insider and outsiders' relationship was improved, and the conflict of information between investors and outsiders was reduced by good corporate governance based on corporate information transparency (Buallay et al., 2017). Besides, based on stakeholder theory, corporate insiders are limited to providing negative corporate information to reduce the effect on corporate stakeholders (Kothari et al., 2009). Buallay et al. (2017) concluded that corporate governance could reduce corporate conflicts. As a result, corporate governance has an essential influence on quality and financial disclosure transparency. According to information asymmetry, this theory demonstrates the relationship between insiders and outsiders based on their advantages for financial transparency information. It also concluded that there were some conflicts for advantages between insiders and outsiders based on financial information because insiders have expectations to share positive corporate information for companies when they have negative information to be attractive to investors (Habib et al., 2019). According to an explanation for corporate social responsibilities, good financial information could reduce conflicts between insiders and outsiders because of protecting information for investors (Al-Khonain & Al-Adeem, 2020). Stakeholder and corporate social responsibility theories demonstrated policies for corporate insiders to reduce conflicts between shareholders and corporate insiders, and it also improved corporate information through financial statements (Cui et al., 2018). Other studies believed that corporate social responsibilities are the policies that organizations and individuals have to respect to maintain accurate corporate information, especially in financial statements, and financial disclosure transparency was also the policy for social ethical responsibility to reduce individual misbehavior and individuals or organizational advantages (Cho et al., 2012).

In Vietnam, previous evidence by (Ho Thuy Tien & Hoang Manh Khanh, 2021) concluded that the BOD factor has a significant relationship with financial disclosure transparency. In detail, the BOD chairman duality has a negative relationship with financial disclosure transparency. To explain, when the BOD leader chairman has more roles in corporate firms, it cannot manage financial disclosure transparency effectively, and if the BOD chairman does not have more roles in corporate firms, it can improve financial disclosure transparency. Le Thi My Hanh (2015) demonstrated that the BOD factor positively had a relationship with financial disclosure transparency in Vietnamese listed firms. To detail, this evidence demonstrated the positive relationship between BOD independent members and financial disclosure transparency, or when the number of BOD independent members increased, it also improved financial disclosure transparency for almost all Vietnamese listed firms.

Some previous evidence believed that effective corporate governance is dependent on several members, expertise, and an independent BOD that are beneficial to reduce conflicts in management and improve financial disclosure transparency (Mathuva et al., 2019). The studies of Gulzar & Zongjun (2011) concluded that BOD that is not dual will improve financial disclosure transparency based on earning management measurement. This evidence also supports the belief that gender in the BOD or more women members in the BOD could improve earning management. According to Salehi et al. (2022), board independence and audit committee independence have a significant negative relationship with financial disclosure transparency. However, the expertise of BOD and audit committee members, and managerial ownership have a significant positive effect on financial disclosure transparency. Previous evidence by Siregar & Utama (2008) concluded that audit committees that had higher sizes, independence, and expertise could have good performance in management. Other evidence from Hamrouni et al. (2022) concluded that environmental disclosure had a significant positive effect on information asymmetric, and board size had a significant positive effect on environmental information transparency. However, gender diversification and board independence have a significant negative effect on information transparency. However, there was no consistency between the research outcomes of corporate governance factors and financial disclosure transparency, therefore, it was difficult to conclude this relationship. Based on research problems, this evidence will combine individual corporate governance factors in BOD and audit committee as composite factors that were BOD sizes, BOD independent members, BOD financial expertise members, BOD women members, BOD stability, BOD duality, audit committee sizes, audit committee independence, audit committee financial expertise, and audit committee duality to have a more accurate conclusion for this research, and this research also predicted the following assumptions:

- H1: Corporate governance composite factors have a significant positive effect on financial disclosure transparency.

3. METHODOLOGY

To examine the effect of corporate governance on financial disclosure transparency in Vietnamese listed firms, the quantitative research method is conducted based on STATA 16 software to analyze the panel regression model (Pooled OLS, fixed effect model (FEM), and random effect model (REM)). Choosing a suitable model is determined by Hausman and F-test examination to choose FEM, REM, or Pooled OLS, and Wooldridge and Heteroskedasticity to examine autocorrelation and variance errors after selecting suitable panel models.

3.1. Samples

This study collects samples from 353 Vietnamese listed firms from 2013-2021 that do not include financial services, banking, insurance, and securities listed firms because of different and special operations, and based on formula for financial disclosure transparency. They are also collected in financial statements and other financial information on www.vietstock.vn, and it is also maintained in continuous operation.

3.2. Research model

According to assumptions and previous evidence of Nair et al. (2019), this evidence proposals research mode to examine effect of corporate governance composite factors on financial disclosure transparency in Vietnamese listed firms based on this formula:

FINTPY = β0 + β1 BDit + β2 SIZEit + β3 DEBITit + β4 PROFITit + β5 ASSET + β6 AUDITit + eit

Where:

*** Dependent variables: FINTPY:** financial disclosure transparency. It was measured according to three components that are Earnings Aggressiveness – EA, Earnings Smoothing – ES, and Loss Avoidance – LA. Some previous evidence Filatotchev & Boyd (2009) and Nair et al. (2019) used these three factors to measure financial disclosure transparency. Therefore, higher earning aggressiveness, earnings smoothing, and loss avoidance could reduce financial disclosure transparency, and they are calculated based on these formulas:

- EA = (DA it - DCL it - DCASH it + DSTD it - DEP it + TP it)/ A it-1

- ES = standard deviation of net imcome/standard deviation of cash flow operation.

- LA: dummy variables that D=1 when the profitability is from 0 to 2%, otherwise, D=0.

Where:

ΔAit: Change in total asset of firm i-year t to year t-1

ΔCLit: Change in current liabilities of firm i-year t to year t-1

ΔSTDit: Change in short-tern debt of firm i-year t to year t-1

DCASHit: Change in cash of firm i-year t to year t-1

DEPit: Depreciation of firm i-year t

TPit: Taxes expenses of company i-year t

***Indepdent variables BDit**: Based on concept of corporate governance, the audit committee and Board of directors are two main components in corporate gorvernance. Therefore, corporate governance composites are calculated based on this formula for 10 corporate governance criteria in the board of director and audit committee factors according to dummy variables according to number of criteria that the company achieves in corporate governance, and previous evidence of Carcello et al. (2006) for audit committee factors, and Mathuva et al. (2019), Singh & Vinnicombe (2004) for the board of director (BOD) factors. Besides, for corporate board of directors, there are six factors that are board sizes, BOD independent members , BOD financial expertise members , BOD women members , BOD stability, BOD duality, and four factors in audit committee that are audit committee sizes, audit committee independence, audit committee financial expertise, and audit committee duality. The reason to choose these factors in corporate governance component is that they are simple factors in corporate governance characteristics, and can apply in Vietnamese corporate governance situations:

BD=BSIZE+BIND+BEXP+BWOMEN+BSGM+BCEODUAL+AACS+AACI+ACFS+ADIRSHIP

Where:

BOD factors:

BSIZE: BOD sizes that D=1 if firm i-year t has firm size lower than 50% average observations, and higher than 5 members, otherwise, D=0

BIND: BOD independent members that D=1 if independent members percentages are higher than 60% in BOD, otherwise D=0

BEXP: BOD financial expertise members that D=1 if BOD members had financial expertise, otherwise D=0

BWOMEN: BOD women members that D=1 if BOD has at least one women member, otherwise D=0

BSGM: BOD stability that D=1 if there is no change in BOD, otherwise D=0

BCEODUAL: BOD duality that D=1 if there is no duality, otherwise D=0

Audit committee factors:

AACS: Audit committee sizes that D=1 if audit committee size is higher than average BOD size, and have more than two members, otherwise D=0

AACI: Audit committee independence that D=1 if there is 100% indepdnent members in audit committee, otherwise D=0

ACFS: Audit committee financial expertise that D=1 if there is at least one audit committee member has financial expertise, otherwise D=0

ADIRSHIP: Audit committee duality that D=1 when there is no duality in audit committee, otherwise D=0

*** Control variables:** SIZE demonstrated firm size, calculated based on logarithm of total asset (Bhattacharya et al., 2005). DEBIT demonstrated leverage, calculated by total liabilities / total asset (Zamir & Saeed, 2020). PROFIT demonstrated financial outcomes, calculated by net income/ total asset (Hamrouni et al., 2022). ASSET demonstrated effective using asset, calculated by net revenue to total asset (Cheung et al., 2007). AUDIT demonstrated audit size, demonstrated by dummy variables that D=1 if financial statement is audited by BIG4 companies (Nair et al., 2019).

4. RESULT

4.1 Descriptive statistic:

Firstly, according to descriptive statistics in table 1, exactly 3177 observations or 353 listed firms were selected to research during 2013-2021:

	Observations	Mean	Median	Std	Max	Min	skewness
EA	3177	0.053	0.026	0.199	-0.908	1.67	2.06
ES	3177	1.063	1.104	0.208	0.58	1.279	-1.15
LA	3177	0.198	0.000	0.399	0	1	1.513
HDQT	3177	4.028	4.000	1.158	1	8	0.081
AUDIT	3177	0.286	0.000	0.452	0	1	0.945
SIZE	3177	27.572	27.557	1.582	23.322	33.691	0.239
DEBIT	3177	0.48	0.495	0.226	0.001	0.948	-0.169
PROFIT	3177	0.1	0.092	0.133	-1.733	0.982	-2.418
ASSET	3177	0.735	0.671	0.464	0	1.989	0.434

Table 1: Variable information

Firstly, financial disclosure transparency is measured by earnings aggressiveness (EA), earning smoothing (ES), and loss avoidance (LA). When the earnings aggressiveness (EA), earning smoothing (ES), and loss avoidance (LA) values are higher, they also decrease financial disclosure transparency. For earnings aggressiveness (EA), the average level of difference between some accounts in the balance sheet (DTotal asset - DCurrent liabilities - DCash and cash equivalent+ DShort-term debt – Depreciation + Corporate income taxes) is nearly 5.3% to total asset in the previous year. However, a few listed firms had higher financial disclosure transparency based on EA which is nearly -0.908 for minimum value, and the maximum EA is nearly 1.67 which demonstrates lower financial disclosure transparency in a few corporate firms. Next, for earning smoothing (ES), the average level of standard deviation for net income and cash flow operation is nearly 106.3%. However, a few listed firms had higher financial disclosure transparency based on ES which is nearly 0.58 for minimum value, and the maximum ES is nearly 1.279 which demonstrates lower financial disclosure transparency in a few corporate firms. Finally, for loss avoidance (LA), this factor is measured based on a dummy variable that D=1 if profitability is in the range of 0-2%, otherwise D=0. With nearly 0.198 in average value, almost all listed firms have differences in level of profitability, or D=0.

Corporate governance composite factors are measured based on 10 criteria including 6 BOD factors that are BOD sizes, BOD independent members, BOD financial expertise members, BOD women members, BOD stability, BOD duality, and four audit committee factors audit committee sizes, audit committee independence, audit committee financial expertise, and audit committee duality. Based on nearly 4.028 for average value, almost all Vietnamese corporate firms accepted only 4/10 criteria in Vietnamese corporate governance factors. However, a few listed firms accepted 8/10 corporate governance factors, other firms accepted only 1/10 corporate governance factors.

4.2 Correlation:

The result for the correlation between variables is listed in table 2:

Factors	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
(1) EA	1.000								
(2) ES	-0.045**	1.000							

(3) LA	-0.074***	0.026	1.000						
(4) HDQT	-0.010	0.035**	-0.099***	1.000					
(5) AUDIT	-0.034*	-0.003	-0.064***	0.238***	1.000				
(6) SIZE	0.084***	0.043**	-0.005	0.221***	0.502***	1.000			
(7) DEBIT	0.057***	-0.011	0.251***	-0.074***	0.007	0.280***	1.000		
(8) PROFIT	0.165***	-0.045**	-0.264***	0.104***	0.085***	0.110***	-0.134***	1.000	
(9) ASSET	-0.082***	-0.046***	-0.152***	0.000	0.015	-0.185***	0.015	0.293***	1.000

*** p<0.01. ** p<0.05. * p<0.1

Table 2: Correlation outcomes

Firstly, in the earnings aggressiveness (EA) model, the corporate governance (CG) composite factors will have a negative effect on EA, or the CG composite factors will have a positive effect on financial disclosure transparency based on earnings aggressiveness (EA). Secondly, in the earning smoothing (ES) model, the CG composite factors will have a positive effect on ES, or CG composite factors will have a negative effect on financial disclosure transparency based on earning smoothing (ES). Finally, in the loss avoidance (LA) model, the CG composite factors will have a negative effect on LA, or CG composite factors will have a positive effect on financial disclosure transparency based on loss avoidance (LA).

4.3. VIF model:

	VIF	1/VIF
Firm size (SIZE)	1.693	0.591
Audit size (AUDIT)	1.425	0.702
Asset performance (ASSET)	1.202	0.832
Leverage (DEBIT)	1.192	0.839
Profitability (PROFIT)	1.184	0.844
Corporate governance composite factors (HDQT)	1.097	0.912
VIF average value	1.299	.

Table 3: VIF outcomes

According to the VIF result in this table, all six independent and control variables are accepted in EA, ES, and LA models, and the VIF average value is nearly 1.299 or in the range 1-2, and all these independent and control variables are not multicollinear.

4.4 Model selection examination:

The condition to choose a final model for EA, ES, and LA model is that it is chosen by Hasman and F-test examination. Besides, these models do not have mistakes in variance and autocorrelation errors. Table 4 demonstrates more information for the model examination.

Kinds of models	EA model		ES model		LA model	
	F-test/Chi-square	p-value	F-test/Chi-square	p-value	F-test/Chi-square	p-value
Hausman	85.94	<0.01	172	<0.01	42.85	<0.01
F-test	1.93	<0.01	0.46	1	3.54	<0.01
Heteroskedasticity	121.79	<0.01	11.22	0.0008	890.96	<0.01
Wooldridge	15.993	0.0001	92262.835	<0.01	21.271	<0.01

Table 4: Model selection examination outcome

Firstly, in the Hausman examination, because of a lower than 0.05 p-value, EA, ES, and LA models will choose the fixed effect model as the research outcome. Secondly, based on a p-value that is lower than 0,05, the EA and LA models will choose the fixed effect model as the research outcome. However, in the ES model, because of a higher than 0.05 p-value, this model will choose Pooled OLS as the research outcome.

After having a fixed effect model (FEM) for EA and LA models, and Pooled OLS for the ES model, the Heteroskedasticity and Wooldridge examination is conducted to examine the errors for each model after selection. Because of lower than 0.05 for Heteroskedasticity and Wooldridge examination, the fixed effect model for the EA and LA model, and Pooled OLS for the ES model have autocorrelation and variance errors. Therefore, the robust model is chosen for the EA, ES, and LA models to fix autocorrelation and variance errors.

4.5 Regression results:

Independent/ Control variables	EA model	ES model	LA model
CG composite factors (HDQT)	-0.004	0.006*	-0.016***
	-1.29	1.76	-2.78
Audit size (AUDIT)	-0.033***	-0.018*	-0.007
	-3.63	-1.86	-0.40
Firm size (SIZE)	0.007***	0.009***	-0.015***
	2.65	2.97	-2.63
Leverage (DEBIT)	0.062***	-0.032*	0.424***
	3.61	-1.78	12.48
Profitability (PROFIT)	0.322***	-0.082**	-0.56***
	10.03	-2.37	-5.76
Asset performance (ASSET)	-0.058***	-0.008	-0.095***
	-7.12	-0.85	-6.12
Constant	-0.144**	0.826***	0.59***
	-1.97	10.35	4.07
R-square	0.058	0.008	0.132
F-test	28.199	3.893	59.153
p-value	<0.01	0.001	<0.01
Observation	3177	3177	3177
Initial Durbin- Watson	1.556752	2.568653	1.116869
Final Durbin- Watson	1.777013	1.750643	1.803238

Table 5: Regression outcome (*, **, *: Significant at p-value=0.1,0.05, and 0.01)**

The outcomes for EA, ES, and LA models are listed in table 5 based on a robust model for FEM of the EA and LA model, and Pooled OLS for the ES model. Firstly, according to overall regression information, exactly 3177 observations or 353 corporate listed firms in HOSE and HNX in three models during 2013-2021. Because of a lower than 0.05 p-value, at least one independent and control variable could influence EA, ES, and LA. Next, based on R-square, the level of predicted variance relationship between control or independent variables and dependent variables is nearly 5.8% for the EA model, 0.8% for the ES model, and 13.2% for the LA model. Finally, according to Durbin – Watson value for the EA, ES, and LA model that is in the range 1-3, there is no autocorrelation for the EA, ES, and LA model based on a robust regression model.

Firstly, based on the earning aggressiveness (EA) model, the corporate governance (CG) factors will reduce earning aggressiveness (EA), or corporate governance (CG) factors will have a positive relationship with financial disclosure transparency based on reducing earning aggressiveness (EA) because of nearly -0.004 for the beta. To explain, when there are 100 items for corporate governance (CG) factors, nearly 0.4 corporate governance (CG) factors items will have a negative relationship with earning aggressiveness (EA). However, because of a higher than 0.1 p-value, corporate governance (CG) composite factors do not significant relationship with financial disclosure transparency based on earning aggressiveness (EA), or CG component factors will not influence earning aggressiveness (EA).

Secondly, based on the earning smoothing (ES) model, the corporate governance (CG) factors will have a positive effect on earning smoothing (ES), or corporate governance (CG) factors will have a negative relationship with financial disclosure transparency based on increasing earning smoothing (ES) because of nearly 0.006 for beta. To explain, when there are 100 items for corporate governance (CG) factors, nearly 0.6 corporate governance (CG) factors items will have a positive relationship with earning smoothing (ES). Besides, because of lower than 0.1 for p-value, the negative effect of CG composite factors and financial disclosure transparency according to increasing earning smoothing (ES) is accepted. It is explained that when corporate governance factors increased, it also increases earning smoothing (ES), or reduced financial disclosure transparency.

Finally, in the loss avoidance (LA) model, the corporate governance (CG) factors will reduce loss avoidance (LA), or corporate governance (CG) factors will be a positive relationship with financial disclosure transparency based on reducing loss avoidance (LA) because of nearly -0.016 for the beta. To explain, when there are 100 items for corporate governance (CG) factors, nearly 1.6 corporate governance (CG) factors items will have a negative relationship with loss avoidance (LA). Besides, because of lower than 0.01 for p-value, the positive relationship between CG composite factors and financial disclosure transparency based on reducing loss avoidance (LA) is accepted. It is explained that when corporate governance factors increased, it reduced loss avoidance (LA), or improves financial disclosure transparency.

4.6 Discussion

Firstly, the research assumption is concluded in table 6:

	EA model	ES model	LA model
H: Corporate governance composite factors have a significant positive effect on financial disclosure transparency.	Rejected	Rejected (Negative*)	Accepted (***)

Table 6: Hypothesis conclusion (*, **, *: Significant at p-value=0.1,0.05, and 0.01)**

Secondly, the prediction for the effect of independent and control variables on dependent variables is concluded in table 7:

Indepenedent/ Control variables	Expected outcome with financial disclosure transparency	EA model	ES model	LA model
Corporate governance composite factors (HDQT)	Positive	No relationship	Negative(*)	Positive (***)
Ausit size (AUDIT)	Positive	Positive (***)	Positive (*)	No relationship

Firm size (SIZE)	Positive	Negative(***)	Negative(***)	Positive (***)
Leverage (DEBIT)	Negative	Negative(***)	Positive (*)	Negative(***)
Profitability (PROFIT)	Positive	Negative(***)	Positive (**)	Positive (***)
Asset performance (ASSET)	Positive	Positive (***)	No relationship	Positive (***)

Table 7: Variable prediction outcomes (*, **, *: Significant at p-value=0.1,0.05, and 0.01)**

Firstly, according to the earning aggressiveness (EA) model outcome, the CG composite factors do not affect financial disclosure transparency based on earning aggressiveness (EA). To explain, there is a small proportion of corporate governance criteria in almost all Vietnamese firms. As a result, it could not influence earning aggressiveness (EA). It also explained that almost all BOD insiders do not concentrate on earning aggressiveness (EA) in financial statements. It also demonstrates the insider behaviors to create accounting that they still do not misbehave by aggressing profitabilities in financial statements. Besides, there is no difference in earning aggressiveness (EA) valuation, as a result, CG composites could not influence earning aggressiveness (EA). This outcome is not consistent with previous studies of Siregar & Utama (2008) that BOD and audit committee members have essential roles in influencing financial disclosure transparency, and it also does not accept the research assumption.

Secondly, based on earning smoothing (ES) model outcome, the CG composite factors will improve earning smoothing (ES) or will slightly decrease financial disclosure transparency. To explain, almost all CG members concentrate on firm net loss/ profit income, and outsiders will choose corporate firms that have good performance in financial strength to invest. Therefore, CG members will change or create financing accounts based on profitability to attract more investors. This result explains that individual and organizational behavior reduces financial disclosure transparency by changing accounts in financial statement and profitability to increase valuation for corporation, and they will attract more investors by having positive financial profitability performance, and managers in CG could not demonstrate the negative financial information to reduce attractive funds from outsiders (Hamrouni et al., 2022). This result is consistent with the information asymmetric (Hamrouni et al., 2022), which is explained that only insiders have more negative company information than outsiders, and there is conflicts between insiders and outsiders advantages, and it is also consistent with the explanation by Salehi et al. (2022) to demonstrate the negatively relationship between financial disclosure transparency and corporate governance components according to increase earning smoothing (ES). However, this outcome does not accept the research assumption, and it also does not support the explanation of Siregar and Utama (2008) that audit committee members have essential roles in managing financial disclosure transparency.

Finally, CG composite factors will increase financial disclosure transparency based on reducing loss avoidance (LA) in corporate profitability, or CG composite factors have negatively relationship with loss avoidance (LA). To explain, outsiders and corporate insiders concentrate on corporate financial situation. Therefore, financial statement is essential and useful to influence investor and insider behavior and decision because financial statement will reflect the financial health and corporate firm situation in the future, and CG insiders will manage financial statement more carefully to have more corporate situation information, and they have more responsibilities and policies to improve financial disclosure transparency. This outcome also demonstrated that corporate information has essential roles for insiders and outsiders to maintain operations, and it also provides the corporate financial health, especially the level of earnings according to the income statement. This outcome is accepted with stakeholder theory and corporate social responsibilities (Cho et al., 2013) that are relevant to individual and organizational roles to maintain financial disclosure transparency, and financial statement is advantage for insiders and outsiders to reduce conflicts information between insiders and outsiders, and protect investor advantages because of having more information from corporate financial statements. This outcome is also consistent with the research hypothesis, and some previous evidence of Mathuva et al. (2019) and Habib et al. (2018) that CG insiders have more important roles in financial disclosure transparency based on managing corporate information and individual advantages to reduce conflicts between insiders and outsiders, and according to social responsibility policies, the financial transparency information is also the requirement in corporate ethics to reduce individual misbehavior and improve shareholder beliefs (Cui et al, 2016).

5. CONCLUSION

The objective of this evidence is to examine the relationship between corporate governance (CG) composite factors and financial disclosure transparency based on three components that are earnings aggressiveness (EA), earning smoothing (ES), and loss avoidance (LA). Besides, based on panel data, there are exactly 3177 observations, or 353 listed firms in HOSE and HNX in this evidence during 2013-2021. The outcome of this evidence is that CG composite factors have a relationship with financial disclosure transparency based on the ES and LA models. However, CG composite factors do not affect earnings aggressiveness (EA). To detail, based on the ES model, CG composite factors increase net income differences or reduce financial disclosure transparency. In the loss avoidance (LA) model, CG composite factors reduce loss avoidance or increase financial disclosure transparency based on decreasing corporate loss avoidance (LA).

For research contribution, firstly, this evidence concludes that corporate governance insiders could change or increase differences in income in the financial statement or reduce financial disclosure transparency to create accounting in developing markets. This outcome also supports information asymmetric in that insiders have more power in having corporate information based on financial statements. Therefore, the first recommendation for this research is that corporate firms need to have suitable policies to reduce individual and organizational advantages to prevent corporate firms' misbehaviors that can change income differences in financial statements.

Secondly, the loss avoidance (LA) model outcome concludes the essential roles of corporate governance insiders on financial disclosure transparency and business reputation, especially the accuracy of financial statements and investor advantages to improve corporate insider responsibilities in corporate information based on stakeholder, agency, and corporate social responsibilities theory. Therefore, the recommendation for this evidence is that the social responsibilities and policies need to be improved and accurate for corporate governance structures to improve financial disclosure transparency.

However, the numbers of corporate firms and corporate governance factors are the limitations in this evidence, this research only concentrates on corporate listed firms in HOSE and HNX, as a result, some corporate listed firms in UPCOM or other Vietnamese listed firms are not included in this evidence, and this outcome is not eneralized and correlated for all Vietnamese corporate firms. Besides, some relevant corporate governance factors are not included in this research that are percentage corporate ownership, and other research for audit committee members. Therefore, the final recommendation for this research is that this study needs to improve and increase more Vietnamese corporate firms, and other factors in corporate governance to have more general results for the relationship between corporate governance factors and financial disclosure transparency.

FACTORS AFFECTING THE PROFITS OF LISTED MANUFACTURING ENTERPRISES ON THE VIETNAMESE STOCK EXCHANGE

M.Fin Phan Thi Huong[1]

Abstract: *The purpose of this study is to evaluate the factors affecting the operational efficiency of publicly listed manufacturing companies on the Vietnamese stock market during the period 2010-2022. With panel data of 1690 observations, the results indicate that the profitability ratio has been influenced by five factors. The most influential factors that positively affecting ROA must include Cashflow (coef = 0.947), while the other factors show statistical significance, but their coefficients suggest a relatively weak impact (debt, size, liquid, leverage). At a significance level of 1%, the research finds robust statistical evidence supporting the positive impact of both Cashflow and Size on Tobin's Q of manufacturing companies ($coef_{Size}$ = 774.658, $coef_{Cashflow}$ = 25407.03). The author has not found out any statistically significant evidence for the impact of debt, liquid, leverage on Tobin's Q. Furthermore, based on statistical results from the collected sample, the author observes that during the COVID-19 period from 2020 to 2022, 8.21% of manufacturing enterprises reported negative net income. Meanwhile, before the pandemic, from 2010 to 2019, 9.13% of the enterprises had reported negative net income. This ratio shows the ability of manufacturing companies on the Vietnamese stock market to adapt and respond to the difficult situation due to the pandemic.*

Key words: *Capital Structure, Firm Performance, Optimal Capital Structure, Profitability, Financial Leverage.*

1. INTRODUCTION

In the intricate landscape of the national and global economies, manufacturing enterprises play a pivotal and indispensable part. Their role extends beyond merely producing goods and services, encompassing far-reaching influence on the development and progress of society as a whole. They are not merely business entities; they have become vital building blocks for constructing and sustaining economic prosperity. Manufacturing businesses are responsible for crafting value-added products from raw materials. They not only fulfill consumer needs but also contribute to industrial development, enhance quality of life, and drive technological innovation. By generating employment opportunities, manufacturing enterprises serve as a crucial source of income for millions of individuals worldwide. From producing daily consumer goods to pioneering cutting-edge technologies, they play a significant role in establishing a robust economic infrastructure. Simultaneously, through participation in the international market and exporting goods, they foster global cooperation, expand accessibility for nations, and foster global connections. It is evident that the role of manufacturing enterprises extends beyond product creation, encompassing the broader task of constructing a resilient and sustainable economic foundation.

In the unprecedented challenges posed by the COVID-19 pandemic, the role of manufacturing enterprises has become increasingly vital and indispensable, like never before. They have contributed not only to the economy but also to the safety and recovery of society. Amid the pandemic, maintaining the supply of essential products such as medical devices, food, pharmaceuticals, and chemicals has become incredibly crucial. Manufacturing enterprises have secured the stable supply of these products to meet the community's needs and aid in disease control efforts. For the reasons mention above, the author undertakes this study with the goal of investigating how financial factors

1 Email: huongphan@ufm.edu.vn, University of Finance- Marketing.

have impacted the operational efficiency of manufacturing enterprises over the past decade. The findings of this research will serve as a scientific basis, offering additional statistical evidence to provide managerial recommendations within the realm of production and business.

2.1. Empirical Review

Researches worldwide

Previous studies on the relationship between financial factors of businesses and their impact on efficiency have been conducted by various authors, leading to differences in the results presented. This can be exemplified by studies such as the one conducted by Onaolapo and Kajola (2010), which utilized a dataset comprising 30 non-financial firms in Nigeria during the period 2001 – 2007. Their findings provided evidence of the influencing factors on firm efficiency, represented by ROA and ROE ratio. The results indicated that when businesses utilize excessive debt and invest disproportionately in fixed assets, it leads to negative effects on efficiency. Conversely, businesses with advantages in terms of larger scale or strong growth rates tend to achieve better efficiency. Furthermore, the outcomes from the research conducted by Gatsi and colleagues (2013), utilizing regression analysis on data spanning from 2005 to 2012 with manufacturing firms listed on the stock market in Ghana, demonstrated statistically significant positive relationships between firm size and financial efficiency, as represented by the ROA variable. Due to the variability in these findings, it is evident that understanding the complex relationship between financial factors and business efficiency requires comprehensive investigation and analysis. However, there is no basis to conclude a relationship between liquidity and financial efficiency. On the other hand, when using a combined approach of both Tobin's Q and ROA coefficients to study the profit generation capability of listed companies on the Pakistan Stock Exchange during the period from 2001 to 2009. Khidmat & Rehman (2014) revealed that factors influencing profitability included the quick ratio, current ratio, debt-to-equity ratio with an inverse relationship, and debt-to-total-assets ratio with a direct relationship. Additionally, liquidity had a consistent positive effect and statistical significance on this dataset. Moreover, Durrah and et al. (2016) obtained similar results when conducting research to examine the correlation between liquidity ratios and financial efficiency indicators for companies listed in the food industry during the period from 2012 to 2014. The research results indicated a positive correlation between liquidity ratios and financial efficiency when using the representative variable of ROA. Many studies have also found a positive correlation between operational duration, operational scale, and company profitability, along with a reverse impact of the debt ratio (Minnema & Andersson, 2018; Owolabi & Obida, 2012; Lazaridis & Tryfonidis, 2006; Liargovas & Skandalis, 2010). Author Toraman et al. (2013) studied the effect of capital structure on the profitability of manufacturing firms in Turkey in the period 2005-2011. These authors also considered capital structure measures as long-term liabilities to total assets and as a proxy for firm performance as ROA. The results also showed that the debt ratio negatively affects firm performance in this sample. Simultaneously, Zeitun and Haq (2015) tested the relationship between debt ratios for the operation of 400 enterprises in Qatar, Oman, Kuwait, the UAE, and Bahrain from 2004 to 2012. The author also provided evidence that the debt ratio had a negative impact on firm performance and was especially large in the post-crisis period. Furthermore, the study by Salim and Yadav (2012) used measures of ROA, ROE, and EPS and Tobin's Q to measure the efficiency of 237 companies listed on the Bursa Malaysia stock exchange. The results also showed that there was a negative correlation between the debt ratio and the ratio of long-term debt to total debt on the representative variables ROA, ROE, and EPS, and Tobin's Q.

Researches in Vietnam

In Vietnam, research on the relationship between firm size and business performance has also garnered attention from researchers and managers. Notable studies include those by authors such as Toan (2016), who conducted research on the topic "Impact of working capital policy on return on total assets of real estate companies in Vietnam". The research results indicated that factors such as firm size, leverage ratio, and economic growth rate positively influenced business performance. On the other hand, factors such as average collection period, inventory turnover period, and cash conversion cycle showed negative impact on business efficiency. Furthermore, the study by authors Van & Nga (2018) was conducted on construction material manufacturing companies in Vietnam to explore the influence of working capital management on firms' profitability. The authors presented multiple research hypotheses and employed OLS, REM, and FEM models to elucidate the impact of factors as follows: inventory turnover period, average payment period, and firm size positively affected the return on total assets. Factors like average collection period, cash turnover period, debt ratio, current ratio, and fixed asset turnover ratio exhibited an inverse relationship with the return on total assets. Additionally, studies conducted by Nguyen (2020) and Thanh (2022) both showed consistent results indicating a positive relationship between firm size and business efficiency. Furthermore, there were also several studies that revealed a contrasting relationship between firm size and business efficiency, such as the research conducted by author Thuy et al. (2020). They investigated factors influencing the financial performance of companies listed on the Hanoi Stock Exchange during the period 2013-2017. The research results indicated that corporate income tax, company size, and growth rate had an inverse impact on financial performance. In a prior study by author Thuy et al. (2015), similar results were obtained. They conducted research on 230 non-financial joint-stock companies listed on the Ho Chi Minh Stock Exchange (2011-2013) across 14 industries. Other studies by authors Van & Nga (2018) focused on examining the relationship between business efficiency and the scale of construction companies listed on the Vietnamese stock market (2012-2016). The results revealed that firm size had no statistically significant effect. The authors explained that while larger firms might experience increased profitability due to their size, this increase might not be substantial enough to lead to a rise in the return on assets. Additionally, according to the study by Linh & Nga (2022), the impact of various firm characteristics on the profitability of consumer goods manufacturing businesses was examined. This research ROA and ROE as measures of profitability. The study utilized a sample of 79 listed companies on both the HNX and HOSE during the period from 2016 to 2020. The preliminary results indicated that the profitability of consumer goods businesses listed on the Vietnamese stock market is influenced by firm characteristics, particularly factors such as scale, financial leverage, and liquidity.

2.2. Theoretical Framework

Modigliani and Miller Capital Structure Theory (M&M)

According to Modigliani and Miller's (1958) capital structure theory, it postulates that in a perfectly competitive market, external capital conditions (debt obligations) and equity capital are equivalent. In other words, the value of a firm is independent of the number of shares issued by the firm and is based on the assets of the firm. The sources of this capital formation can come from either debt obligations or equity capital. The hypothesis proposed is as follows:

Hypothesis H_1: The relationship between Leverage and firm efficiency is inverse (-);

Liquidity Theory

Liquidity is a term used to denote the extent to which any asset can be bought or sold in the market without affecting its value. An asset with high liquidity is one that can be quickly sold in the market without a significant or minimal decrease in its price (often characterized by a high volume of transactions). Assets with high liquidity entail lower risk. According to Horne (1968), liquidity is described as the ability to realize the value of an accepted medium in exchange. The hypothesis proposed is as follows:

Hypothesis H_2: Liquidity has a positive impact on firm efficiency (+).

Free Cash Flow Theory

According to studies by Utami & Inanga (2011), once profit distribution decisions have been made by a company and a necessary amount of cash is held to sustain production and business operations, conflicts of interest may arise between the company's owners and its representatives. Corporate managers, who represent shareholders, are also shareholders of the company, creating a conflict of interest between the two parties due to their differing purposes for utilizing cash. The hypothesis proposed is as follows:

Hypothesis H_3: Cashflow has a positive impact on firm efficiency (+).

2.3. Research Methodology

2.3.1. Data Description

The study utilizes an unbalanced panel dataset consisting of 1690 observations collected from audited financial reports and stock trading information of 130 manufacturing companies listed on the Vietnamese Stock Exchange during the period 2010 - 2022. The author chose this timeframe to provide a better measurement of the economic situation after the global economic crisis of 2008. The author selected only those manufacturing companies that disclosed audited financial reports, as the research employs financial indicators representative of the characteristics of each company. Companies that did not disclose financial reports or did not provide complete information during this period were excluded from the study sample.

2.3.2. Research Design and Definition of Variables

Return on total assets (ROA);

According to a study developed by Kaplan and Norton (2001), during the business production process, companies aspire to generate profit by comparing their earnings to the invested assets, which helps assess the capability of generating profit from assets. This metric indicates how much profit, after taxes, a company earns from investing one unit of assets. The higher this ratio, the more efficient the utilization of assets, which contributes to enhancing capital efficiency.

Tobin's Q Ratio;

In 1969, James Tobin (1996) introduced the concept of Tobin's Q ratio. Tobin's Q idea was that if the market values a company higher than its physical value, it signifies that the company has promising growth prospects. Tobin's Q is widely used to assess the future value of a business. In 1944, a simple approach proposed by Chung and Pruiit (1944) provided an approximate calculation for Tobin's Q value using the formula:

Tobin's Q = (MVE + PS + DEBT) / TA (1)

Where:

MVE: Market Value of Equity

PS: Preferred Stock value

DEBT: Debt obligations to be repaid and book value of long-term debt

TA: Total Assets

Based on the theory and previous studies conducted by Salim and Yadav (2012); Durrah et al. (2016), the expected model to be applied to listed manufacturing firms in the Vietnamese stock market is as follows:

$$\textbf{ROA} = \boldsymbol{\beta_0} + \boldsymbol{\beta_1 ROA_{i,t-1}} + \boldsymbol{\beta_2 Debt_{i,t}} + \boldsymbol{\beta_3 Size_{i,t}} + \boldsymbol{\beta_4 Liquid_{i,t}} + \boldsymbol{\beta_5 Cashflow_{i,t}} + \boldsymbol{\beta_6 Leverage_{i,t}} + \boldsymbol{\varepsilon_{i,t}} \quad \textbf{(Model 1)}$$

$$\textbf{Tob}\boldsymbol{Q_{i,t}} = \boldsymbol{\beta_0} + \boldsymbol{\beta_1 TobQ_{i,t-1}} + \boldsymbol{\beta_2 Debt_{i,t}} + \boldsymbol{\beta_3 Size_{i,t}} + \boldsymbol{\beta_4 Liquid_{i,t}} + \boldsymbol{\beta_5 Cashflow_{i,t}} + \boldsymbol{\beta_6 Leverage_{i,t}} + \boldsymbol{\varepsilon_{i,t}} \quad \textbf{(Model 2)}$$

Table 1. Summary of variables in the model

Variables	Symbol	Measure	hypothesis	Reference source
Dependent variables				
Tobin's Q	TOBIN'SQ	see formula (1)		James Tobin (1969); Khidmat & Rehman (2014); Salim & Yadav (2012)

2.3.3. Methodology

In the analysis of panel data, various regression methods are employed to explore the relationship between the dependent and independent variables. OLS is the most basic and widely used method, aiming to identify the linear relationship between the dependent variable and one or more independent variables. The objective is to find the regression line that minimizes the sum of squared errors. Next, REM and FEM regressions are two significant methods for analyzing panel data, where each observation is tracked over time or space. Finally, the System GMM regression is utilized in analyzing panel data to address issues related to conventional regression outcomes. This method integrates both random and fixed effects in the regression model. SGMM is built on the theory of GMM estimation, where parameters are estimated to optimize the GMM objective function. GMM focuses on optimizing the conditions of expected parameter values for errors. SGMM has the capability to control the effects of both random and fixed factors in the regression model. It also helps reduce the bias in results caused by unobserved variations.

3. RESULTS AND DISCUSSION

3.1. Descriptive Statistics Analysis

Bảng 3.1. Descriptive statistics results

Variable	Obs	Mean	Std. Dev.	Min	Max
Roa	1,690	0.061	0.175	-3.350	3.919
TOBIN'SQ	1,513	16397.52	17178.73	400	141459
Size	1,690	13.641	1.518	9.821	19.767
Debt	1,690	0.129	0.175	0	0.943
Cashflow	1,690	0.089	0.179	-3.241	3.983
Liquid	1,690	2.292	3.285	0	42.987
Leverage	1,690	0.579	2.179	0.003	56.916

(Source: Compiled by the author)

The variables Roa and TOBIN'SQ have a wide range of values from -3.350 to 3.919, with a high standard deviation (0.175). This indicates significant volatility in asset profitability. Data analysis reveals that many businesses were affected by the COVID-19 pandemic, resulting in negative after-tax profits. The period of negative profits mainly occurred in the years 2020, 2021, and 2022, with the proportion of companies reporting negative profit periods was 8.21%. The number of companies with negative profit periods is quite low and not higher than the pre-pandemic period which was 9.31%. These results suggest that Vietnamese manufacturing enterprises demonstrate relatively good resilience against the impacts of the COVID-19 pandemic. Additionally, TOBIN'SQ has a relatively high average value (16,397.52) and a high standard deviation (17,178.73), indicating significant variation in fixed asset values across observations. This could reflect the diversity in the market capitalization scale of different companies. The size variable represents the average size of companies, with a relatively low standard deviation (1.518). The Cashflow variable represents the net cash flow from business activities, exhibiting considerable volatility and a relatively wide range of values. These results are understandable, as during the period 2020-2022, many companies were affected by the COVID-19 pandemic, leading to disruptions in production activities and significant changes in cash flow. Similar to cash flow, liquidity and financial leverage also exhibit a similar pattern.

3.2. Correlation Analysis

Table 3.2: Correlation coefficient matrix

	Roa	Tobin'sQ	Size	Debt	Cashflow	Liquid	Leverage
Roa	1						
Tobin's Q	0.216	1					

Size	0.013	0.358	1				
Debt	-0.135	0.081	0.347	1			
Cashflow	0.931	0.171	-0.016	-0.118	1		
Liquid	0.077	-0.029	-0.193	-0.075	0.025	1	
Leverage	-0.369	-0.112	0.133	0.176	-0.333	-0.482	1

The correlation coefficient matrix provides information about the correlation relationships between pairs of variables in the research data. Table 3.2 presents some noteworthy observations. The correlation relationship between Leverage and Roa is negative and quite substantial (-0.369). This indicates a significant negative correlation between a company's financial Leverage and ROA. Similarly, the correlation between Cashflow and Roa is very strong (0.931), indicating a highly robust relationship between Cashflow and ROA. In contrast to ROA, the correlations between Leverage and Cashflow with Tobin's Q are relatively weak. Moreover, the correlation relationship between Size and Tobin's Q is positive and quite strong (0.358). This suggests a fairly strong connection between the size Size and its Tobin's Q.

3.3. Regression Analysis

3.3.1. Multicollinearity test

Variable	VIF		1/VIF	
	ROA	Tobin's Q	ROA	Tobin's Q
Leverage	1.5	1.53	0.665449	0.653562
Cashflow	1.5	1.37	0.667635	0.728641
Size	1.18	1.18	0.849208	0.850742
Debt	1.12	1.17	0.890234	0.855019
Liquid	1.06	1.16	0.946456	0.860911
Mean VIF	1.27	1.28		

Multicollinearity testing is a crucial step in regression analysis, especially when there are multiple independent variables in the model. Multicollinearity occurs when two or more independent variables are highly correlated, which can affect the ability to distinguish the individual effects of each variable on the dependent variable. The results of multicollinearity testing in the research model indicate an average VIF of 1.27-1.28. The VIF scores for each variable are relatively low, suggesting that multicollinearity is not a significant concern for models 1 and 2.

3.3.2. Heteroskedasticity Test

White's test	P_value	Result
ROA	Prob> chi 2= 0.000	Homoskedasticity
Tobin's Q	Prob>chi 2= 0.000	Homoskedasticity

In a regression model, the variance of residuals plays a crucial role in ensuring the accuracy and reliability of regression estimates. When the variance changes unevenly, the residuals of the regression model are not evenly distributed and may impact the statistical significance and efficiency of regression estimates. This can lead to errors in assessing the confidence of regression coefficient estimates, standard errors, and hypothesis testing.

In this study, the White Test was chosen as a heteroskedasticity test. The White Test is a common test to check for the non-constant variance of residuals in a regression model. The White Test examines whether there is a correlation between the squared residuals and the independent variables. If the p-value of this test is low, it indicates evidence of variance heteroskedasticity. Through the heteroskedasticity test, it can be observed that the Prob> Chi^2 for both the ROA ratio and the Tobin's Q ratio are less than 0.01. Therefore, it can be concluded that there is heteroskedasticity in the variance of residuals, indicating that OLS, REM, and FEM estimates are no longer efficient. To address this issue, the author employs the GMM model.

3.3.3. Regression results and discussion

Table 3.2: Regression results

Variable	Tobin's Q-Model 2				ROA-Model 1			
	OLS	FEM	REM	SGMM	OLS	FEM	REM	SGMM
ROA(-1)				0.898*** (0.000)				0.011*** (0.000)

(Source: Compiled by the author)

Hypothesis H_1, The relationship between Leverage and firm efficiency is inverse. The study did not find any statistically significant evidence of the impact of Leverage on Tobin's Q. Additionally, the inverse impact on ROA is very minimal. This result supports the M&M theory. The debt-to-asset ratio represents the proportion of debt to the total value of a company's assets. This ratio is commonly used to measure the level of a company's debt. In a perfect market environment, according to the M&M theory, this ratio does not affect the value of the firm.

Hypothesis H_2, Liquidity has a positive impact on firm efficiency. The study did not find any statistically significant evidence of the impact of Liquid on Tobin's Q. Additionally, the impact of Liquid on ROA is also very weak (coef = 0.004). This result is in line with the perspective of Gatsi et al. (2013). However, this finding stands in direct contrast to the findings of Durrah et al. (2016), Thuy et al. (2020), Thuy et al. (2015), and Linh & Nga (2022). When manufacturing firms own assets with high liquidity, it can raise investor concerns about investment efficiency, as easily tradable assets might cast doubt on long-term investment effectiveness. This reduction in investment capital in the company can lead to a decline in business efficiency.

Hypothesis H_3, Cashflow has a positive impact on firm efficiency. With a statistical significance level of 1%, Cashflow has a very strong impact on Tobin's Q (coef = 25407.03) and ROA (coef = 0.947). When companies hold a substantial amount of cash, it aligns better with the interests of the company owners. This profit stream is returned to the owners as dividends, increasing their income. Moreover, having a significant amount of free cash instills confidence that the company can meet debt obligations and enhances the company's borrowing capability. This finding is in line with the free cash flow hypothesis and is consistent with the research results of Brush et al. (2000) and Utami & Inanga (2011).

There exists an inverse relationship between Long-term Debt and firm efficiency. With a significance level of 1%, the debt structure has a relatively small inverse effect on the ROA of manufacturing firms (coef = -0.015). This result supports and is consistent with the research findings of Onaolapo and Kajola (2010), as well as Simerly and Li (2000). However, the study did not find statistically significant evidence of the impact of debt structure on Tobin's Q. This result aligns well with the M&M theory, which emphasizes that when a company chooses debt financing, such as using debt or equity, the value of the company remains unchanged. Recent research conducted in various countries suggests that the debt ratio appears to have a more cyclical nature compared to the risk-based equity ratio. Therefore, financial managers in companies should strive for an optimal level of adjustment while also noting that excessively high adjustment levels could significantly increase the risk of insolvency and financial costs. The findings indicate that companies with high financial leverage will face pressures on costs and the ability to optimize capital utilization. Hence, excessive use of debt can lead to reduced firm efficiency, aligning with the hypothesis on the debt ratio. The M&M theory has demonstrated, through counterexamples, that in a perfect environment, traditional financial methods such as increasing debt to reduce tax costs cannot provide a financial advantage to the firm.

There is a positive relationship between Size and firm efficiency. With a confidence level of 99%, there is statistically significant evidence indicating that Size has a very strong positive impact on Tobin's Q (Coef = 774.658). The research findings align well with and are consistent with the studies conducted by Onaolapo and Kajola (2010), Gatsi et al. (2013), Minnema & Andersson (2018), Owolabi & Obida (2012), Lazaridis & Tryfonidis (2006), Liargovas & Skandalis (2010), Toan (2016), Nguyen (2020), and Thanh (2022). When firm size is measured by the total assets of the company, a larger size indicates a higher total asset value, reflecting the strong financial capacity of the company. This allows the company to enhance product consumption and provide services to consumers. Conversely, size has a very small and insignificant impact on ROA.

4. CONCLUSIONS AND POLICY IMPLICATIONS

The results of testing the factors influencing the operational efficiency of manufacturing businesses show that the return on ROA is influenced by five factors in the study. The most influential factor on ROA is the company's cashflow. Although other factors have an impact, their effect is weaker. On the contrary, Tobin's Q is strongly influenced by both cashflow and size. Other factors were either weak or not found to be significant during the study period. A summary table of the research results is provided below.

Hypothesis	Model 1		Model 2	
	ROA	(+/-)	Tobin'Q	(+/-)
The relationship between Leverage and firm efficiency is inverse (H_1)	Accept	- (Weak)	Rejected	
Liquidity has a positive impact on firm efficiency (H_2)	Accept	+ (Weak)	Rejected	
Cashflow has a positive impact on firm efficiency (H_3)	Accept	+ (Strong)	Accept	+ (Strong)

The results of the descriptive statistical analysis of the research sample reveal that during the COVID-19 period (2020-2022), the proportion of manufacturing businesses reporting negative after-tax financial profit was 8.21%. This ratio is even lower than before the COVID-19 outbreak (9.13%). The research findings demonstrate the adaptability and resilience of Vietnamese businesses in challenging circumstances. Several positive factors may account for Vietnam's achievements, including

Adaptability: Businesses may have implemented adaptive measures and adjusted their business strategies to cope with difficult situations. This includes cost-cutting, enhancing operational efficiency, and finding ways to sustain revenue during challenging times.

Business strategy adjustments: Some businesses may have changed their business models, services, or products to meet new market demands in the context of the pandemic. This could lead to better profit retention.

Better risk management: Businesses may have implemented better risk management measures, such as entering into price-risk-reducing contracts or increasing inventory to ensure supply during challenging period.

Government support or economic stimulus package: Some businesses may have received financial support from the government or benefited from economic stimulus package during the pandemic**.**

However, in this study, the author only tested large-cap manufacturing enterprises listed on the stock exchange, small and medium enterprises or microenterprises were not covered by this study.

THE INFLUENCE OF MACROECONOMIC FACTORS ON PRIVATE SECTOR INVESTMENT: EVIDENCE FROM VIETNAM

Ph.D Pham Duc Huy[1]

Abstract: *This article analyzes the impact of macroeconomic factors on private sector investment in Vietnam during the period from 1996 to 2022 by applying an autoregressive distributed lagged (ARDL) model. Findings revealed that real GDP and credit to the private sector have a positive effect on the private sector in Vietnam. This demonstrates that higher GDP growth boosts confidence among private enterprises that they can afford to pay off loans and subsequently increase their investment demand. Additionally, transferring credit from the banking sector to the private sector is probably going to increase investment in that area. However, the cost of bringing money into the nation is increased by the real exchange rate. Private investment in Vietnam is discouraged by the country's high cost of production, which makes investments prohibitively expensive.*

Keywords: *private investment; private sector; private sector investment; private sector in Vietnam; ARDL.*

1. INTRODUCTION

During the initial stages of the Doi Moi (1986) reform process, the government acknowledged the significance of restructuring the function of State-Owned Enterprises (SOEs) in order to diminish the prevalence of inefficient state production. This restructuring aimed to foster the advancement of the private sector, facilitate job generation, and stimulate economic growth. From as early as 1992, the primary emphasis of the initial reform endeavors was directed towards the equitization of state-owned enterprises (SOEs). So far, the private sector is an important contributor to Vietnam's economic growth. According to SBV (2022), the private economic sector now accounts for about 40% of GDP and attracts 85% of the labor force, contributing an increasingly important contribution to economic growth and restructuring. In Vietnam, private enterprises have surpassed the SOEs in terms of generating income for workers, and this gap is widening. The jobs created by private-sector enterprises have helped millions of workers move from lower-income jobs in agriculture to more productive jobs with higher wages. Vietnam has distinguished itself in the ranks of emerging market development, surging to middle-income status in just one generation, and cutting its poverty rate from 50 percent in 1990 to 2 percent in 2018. The country's robust and sustained economic growth was driven by open trade, sector liberalization, and an export-oriented growth model, in which the private sector played a leading role. With success comes confidence, and Vietnam set a goal of becoming a high-income country by 2045. With these results, thanks to the continued efforts of the Vietnamese government in the process of reform, the policy and legal environment for the private sector have been continuously improved.

Notwithstanding the commendable endeavors made thus far, the economy of Vietnam is confronted with constrained access to capital, subpar agricultural productivity, a deceleration in economic growth, elevated levels of inflation, and a substantial budget deficit. These factors

[1] Email: huypham@ufm.edu.vn, Universiy of Finance – Marketing.

collectively pose significant obstacles to the expansion of private sector investment, especially during the COVID-19 pandemic. Additionally, the growth rate of the private sector has tended to decrease in recent years because the quality of growth in the private sector is a serious problem.The private economy is mainly small and micro-scale, the level of technology, management, financial capacity, product quality and competitiveness are still low and lack of links with each other and other economic sectors. The capacity for international economic integration and competition is still limited, and the level of deep participation in regional and global value chains is still low. The paramount issue is that private enterprises in Vietnam are constantly in a shortage of capital to serve their business. Therefore, The Vietnamese government has implemented effective fiscal and monetary policies to support the positive growth of private enterprises.

In a nutshell, according to investment theory (Patnaik & Joshi, 1998), some elements that are thought of as shift factors in the investment function, such as liquidity constraints, demand conditions in the economy, public investment, the real exchange rate, macroeconomic uncertainties, and the cost of capital, can also have a significant impact on private investment by either stimulating or dampening it. Therefore, the goal of this study is to pinpoint the key factors that influence private sector investment in Vietnam.

2. LITERATURE REVIEW

Ghura and Goodwin (2000) use panel data from 1975-1992 to study private investment in Asia, Sub-Saharan Africa (SSA), and Latin America. Random effects estimation was preferred by econometric tests. The results, including pooled data from all 31 nations, confirm several empirical findings. Real GDP growth, government investment, financial intermediation, government credit reductions, and world interest rate drops boosted private investment in developing countries. Another intriguing finding is that educational improvement increases private investment. This study did not confirm prior studies' statistically significant negative impacts of foreign debt on private investment. The results for the complete sample of nations are not consistent across regions; real GDP growth enhances private investment in Asia and Latin America but not in the SSA. Additionally, government funding boosted private investment in SSA but not in Asia or Latin America. In Asia and SSA, private sector lending increased private investment, but not in Latin America. Additionally, government credit increases hurt private investment in SSA and Latin America. The negative consequences of external shocks were statistically significant exclusively in SSA, confirming that the region is vulnerable. Identical opinion, Ngoma et al., (2019) used panel data from 2000–2017 for 35 Sub-Saharan African (SSA) countries to analyze the macroeconomic determinants of private investment using pooled regression, fixed effects, and random effects models and the Panel Corrected Standard Error (PCSE) technique. Critical diagnostic tests showed that the data was stationary using unit root testing. More diagnostic tests showed heteroskedasticity, autocorrelation, and cross-sectional dependency in the fixed effects model. The discovered statistical issues were addressed using PCSE. In the SSA region, GDP, real interest rates, public investment, and inflation determined private investment. Similar, Bonga and Nyoni (2017) examined the causes of Zimbabwe's poor private investment over the previous 30 years. Their findings showed that GDP and public investment are Zimbabwe's biggest private investment drivers. The study suggested improving GDP, governmental investment, interest rate, and other macroeconomic factors to boost private sector investment.

Shijaku and Kalluci (2017) identify and evaluate the long-term determinants of bank credit to the private sector in Albania using a vector error correction mechanism (VECM). Bank credit can be adjusted to balance, according to estimates. The findings suggest lending enhances economic growth. Banking, financial intermediation, and financial liberalization would increase lending demand. Lower lending costs, less domestic government borrowing, and better bank credit would further encourage lending. The exchange rate also shows demand valuation and consumption smoothing effects. By used VECM, Abate (2016) investigated and analyzed factors affecting Ethiopian domestic private investment. They used annual data for VAR and VECM. They found that long-term governmental investment, real GDP, exchange rate, and credit have a positive impact on private investment. In the short term, exchange rates and inflation affected private investment positively and negatively. Thus, to enhance private sector performance, they suggested steps to increase real income and private investment. Basic infrastructure development, stable investment, macroeconomic and political stability, etc. Similarly, the study conducted by Onyeisi et al. (2018) investigates the impact of foreign remittance inflows on domestic loans in the private sector of Nigeria during the period from 1980 to 2015. The empirical analysis demonstrates that private sector domestic credit is influenced by several factors, namely international remittance inflows (IRIGWT), overseas development aid (ODAGNI), real GDP, inflation (INFL), and the exchange rate (EXR). The study employed co-integration and vector error correction techniques to estimate the models. The study found that the variable IRIGWT exhibited a statistically non-significant positive association with DCPS in the short-term. Conversely, the variable ODAGNI shown a statistically significant negative correlation with DCPS. Moreover, this study aims to investigate the impact of real gross domestic product (RGDP), exchange rate (EXR), and inflation (INF) on domestic loans to the private sector.

The macroeconomic factors influencing private investment in Nigeria were examined by Ayeni (2014), the ARDL (Autoregressive Distributed Lag) Cointegration technique was utilized in the study to examine whether there was a long-term link in Nigeria. The findings indicated that Nigeria's GDP, real interest rates, real exchange rates, inflation rate, and loans to the private sector have not been able to effectively contribute to or stimulate private investment since they all display indicators that are contradictory to expectations. However, the study recommended that in addition to enhancing the macroeconomic factors that encourage investment, the government should also foster a favorable political climate that encourages private sector investment. The ARDL co-integration method was used to examine a long-run equilibrium model of private investment between 1980 and 2019 in the Ayeni (2020)GIEPA, was formed to develop Free Zones in selected locations to enable investors to operate in a more macroeconomic friendly environment. Despite all efforts, the Gambia economy suffers from limited availability of foreign exchange, weak agricultural output, a slowdown in their major investment—tourism, high inflation, a huge fiscal deficit, and a huge domestic debt burden. This study identified the determinants of domestic private investment in the Gambia. The study employed the ARDL Co- integration method to analyze a long-run equilibrium model of private investment. Exchange rate, credit to private sector, external debts, Real Interest Rate, Real Exchange Rate, Inflation, among others were identified as exogenous variables. Findings show that high exchange rate increased the real cost of import especially capital goods thereby making investment very costly. Financing of huge debts also inhibited private investment in the Gambia. Aggregate Demand Condition, Real Interest Rate, Real Exchange Rate, Inflation all performed below expectation. Credit to the private sector has not contributed effectively to boost private investment in the Gambia due to insufficient credit. The study therefore suggests an exchange rate policy that will be favorable to reduce cost of imported capital goods. The Gambia should look inward for the supplying of raw materials locally or promote investment in the areas where the required raw materials are available locally as stated by the comparative advantage theory.”,”author”:[{“dropping-particle”:””,”family”:”Ayeni”,”given”:”Raphael Kolade”,”non-dropping-particle”:””,”parse-names”:false,”suffix”:””}],”container-title”:”Cogent Economics and Finance”,”id”:”ITEM-1”,”issue”:”1”,”issued”:{“date-parts”:[[“2020”]]},”publisher”:”Cogent”,”title”:”Determinants of private sector investment in a less developed country: a case of the Gambia”,”type”:”article-journal”,”volume”:”8”},”uris”:[“http://www.mendeley.com/documents/?uuid=5a15fe6f-125c-4a4a-b7d4-e52883b1f634”]}],”mendeley”:{“formattedCitation”:”(Ayeni, 2020 study on private sector investment in Gambia. A high exchange rate raised the real cost of imports, particularly capital goods, according to the findings, making investment highly expensive. The results demonstrate that a high exchange rate (REXR) raised the real cost of imports, particularly capital goods, making investment more expensive. EDT financing prevented the Gambia from attracting private investment. The real exchange rate (REXR), real interest rate (RINT), and inflation (INFR) are all below expectations. Due to a lack of credit, credit to the private sector (CRPS) has not significantly increased private investment (PINV) in the Gambia. As a result, the study recommends an exchange rate strategy that will help lower the price of imported capital goods. According to the comparative advantage theory, The Gambia should turn inward for the supply of raw resources domestically or encourage investment in the areas where the necessary raw materials are locally available. Besides, Verma (2007) examined investment’s endogenous effect. The study’s main goal was to conduct a unit root test to endogenously determine a time sense break. Long-term association was analyzed by ARDL (Autoregressive Distributed Lag) and short-term relationship using ECM. The study analyzed the association between each dependent variable and the other independent factors. GDP and GDP savings positively and significantly affect private investment. According to Sajid and Sarfraz (2008), they examined private investment and currency rate causality. Their study examined investment-exchange rate causality using cointegration and vector error correction. They found a long-term and short-term equilibrium link between private investment and exchange rate. Frimpong and Marbuah (2010) measured private investment determinants by time series econometric methods, coin-tegration, and error correction in an ARDL model. According to Frimpong and Marbuah (2010), the following factors have an immediate impact on private investment in Ghana: state investment, inflation, real interest rates, openness, real exchange rates, and constitutional law. They noted that real production, inflation, external debt, real interest rate, openness, and real exchange rate greatly affect private investment over time.

3. RESEARCH METHODOLOGY

According to Ayeni (2020), a relationship exists between total output, or revenue, and additional investment spending. In essence, this elucidates the rationale behind the tendency for a rise in national income to frequently provide a greater-than-proportional surge in investment expenditure. Moreover, the determination of investment in an economy is contingent upon the direction of change in economic activity rather than its absolute level. When there is a modification in the national income or output of an economy, it typically results in a corresponding alteration in investment. Based one the model of Ayeni (2020), author study GDP and five other explanatory variables affect private investment (PINV) in Vietnam. The data utilized in this study encompasses the time period from 1996 to 2022, as determined by the availability of relevant variables. The data included in this analysis were obtained from the World Bank Indicators during the year 2022. The model is clearly stated in the following manner:

$$PINV = \beta_0 + \beta_1 RGDP + \beta_2 CRPS + \beta_3 INFR + \beta_4 RIR + \beta_5 GNE + \beta_6 REER + e \quad (1)$$

Table 1. The definitions of variables

Variable	Description
lnPINV	Private Investment, lnPINV equal to the logarithm of private investment
lnCRPS	Credit to Private Sector proxy for liquidity constraints, lnCRPS equal to the logarithm of credit to private sector
lnGDP	Real Gross Domestic Product proxy for demand conditions in the economy, lnGDP equal to the logarithm of GDP
GNE	Government expenditure on investment proxy for Public investment, lnGNE equal to the logarithm of government expenditure on investment
EXR	Real Exchange Rate
INF	Rate of inflation (proxy for macroeconomic uncertainties/instability)
INT	Real Interest Rate (proxy for User Cost of Capital)

4. EMPIRICAL RESULTS AND DISCUSSION

The aim of the paper is to examine the relationship between microeconomic factors and private sector in Vietnam by employing a the ARDL model. The variables are presented in Table 1, and Descriptive statistics is given in Table 2. In order to achieve the research goal of the paper, there are employed all panel unit root tests available in EViews v. 12 for certain tests, as it is explained in the following section.

Table 2. The overview of descriptive statistics

	LNPINV	LNCRPS	LNGDP	LNGNE	LNEXR	INF	INT
Mean	24.15927	24.91945	25.36058	23.26583	9.782744	0.057722	0.107919

Before proceeding with estimation, it's also prudent to study the orders of integration of our series and ARDL estimation is not valid in the presence of I(2) variables, but does accommodate a mixture of I(0) and I(1) variables. This article use the Im, Pesaran, and Shin (IPS) test with a constant and trend on series in levels. Table 3 summarize these tests. Table 3 showed that INT, INF as integrated of order 0, whereas the remaining variables are identified as integrated of order 1. And we employ the ARDL and Bound Test to examine the model's long-term equilibrium.

Table 3. ADF test results

Series	Test for unit root in level			Test for unit root in 1st difference	
	t-Stat	Prob.		t-Stat	Prob.
LNPINV	-1.2789	0.6236		-3.8439	0.0076
LNCRPS	-2.3243	0.1723		-3.2559	0.0284
LNGDP	-0.4133	0.8928		-3.5591	0.0145
LNGNE	-1.913	0.3215		-5.4322	0.0002
LNEXR	-0.9805	0.7433		-4.6014	0.0013
INF	-3.0848	0.0403		-6.3167	0.0000
INT	-3.2682	0.0272		-6.2867	0.0000

The method starts by estimating the model with ARDL and then checking for cointegration between the variables. Table 4 presents the Bound Cointegration test's findings. Based on the findings presented in Table 4, it can be observed that the F-statistic, evaluated at a 5% threshold of significance, leads to the rejection of the joint null hypothesis pertaining to the lagged level variables. Specifically, this hypothesis concerns the coefficients' variable addition test, which posits that the coefficients are equal to zero. Moreover, the null hypothesis, which posits the absence of cointegration or a long-run link in the private investment model, is rejected based on the observed F-statistic value of 12.04, surpassing the critical value threshold set at the 1% significance level. showing the existence of a long-run equilibrium link in the model. Tables 5 and 6, respectively, give the long-run equation and the short-run dynamics or cointegrating equation.

Table 4. ARDL Bound Cointegration Test

Null Hypothesis: No levels relationship		
Test Statistic	Value	K
F-statistic	12.04	6
Critical Value Bounds		
Significance	I(0) Bound	I(1) Bound
10%	2.334	3.515
5%	2.794	4.148
1%	3.976	5.691

According to Table 7 results of the short-run model of private investment in the Vietnam, the coefficient CointEq(-1) is the auto-adjustable speed of ECM(-1) = -0.873847 and it's statistically significant at 1%. It is understandable that once there is some kind of change from macro variables or short-term fluctuations that will cause private sector investment to deviate from the long-term balance sheet, but in the next period (in this study is a year) then the value of these impacts tends to return to balance with a rate of adjustment of -87.4%.

The results show the short-term relationship (Table 7) and the long-term relationship (Table 6) between private investment and macro-factors. Specifically, CRPS has no effect on PINV in the short term (0.253402), but CRPS has a positive effect on PINV in the long term (0.966237***). Private sector investment is anticipated to increase as a result of a rise in bank lending to the sector. This result identified that the credit given to the private sector by banks in Vietnam played an important role in promoting firms in the country because the financial market hasn't really developed. Besides, real GDP has a positive and significant short-term effect but no effect on private investment in the long term. This demonstrates that higher GDP growth boosts confidence among private enterprises that they can afford to pay off loans and subsequently increase their investment demand. In addition, the results in Table 6 showed that there is no impact of public investment (GNE) on private investment in the long term. Meanwhile, in the short term, GNE has a negative effect on PINV; this result shows public investment crowding out private investment in Vietnam.

The results showed that the real exchange rate exerted negative effects on private investment in the Vietnam economy in the short term. The results of this study are consistent with the Ayeni (2020), the real exchange rate has the potential to have a positive or negative impact on the volume of private sector investment. negatively since it is a factor in determining the actual cost of imports. Real costs for importing capital goods tend to rise when a currency is devalued, which lowers private sector profitability and causes a decline in investment opportunities. In contrast, real currency depreciation can boost investment in industries that produce items for the global market by boosting competitiveness and export volumes. As a result, the real exchange rate has a negative impact on private investment in Vietnam by raising the cost of imported capital goods, which lowers profitability and deters private investment. Furthermore, moderate inflation will help private enterprises alleviate the burden of input costs, supporting economic development. However, the exchange rate increases the real cost of imports, especially capital goods, thereby making investment in private companies very costly.

In this study, the Breusch-Godfrey Serial Correlation Lagrange Multiplier (LM) test is employed to examine the presence of serial correlation. The statistical software EViews-12 is utilized for this purpose. The null hypothesis cannot be rejected as the p-value, as indicated in Table 5, exceeds the significance level of 5%. This implies that the ARDL regression model does not exhibit any serial correlation. Furthermore, it elucidates that the outcomes derived using ARDL Regression are not misleading or devoid of meaning. Additionally, the Breusch-Pagan-Godfrey heteroskedasticity tests have been employed to detect heteroskedasticity in the ARDL regression model. According to the findings presented in Table 5, it was seen that the p-value associated with the R square is greater than 5%. In accordance with the decision rule, this indicates that the null hypothesis cannot be rejected. Moreover, the findings from the Wald test indicate the long-term influence of macroeconomic factors on the private sector in Vietnam. The Regression Specification Error Test (RESET) is applied for the ARDL regression model is appropriately or not. At a 5% significance level, it is impossible to reject the null hypothesis based on Table 5. Consequently, it is possible to conclude that the ARDL regression model is devoid of a specification error issue.. A recursive estimate was used to test structural stability in model ARDL. Two tests are used, the cumulative sum and cumulative sum of squares tests determine the ARDL model's structural integrity. Figure 1 shows the structural stability test results from EViews 12. If the Cumulative Sum (CUSUM) line lies between two critical lines at 5% significance, the result cannot reject the null hypothesis. Otherwise, the null hypothesis would be accepted. We cannot reject the null hypothesis, implying that the ARDL model is structurally stable during the research period.

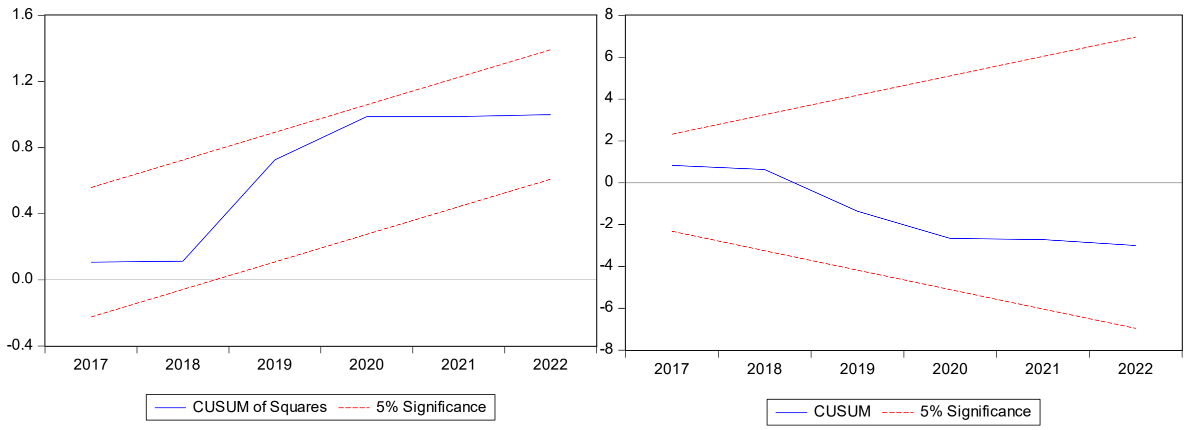

Figure 1. Structural Stability Test

5. CONCLUSIONS

This article uses the ARDL model to analyze microeconomic indicators affecting the private sector in Vietnam during the period from 1996 to 2022. The results showed that CRPS has a positive effect on PINV in the long term, GDP has a positive effect on private investment in the long term, public investment (GNE) is crowding out private investment, real exchange rate rates exert negative effects on private investment in the short term, and inflation raises input costs, therefore affecting private investment. The results showed the influence of macroeconomic factors on private sector investment in Vietnam.

The Fifth Central Conference, session XII, adopted a resolution on private economic development becoming an important driving force of the socialist-oriented market economy. The resolution is a new step forward, aimed at boosting the development of the private sector and the economy as a whole. Simultaneously, it demonstrates the consistent view of the party and the state on the private economy. The content of the resolution, if implemented effectively, will encourage the development of private economic forces and enable innovation as the basis for the release of productivity and creativity and the comprehensive promotion of the private economic role in all stages of the production value chain. Simultaneously, creating the strength and motivation for deeper integration and exploiting the economic components with better potential is a prerequisite for the adoption of technology, especially high-technology, into the fourth industrial revolution. For Vietnam to achieve feats as determined by the Fifth Central Conference and to facilitate economic growth, particularly through private investment, it is imperative to prioritize the management and monitoring of key macroeconomic indicators. Findings from this study identified that the credit given to the private sector by banks in Vietnam played an important role in promoting firms in the country because the financial market hasn't really developed. Therefore, the upgrading of financial markets will enable private enterprises to easily access foreign capital at a low cost, thus developing a sustainable private economy. In the meanwhile, moderate inflation will help private enterprises alleviate the burden of input costs, supporting economic development. The exchange rate, however, makes investing in private enterprises exceedingly expensive by raising the real cost of imports, particularly capital goods. It is necessary to implement an exchange rate policy that will lower the price of imported capital goods. As an alternative, Vietnam can turn to its own resources to supply raw materials or encourage investment in regions where the necessary raw materials are already locally accessible.

EVALUATING ETF FUNDS PERFORMANCE IN VIETNAM STOCK MARKET USING SHARPE RATIO AND ECONOMIC PERFORMANCE MEASURE

Ph.D Tran Hoang Vu[1], MA. Hoang Thi Ngoc Huong[2]

Abstract: The performance of ETF funds play an important role among capital stock market in Viet Nam. If those ETF funds are managed effectively, then pushing thousands of dollars investing into Viet Nam capital stock market. Using traditional and modern methodology as Sharpe ratio and Economic Performance measure respectively to eveluate ETF funds performance. The reason of using traditional method compared with modern method is because of without the normality assumption. Also, traditional risk measure methodology is based on first and second moment as mean and standard deviation; meanwhile, modern risk measure method examines third and fourth moment as well, in case of without normality assumption. Therefore, study the performance of domestic and foreign ETF funds in Viet Nam stock market to evaluate the effectiveness of ETF funds performance accurately by using modern method compared with traditional methods. This is a necessary factor for the Vietnam stock market to be upgraded to emerging market and attract investment capital.

Keywords: Mean-variance, AS index, Sharpe ratio, EPM, ETF funds, Performance

1. INTRODUCTION

Data from the Viet Nam State Securities Commission (SSC) shows that, as of November 2022, the SSC has licensed the establishment of 23 new investment funds (with a total charter capital mobilized of nearly VND 1,800 billion) and licensed public offerings for 4 investment funds, bringing the total number of licensed funds in Vietnam operating in the market to 87 funds, including 48 open-ended funds, 11 ETF funds, 01 real estate fund, 02 closed funds and 25 member funds. The total net asset value of securities investment funds as of October 2022 reached more than 73.4 trillion VND.

By the end of 2022, there are 44 fund management companies in operation with the total value of assets under management at the most recent time (November 2022) estimated at 546 trillion VND, down 9% compared to the previous year as 2021. However, the business activities of fund management companies are still maintained normally and profitable, many companies have mobilized to establish new securities investment funds, thereby contributing to stabilize and develop a healthy stock market with the leading role of institutional investors (SEC, 2023).

To survive and develop sustainably, to lead and attract individual investors to exist in the Viet Nam stock market, investment funds must demonstrate their management effectiveness. The total capital flowing into the stock market not only keeps the stock market stability, but is also the main factor to help Vietnam's stock market being upgraded (OECD, 2022).

To evaluate the performance of domestic and foreign ETF funds existing in Viet Nam stock market, this research focus on traditional method as Sharpe ratio and modern method as Ecomonic Performance measure as well.

[2] University of Finance and Accountancy

Based on Markowitz's (1952) portfolio theory, Sharpe (1964), Lintner (1965) and Mossin (1966) develop the capital asset pricing model (CAPM), in which variance is used for measuring total risk, and derive the Beta for measuring systematic risk. Afterall, standard deviation is used by Sharpe ratio to evaluate the performance of an investing portfolio. However, without the normality assumption, they are imperfect risk measures because they do not satisfy the monotonicity with respect to FSD (First-order stochastic dominance) and SSD (Second-order stochastic dominance). Thus, the systematic risk measure, Beta, derived from the mean-variance capital asset pricing model is questionable.

In recent literature, the economic index of riskiness, proposed by Aumann and Serrano (2008), (hereafter, AS index), is often used as a substitute for standard deviation in risk measurement. Unlike standard deviation, the AS index is monotonic to FSD and SSD. It also satisfies the duality axiom which asserts that people who are less risk averse accept riskier gambles.

In applying the AS index, Homm and Pigorsch (2012) constructed an economic performance measure (EPM), which generalizes the Sharpe ratio by replacing standard deviation. In studying the hedge with futures, Chen et al. (2014) proposed the optimal hedge ratio that minimizes the AS index instead of variance. Furthermore, Chen et al (2017) derive some new capital asset pricing models under some indexes of riskiness including the AS index.

The rest of this paper is organized as follows: In Section 2, previous studies related to risk measure are mentioned in the literature. Section 3 presents research methodology including AS index and EPM methodology which are applied for evaluating all ETF funds performance. Then, the result and discussion between them are compared in section 4. The final section will conclude.

2. LITERATURE REVIEW

Mean-variance strategy first introduced by Markowitz (1952), who defined the optimal rule for allocating wealth across risky asset and investors care only about mean and variance of portfolio's return in this setting. After that, many scholars have developed portfolio selection models with the same purpose to Markowitz in the equity context. Specifically, capitalization-weighted or value-weighted indexes is proposed for equity evaluation, defined as risk-based or smart-beta strategies. Besides that, other smart-beta strategies have developed as equally weighted (EW), global minimum variance (GMV), equal risk contribution (ERC) and maximum diversified (MD). Hitaj & Zambruno (2016)global minimum variance, equal risk contribution and maximum diversified ratio argued that those smart-beta strategies are work well in the equity context which is just one type of investment, and investors wonder know how these risk-based strategies implement under different types of investment instrument. An important investment vehicle ETF funds which combine characteristics of an open-end mutual fund and a stock. Most of ETFs have really low expense ratios and making them cost-effective way to diversify a portfolio (La et al., 2018). Therefore, the objective of this study is to analyze how these smart-beta strategies perform in case of ETF fund portfolio in Viet Nam capital stock market.

Traditionally, first and second-moment is used to measure risk and it is not suitable for different distributions as well as investment vehicles. According to the study of Martellini & Ziemann (2010) and Martellini, & Zambruno (2012) have argued that using two-moment portfolio allocation is not better than accounting third and fourth-moment portfolio allocation together. The study of Aumann and Serrano (2008) has defined the economic index of riskiness for a risky asset as the reciprocal of the positive risk aversion parameter of an individual with constant absolute risk aversion (CARA) who is indifferent between taking and not taking the risky asset. Also, all four-moment are accounted in this strategy.

The ordinary Sharpe ratio was introduced by Sharpe (1966) and widely used by practitioners. It is the ratio between average excess return and risk, where risk is measured as standard deviation of return. Since, there are dissimilar distributions following normality and non-normality. Therefore, using unsuitable methodology for each type of distribution convey incorrect valuation. Using Sharpe ratio as performance measure applied for different distributions are a serious issue. Sharpe ratio was useful for performance measure under normal distribution; however, using Sharpe ratio probably cause issues under non-normal distribution or under loss distribution. For instance, the Sharpe ratio result in wrong rankings in the Sharpe ratio paradox (Hodges, 1998) and the cases of manipulated Sharpe ratios (Goetzmann et al., 2002).

In the study of (Chen et al., 2019) related to modified Sharpe ratio, they introduce Modified or Instantaneous Sharpe ratio and compared with Ordinary Sharpe ratio which is proposed by Sharpe (1966). Using instantaneous Sharpe ratio as performance valuation, a portfolio with higher instantaneous Sharpe ratio will generate in higher expected utility for investors, since instantaneous Sharpe ratio equals the original Sharpe ratio plus half of the volatility of the fund. Similarly, if two portfolios have the same valuation of original Sharpe ratio, then the one with the higher volatility will rank higher according to the modified Sharpe ratio and this is true under dynamic portfolio theory (Chen et al., 2019). As a result, Chen et al. (2019) argued that using instantaneous Sharpe ratio as performance measure to compare two portfolio return, the higher volatility will result the higher expected utilities.

Importantly, Li (2010) has argued that expected utilities is regarding to volatility and based on market trend. Positive expected utilities with high volatility since uptrend market, and negative effect with high volatility since downtrend market.

Specifically, performance measure of low volatility high dividend index is studied in this thesis. If expected result shows that performance measure of low volatility high dividend index is higher than benchmark, the result is consistent with previous study.

3. RESEARCH METHODOLOGY

People do not always make decision related to uncertainty situation if they wonder maximizing expected utility of final assets. Therefore, expected utility plays as an important key for guide to behavior (Bell, 1982). As a result, Aumann and Serrano (2008) have proposed the economic index of riskiness, the AS index, which is axiomatically derived from the theory of decision making under risk. The two key axioms of this index are duality and positive homogeneity. The duality requires the risk index that reflects how less risk-averse individuals accept riskier assets. Thus, it satisfies the above monotonicity. Aumann and Serrano (2008) defined the economic index of riskiness for a risky asset as the reciprocal of the positive risk aversion parameter of an individual with constant absolute risk aversion (CARA) who is indifferent between taking and not taking the risky asset. Under their setup, the AS index must satisfy the following equation:

$$EU(W_0 + S_t - S_0) = U(W_0)$$

Where U is the utility function, is the initial wealth, is the price of the risky asset at time t. Assuming no cash dividend, is the absolute return of holding the asset for the time interval.

Aumann and Serrano (2008) constructed the index of riskiness by using an exponential utility function. Thus, the AS index of the risky asset, AS (S_t) is defined implicitly as follows:

$$Ee^{-(S_t - S_0)/AS(S_t)} = 1 \quad (1)$$

They proved that the AS (S_t) is a unique positive number, and any index satisfying the two axioms is a positive multiple of AS (S_t). Furthermore, they provided a closed-form solution of the AS index under normality. For other distributions, numerical methods are often used for computing the AS index.

Under normal distribution, the economic index of riskiness is equal to $\frac{\sigma^2}{2\mu}$. Constructing initial value of AS index, *AS*(S_0), to solve the equation (1) achieving the AS index:

$$AS() = \frac{3 * (kt - 3) - 4 * \mu * sw^2 - 6 * \sigma * sw + 9 * \sigma^2 / \mu}{18}$$

Where r_0 total return index, kt is kurtosis, sw is skewness, μ and σ are the mean and volatility parameters.

Auman and Serrano (2008) proves that any two indexes are positive multiples of each other since those index are satisfied those two axioms. By using exponential utility function, Aumann and Serrano (2008) proposed the index of riskiness for risky asset, AS (r_t).

The authors proved that the AS () is a unique positive number, and any index satisfied the two axioms is a positive multiple of AS (). In addition, they have developed a closed-form solution of the AS index under normality. Since, there are existing distinct distributions, so it uses numerical methods for computing the AS index (Homm & Pigorsch, 2012)variance and higher moments of the return distribution. It is equivalent to the Sharpe ratio if returns are normally distributed. Moreover, the two performance measures are asymptotically equivalent as the underlying distributions converge to the normal distribution. We suggest a parametric and a non-parametric estimator for the new performance measure and provide an empirical illustration using mutual funds and hedge funds data. Homm & Pigorsch, 2012.

$$EU\left(W_0\left(\frac{S_t}{S_0}\right)\right) = U(W_0)$$

The concept of economic index of riskiness, AS index, satisfy monotonicity, replacing for the use of standard deviation in risk measurement, since monotonicity violation by standard deviation. AS index is related to the concept of risk aversion, it allows decision maker to accept which of two investments are risker without considering specific function or preference order (Homm & Pigorsch, 2012)variance and higher moments of the return distribution. It is equivalent to the Sharpe ratio if returns are normally distributed. Moreover, the two performance measures are asymptotically equivalent as the underlying distributions converge to the normal distribution. We suggest a parametric and a non-parametric estimator for the new performance measure and provide an empirical illustration using mutual funds and hedge funds data. (Homm & Pigorsch, 2012. AS index generate the result of gamble properties in a single number of riskiness that make easier for comparison between portfolio (Homm & Pigorsch, 2012)variance and higher moments of the return distribution. It is equivalent to the Sharpe ratio if returns are normally distributed. Moreover, the two performance measures are asymptotically equivalent as the underlying distributions converge to the normal distribution. We suggest a parametric and a non-parametric estimator for the new performance measure and provide an empirical illustration using mutual funds and hedge funds data. (Homm & Pigorsch, 2012. To deal with the non-normal distribution, an economic performance measure (EPM) which is applied for performance measure, is developed by Homm and Pigorsch (2012). Instead of using standard deviation like Sharpe ratio, EPM divides the mean excess returns by AS index.

Under this above setup, the investment risk is a kind of additive risk. However, if the individual places the initial wealth in the risky asset, then the risk becomes a multiplicative risk. For a multiplicative risk, like Aumann and Serrano's approach (2008), Schreiber (2014) defined an economic index of relative riskiness for a risky asset as the reciprocal of the positive risk aversion parameter of an individual with constant relative risk aversion (CRRA) who is indifferent between taking and not taking the risky asset. Under his setup, the index of relative riskiness must satisfy the following equation:

$$EU\left(W_0\left(\frac{S_t}{S_0}\right)\right) = U(W_0)$$

The concept of first-order and second stochastic dominance are important and this property is not held by most other performance valuation. The advantage of using EPM is including the positive property of monotonicity with respect to the first-order (FSD) and second-order stochastic dominance (SSD). This property conveys the meaning that the mean is monotone with respect to stochastic dominance.

For example, assume there are 2 portfolios. X & Y, and excess return of X is , excess return of Y is .

If r^X FSD r^Y or r^X SSD r^Y then AS $r^X) <$ AS(r^Y) and E(r^X) ≥ E(r^Y)) and therefore, EPM (r^X) > EPM (r^Y)

The EPM generalizes the Sharpe measure by replacing the standard deviation with the AS index. Under the normality, the EPM is equal to twice of the Sharpe ratio squared. Thus, they produce the same performance rankings. However, they may rank investment performance differently if the investment return is non-normal. In Homm and Pigorsch (2012), EPM is defined as:

$$\text{EPM} = E(\tilde{r})/\ \text{AS}(\tilde{r}))$$

Where E($(\tilde{r})$) is the expected excess return of an investment portfolio, and AS $(\tilde{r})$ is the AS index of the random excess return.

4. THE EMPIRICAL RESULTS AND DISCUSSION

ETF funds including domestic and foreign funds are taking into exaime to evaluate the performance. We collect all existing ETF funds in Viet Nam stock market and its components as total return index monthly data from Datastream from January 2016 to December 2022. Some of ETF funds are closed and do not have complete data in the examined period, then are excluded. Based on the total return indexes, we calculate the log returns, and get 84 monthly returns for the index and each of its components. From Datastream, we employ the secondary market middle rate of 3-month Treasury bills as a risk-free rate. Thus, we can get the excess return for the index and the component stocks.

Table 1: Pearson correlation

Beta	MV	AS
MV	1	0.9973
AS	0.9973	1

Table 2: Kendall rank correlation

Beta	MV	AS
MV	1	0.9487
AS	0.9487	1

Peason correlation is satisfactory for testing a null hypothesis of independence between two variables but it is difficult to interpret when the null hypothesis is rejected. Meanwhile, Kendall's rank correlation is a nonparametric measure of rank correlation and it improves upon this by reflecting the strength of the dependence between the variables being compared.

The 2 different Betas are quite close to each other based on the correlation coefficients reported in Table 1 and 2. The correlations between two beta are 0.99 and 0.94 for Pearson correlation and Kendall rank correlation, respectively. Thus, it seems that the new risk measure as AS beta does not produce very different systematic risk measurement.

Table 3 lists the descriptive statistics of the index and its 18 component ETF funds returns. They include the first four central moments, the maximum, and the minimum of the 18 log return time series. 16 out of these series exhibit negative skewness, and all indicate a heavy tail with the kurtosis more than 3. Thus, the return series has a similar stylized fact in the financial literature.

The standard deviation, is quite large for all indices during examined period and the mean monthly returns of all ETF funds are positive. In general, all indices are showing higher negative skewness and higher positive kurtosis, indicating a leptokurtic distribution of returns which is indicates that a distribution of return has fatter tails than a normal distribution, i.e., it indicates a higher probability of very high and very low returns would be expected than the normal case. This departure from normality means that higher moments of the return distribution are necessary to describe portfolio behavior. When the skewness and kurtosis are significant, if we look at only the mean and variance under the normality assumption for the return distribution, we may underestimate the risk and this leads to obtain an inefficient portfolio (Gülder et al. 2011). Thus the mean-variance model proposed by Markowitz is inadequate for optimal portfolio selection problem and higher moments can not be neglected (Gülder et al. 2011). Some indice as MAFM VN30 ETF show normality distribution, but, at the same time, all other indices in the same period show an increased standard deviation, high kurtorsis and low skewness.

Table 4 represent value of Mean-Variance Beta, AS Beta, Sharpe ratio and EPM of all ETF Funds examined in this study. The MV beta and AS index measure do not create very different rankings in term of systematic risk. MV beta accounts only first and second moment; meanwhile AS beta accounts all four moments. Most of the value of AS beta value of all ETF funds are higher than MV Beta value, meaning that the risk in ETF Funds performance is actually higher than accounting in cased of normality assumption.

The value Sharpe ratio and EPM method show not difference between both methods. The value of Sharpe ratio of all indices show overperformance among all ETF funds during examined period. However, none of those performance are statistical siginificance. Meanwhile, the value of EPM performance measure, show less effectiveness than Sharpe ratio; meaning the performance of all exaimed ETF funds perform not effectiveness. Reason explained for the measure compared between two methods above could be the reason of the capital stock market before and after Covid19 period. All mutual funds get lost since Covid19 hit the world. In the research related to ETF funds in Viet Nam stock market, show that first eight months of 2021, Việt Nam's stock market witnessed the largest value of foreign investors net selling. As of August 30, foreign investors net sold more than US$1.5 billion. Previously in 2020, they net sold about $1 billion. When foreign money flows out of the stock market, it may have moved to other investment channels, such as the bond channel, which is attracting capital flows quite well (Minh, 2021).

Since, the performance of ETF funds fluctuated, and not perform well, it directly not only affects investors' behaviour of putting their budget into stock market, but also it indirectly affect the rating of stock market. In the research of Guercio and Tkac (2008) proves that econnomically and statistically significant positive abnormal flow following rating upgrades, and negative abnormal flow following rating downgrades. As well, they found that investor punishment of performance declines, some of which is evident immediately in the month of the rating change (Guercio & Tkac, 2008).

5. CONCLUSION

The variance or standard deviation is often used as a total risk measure of portfolio returns. However, without the normality assumption, they are imperfect risk measures because they do not satisfy the monotonicity with respect to FSD and SSD. Thus, the systematic risk measure, Beta, derived from the mean-variance capital asset pricing model is replaced by AS index is a good choice for evaluating new risk measure. Moreover, the performance measure by EPM as modern method get higher advantages than Sharpe ratio in case of non-normality assumption. This is important factor hint for investors get knowledge putting their money into right ETF funds, protect themselves. Overall, pushing and maintaining Viet Nam stock market stability and chance to be upgraded into emerging market.

SUSTAINABLE DEVELOPMENT OF THE PRIVATE ECONOMIC IN VIETNAM

MA Nguyen Thi Minh Tam[1], MA Nguyen Phuong Hanh[2]

Abstract: The private economy is increasingly taking up a large proportion and playing an important role in the country's economic development. The socialist-oriented market economic model initiated and led by the Party in our country is increasingly perfected, whereby the private economy is increasingly growing in quantity, quality and scale. The results and contributions of the private economy to the economy are enormous in many aspects such as socio-economic development, job creation and promoting the establishment of new businesses. Besides, we can clearly see many remaining limitations in the private economy in our country such as the state's management methods, the technological capacity of enterprises... Through clarifying the definition of the private economy, the current state of the private economy in Vietnam, the article offers some recommendations and solutions for the sustainable development of the Vietnamese private economy.

Keywords: Private economy, sustainable development, Vietnam.

1. INTRODUCTION

During recent Party congresses, the private economy was identified as an important driving force of the economy and the State has made many appropriate policy decisions to encourage the private economy to continue to develop. In recent times, this economic sector has made certain contributions to the country's economy, but besides that, there are still many limitations. Labor productivity is still low, competitiveness is limited, product structure and industries are not diverse and not sensitive to the market. How can the private economy continue to promote its inherent strengths and overcome shortcomings and limitations, thereby contributing to achieving the country's socio-economic goals causing many concerns for the State and private enterprises themselves.

2. STUDY OVERVIEW

In Resolution No. 10-NQ/TW issued at the Fifth Conference of the Party Central Committee (Term XII 2017), the Communist Party of Vietnam affirmed that the private economy is an indispensable component in economy, making a major contribution to the country's development. However, the Resolution has not specifically summarized and updated the results achieved by the private economy by 2022 as well as the fluctuations in the period 2017-2022 when the Covid pandemic occurred.

Author To Ha, through the article Improving labor productivity through the digital economy published in Nhan Dan newspaper in 2020, affirmed that the contribution of increasing regional productivity and shifting labor structure to productivity growth labor, in the period 2011-2018, the individual economic sector made the largest contribution, accounting for 31% of labor productivity growth in the entire economy. The FDI economic sector has the second largest contribution, accounting for about 30%, and is increasingly important to overall labor productivity growth. The

2 University of Finance and Business Administration

state economic sector has the third largest contribution, accounting for about 22%, mainly due to the sector's increased labor productivity in the recent period. However, in the article the author focuses on all three aspects of the private economy, the state economy and the FDI economic sector, so the role of the private economy in Vietnam's economic development has not been clarified.

OCED Organization for Economic Cooperation and Development in its 2021 Small and Medium Enterprises and Startups Policy Report in Vietnam has compiled data, provided an overview, assessment and policy recommendations to help businesses. It is more convenient for small and medium-sized businesses to start a business in our country. However, the research object in the report only includes a part of newly established private enterprises and does not cover previously established and operating enterprises.

Therefore, the authors decided to research and complete the article "Sustainable development of the private economy in Vietnam" with the purpose of clarifying the definition of the private economy and the current state of the private economy in Vietnam, on that basis, provide a number of recommendations and solutions for Vietnam's private economy to develop sustainably.

3. RESEARCH METHODS

To complete the article "Sustainable development of the private economy in Vietnam", the author used the following research methods:

- Data collection method: Research books, newspapers, magazines and websites related to the research issue to get an overview of the role and current situation of the private economy in our country.

- Data analysis and synthesis method: Analyze and evaluate the results achieved by the private economy in recent years and the shortcomings that need to be overcome, towards sustainable development of the private economy in Vietnam Male.

4. THEORETICAL BASIS

4.1. The concept of private economy

The private economy in our country was born and developed quite a long time ago in history, but up to now there are still some different views on the private economy. In other words, the current concept of the private economy still has many conflicting views and no specific unified definition has been given. Based on scientific, theoretical and practical bases, the private economy can be understood from the following angles:

From an economic perspective, "the private economy is an economic part of a country's economic structure system that is formed and developed based on private ownership of means of production as well as profits." personal benefit".

From the perspective of the subject Political Economy, "the private economy is an economic component in the multi-sector economic structure system during the transition period to socialism, based on ownership regimes." private means of production; The private economy is an important component of the national economy. Private economy is used to refer to economic sectors based on private ownership of means of production, including individual economies, small owners and private capitalist economies. Both economic sectors above belong to the same private ownership regime of means of production; However, the ownership scale is different."

Thus, both of the above concepts affirm that the private economy is an inseparable part of today's multi-sector economy, alongside the state economy and the FDI economy. The private economy develops based on private ownership of the means of production, and no matter what type of company it may be organized in or what field it operates in, it all aims to bring profits to its owners. enterprise.

4.2. The role of the private economy in Vietnam's economic development

Vietnam has experienced more than 30 years of economic recovery, including the private economy. From being constrained and prevented from developing, the private economy has now been recognized as an important role in economic development and identified as an important driving force of the economy. The private economy is identified as an indispensable component and needs to be promoted more strongly in the economic structure because the private economy has brought our country many significant economic achievements. The role of the private economic sector is shown in the following points:

First, the private economic sector contributes to awakening an important part of the country's potential, increasing internal resources, and participating in the development of the national economy. This role of the private economic sector is demonstrated through a number of points:

- The private economic sector has contributed to building appropriate production relations to promote the development of production forces. In political economy, "Productive force is the totality of material and conscious elements that create the power to transform the natural world according to the needs of human survival and growth. It is used in the production process of society through certain periods. Structurally, the Production Force consists of two basic parts: means of production and workers. Meanwhile, "Production relations include: ownership relations over the means of production, relations in the organization and management of the production process and relations in the distribution of the results of that production process. As objective economic relations that do not depend on human will, production relations are material relations of social life. The development of the private economic sector makes the ownership relations of our country's economy more diverse, not just limited to state ownership or collective ownership. The transformation of production relations has led to the transformation of management and distribution relations, making production relations flexible, consistent with the level of development of the production force, which is still low and develops unevenly. between regions and sectors across the country. Thereby, the potential of capital, land, labor, and production experience of all classes and ethnic groups is aroused and promoted, contributing to promoting the process of Industrialization and Modernization of the country. Through the development of the private economy, the people's right to mastery, first of all economic mastery, is promoted, which is the basis for expanding the people's mastery over politics, culture, society.

- The private economic sector makes an important contribution to attracting society's idle capital and optimally using local resources. With the characteristic of not requiring too much capital to establish, especially for small-scale private economic sector enterprises, all classes of people can participate in investing or establishing businesses. On the other hand, if additional capital is needed during operations to expand production and business, private enterprises can easily mobilize loans based on relatives and friends... Therefore, promoting various types of private enterprises is considered an effective means of mobilizing capital and using dispersed funds lying dormant in the population into private investment capital. Enterprises in the private economic sector are often small and medium-sized and are dispersed in most localities and territories, so they have the ability to use the potential of raw materials and labor. and experience in producing traditional local crafts.

- The private economic sector has contributed significantly to state budget revenue. Statistics show that the private economic sector's current contribution to the budget is still small but is on the rise. Compared to the contribution to the central budget, the private economic sector's contribution to local budget revenue is much larger. In addition to contributing to budget revenue, businesses in the private economic sector also make significant contributions to the construction of cultural works, schools, sports, roads, bridges, etc. charity houses and other welfare projects.

Second, the private economic sector has made important contributions to promoting growth and restructuring the national economy. Policies of many countries, including Vietnam, often give high priority to the state economic sector, so businesses in this sector are often concentrated in densely populated or economically developed places. . Localities in remote mountain, sea, and island areas have few state-owned enterprises, so they are underdeveloped and even more backward because of little investment in infrastructure such as roads, transportation, etc. private sector with the appearance of businesses in many different industries and fields, even in remote areas, with balanced development between regions, helping to exploit the potential and strengths of remote areas. to rapidly develop manufacturing and service industries, creating economic restructuring and shortening the gap in economic and cultural levels between regions. In general, the GDP growth rate of the private economic sector is steady and approximately equal to the GDP growth rate of the entire economy.

Third, the development of the private economy contributes to attracting a large part of the workforce and training new human resources for the labor market. If in the State economic sector, in order to be recruited, workers often have to have a high level of education and have to go through many complex examination rounds while the number of recruitment is not much, then in the private economic sector has a clear advantage in terms of job creation. The number of vacancies is high, some vacancies even only require applicants to have graduated from high school, so this area can attract a large, diverse, and rich workforce both in terms of quality and quantity. quantity as well as quality from manual labor to high quality labor in all regions of the country, in all strata of the population...

Besides creating jobs, due to the requirements to survive in a competitive market and aim for profit, private enterprises must always find effective measures to organize labor and management. best. Short-term and long-term training courses, organized domestically and internationally, are regularly held. Managers in the private economic sector also face the phenomenon of brain drain, because highly qualified workers often change jobs, so remuneration regimes are designed appropriately and labor techniques are used. The action is carried out very strictly. This has contributed to the training of a workforce with skills and industrial style. At the same time, through this process, the private economic sector is also considered a place to train and train future large business owners and is the initial economic basis for developing large businesses.

Fourth, the private economic sector contributes to promoting the country's international economic integration. In today's modern world, economic integration with the region and the world to attract investment capital and modern technology applied to promote the economy is an inevitable development trend for all countries, including Vietnam. In many forms to implement integration, meet the needs of rapid development, towards industrialization and modernization of the country such as the state joint venture with foreign countries, the state leasing land to foreign investment groups or Economic organizations and private economies enter into joint ventures and partnerships with foreign countries, the connection through the private economic sector is the most prominent and easiest way to implement. Also through that process, the private economy with its characteristics is to proactively innovate and choose appropriate technology to reduce production costs, expand markets, increase labor productivity, and improve quality. product quality... From there, the private economy contributes to promoting technology transfer, cooperation in training human resources and management experience. At the same time, it contributes to promoting Vietnam's trade development and rapid integration into the world economy.

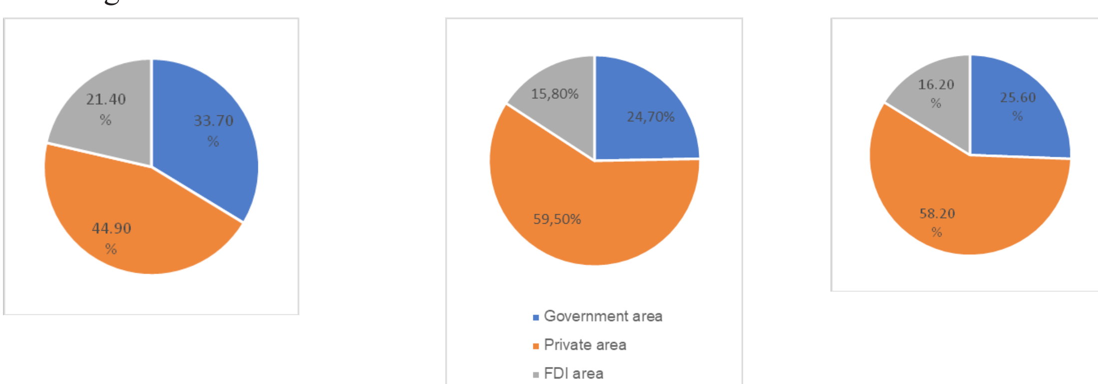
5. CURRENT STATUS OF THE PRIVATE ECONOMY IN VIETNAM

5.1. These achievements

- Contribute to socio-economic development

The private economy currently contributes positively to the gross domestic product with extremely impressive numbers. According to data from the Second Private Economic Forum (held April 2, 2023 in Hanoi), there are currently more than 786 thousand private enterprises, accounting for 98% of the total of more than 800 thousand enterprises; contributing an average of 46.4% of GDP each year in the period 2016-2021, in 2021 alone contributing 18.5% of total budget revenue.

In addition, the private economy also accounts for an increasingly large proportion of investment in the development of the entire society. The General Statistics Office's annual socio-economic situation report shows that there is a steady annual growth of the private economy increasing from 44.9% in 2020 to 59.5% in 2021 and 58.2%. % in 2022.



Year 2020 **Year 2021** **Year 2022**

Figure 1. Proportion of total social investment capital of economic sectors in the period 2020-2022.

(Source: General Statistics Office)

The private economy's revenue contribution from second place has risen to the top position, surpassing the State sector. The private economic sector's contribution to the State budget in the period 2010-2020 continuously increased, in 2010 it only reached 70 trillion VND, accounting for 11.9% of total state budget revenue; By 2015, it reached 129.6 trillion VND, accounting for 12.7% and increasing 85% compared to 2010. In recent years, this sector's contribution has increased rapidly. The private economic sector's contribution to state budget revenue is always higher than the growth rate of general budget revenue of the whole economy. In 2016, it reached 157.1 trillion VND, accounting for 13.88%; By 2020, it will reach 247.1 trillion VND, accounting for 16.36% and 3.5 times higher than in 2010, nearly 2 times higher than in 2015. On average each year in the period 2011-2015, the rate of increase in State budget revenue is water of the entire economy in the period 2011-2015 reached 11.6%, of which the private economic sector reached 13.1%; The budget revenue of the whole economy in the period 2016-2020 reached 8.2%/year, lower than 13.8%/year of the private economic sector. Overall for the period 2011-2020, the budget revenue growth rate of the whole economy reached 9.9%/year, of which the private economic sector reached 13.4%/year.

- Regarding the number of private enterprises

The 1999 Enterprise Law was born not only marking the Party and Government's interest in promoting domestic and foreign enterprises but also removing obstacles for businesses, reforming administrative procedures, from That has caused the number of newly registered businesses to increase sharply, including the number of private enterprises. If in the period 2006-2014, each year the country had about 70,900 newly established private enterprises, in the period 2015-2020, this number increased to 122,500 enterprises. The number of operating private enterprises has also increased significantly, for example in 2010 there were about 268,831 private enterprises operating, then in 2019 it increased to 647,632 enterprises and reached 786,000 private enterprises in 2022.

Year	2010	2015	2019	2021	2022
Private enterprise	268.831	427.710	647.632	694.200	786.000
Total number of enterprises nationwide	279.360	442.485	668.503	857.500	802.040
Proportion (%)	96,23	96,66	96,88	80,96	98

Table 1. Number of private enterprises in Vietnam in the period 2010-2022

(Source: General Statistics Office)

- Regarding the number of employed workers

The privatization process and the migration of workers from rural areas to urban areas have resulted in a surplus of workers in urban areas, while there is a shortage of workers in remote areas. Solving the labor surplus in urban areas is one of the major challenges facing our country's leaders. If previously the state economic sector created the most jobs, since 2016, this position belongs to the private economic sector (not including individual households and collectives). In today's economy, the private economy is the main force carrying out the mission of creating more jobs and income for a large number of workers. Most workers are working in the private economic sector (accounting for 85.8%); Workers working in the "State economic" sector account for 10.5%; The "Foreign-invested" sector accounts for a very small proportion (3.1%) (Labor and Employment Report 2022, General Statistics Office).

Type of economic	Total	% Male in total	% Female in total
Total	100,0	51,9	48,1
Government	10,5	55,1	44,9
Outside the state	85,8	52,0	48,0

There is foreign investment capital	3,1	36,1	63,9
Unknown	0,6	51,1	48,9
City	100,0	52,2	47,8
Government	20,9	53,7	46,3
Outside the state	73,7	52,6	47,4
There is foreign investment capital	4,8	38,4	61,6
Unknown	0,6	51,8	48,2
Countryside	100,0	51,7	48,3
Government	6,5	56,7	43,3
Outside the state	90,5	51,9	48,1
There is foreign investment capital	2,5	34,4	65,6
Unknown	0,6	50,8	49,2

Table 2. Employed workers divided by economic type

(Source: 2022 Labor and Employment Survey Report, General Statistics Office)

- Regarding labor scale

In 2020, up to 77.8% of non-state enterprises among the total number of operating enterprises with production and business results have less than 10 employees, much higher than the rate of 61.5% in 2010. Meanwhile, this rate in the foreign-invested enterprise sector is 1.2% and the state-owned enterprise sector is only 0.02%. The number of enterprises in the non-state sector with a scale from 10 to 199 employees accounts for 17.9%, lower than the rate of 33.2% in 2010. The proportion of enterprises with a scale of over 200 employees in the non-state sector After 10 years, the State has not improved, it is even lower than in 2010, in which the number of non-State enterprises with a scale of 200 to 299 employees accounts for 0.3% (in 2010 it accounted for 0.6%). and the scale of over 300 employees accounts for 0.4% of the total number of operating enterprises with production and business results (in 2010, it accounted for 0.8%).

	Business number		Portion (%)	
	2010	2020	2010	2020
Total	279360	684260	100	100
State enterprises	3283	1963	1,2	0,3
Non-state enterprises	268838	660055	96,2	96,5
FDI enterprises	7254	22242	2,6	3,2
Under 10 employees	173314	540747	62	79
State enterprises	91	103	0,03	0,02
Non-state enterprises	171938	532276	61,5	77,8
FDI enterprises	1270	8368	0,5	1,2
From 10 - 199 employees	98772	133964	35,4	19,6
State enterprises	1796	1069	0,6	0,2
Non-state enterprises	92838	122770	33,2	17,9
FDI enterprises	4138	10125	1,5	1,5
From 200-299 employees	2511	3156	0,9	0,5
State enterprises	280	188	0,1	0,03
Non-state enterprises	1678	2058	0,6	0,3
FDI enterprises	453	910	0,2	0,1
From 300 employees or more	4778	6393	1,7	0,9

State enterprises	1016	603	0,4	0,1
Non-state enterprises	2369	2951	0,8	0,4
FDI enterprises	1393	2839	0,5	0,4

Table 3. Number of enterprises by labor size and type enterprise

(Source: General Statistics Office)

- In terms of capital scale, in 2020, up to 18.5% of non-state enterprises with business capital of less than 1 billion VND out of the total number of operating enterprises have production and business results (the ratio of the year 2010 was 13.2%) and 51.9% had capital from 1 to less than 10 billion VND (the rate in 2010 was 60.2%). Meanwhile, this rate in State-owned enterprises is 0.002% and 0.02% respectively; In the FDI enterprise sector, it is 0.3% and 0.8%; Only 7% of enterprises in the non-state sector have business capital of 50 billion VND or more (this rate in 2010 was 4.5%). Thus, it can be seen that private sector enterprises are mainly small and micro-scale.

	Business number		Portion (%)	
	2010	2020	2010	2020

(Source: Statistical Yearbook)

5.2. Limitations of the private economic sector

Firstly, limitations and weaknesses of mechanisms and methods of state economic management, especially state management in private economic development.

The system of mechanisms and policies on private economic development still has many shortcomings, lacks synchronization, and is not close to reality; limits the transparency of the business investment environment, thereby hindering the development of the private economy. Specifically: Administrative procedures are still complicated; Connecting procedures for businesses is still inadequate; There are also inconsistencies between the Investment Law, Land Law, Bidding Law... or are not consistent with reality, slowing down the investment and development process of the private economy. In addition, many private enterprises want to enter the market but have not met the prescribed conditions or do not clearly understand these conditions, so they are hesitant. According to preliminary statistics from the Central Institute for Economic Management Research (June 2023), there are more than 3,500 business conditions corresponding to 243 conditional business investment industries. However, business investment conditions are regulated in a general and unclear manner. This creates barriers to market entry, limits competition and has adverse impacts on private enterprises, especially small and medium-sized enterprises because many industries and business investment conditions do not meet standards. Criteria for necessity specified in Article 7 of the Investment Law.

Secondly, lack of linkage in the private economic sector leads to limitations in fully participating in regional and global value chains.

The connection and cooperation of private enterprises is still weak, clustering is still high, mainly focusing on a number of fields and industries with quick capital recovery such as real estate services, restaurants, and hotels. On the contrary, in the field of agriculture and new rural construction, very few businesses invest. The general situation in small and medium-sized private enterprises, including large economic corporations, is that they have not been able to deploy other forms of "soft" linkages through agreements and cooperation in the use of brands, services, research results on the application of science and technology in the current sharing economy.

Participation in the global value chain production network in our country is still low compared to economies of similar scale in Southeast Asia. Research by the Asian Development Bank Institute (ADBI) shows that only 36% of Vietnamese enterprises participate in production networks (including direct and indirect exports) compared to 60% in more developed economies, such as Malaysia and Thailand; 21% of small and medium-sized enterprises (SMEs) participate in the global value chain compared to 30% of Thailand and 46% of Malaysia. This shows that Vietnam lacks "leading" businesses to fully participate in the global production and value chain while the supply chains in the economies of Thailand and Malaysia are few. fragmented and SMEs are more likely to benefit from the spillover effects of foreign investment, technology transfer, knowledge transfer and productivity improvements.

Thirdly, private enterprises are always in a state of shortage of capital and business cash flow, especially for medium, small and micro enterprises.

Business capital of private enterprises is often formed from two sources, internal and external. If internal capital is the capital contribution and shares of investors and business owners, external capital is often formed through the loan process. Reality shows that private enterprises do not have time to grasp information or are hindered by administrative procedures, so it is often difficult to access support resources from the State. To have capital to invest in production and business, these businesses must independently access bank finance. However, this is not easy because credit institutions' lending principles are often based on collateral or unsecured loans.

In the "Provincial Competitiveness Survey 2022 (PCI 2022)" of the Vietnam Federation of Commerce and Industry, the biggest difficulty for private enterprises is accessing credit. Specifically, in 2022, access to credit has become the biggest concern for 55.6% of businesses, a continuous increase from 34.8% in 2019, 40.7% in 2020 and 46.7% in 2020. 9% of 2021. The proportion of businesses accessing credit has tended to decrease recently (Figure 2). Many private enterprises are established but lack business capital, leading to losses, temporary suspension of business, and even dissolution and bankruptcy often occur.

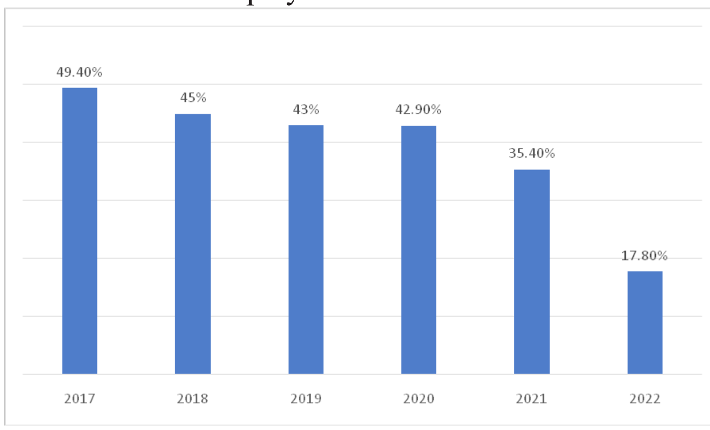

Figure 2. Percentage of businesses accessing credit in the period 2017-2022.

Fourthly, the quality of human resources in private enterprises does not meet requirements.

Human resources here include both the management qualifications of business owners and the qualifications of workers in enterprises. While private business owners are often less trained through professional schools, they apply management based on experience and emotion. Therefore, they often do business in a predatory and predatory way, over time creating a barrier to business development because it is no longer suitable for the current integration and market economy conditions. The situation of many ghost businesses being set up, even though they have registered their business, still hire incompetent people to take on the position of CEO.

Not only the management levels but also the qualifications of workers in private companies are not high. There are people who are accepted to work because they are related to other people in the company while having no qualifications or experience. The percentage of employees who want to stay long-term in private companies is often low. Most of them see the company as a place to learn and if they have the opportunity to get higher salaries in other companies, these people are willing to leave.

Fifthly, the technological capacity of businesses is still outdated.

According to the assessment in the Policy Report on small and medium-sized enterprises and startups in Vietnam by the Organization for Economic Cooperation and Development OCED, the costs for research and development of Vietnamese businesses have not improved much. If in 2008, the score of this index was 3.6/10 (ranked 42/134), increasing to 3.8/10 in 2010 (ranked 27/133), then in 2017 the score was only at 3.8/10 in 2010 (ranked 27/133). 3.5/10 (ranked 49/138). The investment rate of businesses in technological innovation accounts for only 0.3% of revenue, much lower than countries such as India (5%), Korea (10%),.. Outdated technology leads to low labor productivity, production capacity, and competitiveness in both quality and price of the private sector, and even businesses - the most capable entities of the country. The private economy is still very limited while competition is a fundamental factor to ensure survival and development, and is a vital factor for private enterprises in the current period. The labor productivity growth rate of the private economic sector is still low, only equal to 34% of the labor productivity of the state-owned enterprise sector and about 69% of the labor productivity of FDI enterprises.

6. SOME RECOMMENDATIONS AND SOLUTIONS FOR VIETNAM'S PRIVATE ECONOMY TO DEVELOP SUSTAINABLY

To help overcome the above limitations and inadequacies, many of the following solutions need to be implemented synchronously:

Firstly, perfecting synchronous and consistent mechanisms and policies, creating a favorable investment and business environment for private economic development. Ministries, departments and branches need to research and amend inconsistencies between the Investment Law, Land Law, Bidding Law... in order to create consistency between these laws. At the same time, review the issued business investment conditions to eliminate cumbersome, non-specific conditions that are not appropriate to the actual situation, creating favorable conditions for informal business units transformed into a corporate legal entity.

Secondly, create a favorable environment and conditions for business households to voluntarily join forces to form cooperative organizations or operate under the enterprise model, and encourage the private economy to contribute capital and purchase capital. shares of state-owned enterprises when equitized or the State divests capital. Through policies to promote the development of all forms of production and business links, providing goods and services along production networks and market value chains between the private economy and the state economy, the centralized economy. Foreign-invested entities and enterprises, the State can create a widespread spread of advanced technology and modern management, increase added value and expand consumption markets.

Thirdly, allocate development resources effectively, ensuring the private economy has equal access to development resources. Regarding administrative procedures, the State needs to consider simplifying and eliminating cumbersome procedures and bureaucracy. Credit programs and packages need to be built appropriately with reasonable interest rates. In addition, strengthen the activities of the Small and Medium Enterprise Development Fund, thereby creating a source of long-term capital with reasonable interest rates for private sector enterprises to invest in supporting industries, agricultural value chain and create connections between banks and businesses. Re-evaluate the operations of the Credit Guarantee Fund, fundamentally reform the operating method of this fund system.

Fourthly, improve the management level of business owners and the level of workers. Private enterprises usually operate for profit and are operated and managed by the business owner. Therefore, business owners first need to change their perception and get rid of the notion that they only need to manage based on experience. Short-term and long-term training courses on business administration not only provide modern management methods and past lessons of many large businesses in the world, but also explain the causes of the collapse of empires. leading, but also a place to connect ideas and exchange for future administrators. Through the knowledge learned, private business owners will adjust, recruit and use human resources in the company appropriately, and have strategies to train and retain workers. Workers themselves also need to maintain a positive attitude to learn because knowledge is limitless, especially in the age of information technology. If they do not update, they will become outdated.

Fifthly, about technological innovation. In order for business activities to bring about the desired efficiency in the period of deep integration into the region and the world, private enterprises in Vietnam need to attach importance to technology factors. Not only do we focus on product quality, but the packaging also needs to be scientifically and eye-catchingly designed. If the products of private enterprises are not innovated, not competitive enough, and cannot survive, they will be knocked out of the market. Miliket instant noodles product is a typical example. Although it has existed for a long time in the market, it does not have a suitable business and promotion strategy, so it gradually has its market share taken over by other brands. When mentioning instant noodles, Vietnamese people immediately think of Hao Hao noodles, a brand that appeared on the market after Miliket but with a smart communication strategy and advanced technology has helped this brand rise to the top. To overcome obstacles in the process of technological innovation, it is necessary to have progressive thinking and appropriate operating policies from the unit itself and to take advantage of help from the State as well as other businesses.

7. CONCLUSION

In parallel with the growth of the Vietnamese economy, the private sector not only increased in number of businesses but also improved significantly in quality of operations, bringing many achievements and contributions to the economy. society. However, for the private economy to develop sustainably, the Party and State need to have more policies and support to create a favorable business environment, access to resources, and create momentum for the private economy. continue long-term development, operate equally, cooperate, and compete healthily. In addition, businesses themselves also need to proactively apply modern technology, attract and retain qualified workers... towards the goal of sustainable development.

THE ROLE OF MANAGEMENT ACCOUNTING WITH RISK MANAGEMENT IN THE NEW ERA OF ENTERPRISES

MA. Nguyen Hai Ha[1]

Abstract: The fluctuations in economy, politics, society, science and technology, epidemics and natural disasters in the world have put businesses in front of more difficulties and risks than ever before. To solve difficulties and manage risks requires the participation of many parties within the organization of each business. A well-developed business in addition to having abundant financial resources, the role of management accounting in risk management in enterprises in the new period is very important. The article focuses on reviewing the capacity development of modern management accounting to be able to take on an important role in the enterprise's risk management system. On that basis, the article concludes on the importance of management accounting with risk management in enterprises in the new era.

Keywords: management accounting, risk management, new era

JEL code: M41

1. INTRODUCTION

In the fierce business environment after the Covid-19 pandemic, businesses face more difficulties when they have to cope with many old and new crises. Globalization, competition, epidemics, climate change, and many other unusual factors have put the world in a VUCA state (Deepti Sinha & Sachin Sinha, 2020):

- Volatility: Constant, strong volatility
- Uncertainty: Uncertainty/Instability
- Complexity: Complexity
- Ambiguity: Ambiguousness, hard to predict

In order to adapt, businesses need to find and operate appropriate business strategies and and tactics. In an effort to succeed, managers have also realized the important role of risk management, thereby deploying many solutions to identify and handle risks. Management accounting with its natural characteristics has formed the capacity to meet the requirements of managers in risk management operations. The main purpose of management accounting is to inform management in their business decisions. As the organization's operations are becoming more and more complex, the requirements of managers for management accounting are also increasing. The active role of management accountants in risk management has been acknowledged by the International Institute of Management Accounting (IMA) in its latest updates. When revising the Management Accounting Competency Framework in 2018, in order to adapt to the change in management activities of enterprises, IMA added a number of new competencies which required management accountants to must develop the ability to participate in the risk management of the organization. Accordingly, management accounting and risk management are complementary functions and support the decision-making process of business leaders (Rasid et al, 2014).

1 Email: hanguyen22668@gmail.com, University of Finance - Business Administration.

In order to find out the role of management accounting in risk management in enterprises, the article focuses on 3 contents: (i) Understanding types of risks and risk management in enterprises; (ii) The development in the capacity of management accountants to meet the enterprise's ability to participate in risk management; (iii) The role of management accounting in risk management. The final section concludes and gives some directions for future research on this topic.

2. RISK AND RISK MANAGEMENT

In the process of production and business, economic entities will often face risks from internal and external factors. It is the possibility of one or more events occurring that negatively impact the achievement of the organization's intended objectives (COSO, 2013). Thus, according to this definition, risks include both directions: threats that threaten the effective operation of enterprises and opportunities that if enterprises do not promptly seize appropriately, they will lose their advantages.

According to Nguyen Huu Anh et al., (2021), common types of risks include:

Strategic risk: It is the possibility that an organization's current strategy will prove ineffective in the face of fundamental shifts in the operating environment. The risks leading to instability in the strategy can come from changes in economic, political and social policies, in the legal system, the development of the economy, changes in technology, changes in the preferences of customers, competitors, etc. These changes can put businesses at a disadvantage. For example, new technologies can reduce a business's ability to create value, demographic changes can reduce demand for specific goods or services, competitors' low pricing policies can cause businesses to reduce their market share, etc. Some events can bring great opportunities that cause businesses to lose their advantages if they don't grasp and adjust their strategies accordingly. For example, a change in the tax structure can open up new markets, the withdrawal of competitors can create opportunities for new customers, etc. Regardless of whether uncertainties are favorable or unfavorable, the Adjusting the current strategy is something that the top managers of the business must consider.

- Operational risk: this is the possibility that functional activities in the enterprise will be unstable due to internal factors such as faulty operations, equipment failure, loss of staff, inefficient use of resources, ... or due to some external factors such as natural disasters, epidemics that hinder normal production and business activities, power cuts by the local power department, weather, environment, culture, etc. Risks Risks of this type cause the functional activities of the business not to operate as intended

- Financial risks: Although nearly all risks affect the financial parameters of the enterprise, these group risks mainly refer to those that directly affect the cash flow of the enterprise and cause financial loss. Transactions of a financial nature such as buying and selling investments, borrowing and lending, etc. have potential financial risks. Commonly seen risk factors causing this group of risks can be mentioned as: volatility in the stock market, fluctuations in interest rates, exchange rates, debt solvency, debt recovery ability, …

- Compliance risk: when the enterprise fails to timely grasp and comply with the provisions of the government's legal system, in the signed contracts or in the commitments between the enterprise and a party. related, compliance risk arises. Compliance risk also includes situations where the regulations, rules and regulations of the business are not followed, causing consequences. Risks are inevitable and cannot be eliminated, but identifying, analyzing and responding to risks to improve the likelihood of success in operations is what businesses need and should do.

Risk management is an activity best done before disaster strikes. When an incident occurs, it is often too late to start handling it. With the growing amount of risk in business, it is essential for businesses to adopt a proactive approach to measuring and managing risk in all its forms.

According to COSO, risk management is a process, carried out by the board of directors, management and other personnel of the organization, applied during strategy setting as well as throughout the entire organization. organization, designed to identify potential events that may affect the organization and manage risks within its risk appetite, thereby providing reasonable assurance regarding the achievement of its objectives. organizational goals (COSO, 2017). According to the above definition, risk management has the following characteristics:

- Risk management does not seek to eliminate risk but seeks to maintain a level corresponding to risk appetite

- Risk management is a continuous process, throughout the enterprise, not a single action of a single individual or department.

- Risk management is a culture, a practical capacity associated with a specific process.

The question is, does risk management really bring good results for businesses? In a 2008 study, Beasley and colleagues also came to an affirmation of this relationship when they said that risk management has made businesses increase risk awareness such as: risk identification, the origin and causes of risks arise and develop from which to deploy corresponding solutions in both action strategy and routine functional activities. This sequence of actions has improved operational efficiency and reduced the cost of capital. Lawrence et al (2008) also came to the same conclusion that the application of risk management techniques really has a positive effect on performance.

Thus, it can be said that risk management is an indispensable part of an enterprise's work during its operation. This job requires the participation of all components in the business, including management accounting. However, one question is whether management accounting have the capacity to meet this requirement.

3. THE CAPACITY AND ROLE OF MANAGEMENT ACCOUNTING IN ENTERPRISE RISK MANAGEMENT IN THE NEW ERA

3.1. Capacity development of management accountants.

Management accounting was born and accompanies managers in managerial decisions. As business activities fluctuate and gradually become complex, the needs of managers also evolve, posing more difficult problems for management accountants, requiring management accountants to develop new skills. equivalent capacity. The development history of management accounting also shows that the role and function of management accounting has changed along with the change in the business environment to meet the increasing requirements of managers. Specifically, in their 2012 study, Kim Langfield-Smith, Helen Thorne, and Ronald W. Hilton presented a model from the International Federation of Accountants (IFAC) that shows the timelines that show maturity. in the way that management accounting serves managers in the enterprise:

-Before 1950s: Management accounting mainly operated as pure techniques for cost identification, cost determination and financial control.

- The period from 1950 to 1965: During this period, management accounting took a step further when it started to participate in management decisions at a low level. Management accounting developed additional techniques that could provide information for business planning and control. Management accounting were able to analyze management decisions in terms of data collected, processed, and analyzed. At this stage, management accounting also had the capacity to design and operate techniques for assessing management responsibility through the responsibility accounting system.

- Period from 1965 to 1995: Management accounting took a further step when participating in strategic level activities when developing methods of operating process analysis and cost management.

Post-1995: Management accounting have developed competencies to contribute to the creation of added value for the business by using strategic and tactical level techniques such as performance reports, competitor analysis CA competition, CC core competencies, RM risk management, SM strategy mapping, SWOT analysis, VCA value chain analysis. These tools and techniques have helped management accountants create value by assisting managers in the efficient use of resources.

Thus, over time, management accounting has evolved to be able to handle complex situations. Currently, management accounting has integrated its methods and tools and integrated

3.2. The role of management accounting in enterprise risk management in the new era

The maturity of management accounting makes the definition of management accounting changed. Most researchers and related organizations agree that: Management accounting is the process of identifying, measuring, collecting, processing, analyzing and providing economic and financial information to support operations. management activities, advising managers at all levels to make decisions to solve problems related to planning, organizing, implementing, leading and controlling business activities. This definition has shown the role of management accounting in accompanying managers in strategic decisions as well as daily operations.

The relationship between management accounting and risk management in enterprises has been studied by many scholars in different aspects. Tunc Kose, Safak Agdeniz (2019) asserted that management accounting has a significant position in enterprise risk management. Bento et al (2018) argued that with professional experience and training in how to measure, report and analyze the financial and non-financial impact of decisions, management accounting has a special position specifically to play an important role in the establishment of the ERM system. Culasso, F., Broccardo, L., Giacosa, E., Manzi, L.M. - Truant, E. (2016) also said that management accounting integrated with risk management system is a potential trend.

The International Management Accounting Organization (IMA) has also pointed out the core competencies that management accountants can now undertake:

Strategic Management: The competencies needed to envision the future, lead strategic and tactical planning, guide decisions, manage risk, and monitor performance;

- Reporting and control: The competencies required to measure and report an organization's performance in compliance with relevant standards and regulations;

Technology and analytics: The competencies needed to manage technology and analyze data to enhance organizational success;

- Business and operational acumen: The competencies required to contribute as a cross-functional business partner to transform the operations of the entire enterprise;

Leadership: The competencies needed to collaborate with others and inspire teams to achieve organizational goals;

- Professional values and ethics: The competencies required to demonstrate the professional values, ethical behavior and legal compliance required for a sustainable business model. (IMA Management Accounting Competency Framework, 2018)

As can be seen, risk management and related control measures are natural parts of management accounting's core competencies, helping management accountants fulfill their roles. With professional experience and training in how to measure, report, and analyze the financial and non-financial impact of management accounting decisions, we are uniquely positioned to take a leadership role in establishing risk management system (Bento et al., 2018). This is an important role of management accounting in shifting risk management from reactive measures to proactive measures.

According to the IMA. (2014), Enterprise Risk Management: Frameworks, Elements, and Integration, management accountants take an active role in the following risk management categories:

- Acting as a leader in the risk management system, supporting the change from discrete risk management activities into an integrated and unified system;

- Help resolve conflicts between advocates of risk management systems and traditional risk management methods;

- Explain to others in the organization the risk management process;

- Provide managers with an understanding of the organization's risk management framework and processes;

- Support senior managers as well as operational managers in analyzing and quantifying the risk tolerance level and risk tolerance of the organization for each of them;

- Support the implementation of the risk management system in the financial function;

- Provide information to support managers in risk identification;

- Carry out comparative studies for use in risk determination;

- Collect best practice information on risk management practices;

- Assist in quantifying the impacts and likelihood of certain risks on the risk map;

- Assist in identifying and estimating the costs and benefits of different risk elimination or mitigation solutions, and training managers in risk response;

- Design reports to monitor risks and develop financial and non-financial metrics to evaluate the effectiveness of risk mitigation actions;

- Advising managers on the integration of the risk management system with the balanced scorecard and budgeting process;

- Participate in the development of business continuity plans (crisis management);

- Advising on risk disclosure in annual reports;

- Acting as a pioneer in combining corporate governance with risk management

Without the involvement of management accountants in risk management activities, risk management is often just a costly compliance activity. (Culasso, 2016)

4. CONCLUSION

Management accounting provides information that reduces uncertainty in management decisions by means of management accounting tools such as the theory of constraints, lean manufacturing, balanced scorecard, etc. Management accounting has insight into the organization and the industry. With the new competencies identified by the IMA, the role of management accounting is enhanced within an organization. These competencies will support enterprise risk management. However, in order for management accounting to be able to support and integrate into the enterprise's risk management system, scholars need to conduct many studies for different types of enterprises in terms of ownership. ownership, capital size, industry, etc., in accordance with the risk appetite of that organization.

DEVELOPMENT OF CENTRAL BANK DIGITAL CURRENCY IN CHINA – RECOMMENDATIONS FOR VIETNAM

PhD. Nguyen Thi Lien[1], MAc. Vu Thi Thuy Dung[2], MAc. Vu Hai Ha[3]

Abstract: *Digital transformation is taking place strongly in all sectors of the economy. Banking has been a fast-paced field of digital transformation in recent years. From the application of scientific technologies to non-cash payments with the introduction of a series of methods such as bank transfer, QR code scanning... to the application of Blockchain technology to establish a central bank digital currency (CBDC). CBDC is not a choice, but it is an inevitable trend for all countries in the digital era, moving towards a complete replacement for physical fiat money. In 23 cities of varying sizes including large and small and 15 regions, China has been studying and implementing CBDCs. China has encountered both achievements and setbacks during the implementation process; these are all beneficial lessons for Vietnam - which is currently in the process of studying CBDC.*

Keywords: digital transformation, digital money, central bank...

1. OVERVIEW

The digital currency of Central Bank Digital Currency (CBDC) is a digital currency issued by the Central Bank (CB) in each country and used as a substitute for cash and coins in the future.

According to the International Monetary Fund (IMF), more than half of the world's central banks are researching or developing digital currencies. The period 2019-2022 is an explosive period of research and application of CBDC. There are disparities in the research and application of CBDCs among nations. For instance, in the US, a leading developed country in digital technology, it was not until 2019 that the US announced the focus on CBDC research after debates between the US Treasury Department and the US Federal Reserve (FED), until 2023, the US is still in the research stage. Therefore, to replace fiat transactions in the economy and become the first Asian nation to use CBDC, China is revealed as one of the nations that has accomplished the study and begun applying CBDC. China published a CBDC study in 2014, launched a pilot application with 15 key cities in 2022, and now plans to implement CBDC across the country by the end of 2023 while merging research into a cross-border digital currency system (mBridge).

Vietnam is in the research phase of CBDC. China is a country that has implemented CBDC applications and is comparable to Vietnam in terms of its economy and political system. It is crucial to draw lessons from China's study and application of CBDC.

2. THE SITUATION OF CHINA'S CENTRAL BANK'S DEVELOPMENT OF DIGITAL CURRENCY AT THIS POINT

2.1. The process of developing a legal framework as well as pilot implementation for the development of CBDCs in China

The Chinese central bank's digital RMB ("e-CNY" in customary international use) is a legal tender in digital form issued by the People's Bank of China – PBOC. E-CNY is operated by the

1 University of Finance – Business Administration, Email: nguyentlien76@gmail.com.

2 University of Finance – Business Administration.

3 VietNam National University of Agriculture

People's Bank of China (PBOC) and its system of designated commercial banks. The value of e-CNY according to China's currency law is equivalent to that of banknotes and coins, in the national currency block structure, e-CNY is positioned at M0 (Cash in circulation).

a. The phase of launching the research

The People's Bank of China established a special team in 2014 to conduct an in-depth study on subjects such as: Digital currency issuance framework, core technology, digital currency issuance and circulation environment, as well as relevant international experience. In particular, the establishment of the National Central Digital Currency Research Institute is proposed to be built.

b. The phase of finalizing and summarizing the research

In January 2017, the Digital Currency Research Institute in Shenzhen Province under the People's Bank of China was established.

In late 2017, the People's Bank of China convened a number of commercial banks and tech-related institutions to jointly conduct research and development on the digital RMB system under which the Chinese digital currency would be referred to as DC/EP. On the basis of two-tier operation compliance, cash substitution (M0), DC/EP essentially finished the top-level design, standard development, functional research and development as well as debugging during commissioning and starting to implement the general experiment.

c. The phase of implementing the pilot application

In August 2019, the Central Committee of the Communist Party of China and the State Council agreed to a policy of supporting digital currency research and other cutting-edge Shenzhen-based applications. At the end of 2019, e-CNY was meticulously designed for pilot testing in Shenzhen, Xiong'an, Suzhou, Chengdu and the project was applied at the 2022 Winter Olympics and the 2023 Asian Games hosted by China.

In 2020, China synchronized many eCNY implementations in particular: in April 2020, the Central Bank's Digital Currency Research Institute provided feedback on an internal test of the central bank's digital currency. According to the Central Bank's Digital Currency Research Institute, the current online DC/EP information is a test bed in the technology research and development process, the plan to put the official e-CNY into circulation shall be approved as soon as possible. By October of the same year, six additional test areas were added including Shanghai, Hǎinán, Changsha, Xian, Qingdao, and Dalian.

The People's Bank of China's Research Office announced at a press conference in April 2021 that the digital RMB would be used primarily for more sophisticated domestic retail payments, with consideration for use in cross-border payment transactions when the time is appropriate and in line with market demand.

Besides, on 16 July 2021, the PBOC released the "White Book on the R&D Progress of China's Digital RMB", detailing some important notes on the Digital RMB. Publications are released both online and in written copies, free for the public to read and consult.

The PBOC formally stated on April 2, 2022, that the pilot program e-CNY would be expanding to include Tianjin, Chongqing, Guangzhou, Guangdong, Fuzhou (including the Binh Dam Comprehensive Test Site on the Fujian District Binh Dam Island), and Xiamen in addition to the current pilot areas. The Asian Games host cities in particular shall serve as important trial locations.

China Construction Bank launched an asset management service area in the trial regions in June 2022 to facilitate the usage of the digital RMB for asset management product purchases.

China has examined e-CNY extensively and initially introduced it into applications, replacing cash and coins throughout the nation. The Law on Cybersecurity of China and the distinctive ideology of socialism are both followed in the development of strategies, procedures, and plans for the use of e-CNY in China.

2.2. China's most recent pilot program implementation method for CBDCs

China has been the first nation to experiment with the application of CBDC on a national level in the context of comprehensive economic innovation, showcasing the distinct socialist-oriented economy. On top of that China has been researching e-CNY for 5 years (2014 to 2019), with a pilot program starting in 2020.

In preparation for the pilot on a narrow scale, the PBOC has repeatedly published posts explaining the advantages of e-CNY as well as the commitment of the government and the central bank to implement "anonymous controls" – controlling all trading activities but ensuring confidentiality of transaction information.

With such thorough preparation, e-CNY has initially entered into the daily transactions of the Chinese people.

a, Number of e-wallets using e-CNY and Volume of e-CNY transactions via e-wallet

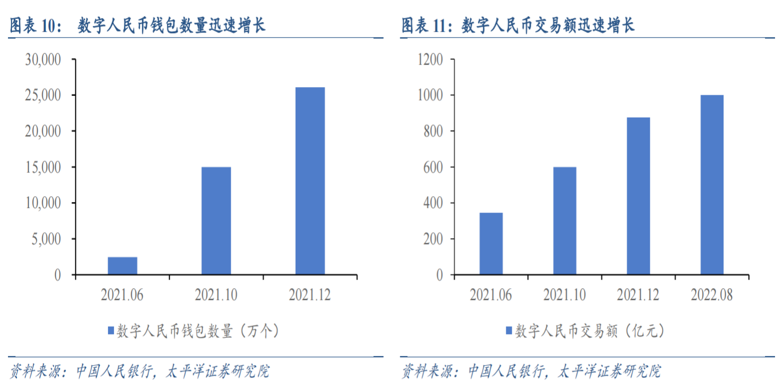

Figure 2.1. Number of e-wallets using e-CNY

Unit: 10,000 wallets

Source: Pacific Securities Research Institute, People's Bank of China

Figure 2.1 shows that in 2021, the official year for synchronized deployment of e-wallets, the number of e-wallets utilizing e-CNY has increased significantly and rapidly. In June 2021, the number of e-CNY integrated e-wallets was installed to about 50 million wallets, by October 2021, this number had increased to 123 million wallets, an increase of 2.4 times compared to June. As of December 2021, the number of e-wallet users for payment had reached 261 million, accounting for 28.89% of the number of people currently using mobile payments (according to China's 2021 Mobile Payment Users Report, about 903.6 million people). A number of initiatives in pilot destinations, together with numerous significant online shopping platforms, are being used to achieve this aim.

Along with the increase in the number of e-wallets, the volume of transactions using e-CNY through e-wallets also achieved impressive growth.

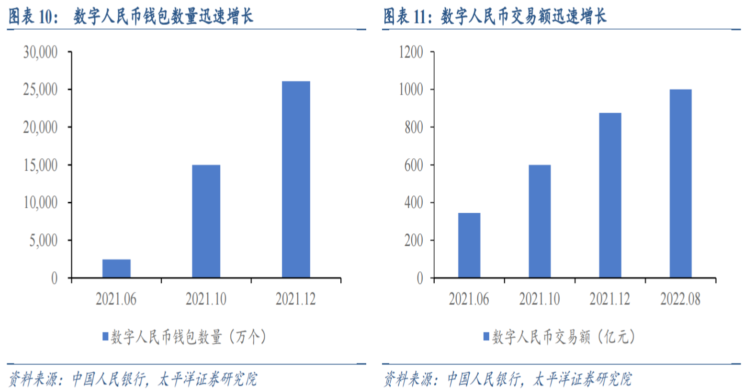

Figure 2.2. Transaction volume via e-wallet using e-CNY

Unit: 100 million RMB

Source: Pacific Securities Research Institute, People's Bank of China

In June 2021, the transaction volume reached 35 billion RMB, by October 2021, the cumulative transaction volume surpassed 60 billion RMB. In December 2021, with many shopping incentives at the end of the year, the cumulative number of transactions reached 87.56 billion RMB and by August 2022, e-CNY reached a new transaction milestone when it exceeded 100 billion RMB.

b, Programs and activities that promote e-CNY trading

Activities and events that promote e-CNY trading conducted in Beijing and pilot cities include:

- Series of e-CNY development activities through the "Red Packet" program:

The number of e-CNY transactions has increased substantially as a result of a number of innovative programs to boost consumption, the most widely recognized of which is the "Red Packet" program with the ability to exchange purchases for free cash.

The Guangdong-Hong Kong-Macao Great Bay Area, a set of measures to encourage domestic consumption, the Shenzhen Local People's Government, and the People's Bank of China recently announced the experimental e-CNY red packet, which shall be available starting in October 2020. The "lottery numbers" that make up the red packets are distributed. A total of 47,573 people out of the 50,000 winners received successful packets and used them for 62,788 transactions totalling 8,764 million RMB. A total of 901,000 RMB worth of digital wallet recharges were made by some lottery winners. The event drew more than 3,000 entrepreneurs from the Luohu - Shenzhen area.

In December 2020, the city of Suzhou in conjunction with the People's Bank of China conducted a "red packet" event. 96,614 winning citizens received red packets, accounting for 96.61% of the total number of winning citizens and 536 people participated in the "dual offline" payment experience. The amount of red packets consumed was 18.9682 million RMB, accounting for 94.84% of the total red packets distributed. There are more than 10,000 offline merchants supporting the use and the amount of red packets consumed online is 8,4782 million RMB, accounting for 44.70%. "Digital RMB" was selected into the "Top Ten New Words in Chinese Media 2020 " published by the National Language Resources Monitoring and Research Center for Minority Languages. The e-CNY e-wallet at this time has appeared as an APP and users can only download the APP. Thus the payment methods include swiping up to pay, swiping down to receive, and users can choose to scan a code or be scanned to pay.

Shenzhen launched a pilot "red packet" program for residents from April 10 to April 23, 2021. The trial customers shall be expanded by 500,000 people. This pilot program is primarily focused on "using the digital RMB for achieving the consumer discounts," with a total discount of 10 million RMB.

In February 2021, Beijing launched the digital RMB red packet presetting activity "Wangfujing Ice and Snow Shopping Festival" and released 10 million digital RMB red packets to individuals in Beijing to stimulate domestic demand and encourage Chinese to shop for Tet. By June 2021, Beijing had issued an additional 200,000 digital RMB red envelopes, each containing 200 RMB.

Also in June 2021, Shanghai, Changsha and many cities in the pilot plan continued to launch a round of these activities to the residents. Shanghai issues 350,000 digital RMB red packets in the amount of 55 RMB per bag and Changsha issues 300,000 digital RMB red packets in the total amount of 40 million RMB at 100 RMB and 200 RMB.

In April 2022, the event "Inauguration Red Packet" was launched in Chongqing city – one of the largest tourist cities in China. The event was co-sponsored by Meituan, China's largest online sales platform for food and shopping services with Bank of China, China Construction Bank and other executive institutions. The aim is to further stimulate the inclusive value of e-CNY, while accelerating the dissemination and promotion of e-CNY in Chongqing, and the expectation of promoting the recovery of offline consumption in Chongqing after the impact of 3 years of the Covid 19 epidemic.

- Application for payment of tickets, public transport fees by e-CNY

On June 29, 2021, Suzhou Railway Line 5 officially went into operation and all station ticket vending machines shall support digital RMB app scan code payment, which is the first case of joining the e-CNY payment app. Baweitong Technology Co., Ltd. is responsible for upgrading ticket machines on other routes and testing the stability of the payment interface of the official app " Suehang ". In 2023, Suzhou Railway Line 1-5 will enable digital RMB payments for ticket purchases.

On 28 June 2021, Chengdu completed the system construction and pre-testing using the "Tianfutong App" for digital RMB payments for buses and subways.

On June 30, 2021, Beijing Railway started testing out the swiping experience for the entire road network's digital RMB payment channel. In addition to online ticketing on the Yitonghang App, Beijing Railway Transport added apps that support offline ticketing, digital RMB cards, ticket replacement, and top-up on August 1, 2021. This is an updated version of the Yitongxing app, which began accepting payments over a digital RMB gateway on June 30. The app will substantially improve the passengers' digital travel experience by recognizing the entire coverage of the digital RMB at rail transit gateways and ticketing payment scenarios.

- Application for payment of gasoline purchase and payment of daily transactions by e-CNY

In March 2022, 20,000 gas stations across the country upgraded their e-CNY payment functionality. In Hǎinán, e-CNY is combined with the promotion of new energy vehicles, and e-CNY has been fully integrated into various payment issues including car deposits and prepayments. At the point of sale of Hǎinán Automobile in Qiónghǎi Shì city, Hǎinán, Qiónghǎi Shì residents are paying a deposit to buy a car through a digital wallet under the guidance of an employee without paying any intermediary fees.

From April 2022, residents of Zhejiang province can use e-CNY to pay taxes and social security-related activities. The e-CNY is also accepted to pay for public buses for ten routes in Guangzhou and public subways at 125 stations in Ningbo city. In April 2023, all government employees in the city of Changshu in Jiangsu province shall receive their salaries in the form of e-CNY.

On May 3, 2022, Hǎinán province launched a campaign to discount all tax-free shopping with e-CNY and plans to issue 10 million consumer coupons in May to assist in promoting the tax-free consumer market in remote islands after the recovery. The digital RMB issued by Hǎinán this time is shown in the form of consumer coupons, vouchers with denominations of 30 RMB, 300 RMB and 500 RMB respectively through the e-CNY wallet.

- Promote research on e-CNY payment applications

On May 8, 2021, the digital RMB was connected to Alipay and three secondary wallets such as Ele.me and Hema.

On November 5, 2021, the updated version of the digital RMB (iOS 1.3.43 Beta), China Merchants Bank was added to the bank's e-wallet interface.

In January 2022, the Digital RMB App (Beta) was launched in major Android app stores and the Apple AppStore. The Business Management Board of the People's Bank of China held the 2022 Working Conference online and via video to summarize the work in 2021, analyze the current economic and financial situation and implement the key tasks in 2022.

On January 4, 2022, the Digital RMB App (Beta Version) was upgraded from version 1.3.46.83 Beta to version 1.0.1.0 which has been put on the shelves of Android app stores and is available for download. On January 5, 2022, residents of 11 e-CNY test zones, including Beijing, Shanghai, and Shenzhen, were able to select the e-CNY APP (test version) that had been put on the shelves of the Android and IOS Apple app stores.

On April 5, 2022, the digital RMB iOS/Android version (beta version) was updated to version 1.0.8, with a size of 107.5 MB, bringing some stability improvements.

In 2022, China continues to maintain a strict Zero Covid policy, which affects the consumption activities of the citizens. However, it is clear from a number of e-CNY implementation activities that the Chinese government has made enormous efforts to integrate e-CNY into every day business transaction. With a flexible combination of banks, local authorities, online shopping platforms (Meituan, Taobao, 1688...) and payment application companies including Wechat and Alipay, e-CNY is no longer an unfamiliar concept for Chinese people, especially for young people in China – the generation always wants to be updated with new trends in payments.

The e-CNY tendency is predictable, given that the strategy to implement e-CNY into the economy is based on the Chinese government's spending incentives. Incentives to use e-CNY will decrease over time as citizens begin to adapt to the use of digital currency.

In November 2021, the Hǎinán Provincial People's Government Office issued the "14th Five-Year Plan for the Construction of the International Tourism and Consumer Center in Hǎinán Province". The proposed plan accelerates the promotion of the digital RMB pilot, while adding exchange and payment service points for foreign currencies and the RMB.

On April 15, 2022, the Chongqing Locak People's Government held a meeting to mobilize and carry out the city's e-CNY pilot work, marking the full launch of the Chongqing e-CNY pilot.

2.3. Evaluate the development of CBDCs in China

In fact, China has had some initial success in getting its citizens to utilize e-CNY. The following are some examples of China's utilization of e-CNY:

- China has always been consistent with the goal of developing CBDC – represented by e-CNY. In fact, consistency in research has helped China achieve its goal of testing e-CNY as soon as possible, surpassing scientific powers such as the United States, Germany or Canada. In particular, many countries around the world have abandoned CBDC research to study parallel directions with digital currency such as polling people or studying cross-border currency.

- In order to conduct applied research for the introduction of e-CNY into the economy, China has invested in the establishment of the national central digital currency research institute, a unit focusing on top-notch human resources in monetary finance and information technology. During the same time, 74 e-CNY-related inventions had been sent to China by the end of August 2019.

- China applies the e-CNY management model according to the 2-tier model: The first level is that the PBOC will play a senior management role for the underlying technology chain such as encryption and digital, data storage, cloud computing and cybersecurity. The second level is the system of designated commercial banks and large procurement payment platforms. The involvement of large commercial banks mainly lies in the storage and transfer of data, and also involves the authentication of the identity and digital wallets of customers using them. Party payment platforms include Wechat and Alipay payment operations, offline POS machines, ATMs, and other payment devices. Through these two levels, e-CNY transactions shall be transmitted directly to the citizens.

Figure 2.3. Units participating in the e-CNY trading system

Source: Pacific Securities Research Institute, People's Bank of China

Figure 2.3 shows that the introduction of e-CNY into the economy is a combination of many related units. In particular, the PBOC acts as the top management level. Banks participating in the system have been expanded compared to 2019 including: Industrial and Commercial Bank, Traffic Bank, Industrial Bank, Construction Bank, Binh An Bank, Post Office Savings Bank... Major platforms involved in creating shopping habits with e-CNY for people: Meituan, Taobao, 1688, Bilibili...Besides, electricity and water payment systems in 15 cities and 23 pilot areas are also required to pay with e-CNY. The supporting software platform is delivered to many large companies in China, including software company Kelan Software Sunlight.

- China has achieved impressive growth in both the number of e-transaction wallets and the volume of transactions during the pilot phase. The number of e-CNY trading wallets has sometimes increased to 2.46 times. This is an unexpected increase for the PBOC.

- In general, China has close links with local authorities where e-CNY is piloted, especially in the implementation of programs to encourage procurement and stimulate consumption in these localities.

- In addition, China promotes the involvement of prominent procurement platforms in expanding the usage of e-CNY. The e-CNY app was introduced in 15 test cities in January 2022 since the large majority of Chinese consumers purchase everyday items using their smart phones. The next phase for the central bank is to collaborate with widely acknowledged trading platforms to reach current customers. In fact, ninety-three percent of mobile payments in China are supported by Tenpay (WeChat) and Alipay (Ant Group).

- China has asked for the strong involvement of commercial banks in the application of e-CNY. China's central bank has delegated much of its responsibility for deploying the e-CNY to China's state-owned banks, the backbone of China's financial system. In 2022, the Industrial and Commercial Bank of China added a "smart exchange function" to its mobile banking app so that customers could automatically convert digital CNY wallet balances into bank deposits. More than 40 employers in Hǎinán province used the Bank of China's (BOC) digital RMB service to pay wages. China Construction Bank began accepting digital RMB to buy asset management products. Agricultural Commercial Bank announced that it has issued its first digital RMB 500,000 loan ($73,986). These banks hold leverage over millions of individuals and thousands of companies both inside and outside of China, so this is important for the widespread adoption of e-CNY.

- China has been successful in paying for e-CNY on public transport such as buses, railways and subways. The adoption of e-CNY is based on the fact that Chinese citizens are familiar with previous non-cash forms of payment.

In addition to the achieved results, the development of e-CNY in China is also facing many problems such as:

- Anonymity control factor for e-CNY transactions: one of the things to know about e-CNY published by the PBOC in the white paper on e-CNY has emphasized that the PBOC will implement anonymity control for all e-CNY transactions. This raises concerns about people's privacy when they make purchases. Although e-CNY applies many technologies, including a digital certificate system, digital signatures and encrypted storage to prevent double-spending, illegal copying and to achieve irreversible transactions. However, information disclosure is a frequent occurrence in the age of technology development, so if there is a breach in the data system of e-CNY, it is really a great danger to national currency security because every expenditure as well as transaction information of the people will be made public, even illegal trading.

- China has not been able to apply e-CNY to the number of elderly people in society. In fact, China is witnessing a rapid aging of the population, however, the number of elderly people accessing and proficiently using e-CNY e-wallets is still limited, and they do not want to change their consumption habits.

Through the successes and limitations in implementing e-CNY in China, it can be seen that China has gained more achievements in bringing digital currency into the economy, opening the era of replacing cash completely in the future. China's lessons and experiences can be applied and should be studied and learned by many countries.

3. RECOMMENDATIONS FOR VIETNAM IN CBDC DEVELOPMENT

According to the overview diagram of CBDC development, Vietnam is currently in the research phase. The phrase digital currency is mentioned in Decision 942/QD-TTg dated June 15, 2021 on Approving the e-Government development strategy towards the Digital Government for the period 2021 - 2025, orientation to 2030, and Decision 1813/QD-TTg on the scheme for developing non-cash payment in Vietnam for the period 2021-2025. The State Bank is assigned by the Prime Minister to act as the focal point and coordinate with relevant ministries and agencies in studying and proposing the national digital currency mechanism. In addition, the Prime Minister assigned the State Bank of Vietnam (SBV) to coordinate with the Ministry of Justice, relevant ministries and agencies to study and propose mechanisms and policies on national digital currency in the period of 2021 - 2025.

The development of CBDCs in Vietnam, if based on experience from China, needs to be synchronized between SBV and related entities. Therefore, some recommendations for the development of Vietnam's CBDC are proposed as follows:

- SBV needs to quickly establish an In-depth Research Committee on Digital Currency. From the time of having the policy of developing e-CNY to the time of building and perfecting human and material resources to establish the Research Institute on e-CNY, it took 3 years, and then 2 years to perfect all theoretical bases on e-CNY. The SBV was based on China's experience in deploying the research department, on which it quickly issued detailed regulations on digital money, thereby deploying propaganda to the people to gradually grasp the term digital money.

- The Government needs to promote the development of Vietnam's own social networks. One of the positive factors in the transmission of regulations as well as consumer incentive programs by CBDC in China is the help of the social network Weibo. Weibo is the largest social network in China founded in 2009. By the end of 2022, the number of active accounts on weibo has reached 593 million users, second only to Douyin (a platform similar to Tik Tok in Vietnam). With the government's management of Weibo, especially individual users (requiring weibo users to use the main phone number to register), the government will control transactions on weibo as well as comments from the people. In Vietnam, 2020 is the year of the explosion of social networks founded by Vietnamese people. As of 2022, the number of social network users included Mocha with 12 million members), Gapo with 6 million members and Lotus with 2.5 million members. The number of users of Vietnamese social networks is still very modest when compared to Facebook, Zalo and Tik Tok in operation. Therefore, in order to implement CBDC, Vietnam needs to develop long-term strategies for the development of its own social network.

- The government needs to promote the development of e-commerce platforms founded by Vietnamese people. According to the ranking of e-commerce platforms (multi-industry) popular on social networks in 2022 in Vietnam, the next leading rankings are Lazada, Tik tok, Tiki and Sendo. According to the report on the e-commerce industry in 2022, Shopee is nearly 73% of the total sales of 4 brokers, corresponding to about 91 trillion. Lazada ranked second, accounting for 20% with revenue of 26.5 trillion. The problem is that the three largest trading floors are not established by Vietnam. Although, in the applications of large commercial banks such as Agribank, electronic trading floors have been implemented right at the banking application associated with VNshop, however, transaction sales have not been officially announced. The Ministry of Industry and Trade also built an e-commerce platform through the Department of E-commerce and Digital Economy. Recently, the Ministry of Industry and Trade, based on Decision 645/QD-TTg dated May 15, 2020 of the Prime Minister approved the National E-commerce Development Master Plan for the period 2021-2025) assigned to the Department of E-commerce and Digital Economy to implement the Scheme to build a unified e-commerce platform in 63 provinces and cities. However, the implementation of this activity has not shown high efficiency.

- The government must encourage the use of non-cash payment systems for local markets and public transportation, particularly buses. In the period 2020-2022, although affected by the Covid epidemic, in the risk there will be opportunities and the greatest opportunity created during this period is that people are required to use non-cash payment methods such as bank transfer, card payment and QR code scanning. After the pandemic was repelled, Vietnamese people are now gradually accustomed to using cashless. This is a potential platform for wider adoption of locations for bank account payments. However, the rate of cash use in the population is still high, especially since the public bus system (except Vinbus) has not yet applied online payment. This is a huge limitation in the application of digital currency technology in payments.

4. CONCLUSION

Digital currency of central bank is a mandatory trend that needs to develop in the future, on the one hand, limiting the negative impact of cryptocurrency transactions, on the other hand, improving the efficiency of macroeconomic financial management, anti-corruption and transnational money laundering. China is one of the first countries to pilot the application of CBDC into practice. Through China, there are many recommendations that can be proposed for research as well as piloting CDBC in Vietnam in the coming time.

BUSINESS VALUATION IN ACQUISITION AND MERGER OF START-UP BUSINESSES IN VIETNAM

MSc, Postgraduate Pham Thi Mai Huong[1]

Abstract: *In recent years, the startup movement in Vietnam has developed strongly, along with the need to determine business value to call for investment capital, mergers and acquisitions (M&A). , business transfer... increased. To know the value of a business and thereby determine the amount of capital needed to mobilize in an M&A transaction, valuing a startup business is an indispensable activity. However, startups encounter many difficulties when valuing businesses to raise capital through M&A. This article analyzes and evaluates the current situation of M&A of startups and valuation of startups in M&A to identify limitations, thereby proposing a number of recommendations and solutions to improve the effectiveness of business valuation. startups in M&A in Vietnam.*

Keywords: *Business valuation; GHOST; Innovative startups; creative start-up.*

I. INTRODUCTION

In Vietnam, since Decision No. 844/QD-TTg dated May 18, 2016 approving the Project "Supporting the national innovative startup ecosystem until 2025" was issued, Innovative Start-up activities in Vietnam have grown strongly, especially with the emergence of large companies in the fields of E-commerce and Fintech. Vietnam's digital economy is forecast to have the fastest growth rate in Southeast Asia, at 31% in the period 2022 - 2025 (According to reports by Google, Temasek and Bain & Company).

Accordingly, the rate of start-up businesses in Vietnam is about 20 businesses/1 million people, more than countries such as Indonesia (2,100 businesses/260.6 million people); China (2,300 businesses/1,378.6 million people) and India (7,500 businesses/1,330.6 million people) (VCCI, 2019). This shows the potential for Vietnam to become a promised land for creative startups on the basis of perfecting the policy framework and focusing on building factors to promote this activity.

Statistics from the Ministry of Science and Technology show that, from 2016 until now, large cash flows have been flowing into Vietnamese startups. The number of investment deals in Vietnam is increasing, but the number of deals under 1 million USD accounts for the majority. The number of deals receiving investment with a capital of more than 10 million USD is still very small. This shows that startups are being considered a boost for M&A activities in Vietnam in the coming time, when the demand for capital and capital calling rounds is strong. Many companies in the technology sector mobilize from a few hundred thousand to 1 million USD. This segment also attracts many investment funds, most of which come from abroad. The 5 startup fields attracting the most investment capital are financial technology (Fintech), e-commerce (E-commerce), technology-based tourism startups (TravelTech), and education startups. Technology-based education (Logistics and Edtech).

Faced with the rising trend and need for capital raising by startup businesses through M&A, the question for them is how much their business is worth in order to inform the parties in need

1 Email: qanhhuong@yahoo.com, Nghe An University of Economics.

(investors).) buy (invest capital) and the parties come to an agreement and agree on the final price. This is the issue of startup business valuation in M&A that the author is focusing on researching below: basic theories of business valuation in M&A; Current status of M&A of startups and valuation of startups in M&A; Limitations of startup business valuation in M&A and solutions to improve the effectiveness of startup business valuation in M&A.

II. CONTENT

1. General issues about business valuation in mergers and acquisitions of start-up businesses.

1.1. Start-up businesses and mergers and acquisitions of start-up businesses

According to Clause 2, Article 3, the Law on Support for Small and Medium Enterprises defines creative start-up enterprises: "Creative start-up small and medium enterprises are small and medium-sized enterprises established to implement ideas on the basis of exploiting intellectual property, technology, and new business models with the ability to grow rapidly" (National Assembly, 2017).

According to Zhang & Yang (2006), a startup is an individual who owns or co-owns a new business based on the application or creative application of science and technology to bring about change. innovative and called innovative startups.

Thus, creative startups or start-ups can be understood as small and medium-sized enterprises, in the early stages of business development, established based on the implementation of innovative technologies. Unique and creative business ideas with the hope of creating big changes in the existing market, achieving high economic efficiency and thereby earning profits. The concept of a creative start-up enterprise under Vietnamese law is a start-up as commonly understood in the world.

In essence, a startup has all the characteristics of a regular business, but focuses on innovation in business models, having new ideas, creating new products with innovative technologies. new technology, new customer segments and new market approaches; Successful people often have the tendency and ambition to explore and dominate a new market segment. From there, they create great influence on both domestic and international markets. However, start-up businesses often have a foundation that is not really solid, so they often have difficulty raising capital. The biggest limitations and challenges for startups are lack of resources for development and lack of strategic direction (Freeman and Engel, 2007).

Mergers and acquisitions (M&A) of startups is a form of direct investment when a number of investors come to a startup business that is operating smoothly to contribute capital, buy shares of the business, or contact With start-up businesses that are losing money, they are forced to offer cheap prices to become controlling shareholders, invest in technological innovation, improve corporate governance, and gradually bring business back to normal and move towards profitable business. interest. Compared to the form of investing in building a new business, which takes time to research the market, complete procedures for granting Investment Certificates, and deploy projects, M&A has an advantage because investors look to businesses Startups can bring them profits. Startup M&A also has all the characteristics of corporate M&A activities in general.

1.2. Purpose of buying, selling and merging start-up businesses

Innovative startups in Vietnam are growing strongly, so when startups reach the growth stage, scale expansion is inevitable (Freeman and Engel, 2007; Arena et al. , 2018; Smirat, 2018).

However, the biggest limitations and challenges for startups are lack of resources for development and lack of strategic direction (Freeman and Engel, 2007). According to research by VCCI (2018), 80 - 90% of startups fail because they do not have enough capital and resources for production and business activities.

Accordingly, attracting capital is one of the key and challenging issues of startup businesses. During the growth phase, startups can mobilize capital through forms such as finding opportunities to raise capital from large enterprises; individual investors; venture capital investment company; borrow from credit institutions or commercial banks; M&A, IPO implementation... (Arena et al., 2018; Smirat, 2018). In particular, start-up M&A is a very popular form today to solve capital problems for start-up businesses - the engine of start-up M&A.

Accordingly, the purpose of startup M&A demonstrates the following aspects:

- Start-up businesses can overcome difficulties in capital during the growth period. According to Patzelt et al. (2007), many startups cannot generate capital, technology and management organization from internal resources, so alliances with other partners or M&A are A good way for startups to have resources to maintain and expand production and business activities (Danzon et al., 2004). Investment capital for start-up businesses often comes from large economic corporations, they support capital for start-up businesses through financial investment or other forms, because this is a beneficial cooperation model. for both sides. Start-up businesses have more capital to grow and contribute to promoting the overall development of the corporation. Large economic corporations can also develop quickly through M&A transactions and become an effective divestment channel for startups (NIC, 2023).

- Besides solving capital sources, startup M&A helps businesses meet human resource requirements, corporate governance levels, use of technology, and expand investment relationships while building trust with customers. with investors, increasing the chance of successfully raising capital for subsequent projects. Next, start-up businesses can promote their images and brands to customers, potential investors and expand public relations; Reduce management, marketing, research and financial costs.

- Startup M&A aims to help businesses overcome legal difficulties in establishing new businesses in new markets. These benefits are diverse and extend to business areas such as brand recognition, licensing, supply chain management and logistics... (Maxfield Brown, 2017).

Startup M&A also serves the purpose of startup investors, along with founders and other leaders in startups, often recouping their investments when they sell the startup. to larger, more established companies in order to exit; or they take startups public, using the startup's accumulated profits to reinvest in the business and pay founders and employees.

1.3. Forms of mergers and acquisitions of start-up businesses

- Contributing capital to a business: The normal capital contribution process is to contribute charter capital for a limited liability company or buy issued shares for a joint stock company. The goal is to increase the company's charter capital.

- Buying back capital contributions or issued shares of company members or shareholders: This is a form of direct capital contribution to the enterprise, it does not increase the charter capital of the enterprise. However, it can change the capital or share ownership structure of the business.

- Business merger: This is a form used when combining one or several companies into another company. It is carried out on the basis of transferring all assets, rights and obligations of the merged company to the receiving company. The merged company will cease to exist, the merged company will inherit all assets, rights and obligations of the merged company.

- Business consolidation: A form of two or more companies combining to form a new company. All of the above companies will cease to exist and form new companies on the basis of inheriting all assets, rights and obligations of the merged companies.

- Business separation: A specific form used for limited liability companies or joint stock companies, it helps achieve the goal of business control through the process of reducing business size.

1.4. Business valuation in mergers and acquisitions of start-up businesses

According to W. Sealrooke (University of Portsmouth, UK), "Valuation is an estimate of the value of specific property rights in monetary form for a clearly defined purpose".

Lim Lan Yuan (Faculty of Construction and Real Estate, National University of Singapore) said that, "Valuation is a science of estimating the value for a specific purpose of a specific asset, at a point in time. determined, taking into account all the characteristics of the asset as well as considering all the underlying economic factors of the market, including the types of investment options.

A business is considered a type of asset (according to Vietnamese Accounting Standards), so business valuation is also the general asset valuation of the business. Therefore, "business valuation is the process of estimating business value according to a certain method. It is the process of determining the actual value of a business at a time according to the market price in order to create a basis for carrying out related transactions such as purchase, sale, consolidation, merger, separation or dissolution. can cause business bankruptcy" (Bui Van Van, Vu Nan Ninh, 2015).

Startups are also a subset of the system of businesses. Accordingly, startup business valuation in M&A is the estimation of the existing and potential value of a startup business at a time in order to carry out a startup M&A transaction.

Valuing start-up businesses in M&A is not simply a calculation technique to determine the value of the business, but also contains many general economic and technical contents, including legality, sociality and feasibility. art (Scott Moeller & Chris Brady, 2009). From the perspective of business investors, the basic standard for estimating business value is first of all the value of income that can be brought from the business's activities in the future, not just the price. current value of the business's assets. Therefore, in business valuation there will be many accepted valuation methods and in most cases, each method brings a different result (Andrew J. Sherman, Milledge A. Hart, 2009). For a startup business, the assigned value does not necessarily correspond to the actual revenue it generates in the early years. Instead, company leaders and investors can consider a company's potential value based on the profits it is expected to generate. Valuing startup businesses in M&A will also apply different methods and methods during the implementation process.

1.5. The role of business valuation in startup M&A

Every operating business needs to pay attention to its business value to measure operational efficiency, growth rate and as a basis for orienting future activities, as a basis for implementation. acquisitions, mergers, capital contributions, capital raising...

Since startups may aim to grow by selling, or merging with other businesses, it is important to be ready for potential selling opportunities. Even if they don't want to sell their business, they should know how much their business is worth.

However, determining the value of startups can be more complicated than large enterprises due to lack of management information systems, lack of reference information, lack of experience, etc., so startups need to Learn clearly about startup business valuation to avoid risks.

During the process of contributing capital to a business, the parties often encounter conflicts in determining the exact value of the business as the starting value for negotiations in negotiations or sales negotiations. According to research, up to 70% of M&A deals fail from the beginning simply because of mispricing the business value. This is a big loss for businesses due to not fully understanding the importance of business valuation.

Therefore, valuation in business merger and acquisition transactions is considered the first step in the entire M&A process. As for business owners, valuation helps them accurately determine the actual value and development potential of the company to avoid over- or under-pricing, making it difficult to attract suitable investors. For investors, valuation plays an even more important role because it helps investors evaluate the appropriate investment level and feasibility of M&A transactions.

2. Current status of business valuation in M&A of startups

2.1. Current status of mergers and acquisitions of start-up businesses in Vietnam

Start-up business development is a new point in Vietnam's current economic picture and is taking place more and more vibrantly. For a startup business, every factor from idea, market, product, environment... is important. However, the decisive factor in the survival and development of businesses is capital. Investors have an additional investment portfolio (can be considered venture capital) which is investing in start-up businesses. Carrying out M&A of startups is also meeting the capital needs of businesses or investors. M&A deals in startups are not large, but they have great potential and basis to show that this will be a promising investment channel. The capital market is an important premise that creates breakthrough growth for startups.

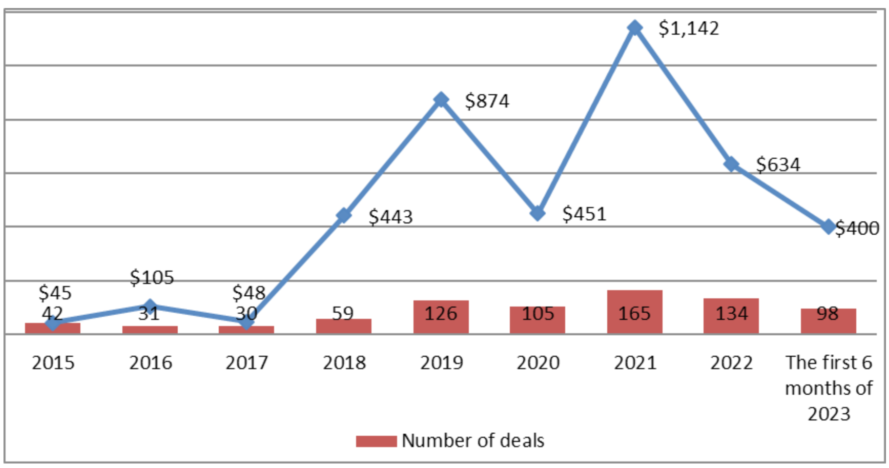
However, start-up businesses are small in scale and have a short operating time, so getting loans from banks will be very difficult. Some businesses that have been operating for more than two years have still not been able to access capital sources for many different reasons. Therefore, start-up businesses can call for capital from many forms such as: Capital from economic corporations and large enterprises; Venture Capital Fund; capital from angel investors; Equity capital is invested by one or more founders; Capital from the Government's start-up support fund; research and development funding; preferential loans, the Government's Credit Guarantee Fund, projects, programs and tax exemption, reduction and incentive policies; Commercial bank loans; Issuing shares or listing shares on the open market (IPO), ...

Startup M&A can be divided into two main types: First, both investment, control and operation for people with expertise or management capacity plus strong financial resources. Second, simply invest financially, even venture capital, and let the original founders manage. The first type is not easy to find because there are too many criteria to meet; Meanwhile, the second type, although it has a lot of potential, is in an extremely cautious state.

Accordingly, to obtain capital to maintain and develop operations, startup businesses have called for capital from many different channels from investors. In the period 2015 - 2023, investment capital in Vietnamese startups will fluctuate over the years. In the years 2015-2016, growth was at a very low level in terms of number of deals and total investment value. M&A deals in the startup world in 2018 were also very exciting, such as Grab acquiring Moca, Sea acquiring Foody and Giaohangtietkiem, PropertyGuru acquiring Batdongsan.com, Vntrip merging Atadi, Scroll investing in Cat Dong (currently operating CungMua .com, NhomMua.com, Shipto.vn), Yeah1 invested in Netlink and many other agreements.

Investment capital in startups in Vietnam in 2021 reached nearly 1.54 billion USD, in 2022 and the first 6 months of 2023 there was a sharp decrease. According to the 2023 Technology Innovation and Investment report published by the National Innovation Center and Do Ventures Venture Capital Fund, investment capital in Vietnamese startups in 2022 reached 634 million USD, down 56% compared to the previous year. last year. In the first 6 months of 2023, the capital will only range from 350-400 million USD.

Figure 1: Venture capital for startups in Vietnam in the period 2015 – 2022



(Source: Research by Do Ventures, NIC, and Cento Ventures)

The report "Emerging Giants in Asia-Pacific 2022" published by HSBC Bank and KPMG Company, Vietnam is one of the countries with the youngest and most dynamic startup environment in Asia. ASIAN. The report "Vietnam Open Innovation Panorama" in 2022 said that Vietnam's startup ecosystem has jumped from 5th to 3rd position among the top 6 economies in ASEAN, just behind Indonesia. and Singapore. The growth is specifically shown through both the rate of capital poured into the market and the number of active investors and startup investment funds. In particular, the following industries: E-commerce, financial technology, medical technology, educational technology, online media and digital solutions for businesses are forecast to create breakthroughs in attracting investment. (Le Do, 2022).

Among the capital attracted from start-up M&A forms, capital from domestic and international angel investors and venture capital funds is the main source of investment for startups in Vietnam. According to the National Innovation Center, in 2022 Vietnam will have 134 investment deals with a total capital of 634 million USD (down 56% compared to 2021). Vietnam ranks third in the number of deals and fourth in the scale of capital invested in private enterprises in Southeast Asia. Among the fields calling for the most capital, financial services has a 248% increase in capital compared to 2021, retail services ranked second although the amount of investment capital in this field decreased by 57%, followed by health and education. According to Do Venture Venture Capital Fund, businesses that have raised Pre-A and Series A rounds (raising capital from 10-50 million USD) tend to grow. Vietnamese funds lead the scale of capital injection (total capital of 287 million USD), followed by Singapore, North America and Korea.

Venture Capital Fund: According to statistics from the Ministry of Science and Technology, there are currently about 40 venture capital funds operating in Vietnam. Typical foreign funds are IDG Ventures Vietnam, Cyber Agent, Mekong Capital, DFJ Vina Capital, ESP Capital, Innovatube, many domestic venture capital funds have been established and operate such as: SeedCom, FPT Ventures, CMC Innovation Fund , VPBank Startup, VIISA, ESP, VSV, 500 Startups Vietnam... These investment funds are willing to invest capital if the business has a foundation of equity capital. However, in reality, this capital source is still very limited due to the low level of prestige and trust of businesses.

Angel Investors: Since 2017, the activities of angel investors in Vietnam have begun to be more systematic and professional, through connecting and forming a number of clubs. , investment networks for startups such as VIC Impact, Hatch Angel Network, iAngel Vietnam or Angel4us.

In addition, capital is also mobilized from economic groups and large businesses conducting M&A or IPO, such as Fossil Group, which once acquired Vietnam's Misfit. Large corporations invest in purchasing potential startup projects, occupying a high ownership ratio to gain control. From there, with experience in management and capital, the purchased startups will be part of the product and service ecosystem of large enterprises and continue to develop in that ecosystem. Regarding the IPO format, Yeah 1's deal with a value of 103 million USD is the only known successful startup IPO deal since 2013 in Vietnam.

Thus, M&A activities of startups in Vietnam in recent times have been diverse and relatively exciting, concentrating domestic and foreign capital sources for development in the startup sector. However, for successful transactions, the valuation of startup businesses is also an issue that needs to be considered to focus and mobilize capital more effectively.

2.2. Current status of business valuation in mergers and acquisitions of start-up businesses

Valuing startups in M&A is always necessary, because startups are often small and medium-sized enterprises, they can aim to develop through forms such as sale and joint venture. or merge with other businesses, so valuing (estimating) their business value is very important. However, valuing startups can be more complicated than large, long-standing businesses because startups have fewer financial years, lack a management information system, lack reference information, and are difficult. to know how big a brand can become (Doan Thi Thanh Huong, 2020).

Therefore, to value businesses in M&A, in reality, different methods and projects are used to value (estimate) the value of startup businesses. Some methods for valuing startups in M&A that have been commonly used for capital raising deals in recent times are:

- Comparable method (Comparables method)

This is the most common method for valuing early-stage startups. Accordingly, investors will find a business similar to the business they are valuing, then use that business value as a measure for valuation.

According to this method, parameters between similar startups that can be compared can be used, such as MAU (Monthly Active User), GMV (Gross Merchandise Value).), or MRR (Monthly Recurring Revenue),...

For example: 02 startups X and Y have similar business models and products. In particular, business Business Y has 100,000 active users, twice as many as X, so comparing according to this user, Y's valuation is 6 million USD.

This method has the advantage of being highly convincing, because it is based on benchmark - a common standard on the market; Using standards of previous businesses, proven by the market; Simple, easy to understand, does not rely on complex calculations, avoids "fraudulent" tricks when pricing.

However, the disadvantage of the method is that the information is incomplete; If the startup is pricing as the first model in the market, there will be no similar businesses to compare; Businesses are not exactly the same, so the valuations obtained are often only relative; In addition, this method is based on market benchmarks, so if the market is in a bubble state (valued higher than real value), the valuation will be the same, or vice versa.

To get the most accurate valuation figure possible, valuers often take benchmark data from many similar companies, and benchmark according to many different indicators (MAU, MRR, GMV,...). From there, a reasonable valuation range can be determined for negotiation between the startup and investors.

- Scorecard method (Scorecard method)

According to this method, valuers will list 5-7 evaluation criteria with different weights, then evaluate each criterion compared to businesses in the industry and calculate the total to calculate the coefficient. final valuation. Next, take the average valuation of startups in the same market and at the same stage and multiply (x) by the valuation coefficient.

For example: A start-up business has an average valuation of a Starup in the same market and period of 3 million USD. The criteria used for evaluation and evaluation indicators are as follows:

Table 1: Criteria and coefficients for evaluating start-up businesses according to the scoreboard method

TT	Criteria	Weight	Relative comparison ratio with other businesses	Component coefficient
	(1)	(2)	(3)	(4)=(2)x(3)
1	Founder/Team Quality	30%	150%	0,45
2	Market size and potential	25%	130%	0,325
3	Quality/differentiated products	15%	120%	0,18
4	Competitive ability in the market	15%	70%	0,105
5	Marketing/distribution strategy	10%	60%	0,06
6	Customer feedback	5%	50%	0,025
	Total	100%		1,145

(Source: Reference from foreign venture capital funds)

=> Target startup valuation = 3 million USD x 1.145= 3.435 million USD

- Venture capital method

According to the method, investors (venture capital funds - Venture Capital) always seek a certain rate of return on investment capital through investing capital in startup businesses. Additionally, according to some industry standards, an investor may assume that the startup can be resold for a price within a certain period of time (such as $200 million over 7 years). Based on these two inputs, investors can easily determine the maximum price they are willing to pay when investing in a startup after adjusting for dilution.

For example:

+ Estimated startup value after receiving investment capital (post-money valuation): Investors believe that the startup can be resold at a valuation of 200 million USD after 7 years. With the expected profit rate, the return on investment capital is 20 times. Accordingly, the startup value after receiving investment capital (post-money valuation) is 200/ 20 = 10 (million USD)

+ Estimate the startup value before receiving investment capital (pre-money valuation): This value can be calculated by subtracting the amount of money the investor plans to invest in the startup from the post-money valuation. Suppose the investor plans to invest 2 million USD in the startup, accordingly the pre-money valuation is 10 - 2 = 8 (million USD)

+ Adjustment for dilution effect: Is the investor's ownership percentage becoming smaller when the startup receives additional investment capital from other investors. A startup can go through many rounds of funding, after each round of funding, the ownership ratio of existing investors in the startup becomes smaller (because the scale of the business becomes larger.) Suppose the investor Investment estimates the dilution rate to be 30%, the startup's pre-money valuation after dilution is 8 x (100% - 30%) = 5.6 (million USD).

- Berkus valuation method

This is a method commonly used to value startups that have no revenue and the basic valuation is based on the startup's development. It is priced based on recent developments. The highest value is 2 million USD (or in many cases up to 2.5 million USD). The valuer only needs to add 0.5 million USD for each additional stage of startup development.

According to this method, the value of a startup business will be based on the monetary value of 5 factors: business idea, applied technology, quality of management, strategic relationships, and implementation ability. products and sales.

- Discounted cash flow method (DCF Method)

DCF is the method often considered to help most accurately evaluate the intrinsic value of a business. However, because the DCF model is based on many assumptions and parameters that are included in the valuation model during the calculation, every time those parameters change, the business value also changes. Therefore, DCF is often more suitable for businesses that have stable revenue, or can be estimated with acceptable accuracy, and is not suitable for businesses that do not have revenue, or revenue unstable. According to this method, the business value is predicted by the future cash flows of that business and then discounted to the present time. The main approach of the DCF method is to consider business value as the total present value of future cash flows that the business can bring to its owners (and all investors who have invested in the business). If the business operates normally, after the 5th year onwards, the business will continue to generate cash flow. Most early-stage startups have very low cash flow, or even no revenue. Therefore, the valuation obtained from this method is often very small. Predicting the discount rate is also not easy, because it is difficult to accurately predict data such as inflation rates, financial crises, or epidemics. Therefore, the discounted cash flow method is usually only applied when valuing start-up companies that have reached a certain maturity, have clear, stable, and large enough revenue.

- Multiples Method (Multiples Method)

Revenue multiple valuation is the most common method used to determine the value of a company. It provides a useful metric when comparing companies with different profit levels but similar margins, products, markets, and competition.

Example: A software company chooses the revenue multiple method because they believe it will take many years before they become profitable.

Therefore, this method is often used by technology companies in practice because many technology companies do not operate for profit. However, the lack of profits does not represent the true profit potential of those companies.

The multiples method is simple to use, can be compared to other startups, requires much less information but makes strong assumptions about the level of comparability. The multiple method is a valuation method that complements other methods.

Valuing a startup company is an almost mandatory job if those business owners need to call for investment capital. In general, valuing a startup business at any stage in the development process also faces certain difficulties.

However, to increase value and accurately determine the value of a startup company, business owners need to pay attention to two important factors:

+ Percentage of realizing the business owner's business plan: The more experience the business owner has in starting a business, the more experience in the field he or she pursues is appreciated.

+ At the time of valuation, what growth rate has that startup achieved in terms of performance indicators (KPI) corresponding to the field of operation of that business.

With the methods of valuing startups in M&A commonly used in practice today, there have been many successful valuation and capital raising deals. According to the Department of Science and Technology Enterprise and Market Development (Ministry of Science and Technology), Vietnam has about 3,800 startups and 11 startups are valued at over 100 million USD. Currently, there are more than 200 investment funds operating in Vietnam and more than 100 business promotion organizations and incubators (ictvietnam.vn, 2022). Currently, Vietnam has 4 unicorns (valued at over 1 billion USD), including: VNG, VNPay, Momo and Sky Mavis. In 2021, investment capital in startups reached a record capital of 1.35 billion USD, thereby making Vietnam the most attractive startup place in the ASEAN region. For example: The deal that made a strong impression on the market was Tiki's successful capital call of 258 million USD.

2.3. Restrictions on valuation activities in mergers and acquisitions of start-up businesses

Currently, M&A activities of startups in general and valuation activities of startups in M&A in particular in Vietnam still have the following limitations.

- Vietnam does not have a separate law on M&A and M&A in startups; The legal framework is still incomplete. Regulations related to M&A activities of businesses in general only stop at establishing the formality of M&A activities. There are no documents guiding clear and specific start-up M&A procedures and processes, while legal documents have different regulations, making business mergers and acquisitions difficult to establish. transaction, status of each buyer and seller, management consequences after purchase...

Many issues directly related to startup M&A that Vietnamese law has not yet specifically regulated such as auditing, valuation, taxes, consulting, brokerage, security, information, and dispute resolution mechanisms. .. Meanwhile, M&A is a commercial and financial transaction, requiring specific regulations, a market mechanism to offer and buy businesses, prices, provide information, transfer and establishing ownership, transferring legal status, shares, stocks, financial obligations, employees, brands... (Nguyen Manh Thai, 2009).

- The system of legal documents on startup M&A is not centralized and unified on a common law but is also scattered across many documents. In fact, an M&A transaction with a business in Vietnam is governed by many different laws: Enterprise Law, Investment Law, Competition Law, Securities Law, Environmental Law, Price Law, Housing Law land; Not to mention circulars and decrees that can be issued at any time and the time to complete and go through legal procedures is more than two years, so the time to complete investment licensing procedures has not yet been determined. shorten. Foreign investors must go through at least three licensing steps, including applying for investment approval, updating the Business Registration Certificate and applying for an Investment Registration Certificate to open an investment capital account. direct. The entire process can take anywhere from 3 months to 6 months, not including the time to obtain the necessary sublicenses to operate.

The Government has provided legal and institutional support including the 2017 Law on Support for Small and Medium Enterprises; Programs and projects such as "Project to support the national innovation startup ecosystem until 2025", "Project to support women's startups in the period 2017 - 2025", "Project to support students startups"... However, new programs only support when the business has been established and have been operating for a while, and cannot support the entire development process of the startup.

- Regarding accessing capital from banks and credit institutions: Startup businesses have difficulty accessing capital and credit support policies from credit institutions and traditional capital mobilization channels because Commercial banks' lending standards for start-up businesses are difficult to meet, only meeting business efficiency standards (Tran Thi Binh An and Nguyen Nhi Quang, 2020). According to VCCI statistics, only about 30% of start-up businesses have access to bank capital, because of the potential risks in business start-up loans, commercial banks are not really interested in start-up businesses. . Currently, very few banks design loan products specifically for startup activities, but mainly view startup capital as a loan need to meet the purpose of establishing a business.

- Regarding business valuation: Currently, there are no specific regulations or instructions on valuation of start-up businesses in M&A. Business valuation in general is being guided in a number of legal documents on valuation such as Price Law No. 11/2012/QH13 issued by the National Assembly on June 20, 2012 and Valuation Standards No. 12 on business valuation issued in Circular No. 122/2017/TT-BTC issued by the Minister of Finance on November 15, 2017. However, currently, there is no separate legal document regulating business valuation or startup business valuation in M&A. M&A deals take place mainly because the parties involved agree on price, so the price set is often subjective and inaccurate.

There are many methods used to value startups in M&A, depending on each specific startup so investors can choose the appropriate method. However, these methods have not been specifically regulated in the separate Law, while general business valuation methods specified in Standard No. 12 according to Circular 122/2017/TT-BTC are not appropriate. with the reality of start-up businesses (Discounted cash flow method, asset method).

Approaching and convincing potential investors (buyers) is often not easy, and start-up businesses not understanding how investors evaluate and evaluate business value can potentially lead to failure. Capital mobilization was unsuccessful. Regarding methods, traditional valuation approaches (such as discounted cash flow - DCF or market comparison) are difficult to apply in startup business valuation.

- Regarding information transparency: Investors often have little information about market prospects, risks related to products and the capabilities of startup founders. This has created a barrier that makes M&A activities in the startup sector not really vibrant, and this challenge is also one of the factors that increase risks for M&A activities.

Finding information in Vietnam is difficult due to the lack of available search tools, as well as the level of reliability and information database. Therefore, the review process is mainly based on documents provided by the seller related to legal, tax, financial and operational aspects of the target investment company. Startup businesses (sellers) are mostly young, lack experience in M&A deals, and are not ready to share information, leading to difficulties in performing reviews, as well as prolonging the implementation process. presently. In such cases, investors will spend a lot of time explaining to the business seller the lists of information, required documents and the purpose of referencing those documents.

3. RECOMMENDATIONS AND PROPOSED SOLUTIONS TO IMPROVE THE EFFICIENCY OF BUSINESS VALUATION IN MERGERS AND ACQUISITIONS OF STARTUP BUSINESSES IN VIETNAM.

On the part of the Government

- Build and complete the legal framework and support from the Government for M&A of startups.

Accordingly, it is necessary to establish an agency to manage or monitor the unified law enforcement of M&A activities, as well as be responsible for providing unified professional guidance for M&A activities.

It is necessary to develop, amend, supplement and unify the law on valuation of start-up enterprises in separate M&A and resolve problems in relevant Laws. Specifically:

+ Issue a Decree or Circular guiding the Competition Law, which clearly stipulates and explains a number of terms (such as "Relevant market") to be able to determine whether an M&A activity falls under the case of concentration. economic center or not.

+ Develop a unified and unique list of industries/fields with restrictions on capital contribution ratio of foreign investors or other investment conditions.

+ Regarding the ownership ratio of foreign investors, conditional investment fields for foreign investors need to be handled in a separate document guiding the implementation of the amended Investment Law.

- There are legal, administrative and tax support policies for startup-related activities that need to be applied. State conditions and policies need to be reformed in the direction of reducing capital barriers, simplifying administrative procedures, and creating openness in investment mechanisms and policies; Apply tax incentives for research and development activities, encouraging innovation in businesses.

- The Government needs to improve the investment environment, making it transparent and competitive; improve investment policies through a combination of various market liberalization measures, such as reducing conditional business lines and removing requirements for duplicate approvals and licenses Assembling each other is causing many difficulties.

- Promote administrative procedure reform and modernization in the financial sector, with a focus on taxes, customs, and the State treasury, contributing to improving the business environment and encouraging startups; At the same time, improve the competitiveness of the economy through organizing the implementation of the Government's resolutions on administrative reform, improving the business environment, and developing businesses in the direction of expanding the application of information technology. information, modernize management methods, expand the scope of electronic tax refunds, electronic invoices and electronic customs systems.

- There needs to be specific and unified regulations on valuation methods for startups in M&A; There needs to be a unified guiding document on enterprise valuation to serve the M&A process, avoiding the situation of self-negotiation on enterprise value as at present. Regulations on business valuation must ensure the correct determination of business value according to Accounting Law and the brand value of the business. From there, ensuring the transparency of the M&A market, avoiding abuse of power by managers and executives of businesses participating in M&A.

On the side of start-up businesses

- There should be measures to minimize the level of investment risk assessed by investors, such as providing truthful information about past business performance as well as vision, strategy and plans. Future; market analysis information... At the same time, start-up businesses need to share with investors their market positioning assessment and business model in relation to other operating businesses. in the same ecosystem and value chain.

- Need to be better equipped with financial knowledge, M&A knowledge and business valuation to be able to successfully access and call for investment capital. Promoting startup finance from both the supply and demand sides will ensure greater success of startups, promoting Vietnam to become a startup nation, gradually building a digital economy in the future. context of the Industrial Revolution 4.0. In addition, start-up businesses should proactively make their books and financial reports transparent. That is beneficial for the healthy development of businesses, creating convenience for businesses when performing M&A.

On the side of commercial banks and credit institutions

- It is necessary to specifically design credit product packages for start-up businesses in accordance with specific conditions and standards to control risks.

- Providing capital with the principle of "investment in establishing a company" with the following criteria: Indicators to evaluate financial efficiency: stable growth, revenue growth due to dominating or opening new markets, In a clearly segmented market, human resources must clearly demonstrate plans to manage and operate a company in a systematic and orderly manner.

- It is necessary to loosen the conditions on financial capacity or credit rating for start-up businesses and focus on assessing the feasibility of the business plan to suit the characteristics of the target audience. this customer.

III. CONCLUSION

Despite the volatile global investment environment, Vietnam remains a favorite destination for investors thanks to its strong economic growth and highly skilled young workforce. Therefore, the trend of startups is increasing, the need for capital is greater and M&A activities of startups are also becoming more and more exciting. Businesses in the current landscape need to focus on the fundamental aspects of the business, use capital wisely with a strategic approach, and continuously adjust operating strategies according to changes. of the economic environment. Besides, it is also necessary to improve the efficiency of startup business valuation in M&A to raise capital safely, effectively and most appropriately.

THE IMPACTS OF BUDGET DEFICIT ON ECONOMIC GROWTH IN COUNTRIES: CONSIDERING THE ROLE OF PUBLIC GOVERNANCE

M.Econ Nguyen Thi Bao Ngoc[1], Ph.D Nguyen Van Bon, Ph.D Nguyen Minh Phuc

Abstract: This paper investigates the impacts of budget deficit on economic growth, considering the role of public governance. Using panel data of 120 countries from 2002 to 2019 and quantile regression techniques, findings show positive impacts of budget deficit, public debt, public governance, the interaction between budget deficit and public governance and a negative impact of inflation on economic growth. The level of impacts vary at different percentiles. The higher percentile, the stronger impact of the budget deficit on economic growth. In contrast, at the 0.1 and 0.25 percentiles, the higher the inflation rate, the more it restrains economic growth.

Keywords: Budget deficit, economic growth, panel data, quantile regression.

JEL classification: G28; H60; O47

1. INTRODUCTION

The state budget is the financial source that helps the government perform the functions and tasks of the state. Balancing the budget helps to stabilise the macro-economy, distribute and use resources effectively, and ensure fairness in society. However, because the economy is always fluctuating, the government has to adjust collections and expenditures accordingly to regulate the economy, so the balance of budget revenue and expenditure is only relative. When government expenditures are larger than collections, budget deficit will be a result. The government always concern the budget deficit problem because of its impact on the economy and other areas of society. According to the economic growth model of Cobb-Douglas (1946) ($Y = AK^{\alpha}L^{\beta}R^{\gamma}$), economic growth is influenced by the input factors of production, including: Labor (L), productive capital (K), natural resources (R) and science technology (A). Although there is no factor in the model for the government, it can be seen that the government's administration of fiscal policy will greatly affect the input factors. In other words, in the process of spending management, if the government spends on human capital, spending on investment capital and spending on science and technology, it will contribute to promoting economic growth. However, there is still no absolute confirmation on whether the impact of budget deficit on economic growth is positive or negative at the country level because there are many different opinions on this correlation. Furthermore, previous empirical studies also show that the impacts of budget deficits on economic growth are not the same across different countries. This relationship is divided into three main viewpoints (Bernheim, 1989): (1) The first viewpoint is that budget deficit has a positive effect on economic growth (Keynesian); (2) The second viewpoint is that budget deficit has a negative impact on economic growth (Ricardian theory); (3) The last is that budget deficit has no impact on economic growth in the long run (Neoclassical theory). This paper investigates the following main question: how does the budget deficit affect economic growth and whether the different impact of the budget deficit on economic growth in each country is resulted from the operating mechanism of the

1 Email: ntb.ngoc@ufm.edu.vn, University of Finance – Marketing

government in different countries or in other words, the institutional difference? To date, to the best of the author's knowledge, there is no empirical study examining the effects of budget deficits on economic growth that consider the role of public governance. Besides, although empirical research on the impact of budget deficit on economic growth has many different points of view and methods, the authors have not found any empirical evidence that the compares this effect when using two methods: ordinary least squares with fixed effects model (OLS – FEM) and percentile regression with 0.1; 0.25; 0.5; 0.75 percentiles.

2. THEORETICAL FRAMEWORK AND LITERATURE REVIEW

2.1. Theoretical framework

- Keynesian theory is presented in Palgrave Macmillan's book "An Overview of Employment, Interest and Money" (1936). According to this theory, budget deficit has a positive effect on economic growth. Keynes argued that the state budget is an effective government tool to stimulate private investment as well as consumption. The State affects the economy through pump priming that increase private investment, increase personal savings, overcome crises, decrease unemployment and stabilise the economy. Domar (1944) also demonstrated that consecutive budget deficits are also not negative impacts when the economy grows positively. The author also state that it is a usual state of budget deficit when government spending exceeds government revenue. Kurayish Ssebulime's research (2019) shows the similar results. In addition, Saud Ghali Sabr (2021) believes that the budget deficit has a positive effect on economic growth in the short run and this effect is not strong.

- Racardian theory is presented in "Principles of Political Economy and Taxation" book published by John Murray (1817). According to this theory, a prolonged budget deficit will force the government to find another sources to cover it. Whether the government borrows or collects taxes to compensate, people still have to reduce spending to save money and pay taxes. Such declining spending will refrain economic growth in the future. There are some studies that have the similar viewpoint. (Awe & Funlayo, 2014; Hashibul Hassan, 2014; Mansoor Arjomanda, 2016; Fahmida Ahmad, 2017; Todorova, 2019; Haile, 2020; Shamsideen Adewale Yusuff, 2020; Rummana Zaheer, 2021)

- Neoclassical theory (Solow, 1999) states that budget deficit only affects economic growth in the short run. According to this theory, every individual has a personal spending plan. Government borrowing that covers the budget deficit will shift the tax burden to the future. Thus, individuals who do not currently bear the tax burden could increase their spending. An increase in spending reduces savings and hence interest rates must rise to balance capital markets. This rising interest rates results in a decline in private investment. Therefore, the budget deficit has a negative impact on economic growth in the short run. However, according to modern economists, this impact is only the result from the jostling effect and happens in the short run. In the long run, the government will not be able to intervene in the economy through financial policies. There are some studies that follow this viewpoint (Nayab, 2015; Karadeniz, 2021).

2.2. Literature review

Previous empirical studies research the impacts of budget deficit on economic growth in individual countries or groups of countries by using different methods. Research results show that the impact of budget deficit on economic growth in different countries is different.

Some studies follow the view that budget deficit has no negative impact on economic growth. Kurayish Ssebulime (2019) uses data in the period 1980 - 2016 in Uganda with cointegration method, error correction model and Granger causality pairwise. This research result shows that the budget deficit causes severe inflation in Urganda and thereby negatively affects the economy. However, it only happens in the short run and in the long run the budget deficit limits inflation through the regulation of money supply and exchange rate. Saud Ghali Sabr (2021) studies effects of the budget deficit on economic growth in both short and long run in Iraq in the period 1980-2018. Using autoregressive distribution lagged model (ARDL), he shows that the budget deficit has a positive effect on economic growth although it only happens in the short run and is not strong.

Some studies follow the view that budget deficits have a restraining impact on economic growth: Awe and Funlayo (2014) studies the short-term and long-term effects of budget deficit on economic growth in Nigeria in the period 1980 -2011. The OLS regression results show that there is a relationship between budget deficit and economic growth. Using the Johansen cointegration technique to investigate the long-term effects of budget deficits, this research founds that there is a significant long-term relationship between budget deficits and economic growth in Nigeria. The results from error-correcting model show that there is a negative relationship between budget deficit and gross domestic product. Using the same method, Hashibul Hassan (2014) studied the impact of budget deficit on economic growth in Bangladesh in the period 1976 - 2012 and find the similar results. Using the STAR model, Rummana Zaheer (2021) also finds that the budget deficit has a negative impact on economic growth in a single country at the threshold of 5.67% by using data in Pakistan in the period 1972 – 2014. Matandare et al (2018) examines the relationship between public debt and economic growth in Zimbabwe by using Ordinary Least Square (OLS) with 1980 to 2016 time series data. The study found that there is a negative significant relationship between external debt and economic growth in Zimbabwe for the period under study. With the same research topic, Yusuf1 and Aziza Said (2018) had similar results when considering the impact of public debt on economic growth in Tanzania for the period 1970 to 2015. However research using co-integration and Vector Error Correction Mechanism (VECM) and Approach to examine the relationship between public debt and economic growth and granger causality test to examine the causal relationship between variables. VECM estimates show that there is a negative relationship between public debt and economic growth in Tanzania in terms of research time. Several studies have investigated the impact of budget deficits on economic growth within a group of countries. For example, there are some studies by Mansoor Arjomanda (2016) with data from ten selected countries in the MENA region (including Egypt, Iran, United Arab Emirates, Jordan, Kuwait, Lebanon, Morocco, Oman, Syria and Tunisia) for the period 2000-2013, Todorova (2019) uses data from 17 European countries: Bulgaria and new members of the European Union (Cyprus, The Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, Slovenia, Romania, and Croatia) during 2015 as well as the Balkan countries (Serbia, Turkey, Greece, North Macedonia) in the period 2007 -2018. The panel data regression results show that the budget deficit has a negative impact on economic growth. And some studies have the same results (Fahmida Ahmad, 2017; Haile, 2020; Shamsideen Adewale Yusuff, 2020)

Some studies follow the view that budget deficit does not have any impact on economy in the long run. Nayab (2015) investigates the impact of budget deficits on economic growth in Pakistan from 1976 to 2007. The author uses cointegration technique, VAR model, vector error correction model VECM and the results show that budget deficit does not affect economic growth. In the same opinion, Karadeniz (2021) studies data in the period 1994 - 2019 in 14 developing countries (including Antigua and Barbuda, Meksika, Endonezya, Pakistan, Hırvatistan, Panama, Jamaika, Paraguay, Kolombiya, Romanya, Kosta Rika, Sri Lanka, Malezya, Şili). The results show that the budget deficit has a decreasing effect on the economic growth rate.

Some studies follow the view that governance has a great influence on the economic growth of a country. Acemoglu et al. (2019) uses an annual panel comprising 175 countries from 1960 to 2010 to study the impact of the democracy on economic growth. Research results show that democracy has a significant and robust positive effect on GDP and democratizations increase GDP per capita by about 20% in the long run. This can be seen the role of institutions in promoting economic growth. Jalilian et al. (2007) explores the role of state regulation using an econometric model of the impact of regulation on growth. The results based on two different techniques of estimation suggest a strong causal link between regulatory quality and economic performance. The authors mentioned a set of six aggregate indicators developed by the World Bank. They think that the indicators are normalized with higher values denoting better governance. The six indicators provide a subjective assessment of the following aspects of a country's quality of governance: Voice and accountability, political stability, government effectiveness, regulatory quality, rule of law, control of corruption.

3. RESEARCH METHODOLOGY

3.1. Research models

Based on the research of Awe and Funlayo (2014) and Mansoor Arjomanda (2016), this paper uses the following models to investigate the impact of budget deficit on economic growth when considering the role of public governance in countries. The model is specifically built by the authors as follows:

$$gdp_{it} = \alpha_0 + \alpha_1 inf_{it} + \alpha_2 deb_{it} + \alpha_3 def_{it} + \alpha_4 go_{it} + \alpha_5 (defxgo)_{it}$$

Where:

gdp_{it}: Economic growth for country i in year t (GDP per capita – constant 2010 US$)

inf_{it}: Inflation for country i in year t (%)

deb_{it}: Public debt for country i in year t (%GDP)

def_{it}: Budget deficit for country i in year t (% GDP)

go_{it}: public governance for country i in year t

def x go: interaction term between budget deficit and public governance.

ε_{it}: error term

3.2. Data

In this paper, the authors use data from 120 countries in the period 2002 – 2019. Data are extracted from the World Bank World Development Indicators (WDI), Worldwide Governance Indicators (WGI), and IMF World Economic Outlook (WEO) databases.

There are two main sources of institutional data. The first is The Worldwide Governance Indicators (WGI). This is a project which reports aggregate and individual governance indicators for over 200 countries and territories over the period 1996–2020, for six dimensions of governance: Voice and Accountability, Political Stability, Government Effectiveness, Regulatory Quality, Rule of Law, Control of Corruption. They are measured by public and business perceptions on various aspects of the institution. The second is Corruption Perceptions Index - CPI). It is used to measure corruption perceptions in the public sector in various countries around the world. However, the authors selected six dimensions of governance because we want to consider the impact of each indicator and it's not just about corruption. Moreover, the institutions in each country are different, so it is convenient to consider each indicator separately to make policy implications suitable for each country.

Table 1: List of used dependent, independent and interaction variables

No	Variables	Sign	Measurement	Source	Hypothesis	Research
Dependent variable						
1	Economic growth	gdp	GDP per captia (constant 2010 US$)	World Bank Development Indicators (WDIs)		Matandare, & Tito (2018), Yusuf1 and Said (2018)
Independent variable						
2	Inflation	inf	The annual change in percentage of consumer price index (CPI)	The World Economic Outlook (WEO) from IMF database	-	Hashibul Hassan (2014); Mansoor Arjomanda (2016); Karadeniz (2021);
3	Public debt	deb	Total public debt (% GDP)	IMF (Historical Public Debt Database)	+	Ahlborn and Schweickert (2018); Saungwemea and Odhiambo (2019)
4	Budget Deficit	def	The potion of the total of government lending/net borrowing (% GDP)	IMF	+	Domar (1944); Saud Ghali Sabr (2021)
5	Regulatory quality	go1	Regulatory quality captures the perception of government's ability to formulate and implement sound policies and regulations that permit and promote private sector development.	Worldwide Governance Indicators (WGI), World Bank (WB)	+	Jalilian et al. (2007)
6	Rule of law	go2	Rule of law captures perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence.	WGI, WB	+	Jalilian et al. (2007)
7	Voice and Accountability	go3	Voice and accountability captures perceptions of the extent to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media	WGI, WB	+	Jalilian et al. (2007)

8	Control of Corruption	go4	Control of corruption captures perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests.	WGI, WB	+	Jalilian et al. (2007)
9	Government Effectiveness	go5	Government effectiveness captures perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies.	WGI, WB	+	Jalilian et al. (2007)
10	Political Stability	go6	Political Stability measures perceptions of the likelihood of political instability and/or politically-motivated violence, including terrorism.	WGI, WB	+	Jalilian et al. (2007)
Interaction variable						
11	Interaction between budget deficit and public governance	def x go	Budget deficit x public governance		+	

RESEARCH METHOD

The authors use a multivariate regression model on panel data with the OLS method and fixed effects model (FEM). However, the Breush-Pagan test results show that the variance of the FEM model is not heterogeneous. Therefore, it is appropriate to use percentile regression to study the performance for many different percentiles. The percentile regression method was first introduced by Koenker and Bassett in 1978. Instead of using the OLS method to estimate the parameters of the mean regression coefficient, Koenker and Bassett (1978) proposed estimating the regression parameters coefficient of each dependent variable on each percentile in such a way that the sum of absolute differences of the regression function at percentile τ of the dependent variable is minimal. The advantage of this method is to investigate in detail the impact of independent variables on the dependent variable on each percentile. Due to the limitation of the article and the nature of the research sample, the author chose the basic percentiles for analysis, including the 0.1; 0.25; 0.5 and 0.75 percentiles.

3. RESULTS

3.1. Descriptive statistics

Table 2 shows that most variables have positive mean except def and go3 variables. The negative mean of def variable shows that budget deficits are quite common in countries. The go3 variable captures public governance policy related to voice and accountability. This negative mean of go3 variable shows that countries implementing this policy have not really been thorough. The gdp value ranges from 208.075 USD to 100,000 USD and has an average value of 15,207.03 USD. The inf value ranges from - 60.4964% to 100.254% and has a mean value of 5.113075%. The def value (measured as a % of gdp) ranges from - 35.4 % to 43.3 % and has an average value of -1.88244 %. Six dimensions of governance are measured by public and business perceptions on various aspects of the institution. Estimate of them gives the country's score on the aggregate indicator, in units of a standard normal distribution, i.e. ranging from approximately -2.5 to 2.5. A value of (-2.5) represents the lowest level of perception of different aspects of the institution and a value of 2.5 represents the highest level of perception of different areas of the institution in each country. It can be seen that the level of perception of the variable go1 is the highest among 6 components of go with maximum and minimum values of 2.469 and – 1.722 respectively. This shows that the governments of countries are very aware of the need to increase investment in the private sector. Countries also have a high sense of corruption control but do not pay enough attention to Voice and Accountability. This is shown through the results: go4 variable has the highest mean (0.189092), go3 has the lowest mean (-0.05902) amongst 6 components of go.

Table 2: Descriptive statistics for all used dependents

No.	Variable	Obs	Mean	Std. Dev.	Min	Max
1	gdp	2160	15207.03	20224.99	208.075	100000
2	inf	2160	5.113075	6.81069	-60.4964	100.254
3	def	2160	-1.88244	5.155491	-35.4	43.3
4	deb	2160	53.62795	43.79242	0	558.119
5	go1	2160	0.083426	1.05644	-1.722	2.46999
6	go2	2160	0.144269	1.013291	-2.078	2.43698
7	go3	2160	-0.05902	0.946102	-2.1808	1.75519
8	go4	2160	0.189092	0.95138	-2.344	2.26054
9	go5	2160	0.086027	1.012207	-1.838	2.1003
10	go6	2160	0.094707	0.919852	-2.233	1.801

3.2. Multivariable correlation analysis

In Table 3, the correlation coefficients between all independent variables do not show autocorrelation among the inf, def, deb, go variables. The correlation between the variables budget deficit (def) and the public governance related to voice and accountability (go3) is the highest (0.1651) that is much less than 0.800. Hence, these correlations are satisfactory to run regression (Wooldridge, 2013). The correlations between the components of public governance show the combination of components in the implementation of public governance policy. Besides, it can be seen that budget deficit (def) is positively correlated with governance variables and the degree of correlation is different. This suggests that an increase in institutional values can lead to an increase in the budget deficit. Since then, it will inhibit economic growth if the variable def has a negative impact on economic growth and will promote economic growth if the variable def has a positive impact on economic growth. The governance variables also have a positive correlation with public debt (deb) except for the variables go3 and go4. Thus, if the deb variable has a positive effect on economic growth, the increase in the value of the institutional variables go1, go2, go5, go6 will promote economic development but will inhibit economic growth if increasing value of go3, go4.

3.2. Regression results

3.2.1. OLS regression (FEM) results

The results of OLS regression (FEM) of Model are shown in Table 4. The results shown in Table 4 shows the level and direction of the impact of these variables but especially consider the role of public governance when including the interaction terms between budget deficit and public governance in model. However, in order to examine the impact of these variables on the economic growth at different percentiles in detail, the percentile regression results of Model are shown in table 6 .

Table 4: OLS regression (FEM) results: The impact of budget deficit on economic growth when considering the role of public governance.

*Note: ***, **, * Coefficients are significant at 1%, 5%, 10% levels, respectively.*

The regression coefficients of def are shown in Table 4. These coefficients show the degree of impact of def on gdp are different when considering the role of public governance at significance level (1%). The results show that the budget deficit has a positive effect on economic growth and is strongest when considering the role of go6 and the lowest when considering the role of go1. This shows the important role of institutions in contributing to increasing the positive impact of the budget deficit on economic growth. As a result, the different impact of the budget deficit on economic growth in each country is resulted from the operating mechanism of the government in different countries.

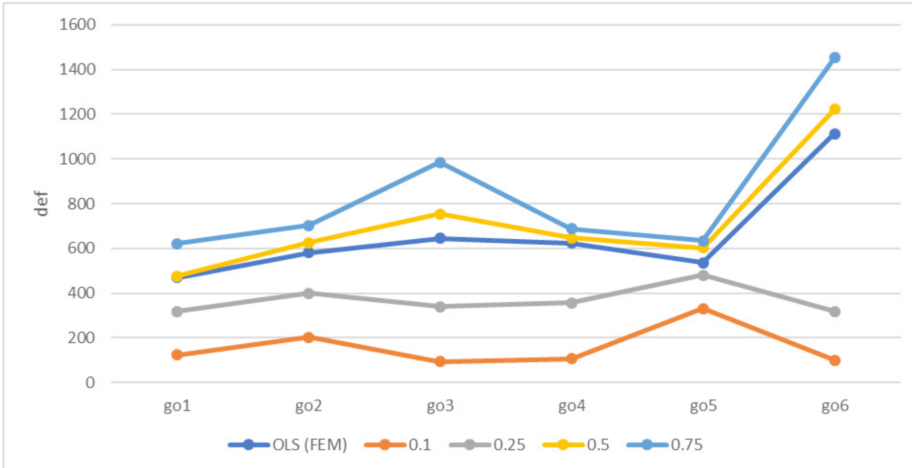
*Note: ***, **, * Coefficients are significant at 1%, 5%, 10% levels, respectively.*

Table 5 show that the budget deficit (def) has a stronger positive impact on economic growth at significance level (1%) at the 0.25, 0.5, and 0.75 percentiles when considering the role of public governance. These results show the role of public governance in the impact of budget deficit on economic growth. In other words, countries have different public governance, the impact of budget deficit on economic growth is different. Countries with good public governance will promote economic growth, conversely, countries with poor governance will restrain economic growth.

The regression coefficients of def at the percentiles in Table 5 are shown in Figure 1. These coefficients show the degree of impact of def on gdp are different in other percentiles when considering the role of public governance. The dark blue dotted line represents the overall impact of def on gdp when considering the role of public governance, which is the result obtained from the OLS method (FEM) in Table 4. The impact of def on gdp is positive and statistically significant at all percentiles. Also, the higher the percentile, the stronger the impact of def on gdp when considering the role of public governance. The yellow line at the lowest position shows the impact of def on gdp at the 0.1 percentile and the blue line at the highest position shows the impact of def on gdp at the 0.75 percentile.

Figure 1: The regression coefficients of def in the percentiles when considering the role of public governance



4. DISCUSSION

The results of the study show that there is a difference in the level of impact of the factors on economic growth between not considering and considering the role of public governance in the two OLS methods (FEM) and percentile regression.

✓ Regarding analysis results by OLS regression (FEM): When considering the role of public governance, the results are quite similar in terms of the impact of factors on economic growth: budget deficit, public debt and public governance are positively correlated with economic growth. However, the degree of impact of these factors on economic growth has changed when considering the role of public governance. Budget deficit, public debt and public governance all have stronger economic impacts at 1% significance level. In addition, the interaction variable between budget deficit and public governance has a positive coefficient at the 1% significance level that are consistent with 6 components of public governance. These results confirm that public governance play a very important role in the impact of budget deficit on economic growth. In other words, if a country has good public governance, the budget deficit will have a very strong impact on promoting economic growth. The impact of inflation factor is still only statistically significant with components go3, go4, go6 although the level of negative impact has increased. Thus, with considering the role of public governance, the OLS (FEM) analysis results show a good impact of fiscal deficit, public debt and public governance on economic growth. This conclusion supports Keynesian theory when it emphasises the role of the government. Keynes believes that the state budget is the most effective tool to help balance the economy and increased government spending will contribute to promoting economic growth. There are some studies that have the same opinion. Domar (1944) also proves that consecutive budget deficits also do not negatively affect when the economy grows positively. Woodford (1990) argues that with higher public debt, the government uses public debt to invest in infrastructure that increases the flexibility of the private sector and hence can increase economic efficiency. Therefore, it can be seen that with a reasonable policy of public debt, investment in infrastructure will gradually solve capital demands, thereby improving the production capacity of the economy. However, when regression using OLS (FEM), we only see the overall impact of the factors on economic growth and do not see that the impacts of these factors are different in percentiles. We can only see these impact through the results from the percentile regression.

✓ Regarding analysis results by percentile regression: When considering the role of public governance at the percentiles, the positive coefficient for interaction term between budget deficit and public governance shows that the better public governance, the stronger the positive impact of the budget deficit on economic growth in all percentiles. At the different percentiles, the role of each public governance component is also different. At the 0.1 percentile, the level of impact of the interaction variable between budget deficit and government efficiency (go5) is highest among 6 components of public governance. This means that, at the 0.1 percentile, the quality of government policy plays a major role in increasing the positive impact of the budget deficit on economic growth. However, at the remaining percentiles, there is a change in the roles of public governance factors. Specifically: at the 0.25 percentile, the role of public governance is mainly played by the rule of law (go2), at the 0.5 and 0.75 percentiles it is political stability (go6). This result strengthens the support for Keynesian theory. It shows that public debt and budget deficit have a positive impact on economic growth. Ahlborn and Schweickert (2018) tested the long-term relationship of public debt and growth, and similar studies (Saungwemea & Odhiambo, 2019) also provided similar results.

5. CONCLUSION AND POLICY IMPLICATIONS

5.1. Conclusion

The study uses data from 120 countries around the world to investigate the impact of budget deficits on economic growth when considering the role of public governance. The authors use panel data regression to identify factors affecting economic growth as well as consider the role of public governance. Besides, percentile regression is also implemented to analyse in detail the impact of the factors on economic growth at different percentiles.

The research results show that the OLS method (FEM) only shows the overall impact of factors on economic growth, while percentile regression shows in detail the impact of factors on economic growth at different percentiles. The results of the percentile regression will help policymakers make appropriate policies corresponding to the percentile of economic growth in their country. However, both of the two methods share the same results that economic growth is affected by budget deficit, inflation, public debt and public governance. In which, the fiscal deficit, public debt and public governance have positive effects on economic growth, while the inflation has more negative effects on economic growth than positive ones. Besides, the interaction variable between budget deficit and public governance has a positive coefficient, demonstrating the role of public governance in this relationship. Specifically, the better the country's public governance, the stronger the positive impact of the budget deficit on economic growth. The level of impact of factors on economic growth is also changed at different percentiles. Inflation has a significantly negative impact on economic growth at 0.1 and 0.25 percentiles. The higher the percentile, the stronger the impact of the budget deficit on economic growth, holding all other factors constant. But at different percentiles, the role of public governance components in promoting the positive impact of the fiscal deficit on economic growth is also different.

5.2. Policy implications

Based on the research results, the authors propose some suggestions as follows:

The percentile regression results show that there is a difference in the level of impact of the factors according to the percentile of economic growth. Thus, in order to promote economic growth, it is necessary to pay attention to the factors corresponding to the percentile of each country. At all percentiles of economic growth, countries should increase state budget spending on necessary items such as key investment spending, consumption stimulus spending, public goods and services spending. Especially at the higher percentile, the more attention should be paid to government spending because at the higher percentile, the stronger the positive impact of the budget deficit on economic growth. In other words, the budget deficit is just a normal phenomenon of the government spending a lot on the economy to promote economic growth and development. The increase in government spending must be reasonable and manageable because the government has to borrow to cover the budget deficit when the budget deficit increases. This will lead to an increase in public debt. According to the research results, public debt has a positive effect on economic growth, but this effect tends to decrease at the 0.75 percentile. Thus, governments when making spending policies need to have a connection with the public debt situation and the level of economic growth to have an appropriate spending balance. For countries with economic growth at the 0.1 and 0.25 percentiles, government do not only increase budget expenditure but also control inflation to limit the restraining effects of inflation on economic growth.

The research results also show that the budget deficit has a positive impact on economic growth. In addition, different countries having different public governance will lead to different degree of this impact. The better public governance country has, the more it promotes the positive impact of the fiscal deficit on economic growth. Conversely, a country with poor governance reduces this positive effect. Therefore, countries do not increase state budget spending but also need to pay attention to their public governance policies. At different percentiles, the role of public governance components in promoting the positive impact of the fiscal deficit on economic growth is also different. Therefore, countries need to focus on public governance components that have a key role corresponding to their country's percentile in order to have a suitable adjustment.

HETEROGENEOUS DEPENDENCE BETWEEN GREEN FINANCE AND CRYPTOCURRENCY MARKETS: NEW INSIGHTS FROM TIME-FREQUENCY ANALYSIS

MS Nguyen Mau Ba Dang, MS Thai Thi Tuong Vi, Ph.D Ngo Thai Hung[1]

Abstract: The current study aims to empirically investigate the lead-lag associations between major cryptocurrency markets and green finance measured in terms of green bonds. For empirical estimation, the wavelet analysis and spectral Granger-causality test are utilized to analyze the daily data, covering the period from 2018 to 2023. The results show that the correlation between the returns of the green bond market and cryptocurrencies is not stable over time, which rises from the short- to long-run horizon. However, the co-movements between these assets tend to be different and, in some cases, strong, especially during recent financial crises. Furthermore, the Granger causality test demonstrates the existence of a bi-directional causality between the prices of these cryptocurrencies and green bonds. These outcomes have implications for portfolio managers, investors, and researchers concerned with investment strategies, portfolio allocation, and the possible diversification benefits of making better green bond market decisions.

Keywords: Green bonds, cryptocurrencies, wavelet analysis, causality.

JEL classifications: G10, G11, G15.

1. INTRODUCTION

Climate change has become one of the most severe concerns confronting the world in recent decades, necessitating a worldwide agenda for green and sustainable development in the future (Gozgor and Karakas, 2023). The question of whether green bonds would be used as a method of hedging in the context of financial risk management has grown increasingly relevant as their popularity in the financial markets grows (Udeagha and Muchapondwa, 2023). Since the introduction of this new way of banking and investing, public interest in crypto currencies has grown significantly. Due to their success and ability to diversify, cryptocurrencies have drawn in investors from all around the world (Patel et al. 2023). Since then, there has been a growing interest in investigating the influence these financial innovations have on the global environment in the direction of a climate-resilient economy (Ye et al. 2023b).

Institutional and individual investors can also diversify their portfolios with green bonds and cryptocurrencies (Yadav et al. 2023). The need for safe haven securities and the diversification of portfolios have long been important elements of investment strategy. Among the alternative investments are cryptocurrencies and green bonds (Haq et al. 2023; Ye et al. 2023; Hung, 2023). Investors and portfolio managers utilize these investment alternatives for hedging to lower risk due to their safe haven features. This paper examines the lead-lag relationship between green bonds and the main cryptocurrency markets in light of the increased demand for environmentally conscious investments in financial markets and the need to allocate financial resources for green initiatives.

Our motivation is that participants in cryptocurrency and sustainable financial markets have a variety of investment horizons and goals, which necessitates not only differentiating between social and financial returns due to environmental effects but also using a wavelet analysis to draw conclusions in a time-frequency space. The scholarly research on hedging shows potential distinctions between traditional cryptocurrencies. Additionally, during the past five years, the hedging and diversification functions of Bitcoin and other cryptocurrencies have grown (Ren and

1 Email: badang@ufm.edu.vn, University of Finance-Marketing.

Lucey, 2022; Sharif et al. 2023); nevertheless, the hedging and diversification functions of green bonds with sustainable cryptocurrencies are still underutilized (Zhang and Umair, 2023; Ye et al. 2023a). We examine the leading and lagging roles of all asset types to answer these concerns.

To the best of our knowledge, no prior articles have looked at the intercorrelation and co-movement between crypto markets and green bonds, despite the fact that many studies have looked at the relationship between green and conventional financial markets, such as the stock, energy, and precious metals markets (Lee et al. 2023; Arfaoui et al. 2023; Huang et al. 2023). This study attempts to address a gap in the literature by analyzing the interplay between green markets and the key cryptocurrencies (Ethereum (ETH), Bitcoin cash (BCH), Ripple (XRP), Bitcoin (BIT), and Ethereum Operating System EOS) in recent crises (COVID-19 outbreak and the Ukraine invasion).

Accordingly, this study explores the causal causality and lead-lag linkage between the green bond market and cryptocurrency indices using a time-frequency analysis. The primary goal of this study is to determine differences in the pattern of the green-crypto nexus over recent crises (the COVID-19 pandemic and the Russia-Ukraine war) and to give a clear picture of the complex, time-varying, and multiscale relationships of green bond markets and cryptocurrencies. Hence, the current work investigates the multiscale links between the green bond index and the cryptocurrency markets. Our research provides straightforward insights into the financial implications of introducing green bonds, as well as the possible advantages they offer over other green financial vehicles. Therefore, we contribute to new strands of literature on green bond markets by investing in their relationship with key cryptocurrencies.

This article contributes to the related literature in several ways. Firstly, the present study expands understanding by examining the dynamic co-movements between cryptocurrencies and green financial instruments within the context of sustainable finance. Prior studies have concentrated on traditional cryptocurrencies, which is consistent with increased environmental and financial concerns in the presence of particular and ambiguous shocks—that is, the COVID-19 pandemic and the Ukraine invasion. Secondly, the co-movements of green bonds and cryptocurrencies are time-dependently analyzed in the study. Instead of passive investors, who are more concerned with the long-term success of their portfolios, active investors, like huge investment banks, are more focused on the short term. Investors from various groups, therefore, have various risk management. A simultaneous evaluation of the strength of co-movements across various frequencies and the size of this strength over time is possible thanks to the wavelet analysis. We therefore use wavelet techniques in this investigation, more specifically continuous wavelet transformation and wavelet coherence. The evaluation of the time-varying co-movement among the researched variables is made possible by the wavelet coherence and cross-wavelet plots. We also check the robustness of the results using spectral Granger causality test. Thirdly, this study improves our understanding of the interplay of sustainable investment markets by taking into account the specific dynamics and intercorrelations among these financial factorsIt also helps to provide a more sophisticated understanding of portfolio diversification, risk management, and investment strategies in the context of sustainable finance.

The research is divided into five sections: Section 2 presents the related literature. Section 3 represents methodology and data. Section 4 shows the empirical results. Section 5 concludes the study.

2. LITERATURE REVIEW

Many studies have previously looked at the cryptocurrency markets from different perspectives, including their function as hedges (Gozgor and Karakas, 2023; Yadav et al., 2023), safe havens (Huang et al., 2023; Yadav et al., 2023; Ren and Lucey, 2023), particularly during the COVID-19 crisis (Sharif et al., 2023), and diversification from conventional financial markets (Abakah et al., 2023; Patel et al., 2023). Due to the significant energy use involved in most of the cryptocurrency mining and transactions, traditional energy assets have been frequently taken into account in the literature that currently exists on the relationship between cryptocurrencies and other assets. Although the green energy sector has grown significantly in recent years, little research has been done on the relationship between cryptocurrencies and the green energy markets (Sharif et al., 2023).

Despite the fact that the green market has seen a significant increase in recent years, there has been little literature on the relationship between green markets and cryptocurrencies. Siddique et al. (2023) examine the relationship between cryptocurrency, carbon, and green markets and provide evidence of strong intra-class connectedness clusters with little interconnectedness among the markets. Similar findings are made by Zhang and Umair (2023), who also find important dynamic spillover effects between carbon markets and renewable energy stocks as well as between green bonds and renewable energy stocks. According to Gozgor and Karakas (2023), the returns on US Treasury bonds and the US dollar are inversely correlated with the returns on green bonds.

Huang et al. (2023) use a TVP-VAR model to investigate the dynamic interlinkages between green markets and Bitcoin during the COVID-19 outbreak. The authors put forward the idea that green assets will continue to serve as an efficient hedge for Bitcoin regardless of the pandemic. Arfaoui et al. (2023) document that green bonds have the least integration with other financial markets, which points to their importance in helping investors diversify their portfolios. For the American, European, and Asian markets, Sharif et al. (2023) examine the intercorrelations and spillover effects between green economy indices, five clean cryptocurrencies, and five black cryptocurrencies. They show that, compared to dirty cryptocurrencies, the overall correlation between green economic indices and clean cryptocurrencies is higher. According to Haq et al. (2023), there will be a moderate short-term (positive) and long-term (negative) co-movement between the markets for green bonds and sustainable cryptocurrency. Ye et al. (2023b) look into the role of asymmetries in identifying the association between blockchain technology and green investment in the global environment. They show that assuming symmetric and weak coherence relationships between blockchain technology and green investment in the global environment leads to biased and misleading findings that do not reflect the real-world scenario.

While the available research has yet to identify obvious linkages between crypto markets, green investments, and sustainable equity, their nexus can be seen in a number of studies. Lee et al. (2023) suggest the three investment tools interact in various market situations. The findings indicate a high tail dependence between green bonds, sustainable stocks, and cryptocurrency. Patel et al. (2023) demonstrate that the magnitude of spillovers and relative roles of each cryptocurrency and socially responsible investments change during the war. Abakah et al. (2023) point out that the blockchain market has considerable adverse effects on the environment that could cause financial assets that support the ecosystem to experience shocks. Yadav et al. (2023) explore the nexus between the green bond, energy, crypto, and carbon markets. It was discovered that Bitcoin has the least connectivity compared to other asset classes, whereas the energy market has the best connectivity. Ye et al. (2023a) examine the impact of asymmetries in influencing the relationship between blockchain and green investment and conclude that there is an asymmetric relationship between crypto currency and biofuel usage in the short and long run. Udeagha and Muchapondwa (2023) look at how economic development impacts green finance and financial technology for the BRICS countries and reach the same finding that environmental sustainability is enhanced by green finance. Yadav et al. (2023) demonstrate the prevalence of long-run spillovers from green bonds to renewable energy and the cryptocurrency market. The findings of Lorente et al. (2023) reveal that the green bond and clean energy markets are inversely related to the GPR at the extreme 10th and 90th quantiles.

The aforementioned discussion leads us to the conclusion that the body of knowledge regarding the connection between green bond markets and cryptocurrency markets is rapidly expanding. Prior research, however, says nothing about examining the time-frequency characteristics of this nexus. As a result, this article aims to close the gap in the existing literature.

3. METHODOLOGY

Cross wavelet transform (XWT), wavelet coherence (WTC) are utilized in this work to show how the domestic variance and covariance of two examined variables change in time-frequency space, as well as the lead-lag interactions between them. This section provides a quick overview of wavelet techniques.

Continuous wavelet transform (XWT)

$W_x(s)$ denotes the XWT which allows us to estiamte the joint behavior of time series for both frequency and time. The wavelet is given as:

$$W_x(s) = \int_{-\infty}^{\infty} x(t) \frac{1}{\sqrt{s}} \psi^* \left(\frac{t}{s} \right) \tag{1}$$

where * shows the complex conjugate and s is the scale parameter which determines whether the wavelet can detect higher or lower elements of the series $x(t)$, possible when the admissibility condition yields.

Wavelet coherence

WTC is efficient in estiamting the localized interconnection between indicators in a time and frequency domains. The cross-wavelet of two series $x(t)$ and $y(t)$ can be written as:

$$W_n^{XY}(u,s) = W_n^X(s,\tau) W_n^{Y*}(s,\tau) \tag{2}$$

where the scale is s, u presents the position, and * demonstrates the complex conjugate. The WTC can be written as follows:

$$R_n^2(s,\tau) = \frac{|S\left(s^{-1} W_n^{XY}(s,\tau)\right)|^2)}{S\left(s^{-1} |W_X(s,\tau)|^2\right) S\left(s^{-1} |W_Y(s,\tau)|^2\right)} \tag{3}$$

where S connotes smoothing process for both time and frequency simultaneously. $R_n^2(s,\tau)$ is in the range $0 \le R^2(s,\tau) \le 1$.

4. DATA

This study aims to explore the time and frequency relationship between green financial instruments and major cryptocurrency markets for daily data from August 1, 2018, to August 30, 2023. The S&P Green Bond Index was used as a proxy to represent green financial instruments (GF). The performance of international green bonds, which finance environmentally friendly projects, is measured by the S&P Green Bond Index (Husain et al., 2023). For cryptocurrencies, we employed five cryptocurrencies, which were gathered from the website www.coindesk.com, are Ethereum (ETH), Bitcoin Cash (BCH), Ripple (XRP), Bitcoin (BIT), and Ethereum Operating System (EOS). Existing studies utilize these markets for green and cryptocurrencies' representations. For details, see: Arif et al. (2021), Husain et al. (2023), Hung (2023) and Siddique et al. (2023).

The daily data for the geen bond index is collected from the S&P Global website (https://www.marketplace.spglobal.com/) while cryptocurrencies are extracted from the link www.coindesk.com. We convert index prices into logarithmic first differences as a proxy for returns.

The dynamic prices and returns are shown in Figure 1, which provides evidence of fluctuations and volatility clustering in the market under investigation during different timeframes. More importantly, the peaks of prices and volatility can be seen from January 2020 in all markets, suggesting that COVID-19 remarkably impacted the green bond and cryptocurrencies markets.

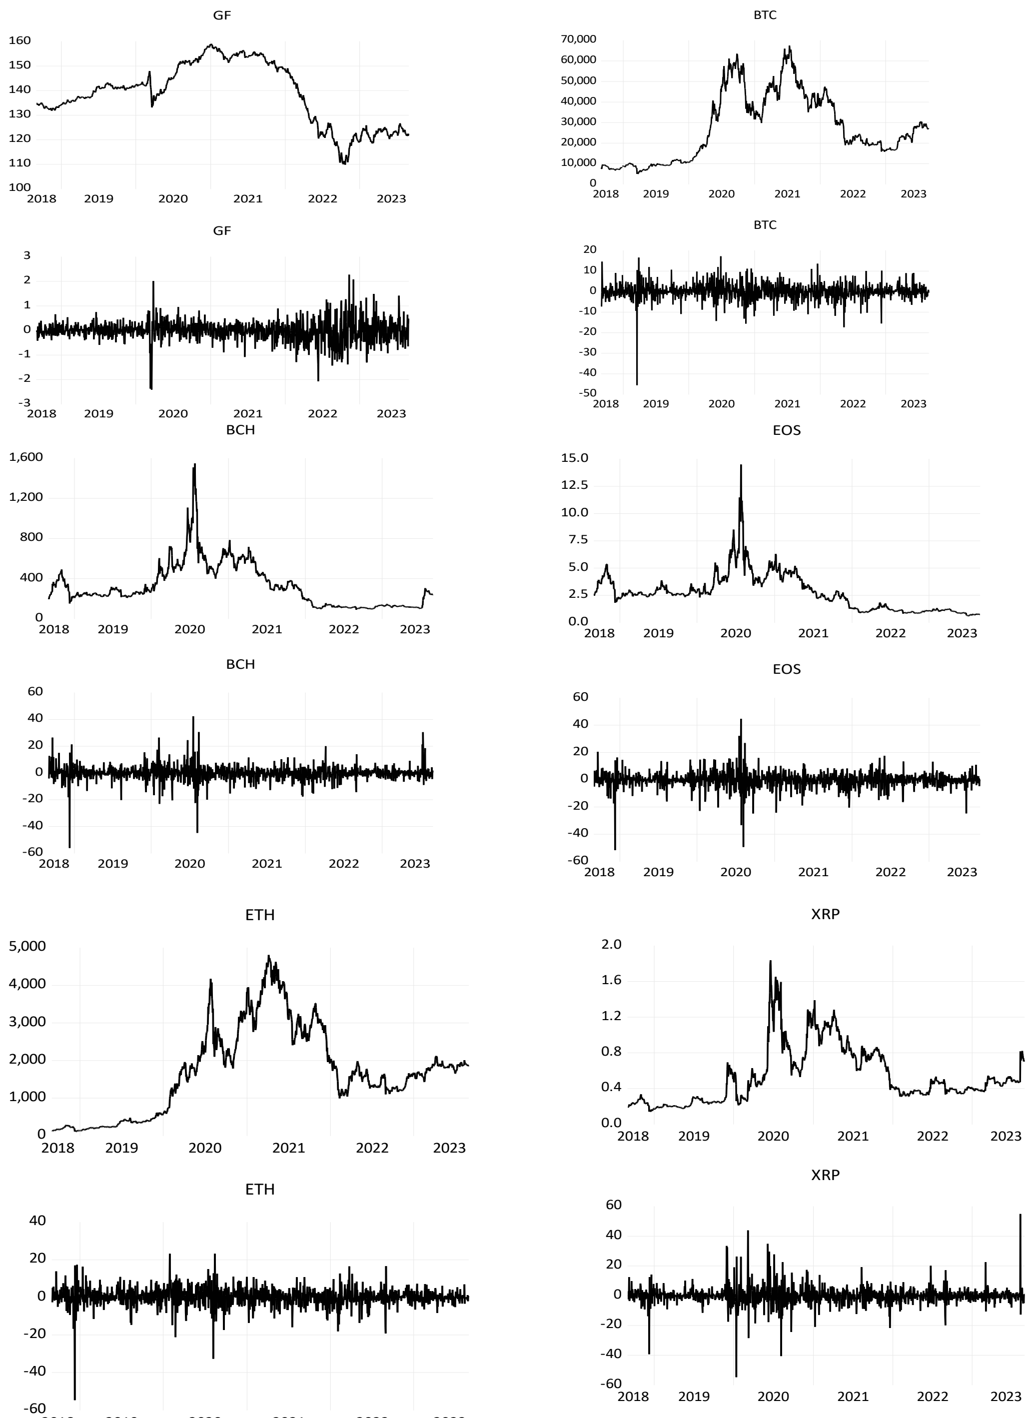

Figure 1. Daily prices and returns of GF, BTC, BCH, EOS, ETH and XPR market indices

The descriptive statistics for the return series are represented in Table 1. The mean return for all selected cryptocurrencies is positive, while green finance has a negative value during the sample period. According to the standard deviation, BCH, ETH, EOS, and XRP are more volatile than the GF and Bitcoin markets. The coefficients of skewness and kurtosis indicate that all markets have a leptokurtic distribution. In this regard, the findings of the Jarque-Bera test uncover that the examined series do not have a normal distribution. In addition, the ADF unit root test suggests that GF and all cryptocurrency returns are stationary.

Table 1. Descriptive statistics of sample return data

	GF	BTC	ETH	BCH	EOS	XRP
Mean	-0.007422	0.092798	0.204377	0.012944	0.096108	0.100785
Maximum	2.271737	17.19993	23.23139	42.39830	44.72424	54.95832
Minimum	-2.409932	-45.55871	-54.70192	-56.12829	-51.70109	-54.74531

Jarque-Bera	1254.681***	20194.38***	13636.96***	15163.12***	10319.03***	18908.89***
ADF	-29.89807***	-38.01121***	-38.90268***	-39.71634***	-41.56888***	-38.34687***

Notes: ADF is the computed statistics of the Augmented Dickey and Fuller unit root test. *** significant at 1%.

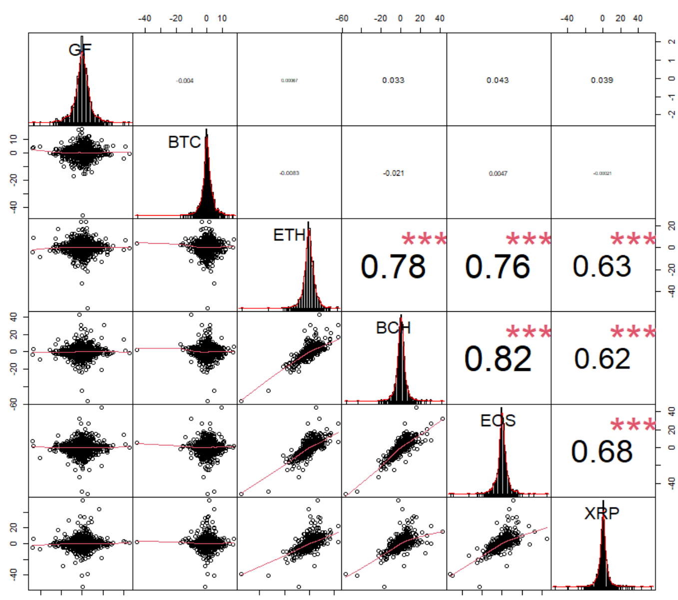

Figure 2. Correlation plot of the exmained variables

The unconditional correlations between GF and the cryptocurrency markets are reported in Figure 2. As shown in Figure 2, the linear correlations are significant and high between the cryptocurrency assets, revealing a strong association with others. Nevertheless, GF had no relationship with cryptocurrencies during the sample period. In general, we would demonstrate that no correlation might provide diversification benefits to portfolio holders in cryptocurrencies.

Empirical results

Wavelet Power Spectrum

Figure 3 illustrates the wavelet power spectrum of all time series under consideration. The vertical axis shows frequency, while the horizontal axis denotes time. The color code goes from blue to red, with blue representing low power and red indicating high power. Figure 3 shows that these markets have various characteristics at different time frequencies. Specifically, during COVID-19, around 2020, power increased dramatically up to the medium run in the cryptocurrency markets, in particular, BTC and XPR indices. Among them, the first region is from 2019 to 2020, which is mainly affected by the first wave of the COVID-19 crisis. After an increase in power in the short run, there is a significant rise in power in the long run around 2020. This is true for green bond markets, revealing that major cryptocurrency markets are more volatile than GF. An increase in power around 2020 indicates an increase in variation because of the COVID-19 pandemic.

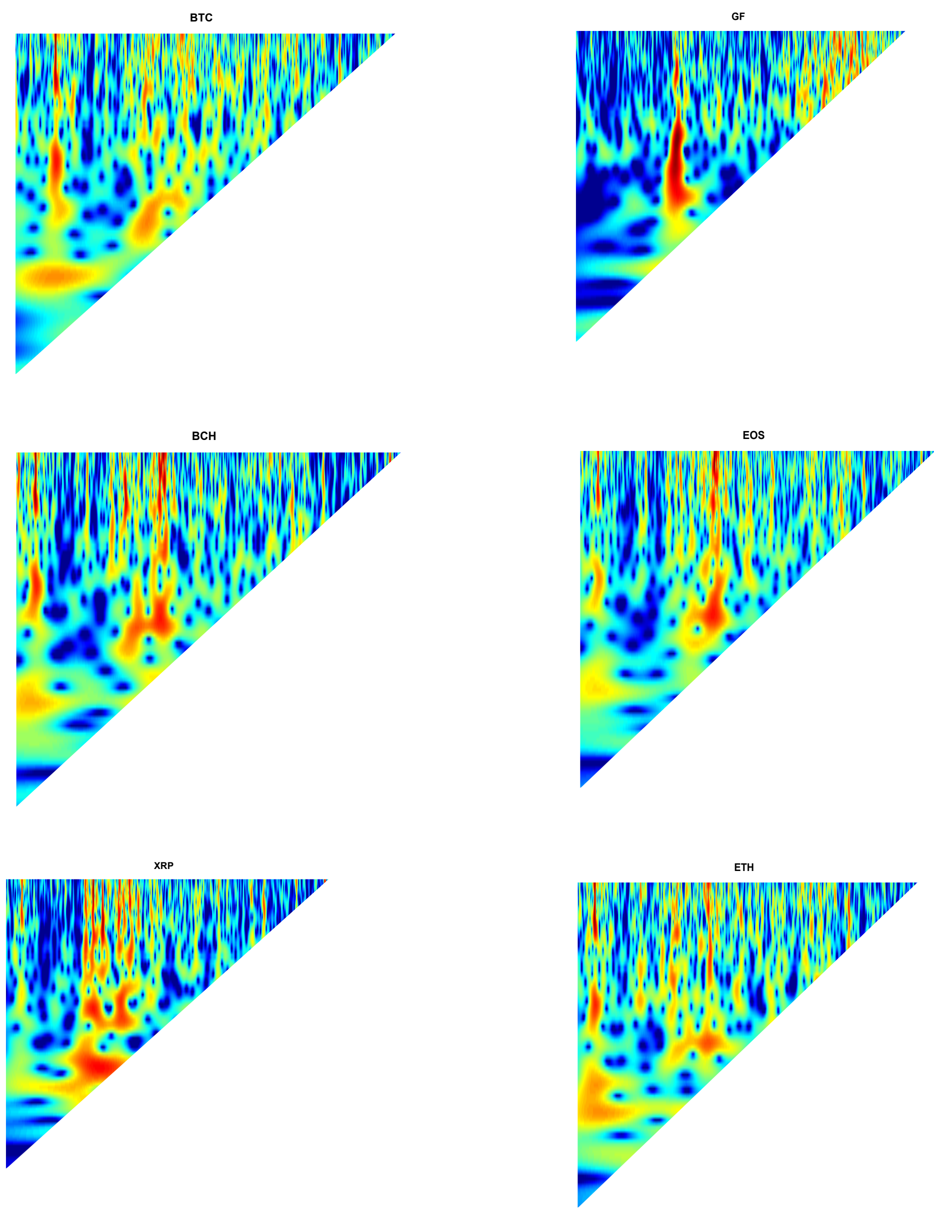

Figure 3. Wavelet Power Spectrum for the employed variables

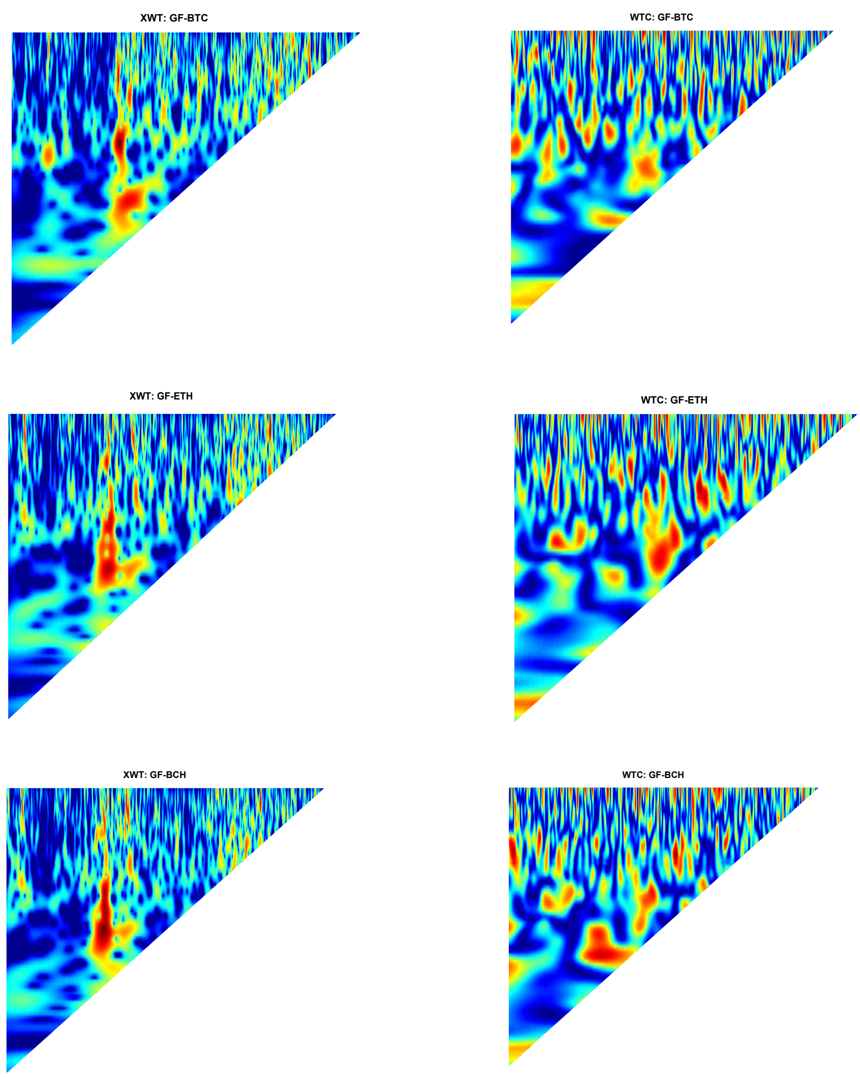
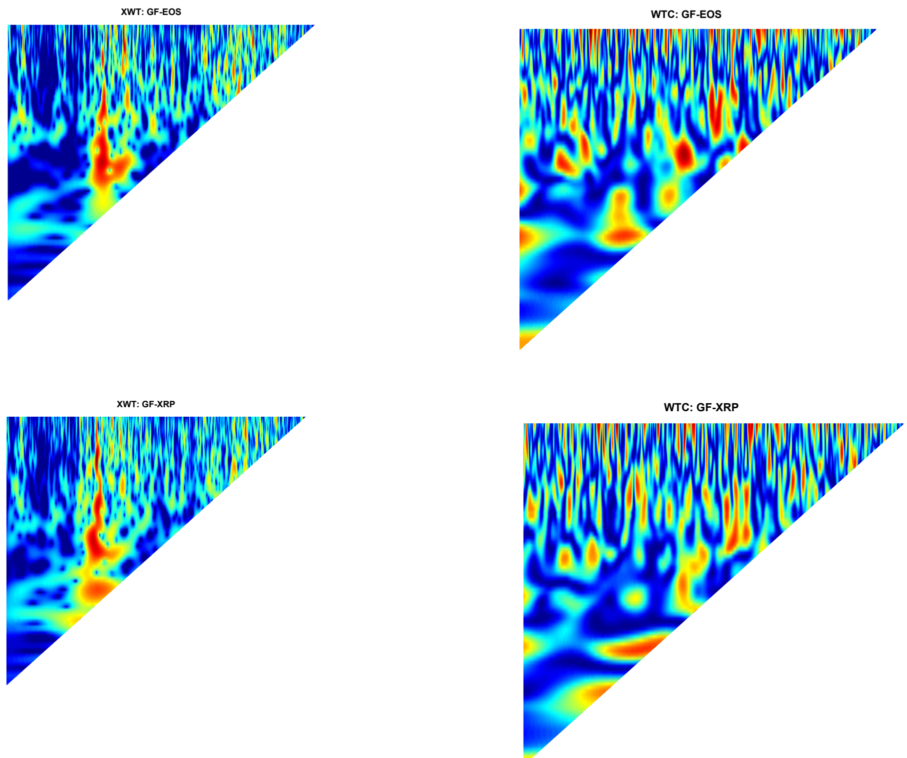
Wavelet coherence

Figure 4 shows the cross-wavelet transform (left side) and wavelet coherence (right side) between GF and the selected cryptocurrency markets. The color bar is depicted on the right side of each figure. Blue represents little power, while yellow, reddish yellow, and red represent high, higher, and maximum power, respectively. The power of the wavelet increases with the amount of color density.

Figure 4 depicts that with time covering our sample period on the horizontal axis and frequencies on the vertical axis. The areas with heavy shaded contours are significant at the 5% level. Warmer colors (red) indicate places with high significant dependence, whereas colder colors (blue) indicate regions where the two markets are significantly less dependent on one another. The lead-lag phase relationships between the GF and crypto markets are revealed by the phase arrows. Left arrows denote anti-phase, which indicates the opposite, while right arrows denote in-phase, which indicates the co-movement of two markets on a specific scale. The first market leads, as indicated by the right-down or left-up arrows, while the second market leads, as indicated by the right-up or left-down arrows.





Cross wavelet transform Wavelet coherence

Figure 4. The wavelet coherence pairs of GF and cryptocurrencies

It is worth noting that the direction of the arrows at different scales and across time in Figure 4 (cross wavelet transform) differs between the pairs of GF and crypto market returns. Throughout 2019–2020, the green bond and cryptocurrency returns pair exhibits a zone of significant coherency and co-movement at the lower frequency band. XWT systematically explains the popular power of two indicators without normalizing to the single wavelet power spectrum. This can occasionally produce similar outcomes because the jump created in the cross-spectrum, which is a multiplication of the continuous wavelet transformation of two series, cannot be attributed to the nexus between two series if one of the spectra is local and the other one exhibits a very high jump. As a result, we employ wavelet coherence analysis to capture the significant lead-lag interplay between GF and cryptocurrencies in the time-frequency spaces. The findings of wavelet coherence are presented on the right-hand side of Figure 4.

In terms of cross-mean effects, we see various narrow and small zones with a high degree of coherence that are spread across the whole analysis period. Most important local dependencies have a propensity to be short-lived, existing within various short-run time scales. Furthermore, the arrows in such places have either a rightward or a leftward trajectory, showing the existence of positive or negative contagion effects between the GF and crypto markets.

The following plot reports the coherency between GF and Bitcoin. Strong coherencies between these variables, where the GF is driven, are mostly localized at the medium and low frequencies, suggesting that there is a long-term association between BTC and GF during the COVID-19 and Russia-Ukraine crises. The arrows pointing right indicate an in-phase nexus between these variables, revealing a positive relationship during the recent crises in low frequency. However, this relationship is negative from 2018 to 2020 in the short and medium frequencies. These results corroborate the studies of Huang et al. (2023) and Arfaoui et al. (2023).

In the case of the GF-BCH pair, red zones are detected, suggesting the existence of a lead-lag nexus between green bond and BCH markets in the medium run. The direction of the arrows is left side down in the 8–16 cycle period in the periods 2018–2019 and 2021–2022, which reveals the negative relationship between the two series. Nevertheless, some in-phase cyclic effects are also visible in this association during 2019–2020 in the long run, a 2-4 cyclic period. Similarly, the wavelet coherence for GF-EOS represents the left side up in the 4–16 cycle period between 2019 and 2023. This indicates an anti-phase cyclic effect led by EOS. By contrast, the in-phase cyclic effect with arrows right side down will occur in 2019 and 2023 in the long run. Overall, it is clearly understood that BCH and EOS have leading effects on GF in the short and medium run during the sample period. BCH and EOS have solid green attributes; they are good hedges, and their prices are significantly impacted by the appreciation and depreciation of the green bond market (Ye et al. 2023a).

For the GF-ETH pair, we observe strong dependence during 2020–2023 for the frequency of 16–32 days, with arrows pointing to the lower left, which highlights they are anti-phase and ETH is leading. Conversely, significant areas between GF and ETH are also visible during 2019–2020 and 2023, where they are in phase and GF is leading. We note that there is both a negative and positive relationship between GF and ETH in the short, medium, and long run at different time periods. However, these movements are not very strong, in line with the literature (Lee et al. 2023).

It is evident that the GF-XPR pair co-moves in a similar direction in the lower frequency scale, that is, 128–256-day cycles during 2019–2020 and 2021–2023. By contrast, the relationship changes in the opposite direction in the high and medium frequency scales, that is, 8- to 32-day cycles, over the sample period. Overall, we see weak coherence between XRP and GF during the period shown, which implies that XPR provides a chance for diversification. The findings are in agreement with those of Arfaoui et al. (2023) and Ye et al. (2023b).

5. ROBUSTNESS CHECK

To validate our estimates, we propose the spectral Granger-causality test of Breitung and Candelon (2006). This approach works well for both stationary and non-stationary time series (Khalfaoui et al., 2022). We chose the best lags for the various VAR models using the Akaike information criterion and the Schwarz Bayesian information criterion. As a result, the optimal lag is 4. In other words, this technique allows us to explore causality tests in the sense of Granger under the frequency domain to capture relationships between GF and cryptocurrency markets. At various frequencies (0-1, 1-2, and 2-3), the causal association between crypto and green bond markets uncovers short, medium, and long term, respectively. The results of the test are depicted in Figure 5. The upper line (red) shows a level of significance of 5%, while the bottom line (blue) suggests a level of significance of 10%.

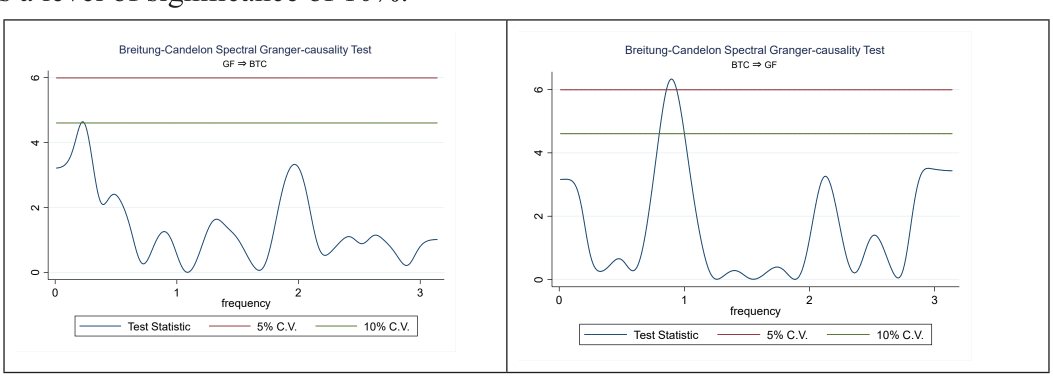


Figure 5. Breitung-Candelon spectral Granger causality test between GF and cryptocurrency markets

As indicated in Figure 5, it is illustrated that the hypothesis that the crypto markets do not Granger-cause the green bond market can be rejected for high and medium frequencies at a 10% significance level. The outcomes demonstrate that there is a bidirectional causality between GF, BTC, BCH, XPR, and BCH in the short and medium run, except that the EOS does not cause a green bond market. In fact, it is in line with our wavelet analysis that there is a significant lead-lag relationship between GF and cryptocurrency markets in different time and frequency domains.

Overall, our findings indicate the presence of a causal relationship between changes in GF and changes in cryptocurrency prices using a wavelet technique, as do those of Yadav et al.

(2023) and Arfaoui et al. (2023), among others. The results of Ye et al. (2023a, b), Yadav et al. (2023) and Lee et al. (2023) are all in agreement with our findings that there is a bidirectional causal relationship between changes in the price of cryptocurrencies and green bond markets. Furthermore, our findings are consistent with existing articles that green markets offer hedging potential and effective diversification for cryptocurrency markets (Abakah et al. 2023). In light of the existing literature (Udeagha and Muchapondwa, 2023; Lorente et al. 2023), two underlying mechanisms, namely the process of green economic transformation and the dynamics of production costs, can explain the sheltering role of green assets. Environmental threats have stimulated the financing of cleaner energy while simultaneously calling for a green transition of the energy-intensive development mode, including cryptocurrency trading and mining, in the context of globally expanding energy consumption with substantial CO2 emissions. Despite the existence of active cryptocurrency trading aimed at generating financial gains, green investors would choose to stick with safer investments, resulting in an insignificant or even opposite relationship between the dynamics of the two types of assets (Ren and Lucey, 2022).

Important policy consequences result from understanding the heterogeneous relationship between the markets for green bonds and cryptocurrencies. Our work demonstrates a lead-lag association between price movements in green bonds and cryptocurrencies. Under different market conditions, how green or sustainable investments behave has little impact on how cryptocurrencies behave. We also discover that significant cryptocurrency changes have a negative impact on green bonds. In order to enhance environmental sustainability through legislation, governments and businesses should take into account the asymmetric relationship between cryptocurrency prices and changes in green bond markets. Additionally, governments and businesses can reduce the environmental impact of cryptocurrency use by supporting the creation of green bonds through regulations that encourage the consumption of clean energy in cryptocurrency mining and trading activities. What is more, governments, corporations, and investors should be aware of the asymmetric impact of green bonds on cryptocurrency values in order to continuously incentivize the development of green bonds and ensure environmental sustainability.

6. CONCLUSION

Green investments opened a new space in the financial world as a result of the widespread concern over climate change. Many investors are keeping an eye out for green instruments as a source for supporting and promoting sustainability as the SDGs receive greater attention. Previous research revealed that traditional cryptocurrencies might benefit from using green assets as a hedge or safe haven. This empirical study sheds light on the dynamic dependence structure between green financial instruments and major cryptocurrency markets for daily data from August 1, 2018, to August 30, 2023. We use the wavelet analysis and Granger causality frameworks as they highlight the strength, causality direction, and lead-lag nexus between the selected market returns.

Our analysis illustrates that the correlation between the returns of the green bond market and key cryptocurrencies is not stable over time. The intensity of coherence is significant across the time-scale domain, and it rises from the short to the long run. The short-term relationship between GF and crypto markets is weaker than the medium- and long-term effects. However, the co-movements between these assets tend to be different and, in some cases, strong, especially during recent financial crises. Furthermore, the Granger causality test demonstrates the existence of a bi-directional causality between the prices of these cryptocurrencies and green bonds.

Our empirical results may have insightful implications for different stakeholders and researchers, especially during the recent global crises such as the COVID-19 outbreak and the Ukraine invasion. Based on these outcomes, by considering the diversification benefits of introducing green bond markets, investors and portfolio managers could construct cross-asset hedging strategies. Our findings may encourage scholars to look into the interconnections of important asset types, which are currently understudied.

BARRIERS AND SOLUTIONS TO PROMOTE THE PRIVATE ECONOMY FAST AND SUSTAINABLE DEVELOPMENT

Dr. Duong Thi Quynh Lien[1], Dr. Nguyen Phi Hung[2]

Abstract: In addition to the achievements that have been achieved, the development of the private economy in our country over the past time has many limitations and shortcomings. These shortcomings are mainly due to the fact that the development of the private economy in our country is currently facing great barriers such as: the institutions for business development, entrepreneurs are still inadequate; the legal environment for the private sector is not really complete, the business environment still has high potential risks; Many legal regulations on the private economy have been promulgated but have not been strictly implemented;... Articles with mentioned qualitative research methods mention the barriers that are preventing the private economy from developing quickly and sustainably solutions such as: building and completing the legal framework, creating a safe and favorable investment and business environment for the development of the private economy; improve the effectiveness and efficiency of the State's management over private economic development. The removal of barriers is an urgent issue that the private and state economic actors themselves need to pay attention to and solve.

Keywords: economy, private economy, development, barriers, sustainability

1. INTRODUCTION

In recent years, the private economic sector has made great progress, contributing to creating more jobs, increasing incomes, improving people's lives and making an important contribution to the dynamic development of the country of the entire economy of the country. However, besides the achievements, the development of the private economy in our country is also facing barriers, confusions and obstacles both in theory and in practice... The private sector still has many limitations and shortcomings. That fact requires continuing to build and deploy a system of solutions to promote the fast and sustainable development of the private economy, which deserves to be "an important driving force of the market-oriented economy "socialist" as the Party pointed out.

Resolution No. 10-NQ/TW dated June 3, 2017 of the 5th Conference of the Central Committee of the Party (term XII) emphasized a number of new points about the development of the private sector as a driving force. Important aspects of the socialist-oriented market economy include: (4, 5, 6)

- The state economy, the collective economy together with the private economy are the core to develop an independent and self-reliant economy;
- To encourage and create favorable conditions for the private economy to develop rapidly, sustainably and diversify with high growth rates in terms of scale, quantity, quality and contribution proportion to GDP;
- The private economy can be developed in all sectors and fields that are not prohibited by law;
- Encourage the private sector to contribute capital and purchase shares of state-owned enterprises upon equitization or divestment by the state. Thus, it can be seen that the private sector can be considered as the "key" for Vietnam's economic growth.

2. GENERAL OVERVIEW OF THE PRIVATE ECONOMY

Terrible economy private core To be area area terrible economy including the business Karma, muscle department product export terrible business rely on private ownership of the factors of production. The private economy usually exists in the form of: private enterprise, partnership, limited liability company, joint stock company, etc. section and the household terrible business fish body. Opposite to with area area terrible economy private core, profit profit always to be item pepper row initiating business activities; Therefore, the private economy has the outstanding characteristics of: High dynamism and creativity, always reacting flexibly to changes in supply and demand in the market. The private economy always has a sense and acts of fierce competition, with the desire to expand market share, eagerly position poison permission in job product export and bow grant the product Products, pandemic service answer application soft and demand school to collect profit profit high .. Although so, job run according to profit profit High and edge painting eagerly jerk market school also cause give terrible economy private core often Go attached with the face left like: edge painting not heal strong; product export have count on one's own play guide next risk muscle terrible panic excess, cause waste fee the source force of commune festival; Because commit France the law, hide contraband tax, time cheat love commercial, terrible business left permission; Are not perform full enough blame duty commune festival, cause cancel ruin lip school; family increase any jar class in commune festival, adversely affect the socio-economic life … (1, 2)

The negative aspects of the private economy can be completely controlled with the creation of a system of mechanisms and policies by the State to regulate the macro economy, especially the construction and implementation of a legal environment-business requires investors and businesses to uphold social responsibility, not to pursue profits at all costs, violating business ethics. With the effective use of macroeconomic-economic management tools, the State can fully exploit and promote the advantages of the private economy to contribute to economic development-society of the country.

3. SOME BARIERS TO PRIVATE ECONOMIC DEVELOPMENT IN VIETNAM TODAY

Thanks to the Party's correct policies and guidelines in developing the private economy in the reform period, the private sector in our country has made great strides in recent years and achieved many achievements. remarkable. Currently, our country has about 600,000 enterprises, and there are over 500,000 private enterprises. The private economy continuously maintained a good growth rate, accounting for 40-43%. The private sector's contribution to GDP structure is always above 43% of GDP (compared to the state sector's 28.9% of GDP and the FDI sector's 18 percent). % of GDP). Each year, private enterprises create about 1.2 million jobs (attracting about 85% of the labor force)… The strong private economy is not only a factor to ensure the maintenance of GDP growth rate, creating a stable source of revenue for the state budget, but also contributing to solving a series of social problems such as: creating more jobs for workers, contributing to hunger eradication, poverty reduction, and improvement of people's lives; contribute to training high-quality workers to meet the requirements of knowledge-based economy development… Many brands of the private sector have been recognized not only in the domestic market but also in the regional and international markets; There have appeared private economic groups with large scale in both capital and high technology. (3, 7)

Despite many remarkable achievements, however, private economic development currently, our country is facing many major barriers such as: (8, 9, 12)

Firstly, there are many shortcomings in the institution of business development *and entrepreneurs.* Still still one number question topic about play develop terrible economy private core need next custom Okay tool can chemical, do clear than both come back physical theory and practice , such as the problem of defining specific criteria belong to private capitalist economy to avoid identifying the private economy with the private capitalist economy; the issue of private economic development with solving exploitation and exploitation or the problem of party members working in the private economy core…

Secondly, the legal environment for the private economic sector is not really perfect, the legal system, mechanisms and policies to encourage the development of the private economy are still inadequate and limited; many policies have been issued but are not complete, clear, inconsistent, inconsistent and overlapping… causing many difficulties for private enterprises in production and business activities. On the other hand, the business environment has improved a lot recently, but there are still high risks, lack of transparency and not really creating favorable conditions for the private sector to develop strongly.

Third, many legal provisions on the private economy have been issued but have not been strictly implemented, such as the Law on Support for Small and Medium Enterprises promulgated by the National Assembly on June 20, but since then Up to now, 2 years after the law took effect, the majority of enterprises have not yet enjoyed the incentives and supports as prescribed in the Law. For example, the number of businesses accessing credit capital from banks is small and quite difficult, the State's support funds have not been deployed effectively ...; administrative procedures for businesses that want to start a business or expand production and business activities... are cumbersome and complicated; It is quite common to see the situation of harassment, trouble, abuse of power, and difficulties for businesses Karma…

Fourthly, at the IX Congress, although the Party made a request to realize the policy of equality of opportunity in access to capital, land, labor, technology in production, business and export, import ... for all economic sectors, including the private sector . However, in reality, since then, private sector enterprises still seem to suffer from injustice in their access to these factors. For example, in getting a bank loan to start up or expand production and business activities of private enterprises, especially small and medium enterprises, often face many difficulties. Up to 34.1% of private sector enterprises reported spending more than 20% of their time in a month dealing with tax and customs procedures, while this figure in the state-owned enterprise sector was only 14.7%.

In addition, some policies regulate that only state-owned enterprises are mentioned and given priority, but not private ones. In general, the right to freedom of business and property rights, and access to opportunities business, social resources are not really equal between the private economy and other economic sectors.

Fifth, the starting point and internal capacity of the private economy is still low, which is reflected in the limited industrial production capacity of private enterprises. Industrial production in the majority of private enterprises in Vietnam is currently at the level of processing and assembly based on the use of imported machinery, equipment and raw materials. Most of the production stages that bring high added value such as design, styling, marketing... are mainly performed by foreign partners. Not only that, most private enterprises do not invest in developing high-quality human resources. Therefore, the application of science-technology, application of advanced technology, and modern management are still weak.

Because of the above barriers, there are still many limitations and shortcomings in the development of the private economy in our country. Among more than 500,000 private enterprises, 96% are small and medium-sized enterprises, 2% are medium-sized enterprises, and only 2% are large-scale enterprises. The 12th Party Congress made the following statement: "Most of the private enterprises are small and lack linkages connection, the ability to cope with risks is weak, many businesses have to dissolve or stop operating moving".

In general, the level of production and business organization of most private enterprises is very low. Even a small percentage of large private enterprises still mainly rely on the advantage of land or loans, but have not invested deeply in development in the fields of production and manufacturing... Recently, there have been a number of large private economic groups that have paid attention to investing and developing technology in the fields of electronics, mechanical engineering, pharmaceutical chemistry, etc. (typically, V ingroup started out as a group of companies service and real estate groups have now switched to technology) and achieved certain successes, but compared to the total number of private enterprises in the whole country, this rate is still too low and not enough meet requirements. (10, 14)

4. SOME SOLUTIONS TO PROMOTE THE PRIVATE ECONOMY FOR FAST AND SUSTAINABLE DEVELOPMENT

Faced with the great barriers that are posed to the development of the private economy in our country today, it is necessary to build a system of solutions to break down barriers to promote the private economy to continue to develop strongly strive: by 2030 there will be at least 1 million enterprises, by 2040 there will be more than 1.5 million enterprises and by 2050, there will be at least 2 million enterprises; increase the proportion of the private sector's contribution to GDP to about 50% by 2025, about 55% by 2025, about 60-65% by 2030. Specific solutions need to be taken into account like: (11, 12, 13)

Firstly, soon improve the theory to create the basis for unifying awareness about the role of the private economy in the socially oriented market economy festival owner meaning.

Need push fast job complete good physical thesis about background terrible economy market school determined direction commune festival owner means and taste position and role of economic sectors in a socially oriented market economy festival owner meaning. This is closely related to the re-perception of the role of the State, the State economic sector and the private economic sector in the national economy. The role of the State and the State economic sector main To be live job ants create market school, build build Summer floor terrible economy - carefully art "hard" and "soft" for background terrible economic, do give market school Hentai dynamic Good than. Need early corpse determined clear commit Because the branch, sectors and products that are strategic or have great influence on the stability and security of the international economy people but Home water need Right poison permission, need hold hold 100% capital thing rate, or hold neck part domination of business to perform the role of macroeconomic regulation. The State needs to accelerate divestment from for-profit business fields, because of the efficiency in business activities of enterprises. Karma home most water is very low compared to business out-of-home career water.

It is necessary to emphasize and clarify the perception that identifying "the state economy plays a leading role, the private economy is an important driving force of the economy" does not include discrimination between "the leading role of the economy direction" compared to "developmental driving force", but the main problem here is to determine the correct position and role of each economic sector in the economy. The private economy now accounts for the majority in terms of quantity, job creation and investment capital in the society; Therefore, it is necessary to remove barriers and promote the development of the private economy so that the private economy can truly become the "most important driving force" of our economy. If officially confirmed, it will have the effect of strongly promoting the spirit of entrepreneurship, creating a breakthrough in the economic development of the country.

Secondly, Continue to improve the legal environment, encourage and create favorable conditions for the development of the private economy.

It is necessary to study and amend and supplement the necessary legal documents as soon as possible, to facilitate investors' peace of mind in investing capital in their business, and to remove annoying procedures in investment promotion and operation. business, Consideration should be given to the elimination of preferences by business sector economy to real events build build one lip school terrible business jar class before France the law. Need complete good literature copy France physical according to direction guarantee tell events system best between the The law and Nghi determined, pine private instruction; remove barriers to market liberalization, secure private property rights with special institutions that monitor contractual obligations. In particular, it is necessary to build muscle department France physical give job image wall, real presently, according to track, bar physical, prize decide painting challenge the fit economic council and handle economic-financial issues when doing business Enterprises are dissolved or go bankrupt in accordance with market rules regardless of economic sectors any.

It is necessary to improve the institution of resource allocation so that the national resources can be mobilized and used most effectively; It is necessary to have breakthrough solutions to remove the begging mechanism in accessing and allocating capital from the bank book home water; develop and implement a disclosure mechanism job fight contractor - hit contractor the attend judgment, the labour submit head private from capital echo book home water; guarantee tell terrible economy private People have equal access to State credit capital, as well as use of resources national resources as economic sectors other.

Third, it is necessary to really create a change in ensuring that the private economy is truly equal before the law as with other economic sectors.

It is necessary to eliminate the stigma in the perception and behavior of civil servants in the apparatus permission force belong to Home water opposite to with the business Karma and business core belong area area terrible economy private core when enforce labour service. Need unloading cancel the fence stop paper permission child Are not need set compartment stop and do depressed heart investors when investing and doing business. It is necessary to comply with the spirit of "What is not prohibited by law, businesses all jobs can be done"; in particular, need to support businesses private sector access to information market school, also like Have muscle processing recommended encourage the business Karma head private research rescue change new carefully art, technology, applying technological advances to products export terrible business and administration business career.

Fourth, it is necessary to improve the institutional quality and governance of the private economic sector.

The business Karma need to actively build and develop corporate culture healthy businesses, forming a team of socially responsible entrepreneurs, living and working in compliance with the standards set by the business construction industry, guarantee tell events look clean, bright White, be patient decide speak "Are not" with love status greed corruption, repent revealed in business, building the image of a responsible businessman towards society, thereby, change inferiority attitudes towards entrepreneurs businesses and entrepreneurs in the private sector core.

In addition, the State should attach great importance to honoring enterprises Businesses and entrepreneurs perform well in business activities, make many contributions to the economic development of the country, join hands to solve social problems in parallel with strictly handling enterprises enterprises and individuals conduct business in violation of the law, evade or fail to fulfill social commitments, cause image enjoy bad arrive lip school terrible economy and life living commune festival belong to add copper. Home water It is also necessary to support and create conditions to improve the level of business administration Karma for management staff in enterprises Karma outside the state through the maintenance of programs Training, fostering knowledge, skills, support France physical give the business Karma in too submit start Karma or next near pine believe market school water outside, creating opportunities for businesses Karma exchange and learn business knowledge and skills in the context of the industrial revolution 4.0, minimizing risks for businesses Karma when participating in the market school.

Fifth, improve the effectiveness and efficiency of State management over private economic development. In order to implement this solution in practice, it is generally necessary to build a lean, effective and efficient state apparatus; build a team of officials and civil servants with integrity, solid political ideology and high professional qualifications to meet the requirements of each job position. Along with that is the strength of reforming administrative procedures, simplifying and shortening the processing time of administrative procedures, especially in terms of business establishment, business registration, licensing, tax, and export, import..., implement a state, a constructivist government. Strengths in applying information technology in management, creating transparent management information systems in society to create conditions for people and businesses to access, exploit and use.

Sixth, to develop policies to encourage and support private enterprises to innovate, create and modernize technology, develop human resources in order to improve productivity and quality in production and business activities. In fact, there are very few private enterprises in Vietnam today that invest in innovation, creativity, technology modernization or investment in the development of high-quality human resources that mainly rely on profits land, natural resources, and cheap labor. That is one of the basic reasons why the majority of private enterprises in Vietnam are small businesses, with low production capacity and competitiveness enterprises of the private economic sector innovate, modernize technology, develop human resources. Specifically, the State should strengthen support for private enterprises to invest in research, development and technology transfer activities, especially new and advanced technologies in production and business activities. or corporate governance. Develop funds to support innovation and technology application.

In addition, it is also necessary to strengthen the implementation of the national strategy on human resource development. To fundamentally and comprehensively renovate and improve the quality of education and training, especially vocational training, and to train high-quality human resources to meet the demand for quantity and quality of human resources for economic development private. To encourage scientific institutions, managers, and scientists to associate with enterprises in training human resources for enterprises and transferring new and advanced technologies to enterprises. Continue to promote the construction and promote the role of the Vietnamese business team in the period of accelerating industrialization, modernization and international integration...

Seventh, private enterprises themselves need to actively develop appropriate business strategies on the basis of perfecting their organizational and management apparatus, promoting marketing activities, and practicing risk reduction measures in their business and many other measures to improve operational efficiency. In order to avoid falling into hot development leading to bankruptcy, the business strategy of private enterprises should derive from the comparative advantages of each locality with specific advantages in terms of resources, geography, natural conditions, etc. course. Moreover, the business strategies of private enterprises need to be consistent with the overall socio-economic development goals of the whole country, the strategies of each specific industry as well as the capacity of the private sector capital, technology, human capacity... to ensure succes.

5. CONCLUSION

Thus, it is clear that in order to promote the private economy to develop quickly and sustainably, worthy of being an important driving force of the economy, it is necessary to propose and implement many solutions to remove barriers that are hindering the growth of the economy. development of the private economy. This system of solutions needs to be developed and implemented synchronously in terms of both mechanisms and policies; improve the management efficiency of the State ... or solutions come from the development strategy of private enterprises.

ELECTRONIC BANKING SERVICE QUALITY IMPACT ON CUSTOMER SATISFACTION IN HO CHI MINH CITY'S COMMERCIAL BANKING SECTOR

Ph.D Nguyen Thi Thuy Giang[1], Huynh Thi Ngoc Tram[2]

Abstract: *Banks are extending their services from traditional face-to-face banking interactions to a self-service system. This study aimed to investigate how the various aspects of E-Banking service quality relate to customer satisfaction and identify which dimension may substantially impact customer satisfaction. Data were collected via a survey questionnaire distributed to clients of commercial banks in Ho Chi Minh City. A total of 533 responses were obtained and analyzed using structural equation modeling with PLS-SEM. The findings show that convenience, quality information, security, reliability, responsiveness, and website design significantly impact customer satisfaction, with reliability being the dimension with the most substantial impact. The study also provides significant implications for academicians and practitioners. The study offers valuable perspectives for commercial banks aiming to enhance their e-banking services and guarantee customer satisfaction.*

Keywords: *E-Banking, Customer Satisfaction, Ho Chi Minh City Commercial Banks.*

1. INTRODUCTION

Electronic banking (e-banking) was born due to globalization, competition, and the rapid growth of IT systems. It has evolved into a self-service delivery medium that enables banks to offer information and services to their customers more conveniently through various technological channels like the Internet and mobile phones (Chaimaa et al., 2020). There are multiple channels to conduct transactions, such as by computer, mobile phone, tablet, or face-to-face banking (Al-Qeisi et al., 2014). The nature of the transaction can also influence the choice of which channel to use. For instance, high-involvement transactions like loans may be more suited for face-to-face banking, whereas low-involvement transactions like checking account balances are typically handled online.

The use of e-banking is expected to increase steadily between 2021 and 2024, with the Asian market being the largest. Vietnam has a fast-growing e-commerce market and one of the highest smartphone and internet penetration rates worldwide. According to Statista's 2023 report, it is estimated that the total transaction value in this sector will reach USD 15 billion in 2021, and it is expected to experience an annual growth rate of 15.7% by 2025. Despite these positive trends, it's worth noting that only 30% of Vietnamese adults currently utilize digital banking services, indicating ample room for further development.

E-banking comes with many advantages. On the one hand, it provides customers personalized services, transaction security, speed of processing transactions, and overall better service quality (Abdulfattah, 2012). Consequently, this swift evolution in banking services and customer interactions necessitates examining and investigating the quality of service banks offer through E-Banking. Electronic service quality is an essential tool to measure customer satisfaction (Tetteh, 2021). Despite the many benefits of e-banking, the growing physical separation between banks

[1] Email: nguyengiang@ufm.edu.vn, University of Finance - Marketing .

[2] University of Finance - Marketing.

and customers can trigger security apprehensions and a lack of confidence. As a result, researchers have focused on the security and reliability of electronic banking services due to their strong influence on business performance and customer satisfaction.

The SERVQUAL model of Parasuraman et al. (1988) is widely used to measure the service quality in the service industry using quality determinates. Han and Baek (2004) also adopted the SERVQUAL Model to measure the service quality of e-banking. However, some of the quality determinants contradict multiple meanings, specifically online banking (Othman, 2020). This study identifies the quality gaps that impact customer satisfaction when utilizing E-Banking. The quality gaps have led us to identify service quality gaps for e-banking. Thus, the research framework was based on E-S-QUAL (Parasuraman et al., 2005) to measure e-banking service quality. There is growing pressure to gain a deeper comprehension of online quality, as consumer experiences raise expectations for online businesses (Yoo & Donthu, 2001). Wolfinbarger & Gilly (2003) indicated website design includes all elements of the consumer's experience at the website (except for customer service), including navigation, information search, order processing, appropriate personalization, and product selection. The present study also adopts the E-TAILQ model by Wolfinbarger & Gilly (2003).

The primary goal of this study is to determine the aspects of electronic banking services quality that impact Ho Chi Minh City Commercial banking sector's customer satisfaction. Section 2 provides background information on the literature review and research method. Section 3 details the research results and discussion. Section 4 concludes with a discussion of outcomes, presents theoretical managerial implications, the limitations, and suggested directions for further research.

2. LITERATURE REVIEW AND RESEARCH HYPOTHESES DEVELOPMENT

2.1. The E-S-QUAL model of Parasuraman et al. (2005)

The E-S-QUAL model developed by Parasuraman et al. (2005) broadly encompasses all phases of a customer's interaction with a website. This model serves as a tool for measuring electronic service quality and has surveyed customers' perceptions of service quality. The initial measurement of the E-S-QUAL model included dimensions like efficiency, fulfillment, system availability, security/privacy, responsiveness, compensation, and contact, which are widely used today. Currently, the E-S-QUAL scale is regarded as one of the most comprehensive measures for evaluating online services, covering users' prior experiences (interpreted as website quality assessments), the shopping process, and post-transaction service (after-sales service).

2.2. The E-TAILQ model of Wolfinbarger & Gilly (2003)

The E-TAILQ model underscores the importance of developing a comprehensive conceptual framework for defining and evaluating the quality of the online shopping experience, encompassing everything from the initial stages of information search and website navigation to the final steps of placing orders, engaging with customer service, receiving deliveries, and assessing satisfaction with purchased products. The increasing expectations of consumers towards online businesses, driven by their evolving experiences, demand a deeper understanding of online quality (Yoo & Donthu, 2001).

To evaluate quality, the analysis reveals that four factors: reliability, website design, security, and customer service - are used to explore the online consumer experience. These studies have suggested issues and attributes that warrant further investigation as we strive to understand and model the perceived quality of the online shopping experience, which affects customer assessments of quality, satisfaction, loyalty, and attitudes toward the website.

2.3. Theoretical Framework and Method

2.3.1. Convenience and customer satisfaction

Convenience is understood to offer easy, quick, and convenient access to computer systems (Weir et al. 2009). Electronic banking offers the convenience of easy access for customers, allowing them to engage with e-banking services anytime and anywhere, facilitating easier access to services and products, saving resources, and reducing dissatisfaction (Rashwan, 2019). The Uses and Gratifications (U&G) theory is a widely employed theoretical framework used to explain how convenience impacts user satisfaction with information systems as users can access them from anywhere with an internet connection, at any time, and swiftly search for information (Menon & Meghana, 2021). Considering resources such as time, money, and effort that customers invest in registering and using a product/service, convenience is regarded as an attribute that enhances the value of the product/service at a constant price (Mokha, 2022). According to Khan et al., (2022), there exists a positive and significant correlation between convenience in using electronic banking services and customer satisfaction. They find that convenience plays a pivotal role in helping banks thrive in the global market by leveraging their competitive edge rooted in convenience. Consequently, banks related to this sector can secure a significant market share by providing user-friendly and convenient services. As such, we propose the following hypothesis:

H1: Convenience positively influences satisfaction with the quality of electronic banking services

2.3.2. Quality Information and Customer satisfaction

Information quality is the trust customers place in the accuracy, timeliness, and usefulness of the information system for users (Delone & Mclean, 1992). The significance of information availability and its comprehensiveness becomes evident when users can manage the content, arrangement, and duration of pertinent product information. According to the IS Success Model, information quality is correlated with satisfaction and intention to use (Delone & Mclean, 1992). Research results regarding the integration of the Webqual 4.0 system (Hamzah, 2022) suggest that information quality may encompass output characteristics provided by the information system, such as accuracy, timeliness, and completeness of data. When customers perceive the information provided as sufficient, trustworthy, and reasonable, they will be satisfied with the transaction, continue to use the service, and recommend it to others. Additionally, the research model of Minh (2020) shows that trust positively influences satisfaction, while trust is also positively influenced by information quality. As such, we propose the following hypothesis:

H2: Information quality positively influences satisfaction with the quality of electronic banking services.

2.3.3. Security and customer satisfaction

Security is the protection of users from the risk of fraud and financial loss has been shown empirically to have a strong impact on attitudes toward the use of online financial services (Parasuraman et al., 2005). The higher the sensitivity of personal data, the greater the privacy concern. According to (Mokha, 2022), security in transactions represents the safety and protection of customers' personal information and privacy/information security when carrying out any transaction, safeguarded by the bank. In other words, security involves safeguarding users from financial fraud risks and respecting private information. Therefore, this can be viewed as an essential requirement for any product or service user. As a result, electronic banks ensure security, which meets customers' needs and desires, ultimately leading to a higher level of satisfaction with the service (Thuy, 2019). Consequently, the hypothesis is derived from the above literature:

H3: Security positively influences on satisfaction with the quality of electronic banking services.

2.3.4. Reliability and Customer satisfaction

Parasuraman et al. (2005), reliability/fulfillment involves accurate representation of the product, on-time delivery, and accurate orders. Reliability is an aspect of service quality related to the knowledge and capability of company employees to instill confidence and leave no doubts about the company's existence. The attributes of this aspect include delivering services as promised, being reliable in handling customer services, providing accurate services from the first instance, delivering services on time as promised, and maintaining error-free documentation (Khatoon, 2020). Therefore, the hypothesis is derived from the above literature:

H4: Reliability positively influences satisfaction with the quality of electronic banking services.

2.3.5. Website design and Customer satisfaction

According to the E-TAILQ model, website design encompasses all elements of the consumer's experience on the website (excluding customer service), including navigation, information search, order processing, tailored personalization, and product selection. Website design refers to customers' perceptions of website design quality (ease of navigation, accessibility, user load time; useful, complete, and clear content) (Al-Qeisi et al., 2014). Many scholars have suggested that design characteristics are essential components that contribute to the quality of e-banking services and positively impact customer satisfaction (Sulieman and Warda, 2017). Thus, this is a pivotal factor that distinguishes banks from one another and serves as the key to maintaining customer loyalty to the bank (Thuy, 2019). Therefore, the hypothesis is derived from the above literature:

H5: Website design positively influences satisfaction with the quality of electronic banking services.

2.3.6. Responsiveness and Customer satisfaction

The E-S-QUAL model suggests that responsiveness is the efficient handling and provision of relevant information to customers by service providers to assist customers and deliver services promptly. The attributes of this aspect include notifying customers about the certainty of service delivery time, providing quick service to customers, being ready to assist customers, and being willing to meet customer requirements (Nurochani, 2023). Furthermore, responsiveness manifests care and an understanding of customer desires and needs (Beshir et al., 2020). This means that banks need to focus on individual customer care. Customers must see that the bank is doing its best to meet their needs. According to Ladhari (2011), the primary factor within the service quality aspect in Canadian and Tunisian banks is reliability and responsiveness. These elements stand as the most crucial determinants of satisfaction. Thus, we propose the following hypothesis:

H6: Responsiveness positively influences satisfaction with the quality of electronic banking services.

Table 1. Previous studies on electronic service quality in the e-banking context

Variable	Model	Dimension	Author
Convenience	The e-satisfaction model.	Convenience, Site design, and Financial security	Weir (2009); Szymanski and Hise (2000)
Information Quality	IS Success Model	Information quality, System quality, Service quality	Nguyen Thi Binh Minh (2020)
Security	E-S-QUAL	Efficiency, Security, Responsiveness, Assurance, Design, Empathy, Benefits	Bui Van Thuy (2019); Parasuraman et al. (2005)
Reliability	E-TAILQ, E-S-QUAL	Fulfillment/Reliability, Website Design, Privacy/Security, Customer Service	Mary Wolfinbager and Gilly (2003), Parasuraman et al. (2005)
Website Design	E-S-QUAL, E-TAILQ	Fulfillment/Reliability, Website Design, Privacy/Security, Customer Service	Wolfinbager and Gilly (2003)
Responsiveness	E-S-QUAL	Efficiency, Reliability, Security and privacy, Responsiveness, Satisfaction	Hammoud et al., (2018)

2.4 Methodology

2.4.1 Measures

The data comprised current users of Internet banking in Ho Chi Minh City. This research was carried out in Vietnam, where the primary language is Vietnamese. To adapt to this context, the survey was translated into Vietnamese by two proficient marketing researchers who were fluent in both English and Vietnamese and had a good understanding of the concepts being measured. Subsequently, a consolidated translation based on their translations, resolving any discrepancies through discussion. Client perceptions were measured using a Likert-type scale with 1 through 5, 1 being strongly disagree and 5 being strongly agree.

The instrument was subjected to a pilot test involving university graduate students and staff to ensure the clarity of meaning, comprehension, and adherence to guidelines and determine the time required for completion. Due to data protection constraints, reaching out to users through banks was not feasible. Nonetheless, since a significant portion of the population uses banking services, a convenient mall intercept sampling method was employed to gather diverse consumer opinions.

The survey instrument was additionally made available online via Google Survey Form and shared across various social media platforms. This facilitated the involvement of a varied group of participants and boosted the response rate. Ultimately, a total of 533 valid samples were gathered and analyzed for the study. Invalid or incomplete responses from participants were systematically excluded from the sample.

2.4.2. Data collection

The survey descriptive analysis of socio-demographic characteristics is shown in Table 2. The relatively high level of education and predominance of women in the sample reflect the profile of e-banking customers in Ho Chi Minh City. The data were collected from March to June 2023 from screened consumers to ensure they had taken part in using quality service E-Banking.

Table 2. Demographics information

Item	Frequency	Percent
Gender		
Male	277	52
Female	256	48
Age		
18-25 years	216	41
26-35 years	214	40
35-50 years	82	15
50 and above	21	4
Education Level		
High school	124	23,3
Diploma	84	15,8
Bachelor	141	26,4
Master	103	19,3
PHD	72	13,5
Other	9	1,7
Total	533	100
Monthly Income Level		
5.000.000 – 10.000.000 VND	243	45,6
10.000.000 – 25.000.000 VND	121	22,7
25.000.000 – 50.000.000 VND	64	12
>50.000.000 VND	105	19,7
Length of E-banking usage		
Less than a year	111	20,8
Between a and 3 years	230	43,2
4-7 years	113	21,2
More than 8 years	79	14,8
Frequency of E-banking services usage		
Once per month	68	12,7
Twice per month	124	23,2
Three times per month	151	28,3
+4 times per month	190	35,8

3. RESEARCH RESULTS AND DISCUSSION

Apply partial least squares structural equation modeling (PLS-SEM) to test the research model using SmartPLS 3.2. The analysis involves separate assessments of the measurement model and structural model.

3.1. Measurement Model

We used Smart-PLS to achieve this objective and tested the correlation between variables. In contrast, discriminant validity is assessed by measures such as Fornell Larcker, and cross-loading. The results in Table 3 show a summary of the PLS quality of the measurement model. SmartPLS is used to examine the reliability and validity of the construct measures. Internal consistency reliability is measured by both Cronbach's α and composite reliability. Traditionally, "Cronbach's alpha" is used to measure internal consistency reliability in social science research, but it tends to provide a conservative measurement in PLS-SEM. Prior literature has suggested using "Composite Reliability" as a replacement (Wong, 2013). From Table 3, all the items have CR above 0.80

(0.7<CR≤0.9), which is regarded as satisfactory (Hair et al., 2019). So, all values fall within the acceptable range to conclude good reliability.

Convergent validity (AVE) and discriminant validity were assessed for each construct (refer to Table 2). The AVE values for all constructs exceed 0.50, indicating that, on average, each construct accounts for more than half of the variance in its respective indicators. All the indicators' outer loadings > 0.7 on a construct are higher than its cross-loadings, suggesting that descriptive validity is achieved (Hair et al., 2019). Therefore, convergent validity has been established for the constructs.

Table 3. Constructs with items and reliability and validity

Constructs	**Outer loading**	**Alpha**	**CR**	**AVE**
Convenience – CO (adopted from Weir, 2009; Szymanski and Hise, 2000)				
The instructions for using this device were easy to understand (CO1)	0.828	0.699	0.833	0.627
Using this device was quick (CO2)	0.837			
Knowing how to get the code from the device was easy (CO3)	0.703			
Information Quality -IQ (adopted from Delone and Mclean, 2003; Minh, 2020)				
The displayed information content is highly useful. (IQ1)	0.827	0.725	0.845	0.645
The provided information is relevant to the execution of transactions. (IQ2)	0.809			
The information is consistently updated. (IQ3)	0.773			
Security - SE (adopted from Thuy, 2019)				
The website/software safeguards customer account and bank card information. (SE1)	0.813	0.706	0.836	0.630
Access to the website/software is conducted in a secure mode. (SE2)	0.818			
Users have confidence in the provided transaction security. (SE3)	0.749			
Reliability (REL) (adopted from Wolfinbager and Gilly (2003); Parasuraman et al.,2005)				
The product that came was represented accurately by the website. (REL1)	0.820	0.729	0.847	0.649
You get what you ordered from this site. (REL2)	0.839			
The product is delivered by the time promised by the company. (REL3)	0.755			
Website Design (WD) (adopted from Wolfinbager and Gilly, 2003)				
The website provides in-depth information. (WD1)	0.815	0.676	0.821	0.604
This website has a good selection. (WD2)	0.738			
It is quick and easy to complete a transaction on this website. (WD3)	0.777			
Responsiveness (RES) (adopted from Hammoud et al., 2018)				
E-Banking services are available 24/7. (RES1)	0.773	0.691	0.829	0.618
E-banking services provide answers to your questions. (RES2)	0.796			
E-Banking services respond immediately to clients' requests. (RES3)	0.788			
Satisfaction (SA) (adopted from Rashwan, 2019)				
I am generally pleased with the Banking's online services. (SA1)	0.787	0.709	0.838	0.633
I am satisfied with the overall online bank's products and services. (SA2)	0.838			
I am happy with E-banking. (SA3)	0.759			

To test discriminant validity, results show that the square root of the AVE was greater than its correlation with any other construct (Table 4) (Fornell & Larcker, 1981). Thus, we conclude that this research has no problem with discriminant validity.

Table 4. Discriminant validity (Fornell-Larcker)

	SE	IQ	RES	SA	REL	WD	CO
SE	0.794						

IQ	0.648	0.803					
RES	0.640	0.654	0.786				
SA	0.637	0.640	0.635	0.796			
REL	0.652	0.655	0.641	0.646	0.805		
WD	0.599	0.603	0.638	0.608	0.602	0.777	
CO	0.563	0.609	0.595	0.595	0.651	0.554	0.792

3.2 The structural model

To test our research framework, we used structural model path coefficients. In particular, we followed Hair et al. (2019) recommendations which focused on conducting four tests: (1) coefficient of determination (R^2) to measure the predictive power of our model, (2) effect size (f^2), predictive relevance (Q^2) and structural model path coefficients.

Our results show the values of R^2 for Satisfaction (0.575) obtained moderate R^2 values (Hair et al., 2019). The values of f^2 results revealed some significant impacts. For instance, Security on Satisfaction (f^2 = 0.032), Information Quality on Satisfaction (f^2 = 0.025), Responsiveness on Satisfaction (f^2 =0.021), Reliability on Satisfaction (f^2 = 0.026), Website design on Satisfaction (f^2 = 0.024). To test Q^2, we used the blindfolding technique in which we omitted the distance set to 7. This study's electronic service quality toward customer satisfaction provides a high predictive medium (Q^2 = 0.351).

Our results show that VIF values range from 1.219 to 1.592, indicating noncollinearity issues because the values are below '5' (Hair et al., 2019). The Standardized Root Mean Square Residual (SRMR) index needs to be considered to assess the model's goodness of fit to the empirical data. the SRMR value is 0.078, which is < 0.08, indicating that the structural model fits the data well. To test our hypotheses, we run PLS using the bootstrapping technique with 5,000 iterations (Hair et al., 2019). Our results revealed that all the proposed hypotheses were supported. Table 5 shows PLS results for the structural model. Our results revealed that all the proposed hypotheses were supported.

Table 5. Results for Structural Model

Giả thuyết	Mối quan hệ	Original Sample (O)	STDEV	T Statistics	P Values	Result
H1	CO -> SA	0.124	0.062	1.996	0.046	Accepted
H2	IQ -> SA	0.158	0.061	2.578	0.010	Accepted
H3	SE -> SA	0.176	0.054	3.251	0.001	Accepted
H4	REL -> SA	0.165	0.059	2.778	0.005	Accepted
H5	WD -> SA	0.146	0.052	2.819	0.005	Accepted
H6	RES -> SA	0.145	0.052	2.791	0.005	Accepted

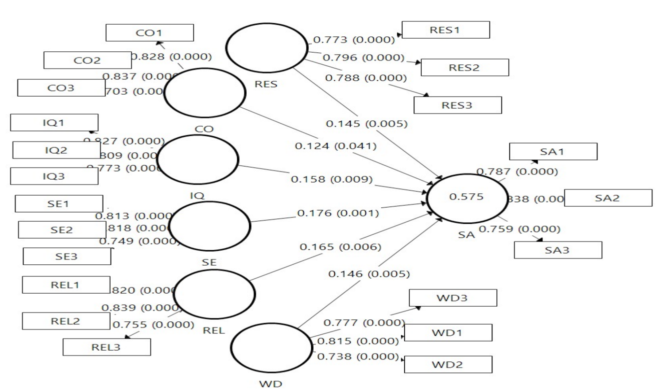

Figure 1. Structural Model

3.3. Discussion

The results of this study demonstrated that service quality plays a substantial role in influencing customer satisfaction with E-Banking services but also that security is the strongest dimension of service quality affecting customer satisfaction. This is supported by previous research (Rozie et al., 2023; Mokha, 2022; Weir et al., 2009). Despite the many benefits provided by e-banking, the increasing distance between banks and customers may lead to security concerns and a lack of confidence. Security concerns are among the major inconveniences related to the adoption of e-banking (Chaimaa et al., 2020). Clients are increasingly concerned about the security and privacy of electronic banking services, realizing their importance in terms of corporate performance and customer pleasure. Risk can originate from either within or outside the system, so banking regulatory and supervisory agencies must ensure that banks have appropriate practices to safeguard the security of data and the integrity of systems and data. The security practices of banks should be regularly assessed and reviewed by external experts to analyze network vulnerabilities and readiness for recovery.

The reliability dimension has been cited as an equally important facet of E-S- Q (Hamzah, 2022; Parasuraman et al., 2005). According to Beshir (2020), customers will be happier if they perceive that their services meet the initially agreed-upon requirements and deliver the information and services promised beforehand. Organizations need to focus on quality to increase reliability and customer satisfaction and promote customer engagement in the banking sector. Banks should prioritize service quality, including reliability and empathy, by offering value-added services and benefits for women and the elderly. Bank executives will recognize that the most significant influencing factor is customer satisfaction from the consumer's perspective. Reliability, such as employees keeping their promises, is crucial for overall development. Therefore, banks need appropriate measures to train their employees to provide a similar level of service to customers. Moreover, employees should engage with consumers and consider problem-solving techniques to enhance relationships and build proper trust in the bank.

Website design is also the most influential factor affecting the quality of e-banking services. Many scholars have suggested that design characteristics are essential components that contribute to the quality of e-banking services and positively impact customer satisfaction (Sulieman and Warda, 2017; Bui Van Thuy, 2019). Moreover, website design is the most influential factor affecting the quality of e-banking services, in contrast to the previous findings of Wolfinbarger & Gilly (2003). According to Vu (2018), an attractive website design with logically organized information makes it easy for customers to find information. It provides a comfortable interaction experience, so design characteristics also influence e-banking customer satisfaction. Gautam and Sah (2023) found that the efficiency of the website and electronic customer service were the most significant aspects of e-banking service practices. These were followed by user-friendliness, security and privacy, and the organization's site. This highlights that banks with efficient websites and swift transactions through easily accessible online platforms tend to attract more customers. Bank websites should present details regarding their privacy policies to safeguard customer data and maintain the confidentiality of credit card information. This includes privacy and security, building trust in the website, ensuring information quality and responsiveness. Ultimately, this leads to customer satisfaction and the likelihood of customers returning for electronic transactions with the bank without considering switching to another institution.

The findings also indicate the connection between the information quality and customer satisfaction. When engaging with banks and similar financial entities, customers prioritize the website's security and confidentiality. It is also consistent with prior (Hamzah, 2022). It states that banks should increase the information quality in Internet banking by offering customer satisfaction. To guarantee the quality of information, banks must comply with the State Bank's regulations regarding information disclosure to customers. Moreover, banks should establish an efficient, secure, and transparent information management system. It is essential for banks to regularly and promptly conduct assessments and appraisals of the information they deliver. Additionally, they should swiftly and openly receive and address customer feedback and suggestions concerning information quality.

The findings from the present study reveal several important, even if broad, implications for practitioners. Finally, convenience and responsiveness are the least critical of the four E-S-QUAL. Previous research has argued that responsiveness may not be critical for users (Wolfinbarger & Gilly, 2003). According to Jahan & Shahria (2021), the convenience factors associated with mobile banking do not significantly determine satisfaction. There could be several explanations for this phenomenon. For instance, individuals have become accustomed to mobile security codes and account PINs over time. While they were initially a primary concern for people, they do not significantly impact overall satisfaction. However, no single factor should be overlooked in this era of intense competition. Although these factors may not significantly influence today, banks can still enhance the number of mobile banking customers by implementing a convenient banking policy through adopting appropriate measures. This is because, within the banking industry, these factors may not actively contribute to developing loyal customers. The responsiveness dimension has a negligible impact on Customer Satisfaction. Within the dimensions of service quality, Responsiveness is essentially a variable or dimension that doesn't pose an issue in this research. Service quality related to responsiveness, or the speed of response to customers, is generally swift and doesn't trouble customers.

However, the results are also consistent with prior Internet banking research such as Ladhari et al., 2011; Ishfaq, 2022; and Khan, 2022. This plays a pivotal role in fulfilling customer needs and desires, ensuring customers always feel heard and understood. It also contributes to creating a psychological element that positively influences customer satisfaction when they use electronic banking services conveniently.

In this study, all six components of banking service quality influence e-customer satisfaction. Therefore, banks should strategically raise customer awareness of the acceptability of the Internet banking system.

4. CONCLUSION AND IMPLICATIONS

In this study, we present a new method that integrates E-S-QUAL and E-TAILQ to examine the relationship between the dimensions of E-Banking service quality and customer satisfaction. Six dimensions of Internet banking service quality were taken for the study. Our contribution to theory is an extended model based on E-S-QUAL and E-TAILQ in which overall electric service quality, as measured by the E-S-QUAL and E-TAILQ variables, influences satisfaction.

Numerous research studies in the literature have employed E-TAILQ and E-S-QUAL scales to evaluate the quality of e-services in advanced or developed nations (Zia et al., 2022). Only a few studies addressed the validity of these widely used competing scales in an emerging economy like Vietnam. This study addresses the literature gap by addressing the reliability and validity of these scales and assesses the impact of e-service quality in Internet banking. Besides, the study reveals insights into the literature by addressing multiple dimensions of e-service quality and summarizes a deep understanding of each scale item that affects customer satisfaction.

4.1 Implications for Theory

In Internet banking, our findings show that adding convenience to the integrated E-S-QUAL and E-TAILQ variables provides more insight. Our theoretical model also confirms the information quality factor by the IS success model (Delone & Mclean, 1992). With this theoretical design, future researchers can quickly test additional variables that might mediate the influence of satisfaction on continuance.

4.2 Implications for Practice

The empirical reveals that Ho Chi Minh commercial banks can enhance their competitiveness and achieve sustainable growth in the highly competitive e-banking sector by prioritizing security, reliability, quality information, responsiveness, website design, and convenience.

Numerous obstacles exist when upholding services and service quality within the banking industry. Therefore, these discoveries provide valuable insights to the banking sector for crafting effective marketing strategies, fostering enduring customer relationships, and attaining a competitive edge in the market. Additionally, this research is expected to contribute to expanding digital banking on both domestic and international fronts. It is poised to be advantageous for enhancing individuals' financial well-being, strengthening communities, and reinforcing financial connections.

4.3 Limitations and Future Research Directions

The foremost limitation of this research is associated with convenience sampling. Furthermore, this study used the "E-S-QUAL scale" to assess the E-S-QUAL on the client of Viet Nam; however, other scale constructs like "WEBQUAL" can also be examined on the population. Research can be done to obtain a comparative analysis between foreign and local banks in Viet Nam. The current framework can be broadened by incorporating additional variables such as re-purchase intention, word-of-mouth recommendations, and perceived value. Furthermore, future research could employ probability sampling methods instead of convenience sampling to enhance the robustness of the results and mitigate selection bias concerns. Additionally, it would be beneficial to integrate insights from e-banking to complement and reinforce the findings about E-S-QUAL and E-TAILQ, thus enhancing the practical implications.

THE ROLE OF EWOM AND BRAND TRUST IN THE ONLINE PURCHASE INTENTION: AN EMPIRICAL OF THE UNIQLO FASHION BRAND

Ph.D Nguyen Thi Thuy Giang[1], Nguyen Thanh Mai, Nguyen Thuy Tien

Abstract: This study aims to examine the interaction effect of eWOM on online purchase intention and brand trust toward purchase intention at the Uniqlo fashion online store. The role of the mediation of satisfaction is vestigated. A quantitative approach was utilized to gather data via online surveys to bolster the suggested model. A total of 186 participants were included in the sample, chosen through non-probabilistic convenience sampling methods, and provided with instructions to answer the survey questions. The collected data underwent analysis utilizing PLS-SEM techniques. The findings indicate that the interaction between eWOM and brand trust influences purchase intention. Notably, the results reveal the dual roles of eWOM and brand trust, which increase purchase intention directly and indirectly.

Keywords: Brand trust, eWom, fashion industry, purchase intention.

1. INTRODUCTION

With the rise of the internet and social media, eWOM has become increasingly important in consumer purchasing decisions in the apparel industry. Prospective customers use eWOM as a source of clothing inspiration, highlighting the importance of the internet in the apparel industry. The consumer trend reflects an increasing inclination to engage in online fashion shopping (Dream Incubator Group, 2021). This trend is driven by the higher income levels of the population and the influence of brands and fashion trends on consumer choices. Among the international fashion brands venturing into the Vietnamese market, Uniqlo is one of the noteworthy names. Uniqlo, Japan's leading fashion brand, has a global presence with more than 2,200 stores worldwide, but its primary focus is on the Asian market, where approximately 92% of its stores are located.

EWOM marketing can create an exponential referral chain in the fashion industry, contributing to constant traffic, leads, and sales. This property of eWOM makes it an important channel, allowing consumers to actively participate in discussions about specific products and brands and share information reliably and effectively, helping to reduce risk in the purchasing process (Hennig-Thurau & Walsh, 2004). However, there are also challenges related to the origin and reliability of eWOM information (Chatterjee, 2004). Social media interactions are expected to entail more unpredictability and less control when compared to in-person communication. As a result, specific online consumers may attach significant importance to uncertainty avoidance (Hudson et al., 2015). Trust, in this context, denotes the extent of a customer's faith in the existence of a relationship with the service brand (Cheng & Jiang, 2022). Customer satisfaction correlates with brand trust, influencing positive or negative customer retention. Customer satisfaction influences purchase intention more than service quality (Cronin & Taylor, 1994).

Previous research on purchase intentions predominantly adopted a relational perspective, concentrating on pre-existing connections (such as satisfaction, trust, commitment, and friendship)

---

among members while overlooking the impact of eWOM influence from other social media members. A lack of online purchase intention significantly hinders e-commerce growth (He et al., 2008). Further research is necessary to explore online purchase intention and behavior (Pena-García et al., 2020). Therefore, it is essential to understand how eWOM and brand trust influence purchase intentionthrough satisfaction with the Uniqlo brand in Vietnam. In doing so, we integrate the theory of reasoned action (TRA) and the Theory of Informational Social Influence.

2. LITERATURE REVIEW AND METHODOLOGY

2.1. Theory of reasoned action (TRA)

Ajzen & Fishbein (1975) contended that as people's attitude toward behavior is determined by their salient beliefs about the behavior, their attitude could be changed by influencing their primary beliefs. In a context where customers have little experience online, they will often tend to follow the instructions of their relatives or friends. Especially in Vietnam - one of the countries that promotes community culture, being influenced by relatives and friends around individuals on individual behavioral intentions is often found. According to Fishbein & Ajzen (1975), the subjective norm factor relates to how individuals evaluate how people around them perceive when they perform a behavior that receives negative opinions. Previous researchers have frequently used TRA to examine eWOM and purchase intention (Yusuf et al., 2018). This has been widely used in the context of e-commerce behavior (Lim & Dubinsky, 2005).

2.2. Theory of Informational Social Influence

Deutsch and Gerard (1955) propose two distinct categories of social influence: informational and normative social influence. Social effect occurs when the actions, viewpoints, and words of others impact an individual's actions or thoughts. People consistently assess their beliefs against those voiced by others to determine the appropriateness of their behavior (Kuan et al., 2014). The theoretical stance emphasizes a social information processing approach, wherein individuals can directly construct meaning through exposure to the expressed opinions and attitudes of others.

2.2. Hypothesis development

2.2.1. eWOM and customer satisfaction

eWOM

Word of mouth refers to the direct exchange of information between consumers regarding a product or brand. With the advancement of information and communication technologies, this form of communication has evolved into eWOM (Luthfiyatillah et al., 2020). eWOM encompasses communication on the internet and is facilitated through various online platforms, such as blogs, reviews, forums, online marketplaces, and social media channels. The content shared by previous customers on these platforms helps instill confidence in potential buyers when purchasing products or services.

C*ustomer satisfaction*

Satisfaction holds significant importance in the competitive landscape of e-commerce because it dramatically influences people's intentions and behaviors (Hsu et al., 2016). Satisfaction is commonly employed as an indicator of the quality of relationships, and a satisfactory relationship signifies that customers have enjoyed a positive experience with a brand's products or services (Jeon & Baeck, 2016). Achieving customer satisfaction is a crucial goal for all companies, and one of the critical elements in achieving it is eWOM. As Rahayu et al. (2023) stated, customer satisfaction represents customers' emotional responses to the experiences they anticipate and ultimately receive.

The theory of Informational Social Influence refers to an individual's desire for contentment derived from a product or service (Pasaribu et al., 2019). As per the findings of Laura and Fadella (2022), social media is a valuable tool for enabling people to connect with others, sharing information, and acting as an informative platform where users can learn about products offered by thrift store businesses. A study conducted by Seo et al. (2020) highlights the effectiveness of eWOM in showcasing positive reviews on social media and encouraging customers to share favorable feedback about their shopping experiences on social platforms. If consumers possess a great psychological experience with a particular product or service, they may be satisfied (Djelassi et al., 2018; Teng & Wu, 2019). Thus, we propose the following hypothesis:

H1: eWOM has a significant positive impact on consumer satisfaction.

2.2.2 Brand trust and consumer satisfaction

Brand trust

Fernandez and Lewis (2019) argue that brand trust is when consumers want to believe in themselves and an available product. Brand trust is the belief in a brand's dependability, as seen by consumers. It stems from their experiences and a consistent track record of meeting product performance and satisfaction expectations. In this fashion industry, brand trust is critical in competitive endeavors and in establishing strong consumer confidence. When consumers have a high level of trust in a brand, they are more inclined to select products or services from that brand, even if the price is higher than rival brands. Spending increased time engaging with a brand on social media results in a greater level of consumer investment in the relationship, consequently leading to a more robust brand relationship quality. Additionally, these interactions can benefit consumers by enhancing their understanding of the brand's products or services, reducing consumption-related risks, and fostering a heightened sense of trust (Hudson et al., 2015). For example, in the fashion industry, brands provide customers with reliable information through chatbots, diminishing uncertainty levels and bolstering customer satisfaction (Cheng & Jiang, 2022). Thus, we propose the following hypothesis:

H2: Customer satisfaction has a significant positive impact on brand trust.

2.2.3 Online purchase intention and Brand trust

Online purchase intention

Intentions indicate a willingness to perform a specific behavior, such as online purchasing (Ajzen, 1991). In this research, the online purchase intention concept, derived from Fu et al. (2020), refers to the readiness to accept recommendations and advice from members of social media communities before finalizing purchase decisions. Therefore, online purchase intention is the degree to which a consumer is willing to buy a product through an online store; in other words, consumers make purchases over the Internet. Calefato et al. (2015) emphasized the crucial role of social media interactions in cultivating brand trust, noting that such interactions can arise from a firm's generated content or through online comments and social media metrics. Jadil et al. (2022) underscored the significant influence of online trust on consumer behavior, a sentiment also supported by Pop et al. (2022), who affirmed that brand trust positively impacts purchase intent. Therefore, we propose the following hypotheses:

Hypothesis H3: Brand trust significantly positively impacts the online purchase intention

2.2.4 Customer satisfaction and online purchase intention

Consumers have the opportunity to leverage social networks for more informed buying choices. Given that social network users typically consist of friends, indirect acquaintances, or even strangers, the information they share tends to come across as more genuine when compared to recommendations or reviews found on e-commerce platforms that sellers supply. Consequently, consumers tend to favor information available on the shopping sections of social networking websites (Fu et al., 2020). Besides, in the context where brands are increasingly important in the business, other researchers have argued that high brand satisfaction is a reliable indicator of a person's likelihood to purchase (Paulo Rita et al., 2019). Therefore, we propose the following hypotheses:

Hypothesis H4: Customer satisfaction has a significant positive impact on purchase intention.

2.2.5. eWOM and online purchase intention

Today, online platforms empower users to reshape their perceptions of products and services, influencing their choices regarding service usage and purchases (Castillo & Fernández, 2019; Nuseir, 2019). eWOM is the act of consumers sharing their opinions online through social media and digital platforms. Typically, these viewpoints are shared with other users. eWOM, defined by Hennig-Thurau et al. (2004), refers to any statement made by customers about a company or product shared on the internet with a broad audience. This significantly impacts businesses and their clientele (López & Sicilia, 2014). Therefore, we propose the following hypotheses:

Hypothesis H5: eWOM significantly positively impacts the purchase intention of social shopping.

2.3. Customer Satisfaction as a Mediator

In marketing, consumer satisfaction is consistently recognized as a crucial factor in the intention to repurchase. When examining the connection between satisfaction and sense, studies always reveal that satisfaction consistently and positively impacts purchase intentions (Cronin & Taylor, 1994). Positive eWOM is directed based on favorable or unfavorable assessments of service quality, and these assessments play a pivotal role in shaping purchase intentions. Customer satisfaction is an emotional response of approval when getting satisfactory results and as an alternative when getting dissatisfied results (Cheng et al., 2018). This study revealed the mediation effects of satisfaction on purchase intention. The following hypotheses are proposed:

H6: The indirect effect of eWOM on online purchase intention will be mediated through customer satisfaction.

2.4. Methodology

2.4.1. Measures

For this study, we employed quantitative research methods. The questionnaire used in the study underwent a thorough review process, involving feedback from two Uniqlo store employees and two marketing professors. Their input was taken into account to refine the final questionnaire. Before launching the official survey, we conducted a pilot test by personally distributing the questionnaire to 30 individuals to validate its suitability and assess the accuracy of the phrasing. We also carefully reviewed both numerical and qualitative feedback obtained during the pretests.

In this study, we used measurement scales that were previously validated in the literature. The measures for online purchase intentions were adapted from Fu et al.'s (2020) research. To measure trust brand and satisfaction, we adapted the study of Cheng and Jiang (2022). The scales to measure eWOM were obtained from the study by Kala & Chaubey (2018). All these measurement items were rated on a five-point Likert-type scale, ranging from "strongly agree (5)" to "strongly disagree (1)." The items for the scale can be located in Table 2.

2.4.2. Data collection

Yoo et al. (2000) pointed out that the accuracy and validity of responses in a questionnaire about specific services depend on the respondents' knowledge and personal experiences with those services. To ensure reliable responses, we implemented initial screening questions to confirm the respondents were familiar with the Uniqlo fashion brand. We distributed the questionnaire through social networks and sent regular reminders to improve the response rate. To encourage participation and ensure reliable evaluation, respondents were given a choice between a thank-you gift or three ebooks related to international business or receiving VND 30,000 through the electronic wallet.

The author collected data from March to June 2023 from Ho Chi Minh City customers who had taken part in Uniqlo's fashion brand activities. A total of 213 valid responses were gathered and analyzed after excluding invalid or incomplete answers. As a result, 186 responses from customers interested in Uniqlo in Ho Chi Minh City were included in the analysis. The response rate of 87.3% (186 out of 213) exceeded the recommended minimum threshold of 20% for survey-based research. Additionally, the survey sample exclusively focused on Ho Chi Minh City, ensuring geographical representation. You can find the demographic information for the sample in Table 1.

Table 1. Respondents' profile (n = 186)

Demographic characteristics		Occurrence frequency	Occurrence rate (%)
Sex	Male	67	36
	Female	119	64
Age	Under l8 years old	28	15,1
	From 18 to under 32 years old	48	25,8
	From 32 to under 40 years old	45	24,2
	Over 40 years old	65	34,9
Occupation	Housewife	35	18,8
	Employee	21	11,3
	Freelancer	44	23,7
	Student	28	15,1
	Other	58	31,2
Income	Under 5 million VND	9	4,8
	From 5 to under 10 million VND	36	19,4
	From l0 to under 15 million VND	45	24,2
	From 15 to 20 million VND	47	25,3
Total		186	100%

3. RESEARCH RESULTS AND DISCUSSION

Hair et al. (2019) argue that PLS is well-suited for examining causal relationships formulated based on theories and tested using hypotheses and empirical data.

3.1. Measurement Model

The results in Table 2 show that the measurement scale meets the requirements of both Cronbach's Alpha is > 0.7, and all CR indicates surpass the required threshold, demonstrating the reliability of the measurement scale. The factor loading is more than 0.7, and only item (BT3) has been dropped because the loading coefficients are weak.

Table 2: Construct Measures and Confirmatory Factor Analysis Results

Construct and Scale Item			Factor Loading
eWOM (CR= 0.882; AVE = 0.598; α= 0.833)	eW1	I understand a product better after receiving relevant information about that product in online reviews.	0.768
	eW2	A comment or update about a product/brand on eWOM forms influences how I consider that product	0.791
	eW3	I will likely change my opinion about a product or brand after reading positive or negative comments on an eWOM forum.	0.785
	eW4	Given a choice between two products, one recommended on eWOM forums and the other not, I would always buy the recommended product.	0.741
	eW5	eWOM forms are important sources of information for me.	0.782
Brand Trust (BT) (CR= 0.859; AVE = 0.604; α=0.783)	BT1	I believe the brand treats me fairly and justly	0.802
	BT2	I believe that whenever the brand makes an important decision, I know it will be concerned about me	0.811
	BT4	I believe the brand takes my opinions into account when making decisions	0.762
	BT5	I believe I feel very confident about the brand's skills	0.731
Customer Satisfaction (SA) (CR= 0.811; AVE = 0.569; α=0.868)	ST1	Compared to other fashion stores online, I am delighted with X.	0.754
	ST2	Based on all my experience with X, I am delighted	0.752
	ST3	I believe both this brand and I benefit from the relationship	0.753
	ST4	I believe I enjoy dealing with this brand.	0.762
	ST5	Generally speaking, I am pleased with the relationship this brand has established with me	0.751
Online purchase intention (PI) (CR=0.898 ; AVE = 0.639; α= 0.858)	PI1	I strongly intend to purchase the product if members on social media recommend the product.	0.794
	PI2	I trust social media product reviews.	0.767
	PI3	I will consider the shopping experiences of members when I want to buy.	0.821
	PI4	I will ask members of social media to provide me with their suggestions before I go shopping.	0.833
	PI5	I am willing to buy the products recommended by members on social media.	0.780

For criminant validity, we employed two criteria: the square root of AVE and the Heterotrait − Monotrait Ratio (HTMT). Our findings indicate that the square root of AVE exceeded its correlation with any other construct (as shown in Table 3) by Fornell and Larcker (1981). Furthermore, Heterotrait − Monotrait ratios, as depicted in Table 4, were below the threshold of 0.90, as suggested by Henseler et al. (2015). Therefore, based on the outcomes of these two criteria, we can confidently affirm that this research does not encounter issues with discriminant validity.

Table 3. Discriminant validity (Fornell-Larcker)

	BT	eWOM	PI	SA
BT	0.777			
eWOM	0.169	0.774		
PI	0.270	0.566	0.799	
SA	0.206	0.466	0.513	0.754

Table 4. The Heterotrait – Monotrait Ratio (HTMT)

	BT	**eWOM**	**PI**	**SA**
BT				
eWOM	0.200			
PI	0.327	0.664		
SA	0.259	0.560	0.610	

4.2 The structural model

Our results show the values of R^2 for BT (0.043), SA (0.217), and PI (0.418). Both R^2 values were considered acceptable. Both SA (0.217) and PI (0.418) obtained moderate R^2 values. However, BT counts for a value of 0.043, considered weak. The values of f^2 results revealed some significant impacts. For instance, some values yield large effects, such as eWOM on PI ($f^2 = 0.219$) and eWOM on SA ($f^2 = 0.277$). Others pay minor effects, such as BT on PI ($f^2 = 0.032$) and SA on BT ($f^2 = 0.044$). At the same time, we find that the impact of SA on PI ($f^2 = 0.115$) is medium (Cohen, 1988). To assess Q^2, we employed the blindfolding technique by excluding the distance set to 7 from our analysis. The results showed that all four endogenous variables had Q^2 values greater than zero. These values varied within a range ranging from $Q^2 = 0.023$ to 0.262. Lastly, the VIF (Variance Inflation Factor) values fell within the scope of 1.519 to 2.161, indicating the absence of collinearity issues since they are below the threshold of '5', as advised by Hair et al. (2019).

The Standardized Root Mean Square Residual (SRMR) index must be considered to assess the model's goodness of fit to the empirical data. The SRMR value is 0.062, which is < 0.08, indicating that the structural model fits the data well (Henseler et al., 2017).

To examine our hypotheses, we employed PLS along with the bootstrapping method, conducting 5,000 iterations following the approach suggested by Hair et al. (2019). Our findings indicated that all our hypotheses were corroborated, as demonstrated in Table 5.

Table 5. PLS Results for Structural Model

	Original Sample (0)	**T Statistics**	**P Values**	**Result**
H1: eWOM -> SA	0.466	8.458	0.000	Accepted
H2: SA -> BT	0.206	3.334	0.001	Accepted
H3: BT-> PI	0.140	3.064	0.002	Accepted
H4: SA -> PI	0.295	5.202	0.000	Accepted

H5: eWOM -> PI	0.405	6.089	0.000	Accepted
H6: eWOM -> SA -> PI	0.138	4.167	0.000	Accepted

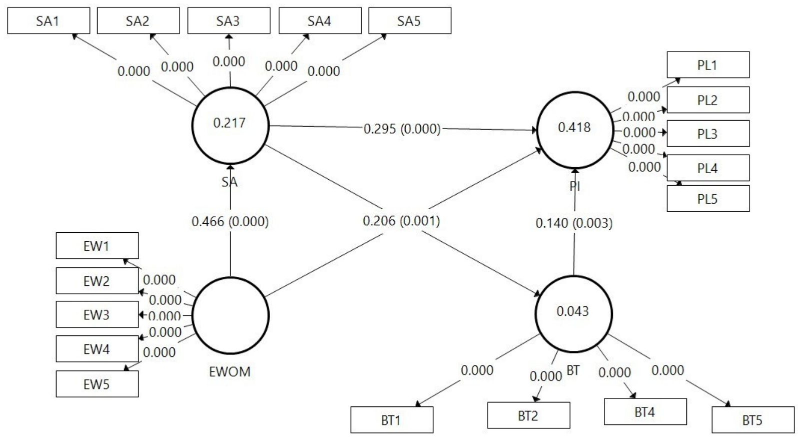

Figure 1. Structural model test results

3.3. Discussion

The PLS results for the structural model, as presented in Table 5, confirm that all the hypotheses we formulated have received empirical support.

- In support of hypothesis H1, Our research confirmed that eWOM significantly impacts customer satisfaction ($\beta = 0.466$, $p = 0.000$), which is crucial for a company's profitability. This aligns with previous studies by Duarte et al. and Laura and Fadella that highlighted the positive influence of eWOM on customer satisfaction, especially in the fashion industry. Social media interactions can efficiently resolve customer issues, resulting in satisfaction (Ramanathan et al., 2017). Effective social media interaction by companies in addressing product/service issues enhances customer satisfaction (Kautish et al., 2023). The current result comes from extant literature (Luthfiyatillah et al., 2020; Hendro & Keni, 2020; Pradeep Kautish et al., 2023; Patel et al., 2023).

- Hypothesis H2 suggests that customer satisfaction significantly and positively influences brand trust, supported by $\beta = 0.206$ and $p = 0.001$. This is consistent with previous research by Cheng and Jiang (2022) and Meylani Tuti and Viki Sulistia (2022). Brand trust is essential for customer satisfaction (Fernandez & Lewis, 2019; Alsini, 2017; Sangadji & Sopiah, 2013; Hudson et al., 2015; Cheng & Jiang, 2021).

- Supported hypothesis H3 ($\beta = 0.140$, $p = 0.002$), Brand trust significantly impacts online purchase intention. Higher trust in a brand leads to a higher likelihood of purchases. Kim and Kim (2021) report that brand trust affects purchase intentions, influencer trust, attractiveness, and similarity to followers. Armawan et al. (2022) also demonstrate that social media marketing, SerQual, and eWOM influence purchase intentions through brand image and trust.

- Supporting hypothesis H4 ($\beta = 0.295$, $p = 0.000$), customer satisfaction significantly affects online purchase intention. This discovery corresponds with Dash et al.'s (2021) research, which delves into the evolution of Marketing 4.0 and empirically investigates its influence on customer satisfaction and purchase intent. Similarly, Sadia Khatoon et al. (2020) discovered a positive correlation between customer satisfaction and purchase intention. Furthermore, the current findings align with existing literature (Rita et al., 2019).

- Supporting hypothesis H5 (β = 0.405, p = 0.000, eWOM (electronic word-of-mouth) has a positive impact on online purchase intention. Social media has immense influence in spreading and filtering topics, shaping personal decisions, and creating a moral environment for eWOM. This makes social e-commerce information more credible and useful (Hajli, 2018), increasing consumers' willingness to share their shopping experiences. As a result, improving the reputation of opinion leaders has become a rapidly growing business strategy. Yusuf et al. (2018) provide insight into what individual users need for eWOM communication in social commerce. When customers actively engage in eWOM communication, they are more likely to develop a stronger intention to purchase.

- Table 5 shows that customer satisfaction partially mediates the relationship between eWOM and online purchase intention (β = 0.138, P = 0.006). This confirms that satisfaction consistently and positively impacts purchase intention. Customer satisfaction is essential for businesses to adapt to evolving customer behaviors in dynamic environments and remain competitive (Khatoon et al., 2020).

4. CONCLUSION AND IMPLICATIONS

This study examined how electronic word-of-mouth (eWOM) and brand trust impact consumers' intention to purchase online, mainly when the eWOM is considered highly influential, and consumers have a high level of aversion to uncertainty. When consumers perceive information as credible, they are more likely to participate in eWOM activities such as sharing or seeking information. Uniqlo brand should encourage customers to include important details when sharing their experiences to assist other consumers in verifying the credibility of the messages. Uniqlo, which offers comfortable and distinctive products, can affect customer satisfaction. Therefore, Uniqlo must maintain and develop its unique products to retain or increase customers' intention to purchase their products online.

To achieve this objective, the study proposed six hypotheses based on the integration foundation theory of reasoned action and the theory of informational social influence. The findings of the study indicate that all six hypotheses were supported. The study analyzed the factors of eWOM, brand trust, and satisfaction with the Uniqlo brand, which directly and indirectly affect online purchase intention. The study suggests that electronic eWOM has the greatest influence on consumers, who exhibit a strong tendency to engage in eWOM and, in turn, have a higher likelihood of making purchases. Customer satisfaction is a crucial factor that influences purchase intention. Given the widespread of online shopping, consumers have now become information sources and information seekers. As it is commonly acknowledged, obtaining as much information as possible is one of the fundamental benefits of being part of online groups. eWOM is currently recognized as a crucial marketing tool that is believed to have a greater impact on consumers than traditional advertisements (Yusuf et al, 2018). However, there has not been enough research on eWOM yet, particularly on what factors determine consumer engagement with eWOM in online shopping. In this study, we aim to investigate the determinants of eWOM and its influence on consumers' purchase intention of the Uniqlo brand during online shopping.

This study provides valuable insights into the factors that influence consumers' online purchase intentions for the Uniqlo brand. The findings can help in developing effective marketing strategies that optimize costs, making it easier for consumers to make informed, convenient, and value-driven purchases. By encouraging customers to leave reviews, the Uniqlo brand can benefit from eWOM generated by satisfied customers. Nowadays, many companies organize contests to select the best reviews of the year, which encourages their clients to write more reviews. These findings can guide firms in developing better online strategies to engage with customers and encourage eWOM.

4.1. Implications for Theory

Informational social influence becomes particularly significant when consumers face time constraints, possess limited knowledge, perceive high risks associated with their actions, or lack the motivation to make purchase decisions independently. We posit that prospective online shoppers are likely to seek the opinions of their friends or online consumer groups before making an online purchase intention. Our study primarily focused on positive informational social influence (eWOM) because our objective was to enhance the online shopping experience. Moreover, the effect of eWOM on online purchase intention is strongly mediated by customer satisfaction.

4.2. Implications for Practice

- Our research also provides material, especially for the fashion industry. Many retailers have recognized the power of the Internet, yet they still struggle to determine which strategies will be most effective in influencing consumers' purchasing intentions. Consumer reviews play an essential role in enhancing online consumers' purchase decisions. Our research provides empirical evidence that eWOM, brand trust, and satisfaction of other consumers positively influence online purchase intention. Messages in online discussion forums and customer satisfaction influence consumers' purchase decisions through brand trust. The results of this study provide recommendations for marketing managers in the branded fashion industry in Vietnam.

- Achieving customer satisfaction is crucial for success in the branded fashion industry. To achieve this, the Uniqlo brand should focus on providing an excellent physical store space or website interface, responding to customer inquiries promptly, and processing orders efficiently. Customers often express their satisfaction through reviews. They can rate the products, provide feedback, and interact by commenting on websites or online stores. Satisfaction links electronic media or word of mouth and purchase intention. Fashion store managers must build effective communication strategies and improve marketing management to create comfortable experiences for customers. Doing so can improve service and product quality, increase customer satisfaction, and enhance brand trust.

- Uniqlo must maintain a seamless offline-to-online transition through an omnichannel approach to retain consumer trust. Improving product and service quality, responding to customer feedback, building a strong brand image, and enhancing customer satisfaction can promote purchase intention and increase profits.

4.3. Limitations and Future Research Directions

Despite the contributions of the current study, it has several limitations. To begin with, one limitation of our study stems from the fact that the data was gathered from relatively homogenous consumer groups. Another limitation is the relatively modest sample size, which might restrict our capacity to demonstrate statistical significance during hypothesis testing. Lastly, it is important to note that our research exclusively focuses on examining the effects of "positive" informational social influence on consumer decision-making within online shopping. In contrast, negative word of mouth in traditional shopping spreads faster than positive feedback.

Further research directions need to improve the limitations of this study. First, many non-fixed and unstable factors can cause consumer opinions to change over time. Second, because the investigation is limited to the Uniqlo brand in Ho Chi Minh City, it may not be possible to evaluate the purchase intentions of Uniqlo in particular and other brands in general more thoroughly. Finally, there may be limitations to selecting each variable that influences respondent choice.

THE MODERATING ROLE OF GOVERNMENT SUPPORT PROGRAMS: THE CASE OF VIETNAMESE AGRICULTURAL SMES EXPORTING TO ASEAN+3

Assoc. Prof. PhD Le Tan Buu[1], Ph.D Mai Xuan Dao[2]

Abstract: This paper examines the moderating effect of Government support programs on the relationship between perceived internal, external export barriers and export performance. 278 Vietnamese SMEs exporting agricultural products to ASEAN+3 were surveyed. The research method is the mixed research method of qualitative and quantitative methods. Smart-PLS software was applied to test the data. The results show that there are not the moderating effects of Government support programs on the relationships between internal, external export barriers and export performance. In addition, perceived internal export barriers have a small effect on export performance but perceived external export barriers do not affect export performance. Based on the results, some policy implications are suggested related to the increase in SME's resource and Government support programs.

Key words: export performance, external barriers, Government support programs, internal barriers

JEL code: P33

1. INTRODUCTION

Vietnam has shifted from a trade deficit to a trade surplus since 2012. However, there is trade deficit in some markets, especially the ASEAN+3 with about 60 billion USD from 2018 to 2022 (The authors' calculation). Besides, agricultural products are Vietnamese traditional exports and ASEAN+3 are Vietnamese key export markets. The trade deficit with ASEAN+3 can be handled by increasing Vietnamese SMEs agricultural exports to these markets. In addition, exporting to ASEAN+3 is suitable for SMEs that possess limited resources. With limited resources they face a lot of barriers to export to far distance markets such as American or European markets. Therefore, SMEs are far more dependent on external resources to export (Ramaswami & Yang, 1990). One of important external resources is Government support programs. With resource limitation, the support from the Government is very important to SMEs. However, it is inevitable that SMEs will encounter many barriers when exporting to ASEAN+3 market. In order to overcome many barriers, Government support programs are needed. There have been studies on Government support programs as an antecedent to help reduce export barriers, thereby increasing export results (Karakaya & Yannopoulos, 2012). In addition, there are a lot of researches which prove the direct relationship between Government support programs and export performance (Ali & Shamsuddoha, 2007; Leonidou et al., 2011; Haddoud et al., 2017; Wang et al., 2017) but not many researches have been found on the moderating role of Government support programs. Do Government export support programs reduce the negative impact between export barriers and export performance? Related to this topic, there is just research from Haddoud et al., (2018). The research context of these authors was in Algeria, targeting SMEs operating in the manufacturing sector. Therefore, it is essential to research the moderating role of Government export support programs in the other countries and in specific export field to evaluate the importance of this variable. This paper objectives include:

1 Email: buult@ueh.edu.vn, University of Economics Ho Chi Minh City.

2 University of Finance - Marketing.

- To test the moderating effect of Government support programs on the relationship between perceived export barriers and export performance.
- To test the relationship between perceived export barriers and export performance.
- To suggest some policy implications to push the export of agricultural products to ASEAN+3.

2. LITERATURE REVIEW AND METHODOLOGY

2.1. Literature Review

- Export barriers

Export barriers are limitations that hinder a firm's ability to initiate, continue, or develop business in foreign markets (Morgan & Katsikeas, 1998; Leonidou, 2004). There is also a wide array of export barriers which can be grouped as initial and ongoing barriers (Bilkey & Tesar, 1977); internal and external export barriers (Cavusgil, 1984; Leonidou, 1995); barriers from regular and sporadic exporters (Kaleka & Katsikeas, 1995). This research approaches the classification of internal barriers and external barriers (Leonidou, 1995). All causes associated with the enterprise's internal structure are internal barriers and all those issues that are outside the enterprise are considered as external barriers. Internal barriers include informational, functional, financial and marketing barriers while external barriers include procedural, governmental, task and environmental barriers (Narayanan, 2015).

- Government support programs

Government support programs are public policy measures offered to business community with the aim to improve the international competitiveness of domestic firms (Lages & Montgomery 2005). Seringhaus (1986) suggested that Government support programs are designed to "motivate firms into export action" and to "stimulate the exporting process". According to Shamsuddoha et al., (2009), the use of Government support programs gives managers more information and experience to help them overcome export barriers as well as create export stimuli which increase the export performance. According to Gençtürk and Kotabe (2001), Kotabe and Czinkota (1992), Singer and Czinkota (1994), Government support programs may be classified according to the nature of offered knowledge. The authors identified informational and experiential knowledge, with the former obtained through workshops and seminars and the latter acquired through direct contacts with foreign markets and clients. Some authors divided Government support programs based on real programs in their countries (Lages & Montgomery, 2005; Freixanet & Churakova, 2018). Leonidou et al., (2011) classified Government support programs into support of information, training, trade mobility and finance. Leonidou et al., (2011) classification is applied in this paper because with specific support program groups are clearer to understand.

- Export performance

According to Cavusgil and Zou (1994), export performance is defined as the degree which a firm implements strategies and economic objectives related to exporting to foreign markets. Papadopoulos & Martín (2010) define that export performance are business results in international market. Export performance can be showed in financial measures, such as international sales, profit, market share and growth measures. Furthermore, there are non-financial measures, such as management satisfaction with exporting and goal achievement (Zou & Stan, 1998). In order to measure export performance, it can be measured by either objective or subjective method. While objective measure relates to financial data such as profit, sales, growth…, subjective measure is based on the perception of the board of directors or decision-makers in SMEs. Subjective measure is more practical because SMEs board of directors or decision-makers are reluctant to provide their own SMEs' financial data (Hult et al., 2008). Because of this, this paper approaches subjective measure based on SMEs' satisfaction on export performance which is consistent with Ali & Shamsuddoha (2007), Sadeghi et al., (2018).

- The relationship between perceived export barriers and export performance

According to Resource-Based View (RBV) theory, a firm's competitive advantage comes primarily from its valuable tangible and intangible resources (Wernerfelt, 1984). In the context of internationalization, if a firm aspires to enter international markets and to export regularly, it should consider whether its resources can be a source of competitive advantage. More specifically, the firm should assess whether its resources are valuable, rare, and difficult to imitate or substitute (Barney, 1991). RBV is applicable to analyze the international activities of smaller firms because it helps to gauge how well positioned a firm is to succeed in expanding to foreign markets. If SMEs does not possess unique resources, the enterprise will perceive as internal export barriers that adversely affect their performance.

According to Lawrence and Lorsch 's contingency theory (1967), SMEs internationalization behavior is dynamic and diverse because it mostly depends on the enterprise 's capabilities and on the external environment. Sousa et al. (2008); Nemkova et al. (2012) show that the external factors are approached based on external environmental factors which affect SMEs strategy and performance. In export activity, external factors are specific external environmental factors which are beyond SMEs' control such as political factors, characteristics of the export markets, legal factors, supports from domestic government… (Katsikeas, 2014). The adverse external environmental factors will be perceived as external export barriers and can be considered as external export barriers which affect SMEs' export performance. The more barriers are perceived, the more negatively effects on export performance that SMEs realize. This is because an enterprise that perceives export barriers will have a negative attitude towards exports which will be reflected in its export performance (Dean et al., 2000). Perceived barriers will limit the ability of relevant enterprises to effectively seek, identify and exploit export opportunities. This leads to dissatisfaction with export performance (Katsikeas et al., 1996). Most studies confirm that management perceptions of export barriers negatively affect export performance (Zou & Stan, 1998) and this has been proved in many studies such as Da Silva and Da Rocha (2001); Wilkinson and Brouthers (2006); Al-Hyari et al. (2012); Boermans and Roelfsema (2013); Sinkovics et al. (2018); Yong et al. (2018). Therefore, the following hypotheses will be tested:

H1: There is a negative relationship between perceived internal export barriers and export performance.

H2: There is a negative relationship between perceived external export barriers and export performance.

- The Government export support: the institutional based view

According to North (1990), the institutional based view is a system of constraints that shape and guide the actions of individuals and organizations to reduce uncertainty. The institutional theory provides a theoretical base to explain the enhancing role of institutional interactions on firms' internationalization (Oparaocha, 2015). Such interactions would typically provide an access to additional resources that firms may use in their international development (Oparaocha, 2015).

Government support is to guide businesses, provide knowledge, experience, reduce uncertainties... to achieve good performance. Government support is believed to be crucial for SMEs to overcome the hostile and uncertain environment which often associate with export markets (Seringhaus & Rosson, 1991).

- The relationship between Government support programs and export performance and the moderating effect of Government support programs

Government support programs are necessary for SMEs with limited resources. These programs help to improve SMEs capacity to initiate export activities, to satisfy export orders, to maintain and promote export activities. Government support programs help SMEs boost their export performance which have been proved in a lot of researches (Singer & Czinkota, 1994; Leonidou & et al., 2011; Shamsuddoha & et al., 2009; Durmusoglu & et al., 2012…). Besides, related to the relationship between Government support programs and export performance, in term of the relationship with export barriers, there is also research from Karakaya and Yannopoulos (2012) which shows the indirect effect between Government support programs and export performance via export barriers.

In this paper, we posit that the Government export programs enhance export performance through the reduction of export barriers. Wilkinson & Brouthers (2006) believed that attending exhibitions, fairs and seminars helps businesses increase their activities in markets which they lack experience. Durmusoglu et al. (2012) mentioned that export support is the main factor that positively affects export performance and helps to encourage businesses to increase their performance in new markets. Myint (2019) also shows that there is a positive relationship between financial, technical support and export performance when studying garment businesses in Myanmar. Therefore, with each kind of government support programs, it helps decrease the negative effect of informational barriers (Seringhaus, 1987; Shamsuddoha et al., 2009), export procedure barriers (Leonidou et al., 2011), customer requirement barriers (Seringhaus, 1987)… which push the SMEs export performance. With these arguments in mind, next hypotheses are proposed as follows:

H3: The Government support programs reduce the negative influence of perceived internal export barriers on export performance

H4: The Government support programs reduce the negative influence of perceived external export barriers on export performance

Research model is suggested as follow:

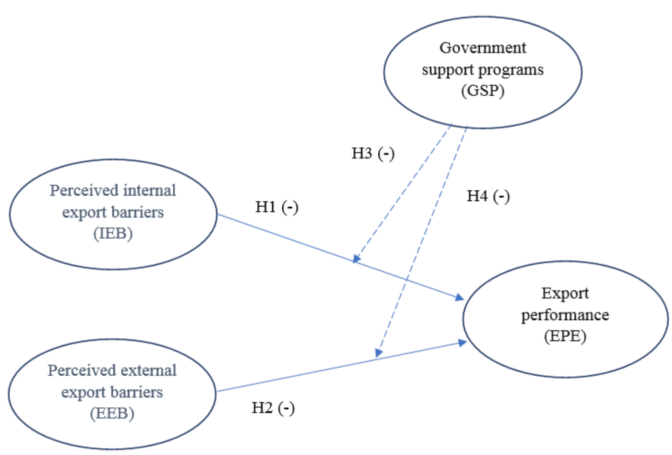

Figure 1: Proposed research model

2.2. Methodology

- *Method*

This study applied mixed method of qualitative and quantitative methods. Qualitative method was conducted through in-depth interviews with senior executives, owners coming from Vietnamese agricultural export SMEs to adjust the scales. After this step, the all scales were formed (Table 1). Next, the main survey was conducted by using face to face interviews or online survey. The second step of quantitative method was implemented to assess the measurement model and structural model.

- *Sample and data collection*

Survey samples are decision-makers in Vietnamese agricultural export SMEs located in some provinces in the North, the Centre and Highland and the South of Vietnam. Because it was not easy to approach SMEs decision-makers which belongs to the boards of directors, the sample taking method is convenience and snowball.

- *Statistical analysis*

PLS-SEM was applied to test hypotheses. PLS-SEM is suitable for this research model because of the following reasons:

- The sample (n = 278) is somewhat small.
- Lacking of testing the moderating effect of Government support programs in Vietnam so this research is also a kind of exploring research for which PLS-SEM is appropriate.

- *Scales*

The research scales are inherited from previous studies which were showed in the literature review and they are adjusted through the qualitative step to be suitable for the context in Vietnam. Government support programs (GSP) is a second order construct (Leonidou et al., 2011). Export performance (EPE) is a first order construct (Katsikeas et al, 1996). Perceived internal export barriers (IEB) and perceived external export barriers (EEB) are first order constructs based on previous studies and showed in below table:

Table 1: The research variables

Variables		Sources
Independent variables	Perceived internal export barriers (IEB)	
IEB1	Lack of experience/knowledge in X market	Leonidou (2004); Tesfom & Lutz (2006); Kahiya (2015)
IEB2	Inadequate/untrained personnel for exporting	Leonidou (1995); Morgan & Katsikeas (1998); Kahiya (2015)
IEB3	Limited working capital to support exports	Leonidou (1995); Jalali (2013); Radojevic et al. (2014); Kahiya (2015)
IEB4	Gathering data/information about X market	Leonidou (1995); Da Silva & Da Rocha (2001); Kahiya (2015)
IEB5	Strict foreign rules and regulations in X market	Leonidou (1995); Kaleka & Katsikeas (1995); Da Silva & Da Rocha (2001); Wijayarathne & Perera (2018).
IEB6	Lack of trademark	Face to face interview
IEB7	Offering competitive prices in X market	Leonidou (1995); Radojevic et al. (2014); Wijayarathne & Perera (2018)
	Perceived external export barriers (EEB)	
EEB1	Lacking of vertical link in agricultural value chain	Face to face interview

EEB2	High interest rate	Shaw & Darroch (2004); Kahiya (2015)
EEB3	High domestic production - export costs	Leonidou (1995); Da Silva & Da Rocha (2001); Makrini (2015) Face to face interview
EEB4	Informal costs (Corruption) in home country	Kaleka & Katsikeas (1995); Khorana et al. (2010)
EEB5	Lack of efficient home government export assistance/incentives	Da Silva & Da Rocha (2001); Radojevic et al. (2014); Makrini (2015); Wijayarathne & Perera (2018)
EEB6	Unfavorable and changeable home country's export rules and regulations	Leonidou (2004); Milanzi (2012); Radojevic et al. (2014); Kahiya (2015). Face to face interview
EEB7	Health, safety, quality & technical standards in X market	Korneliussen & Blasius (2008); Pinho & Martins (2010); Kahiya (2015)
EEB8	Stiff competition in X market	Leonidou (1995); Morgan & Katsikeas (1998); Da Silva & Da Rocha (2001); Jalali (2013); Radojevic et al. (2014); Kahiya (2015)
EEB9	Different foreign customer habits/attitudes	Leonidou (1995); Da Silva & Da Rocha (2001); Kahiya (2015); Makrini (2015)
EEB10	The risk of being sued by the customers in X market country who apply safeguard measures, anti-dumping tariff	Korneliussen & Blasius (2008).
EEB11	Intellectual property rights protection in foreign markets	Mangal & et al. (2012).
Moderator variables	Government support programs (GSP)	
INP	Information support programs	Leonidou et al., (2011)
INP1	Information about foreign market opportunities in market X	
INP2	Specific information about doing business with a particular firm	
INP3	Provision of marketing information/advice	
INP4	The Government issues export publications (export newsletters, special reports, mailing lists, and directories…)	
ETP	Training support programs	
ETP1	Export seminars, conferences, workshops…	
ETP2	Free training programs specializing in exporting	
ETP3	Counseling advice on export business	
TMP	Trade Mobility support programs	
TMP1	Participation in trade shows/exhibitions	
TMP2	Participation in trade missions which can have an inward or outward	
TMP3	Support by trade offices abroad	
TMP4	Trademark set up	
TMP5	Innovation, quality improvements	
TMP6	Patent registration, geographical indication for agricultural products	
FIP	Financial support programs	
FIP1	Export credit	
FIP2	Preferential loans with low interest rates	
FIP3	Capital from SMEs development fund	

Dependent variables	Export performance (EPE)	Katsikeas et al. (1996)
EPE1	Satisfaction with export sales in market X	
EPE2	Satisfaction with export market share in market X	
EPE3	Satisfaction with export profit in market X	

X: a market in ASEAN+3

3. RESULTS AND DISCUSSION

3.1. Sample characteristic

Table 2: Characteristics of research samples

Characteristics		Number of participants	Percentage (%)
Area	North	46	16
	Centre and Highland	64	23
	South	168	61
Firm size	Below 50	192	69
	From and above 50 to below 100	56	20
	From 100 to below 200	30	11
Number of export business years	Below 5 years	113	41
	From 5 to 10 years	106	38
	From 11 to 15 years	23	8
	Above 15 years	36	13
Selected export market	Asean	108	39
	Korea	25	9
	Japan	23	8
	China	122	44

3.2. Evaluation of measurement model

First, the assessment of GSP second order construct is conducted using repeated indicator approach. The reliability, convergent validity and discriminant validity of all indicators are valid. Second, measurement model including all research constructs are estimated.

The result shows the constructs of GSP and EPE meet reliability, convergent validity and discriminant validity. The constructs of IEB and EEB just meet reliability and discriminant validity. In order to meet convergent validity of these two constructs, the following variables should be removed: IEB5, IEB7, EEB2, EEB9. After removing the mentioned variables, all constructs meet reliability, convergent validity and discriminant validity, showing in the table below:

Table 3: Measurement models results

Constructs	Variables	Internal Consistency Reliability		Convergent Validity		Discriminant Validity
		Cronbach's Alpha	Composite Reliability	Loadings	AVE	HTMT

IEB	IEB1	0.791	0.827	0.765	0.549	<1 (Yes)
	IEB3			0.671		
	IEB4			0.623		
	IEB6			0.878		
EEB	EEB4	0.834	0.880	0.703	0.595	<1 (Yes)
	EEB6			0.72		
	EEB7			0.84		
	EEB8			0.77		
	EEB10			0.814		
GSP	INP	0.965	0.968		0.654	<1 (Yes)
	INP1			0.825		
	INP2			0.784

3.3. Evaluation of structural model

Structural model is measured based on the following criteria (Hair et al., 2017):

- Collinearity assessment between constructs
- Structural model path coefficients
- Coefficient of determination (R^2 value)
- Effect size (f^2)
- Blindfolding and Predictive relevance **(**Q^2**)**
- Effect size (q^2)

Table 4: Results of structural model evaluation

Hypotheses	Relationship	Path Coefficients	Bootstrap	p-Values	Significance	VIF	f^2
H1(-)	IEB->EPE	-0.106	[-0.211; 0.069]	0.085	Yes (p<0.1)	1.071	0.014

H2 (-)	EEB->EPE	0.151	[0.049; 0.263]	0.006	No (the sign of Path Coefficient is different from hypothesis)	1.094	0.028
H3 (-)	GSP->IEB*EPE	-0.118	[-0,286; 0.261]	0.454	No	1.046	0.018
H4 (-)	GSP->EEB*EPE	0.166	[-0.258; 0.32]	0.223	No	1.075	0.034
	GSP->EPE	0.345	[0.213; 0.45]	0.000	Yes ($p < 0.05$)	1.106	0.146
Criteria							
R^2		0.262					
R^2 adjusted		0.248					
Q^2		0.146					
q^2		q^2 (IEB is removed) =0.0094; q^2 (EEB is removed) =0.03					

Source: Processed results from the authors' survey data

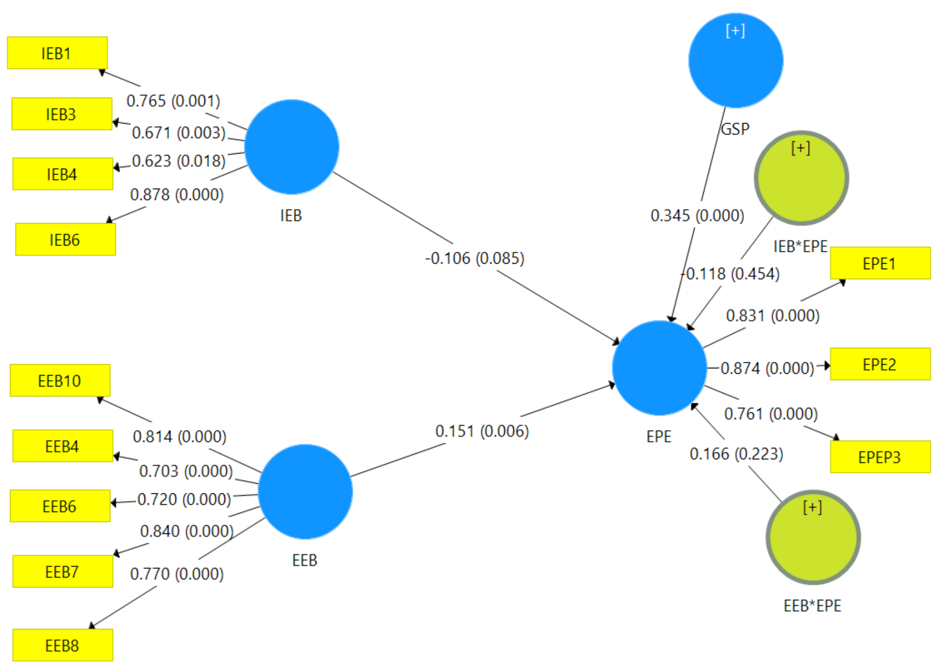

Figure 2: Structural model results

Source: Processed results from the authors' survey data

1) Collinearity assessment

VIF (variance inflation factor) is used to analyze possible collinearity. The results of Table 4 show that independent variables' VIF are below 5. Therefore, it proves there is not collinearity (Hair et al., 2017).

2) Structural model path coefficients

The result show that there is one accepted hypothesis (H1) which shows the reverse relationship between perceived internal export barriers and export performance with β=-0.106 showing a small effect. This result is similar to Jalali (2012), Anil et al. (2016), Safari et al. (2019), Haddoud et al. (2018) which show perceived internal export barriers have bad effect on export performance. The result of Haddoud et al. (2018) also shows a small effect of β=-0.15 for information barriers and β=-0.13 for functional barriers which nearly the same as our research.

There exists a positive relationship between perceived external export barriers and export performance (H2) which means that the more external export barriers SMEs perceive the better SMEs export performance they gain. This is similar to the research of Anil et al. (2016) which explained that external export barriers have forced SMEs to develop resources to solve export barriers, SMEs must operate more efficiently and compete for export performance. However, H2 is rejected because the sign of path coefficient is different from the hypothesis.

Although there exists a direct positive relationship between Government support programs and export performance but there is not the existence of the moderating effects of Government support programs on the relationship between perceived internal export barriers and export performance and the relationship between perceived external export barriers and export performance. Therefore H3, H4 are rejected which show that Government support programs cannot help to reduce the bad effects on the relationship between perceived internal export barriers and export performance and the relationship between perceived external export barriers and export performance. The result of H3 is partial similar to the research of Haddoud et al. (2018) which shows the export support programs of trade missions and export seminars do not affect the relationship between perceived internal barriers of information and export propensity but trade shows and trade missions affect the relationship between perceived internal barriers of information, function and export propensity. The result of H4 is similar to the research of Haddoud et al. (2018) which show the export support programs do not affect the relationship between perceived external barriers of procedure, environment and export propensity.

3) Coefficient of determination (R^2 value)

This value is the coefficient represents the amount of variance in the endogenous constructs explained by all of the exogenous constructs linked to it, where values of 0.5 are considered to be moderate and 0.25 are weak (Hair et al., 2017). In our model, R^2 is 0.262 so we can assess that this value is moderate. In addition, regarding the variances explained by independent variables of IEB and EEB, R^2 of 0.262 shows that perceived internal and external export barriers accounted for 26.2 per cent of the export performance variations.

4) Effect size (f^2)

In addition to evaluating the R^2 values of all endogenous constructs, the change in the R^2 value when a specified exogenous construct is omitted from the model can be used to evaluate whether the omitted construct has a substantive impact on the endogenous constructs or not. f^2 of 0.02, 0.15, and 0.35, respectively, represent small, medium, and large effects (Cohen, 1988) of the exogenous latent variable. Effect size values of less than 0.02 indicate that there is no effect. The result in Table 4 shows that there is no effect for the relationship between perceived internal export barriers and export performance (f^2=0.014); small effect for the relationship between perceived external export barriers and export performance (f^2=0.028); medium effect for the relationship between Government support programs and export performance (f^2=0.146). f^2 for the relationships of moderating GSP have no effect (f^2=0.018 and 0.034)

5) Blindfolding and Predictive relevance (Q^2)

Geisser (Q^2) test indicates the predictive ability of the dependent variables. The result shows that the dependent constructs are higher than 0 for EPE which supports the predictive capacity of our model.

6) Effect size (q^2)

The Q^2 values estimated by the blindfolding procedure represent a measure of how well the path model can predict the originally observed values. Similar to the f^2 effect size approach for assessing R^2 values, the relative impact of predictive relevance can be compared by means of the measure to the q^2 effect size. As a relative measure of predictive relevance, values of 0.02, 0.15, and 0.35 indicate that an exogenous construct has a small, medium, or large predictive relevance, respectively, for a certain endogenous construct. This figure must be computed manually because the Smart-PLS software does not provide it. To compute the q^2 value of a selected endogenous latent variable, we need the Q^2included and Q^2excluded values. The Q^2included result from the previous blindfolding estimation is available from Table 4. q^2 (IEB is removed)=0.0094 and q^2 (EEB is removed)=0.03 which show perceived internal export barriers and perceived external export barriers has small predictive relevance for export performance.

4. CONCLUSION

In order to meet the research objectives, mixed method of qualitative and quantitative methods is applied. The results show that there is not the existence of the moderating effects of Government support programs on the relationship between perceived internal export barriers and export performance; the relationship between perceived external export barriers and export performance but there exists a direct positive relationship between Government support programs and export performance. In addition, perceived internal export barriers have small effect on export performance but perceived external export barriers do not affect export performance.

5. SOME POLICY IMPLICATIONS

Based on the result of there are existences of the relationship between perceived internal export barriers and export performance; the relationship between Government support programs and export performance; there are not any effects of Government support programs on the links between perceived internal export barriers and export performance, perceived external export barriers and export performance, some research implications are suggested as follows:

Firstly, SMEs exporting agricultural products to ASEAN+3 should develop their own resources and capacity which include human resource, asset and financial resources. Rich resources help SMEs to reduce perceived internal barriers and then leads to a good effect on export performance in ASEAN+3 market. Therefore, SMEs need to have policies to recruit, retain and train high-quality personnel to have enough human resource with high knowledge and experience in exporting agricultural products to ASEAN+3. In addition, SMEs need to exploit the asset resource, capital resource effectively and plan to invest to gain more assets and capital.

Secondly, SMEs should be active in looking for Government support programs. Government support in trade mobility, information, training and finance are all necessary to contribute to the increase in SMEs export performance.

Thirdly, Government support programs should be focused on programs which helps to enhance the SMEs resources. This leads to the decrease in perceived internal export barriers and then affects the export performance. The support programs should be designed and implemented to be suitable for the kind of enterprises which are SMEs exporting agricultural products to ASEAN+3.

Fourthly, the Government should re-consider the effectiveness of all support programs to make sure that they can meet the SMEs' demands. With ineffective programs, it is not useful to apply to reduce the effects of perceived internal as well as external export barriers on export performance.

This research has some limitations related to sample size and sample taking method because the difficulty in approaching the board of director members in SMEs.

The future researches should increase the sample size and apply the more exact sample size taking method such as stratified random sampling. The future researches can be focused on Government support programs as a mediator variable or Government support programs as moderator variables for the link of both perceived export barriers and stimuli.

THE IMPACT OF FINANCIAL LEVERAGE ON INVESTMENT ACTIVITIES OF VIETNAMESE LISTED FIRMS

Ph.D Nguyen Viet Hong Anh[1], Lam Dai Trang[2]

Abstract: This research investigates the impact of financial leverage on investment activities of Vietnamese enterprises by utilizing panel data regression with data collected from 98 companies listed on the Vietnam's stock market from 2015 to 2022. The results from the FGLS regression method on data indicated that financial leverage has a negative impact on investment activities, supporting the agency cost theory and pecking order theory. In addition, the cash flow hypothesis provides a positive impact on investment while liquidity, return on total assets and firm size imply a negative effect and are all statistically significant. The outcomes of this paper suggest policy implications for managers in the company and strategies for investors.

Keywords: Financial leverage, investment activities, FGLS regression.

1. INTRODUCTION

The role of businesses in the economy is becoming significantly important, contributing to shaping and developing the country in the context of the current 4.0 economy, which has been integrating and modernizing. The regulatory authorities determine the growth of the economy to effectively achieve stability and survival of companies in a competitive environment, especially for listed companies on the stock market. Competing in today's emerging capital market in Vietnam strictly requires businesses to have good and appropriate business strategies to survive or become industry leaders in the market. This is becoming more difficult when Vietnamese stock market is considered imperfect, with many legal barriers, information asymmetry and investors' psychological factors. Therefore, businesses need to carefully consider each decision when implementing policies to expand and develop their business activities.

Investment activities are considered as one of the three core financial activities of an enterprise, along with financing activities and profit-sharing activities. Enterprises need to plan and budget for an investment project to limit risks and assess the potential for socio-economic growth, profitability, and benefits in the future. Capital, also known as funding, is considered by managers as a prerequisite when an enterprise decides to make an investment project. There are many different methods of financing capital, typically two of which are featured in the capital structure: financing through equity or through debt. Each form of funding will have different effects on business performance and in corporate finance. Financial liabilities are considered as a method of external financing and a profit amplification tool to increase the profitability of the business (Barclay et al., 1999). Studies on the effect of financial leverage on investment activities of companies are quite popular in many countries around the world (Noor et al., 2022; Ilker Yilmaz, 2022; Hermuningsih et al., 2020). However, research on this topic is relatively limited in Vietnam, typically recent studies such as research by Nguyen Thi Ngoc Trang and Trang Thuy Quyen (2013); Tran Thi Tam Nguyen and Truong Dong Loc (2018); Mo and Thanh (2023). Based

[2] University of Finance- Marketing

on those reasons, this study aims to find out the influence of financial leverage on the investment activities of companies listed on the Vietnam stock market in the period 2015 to 2022 in order to provide more empirical evidence then gives some policy contributions to help managers consider the use of debt in the process of budgeting for investment projects of enterprises.

2. THEORETICAL FRAMEWORK AND LITERATURE REVIEW

2.1. Theory related to how financial leverage impacts on the firm's investment activities.

2.1.1. Modigliani and Miller Theory

Modigliani and Miller (1958) came up with the theory of capital structure referring to how the amount of debt and equity is allocated to operate its financial activities. According to M&M theory, in the perfect market without tax, whether a business decides to use debt or equity financing will not cause any differences in the value of the firm and the company's operations do not depend on financial leverage. However, the stock market in reality is always volatile, there are many problems related to transaction costs, agency costs and bankruptcy, information asymmetry or herd psychology effects, etc. This has led to cases of underinvestment or overinvestment in businesses. Therefore, Modigliani and Miller (1963) developed their previous research by adding a tax factor and concluded that in tax conditions, businesses should choose to finance by debt rather than by capital due to the advantages from the tax shield of debt.

2.1.2. Trade-Off Theory of Capital Structure

Based on the foundation developed from M&M theory, trade-off theory is known as one of two important theories along with the pecking order theory that explains the relationship between equity and debt in firm's capital structure decisions. This theory is related to the behavior of businesses in deciding to choose debt or equity capital in business activities to balance between costs and benefits from tax shields. Therefore, highly profitable firms are likely to use leverage at higher levels to take the additional benefits of the tax shield of debt (Mackie-Mason 1990; Fama-French 2002). Besides the existence of tax shield benefits, if a business is financed entirely with debt, there will have a high level of risk related to financial distress leading to bankruptcy, including direct costs such as financial distress costs and bankruptcy-related costs and indirect costs related to costs comes from loss of customers and suppliers or layoff of employees etc. This is the reason why most businesses tend to use debt and equity in a certain proportion, or in other words, to maintain an optimal capital structure is one of the most company's essential goals.

This theory also shows a negative relationship between the level of debt use and the growth opportunities. Specifically, firms with greater growth opportunities will have lower debt levels, since greater investment opportunities increase the likelihood of agency problems between managers and owners; between owners and creditors, despite of a strong incentive to promote underinvestment of the owners (Myers 1977; Smith, Warner 1979).

2.1.3. Pecking Order Theory

The pecking order theory derived from asymmetric information when the board of directors and corporate executives get a lot of important information about the growth potential, worth as well as risks of investment projects more than investors. Therefore, a business's choice between issuing debt securities or equity securities acts as a signal to shareholders outside the company. The pecking order theory suggests that among a business's investment opportunities, managers prioritize financing from three sources: retained earnings first, debt will be second, and equity will be the final one.

According to Myers and Majluf (1984) argued that high information quality transparency in the company can reduce costs from information asymmetry by only using external financing if it is difficult to find the internal sources. This implies that if external financing resources are fundamental, the company should consider using debt before issuing shares of equity. In fact, the choice of the appropriate capital structure to maximize profits depends on many factors, specifically investment opportunities and profitability of the company. Firms with high profits can choose the retained earnings to finance for their profitability and maintain a steady debt ratio. Conversely, firms with lower growth rates will be forced to issue debt financing (Donaldson, 1963) due to the limitation of internal capital resources.

2.1.4. Agency Costs Theory

The conflicts between shareholders and representatives of the enterprise affect the choice of capital structure. For example, when a business decides to use a large amount of external funding, for instance, it can lead to agency costs for managers by issuing common equity. It could be explained that when the management expects high growth rates, external capital will create a lot of value in business investment opportunities because the benefits of management and shareholders are equal (Jung, Kim, and Stulz, 1996). On the contrary, when the firm does not have strong investment opportunities, debt will play a role in limiting agency costs based on the decisions of managers according to the study of Jensen (1986), Stulz (1990); Berger, Ofek and Yermack (1997).

According to Jensen and Meckling (1976) and Myers (1977), a company might lose out the investment opportunities by financing a high level of debt due to excessive leverage problems. For risky debt, a portion of the net present value can be generated from any profitable future investment returns and redistributed from creditors. Shareholders could tend to reject a good investment opportunity through the transfer of this net asset value. Furthermore, the loss of benefits or opportunity costs of the foregone project combined with the costs of enforcing the terms of the contract constitute the agency cost of debt. In addition, if there are low transaction costs, the incentive to underinvest will be reduced (Aivazian & Callen, 1980).

2.2. Literature Review

The research related to the relationship between financial leverage and investment activities is relatively popular in scientific research field in over the world. However, these studies provide much different empirical evidence about the effect of financial leverage on firm investment activities owing to differences in data scale, methodology as well as measurement methods related to this topic.

2.2.1. Financial leverage impacts negatively on investment activities

Mondosha and colleagues (2018) investigated a study on 51 businesses in different sectors listed on African stock markets in the period 2008-2014. Research results indicated that leverage is a necessary element in investment decisions when cash flow for investment activities is limited, shown by the negative correlation between the ratio of total debt to total assets and investment. Similarly, Ali et al (2019) researched a sample of data of listed enterprises on the Pakistani stock market from year 2008 to 2017. The consequence showed that financial leverage of firms impacts negatively on investment in the low growth rates environment and there is a positive influence between financial leverage and investment in firms with high growth rates vice versa. In the studies of Jiang et al. (2019) also found negative evidence related to the effect of debt on investment activities in enterprises belong to class A-shares listed on the Chinese stock market. Using the difference-in-difference (DID) estimation method, the study provided evidence that the restriction of debt impacts certainly to the efficiency of investment by reducing over-investment in state-owned enterprises and private enterprises, firms in the energy sector and especially sharply decreased for companies paying debt by assets. Akca and colleagues (2021) identified the leverage and investment have adverse effects together in a sample of comprised companies in 5 countries (Turkey, Brazil, China, Indonesia, S. Africa and India) from 2005- 2015. Similar results were found in the research papers by Antonecchia and Ferrari (2016) for companies in Italy and Spain during the period 2006-2014; Buca and Vermeulen (2017) for 24 industries sectors of firms in 6 countries (France, Germany, France, Italy, Spain, Belgium, and Portugal) from 2000-2014. This notes that firm's investment is negatively affected by financial leverage and over debt using easily leads to under-investment and causes a prejudicial influence on increase business according to studies by Khan et al. (2019); Kumar et al (2019); Noor et al (2022) and Mo et al. (2023).

There are several similar studies in Vietnam also consistent with the previous views of the above research. Specifically, in the research article by Tran Thi Tam Nguyen and Truong Dong Loc (2018) on 248 companies listed on Ho Chi Minh and Ha Noi Stock Exchange in Vietnam through 2014-2017 period, the evidence shown that the relationship between debt and investment activities is negative correlation, specifically leverage has a weaker effect on investment activities in high-growth firms. Then Vo's (2019) research on the Stock Exchange of Ho Chi Minh City from year 2006 to 2015 indicated that when leverage increases, businesses' investment opportunities are limited for under conditions of high growth companies compared to companies with lower growth opportunities. In addition, investment activities occur frequently in companies with high market capitalization (Tobin's Q > 1), like increased cash flow. Companies with high revenue will limit investment and mainly focus on growing sales. In conclusion, it can be seen that financial leverage shows a negative correlation with investment decisions, meaning that the higher the level of debt utilization by a business, the more limited investment opportunities will be (Aivazian et al., 2005).

2.2.2. Financial leverage impacts positively on investment activities

Besides many studies findings the negative influence of leverage on investment activities, some others besides show that the relationship between financial leverage and investment activities is positively correlated. The first is findings research of Gebauer et al. (2018) on 920 listed and unlisted enterprises in 5 countries comprised Italy, Spain, Portugal, Greece and Slovenia during the year 2005 to 2014. Using threshold regression combined with GMM regression, the study provides evidence that when a company uses debt at too high a level, it limits investment opportunities due to higher default risk and higher financing costs. Similarly, Hermuningsih et al. (2020) examined classical linear regression using SPSS tool and tested the data set defects on 10 food service enterprises in the period 2015-2020. The outcomes demonstrated that financial leverage has a beneficial impact on investment, implying that businesses use leverage to finance investment activities. The financial leverage is higher, the investment opportunity is greater. Meanwhile, Chang et al.'s (2020) research on 412 enterprises in green industries, energy saving, environmental protection and green upgrading infrastructure from 2011 to 2017.By using regression FEM and

GMM, the research results proved that investment is negatively impacted by the book value of debt while being positively impacted by the market value of debt. Consistent with the above studies' evidence, Kumar et al. (2020) also found similar results of the positive impact of debt on investment in their study with a data set taken from listed banks. in Pakistan stock market during the period 2006-2013.

In Vietnam, a typical study by Nguyen Thi Ngoc Trang and Trang Thuy Quyen (2013) performed panel data regression techniques with a data sample of 264 enterprises on two largest stock markets namely Ho Chi Minh and Ha Noi Stock Exchages in Vietnam in the period 2009-2011. The authors explained the relationship between financial leverage for all companies in the sample and companies with high growth rates, a higher level of leverage will create more investment opportunities for the business. In comparison, for low growth rates companies, debt will bring more pressure to firm's future investment projects. In addition, research by Nguyen and Dong (2013) using the GMM regression method with the sample contained in 500 listed firms from 2006 to 2010 found that firms would have many investment opportunities by taking advantage of debt financing. Therefore, the above studies strongly agree with the point that financial leverage and investment activities have a positive correlation. This implies that financial leverage plays an important role, contributing to promoting efficiency and bringing many opportunities in business investment activities, or in other words, debt is evaluated as a tool to gain the benefits from tax shields (Graham, 2000), as well as creating growing cash flow, increasing profitability as well as developing investment activities of businesses.

2.2.3. Financial leverage has no impact on investment activities.

Finally, some studies demonstrate that there is no correlation was found between financial leverage and corporate investment decisions. Omet et al. (2015) studied factors affecting investment activities and regression results showed that leverage does not have a significant effect on investment decisions of 52 industrial enterprises from 2000-2013. Mwangi (2017) examined the sample of 46 non-financial companies listed on the National Stock Exchange of India during the period time from 2012 to 2016 using a regression model to find out the firm's investment activities were not impacted by using debt. A similar study was initiated by Putri et al. (2020) based on a data set of 75 listed companies on the Indonesian stock market selected based on the Z'-score index (Z'-score) (Z'-score > 2.6: The enterprise is not bankrupt). The results indicated that cash flow and financial leverage do not affect investment decisions while profitability on total assets has a positive impact on investment decisions of firms facing financial difficulties. These findings pointed out the same results that the relationship between financial leverage and investment activities is very weak and in fact financial leverage does not affect investment activities.

3. METHODOLOGY AND MODEL

3.1. Model

According to the theoretical basis and empirical research mentioned, these factors affecting investment activities of businesses selected for research include financial leverage (LEV - Leverage), cash flow (CF – Cash flow), liquidity (LIQ), asset performance (SALE), profitability ratio (ROA), business scale (SIZE), years of operation (AGE) and Tobin's Q index. Each factor is represented as a variable independently in the regression model and the basis of the included variables is explained in detail in table 1.

Following the former studies of Aka et al. (2021), Kumar et al. (2019), Mo et al. (2023), the model proposes to analyze the influencing factors impact on investment activities of enterprises in the panel data with a static multiple-regression function as follows:

$I/Ki,t = \beta_0 + \beta_1 LEVi,t\text{-}1 + \beta_2 CFi,t\text{-}1 + \beta_3 LIQi,t\text{-}1 + \beta_4 SALEi,t\text{-}1 + \beta_5 ROAi,t\text{-}1 + \beta_6 SIZEi,t\text{-}1 + \beta_7 AGEi,t\text{-}1 + \beta_8 Qi,t\text{-}1 + \varepsilon i,t$ (1)

where i represents for firm and t represents for year.

Table 1. Variables and estimation of variables in the model

Symbol	Variable names	Measurement	Expected results	Previous studies
Dependent variables				
I/K	Net investment	(Book value of fixed asset$_{i,t}$ - Book value of fixed asset$_{i,t-1}$+Dep$_{i,t}$)/ Net fixed assets$_{i,t-1}$	/	/
Independent variables				
LEV	Leverage	Total book value of debt$_{i,t-1}$/Total equity$_{i,t-1}$	(-)	Khan, M. A.; Qin, X. & Jebran, K. (2019); Noor, H.; Zafar, N., and Fizzalftikhar (2022); Mo, Tran., Thu, Hoang., and Thanh, Diep. (2023)
Control variables				
CF	Cash flow	OCF$_{i,t-1}$=[EBIT(1-t)$_{i,t-1}$+Dep$_{i,t-1}$]/ Net fixed assets$_{i,t-1}$	(+)	Akca, T., Karan, M. B., and Yıldız, Y. (2021); Ilker Yilmaz (2022)
LIQ	Current ratio	Current assets$_{i,t-1}$/ Current debts$_{i,t-1}$	(+)	Danso, A., Lartey, T., Fosu, S., Owusu-Agyei, S., & Uddin, M. (2019); Kumar, V. & Aleemi, A. R. (2020)
SALE	Asset Performance	Net sales$_{i,t-1}$/ Net fixed assets$_{i,t-1}$	(+)	Kumar, S., Verma, Dr. A. & Kumar, Dr. CVRS V. (2019); Akca, T., Karan, M. B., and Yıldız, Y. (2021)
ROA	Return on assets	Profit after tax$_{i,t-1}$/ Total assets$_{i,t-1}$	(+)	Putri, S. N. A. & Puryandani, S. (2020); Noor, H., Zafar, N., and Fizzalftikhar (2022)

AGE	Years of operation	The number of years since the company started to operate$_{i,t-1}$	(-)	Kumar, S., Verma, Dr. A. & Kumar, Dr. CVRS V. (2019); Mo, Tran., Thu, Hoang., and Thanh, Diep. (2023)
Tobin's Q	Tobin's Q index	(Market value of shares$_{i,t-1}$ + Book value of total debt$_{i,t-1}$)/Book value of total assets$_{i,t-1}$	(+)	Kumar, S., Verma, Dr. A. & Kumar, Dr. CVRS V. (2019); Kumar, V. & Aleemi, A. R. (2020)

(Source: Calculation results from Stata 17.0)

3.2. Methodology

Model (1) is regressed against panel data including Pooled OLS (Pooled least squares model), FEM (fixed effects model) and REM (random effects model). While the Pooled OLS model is extensively used as a benchmark in panel data regression, the choice between FEM and REM models is often depended on the standard Hausman test (Gujarati, 2004; Baltagi, 2005).

The author procees the necessary tests to choose the relevant model: F-test (to select between Pooled OLS and FEM models); Breusch–Pagan Lagrangian test (to decide Pooled OLS or REM) and Hausman test (to come up with FEM or REM models).

After selecting the appropriate model, the author continues to conduct defect tests: Heteroscedasticity test (using the Modified Wald test for the FEM model and the Breusch–Pagan Lagrangian test for the model). REM) and autocorrelation (using the Wooldridge test) (Wooldridge, 2002).

Finally, if the model has heteroscedasticity and autocorrelation, the author proceeds to correct violations of statistical hypotheses to ensure the constancy and effectiveness of the model using the square method. Feasible Generalized Least Square (FGLS).

The sample data was collected from annual financial statements of 98 non-financial companies listed on the Vietnamese stock market included 3 main market exchanges known as HOSE, HNX and UPCOM during the period from 2015 to 2022. Unbalanced panel data with a total number of observations is 784. Data source from website finance.vietstock.vn. The article uses the ratio of net investment expenditure (I) to net fixed assets (K) to measure the investment activities of enterprises.

4. EMPIRICAL RESULTS

4.1. Descriptive statistics of research variables

Table 2 provides statistics illustrated on net investment, financial leverage, and other control variables. As can be seen, all variables have optimistic average values over the study period.

Table 2. Descriptive statistics

Variables	Mean	Std. Deviation	Minimum	Maximum
$I_{i.t}/K_{i.t-1}$	113.1352	65.3139	1	284
$LEV_{i.t-1}$	0.5295	0.1801	0.05	0.99
$CF_{i.t-1}$	118.7538	77.2385	1	317

(Source: Calculation results from Stata 17.0)

In particular, the asset utilization efficiency (SALE) of companies in the sample reached an average of 231.44 million VND and is the variable with the strongest fluctuation. Cash flow (CF) averaged 118.75 million VND and average net investment was 113.14 million VND.

4.2. Correlation analysis and multicollinearity test

(Source: Calculation results from Stata 17.0)

The Pearson correlation test was performed between the explanatory variables to consider multicollinearity between the variables and the findings are indicated in table 3. Based on the results, most of the pairwise correlation coefficients between the variables are consistent less than 0.5. The highest correlation coefficient is 0.6 between net investment (I/K) and cash flow (CF) variables.

Table 4. Variance Inflation Factors (VIF)

Variables	VIF	1/VIF
LEV	1.83	0.545394

AGE	1.18	0.847616
Q	1.50	0.668695
Mean VIF	1.49	

(Source: Calculation results from Stata 17.0)

High correlation raises concerns about the possibility of multicollinearity problems. Therefore, the author conducted further analysis using variance inflation factor (VIF) analysis. The results from table 4 analyzed that most of the VIF number values are very low and less than 10 at all, meaning that the multicollinearity between explanatory variables in the regression model does not occur.

4.3. Test model selection

The main type of research data is panel data. There are three common regressions with panel data known as fixed effects (FEM) and random effects (REM) models or pooled OLS regression respectively. We use F-test to select between Pooled OLS and FEM. From the results, it shows that the F test value is 3.99 and Prob value > F = 0.0000 with a statistical significance level of 5%. From there, it is determined that the fixed effects regression model is better than the pooled OLS regression.

Table 5. Results of model selection testing

F test:			3.99**
Hausman test:			42.78**
Breusch and Pagan Lagrangian multiplier test:			135.66**

*Note: t_statistics in parentheses (). **,*Correlation is significant respectively at the 0.05 and 0.1 level.*

(Source: Calculation results from Stata 17.0)

Next, we performed the Breusch and Pagan Lagrange test to examine the efficiency in estimation between the two methods of random effects regression and pooled OLS regression. Results from this test report a statistical value of 135.66 and Prob > Chi = 0.0000 at a 5% level of statistical significance. This shows that compared with pooled OLS regression, random effects (REM) estimation is more efficient.

Finally, the Hausman test was applied to check whether the study results should be focused on the fixed effects model (FEM) or the random effects model (REM). Since the Hausman test gives P-value less than 0.05, the research will choose the regression results with fixed effects (FEM) to explain the relationship to be studied.

In summary, from the results of testing the above choice between pairs of estimation methods, the fixed effects estimation method (FEM) is selected as the appropriate model.

4.4. Autocorrelation test

While there are lots of discoveries about several tests for serial correlation in panel data models, the test stated by Wooldridge (2002) is commonly used because the assumption requirements are not strict as well as are easy to implement. The results of the Wooldridge series correlation test show that the FEM regression model has a first-order autocorrelation phenomenon at the 5% significance level.

Table 6. Autocorrelation test results

Wooldridge test for autocorrelation in panel data	
H_0: no first order autocorrelation	
F (1, 97)	3.313**
Prob > F =	0.0718

*Note: **Correlation is significant at the 0.05 level.*

(Source: Calculation results from Stata 17.0)

The results of the autocorrelation test are presented in Table 6, showing that the hypothesis H_0 that the model does not have autocorrelation is accepted at the 5% significance level. Therefore, the assumptions of the conventional linear regression model, specifically the autocorrelation of the residuals, are not violated from the research results.

4.5. Heteroskedasticity test

In this study, to perform the heteroscedasticity test, the author performed the Modified Wald test (see Greene, 2000, p. 598). The test is depended on the expectation that the variance of the error of the regression equation is independent of the independent variables in the model, meaning the variance is constant. If there is rejection in null hypothesis, the model has heteroscedasticity. If the Modified Wald test shows that there is conditional heteroscedasticity, the author will use FGLS (Feasible Generalized Least Squares) estimation or correct the variance of the standard error to ensure the results. The estimate is efficient.

Table 7. Results of heteroscedasticity test

Modified Wald test for groupwise heteroskedasticity in fixed effect regression model	
H_0: Constant variance	
χ^2_1 =	70993.82**
Prob > χ^2 =	0.0000

*Note: **Correlation is significant at the 0.05 level.*

(Source: Calculation results from Stata 17.0)

The results of testing heteroscedasticity are presented in Table 7, showing that the hypothesis H0 that the model has constant variance is rejected at the 5% statistical significance level. Therefore, the estimated model violates the assumption of the conventional linear regression model regarding the constancy of the variance of the residuals.

In summary, the results of the Wald test and Wooldridge test in Tables 6 and 7 show that the research model does not have autocorrelation, on the other hand, the phenomenon of heteroskedasticity exists at a significance level of 5% in the model. In order to develop the effectiveness of estimation, the FGLS method as proposed by Beck & Katz (1995) is applied and used for analysis.

4.6. The impact of financial leverage on investment activities

The regression results demonstrate that the fixed effects model (FEM) is appropriate to analyze how the financial leverage affects to firm's investment activities. After testing the defects, it shows that the estimated research model has the phenomenon of heteroskedasticity at the 5% significance level. However, this defect can be overcome by using FGLS techniques or using OLS estimation on panel data but recalculating the covariance matrix of error term and standard errors of the regression coefficient so that the tests of them become more reliable. The authors will indicate by the FGLS regression method in this study and the empirical results presented in table 8. The results of the Wald test of the estimated model with a P-value below 0.05 show that the model used is acceptable.

Table 8. The influence of financial leverage on investment activities

*Note: **Correlation is significant at the 0.05 level.*

(Source: Calculation results from Stata 17.0)

Regression outcomes analyze that investment activities of listed firms are negatively affected by leverage ratio, liquidity, profitability, and firm size while cash flow shows a positive impact on investment activity at the 5% level statistically significant. In addition, asset performance and years of operation have a positive correlation while there is a positive correlation between Tobin's Q index and investment activities but all of them are statistically insignificant.

The estimation consequence proves that leverage and investment activities fluctuate in opposite directions. This result is consistent with the hypothesis and former studies such as Khan et al. (2019); Noor et al. (2022); Mo et al. (2023). Specifically, when financial leverage increases by 1%, the company's net investment will decrease by 14.81% at the 5% level statistically significant. The research results support the agency cost theory explained by the agency conflict problem between shareholders and managers (Myer, 1977) in imperfect markets leading to ineffective investment. This is due to many different reasons, specifically limitations in the legal framework, the level of information transparency and the role of the Board of Supervisors in the Board of Directors has not really been promoted in the real world in Vietnam. On the contrary, the internal governance structure of Vietnam companies is based on the two-tier governance model significantly applied in China and Germany that emphasizes the executive role being separated from the supervisory role. Although the decision-making process is slowed down, intermediation costs will be reduced. Meanwhile, in comparison with UK, US, Australia, Singapore, and Malaysia enforce the one-layer governance model (Anglo-Saxon model) to create more opportunities for the Board of Directors, especially is a CEO who can fully promote autonomy and creativity and making decision in corporate governance, but this model also causes abuse of power by management. In general, it can be concluded that agency conflicts within businesses in Vietnam are distinguish from Western countries leading to differences in research results.

The agency problem between shareholders and managers was explained by Jensen (1986), Stulz (1990) and Grossman and Hart (1982) about the negative correlation between financial leverage and investment performance. Jensen and Meckling (1976) suggested using debt leverage as a tool to limit agency conflicts. Increasing the debt-to-equity ratio in the capital structure will reduce dependence on equity capital mobilization, leading to reduced conflicts between shareholders and managers. Furthermore, debt requires the company to budget for the interest and principal expenses increased default in the future, which will interfere the managers from consuming free cash flow to invest in project has NPV < 0 (Jensen, 1986; Aivazian et al., 2005; Zhang, 2009). However, the agency costs of debt along with shareholders' responsibilities to creditors will increase at the same time as businesses use debt financing for investment projects. According to Myers (1977); Pawlina & Renneboog (2005); De Gryse & De Jong (2006) that means, management may be reluctant to pay external capital expenditures regardless of information asymmetry as default risk increases. Debt then causes constraints on investment spending due to the required cost of capital and increased default risk, explaining the negative correlation between leverage and investment. Therefore, companies might encounter many problems when using leverage as a tool to control agency costs. Firms with too high a level of debt use can cause under-investment, while companies finance by equity instead of by debt might control the over-investment situation.

The study also provides empirical evidence that cash flow has a positive impact on investment activities, proving that firms tend to focus on internal capital sources rather than external capital sources. This finding also supports the pecking order theory. In comparison, liquidity, return on total assets and firm size have a negative correlation with investment activities. This can be explained due to the macroeconomic fluctuations such as the US-China trade war, the Middle East struggles, and the Covid-19 pandemic during the period 2018-2022, which has led to many difficulties in production and operation activities of companies, lack of the ability to pay debt, low asset utilization efficiency and most large enterprises mainly focus on maintaining competitive market share rather than expanding investment activities.

5. CONCLUSION AND POLICY IMPLICATIONS SUGGESTION

This research paper analyzes the impact of financial leverage on investment activities of Vietnamese firms with annual data selected from 98 companies listed on the Vietnamese stock market from 2015 to 2022. Empirical evidence from the FGLS regression method shows that financial leverage and investment activities have a negative correlation, meaning that when leverage increases, net investment will decrease due to debt pressure affecting to the investment opportunities of companies in Vietnam. In addition, the difficulties of the economy have negatively impacted the ability of firms to pay off debts, so most managers focus on policies to restore and maintain business operations rather than finding external investment opportunities. In addition, the study also found the influence of cash flow, liquidity, return on total assets and firm size on investment activities of non-financial companies listed on the stock market Vietnam.

This paper aims to provide some recommended policies for company's managers and investors to participate in capital market. The problem of inefficient investment is related to agency conflicts in the company, where leverage acts as a valuable tool to keep the interests of shareholders safe and solve the problem of over investment. Managers should consider using financing policies to tackle overinvestment behavior, more specifically, consider long-term loans to increase the marginal efficiency of leverage. In addition, companies should identify other factors that affect investment to make decisions on using appropriate leverage subjected to the firm characteristics and type of the business, avoiding excessive debt abuse leading to the risk of insolvency, loss of future investment opportunities or even bankruptcy. In addition, for investors, when reviewing their investment portfolio, they need to carefully consider and evaluate the debt structure that businesses use to finance investment projects as well as the potential growth potential of those projects.

THE ROLE OF FINANCIAL DEVELOPMENT TO ADDRESSING INCOME INEQUALITY: EXPERIMENTAL EVIDENCE IN DEVELOPING COUNTRIES AND POLICY IMPLICATIONS FOR VIETNAM

M.Fin To Thi Hong Gam[1]

Abstract: The study was conducted to assess the role of financial development in addressing income inequality in developing economies through a sample of 36 developing countries from 2008-2020 and the Bayes approach. The results of the study show that financial development increases income inequality, but when reaching the threshold of 121.965% of GDP, it will have an impact on reducing income inequality. This is consistent with Greenwood & Jovanovic's (1990) hypothesis that the relationship between financial development and income inequality follows an inverted U-shape. In addition, the research results also show that trade openness, inflation, and infrastructure will help close the income gap but government spending, human capital and economic growth will make it worse. From the research results, the author offers policy implications to promote the role of financial development in reducing income inequality in developing countries in general and Vietnam in particular.

Keywords: Income inequality, Financial development, developing countries

1. INTRODUCTION

Keeping up with the growth path of developed countries is always a matter of concern in developing countries. However, economic growth that does not keep pace with social progress and development can also destabilize countries. Therefore, instead of individual economic development goals, developing countries attach importance to sustainable development.

Income inequality has long been seen as a drag on sustainable growth. In the "2030 Agenda for Sustainable Development" of the United Nations (2015), it was stated that: "Sustained, inclusive and sustainable economic growth is essential for prosperity. This will only be possible if wealth is shared and income inequality is addressed". Therefore, for sustainable development, it is necessary to solve the problem of income inequality.

Many empirical studies have been conducted to find the factors affecting income inequality, thereby providing proposals to reduce income inequality for policymakers in different countries. One of those research streams is the study of the role of financial development on income inequality. Financial development is simply understood as the process of overcoming cost barriers that exist in the financial system, including the costs of collecting information, enforcing contracts, and carrying out transactions (World Bank, 2023). Any improvement in access to finance and a concomitant reduction in credit constraints is expected to benefit the poor by facilitating their financing so that they can invest in human capital, career skills and business opportunities. This is expected to help narrow the gap between rich and poor. However, the results of studies on the relationship between financial development and income inequality so far are still mixed. Three popular trends in the results of previous studies: i) Financial development can decrease income inequality (Bittencourt & F, 2006; Enowbi Batuo et al., 2010; Kapingura, 2017; Zhang & Ben

1 Email: togam@ufm.edu.vn, University of Finance – Marketing.

Naceur, 2019); ii) Financial development exacerbates income inequality (Tiwari et al., 2013; Jauch & Watzka, 2016); or iii) The relationship of financial development and income inequality is nonlinear. On the one hand, financial development increases income inequality in early financial development, but after a threshold is reached, an increase in the level of development will have the effect of narrowing the income gap, such a relationship is also known as an inverted U-shaped relationship (Shahbaz et al., 2015; Destek et al, 2020); On the other hand, there are studies show that the relationship between financial development and income inequality follows a U-shaped (Tan and Law, 2012; Ridzuan et al., 2021). The inconsistency in the above studies is due to the difference between the scope of research space, research time and research methods.

It is clear that the above studies have approached financial development in two ways: Analyzing the impact of financial development into individual components or combining the components of financial development into a total index. The Global Financial Development Database of the World Bank developed a comprehensive yet relatively simple conceptual 4x2 framework to evaluate financial development globally. The four sets of proxy variables defined by this paradigm as traits of a sound financial system are financial depth, access, efficiency, and stability. Then, the impact of these four elements on the financial institutions and financial markets—the two key pillars of the financial sector—is assessed. Using this World Bank measure of financial development to examine its impact on income inequality has the advantage of taking into account all manifestations of financial development, but the disadvantage is that can only confirm the net impact of financial development while individual components may have different impacts on income inequality (Kapingura, 2017; Zhang & Ben Naceur, 2019). This will reveal limitations when researchers want to present appropriate policy implications for each perspective. This problem can be solved by analyzing the impact of all factors of financial development separately on income inequality to find the impact of each component. However, in this study, the author will investigate the impact of neither financial development using a composite index, nor all aspects of financial development on income equality, priority is given to focusing on financial development from a banking perspective because the development of the banking sector has a stronger positive impact on income distribution than the development of the stock market (Zhang & Ben Naceur, 2019). Alleviating constraints on access to credit was supposed to benefit low-income groups through human capital channels (Galor & Zeira, 1993), or career options (Banerjee, A. V., & Newman, A. F., 1993), or improve household capital income with small fixed costs (Greenwood and Jovanovic, 1990), thereby reducing income inequality. The main factor that causes more developed financial markets to eventually reduce income inequality in the cases above is always higher credit availability, which enables household decisions to be made more in line with economic optimality and less in line with inherited wealth. The author will therefore use domestic credit to the private sector (as a percentage of GDP) as a proxy for financial development.

Additionally, previous studies used many different methods such as OLS, FEM, REM, GMM, ARDL, etc. The common point of these methods is the frequency statistical approach which is suitable for research in the field of natural sciences. Meanwhile, the impact of financial development on income inequality takes place in the social environment. The Bayesian method does not need to be based on the assumption that observational samples must be continuously repeated with the same conditions over the years, so it seems suitable for use in case studies in the field of social sciences (Briggs & Nguyen, 2019). That is why the author wants to test this relationship with a new method, the Bayesian method in developing countries. From the research results, the author provides policy implications for Vietnam, which is also a developing country, to promote the role of financial development in narrowing the income gap.

This article is organised as follows. Section 2 presents a summary of the studies. Modeling, methodology framework and data collection are presented in Section 3. Section 4 explains the results and Section 5 provides policy implications for Vietnam.

2. LITERATURE REVIEW

There are many studies that have highlighted different aspects of the link between financial development and income inequality, including:

i) Financial development has the effect of narrowing income inequality. Bittencourt & F (2006) examined the effect of financial development on income inequality using data from Brazil in the 1980s and 1990s and discovered that it increased the poor's access to credit, decreased extreme inequalities, and therefore improved welfare without impairing economic performance. Li et al. (1998), using panel data of 40 developed and least developed countries for the period 1947 to 1994 discovered that a well-functioning financial sector resulted in low income inequality. Similarly, Enowbi Batuo et al. (2010) use data limited to African countries for the period 1980-2004 and apply the generalized method of moments (GMM) technique to examine the impact of financial development on income distribution. The empirical results show that the financial development variables and the composite index predict a negative and linear relationship between finance and the Gini Coefficient. However, in Kapingura's (2017) research, there is no consensus on the impact of financial development components on income inequality. The author examined the relationship between financial sector development and income inequality in South Africa over the period from 1990 to 2012. Using quarterly data and the ARDL model, the study found that financial development measured by the number of ATMs has reduced the level of inequality in South Africa in both the short and long term, but financial development measured by bank credit to the private sector, there is a positive correlation. Zhang & Ben Naceur (2019) examine five dimensions of financial development (including financial access, depth, efficiency, stability and liberalization) that impact income inequality in 143 countries around the world from 1961 to 2011. Using the OLS estimation tool and instrumental variable (IV) regression, the authors find that four out of five aspects of financial development can significantly reduce income inequality and poverty, except that financial liberalization tends to exacerbate those problems.

ii) Financial development increases income inequality. Using the ARDL approach, Tiwari et al. (2013) analyzed the role of financial development on income inequality between rural and urban areas in India over the period 1965–2008. They found that financial development exacerbates income inequality between urban and rural areas in the long run. With the data in India on the other period, from 1982 to 2012, Sehrawat & Giri (2015) examined the relationship between financial development and income inequality. The results of the ARDL test show that financial development exacerbates income inequality both in the long run and in the short run. Jauch & Watzka (2016) examined similar associations in 138 countries over the period 1960–2008. Taking domestic credit to the private sector to GDP as a measure of financial development and using a FEM estimate, the researchers found that all income groups in a country benefit from greater financial development, but richer people benefit more, so income inequality is increasing, which means financial development has a positive effect on income inequality.

iii) The relationship between financial development and income inequality is nonlinear. Based on the link between economic growth and income inequality by Kuznets (1955), Greenwood & Jovanovic (1990) concluded the inverted U-shaped relationship between financial development and income distribution. The two argued in favor of the previous conclusion by claiming that expansion will supply the necessary resources while the financial structure will assure more effective use of capital, allowing for rapid growth. According to this theory, only the wealthy class with a specific income level can take advantage of market opportunities in the early stages of financial development because of the high expenses associated with the substructure. As a result, the income gap between the rich and the poor will widen. In the next period when financial markets can gain a certain volume by solving their infrastructure problems, the poor will also have the means to have cheap credit and the process will lead to a decrease in income inequality. This study has been considered the Greenwood - Jovanovic (GJ) hypothesis and has been considered by many later researchers as a theoretical framework for testing. Shahbaz et al. (2015) studied this association in Iran for the period 1965–2011. Using the ARDL method, they found evidence to support the GJ hypothesis. Park & Shin (2017), using data from 162 countries in the period 1960–2011, found that financial development contributed to reducing inequality to some extent, but as financial development progressed further, it contributed to increasing inequality. Similarly, Younsi & Bechtini (2018) analyzed the relationship between financial development and income inequality in the BRICS countries over the period 1995-2015 using POLS and GMM methods. The empirical findings confirm the GJ hypothesis of an inverted U-shaped relationship between financial sector development, and income inequality in the BRICS countries during this century. Chakroun (2020) used instrumental variable threshold regression introduced by Caner and Hansen in 2004 on a cross-sectional database of 60 developed and developing countries to test the GJ hypothesis. The finding shows that there is a significant financial development threshold effect in the financial development-income inequality relationship.

However, the GJ hypothesis does not always exist. There is no evidence to support the GJ hypothesis in the paper investigated by Shahbaz & Islam (2011) about the relationship between financial development measured by domestic credit distributed to the private sector as a share of GDP and income inequality in Pakistan in the period 1971–2005 following the ARDL method. Similarly, although Enowbi Batuo et al. (2010) asserted the existence of a negative and linear relationship between financial development and the Gini Coefficient, an inverted U-shaped relationship was not established.

Besides the inverted U-shaped relationship, the relationship between financial development and income inequality is also found to follow a U-shaped in some studies. Tan & Law (2012) analysed the relationship between financial development and income inequality using data from 35 countries. Their results indicate a U-shaped relationship between financial depth and income distribution. (Ridzuan et al., 2021) applied the bounds test to examine the long-run and short-run relationship based on data samples in 4 Southeast Asian countries from 1970 to 2016. The results show the presence of the financial Kuznets hypothesis in the shape of an inverted U in Malaysia and Thailand, while U-shaped curves are found in Indonesia and the Philippines.

3. RESEARCH MODELS AND METHODS

Based on the model of Shahbaz et al. (2015), the author proposes the following model:

$$GINI_{it} = \theta_0 + \theta_1 * PVRT_{it} + \theta_2 * PVRT2_{it} + \theta_x * X_{it} + u_{it} \quad (1)$$

where i represents the country and t is the time of observation in the model. The variables in the model are described in the following table:

Table 1: Summary of variables in the research model

Variable name	Symbol	Measure	Source	Expected	Inheritance Research
Dependent variable					
Income inequality	GINI	GINI coefficient	WDI		(Zhang & Chen, 2015)
Independent variables					
Financial development	PRVT	Domestic credit to private sector/GDP	WDI	+	(Shahbaz et al., 2015)
Square of the financial development	PRVT2	PRVT Squared	WDI	-	(Shahbaz et al., 2015)
Control variable					
Trade openness	TRD	(Export + Import)/GDP	WDI	-	(Chakroun, 2020)
Inflation	INF	Inflation, GDP deflator	WDI	-	(Chakroun, 2020)
Infrastructure	TEL	Fixed telephone subscriptions/ Population, total	WDI	-	(Calderón & Servén, 2004)
Government spending	GEG	government final consumption expenditures/GDP	WDI	+	(Zhang & Chen, 2015)
Education	EDU	School enrollment, primary/ Population by age group	WDI	-	(Chakroun, 2020)
Economic growth	GDP	GDP per capita growth	WDI	+	(Chakroun, 2020)

Source: Author's compilation

Note: "+" means there is a positive relationship with income inequality

"-" means there is a negative relationship with income inequality

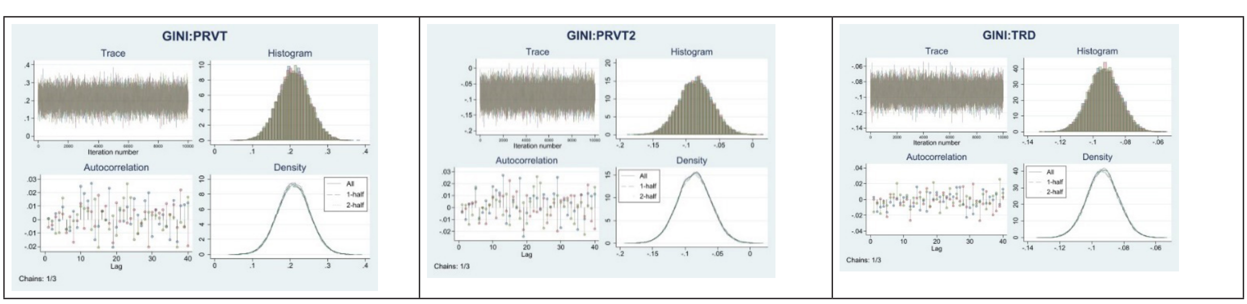
The sample includes 36 developing countries (Appendix 1) and the period mentioned in the paper is from 2008 to 2020 due to data availability. Data sources: World Development Indicators (WDI).

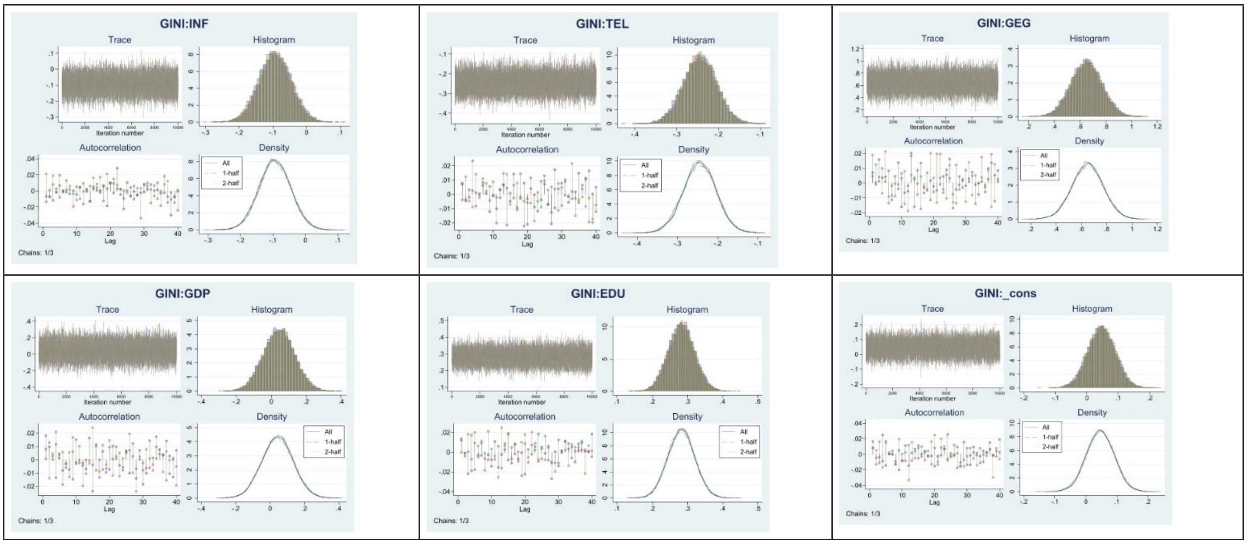
To analyze the impact of independent variables on income inequality, the author approaches the Bayesian method because this method has advantages that can overcome model defects such as autocorrelation, variable variance, and endogenous (Ramírez Hassan & Montoya Blandón, 2019).

Prior information is unavailable because the majority of earlier studies used a frequency method. However, with a sample of 36 developing countries and a period of 13 years, the number of observations is relatively large, so prior information does not affect the posterior distribution too much. The Markov Chain Monte Carlo (MCMC) technique and Gibbs sampling are used to create posterior distributions for each parameter in the model.

4. RESULTS AND DISCUSSION

Figure 1 Convergence diagnostic graph





Source: Author's calculation on Stata 17.0

From Figure 1, we see that the values of the coefficients fluctuate around the mean, and the graph shape is uniform, it can be concluded that the Bayesian simulation is stable.

Table 2: Bayes Regression Results

	Mean	Std. dev	MCSE	Median	Equal-tailed [95% cred. interval]	
PRVT	0.2098434	0.0419797	0.000242	0.2099387	0.127698	0.2927133

var	0.0048917	0.0003253	0.000002	0.0048775	0.0042967	0.0055665

Source: Results from running the model on Stata 17.

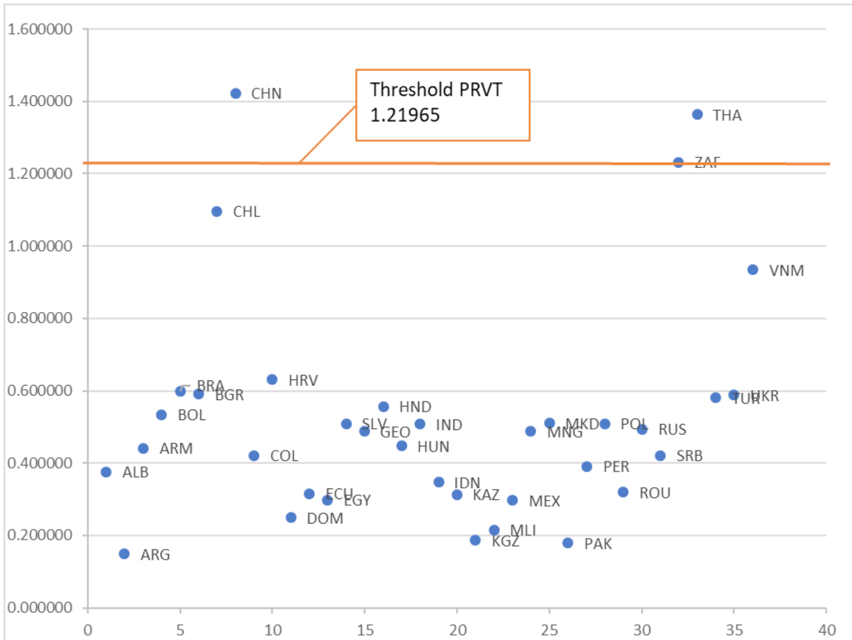
The regression coefficients in Table 2 show the change of income inequality GINI when there is a mean change of each independent variable in the model. Specifically:

$$\mathbf{GINI_{it} = 0.0463976 + 0.2098434*PRVT_{it} - 0.0860259*PRVT2_{it} - 0.0931698*TRD_{it} - 0.937823*INF_{it} - 0.2445297*TEL_{it} + 0.6489337*GEG_{it} + 0\ .0437654*GDP_{it} + 0.2827289*EDU_{it} + e_{it}}$$

Thus, the variables PRVT, GEG, GDP, and EDU have a positive effect on GINI, while the variables TRD, INF, and TEL have a negative effect on GINI. The regression coefficient of the PRVT2 variable of the model is negative, which means that there exists a turning point Specifically:

The regression coefficient of PRVT has a positive sign and the coefficient of PRVT2 is negative, that is, PRVT increases GINI, however, when passing a threshold PRVT = $\frac{0.2098434 \quad 0.2098434}{2\times 0.0860259\, 2\times 0.0860259}$ = 1.21965, the GINI coefficient will be reduced. This result is consistent with the hypothesis of **Greenwood & Jovanovic (1990)**. In the first stage of financial development, due to the high costs that stemmed from the substructure, only the rich could take advantage of market opportunities. As a result, the income inequality gap will widen. In the next period when financial markets can gain a certain volume by addressing their infrastructure problems, the poor will also have the means to have cheap credit and the process will lead to a decrease in income inequality. This result is similar to many previous studies such as that of Destek et al. (2020), and Chakroun (2020)

Figure 2: Average PRVT of the 36 countries in the sample



Source: Results from data of World Development Indicators (WDI)

The results from Figure 2 show that only 3/36 countries have a level of financial development (represented by private credit) above the turning point 1.21965, while 33/36 countries in the sample have financial development level lower than the threshold, including Vietnam. This means that in these countries, increasing levels of financial development (represented by private credit) will exacerbate income inequality.

Trade openness reduces GINI. In other words, the benefits of trade openness have been translated into a better and fairer distribution of income. This result supports the Stolper-Samuelson theorem and is similar to Ridzuan et al. (2021).

Inflation has a negative effect on GINI. This occurs because mild inflation acts as a stimulant for investors, encouraging investment, which leads to the creation of job possibilities. Additionally, inflation favors the debtors and most of the poor in developing economies are indebted. (Shahbaz & Islam, 2011)

Infrastructure as represented by Fixed telephone subscriptions/total population has a negative effect on income inequality, demonstrating that enhanced infrastructure can reduce income inequality. This result supports the view of Calderón & Servén (2004) that infrastructure will help the poor integrate more effectively into the economy.

Government spending drives incomes to become more unequal. This result is similar to Altunbaş & Thornton, (2019), which studied 121 developed and developing countries, indicating that most final government spending is in the form of transfers to the middle class.

Economic growth has a positive effect on GINI, which implies that economic growth hinders equal income distribution. This result is consistent with Shahbaz et al. (2015) in the case of Pakistan but contradicts Destek et al., (2020) when they studied in Turkey in the period 1990-2015 using the ARDL method.

Education is expected to improve income inequality, but in this study, the impact of education is positively related to income inequality. Enowbi Batuo et al. (2010) reached a similar conclusion, arguing that an increase in enrollment rates would exacerbate income inequality with data for 22 African countries between 1990 and 2004. This can be argued because education is still costly for the poor (Bukhari & Munir, 2016). Another possible explanation for the above result is that the enrollment rate may not be the best representative of workers' educational attainment as wage inequality may be affected by the education level of the current workforce rather than the future (Xu et al., 2021).

5. POLICY IMPLICATIONS

Policy implications for developing countries

For better income distribution, the financial sector in developing countries must be strengthened and strive to surpass the threshold point. In addition to enhancing financial development, developing country legislators need to make it easier for entrepreneurs to access financial services. Access to capital markets by the poor and disadvantaged can be beneficial to them by developing entrepreneurial skills and thus engaging them in productive activities and/or by enabling them to learn higher level and quality training, especially in the fields of science and technology, which can help people to form capital and innovation.

Policy implications for Vietnam

Firstly, the average level of financial development of Vietnam over the years is 93.43% of GDP, still below the threshold point of 121.965% of GDP, so similar to developing countries, Vietnamese policymakers need to continue its financial development policies, especially effective management systems for financial institutions, as well as strengthen the financial infrastructure (credit information, collateral and insolvency mode).

Second, policymakers can increase commercial activities as a means to create employment opportunities for unskilled workers, which are abundant in Vietnam, which can increase the income of unskilled workers. they increase, narrowing the income gap with skilled workers.

Third, higher inflation has benefited the income distribution in developing countries. Therefore, policymakers need to ensure that any reforms, such as fiscal reforms that lead to inflation, have overall positive effects on economic growth as well as social development by keeping income distribution gaps to a minimum.

Fourth, government final consumption expenditures need to be increased on education, in order to avoid the cost of education being a burden on the poor, leading to a vicious circle that cannot escape poverty because of limited human capital.

FOREIGN DIRECT INVESTMENT, INVESTMENT OF SMALL AND MEDIUM ENTERPRISES - CROWDING OUT EFFECT?

Ph.D Nguyen Tran Xuan Linh[1], M.Fin Le Thi Lan[2]

Abstract: The study was conducted to assess the impact of FDI inflows on investment activities of small and medium enterprises (SMEs). Research results show a crowding out effect of FDI inflows, which implies that localities need to focus on the quality of FDI inflows instead of quantity. In addition, the study also considers the impact of internal factors of SMEs, Bayesian regression results show that the size of SMEs, SMEs with e-commerce activities tend to promote investment activities; while the number of years of operation of the business has a negative impact on this activity. Finally, government spending has a positive impact on investment activities of SMEs, the implication of this finding is that the government should increase the rate of allocation budget state to provinces which have high level of budget contribution and great growth potential.

Keywords: small and medium enterprises, foreign direct investment, crowding out effect

1. INTRODUCTION

There have been many studies and researches in the world showing the importance of Foreign Direct Investment (FDI) to the economy of developing countries, including Vietnam. Not only is FDI an additional source of developmental investment capital, but also a more stable capital flow than other international investment flows, because FDI is based on a long-term view of the market, growth prospects and doesn't create debts for the government of the host country; therefore, it tends not to change in adverse circumstances. Beside capital transfer, FDI is also a technology transfer channel from developed countries to investment-receiving countries, contributing to increasing the technology research and development capabilities of the host countries.

Realizing this important role, Vietnam has quickly opened up its economy, traded with foreign countries and received FDI as an important source of capital for economic growth since Doi Moi in 1986. Based on information from the OECD FDI Regulatory Restrictiveness Index, Vietnam is one of the economies with the largest openness to FDI in the ASEAN region. In 2021, despite being affected by the COVID-19 epidemic, FDI attraction of Vietnam is estimated at 31.15 billion USD, up 9.2% over the same period in 2020 (GSO). Besides the assessment that FDI is a bright spot in Vietnam's economic picture, there are more and more worries about the absorption of this capital flow. Experts have warned of risks when Vietnam's economy is too dependent on external resources. The contribution of the FDI sector to Vietnam's GDP growth is increasing, from 14.6% in the period 1991-1995 to over 20% after 2010. In particular, the prolonged COVID-19 outbreaks have eroded the strength of many domestic enterprises.

According to statistics from the National Business Registration Portal of Vietnam, in December 2021, 13,945 enterprises were temporarily suspended or dissolved; most of them were established less than 5 years and had small capital scale. (90.1% of suspended and 88.6% of dissolved enterprises were SMEs). FDI enterprises were also affected significantly when up to

[2] College Of Foreign Economic Relation

26% of SMEs have to let a certain number of employees quit their jobs to be able to maintain their operations (Khanh Linh, 2021). The question is whether FDI enterprises are crowding out the domestic enterprises, and what can be done to both attract FDI and ensure the operation of SMEs in Vietnam? To answer this, the authors use the data of SMEs in Vietnam to analyze the impact of FDI on this kind of enterprises, thereby proposing some policy implications to improve the efficiency of FDI inflows and avoid causing a crowding-out effect on Vietnam's SMEs.

2. LITERATURE REVIEW

Over the past years, FDI has always been a topic attracting the attention of domestic and foreign researchers, especially its impact on the activities of enterprises in the host country.

FDI can replace or supplement domestic investment. However, the exact impact of FDI on domestic investment depends on several factors. First of all, the competitive nature of the sector in which investments are directed will determine the impact of FDI. If FDI flows into a low-competition, high-tech sector, it will create positive effects through the transfer of knowledge, technology and investment (Agosin & Machado, 2005). In contrast, if FDI flows into a competitive sector, the lower marginal costs of Multinational enterprises will further increase the level of competition, leading to a crowding out effect (Aitken & Harrison, 1999). Secondly, the impact of FDI depends on the spillover of knowledge and technology. Blomström & Kokko (1998) argue that by contacting foreign firms, domestic firms can initially observe and then integrate technologies into local firms, thereby promoting domestic investment. However, Kogut & Zander (1996) argue that sometimes Multinational enterprises try to make use of whatever advantage they have and as such, domestic investment may shrink in reality. Thirdly, labor turnover also affects the impact of FDI on domestic investment. As foreign firms often offer higher wages to employees (Dunning, 1983), the quality and quantity of managers available to domestic firms decreases, making the inflows of domestic investment narrowed. However, if they then work with a local company, these employees can develop valuable insights into the strategies and practices of Multinational enterprises (Meyer, 2004), helping businesses have strong and stable growth, thereby promoting investment of these companies.

Agosin & Machado (2005) assesses the extent to which FDI crowds in or crowds out domestic investment in 36 developing countries in Asia, Africa and Latin America in the period 1971-2000. Applying GMM estimation, the study shows that the impact of FDI on domestic investment in each region is different. Specifically, for the three decades involved (from 1971 to 2000), FDI crowded out domestic investment in Latin America, but contributed to an increase in overall investment in Africa and Asia. As for each decade, the study shows that this crowding out effect only occurred in Latin America in the 1970s and in Africa in the 1990s. In particular, in Latin America, if only 80% of FDI was converted into real investment, the effect of FDI on total investment is said to be neutral.

Pilbeam & Oboleviciute (2012) investigates whether FDI crowds in or crowds out domestic investment in the European Union (EU). The study applies the GMM estimation on the data covering 26 of the 27 EU countries (except Luxembourg) for the period 1990-2008. The results show that FDI has no negative impact on domestic investment in the 12 new EU member states over the long run, but completely crowds out domestic investment in the older EU14 member states in the short run.

The study of Jude (2019) examines the relationship between FDI and domestic investment in 10 Central and Eastern European countries for the period 1995-2015. The author also finds the FDI crowding out effect toward domestic investment in the short run through the GMM estimation.

Besides the objective factor that FDI capital can affect domestic investment, many studies also show that some internal characteristics of enterprises also affect the ability to access capital through the impact on investment activities by SMEs. Bates (1990) emphasizes that the education level of business owners is a major determinant of the amount of money banks lend to SMEs. Zarook et al (2013) also confirmed that management experience and education level, and SME assets have a significant positive impact on SME's access to finance.

In Vietnam, there are also many studies on the role of FDI, especially studies on the impact of this capital on the exit of the industry of domestic enterprises.

Pham et al. (2014) argue that the presence of FDI has created competitive pressure on domestic enterprises. The authors' research has found evidence that in addition to factors such as age of the firm, firm size, import and export status, market concentration, and labor productivity, the appearance of FDI in the same industry significantly and positively increases the posibility of exiting industry of domestic firms.

Pham (2016) study the effect of crowding in and crowding out investment of FDI on Vietnamese enterprises in the period 2001-2010. Applying OLS, Fixed Effects and GMM regression models, the author found a firm-level crowding-out effect due to higher shares in turnover as the level of foreign capital increases as well as an industry-level crowding-in effect as the share of foreign-owned firms in turnover is lower when the industry-level of foreign capital intensity increases. Specifically, the author argues that domestic firms tend to lose market share to their foreign-invested firms when they compete head to head, but they also tend to benefit from higher levels of foreign capital invested in their industry.

Nguyen & Do Quynh (2020) study the crowding out effect of FDI on the exit of domestic enterprises in the Vietnamese textile and garment industry by applying Logistic regression model. The results show that the number of years of operation, enterprise size, labor productivity and import-export status have a negative relationship with the exit rate of Vietnamese textile and garment enterprises. Meanwhile, FDI not only does not increase the exit rate of domestic textile and garment enterprises, but on the contrary also helps to improve the viability of these enterprises.

Similarly, the study of Do (2020) also shows that the presence of FDI does not cause crowding out effect on the exit of food processing enterprises in Vietnam but also helps to reduce the number of firms exitting the industry.

In general, studies on FDI in Vietnam have been conducted in different approaches and yielded inconsistent results. This proves that the impact of FDI on each industry is not the same. However, there have been no studies assessing the impact of FDI on SMEs - an important part that accounts for about 96.7% of the total number of enterprises, employs 51% of the workforce and contributes more than 40% of GDP in Vietnam (Ministry of Planning and Investment, 2020). Therefore, the authors will focus on studying SMEs to provide appropriate policy implications.

3. METHODOLOGY

The related studies mentioned above showed that FDI can positively or negatively affect the operations of the host country's businesses. However, in developing countries like Vietnam, policymakers expect that FDI would positively impact domestic enterprises' operations; hence, the authors hypothesize as follows:

Hypothesis 1: FDI inflows promote investment activities of the SMEs.

Besides that, based on a review of previous studies, the authors also test other factors that may affect the investment activities of SMEs, including:

Bhattacharya & Bloch (2004) argue that large enterprises have the ability to exploit economics of scale and their ability to access capital is also better, so large enterprises will have more resources to invest than small businesses. Thus, hypothesis 3 is:

Hypothesis 2: The size of the enterprise is directly proportional to its investment activities.

Since the enterprise has been operating for a long time, the knowledge and experience will be accumulated more and more, which will promote investment activities of enterprises (Rossi & Cebula, 2015).

Hypothesis 3: The longer the enterprise is in operation, the more likely it is to carry out investment activities.

According to Zarook et al (2013), the higher the education level the enterprise owners have, the more easily they can access bank credit, which will create favorable conditions for investment and expansion activities for production and business of the enterprise.

Hypothesis 4: The higher the education level of managers, the easier it is for SMEs to access investment capital.

The research written by Batubara et al (2021) shows that the application of e-commerce has a positive effect on increasing and stabilizing revenue for enterprises. When enterprise's revenue grows steadily, it tends to invest to expand business activities. In addition, enterprises with stable revenue will have easier access to loans from financial institutions, so they will be more favorable when carrying out their investment activities, so the next hypothesis is:

Hypothesis 5: SMEs that apply e-commerce will tend to carry out investment activities.

Costello & Tuchen (1998) stated that enterprises having websites can publish their product information on the website, making it easier for accessing customers as well as receiving customer feedback to improve product quality, so the revenue of these enterprises tends to grow steadily. Besides, Mushtaq et al (2021) argue that the application of information and communication technology helps to reduce information asymmetry among SMEs. As a result, banks are more likely to grant credit and to finance projects and the working capital of innovative enterprises. The next research hypothesis is as follows:

Hypothesis 6: SMEs having websites tend to carry out investment activities.

Essien et al (2016) argue that public spending has a role in promoting output growth. Keynes (1936) argued that, through fiscally subsidized budget spending and infrastructure investment programs, the government effectively increased aggregate demand, boosting consumption and stimulate investment activities of enterprises. Therefore, the authors propose hypothesis 8 as follows:

Hypothesis 7: Government spending promotes investment by SMEs.

Hypothesis 8: the authors supposed that firms with highly educated managers would help limit the negative impact of FDI on business investment.

$$INV = \beta_1 FDI + \beta_2 \text{SIZE} + \beta_3 AGE + \beta_4 E_{COM} + \beta_5 WEB + \beta_6 EDU + \beta_7 GOV + \beta_8 EDU\_FDI + \varepsilon$$

Table 1. Description of variables in the research model

Variable	Explaination	Expectation sign
Dependent variable		
INV	Investment activities of SME, receive the value "1" if the enterprise has investment activities within 3 years and "0" otherwise.	
Independent variables		
FDI	Natural logarithm of FDI.	+/-
SIZE	Enterprise size, logarithm of enterprise asset size.	+
AGE	Logarithm of years of operation of the enterprise.	+
E_COM	E-commerce, receive the value "1" if the SME has e-commerce activities and "0" in the opposite case.	+
WEB	E-commerce, receive the value "1" if the SME has a website and "0" in the opposite case.	+
EDU	Manager's educational level, value "1" if not graduated from primary school, value "2" if not graduated from lower secondary school, value "3" if not graduated from high school, value "4" if graduated from high school or higher.	+
GOV	Government spending as a percentage of GDP	+
EDU_FDI	The interaction variable of the manager's educational level and the FDI variables.	-

The dependent variable is the binary variable; it takes the value 1 if the business had investment activities and 0 for otherwise; hence we applied Bayesian Logit regression to explore the impact of FDI on the investment of SMEs in Vietnam. Because the studies on the impact of factors on the profitability of SMEs are mainly carried out by the frequency econometric method, we do not have prior information on the distribution of variables in the research model. In this case, Gelman et al. (2008) propose a Cauchy distribution (0; 2.5) for the parameters in the model and Cauchy (0; 10) for the constant in Bayesian Logit model.

4. RESULTS AND DISCUSSIONS

Table 2. Descriptive statistics of variables in the model

Variable	Obs	Mean	Std. Dev.	Min	Max

GOV	2,647	0.16	0.08	0.06	0.31

Source: Authors' calculation

To carry out the study, the authors used data from a survey with the participation of 2,647 SMEs conducted by the Central Institute for Economic Management (CIEM) under the direct authority of the Ministry of Planning and Investment of Vietnam, the Institute of Labour Science and Social Affairs under the Ministry of Labour, Invalids and Social Affairs of Vietnam and the Development Economics Research Group (DEGR) of the University of Copenhagen, Denmark.

Table 2 presents the statistical results of the variables in the model. The number of observations in the model is 2,647 enterprises, with 49% having investment activities in the last 3 years, while only 9% having e-commerce activities and 12% having an official website.

The logarithmic mean (standard deviation) of *SIZE* is 14.01 (0.66), *AGE* is 2.63 (0.65), *FDI* is 3.94 (0.66), *GOV* is 0.16 (0.08), *EDU* is 3.66 (0.60).

Table 3. Regression results

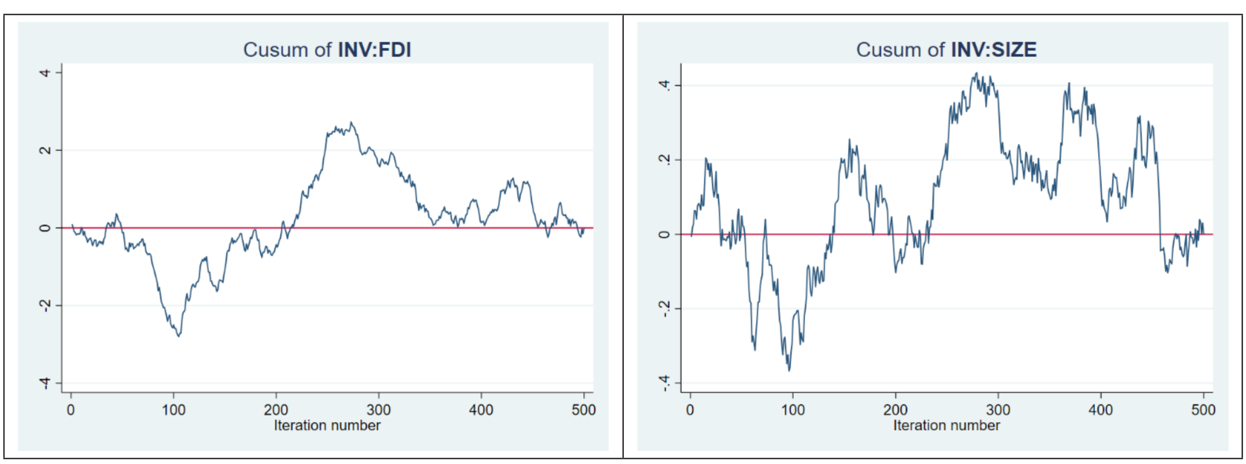
_cons	-4.338	0.586	0.300	-4.329	-5.411	-3.273
Acceptance rate	0.235					
Efficiency: min	0.110					

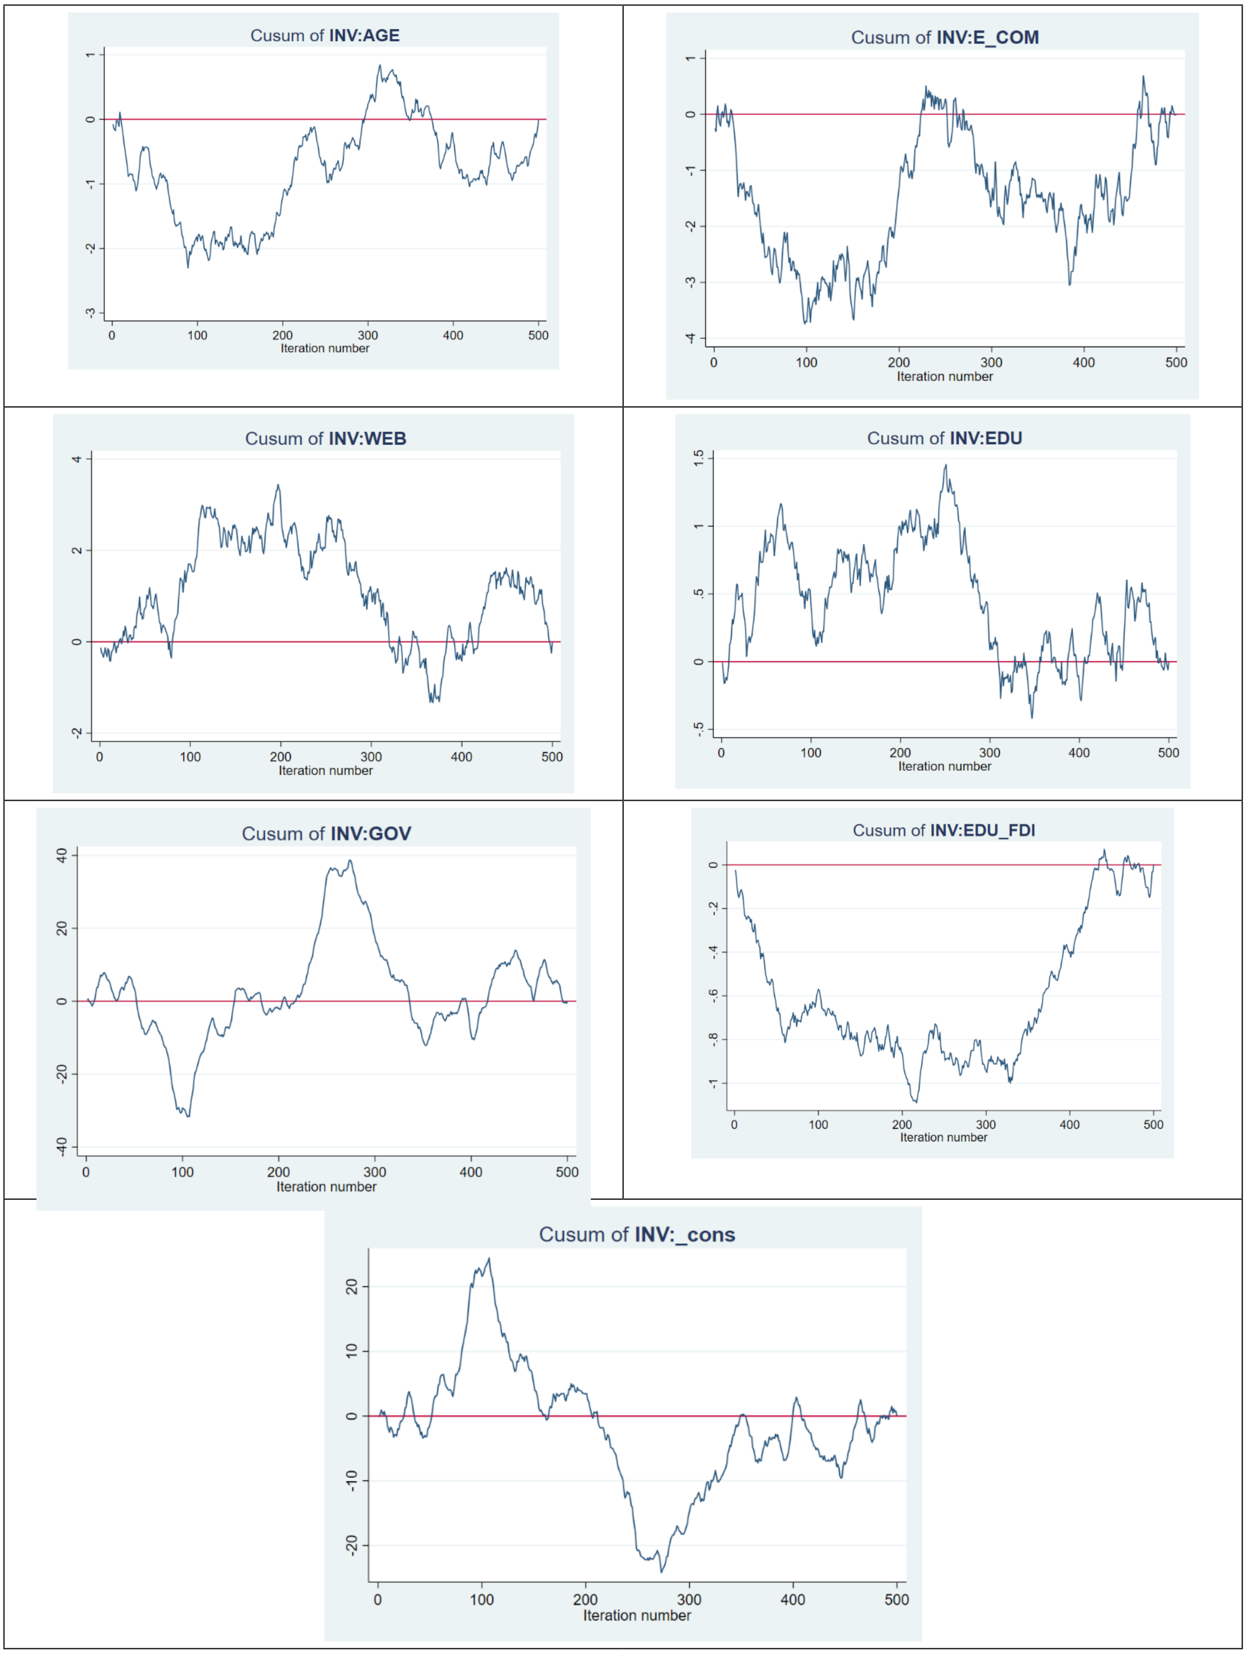
Source: Authors' calculation

According to Roberts & Rosenthal (2001), an acceptance rate of 0.15-0.5 is optimal. Table 3 shows that the average acceptance rate is 0.223, so the regression model has an acceptance rate. To check the convergence of the MCMC series of parameters, we can consider the effective sample size, whereby a sample size greater than 1% is considered satisfactory. The results in Table 3 show that the minimum effective sample size is 0.12, so it can be concluded that the model meets the requirements for convergence.

Besides the effective sample size, another criterion that should be considered when evaluating the convergence of MCMC series is the use of the Cusum charts.

Figure 1. Cusum charts





Source: Authors' calculation

The Cusum charts are used to evaluate the mixing rate of the MCMC series. The slower the sequence mixing is (the MCMC series does not converge), the smoother the cusum curve is. In contrast, the faster the mixing speed of the series is, the rougher the cusum curve is, and the faster the MCMC series will converge. Figure 1 shows the Cusum charts of the parameters that intersect the x-axis many times and have jagged lines, which confirms that the MCMC series of the model meets the convergence conditions.

The results in Table 3 show that FDI inflows have a negative impact on investment of SMEs, while government spending (GOV) has an improved effect on investment activities of this group of enterprises. For intrinsic factors, only the time of operation (AGE) has a negative impact on investment activities of SMEs, the remaining factors include enterprise size (SIZE), e-commerce (E_COM), enterprises with official website (WEB) and the education level of the enterprise owner (EDU) have a positive impact on the investment activities of SMEs. Unlike the frequency method, which only knows the trend of the independent variables' effects on the dependent variable, the Bayesian method allows us to calculate the probability of the occurrence of these events, in other words, we can determine the exact level of the trend of the independent variable's impact on the dependent variable.

Table 4. Posterior probability

	Mean	Std. Dev.	MCSE

Source: Authors' calculation

The results in Table 4 show that the negative impact of FDI inflows on SME investment is very clear with the probability of the impact up to 100%. Aitken & Harrison (1999) assert that if FDI flows into highly competitive sectors in the host market, then, with a lower marginal cost advantage, MNEs can create even greater competitive pressures on domestic firms, causing them to narrow their business activities and lead to the crowding out effect. In addition, with the advantage of salary, FDI enterprises can attract high-quality labor sources, making it more difficult for domestic enterprises to find human resources. A shortage of labor force will make domestic businesses less efficient as they are unable to handle large orders (Dunning, 1983). In addition, FDI enterprises with the advantage of assets, the guarantee of the parent company, and the transparency of their records help them improve their competitiveness in accessing domestic credit sources. This leads to a shortage of credit sources for local SMEs, making it difficult for these businesses to find funding sources for their investment activities.

The percentage of government spending over GDP has improved SME investment with a probability of up to 100%, which is consistent with the initial hypothesis. As Keynes (1936) observed, the government can effectively improve investment in the economy by implementing large-scale investment programs to stimulate the market through government orders, purchasing system, thereby stimulating aggregate demand of the economy. In addition, for developing countries with great growth potential like Vietnam, the government can also invest in infrastructure, roads, and industrial parks to create favorable conditions for enterprise activities, thereby promoting investment activities of these enterprises.

Thus, contrary to the initial hypothesis, operating time has a very clear negative impact on investment activities of SMEs. Although enterprises with a long operating time are expected to be able to accumulate experience and capital, thus facilitating investment activities. However, according to Jovanovic (1982), at the beginning of the business cycle, enterprises have a primary objective of achieving the minimum efficient scale that allows them to survive in the markets in which they operate. Achieving efficient scale means that they must achieve a relatively high rate of growth within the first years of operations, and its need for growth should diminish as it approaches or reaches that efficient scale. Farinas & Moreno (1997) also agree with the conclusion of Jovanovic (1982). These authors argue that young firms have a higher growth rate because their most immediate goal is to achieve a certain size of market share to ensure the survival their company. According to these authors, over a certain period of operation, when the customer volume of these enterprises has grown to a certain size, helping them to survive in the market, they will have tended to decrease their growth rate and thus their investment needs also decrease.

The remaining factors including the size of the enterprise's assets (SIZE) and the enterprise with e-commerce activities (E_COM) have a very clear impact on improving investment activities of SMEs with the probabilities are 100%, respectively, which is consistent with the original hypothesis. Besides, the variable of enterprises having official website (WEB) also tends to support the investment activities of SMEs, however, this effect is not clear when the probability of impact is only 90%.

Finally, as expected by the authors, the interaction variable between EDU and FDI has a negative value with a probability of 100%, which implies that a high level of management education would reduce the negative impact positive effects of FDI on investment activities of SMEs.

5. CONCLUSIONS AND POLICY IMPLICATIONS

The study was conducted to analyze the impact of FDI inflows on investment activities of SMEs. The research results show that FDI has a negative impact on investment activities of SMEs, in other words, FDI causes a crowding out effect on investment activities of enterprises. This is explained by the fact that FDI inflows tend to flow into areas with a high degree of competition. With the advantage of operating scale, the marginal cost of FDI enterprises is smaller than that of domestic enterprises operating in the same field, causing competitive pressure on domestic enterprises, especially SMEs when their financial resources, technology and management level are much lower, this can lead to narrowing the market share of SMEs and they cannot conduct investment activities. Besides, the labor force also tends to participate in FDI enterprises instead of domestic enterprises because the salary and other policies of FDI enterprises are better. This has a positive effect of improving the living standards of workers, but for SMEs, they may face many difficulties in recruiting workers and cannot meet large orders because of labor shortage. Banks also tend to favor FDI enterprises because these enterprises have better asset quality and transparency in documents than SMEs. Therefore, the supply of credit to finance investment activities of SMEs is also significantly narrowed. This implies that localities should gradually change their thought, starting from focusing on quality of FDI enterprises rather than quantity. Priority should be given to FDI enterprises investing in key industries with high technology and management levels to create driving force for economic development. For fields where many enterprises have operated, it is necessary to improve criteria such as technology and environmental standards to both improve the quality of FDI inflows and avoid creating a crowding-out effect on operations of local businesses.

For internal factors, the number of years of operation of the enterprises has a negative impact on the investment activities of SMEs; the remaining factors include the size of the enterprise and the enterprise with e-commercial activities have a very clear crowding in effect on the investment activities of this group of businesses, while we do not have enough evidence to conclude the impact of enterprises having official websites on investment activities.

The results also show that the percentage of government spending as a percentage of GDP has improved the investment activities of SMEs. However, boosting public spending can cause a burden on the government budget, so this tool should not be abused. This finding has certain significance in balancing the government budget. The rate of budget regulation should direct to cutting down for localities, state-owned enterprises that use government budget capital inefficiently. It is necessary to radically cut down unnecessary works such as building monuments... to increase the level of budget regulation in key economic regions such as Ho Chi Minh City, Binh Duong, Long An ... especially when these provinces and cities have just experienced a difficult 2021 due to the Covid-19 pandemic. Increasing the rate of budget regulation will help these provinces quickly recover and make remarkable contributions to the economy of Vietnam.

FOREIGN DIRECT INVESTMENT AND ENVIRONMENTAL POLLUTION IN SELECTED ASIAN DEVELOPING COUNTRIES: THE ROLE OF INSTITUTIONAL QUALITY

M.Fin Nguyen Xuan Bao Chau[1]

Abstract: The study assesses the impact of foreign direct investment (FDI) and institutional quality on the environment, while also determining the role of institutional quality in the environmental effects of FDI in developing Asian countries. By analyzing panel data from 10 developing Asian economies for the period 1996-2021 using the System Generalized Method of Moments, the research finds evidence confirming the negative impact of FDI on environmental quality in these countries. Additionally, the study also uncovers the indirect impact of institutional quality on environmental pollution through FDI activities. Based on the research findings, the authors propose several policy implications to enhance institutional quality to mitigate the adverse effects of FDI on the environment.

Keywords: FDI, CO2 emission, environmental pollution, institutional quality

JEL codes: F41, E02, G28

1. INTRODUCTION

Sustainable growth is a long-term objective that all countries aim for. To achieve this goal, in addition to economic development policies, nations also need to pay attention to environmental protection. A trend in recent decades is the global warming and climate change issue, which many countries around the world, especially developing countries, are facing (Tang & Tan, 2015; Al-Mulali et al., 2015). One of the main causes of this situation is the increase in CO2 emissions in countries during economic growth and development. Rapid urbanization and the growth of numerous industrial zones without proportional urban planning have led to severe environmental pollution, particularly in regions with many developing countries, including Asia. According to the World Health Organization (WHO), about 90% of deaths related to air pollution occur in low and middle-income countries, with the majority in Asia and Africa. Asia, being the world's largest continent with over 4.6 billion people[2], is considered a major source of abundant cheap labor. Along with high growth prospects, it has become an attractive destination for foreign direct investment (FDI). According to (UNCTAD, 2021), FDI flows into developing countries account for 75% of global FDI, with over 55% going to developing countries in Asia. This region is currently the largest recipient of FDI in the world. Asian countries encourage foreign and private sector investors to play a greater role in their economies to promote foreign direct investment activities, which also contribute to economic growth and comprehensive economic integration through technology spillover effects and the accumulation of physical and human capital. Along with implementing policies to open up, Asian countries have achieved significant achievements, but not without negative environmental impacts. Therefore, alongside the positive effects that FDI brings to the economy, it is also one of the factors contributing to environmental pollution in developing countries. In other words, foreign direct investment is an important factor in economic growth and development, promoting technology transfer in developing Asian countries. However,

2 According to UNFPA, as of December 26, 2021, the total population of Asia is 4,697,998,233 people.

these countries often have to trade off economic growth, integration, and attracting FDI with energy consumption and environmental degradation. In other words, the economic benefits of FDI come with environmental costs that society has to bear.

In addition to FDI, institutional quality has also been examined recently in terms of its impact on environmental quality. A fair and efficient institutional environment is a prerequisite for promoting economic growth while limiting negative impacts on the environment (Salman et al., 2019). It is acknowledged that countries with more stable political systems, along with existing conditions to attract more FDI, often have negative effects on environmental quality. Therefore, it is essential to improve the quality of regulations and law enforcement, control corruption, and enact strict environmental regulations to improve environmental quality or at least slow down environmental degradation (Salman et al., 2019; Zakaria & Bibi, 2019).

Many empirical studies have demonstrated the impact of FDI and institutional quality on environmental quality, but there is no consensus on the direction of their impact on the environment. Regarding FDI, most studies indicate a negative impact on the environment, as it increases CO2 emissions (Omri et al., 2014; Al-Mulali et al., 2015; Haug & Ucal, 2019; Pazienza, 2019). Conversely, some other studies show a positive impact on the environment, such as the research by Al-mulali (2011); Wang et al. (2019); Shurui et al. (2019); Lin et al. (2022). In terms of institutional quality, most studies suggest that enhancing institutional quality is a solution to improving the environment through effectively controlling corruption issues and increasing the efficiency of law enforcement, especially environmental regulations (M. Khan & Rana, 2021; Obobisa et al., 2022; Salman et al., 2019; Yuan et al., 2021).

However, there are still very few studies that examine the role of institutional quality in the impact of FDI on environmental quality, especially in developing Asian countries. Therefore, this research hopes to contribute to empirical evidence on the specific impact of FDI on environmental quality and assess the role of institutional quality in the impact of FDI on environmental quality in developing Asian countries. The author hopes that the research results will help provide a more accurate assessment of the role of FDI and institutional quality in environmental pollution issues in developing Asian countries in general and Vietnam in particular. Based on this foundation, appropriate policies related to FDI and improvements in institutional quality to mitigate negative impacts on environmental quality in these countries can be proposed.

2. THEORETICAL FRAMEWORK AND LITERATURE REVIEW

2.1. Theory of the impact of FDI on environment quality

The debate on the role and impact of FDI on environmental quality began in the early 1990s. There are two competing theories explaining the contrasting effects of FDI on environmental quality, namely the Pollution Heaven Hypothesis (PHH) and the Pollution Halo Hypothesis (PHL).

The Pollution Heaven Hypothesis (PHH) posits that FDI has a negative influence on environmental quality in the host countries. Long-term economic growth and development are the goals of every nation. As an inevitable trend to achieve this goal, governments of countries often seek to attract FDI by offering specific incentives and environmental standards that are less stringent. This leads to a significant number of “dirty” production activities relocating from developed economies with strict environmental regulations to developing economies, giving rise to the concept of pollution heaven. Consequently, with the increase in FDI inflows, the level of environmental pollution in these countries becomes progressively worse (Tang & Tan, 2015).

Conversely, the Pollution Halo Hypothesis (PHL) suggests that FDI creates opportunities for businesses to grow while gaining access to clean, modern, and energy-efficient technologies, thereby contributing to the improvement of environmental quality. Many empirical studies have found supporting evidence for this hypothesis, such as the research conducted by (Al-mulali, 2011; Wang et al., 2013; Shurui et al., 2019).

2.2. Literature review

Many experimental studies have shown that FDI is one of the critical factors influencing environmental quality in countries, especially developing ones. The FDI inflows into these countries often follow models that use environmentally unsustainable energy sources, theoretically leading to a "pollution haven" phenomenon and causing environmental degradation, as demonstrated in studies by Hoffmann et al. (2005); Tang & Tan (2015); Baek (2016); Candau & Dienesch (2017); Li et al. (2019); Hanif et al. (2019). Similar results were found in a recent study by Y. Wang & Huang (2022) conducted in East Asian countries. However, FDI only increased short-term CO2 emissions, with no statistically significant long-term impact. On the contrary, some studies have found positive effects of FDI on the environment, supporting the hypothesis of spillover effects, suggesting that FDI helps the host countries adopt and apply advanced technologies in production, thus reducing CO2 emissions and contributing to environmental improvement. Examples of such studies include Al-mulali (2011); Wang et al. (2019); Shurui et al. (2019). Similarly, Lin et al. (2022) found a positive impact of FDI in reducing CO2 emissions in China. Additionally, the research discovered that FDI has negative effects on the environment in provinces and cities directly receiving FDI inflows but positive effects on neighboring provinces and cities. Recently, Adeel-Farooq et al. (2021) investigated the impact of FDI on environmental pollution in East Asian countries, examining differences in the origin of FDI inflows. They found that FDI from developed countries has an environmentally beneficial impact, whereas FDI from developing countries often harms the host country's environment.

Exploring the correlation between institutional quality and environmental pollution has recently been a topic of significant interest. Institutional quality in a country is reflected through various aspects, including the level of corruption control, investment-financial policy, and the effectiveness of policy enforcement and legislation. Many experimental studies have examined the influence of institutions in general and specific institutional aspects on environmental quality. Most research results affirm that a country with good governance often establishes stricter environmental regulations and policies to limit negative environmental impacts (Salman et al., 2019; Zakaria & Bibi, 2019). Furthermore, some other studies investigate the regulatory role of institutions in the relationship between environmental quality and various aspects of the economy. For example, a study by Wang et al. (2018) found that controlling corruption can reduce CO2 emissions and regulate the relationship between trade and CO2 in BRICS countries. More recently, Uzar (2020) also provided evidence of the intermediary role of institutions in addressing environmental issues by promoting the use of renewable energy sources. Therefore, an effective institutional system with rigorous monitoring mechanisms helps reduce environmental costs in economic development, contributing to environmental pollution reduction (Salman et al., 2019).

3. MODEL, DATA, AND RESEARCH METHOD

3.1. Research model and data

The study analyzes the impact of FDI (Foreign Direct Investment) on environmental pollution, considering different institutional quality conditions in various developing Asian countries that attract a significant share of FDI with a high global proportion. To achieve this objective, the authors referred to models from previous experimental studies and used the Generalized Method of Moments (GMM) approach for panel data with the following standard models estimated:

Model (1): Assessing the impact of FDI and institutional quality on environmental pollution.

$$CO2_{it} = \mu_i + \alpha FDI_{it} + \beta INST_{it} + \theta X_{it} + \varepsilon_{it}$$

Model (2): Evaluating the interactive effects of FDI and institutional quality on environmental pollution.

$$CO2_{it} = \mu_i + \alpha FDI_{it} + \beta INST_{it} + \delta (FDI * INST)_{it} + \theta X_{it} + \varepsilon_{it}$$

In which: i and t represent the respective country and time, $\mu\mu$ is a constant, εit is the random error term for country i at time t. The set X includes control variables such as trade openness (TO), energy consumption (EN), and financial development (FD).

Environmental pollution_CO2 is the dependent variable reflecting the level of environmental pollution, measured by average CO2 emissions per capita (tons per person). CO2 emission data are collected from the U.S. Energy Information Administration (EIA) database. While various indicators can measure different aspects of environmental pollution (CO2, SO2, NOX), due to data limitations for 1996-2021 concerning other environmental pollution indicators (such as water and soil pollution), CO2 is chosen as the representative indicator.

Foreign Direct Investment_FDI is an independent variable reflecting each country's foreign direct investment attraction level, measured by FDI inflows as a percentage of GDP for each country. FDI data is collected from the World Bank's World Development Indicators (WDI).

Institutional Quality_IQ is an independent variable reflecting the quality of institutions in the sample countries. According to the Worldwide Governance Index (WGI) dataset, institutional quality and governance indicators reflect various aspects of a country's institutions and governance, such as control of corruption, government effectiveness, voice and accountability, regulatory quality, political stability, and the rule of law. This approach implies that including all the indicators in the model as explanatory variables can enhance the model's explanatory power. However, because these variables reflect different aspects of governance, there may be a potential correlation between them, and multicollinearity may occur in the model. Furthermore, it can lead to over-parameterization, affecting the model's confidence. Consequently, the author used the Principal Component Analysis (PCA) method to determine a composite institutional quality index based on six component governance indices.

Trade Openness_TO is a control variable reflecting economic openness, measured by each country's total value of exports and imports as a percentage of GDP. Trade openness data is collected from the World Bank's World Development Indicators (WDI).

Energy Consumption_EN is a control variable that reflects the level of energy consumption in various industrial sectors, production regions, and overall consumption patterns. As foreign direct investment (FDI) inflows and international trade activities expand, the production processes tend to become more energy-intensive, increasing energy consumption. Data on energy consumption per capita (thousand tons per person) in different countries are collected from the U.S. Energy Information Administration (EIA) database. Energy consumption in industrial sectors and production regions significantly contributes to environmental degradation due to its association with high emissions. Therefore, most experimental studies have consistently demonstrated the negative impact of energy consumption on the environment.

Financial Development_FD measures the scale and efficiency of financial intermediaries and financial markets, playing an essential role in economic development. Many experimental studies have found evidence of its negative impact on environmental quality (Boutabba, 2014; N. H. Khan et al., 2018; Salahuddin et al., 2015; Shahbaz et al., 2013; Tamazian et al., 2009; Zhang, 2011). A developed financial system allows businesses more straightforward access to capital, facilitating expansion and business development, thereby increasing CO2 emissions and negatively affecting the environment. Data on the financial development index are collected from the IMF database.

Additionally, to assess the role of institutional quality in the impact of FDI on environmental quality, the author introduces the interaction variable **FDI*IQ** into the model (2). We collected data on CO2 emissions, trade openness, FDI, and energy consumption for Vietnam and nine developing Asian countries, including Bangladesh, Cambodia, India, Indonesia, Malaysia, Mongolia, Nepal, the Philippines, and Thailand, with annual frequency from 1996 to 2021.

3.2. Research method

Based on previous experimental research, the author chose the System- Generalized Method of Moments (SGMM) for panel data to analyze the role of institutional quality in the impact of FDI on environmental quality in developing Asian countries.

Firstly, the author examined the cross-sectional dependence of variables to select an appropriate testing method considering the data characteristics (Cross-sectional Dependence Test). Using Pesaran's (2021) approach, the test's results indicated the presence of cross-sectional dependence among the variables across countries. Therefore, the author proceeded to test the stationarity of the variables to select an appropriate regression model for a proper investigation of the underlying relationship. To confirm the stationarity of variables, the author performed a second-generation CIPS stationarity test. After confirming that the data series were non-stationary, the author continued to determine whether there was a long-term cointegration relationship among the variables by the Westerlund cointegration test.

Since there was no evidence of a long-term cointegration relationship among the variables, traditional regression methods such as POLS, FEM, and REM could be employed. However, when conducting tests for multicollinearity, the author discovered multicollinearity in the model due to interacting variables, and endogeneity issues were also detected. It led to biased and unreliable estimation results. Hence, the author used the SGMM method developed by Arellano & Bond (1991); and Blundell & Bond (1998) to address these shortcomings.

The advantage of this method over traditional regression methods (POLS, FEM, REM) is that it provides robust and unbiased coefficient estimates, even when endogeneity assumptions are violated, with customarily distributed and efficient estimates. To ensure the reliability of the estimation results, we conducted a two-step SGMM estimation. Simultaneously, the author performed the Hansen J test proposed by Blundell & Bond (1998) to assess overid restrictions and to test the hypothesis of no serial correlation.

4. RESEARCH RESULTS AND DISCUSSION

4.1. Descriptive Statistics

Table 4.1 presents descriptive statistics of the variables used in the study. According to the table, the average CO2 emissions per capita from 1996-2021 for developing Asian countries is approximately 2.15 tons per year. Among these, the highest average CO2 emissions per capita are observed in Malaysia, followed by Mongolia and Thailand, with average values of 6.15 tons/year, 5.76 tons/year, and 3.56 tons/year, respectively. In contrast, Nepal has the lowest average CO2 emissions per capita (0.144 tons/year).

The average trade openness is 0.8978 in the sample. Malaysia is noted as the country with the highest level of economic openness, followed by Vietnam and Thailand, with trade openness values of 1.4524 and 1.2117, respectively. On the other hand, Bangladesh and India have the lowest trade openness among the countries, with values of 0.3597 and 0.3941, respectively.

The observed average energy consumption is 2.6 thousand tons per person. Malaysia has the highest energy consumption, followed by Mongolia and Thailand, with average energy consumption per capita of 8.05, 5.44, and 4.97 thousand tons per person, respectively. In contrast, Nepal has the lowest energy consumption, with an average of 0.266 thousand tons per person.

The average FDI (Foreign Direct Investment) as a percentage of GDP is 3.84% in the sample. Mongolia has the highest FDI/GDP ratio at 12.29%, followed by Cambodia and Vietnam at 8.71% and 5.25%, respectively. The lowest FDI/GDP ratios are observed in Nepal and Bangladesh, corresponding to 0.278% and 0.747%. FDI is considered a technology driver for economic growth, especially in developing countries. According to the pollution haven hypothesis, an increase in FDI inflows is expected to lead to an increase in CO2 emissions and environmental pollution.

Tab 4.1. Descriptive statistic results

	CO2	FDI	TO	EN	FD	IQ
Mean	2.1499	3.8489	0.8978	2.6022	0.3399	-0.3760
Max	7.6290	43.9121	2.2041	9.8578	0.7408	0.4568
Min	0.0689	0.0057	0.2193	0.1197	0.0286	-1.1418
St.dev	2.1748	5.3650	0.4739	2.5848	-1.1418	0.3955

Source: Author's calculations

4.2. Multicolinearity test

Multicollinearity occurs when two or more independent variables in a regression model are highly correlated, making it difficult to determine the individual effect of each variable on the dependent variable. In such cases, the parameter estimates can become unstable, making it challenging to interpret the results accurately. If the model exhibits multicollinearity, regression results can be biased. Therefore, the author uses the variance inflation factor (VIF) test to assess the multicollinearity of the variables in models (1) and (2).

Tab 4.2. Results of VIF test

Variables	VIF	
	Model (1)	Model (2)
FDI	1.29	2.20
TO	1.92	2.43
EN	4.46	5.10
FD	2.38	2.41

IQ	2.82	3.39
FDI*IQ		3.07
Mean VIF	2.58	3.10

Source: Author's calculations

The results show that the mean VIF (Variance Inflation Factor) values are greater than two and less than 5, indicating that the model has multicollinearity but is not severe. The multicollinearity phenomenon may occur due to the interaction variable FDI*IQ in the model; however, it is not too severe.

4.3. Unit-root test

The author conducted unit root tests to assess the stationarity of variables in the model. The hypothesis test results concerning the cross-sectional dependence in panel data affirm the existence of cross-sectional dependence among variable series. Therefore, the author applied the second-generation CIPS unit root test with the null hypothesis (H_0) set as a non-stationary variable series. The results of the unit root tests are presented in Table 4.3 below.

Tab 4.3. Results of Unit-root test

Variables	Level 0	Level 1	Conclusion
CO2	-0.411	-3.816***	I(1)
FDI	-.2651***	-5.412***	I(0)
TO	-1.430	-4.251***	I(1)
EN	-0.611	-3.644***	I(1)
FD	-1.873***	-5.384***	I(0)
IQ	-1.327	-3.975***	I(1)
FDI*IQ	-2.220***	-4.998***	I(0)

*Note: ***p<0.01, **p<0.05, *p<0.1*

Source: Author's calculations

The findings in Table 4.3 reveal that only the variables FDI, FD, and the interaction variable FDI*IQ are stationary at the original level. However, all other variables (CO2, TO, EN, and IQ) are stationary at the first differenced level. Subsequently, the author proceeds to conduct cointegration tests to determine the presence of long-term relationships among the variable series.

4.4. Cointergation test

Due to the existence of cross-sectional dependence among the variable series, the Westerlund cointegration test was selected. The specific results of the cointegration test are presented in Table 4.4 below.

Tab 4.4. Result of Westerlund test

	Model (1)	Model (2)
Statistic	-1.195	-0.645
p-value	0.116	0.259

Source: Author's calculations

The results of the cointegration tests in both models indicate that the statistical values are greater than 0.1, demonstrating no cointegrating relationship among the variable series in the model. Based on this, suitable estimation methods for these data could be POLS, FEM, or REM. However, since the model exhibits multicollinearity, using these traditional regression methods might result in biased and less reliable estimation outcomes.

As discussed in section 3 on research methodology, the author continues to examine the endogeneity of the model before applying the SGMM regression method.

4.5. Endogeneity test

To identify endogenous variables in the model, the author used the two-stage least squares (2SLS) regression method with the Durbin Wu-Hausman test for each independent variable, with the null hypothesis (H_0) being that the variable is exogenous. The results of the endogeneity tests for the independent variables in the model are presented in Table 4.5 below.

Tab 4.5. Result of Durbin Wu-Hausman test

Variables	Durbin	Wu-Hausman
FDI	$\chi^2_1 = 14.8802$***	F(1,243) = 15.3789***
TO	$\chi^2_1 = 0.9015$	F(1,243) = 0.8794
EN	$\chi^2_1 = 0.7468$	F(1,243) = 0.7505
FD	$\chi^2_1 = 0.0884$	F(1,243) = 0.0860
IQ	$\chi^2_1 = 3.0866$	F(1,243) = 3.0376

*Note: ***p<0.01, **p<0.05, *p<0.1*

Source: Author's calculations

The results in Table 4.5 show that FDI is the only endogenous variable in the model. Endogeneity can lead to biased coefficient estimates using traditional regression methods. Therefore, to address multicollinearity and endogeneity issues, the author employs the System Generalized Method of Moments (SGMM) to identify correlations between variables in the model. The advantage of this method is that it can provide robust, unbiased, normally distributed, and efficient coefficient estimates even when endogeneity issues are present.

4.6. Estimation results

Source: Author's calculations

AR(1) represents the instrumental variables correlating with the endogenous variable; therefore, the p-value must be less than or equal to 10%. Meanwhile, AR(2) represents the instrumental variables correlating with the residuals, so the p-value must be greater than 10%. Specifically, the results in Table 4.5 show that AR(1) has p-values of 0.039 and 0.082, less than 10%. AR(2) has p-values of 0.125 and 0.161, greater than 10%. It demonstrates that the instrumental variables used in the model are appropriate because they do not correlate with the endogenous variable and the residuals. The Hansen test assesses the validity of instrumental variables for the two-step GMM method, with the null hypothesis (Ho) being that the instrumental variables are valid. The test results yield p-values of 0.195 and 0.475, both more significant than 10%, indicating no basis for rejecting the null hypothesis (Ho). It once again confirms the appropriateness of the instrumental variables.

Additional, the number of instrumental variables is greater than the number of variables in the model and is less than the number of groups. Specifically, for model (1), the number of instrumental variables is 8, which is greater than the number of variables in the model (6 variables, including CO2, FDI, TO, EN, FD, and IQ). For model (2), the number of instrumental variables is 9, which is greater than the number of variables in the model (7 variables including CO2, FDI, TO, EN, FD, IQ, FDI*IQ). It ensures the confidence of the estimation results using the two-step SGMM method.

From the estimation results of the model, it is observed that financial development does not exhibit statistically significant effects on environmental quality. However, all three variables - FDI, TO, and EN - directly impact the increase in CO2 emissions and environmental degradation. It is evident through positive and statistically significant correlation coefficients, although there are differences in the magnitude of the impact of each factor. Specifically, energy consumption (EN) has the most substantial influence on the increase in CO2 emissions, with correlation coefficients of 0.6935 and 0.8186 in the two models, respectively. Next is international trade (TO), with correlation coefficients of 0.769 and 0.1997, followed by FDI, which has the least negative impact. Although the regression coefficient of FDI is not very high, these results confirm the adverse effect of foreign direct investment on environmental quality in developing Asian countries.

In reality, during the initial stages of market liberalization in these countries, FDI inflows concentrated in heavy industries characterized by high emissions. The formation of industrial zones, increased production, and energy consumption led to higher CO2 emissions and environmental pollution. Furthermore, despite being the leading destination for global FDI, these countries often had limited technology and lax legal and environmental regulations, making FDI activities less environmentally efficient. Due to the significant difference between registered FDI and actual FDI invested in the production process in these countries, the increase in CO2 emissions remained relatively low.

Market liberalization promoted international trade and foreign investment activities, increasing the demand for energy use in production and economic development, resulting in increased CO2 emissions that negatively affected the environment. Moreover, developing Asian countries are attractive destinations for exporting products, hazardous waste, and dirty production activities from developed nations.

When considering the individual effects of institutional quality on environmental quality, the study did not find statistically significant effects. However, when examining the interaction effect between FDI and institutional quality, the author discovered a positive impact on the environment at the 10% significance level with a negative coefficient. It suggests that developing countries' institutional quality does not directly impact but indirectly affects the environment through FDI activities. It is a novel finding of the research.

Most ASEAN countries are developing nations with high political risks, corruption issues, and institutional shortcomings. Incomplete legal frameworks and ineffective enforcement of environmental policies, coupled with high levels of corruption, have created conditions for dirty production activities, increasing the risk of environmental pollution. Therefore, improving institutional quality, establishing strict environmental regulations, and enforcing effective monitoring mechanisms are essential measures to mitigate the adverse effects of FDI on the environment.

5. CONCLUSION AND POLICY IMPLICATIONS

The main objective of this study is to assess the impact of foreign direct investment (FDI) on CO2 emissions and simultaneously examine the role of institutional quality in the environmental consequences of FDI in developing Asian countries. These countries have experienced periods of high economic growth, but this growth has come at a significant environmental cost. Using the SGMM method for panel data spanning 10 developing Asian countries from 1996 to 2021, the research supports the pollution haven hypothesis regarding FDI in these countries. Additionally, the study provides evidence that institutional quality indirectly affects the environment through FDI activities.

Developing Asian countries, with their rapidly growing economies, have become attractive destinations for FDI inflows. However, they often have institutional shortcomings, loose legal frameworks, and high levels of corruption, making them recipients of low-quality investments in industries and sectors with high emissions, leading to environmental pollution. The question of "How can we harness the positive effects of FDI while mitigating its negative impacts on the environment?" is a significant policy challenge. To minimize these negative effects and promote sustainable economic growth, Asian developing countries should:

(1) Improve the effectiveness of environmental policy management, monitoring, and enforcement.

(2) Selectively screen international trade activities and FDI projects that meet environmental standards, focusing on investments and products that are environmentally friendly.

(3) Enhance institutional quality, particularly in institutions and policies related to the environment.

(4) Strengthen international cooperation and coordination among countries in the region on climate, air quality, and other environmental pollution issues.

The study was limited to 10 out of 45 Asian developing countries. In future research, the author expects to collect a complete dataset for all 45 Asian developing countries to explore the role of governance quality in the impact of FDI on environmental issues in these countries. Additionally, the author aims to determine the threshold level of governance quality at which the impact of FDI on the environment shifts from negative to positive.

ANALYSIS OF FACTORS AFFECTING AWARENESS OF GREEN BANKING IN SUSTAINABLE DEVELOPMENT

Ph.D Tran Thi Thanh Nga[1]

Abstract: This article aims to study activities related to green banking and the importance of green banking practices. In addition, the study clarifies current opinions related to green banking activities and examines the level of awareness of green banking among customers in Ho Chi Minh City through a survey using a 5-point Likert scale to assess customers' understanding of green banking. The study used SPSS 26.0 and SMART-PLS 26.0 to analyze data and showed that there are three factors: Awareness of e-banking; Awareness of green investment; and Awareness of energy saving that affect awareness of green banking in Vietnam. The research plays a role in discovering factors affecting green banking activities, thereby contributing to raising customers' awareness of green banking in the sustainable development of banking in Vietnam. In addition, the research serves as a basis for planners to set forth directions to increase awareness and social responsibility of the commercial banking system for environmental protection and combating climate change.

Keywords: green banking, SEM, sustainable development

1. INTRODUCTION

According to Hossain, Rahman, Hossain, and Karim (2020), green banking is a type of banking activity where banks strive to perform their daily operations as conscientious members of society by taking into account internal and external environmental sustainability, and such banks are termed as green banks. Green banking could be an influential strategy that recognizes environmental concerns, social responsibilities, and sustainable ecological balances, attracting customers (Rifat et el. (2016). Nowadays, banks are considered the main cause of world climate change as they can focus more on green banking and urge stakeholders to maintain green concepts in their regular operations (Bukhari et al., 2019). Alsayegh et al. (2020) stated that the idea of sustainable banking requires the use of green banking techniques to take into consideration ethical, social, and environmental concerns. In addition, banking institutions play an important role in financing many industrial projects that may exert profoundly adverse social or environmental impacts. Zheng et al. (2021) pointed out that Green Financing is viewed as an important component of sustainable banking, having a significant influence on the development of an eco-friendly economy and industry in general. Therefore, it can be said that in enhancing the sustainable practices of the financial sector, the banking industry should focus on ensuring the financing of eco-conscious projects through financially efficient banking activities to boost banks' competitive advantage, generate more earnings, improve existing assets, and save invested capital and other costs. Up until recently, green banking seemed to be merely an idea and environmental concerns did not appear particularly relevant to bank operations. This concept has yet to be adopted by developing economies. Mir and Bhat (2022) believed that the number of studies on green banking in developing countries is still limited, leading to an urgent need to unlock this concept holistically. Similarly, Sharma and Choubey (2022) observed a scarcity in the number of studies on the green banking space. The majority of research, if any, focuses on corporate social responsibility and environmental management (Biswas, 2016) and green banking strategies (Kaur and Sandhu,

1 Email: ngatcnh@ufm.edu.vn, University of Finance - Marketing.

2019). In Vietnam, there are not many empirical studies related to the role of green banking in sustainable development and green banking-related awareness. Therefore, this study attempts to fill the research gap concerning this issue.

2. LITERATURE REVIEW ON GREEN BANKING

2.1. Definition of green banking

Green banking has been defined in various ways by researchers, but the overall focus remains complete banking systems that ensure significant economic growth while improving environmentally friendly practices. (Lalon, 2015). Green banking is becoming a global standard for application in today's business activities. Green banking is environmentally friendly in that it prevents environmental degradation and makes the earth more eco-friendly. Green banking is recognized as a type of sustainable banking that contributes to protecting the world from environmental damage to ensure economic prosperity (Islam et al., 2020).

Banks must play a more significant role related to climate change through green banking and banking operations must be efficient (Khatun, Sarker & Mitra, 2021). They defines green banking as environmentally friendly banking as well as a set of practices and responsibilities that help establish an environmentally friendly business. Companies have shown increasing interest in integrity issues due to growing external pressure from various stakeholders, including government banking institutions, socially conscious investors, and advocacy, among others; following this trend, the recent increase in environmental costs has motivated businesses to incorporate environmental issues into all levels of management (Mir & Bhat, 2022). (Islam et el., 2020) believe that Green Banks are those carrying out direct activities to minimize environmental impacts such as economically using energy, water, and waste treatment or exerting indirect impact on the environment through increased support for eco-friendly projects such as waste gas plants, renewable and solar energy plants, or bio-manufacturing plants.

(McEwen et al., 2020) argue that a green bank features the following basic characteristics: "(i) Implement e-services and automation; (ii) Prioritize lending or investing in projects with environmental risk assessment; (iii) Pay attention to social goals, sustainable development goals, and green development; (iv) Demonstrate careful supervision and guidance on customer projects to minimize the risk of environmental pollution; (v) Demonstrate a change in the ability of banking officers and customers to evaluate environmentally friendly activities". (Ransom et al., 2005; Tu & Dung, 2017) claimed that the products and services that a green bank needs to provide to customers may include: (1) Online banking services that help commercial banks cut the amount of paper, energy, and other natural resources during use, through the fact that utility bills such as phone, cable TV, services, and credit cards can all be remotely processed via an Internet connection from a computer or smartphone; (2) Infrastructure such as ATMs or specialized screens placed at banks for green checking accounts which banks encourage customers to use by offering attractive interest rates or waiving (reducing) banking fees; (3) Green loans: including "household support loans, commercial center construction loans, or car loans"; (4) Green cards: such as credit cards and debit cards for banks to "contribute funds to environmental protection organizations through each currency unit spent with the card" (usually 0.5% of the value of each transaction).

Goddy et al. (2020) suggested that the concept of "Green Bank" refers to banks that carry out many activities to encourage environmental and low-carbon practices such as encouraging customers to use green products and services, applying environmental standards when approving loan applications, or granting preferential loans to CO2 reduction and renewable energy projects. (Mir & Bhat, 2022) pointed out that banks are still lagging in implementing green banking services despite many opportunities in green banking, hence the need to take strict measures on implementation alongside customer awareness and training. Banks must educate consumers about the concept of green banking and employ all techniques to help protect the environment while enhancing the bank's reputation. Upon reviewing domestic and foreign empirical studies, it is evident that the majority of banks are increasing their development efforts following the current trend to achieve sustainable development (SD) through the use of green practices.

2.2 Customer's awareness of green banking

Green banking is considered one of the processes to ensure sustainability where the negative impact of business activities on the environment is limited. Banks play an intermediary role in the economy as they directly impact the sustainable development of the economy. Green banking not only ensures the greening of sectors but also helps banks improve asset quality in the future. Green banking enhances a bank's image by demonstrating and implementing its environmental commitment; reducing operating costs due to less use of stationery, energy, and water; increasing employee productivity and efficiency through skilled and optimal use of technology; and reducing hazards by installing environmentally friendly equipment. Green banking considerably saves on forestry costs by minimizing the use of paper; reduces greenhouse gas emissions by organizing remote conferences and arranging transportation for employees; supports the development of customers' environmental awareness by organizing awareness-raising programs; and reduces the level of non-performing assets by investing in less risky projects. Green banking involves technical advancements, operational improvements, and changes in customer behavior in the banking sector. Green banking programs often include energy conservation, recycling, carpooling, and environmentally responsible lending. Due to strict environmental regulations by authorities across countries, industries will have to comply with specific standards to conduct business. Green banking saves money and energy by reducing costs and increasing the country's GDP.

Vidyakala (2020) suggested that green bank (GB) activities (environmental worker training, energy-saving activities, green policies, and overall green initiatives) have had a favorable impact on the environmental performance of banks. Green banking aims to achieve sustainability, growth, and development that is sustainable through an eco-friendly and sustainable banking system (Brundtland, 1987) and sustainability can also be achieved with online banking, e-banking, and adherence to the 3D strategy (de-materialization, de-carbonization, and de-mobilization) in the bank's daily operations. After reviewing the above literature, it can be easily assessed that green banking and sustainability have a positive and significant relationship with sustainable growth and development worldwide. Thus, the previous literature supports the view that despite significant risks, the financial sector has responded perfectly to sustainability as an intermediary function in the economy, leading to the conclusion that green banking should never be overlooked to achieve sustainability.

Customer perception of green banking gradually becomes positive as green banking facilitates digitalization, green and eco-friendly infrastructure, and effective IT support that reduces carbon and radiation emissions. Most interestingly tech-savvy customers feel comfortable participating in green banking initiatives but older customers prefer the inefficient traditional banking system. Aiming at customer satisfaction, the technology acceptance model (TAM) will be an option, which is a combination of the theory of Reasoned Action and the theory of Planned Behavior. Customers are ready to accept new technology but to build awareness, banks have acknowledged various issues to assist them in using green banking easily (Shrivastava et al., 2019).

Subrata et al. (2017) research on customer awareness and perception of green banking in Sylhet state, Bangladesh shows that customers are more aware of banking via text messages (SMS banking). Prakash and Pappu (2017) show that customers are more aware and aware of green banking towards large state-owned banks. Satheesh (2017), Omid et al. (2015) pointed out that customers at small private banks along with bank employees are better aware and aware of green banking than the general public, so state banks need to do more. to help the public access the green banking system. Ganesan and Bhuvaneswari (2016) pointed out that education has a great impact on awareness and perception of green banking.

3. RESEARCH DESIGN AND MODEL

3.1. Research design

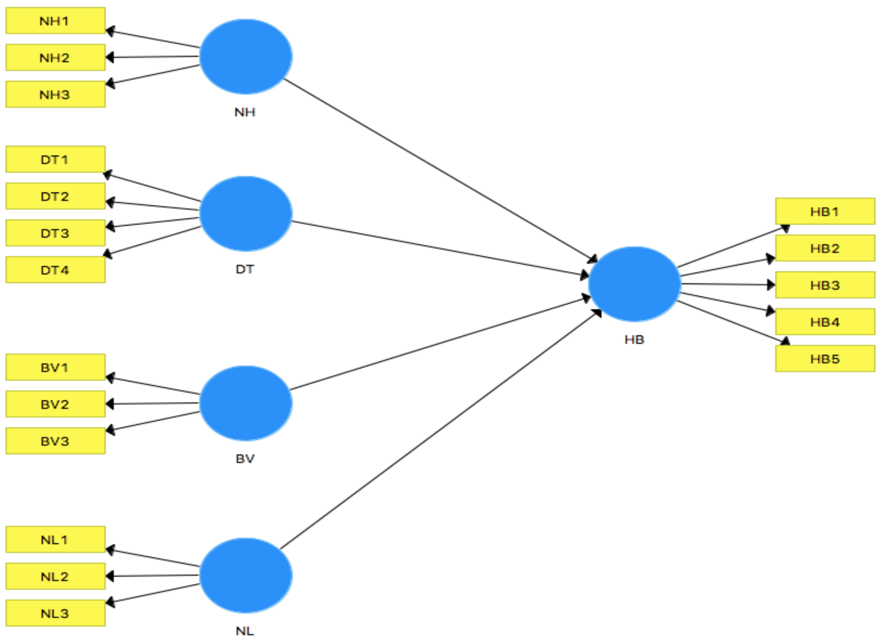
The study created a survey with a total of 18 observed variables for the 5 main concepts of the research model, designed as closed-ended questions with a 5-point Likert scale, from 1 "Strongly disagree" to 5 "Strongly agree". In particular, the number of observed variables for each factor is as follows: (1) Awareness of e-banking (3 observed variables); (2) Awareness of green investment (4 observed variables); (3) Awareness of sustainable banking (3 observed variables); (4) Awareness of energy saving (3 observed variables); and (5) Level of understanding of green banking of customers in Vietnam (5 observed variables). To ensure reliability and objectivity in terms of content and format, questions were extracted and adjusted based on previous studies. The study collected data from customers in Vietnam on their level of understanding of the green banking system. The convenience sampling method was used to randomly send the survey to commercial bank customers living and working in Vietnam. Due to limitations in implementation time, the survey questionnaire was distributed for about one month, and a total of 96 valid responses were collected, consistent with the minimum research sample size needed for the PLS-SEM model.

3.2 Research model

The study inherits from previous studies of Ellahi et al. (2023) and Rai et al. (2019) to build a research model with four main independent variables: (1) Awareness of e-banking; (2) Awareness of green investment; (3) Awareness of sustainable banking; (4) Awareness of energy saving and (5) Level of understanding of green banking of customers in Vietnam.

The study tested the hypothesis and the Structural Equation Modeling (SEM) has advantages over traditional methods because it calculates measurement errors and allows combining and measuring latent concepts with theoretical models at the same time (Hulland et al., 1996). The study employs partial least squares structural equation modeling (PLS-SEM) to overcome the limitations of research data due to time constraints. PLS-SEM can produce analysis results for sample sizes smaller than 200.

Figure 3.1: Research model



With research hypotheses, including:

H1: Awareness of e-banking positively affects the level of understanding of green banking.

H2: Awareness of green investment positively affects the level of understanding of green banking.

H3: Awareness of sustainable banking positively affects the level of understanding of green banking.

H4: Awareness of energy saving positively affects the level of understanding of green banking.

4. Research findings

Table 4.1 Characteristics of the final study sample

Criteria		Quantity	Proportion (%)
Gender	Male	49	51
	Female	47	49
Age	18 – 25 years old	87	90.6
	25 – 35 years old	2	2.1
	Over 35 years old	7	7.3
Average monthly income	Under 5 million	41	42.7
	5 – 10 million	14	14.6
	10 – 15 million	18	18.8
	Over 15 million	23	24
Education level	Undergraduate	79	82.3
	Upper secondary	6	6.3
	Postgraduate	1	1
	Other	10	10.4
Total:		96	100

Table 4.2 Scale reliability assessment results

Latent variable (Cronbach's Alpha)	Measurement variable	Outer Loading	Mean	Total Correlation	Variance
Awareness of e-banking (Cronbach's Alpha = 0.826; CR = 0.896; AVE = 0.743)					
NH1	I prefer paperless transactions with commercial banks.	0.819	4.18	0.619	0.8
NH2	I prefer using e-banking over traditional banking services.	0.884	3.8	0.68	1.024
NH3	I prefer digital receipts after making transactions to paper receipts issued from an ATM.	0.88	3.77	0.708	1.168
Awareness of green investment (Cronbach's Alpha = 0.759; CR = 0.855; AVE = 0.619)					
DT1	I think online banking services are less harmful to the environment.	0.861	3.8	0.656	1.424
DT2	I have heard of or used green facilities (green loans, green mortgages, green investments) provided by commercial banks.	0.867	3.91	0.64	1.075
DT3	I think reducing paper waste through e-statements and digital receipts needs to be implemented in commercial banks nowadays.	0.927	3.81	0.789	1.017
DT4	I like debit and credit cards that are made from eco-friendly recycled materials.	0.349	3.74	0.358	1.353
Awareness of sustainable banking (Cronbach's Alpha = 0.542; CR = 0.757; AVE = 0.512)					
BV1	I want to pay the bank I am using to follow sustainable banking practices.	0.621	3.97	0.384	0.725
BV2	I have seen the bank I am using advertising or promoting green banking activities.	0.811	3.71	0.608	1.114
BV3	I will switch to another bank if the bank I am using does not develop a green banking model.	0.693	3.99	0.611	0.831
Awareness of energy saving (Cronbach's Alpha = 0.671; CR = 0.816; AVE = 0.597)					
NL1	The bank products and services I am using are eco-friendly.	0.715	3.98	0.58	0.652
NL2	The bank products and services I am using are environmentally sustainable.	0.782	3.99	0.544	0.663
NL3	The bank products and services I am using are environmentally friendly.	0.818	3.72	0.603	0.878
Level of understanding of green banking (Cronbach's Alpha = 0.796; CR = 0.859; AVE = 0.552)					
HB1	I am an environmentally conscious person.	0.820	3.69	0.708	0.891
HB2	I have a certain awareness of the concept of green products.	0.744	3.54	0.552	1.051
HB3	I have a certain knowledge of the green banking model.	0.735	4.2	0.676	0.687
HB4	The bank I am using provides green banking-related services and products.	0.636	3.99	0.522	0.642
HB5	I know the green banking model is currently being implemented in the bank I am using.	0.768	3.93	0.659	0.721

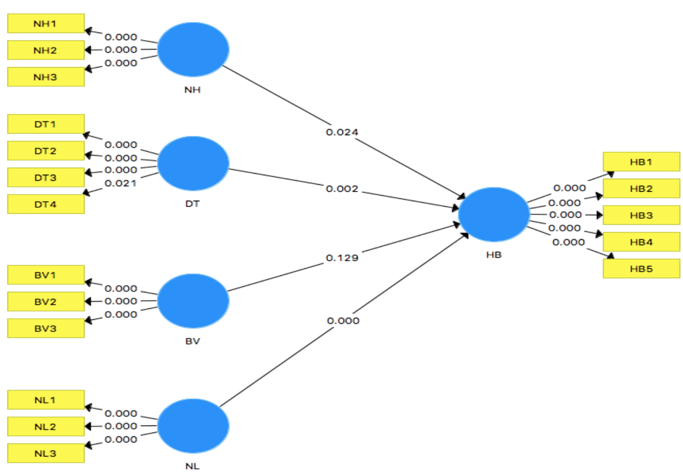
Table 4.3 Evaluation of relationships

Correlation	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values	Conclusion
Awareness of sustainable banking -> Level of understanding of green banking	0.127	0.123	0.084	1.518	0.129	Reject
Awareness of green investment -> Level of understanding of green banking	0.249	0.257	0.08	3.131	0.002	Accept
Awareness of e-banking -> Level of understanding of green banking	0.187	0.188	0.083	2.261	0.024	Accept
Awareness of energy saving -> Level of understanding of green banking	0.441	0.441	0.087	5.092	0.000	Accept

Source: compiled by author.

The results in Table 4.3 show that the impact of variable BV (Awareness of sustainable banking) on variable HB (Level of understanding of green banking) has a value P that does not satisfy the required conditions. (P=0.129>0.5). On the contrary, all the correlations between the remaining three variables and the dependent variable HB (Level of understanding of green banking) all have a coefficient P that satisfies the required condition (P less than or equal to 0.05), specifically with values of 0.002 of DT (Awareness of green investment); 0.024 of NH (Awareness of e-banking); and 0.000 of NL (Awareness of energy saving) respectively.

Figure 4.2 Evaluation of relationships



The results of this study show that there is a rejected research hypothesis, H3, which means that awareness of sustainable banking is not convincingly proven to exert an impact on the level of understanding of green banking in Vietnam. This result is completely different from previously referenced research by Ha Nam Khanh Giao et al(2020); Ellahi et al. (2021); and Raj et al. (2019). This difference may result from the fact that the term Sustainable Banking is still relatively new to customers in the Vietnamese market. The factor found to have the strongest impact is "Awareness of energy saving", showing similar results to the research of Raj et al. (2019) and Ellahi et al. (2021). Two factors found to have an average effect positively impacting the level of green banking knowledge of customers in Vietnam are awareness of e-banking and awareness of green investment, with coefficients f square of 0.059 and 0.095, respectively. This result is similar to the research articles of Ellahi et al., 2021 and Raj et al., 2019. The specific level of impact of each study varies due to differences in subjects, sample size, or survey scope of the studies. However, the biggest similarity is that these two factors always exert a moderate level of impact. This result has proven that the majority of customers, not only in the Vietnamese market but also in other markets around the world, are subject to the moderate impact of these factors on their level of understanding of green banking.

5 CONCLUSIONS AND POLICY IMPLICATIONS

These can be summarized in the following points:

First, to date, there is no widely accepted framework for green or sustainable banking. However, green banking is at different stages of development across countries. As for Vietnam, green banking activities are at a developing stage and green processes have a significant impact on sustainable banking development and the environment.

Second, this research provides useful insights to the banking industry in identifying factors that affect customer awareness of green banking activities. Awareness of energy saving is the factor with the greatest impact on awareness of green banking among customers in Vietnam; therefore, the study recommends that commercial banks can improve Vietnamese customers' awareness of green banking by first raising their awareness of energy saving. This research has noted areas where banks can focus to develop customer awareness related to a greener, more sustainable economy. Advanced technology and electronic applications that can save energy need paying more attention than before. In addition, bank managers also need to be extra mindful of energy saving in the course of business and product development to offer products that promote environmental friendliness to consumers, thereby increasing customer awareness of using green products. To achieve that, bank managers need to build long-term business strategies related to recycling and energy saving.

Third, the research supports the banking industry in identifying areas that require development so that it can focus on improving social satisfaction and stakeholder satisfaction in its areas of operation.

The study still has the following limitations: Firstly, there is a lack of diversity in the characteristics of the sample, with the age group from 18 - 25 years old accounting for more than 90% due to the convenience sampling method employed. Future studies can use other sampling methods to collect more diverse research samples. Second, the scope of the research was limited to Ho Chi Minh City, Vietnam, hence the modest results found.

THE MEDIATING ROLE OF COGNITION, EMOTION AND TRUST IN CONSUMERS' INTENTION TO ADOPT "BUY NOW PAY LATER": A SOR FRAMEWORK ANALYSIS

MBA Tran Nhat Minh[1]

Abstract: This study employs the Stimulus-Organism-Response theory in consumer behavior research to investigate the decision-making process of consumers regarding Buy Now, Pay Later (BNPL) services. Data from 348 university student questionnaires were analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM). The findings highlight the significantly mediating roles of emotion and cognition in shaping trust during the pre-purchase process, ultimately influencing consumers' intentions to adopt BNPL services.

Key words: Buy now pay later, SOR, Trust, Intention

JEL codes: G41, M31

1. INTRODUCTION

Buy Now Pay Later (BNPL) is a modern financial service that allows consumers to make purchases and manage their payments through convenient installments or by deferring payments over a specified period. This is an alternative and innovative installment method that distinguishes itself from traditional bank-provided installments by offering a "zero interest" feature. This implies that consumers are not required to pay interest if they settle their debt punctually. However, failing to do so may result in the imposition of significant surcharges and late payment fees (Raj et al., 2023; Relja et al., 2023).

The development of BNPL in Viet Nam is closely intertwined with the growth of fintech starups, which introduce a novel payment method primarily targeting low-income individuals and Gen Z (Behera & Dadra, 2023; Lia & Natswa, 2021; Lupșa-Tătaru et al., 2023) who may encounter difficulties accessing traditional credit systems. Subsequently, e-commerce platforms such as Lazada, Shopee, and Tiki, along with mobile payment providers like Zalo and MoMo, have actively collaborated with banks to enter this burgeoning market (VnExpress, 2021). Results from both MasterCard and Research & Market indicate that BNPL has a significant growth potential in Vietnam, given that only 32% of respondents currently utilize installment payment methods. The primary reasons for selecting this payment method include the attraction of low or zero interest rates, the ability to save money, avoid waiting, and the added convenience of making purchases at any time (Người Lao Động, 2023; Tuổi Trẻ, 2022).

BNPL services boast a low consumer adoption barrier and are currently governed by different regulations compared to traditional short-term credit systems. Despite garnering substantial media attention and achieving rapid market penetration (Người Lao Động, 2023), BNPL remains relatively new in the financial landscape. Consequently, it is imperative to cultivate an improved understanding of how consumers engage with BNPL.

Contemporary research primarily centers on individuals' personal financial management. From this standpoint, it is posited that Buy Now, Pay Later (BNPL) services may intensify materialistic tendencies, as indicated by studies conducted by Matos et al., (2019) and Raj et al. (2023). This

[1] Email: minhtn@ufm.edu.vn, University of Finance - Marketing.

heightened materialism can have ramifications for consumers' financial well-being (Powell et al., 2023; Schomburgk & Hoffmann, 2022), potentially placing consumers at risk of accumulating debt (Center, 2022; Cook et al., 2023; Lusardi & Tufano, 2015).

Furthermore, effective utilization of BNPL credit is contingent on consumers' attitudes toward debt (Almenberg et al., 2021; Białowolski et al., 2020). Additionally, achieving proficiency in financial literacy (Tahir et al., 2020), and gaining financial experience (Lusardi & Tufano, 2015) are essential prerequisites.

Another line of research suggests that BNPL services, due to their low consumer adoption barriers, have the potential to magnify materialistic tendencies (Matos et al., 2019; Raj et al., 2023; Tan, 2022). This amplified materialism can particularly impact consumers who lack access to traditional credit systems, leading to impulsive purchases (Azmi et al., 2022; Tan, 2022), and a propensity for overconsumption (Azmi et al., 2022).

The existing research gaps lie in the insufficient attention given to understanding how consumers are emotionally impacted by the increasing popularity of BNPL services in the market. Additionally, there is a dearth of research exploring consumers' trust in this emerging payment method as a crucial factor influencing their willingness to adopt it. Incorporating the examination of emotional and trust-related factors in their decision-making process can profoundly enhance understanding of consumer behavior during their pre-purchase stages.

2. LITERATURE REVIEW

2.1. Theoretical Framework

The SOR theory, as proposed by Mehrabian and Russell (1974), can be effectively employed to forecast consumer behavior across diverse contexts, encompassing online shopping, impulsive purchases, customer experiences, and sustainable consumption. (Han et al., 2022; Hewei & Youngsook, 2022; Kumar et al., 2023; Tandon et al., 2023). The model posits that, during consumers' pre-purchase processing, environmental factors have an impact on their perception and emotions, subsequently influencing their behavioral outcomes. The stimuli arising from marketing activities or the purchasing situation serve as triggering factors that raise consumers' awareness (Lupșa-Tătaru et al., 2023; Raj et al., 2023). The organism represents an individual's internal state, comprising both affective and cognitive aspects of their mind, which is influenced by external stimuli (Matos et al., 2019; Tandon et al., 2023). The final stage involves consumers' responses (behaviors) to these stimuli, which are mediated by their perception (Coffey et al., 2023; Schomburgk & Hoffmann, 2022).

2.1.1. Stimuli - Organism

Brand popularity can trigger a bandwagon effect (Ergün, 2021; Lin & Spence, 2019) and also create consumer anticipation for consumption outcomes as expected by service providers (Vichiengior et al., 2019). More over, as consumers become more familiar with a product, they tend to develop positive attitudes towards it (Ha & Perks, 2005; Legendre et al., 2019; Wang et al., 2018) and reduce their emotional perception of associated risks (Huang et al., 2004).

Consumers' attitudes are indeed influenced by external sources. Recommendations or feedback from others can evoke positive emotions in consumers (Zablocki et al., 2019). Consumers may experience a sense of connectedness and a desire to emulate their influencers (Ki & Kim, 2019), potentially feeling a need to belong to the group they are associated with (Alabri, 2022). These emotional responses, in turn, have a positive relationship with consumers' purchase intentions (Ashraf et al., 2023; Aydin et al., 2021; I. Kang et al., 2019; Tran et al., 2019).

When consumers buy products on credit, there is a risk that the credit may transform into debt if they cannot adhere to the repayment schedule (Center, 2022; Evans & Gregson, 2023). This situation necessitates financial responsibility on the part of the consumers (Aalders, 2023; Schomburgk & Hoffmann, 2022), particularly those who exclusively rely on BNPL for credit access (Bian et al., 2023). In the case of BNPL, the presence of low or zero interest rates may enhance consumers' perception of benefits precede costs (Siemens, 2007), thereby significantly stimulating consumption (Bian et al., 2023). Hence, it is suggested that the cost transparency of BNPL could have a positive impact on consumers' cognition.

Since BNPL primarily targets consumers who may have limited access to traditional credit systems, it offers a faster and more accessible financial arrangement. Therefore, it is suggested that the convenience of BNPL positively contributes to consumers' perception of their ability to make purchases that may have been otherwise unattainable solely based on their salary (Evans & Gregson, 2023).

2.1.2. Organism - Response

Research results indicate that marketing stimuli have a positive impact on both consumers' emotions and cognition. These psychological states significantly influences consumer decision-making, In the tourism industry, marketing activities that directly target customers through advertising, as well as indirect approaches using influencers, have been shown to generate positively influenced consumer emotion and leading to their purchase behavior. (Le et al., 2020). In various other domains such as livestreaming, advertising, and online shopping, research findings consistently suggest that both cognition and emotion play crucial roles in influencing consumer decision-making (Gao et al., 2022; J.-A. Kang et al., 2020; Zablocki et al., 2019).

Trust indeed acts as a mechanism for simplifying complexity, enabling consumers to navigate complex purchase situations effectively. In simpler terms, when consumers trust a brand, they are more inclined to view it positively and be more receptive to it (Siegrist, 2021). Indeed, marketing stimuli that incorporate relevant and valuable content can foster trust among consumers towards a brand, rather than solely aiming to persuade them to make a purchase (Hollebeek & Macky, 2019). Additionally, research has shown that trust mediates consumers' intentions to use mobile payments (Park et al., 2019), perception of expericence performance in voice shopping (Bawack et al., 2021). Therefore, it is suggested that consumers' trust can function as mediatior between cognition, emotion and their decision outcome.

2.2. Method

This study utilize quantitative data collected method using a structured questionnaire to collect data from consumers. This approach is also know as survey research, which is considered as suitable method for collecting information from a large sample (Hair et al., 2020).

The study's sample comprised university students, a demographic representing potential BNPL consumers due to their limited income and restricted access to traditional credit systems. A digital questionnaire was created using Google Form. This service from Google was chosen as it was low cost and function rich. It has built-in logic that suitable for this study such as skip patterns and screener questions, as well as has wide range of templates for different kinds of question and scale formats. Another reason for using digital survey is the penetration of internet is over 70% of Vietnamese population (VietnamPlus, 2022). The items are measured on an interval scale using a five-point Likert scale. Interviewees were asked to choose their degree of agreement with the statements, ranging from strongly disagree to strongly agree. The survey was conducted in August 2022 and collected a total of 362 responses. Of these, 14 were excluded from the analysis due to inconsistent or incomplete answers, leaving a final dataset of 348 questionnaires for data analysis.

For data analysis, this study employ PLS-SEM (Partial Least Squares Structural Equation Modeling). This choice is made because the research aims to identify the key constructs that affect the intention to use BNPL. PLS-SEM is a suitable method for understanding and modeling complex relationships among constructs in such cases. The conceptual model has constructs with several path relationships; there is also an advanced element in the proposed model such as moderator variables which make it complicated. Furthermore, as there are potential nonnormality of multivariate data in social science research (Cain et al., 2017) make it ideal for using PLS-SEM in this study. The outer measurement model and the inner measurement model are assessed to examine the PLS-SEM results as recommended by Hair et al. (2020).

3. RESULTS AND DISCUSSION

3.1. Research results

3.1.1. Testing the measurement model

Factor loading is a critical step in the structural model, with a requirement for values to be greater than 0.7 to be considered acceptable. In this study, Popularity exhibits factor loadings ranging from 0.717 to 0.851, all above the acceptable threshold, with 4 items included in the model. Influencer factor loadings range from 0.773 to 0.819, meeting the criterion, with 3 items selected for the model structure. Convenience factor loadings fall between 0.804 and 0.826, with all 4 items included. Cost Transparency has factor loadings between 0.761 and 0.842, and 4 items are integrated into the model. Trust's factor loading varies from 0.742 to 0.787, meeting the threshold, with 3 items included. Finally, Intention exhibits strong factor loadings, ranging from 0.888 to 0.91, well above the acceptable limit.

The study ensures validity through Cronbach's alpha, where values ranging from 0.7 to 0.9 are considered acceptable. The results in Table 1 display the Factor Loading, Outer Weights, and Cronbach's alpha test, all contributing to the overall model's fitness and reliability.

Table 1: Factor loading, Outer weights and Cronbrach's alpha test

Key variable	Item	Item loading	Outer weight	Cronbach's Alpha
Convenience	C1	0.826	0.321	0.835
	C2	0.804	0.297	
	C3	0.817	0.307	
	C4	0.824	0.297	
Cost Transparency	CT1	0.761	0.286	0.823
	CT2	0.817	0.312	
	CT3	0.811	0.313	
	CT4	0.842	0.325	
Influencer	I1	0.813	0.436	0.723

	I2	0.819	0.406	
	I3	0.773	0.404	
Intention	IT1	0.91	0.383	0.883
	IT2	0.888	0.366	
	IT3	0.903	0.362	
Popularity	P1	0.827	0.31	0.817
	P2	0.717	0.274	
	P3	0.851	0.348	
	P4	0.815	0.308	
Trust	T1	0.787	0.36	0.718
	T2	0.742	0.364	
	T3	0.86	0.519	

Reliability tests are conducted to evaluate the internal consistency of measurement items within each construct. Composite reliability (CR) is also recommended for testing the reliability of a construct, and its value should ideally be above 0.70 (Hair et al., 2020). Table 2 shows that all the constructs are reliable, as they exhibit CR values higher than 0.70.

To evaluate convergent validity, the Average Variance Extracted (AVE) metric is used, which quantifies the average shared variance between the construct and its constituent items. To meet the criteria for convergent validity, the AVE should be at least 0.5, and the factor loadings should ideally be at least 0.7 (Hair et al., 2020). All the constructs, showed in Table 1, have AVE values higher than requirements, meaning the collected data do not have any convergent validity problem.

Table 2: Reliability and AVE test

Key variable	rho_A	Composite Reliability	Average Variance Extracted (AVE)
Convenience	**0.836**	**0.89**	**0.669**
Cost Transparency	0.825	0.883	0.653
Influencer	0.724	0.844	0.643
Intention	0.886	0.928	0.81
Popularity	0.824	0.879	0.647
Trust	0.747	0.84	0.637

The hetero-trait-monotrait ratio (HTMT) of correlations is commonly analyzed to evaluate discriminant validity (Sarstedt et al., 2017). A high HTMT value may indicate issues with discriminant validity. In cases where the path model contains constructs that are conceptually highly similar, a threshold of HTMT at 0.9 is typically used. However, when the constructs within the path model exhibit greater conceptual distinction, a threshold of 0.85 could be considered (Henseler et al., 2015). All HTMT values from Table 3 are below 0.85, hence the measurement model was validated.

Table 3: Hetrotrait-Monotrait ratio (HTMT)

	Convenience	Cost Transparency	Influencer	Intention	Popularity	Trust
Convenience						
Cost Transparency	0.397					
Influencer	0.367	0.418				

Intention	0.693	0.65	0.774		
Popularity	0.396	0.082	0.202	0.364	
Trust	0.475	0.463	0.58	0.567	0.205

3.1.2. Assessment of structural model

Potential collinearity issues among the constructs must be examined. Threshold for multicollinearity was determined by the variance inflation factors (VIF) values ranging from 0.2 to 5.0 as proposed by Hair et al. (2019). All variables has VIF value ranging from 1.021 to 1.168, showing no collinearity problem.

Table 4: Standard coefficients and significance value

Path	Path coefficient	p-values	Decision
Influencer -> Emotion	0.5	0	Supported
Popularity -> Emotion	0.79	0	Supported
Convenience -> Cognition	0.628	0	Supported
Cost Transparency -> Cognition	0.597	0	Supported
Emotion -> Trust	0.214	0.001	Supported
Cognition -> Trust	0.362	0	Supported
Trust -> Intention	0.429	0	Supported

To evaluate the strength and significance of the hypotheses, a 5,000 bootstrapping subsamples with no sign change option are carried out. As guided by Hair et al. (2019), path coefficients are reported based on the t-values, ranging from -1 to +1, which show the direction and strength of relationship between constructs. The significance of hypotheses is determined if p-value is equal or smaller than 0.05. The results in Table 4 illustrate that all the relationships were supported ($p < .05$).

3.1.3 Direct and indirect effects

To examine the mediating roles of Emotion, Cognition, and Trust between stimuli and Intention to use BNPL, the Sobel test (Sobel, 1982) and bootstrapping method are recommended, as advocated by Preacher & Hayes (2008), to statistically assess the significance of these mediation effects.

The results of direct and indirect effects, as presented in Table 5, demonstrate that all the paths are statistically significant ($p < .05$). These findings confirm that Emotion and Cognition partially mediate the relationship between stimuli and Trust. Furthermore, Trust also partially mediates the relationships between Emotion, Cognition, and Intention to use BNPL.

Table 5: Direct and indirect effect analysis and p-value

	Original sample	t-statistics	p-values
Direct effect			
Influencer -> Emotion	0.64	10.047	0
Popularity -> Emotion	0.673	11.9	0
Cost Transparency -> Cognition	0.591	21.206	0
Convenience -> Cognition	0.634	22.016	0
Emotion -> Trust	0.263	4.641	0
Cognition -> Trust	0.336	5.778	0
Emotion -> Intention	0.359	10.373	0
Cognition -> Intention	0.519	15.661	0

Trust -> Intention	0.097	2.53	0.011
Indirect effects			
Influencer -> Emotion -> Intention	0.23	6.152	0
Popularity -> Emotion -> Intention	0.242	9.829	0
Convenience -> Cognition -> Intention	0.329	13.385	0
Cost Transparency -> Cognition -> Intention	0.307	13.939	0
Influencer -> Emotion -> Trust -> Intention	0.016	2.01	0.045
Popularity -> Emotion -> Trust -> Intention	0.017	2.225	0.026
Convenience -> Cognition -> Trust -> Intention	0.021	2.286	0.022
Cost Transparency -> Cognition -> Trust -> Intention	0.019	2.257	0.024
Influencer -> Emotion -> Trust	0.168	3.659	0
Popularity -> Emotion -> Trust	0.177	5.158	0
Convenience -> Cognition -> Trust	0.213	5.745	0
Cost Transparency -> Cognition -> Trust	0.199	5.673	0
Emotion -> Trust -> Intention	0.025	2.161	0.031
Cognition -> Trust -> Intention	0.033	2.277	0.023

Figure 1 illustrates the finalized structural model depicting the relationships between the studied constructs, which encompass marketing stimuli and consumers' intention. This model also includes the critical mediating variables of emotion, cognition, and trust.

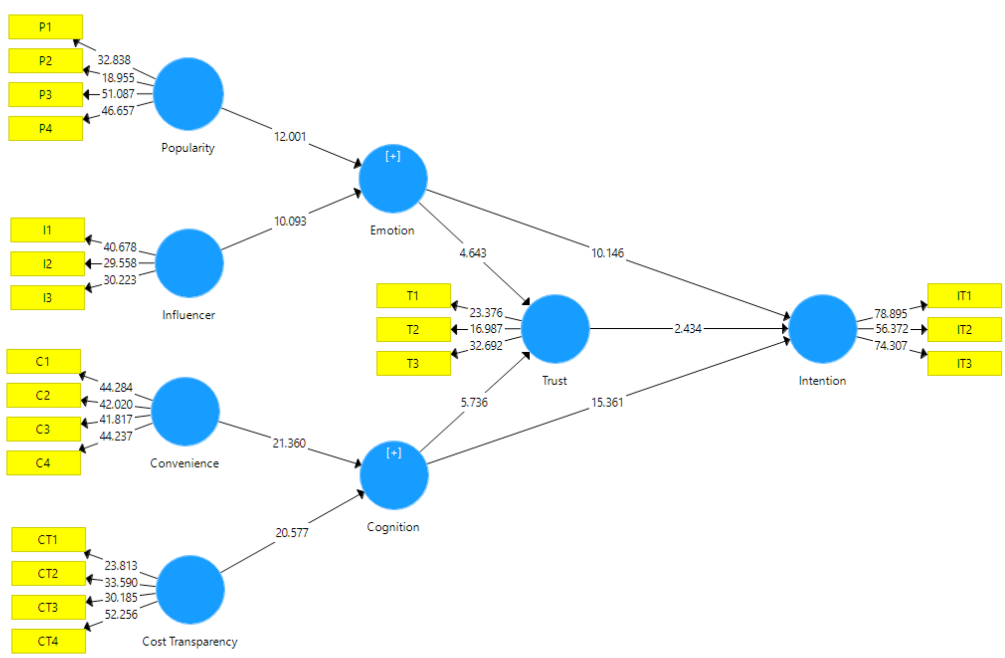

Figure 1: Structural model

3.2. Discussion

Applying the SOR theory in consumer behavior research can contribute valuable insights into how consumers process information to make informed decisions.

The paths from Influencer and Popularity to Emotion and subsequently to Intention both exhibit significant positive relationships. These findings underscore the substantial impact of influencers and the overall popularity of BNPL services on evoking positive emotions among consumers, ultimately influencing their intention to use these services.

Convenience and Cost Transparency significantly affect Cognition, which, in turn, affects Intention. These paths demonstrate strong positive relationships, indicating that the ease of use and the perceived financial benefits associated with BNPL have a substantial influence on consumers' cognitive processes and their intention to adopt this payment method.

Both Influencer and Popularity indirectly influence Intention through Emotion and Trust. These findings highlight the importance of influencers and the overall popularity of BNPL services in not only affecting consumers' emotions but also building trust, which subsequently influences their intention to use BNPL.

Influencer endorsements, Popularity, Convenience, and Cost Transparency are all factors that influence Trust and, consequently, Intention. Emotion and Cognition act as mediators in this process, with positive emotional and cognitive responses leading to higher trust and, in turn, more positive intentions to use BNPL services. Hence, Trust can play a direct role in shaping consumers intention to use BNPL services as well as mediates the relationship between emotion/cognition and intention.

The results also reveal that cognition has a stronger effect on intention than emotion, suggesting that consumers are more influenced by rational factors than emotional factors when deciding to use BNPL.

4. CONCLUSION AND IMPLICATIONS

The study aimed to explore the intricate relationships between various factors - popularity, influencer impact, cost transparency, convenience, and consumers' intention to use Buy Now, Pay Later (BNPL) services, using SOR framework. All relationships were supported, signifying the roles of cognition, emotion, and trust in consumers' decisions during their pre-purchase process. This study highlights the significance of factors such as cognitive and affective state, in turn, affect trust and consequently influence consumers' intentions.

The research provides valuable insights for BNPL providers and marketers. To foster trust among consumers, it's crucial to give equal attention to both cognitive and affective aspects. However, when it comes to acquiring new customers, a more concentrated effort should be directed toward addressing consumers' cognitive considerations.

THE EFFECTS OF INTELLECTUAL CAPITAL ON CORPORATE SUSTAINABLE GROWTH: EVIDENCE FROM VIETNAMESE FOOD AND BEVERAGE FIRMS

MA. Huynh Thi Thuy Duong[1], MAc Vo Thi Bich Ha[2]

Abstract: The study examines the impact of intellectual capital on the sustainable growth of food and beverage companies in Vietnam. Research data includes food and beverage enterprises listed on the Ho Chi Minh City Stock Exchange and the Hanoi Stock Exchange for the period of 2018 - 2022. The regression analysis results show that intellectual capital has a significantly positive effect on the sustainable growth of businesses in the industry. For intellectual capital's components, while capital employed efficiency has no statistically significant relationship, both human capital efficiency and structural capital efficiency have a significant positive relationship on corporate sustainable growth. From the research results, we make some recommendations for business managers.

Keywords: intellectual capital, corporate sustainable growth, food and beverage firms

1. INTRODUCTION

With the shift of the business environment from the traditional economy to the knowledge economy, the intangible assets' value is gradually surpassing the tangible assets' value, leading to problems related to intellectual capital (IC) plays an increasingly important role in improving the enterprises' competitiveness. The development of the knowledge economy puts greater pressure on enterprises to effectively use soft resources such as human capital and knowledge, which have become the main drivers of economic growth (Ahmed et al., 2019). In the past, the success, profitability and value of a business depended mainly on tangible assets such as land, infrastructure and equipment (Nuryaman, 2015) but in today's global economy, intangible assets contribute about 80% of enterprises' value through human resource development and knowledge management (Vodák, 2011). Therefore, investment in IC is inevitable in the current era because it is one of the factors contributing to improving competitiveness.

Corporate sustainability, one of the leading topics in financial management, has attracted much interest in recent years. Sustainable growth determines the enterprises' dynamic development trend not only reflecting their potential for existence and development but also affecting their future performance (Xu et al., 2021). According to Xu et al. (2020), sustainability is very important, especially in times of economic uncertainty. The recent COVID-19 pandemic has caused many difficulties, challenges and changed the way many enterprises do business. This has led enterprises to pay more and more attention to sustainability. Sustainable growth will help enterprises continue to meet their short- and long-term financial goals and prevent them from falling into disrepair and ultimately falling apart.

The role of IC in corporate sustainable growth has recently received much attention from researchers. According to Xu et al. (2021), enterprises that want to own outstanding sustainable growth efficiency must take advantage of intangible resources (IC) to maintain competitive advantages. Zhang & Wang (2022) argue that if a company wants to have good sustainable growth performance, it must maintain a competitive advantage through the use of IC and adjust investment

1 Email: huynhthithuyduong@tckt.edu.vn, University of Finance and Accountancy.

2 University of Finance and Accountancy.

in IC to dynamic changes in the business environment. Some other researchers also believe that IC is important for corporate sustainability as it provides businesses with a potential source of sustainable competitive advantage assisting them in achieving sustainable growth and leading competitition (Mukherjee & Sen, 2019). In addition, previous studies indicated that in emerging economies, intellectual capital and its components serve as a key driver for corporate sustainable growth (Xu & Wang, 2018).

In Vietnam, the topic of intellectual capital has also attracted researchers recently. Many studies focus on the relationship between intellectual capital and the businesses' performance (Hoang et al., 2020; Nhon et al., 2020; Zhang et al., 2021; Kweh et al., 2022; Tran et al., 2022; Nguyen, 2023; Nguyen et al., 2023). These studies all show that intellectual capital and some of its components have an impact on performance. Other studies explore other issues of intellectual capital such as the relationship between intellectual capital and corporate value (Nguyen & Doan, 2020), the relationship between corporate governance and intellectual capital (Tran et al., 2020), the impact of green intellectual capital on green innovation (Tran et al., 2023), review of empirical studies on the impact of intellectual capital on enterprises' sustainable growth around the world and propose research directions in Vietnam (Pham and Dut, 2022), etc. Thus, amount of research on the relationship between IC and sustainable growth is very small and does not focus on a specific industry.

In the fields of production and business activities, the food and beverage industry is one of the important economic sectors with great potential for development. Before 2020, this industry always maintained good growth momentum each year, and is forecasted to have a growth rate of 5-6% in the period 2020-2025 (Vietnam Report, 2020). However, when COVID-19 pandemic appeared in early 2020 and broke out strongly in 2021, the food and beverage industry was seriously affected and could not maintain the previous growth trend. Consumer behavior changes towards prioritizing essential goods, shopping channels also change towards using online channels, forcing businesses in the industry to make adjustments. In 2022, the pandemic has been well controlled, consumer demand has recovered, along with the strong development of science and technology, causing food and beverage businesses to continue to change. In this context, intellectual capital expressed in terms of knowledge, management capacity, technology, and software plays an important role in helping these businesses make changes to meet the real situation. economy and improve competitiveness. Therefore, how to take advantage of resources to achieve sustainable growth is an urgent issue for businesses in the industry. Therefore, the author chooses the food and beverage industry to investigate the relationship between IC and the sustainable growth of enterprises.

2. LITERATURE REVIEW AND HYPOTHESES

2.1. Intellectual capital

Various scholars have proposed different concepts of IC. One of the first to define IC was Thomas A. Stewart. According to Stewart (1997), IC is the intellectual resources such as knowledge, information, intellectual property, and experience that can be used to create value and wealth. According to Roos, Pike, and Fernstrom (2007), IC can be defined as all non-monetary and non-physical resources that are fully or partially controlled by an organization and that contribute to the creation of value for the organization. Khan, S. Z. et al., (2019) supposed that IC represents the majority of firms' intangible assets and encapsulates talents, intellect, knowledge and skills, patents and patterns, goodwill and brand image, competency, and social interaction with other stakeholders.

There are several methods for measuring IC and are often associated with its components. Pulic (1998) introduced the Value Added Intellectual Coefficient (VAIC) model to measure IC efficiency. This model aims to measure the extent to which a company creates added value based on IC efficiency. The VAIC provides a relatively simple quantitative approach based on financial statements that are publicly available and obtained from an identifiable source. VAIC consists of three components: human capital efficiency, structural capital efficiency, and capital employed efficiency. Human capital includes the knowledge, skills and abilities of employees (Luthy, 1998). Employees generate intellectual capital through their competence, attitude and intellectual agility (Bontis et al., 2000; Khalique et al., 2011). Competence includes skills and education; attitude includes behavioral aspects of an employee's work while intellectual agility is based on innovation and solutions to business problems (Bontis et al., 2000; Khalique et al., 2011). Structural capital is everything in an organization that supports employees in their work including: infrastructure, hardware, software, processes, brands, etc. (Luthy, 1998). Bontis et al. (2000) defined structural capital as "Structural capital includes all the non-human storehouses of knowledge in organizations which include the databases, organizational charts, process manuals, strategies, routines and anything whose value to the company is higher than its material value". The third component of VAIC is capital employed efficiency. According to Public (1998), creating added value must have the contribution of capital employed. Capital employed efficiency is an economic term that reflects the level of exploitation and use of capital by an enterprise in production and business activities to create maximum value with minimum cost (Nguyen & Doan, 2020). Capital employed helps companies maintain good relationships with their external as well as internal stakeholders, including customers, governments, employees, creditors and suppliers (Chowdhury et al., 2019).

After Pulic (1998), other scholars have developed models of measuring IC consisting of two components, three components, four components, and five components. Although there are many criteria for dividing the IC's components, there is no significant difference in understanding of the nature of IC (Xu et al., 2021). Specific measurement methods can be used depending on the purpose and subject of the study.

2.2. Sustainable growth

The term "sustainable growth" has been defined by many different studies. Higgins (1977) proposed that "for those companies that want to maintain a target payout ratio and capital structure without issuing new equity, sustainable growth is defined as the annual percentage of increase in sales that is consistent with the firm's established financial policies". It is the maximum rate at which a company can use its internal funds to achieve growth without borrowing money from a bank or financial institution (Xu & Wang, 2018). Van Horne & Wachowicz (2015) defined "the sustainable growth rate is the maximum annual percentage increase in sales that can be achieved based on target operating, debt, and dividend-payout ratios". Some scholars emphasize sustainable growth not only to achieve financial objectives but also substain them into the future (Anbarasan & Sushil, 2018; Yusoff et al., 2018; Mukherjee & Sen, 2019; Xu et al., 2021).

2.3. Intellectual capital and corporate sustainable growth

From the perspective of resource-based theory (Barney, 1991), firms can use available resources to create a competitive advantage because they can implement strategies that create value that current competitors or other potential competitors cannot do. IC is considered a strategic resource of the enterprise (Alvino et al., 2021; Xu et al., 2021). Therefore, only by continuously developing new skills and technologies that cannot be imitated by competitors, a business can establish its dynamic capacity to achieve sustainable profits (Xu et al., 2021).

Many empirical studies have shown the influence of IC and its components on corporate sustainable growth. Mukherjee & Sen (2019) revealed a significant positive impact on corporate sustainable growth in India. In Korea, Xu & Wang (2018) also found evidence that IC has positively related to the sustainable growth of manufacturing enterprises. The research results of Xu et al. (2021) showed that IC has a significant positive effect on sustainable growth with research samples of listed companies of agriculture, tourism and renewable energy sector in China. Similarly, Zhang & Wang (2022) also found a positive relationship between intellectual capital and sustainable growth of manufacturing companies in China. Lu et al. (2021) concluded that IC plays an important role in the sustainable growth of companies in China and Pakistan. Based on previous studies, we propose the following hypothesis:

Hypothesis 1: There is a significant positive relationship between IC and corporate sustainable growth.

IC components also have a separate impact on corporate sustainable growth. According to Pulic (1998), capital employed efficiency refers to all necessary financial funds and physical capital. The capital employed is the financial basis for corporate sustainable growth and the guarantee for enterprises' survival in the market competition (Xu et al., 2021). Some empirical studies also show a positive relationship between capital employed efficiency and corporate sustainable growth (Mukherjee & Sen, 2019; Xu & Wang, 2018; Xu et al., 2020; Xu et al., 2021). Thus, this paper proposes the following hypothesis:

Hypothesis 2: There is a significant positive effect of capital employed efficiency on corporate sustainable growth.

Human capital is the fundamental element to implement the IC's functions. It refers to factors such as the knowledge, skills, abilities, and attitudes of employees in an organization (Chen et al., 2004). Previous empirical evidence suggests that companies with higher human capital efficiency exhibit superior financial or overall business performance (Mukherjee & Sen, 2019). Xu & Wang (2018), Xu et al. (2020), Lu et al. (2021) and Xu et al. (2021) find evidence of a positive effect of human capital efficiency on corporate sustainable growth. Therefore, this relationship is also hypothesized:

Hypothesis 3: There is a significant positive effect of human capital efficiency on corporate sustainable growth

Structural capital is concerned with the mechanics and structure of a business that can help support employees in their search for optimal intellectual performance, and thus overall business performance (Chen et al., 2004). Structured capital is the foundation to play intellectual capital's role, helping businesses be competitive in a dynamic environment and promoting sustainable growth (Xu et al., 2021). Based on these analyses, we propose the following hypotheses:

Hypothesis 4: **There is a signiffcant positive effect of structural capital efficiency on corporate sustainable growth**

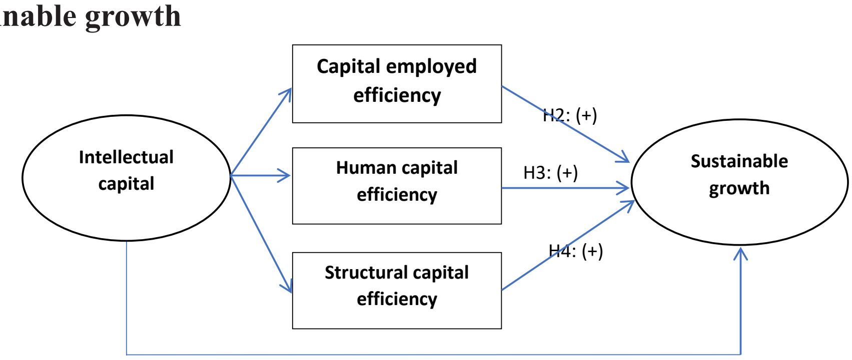

Figure 1: The relationship between IC and its components and sustainable growth

3. DATA AND METHODOLOGY

3.1. Data

In the study, we selected a sample of food and beverage firms listed on the Ho Chi Minh City Stock Exchange (HOSE) and the Hanoi Stock Exchange (HNX) during 2018-2022. We excluded companies that lacked the data to be collected during the research period. Thus, the sample includes 42 companies over 5 years, corresponding to 210 observations. We collected the annual audited financial statements of the companies, then calculated the research variables based on the collected data.

3.2. Methodology

To build models that test the relationship between intellectual capital and corporate sustainable growth, we identify variables based on previous studies. We use employed Van Horne and Wachowicz's sustainable growth rate (SGR) (2015) which is widely used in prior studies as the dependent variable of the study. The formula is as follows:

$SGR = \frac{ROE \times b}{1 - ROE \times b}$ where ROE is return on equity, b is retention ratio.

VAIC and its three components (capital employed efficiency – CEE, human capital efficiency – HCE, structural capital efficiency – SCE) are used as independent variables. Calculation of VAIC is performed sequentially as follows (Pulic, 1998; Pulic, 2000; Dženopoljac et al., 2016; Xu & Wang, 2018; Mukherjee & Sen, 2019):

- Calculate value added (VA): VA = Operating Profit + Employee expenses + Depreciation + Amortization

- Calculate CE (capital employed), HC (human capital), and SC (structural capital)

CE = Total assets - Intangible assets

HC = Total expenditure on employees

SC = VA - HC

- Calculate VAIC and its three components

CEE = VA / CE

HCE = VA / HC

SCE = SC / VA

VAIC = CEE + HCE + SCE

We add two control variables to the model including size (SIZE) as measured by the logarit of total assets and financial leverage (LEV) as measured by the ratio of total debt to total assets. In addition, to test whether the COVID-19 pandemic occurring in 2020 and 2021 affects corporate sustainable growth, we include the COVID dummy variable in the model. The dummy variable was set to 1 during the COVID-19 pandemic from 2020 to 2021 and otherwise 0.

To achieve the research findings, we build the following 5 models:

$SGR_{it} = \beta_0 + \beta_1 VAIC_{it} + \beta_2 SIZE_{it} + \beta_3 LEV_{it} + \beta_4 COVID_{it} + \varepsilon_{it}$ (1)

$SGR_{it} = \beta_0 + \beta_1 CEE_{it} + \beta_2 SIZE_{it} + \beta_3 LEV_{it} + \beta_4 COVID_{it} + \varepsilon_{it}$ (2)

$SGR_{it} = \beta_0 + \beta_1 HCE_{it} + \beta_2 SIZE_{it} + \beta_3 LEV_{it} + \beta_4 COVID_{it} + \varepsilon_{it}$ (3)

$SGR_{it} = \beta_0 + \beta_1 SCE_{it} + \beta_2 SIZE_{it} + \beta_3 LEV_{it} + \beta_4 COVID_{it} + \varepsilon_{it}$ (4)

$SGR_{it} = \beta_0 + \beta_1 CEE_{it} + \beta_2 HCE_{it} + \beta_3 SCE_{it} + \beta_4 SIZE + \beta_5 LEV + \beta_6 COVID_{it} + \varepsilon_{it}$ (5)

where i is the i^{th} enterprise and t is the t^{th} year.

In this study, we use panel data regression to estimate the above models. At the same time, we also use some necessary tests when choosing a suitable model.

4. RESULTS AND DISCUSSION

4.1. Results

4.1.1. Descriptive Statistics

Table 2: Descriptive Statistics of Variables

Variables	Observation	Mean	Std.Dev	Min	Max
SGR	210	0.0646261	0.1641281	-0.65917	1.401019
VAIC	210	6.18205	7.7733	-10.40696	36.69952
CEE	210	0.4630421	0.7740829	-0.06319	5.53642
HCE	210	5.185571	7.072036	-11.4714	34.09153
SCE	210	0.5334374	0.5529816	-4.45041	1.519047
SIZE	210	12.01673	0.7648739	10.68325	14.15027
LEV	210	0.4262022	0.1943219	0.029298	0.842043

Source: Authors' calculations from Stata software

Table 2 shows that the average sustainable growth value of businesses in the food and beverage industry is 0.0646261 – a moderate growth rate. The high standard deviation of sustainable growth shows that there is a high variation in growth among firms in the industry. The industry VAIC mean is 6.18205, with the maximum and minimum being -10,40696 and 36.69952, respectively. Having businesses with a negative VAIC value indicates that the investment in intellectual capital is greater than the value it creates for the business. The industry's CEE, HCE, and SCE have mean values of 0.4630421, 5.185571 and 0.5334374, respectively. In which, the value of HCE fluctuates quite a lot among enterprises in the industry. Among the factors of VAIC, HCE has the largest value, which means that HCE plays a key role in VAIC.

The average size of the logarithm of total annual assets is nearly 12.01673, which does not vary much between firms in the industry. The industry average leverage ratio is 42.62% with the minimum and maximum values at 2.93% and 84.20% respectively. This means that there are companies that are financed almost entirely by equity, but there are businesses that use more than 80% debt in their capital structure.

4.1.2. Regression Analysis

To test the relationship between sustainable growth and intellectual capital according to models (1), (2), (3), (4) and (5), we perform panel data regression analysis with fixed effects model (FEM) and random effect model (REM). Performing the Hausman test to choose between two models FEM and REM, we obtain the following results:

Table 3: Hausman test findings

Model (1)	$\chi^2(4) = 19.11$, P-value = 0.0007	FEM is selected
Model (2)	$\chi^2(4) = 19.17$, P-value = 0.0007	FEM is selected
Model (3)	$\chi^2(4) = 18.14$, P-value = 0.0012	FEM is selected
Model (4)	$\chi^2(4) = 14.32$, P-value = 0.0063	FEM is selected
Model (5)	$\chi^2(6) = 20.85$, P-value = 0.0019	FEM is selected

Source: Authors' calculations from Stata software

After selecting the appropriate regression model, we get the regression results for each model from (1) to (5) in Table 4.

Table 4: Regression results from FEM models

Independent variables	Dependent variable: SGR				
	Model (1)	Model (2)	Model (3)	Model (4)	Model (5)
VAIC	0.01047**				
CEE		0.09934**			0.06015
HCE			0.01033**		0.00743*
SCE				0.03784	0.03090
SIZE	-0.50579***	-0.5073539	-0.50923***	-0.53827***	-0.49922***
LEV	0.19761	0.207182	0.18506	0.24354	0.22899
COVID	-0.03163	-0.03488***	-0.03339	-0.03234	-0.02809

, **, * show the levels of significance at 10%, 5% and 1%.*

Source: Authors' calculations from Stata software

Before deciding whether to accept the above regression results, we check whether the models have autocorrelation and heteroskedasticity. We use the Wooldridge test to detect autocorrelation and the Wald test to check heteroskedasticity. The results are shown in Table 5.

Table 5: The results of autocorrelation and heteroskedasticity

Model	Autocorrelation	Heteroskedasticity
Model (1)	F(1,40) = 7.156, P-value = 0.0108	$\chi^2(46)$ = 120,000, P-value = 0.000
Model (2)	F(1,40) = 8.502, P-value = 0.0058	$\chi^2(46)$ = 53,110, P-value = 0.000
Model (3)	F(1,40) = 7.229, P-value = 0.0104	$\chi^2(46)$ = 140,000, P-value = 0.000
Model (4)	F(1,40) = 9.065, P-value = 0.0045	$\chi^2(46)$ = 93,127, P-value = 0.000
Model (5)	F(1,40) = 7.114, P-value = 0.0110	$\chi^2(46)$ = 210,000, P-value = 0.000

Source: Authors' calculations from Stata software

The results show that all models have autocorrelation and heteroskedasticity. Therefore, to overcome these two phenomena, we use the Feasible Generalized Least Squares (FGLS) method. The results obtained from the FGLS model are presented in the following table:

Table 6: Regression results from the FGLS model

Independent variables	Dependent variable: SGR				
	Model (1)	Model (2)	Model (3)	Model (4)	Model (5)
VAIC	0.00299**				
CEE		0.00325			-0.0057

SCE				0.03934***	0.02957***
SIZE	0.01791**	0.01991***	0.01763**	0.01581**	0.01736**
LEV	0.09509***	0.08704***	0.09573***	0.08719***	0.06435***
COVID	-0.02818***	-0.02102***	-0.02898***	-0.02261***	-0.02031***

, **, * show the levels of significance at 10%, 5% and 1%.*

Source: Authors' calculations from Stata software

The results from the FGLS model show that VAIC has a statistically significant positive relationship with SGR. Specifically, when VAIC increases by one unit, the sustainable growth rate increases by 0.00299 units. This result supports hypothesis one, which is consistent with the prior studies (Mukherjee & Sen, 2019; Xu & Wang, 2018; Lu et al.,2021; Xu et al., 2021; Zhang & Wang, 2022).

Among the three factors of VAIC, CEE does not have a statistically significant relationship with SGR in both models (2) and (5). HCE and SCE have a statistically significant relationship with SGR in the individual models and the model combining the VAIC's three factors. Both HCE and SCE have a positive impact on SGR (β_2 = 0.00222 and β_3 = 0.02957, respectively). These findings are similar with the results of Mukherjee & Sen (2019), Xu & Wang (2018), Lu et al. (2021), and Xu et al. (2021). These results allow us to accept hypotheses three and four but reject hypothesis two.

In addition, SIZE, LEV, and COVID all have a statistically significant relationship with SGR in all research models. SIZE and LEV have a positive effect on SGR. The findings are in line with the previous studies such as Mukherjee & Sen (2019), Xu & Wang (2018), Xu et al. (2021), and Zhang & Wang (2022). Conversely, COVID has a negative effect on SGR.

4.2. Discussion

From the research findings, we accept hypotheses one, three, four, and reject hypothesis two. The accepted hypothesis one shows that there is a positive relationship between IC and corporate sustainable growth. According to the resource-based theory, businesses with a sustainable competitive advantage due to their unique resource ownership can implement strategies to create value that existing or other potential competitors cannot be performed. Because intellectual capital is seen as a business resource, it can create a competitive advantage, increase business value, and contribute to corporate sustainable growth. The food and beverage industry has recently faced a change in consumer behavior, and the shift of traditional shopping trends to modern channels. This situation causes businesses in the industry to make changes, especially in technology and human resource skills - important factors of intellectual capital. Investing in intellectual capital effectively helps these companies keep up with changes, achieve their goals, and lay the foundation for future growth; thereby creating sustainable growth.

The research results allow us to accept hypothesis three, proving that more investment in human capital will ensure sustainable growth for businesses. As we have analyzed, in the face of changes in consumption trends and sales channels, the management's acumen and the cooperation of the staff play an important role in creating the businesses' success in the industry. Therefore, the more effective the investment in human capital, the more sustainable growth it will be to create for the businesses.

Hypothesis four implies that the more businesses focus on managing structural capital (software, technology, processes, databases), the more sustainable growth will be promoted. In the current context, structural capital is an important element of intellectual capital that creates strong competition for food and beverage businesses. Therefore, this factor contributes to corporate sustainable growth. However, hypothesis two is rejected which indicates capital employed efficiency cannot impact achieving sustainable growth.

For the control variables, the regression results also show a positive relationship between the size, financial leverage and sustainable growth. Large-scale enterprises will have economies of scale to create a sustainable growth engine; moreover, pressure from creditors also makes businesses keep this sustainable growth. Finally, the COVID-19 pandemic has really negatively impacted the business of food and beverage companies. In fact, in the two years since COVID-19 occurred, under measures to prevent the spread of the disease, the demand for some goods decreased, some businesses were forced to close, disrupting the supply chain, etc. has adversely affected the revenue, profit and sustainable growth goals of enterprises.

5. CONCLUSION AND IMPLICATIONS

In order to provide empirical evidence on the influence of intellectual capital on corporate sustainable growth in Vietnam, the study uses data of listed companies in the food and beverage industry during the period 2018 – 2022. The study uses the VAIC model to measure the intellectual capital efficiency. By the regression analysis method of research models between sustainable growth rate with VAIC and its components, we have obtained important research results. The results from the FGLS model show that VAIC has a statistically significant relationship with the sustainable growth rate. Specifically, the more effective the investment in intellectual capital, the more sustainable growth rate will increase. We also found a statistically significant positive relationship between HCE and SCE. This proves, the more effective the investment in human capital and structural capital, the more sustainable growth rate will be promoted. The above results allow us to draw the general conclusion that intellectual capital has an impact on the sustainable growth of listed companies in the food and beverage industry. In addition, we also find evidence of a positive relationship between firm size and leverage and sustainable growth; and a negative relationship between COVID-19 and sustainable growth.

From the research results, we believe that food and beverage businesses should raise awareness of the importance of intellectual capital and pay attention to improving the efficiency of intellectual capital investment to foster sustainable growth. We make some recommendations to the enterprises' managers as follows: (1) allocate resources reasonably and have an appropriate strategy for investing in intellectual capital and its components to improve competitiveness; (2) regularly train and share knowledge in the organization to improve the quality of human resources, and at the same time improve the morale and assertiveness of employees to contribute to sustainable growth; (3) need to invest more in technological innovation, regularly research and develop to improve the efficiency of technological innovation; (4) establish a positive corporate culture and develop appropriate management control systems to support the enterprise's business processes. In addition, businesses should also consider the relationship between size, debt ratio, and the COVID-19 pandemic with sustainable growth to have flexible management policies.

The limitation of this study is that it only considers the effects of the three intellectual capital components on corporate sustainable growth. Furthermore, we only studied food and beverage enterprises in the period 2018 - 2022. Further studies can be extended to businesses of many different industries and add more intellectual capital components.

RELATIONSHIP BETWEEN BUSINESS ENVIRONMENT AND ECONOMIC DEVELOPMENT: EVIDENCE FROM SOUTHEAST ASIA

MSc. Hoang Phuong Hai Chau[1]

Abstract: Encountering significant challenges from the middle-income trap, the Association of Southeast Asian Nations (ASEAN) formed ASEAN Economic Community (AEC) envisioning its integration into a competitive global market. Of several solutions, the ASEAN Economic Blueprint 2025, as the name suggested, established a road map to actualize ASEAN's potential. The recent trend of shifting focus to optimal business and economic reform, with a new dynamic brought by a very fast-paced digital transformation in the region and a group of upper-middle-income consumers, has become a new source of hope for ASEAN. Through this transformation, the region expects more business owners to enter the market with fewer barriers. As people start building their entrepreneurship, the region also expects an upward economic growth trajectory. However, the question remains as to how we realize said future. How do we act as a springboard for business owners, the tech-savvy young generation, and a group of wealthy consumers that demand more services? Answering this question, this study tests the relationship between the current business environment and economic development to establish an initial foundation for ASEAN's direction toward business environment reform.

Keywords: business, growth, development, digital transformation

1. INTRODUCTION

On December 31, 2015, ASEAN officially established the "ASEAN Economic Community" - after a joint statement at the ASEAN Summit meeting in Kuala Lumpur, together with the ASEAN Political-Security Community and the Cultural Community. ASEAN society has three important pillars, which include bringing ASEAN to a new step in terms of quality and creating an ASEAN with a position in the world economy.

This economic community is also known for its publication of "ASEAN Economic Community (AEC) Blueprint", which had its first version in 2008, namely "ASEAN Economic Community (AEC) Blueprint 2015" with a distinct outlook on growth. Built upon the success of this blueprint, in 2015, a new version was created with a continued vision to promote and encourage the main themes of integration and cohesiveness in the region. However, several new directions have been established in this blueprint, especially regarding the scene of micro, small, and medium enterprises (MSMEs). ASEAN Economic Community (AEC) Blueprint 2025's aim to create an enabling business environment, thus, has been discussed widely [2] [3]. MSMEs are increasing their position as the most integral form of establishment in ASEAN, with 70 million in ASEAN and accounting for 97.2% to 99.9% of all business activities [4]. The Economic Research Institute for ASEAN and East Asia (ERIA) has conducted research on business development regarding trade, investment human resource development, and many other prominent topics [5].

In light of this blueprint, this paper focuses on the relationship between the business environment and its effect on growth in the region. The research question concerns whether a more open entrepreneurial environment will contribute to economic growth in ASEAN. While there are several aspects to be considered with regard to the business environment, from institutions, regulations, and policies to tax administration, this paper focuses on an economic freedom index that captures the big picture of all the aforementioned. On one side of the equation, the proxy for the business environment will be the Index of Economic Freedom (IEF) by the Heritage Foundation and Wall Street Journal. On the other side, the proxy for growth will be the countries' growth rate of GDP per capita. The findings help establish a cornerstone for the body of literature in ASEAN on whether the step towards a more open and liberal economic environment does align with its intended development trajectory. This becomes more urgent as there is limited theoretical frameworks and empirical evidence focusing solely on Southeast Asia, more specifically on ASEAN, regarding this topic.

There are two papers that this research relied on for idea references. The first one is "A study on the impact of economic freedom on economic growth in ASEAN countries". In this paper, Tran also used IEF as a variable of interest and GDP per capita growth rate as the dependent variable. The author used a sample of eight ASEAN from 2000 to 2017 [1]. However, this paper focused on using the three indicators from the index, while the overall score is vaguely touched upon. In a similar vein, the second paper, "The Impact of Economic Freedom on Economic Growth? New European Dynamic Panel Evidence," used a panel data of 43 European countries from 1995 to 2014. This paper moved to use the entire overall score of IEF as a variable of interest, with a main focus on European countries. This article also included the dummy variable of the European Union (EU) to test the effect of EU membership on economic growth. As the EU is the main theme of the paper, chosen control variables also reflected further characteristics of this region.

Our paper, while sharing some similarities in terms of ideas with these two articles, contributed to the body of works of literature by focusing on ASEAN Member States, with IEF overall score as our main focus, while also extending the timeline from 1998 to 2021 to cover for the effect of Covid in ASEAN. We also control for government expenditure as an independent variable while running a fixed effect model with a robustness check. This distinguishes our paper while respecting the contribution of previous researchers.

In conclusion, this paper's main focus will be the quantified aspects of the business environment on the economic growth of ASEAN Member States.

2. LITERATURE REVIEW

2.1. Definition of business environment

Business environment is a multifaceted and non-homogenous concept with multiple identifications and no official definition[2] [3]. Current literature acknowledges both the importance

[3] Dr Kinange and Nikhil Patil, "BUSINESS ENVIRONMENT: The Concept and A Literature Review," 2020.

and the complexity of defining this concept [1]. Vlachou et al. and Weaver et al. concluded that the concept of "business environment" or "business climate" remains inconclusive and broad, without a concrete grounding [2] [3]. However, the author defined the business environment as "the combination of factors that influence the development of entrepreneurship". This can be seen as the holistic combination of economic, socio-economic, and political characteristics that surround individual business activities. In a similar vein to the ASEAN MSMEs vision, Weaver et al. defined business environment as the existence of a support system for better creation and growth of small enterprises[4].

Within the scope of this paper, we define a business environment similar to that of the Heritage Foundation's Index of Economic Freedom. More specifically, we believe the four main themes covered in this index also encompass what we want to convey with the concept of the business environment. These four main themes of Rule of Law, Government Size, Regulatory Efficiency, and Open Markets also correspond to UNIDO's policy, legal, institutional, and regulations definition of the business environment.

2.2. Development definition

The terms economic growth and economic development are sometimes used interchangeably, but they are fundamentally different [5]. As these concepts are discussed in an extensive body of literature, their definitions are concrete and well-established. Economic growth refers to a quantitative and measured increase in income and national or per capita product. If a country becomes more productive and the national average income increases, we will consider it "economic growth". However, economic development is a broader concept in which economic growth has to be translated into an actual improvement in all aspects of human well-being [6].

According to the Cambridge Dictionary, economic development is the process in which an economy grows or changes and becomes more advanced, especially when both economic and social conditions are improved. Indeed, these improvements tend to focus on structural changes that take place in health, education, or urbanization. Furthermore, this development needs to be shared among all citizens. This means the concentration of economic surplus should not be in an elite group while all other groups suffer [7]. Several countries enjoy economic benefits through natural resources yet the traditional social structure remains. This is not considered development. Society for International Development defined development as the process of quality change and

[7] Perkins et al., "Economics of Development."

a continuation of conditions for that change [1]. In conclusion, there are tee pillars of development: economic growth, structural transformation, and well-being.

Within the scope of this study, we acknowledge the broadness of development, while narrowing it down for research efficiency. Thus, we decide to see development as an improvement in the standard of living and the health of an economy. This captures the essence of these terms while simplifying it to find one suitable proxy. GDP per capita has been chosen as this figure has been as a result since it has been used by researchers extensively when analyzing the topic of life quality[2]. Furthermore, this figure has also been used by economist as a proxy for the state of an economy[3]. Together, GDP per capita, though not perfect, fully delivers the message we want for this study.

3. INDEX

We chose this index mainly for its efficient capturing of the business environment in a holistic approach, both thematically and technically, and its alignment with AEC visions in the past and the future.

Firstly, this index captures the essence of business environment of a country in the most quantitative manners [4]. While there are other attempts to capture this same factor, namely the World Bank's Doing Business Ranking (DBR) or the World Economic Forum's Global Competitiveness Index (GCI), IEF offers a different perspective and strong quantitative measurement of the degree that individuals can function freely in an economy, which includes the freedom to produce, consume, and invest. This index also accounts for the macroeconomic elements of a nation, which helps provide a more holistic outlook, though compressed into one number. Furthermore, IEF also helps convert qualitative data into quantitative numbers for better calculation, with a transparent methodology and grading scheme. In comparison, GCI mostly deals with surveys, and DBR mainly manages local practitioners' responses. We will be more technically dissecting each of its components in detail in the Data & Methodology section.

From a practical standpoint, this index is suitable for serving as a proxy for the business environment from a political economy perspective. By definition, this index "focuses on four key aspects of the economic and entrepreneurial environment over which governments typically exercise policy control" [5]. In fact, IEF also includes both key macroeconomic indexes and the country's historical and political context. In doing so, this index equips researchers with timely information on both the political risks and economic reforms [6]. Through this index, we have a better grasp into the country's risks regarding inflation, taxation, tariffs, and especially property

rights enforcement. This index also provides detailed public policy elements that are translated into business' everyday activities: how free entrepreneurship activities take place, what the nation's priorities are, and which direction of business openness is being encouraged.

From a technical standpoint, the four aspects covered by this index, namely the rule of law, government size, regulatory efficiency, and open markets, deeply affect business functions and can be viewed as the business environment as defined in section 1.1. Indeed, these four pillars directly affect a business's operations, profitability, and sustainability [1]. This strengthens our decision to choose IEF as a proxy for the business environment in the world context. Olson, 2014 further emphasizes how this index can help depict a great picture for business leaders and policy-makers trying to research into any country's market.

Secondly, the ASEAN trajectory and visions from Economic Community Blueprint 2025 are all measured in this index. From its name, this Blueprint acts as a guiding principle with its overarching vision of cultivating optimal business and economic environment, as stated as follows:

"In the next decade, ASEAN will also provide a new emphasis on the development and promotion of micro, small and medium enterprises (MSMEs) in its economic integration efforts. At the same time, ASEAN will likewise embrace the evolving digital technology as leverage to enhance trade and investments, provide an e-based business platform, promote good governance, and facilitate the use of green technology" [2].

Table 1: The relevance of Index of Economic Freedom's indicators and ASEAN vision from ASEAN Economic Community Blueprint 2025

Economic Freedom Indicators	ASEAN Economic Community Blueprint 2025 visions
Business Freedom	B.1. Effective Competition Policy
Financial Freedom	A.4. Financial Integration, Financial Inclusion, and Financial Stability
Fiscal Health	
Government Integrity	B.6. Good Governance
Government Spending	
Investment Freedom	A.3. Investment Environment
Judicial Effectiveness	B.7. Effective, Efficient, Coherent and Responsive Regulations, and Good Regulatory Practice
Labor Freedom	A.5. Facilitating Movement of Skilled Labor and Business Visitors
Monetary Freedom	
Property Rights	B.3. Strengthening Intellectual Property Rights Cooperation
Tax Burden	B.5. Taxation Cooperation
Trade Freedom	A.1. Trade in Goods

(Source: Authors)

One of the earliest attempts to quantify economic freedom and business environment was by Easton and Walker in 1992. Utilizing this index, Islam tested the relationship between scoring high with this index and the national growth rate[3]. The result shows there exists a direct relationship between them in high-income and all countries in the sample. This is not the only paper confirming

a positive relationship of the economic freedom index. In fact, a majority of them stated how there is a direct link between the economic and business environment (and its indexes) with the annual per capita growth rate[1].

The second prominent and commonly applied quantitative measure for economic and business freedom is the Fraser Institute's Economic Freedom of the World (EFW) index. Asking the question of "Does Really Economic Freedom Mater for Growth in South Asia, Nadeem et al. found concrete empirical evidence and positive direction from economic freedom and GDP per capita growth [2]. Akin et al. argued that while there exists a statistically significant and positive correlation between economic freedom and economic growth, the strength of this effect varies as the lower-middle income group receives more contribution from a free environment [3]. Nevertheless, all levels of economic freedom still benefit from this openness. Discovering the relationship in-depth, Faria & Montesinos found a robust pathway from economic openness to prosperity and proposed the least risky way to economic development should be ignited through better policies to cater to these findings [4]. Kacprzyk further explored the relationship by testing each indicator from the index and found property rights, monetary policy quality, freedom to trade, and regulatory framework as the four key aspects of economic freedom that translate into growth. From this finding, the author confirms the significant and positive impact that a free environment has on European economic development, highlighting the biggest impact found in enhancing property rights protection [5].

However, the application of EFW also reveals intriguing findings by Weede that there might be underlying characteristics that direct the strength of this relationship [6]. The level of prior economic development and the existing human capital of the nation itself might play into the mechanism. The author also proposed a new lens to dissect the matter within a global context: economic freedom has a massive spillover effect, as all countries are indirectly taking advantage of it, not only those directly benefiting.

6 Erich Weede, "Economic Freedom and Development: New Calculations and Interpretations," *Cato Journal* 26 (2006): 511.

Last but not least, using Heritage Foundation's IEF, several authors have presented interesting results on the relationship between economic and business environment on growth. Heckel explored whether there is a causal relationship between them and found that the level of freedom measured by the index can be a good predictor for growth [1]. The Granger-causality tests certainly suggest Capital Flows, Property Rights, and Regulation precede growth and not the other way around. However, researchers also found that this effect might also be seen in the long term. As a recent paper by Pratiwi & Wulansari suggests, several factors must first be met for this impact to be visible [2]. Applying panel data cointegration analysis on ASEAN, this study tested the effect of globalization proxied by ICT, economic freedom, and economic openness. While ICT and economic openness showed immediate results in growth, economic freedom required zooming out of the timeline to fully be accounted for. Similar results can be found in a paper by Brkić et. al with a sample of European countries in panel data [3].

Increases in economic freedom proxied by Heritage Foundation's Index are correlated with growth regardless of its level. In the same vein, results from BRICS and Latin America Countries samples also showed concrete evidence. Explaining the relationship's mediator in the BRICS sample, Haydaroglu found that economically free governments and institutions undertake opportunities to enhance the national quality of life and reduce poverty in emerging economies [4]. The aggregate effect of IEF on growth once again confirms its vitality to any developing country. In the Latin American countries sample, Bengoa & Sanchez-Robles entangled the relationship with panel data analysis and found that the channel through which economic freedom manifested its effect on growth is FDI [5]. The quality of FDI that a country attracts will be vital to its developing stage. Indeed, the case study from Vietnam confirms this relationship at 5% significant level while the case study from the ASEAN sample also shows a significant relationship [6] [7].

Another prominent paper using Heritage Foundation's Index is "A Study on the Impact of economic freedom on economic growth in ASEAN Countries". While testing for the relationship between economic and business freedom indicators and growth, the author found several insights into the mechanism that underlies it. Which, higher financial liberalization is seen to have a positive effect on the growth of its association with direct money transfer and foreign investment. These streams of capital, in turn, will stimulate economic growth and translate into long-term development. The author

7 Tran, "A Study on the Impact of Economic Freedom on Economic Growth in ASEAN Countries."

also found that labor freedom increases growth, as lower regulation frameworks on wages, working hours, and labor force participation give employers and employees a window of flexibility. Aligning with AEC Blueprint on lowering the trade barriers through the reduction of tariffs and nontariff, the result also shows a positive effect of trade freedom in the region.

However, this paper by Tran also records worth-noting insights: financial freedom and credit to the private sector do not necessarily hold a positive relationship on economic development in ASEAN [1]. This can be explained through the lens of risk management: credit to the private sector might have an unwanted linkage to the increase in overall risk within an economy.

The idea to combine both Heritage Foundation and Fraser Institute Indexes for a more objective outlook on the matter has been realized by Mimoun & Essaggay [2]. The authors also explored both the aggregate and disaggregated versions of these indexes, as this implementation will provide insights into the most efficient policy recommendation for assured growth. Indeed, property rights, efficiency in government spending, flexible regulations, business freedom, and investment are once again confirmed as major sources for growth, proxied by the total factor of production. In fact, the index itself can explain up to 72 percent difference across regions for GDP per worker and up to 65 percent of the total factor of production. This finding confirms the weight of the economic and institutional environment's influence on cross-countries different levels of development.

Further research into economic and business freedom influence also shows a strong nexus of economic freedom-FDI and growth. In ASEAN, Ansari & Sensarma found that economic freedom can, in fact, be the channel through which FDI fully exercises its effect on growth, alongside improvement in human capital quality and financial institutions [3]. A bigger sample of South Asia, East Asia, Latin America, and North and West Europe contributes to the robustness of this result. This mechanism can also be explained as macroeconomic factors from economic freedom help attract FDI, and this liberalization further enhances the FDI inflow in the long run. Once again, a trade openness policy with relaxed tariff and export procedures create an investment-friendly environment that directly boosts the FDI inflow [4]. Another paper by Azman-Saini et al. helps explain the mechanism on which this relationship fully expands: the degree of effect from FDI is based upon the level of economic freedom in the country as countries with a higher level of freedom also gain more when multinational cooperations enter [5]. This means FDI itself does not directly cause growth but a country's own characteristics. The authors, thus, emphasized the significance of policies that help mediate the full effect of FDI. Since the effect of economic freedom is both direct and indirect,

the government is encouraged to fully account for positive spillovers of foreign investment.

In summary, economic freedom indexes and their key constituents of property rights, legal framework, regulations, trade freedom, and investment freedom show a robust and positive result on growth regardless of the index being used.

However, economic freedom on growth receives massive criticism by Singh & Gal [1]. The author argued how literature had been tainted strongly in favor of economic freedom with massive publication bias, making it challenging to decipher their true effect. Echoing this view is Doucouliagos & Ulubasoglu applied meta-analysis and panel data analysis and found a specification bias when controlling for physical capital [2].

In conclusion, sourcing through the literature, we understand there is a lack of literature on the ASEAN business environment and growth. This is alarming, especially given the new Blueprint that requires in-depth policy aligning with the long-term vision of the regions.

III. DATA & METHODOLOGY

1. Data

1.1. Data description

This study uses a panel data with unbalanced observations, in which 8 Member States of ASEAN will be followed from 1998 until 2021. There, are two reasons we choose these countries and time periods: data availability and the timeline legitimacy of the region. While ASEAN consists of 10 Member States, there is limited data availability for Brunei Darussalam and Myanmar. 1998 was chosen as the start of the timeline so that the effect of the 1997 Asian financial crisis would not be included and confound the result.

We want to include credit to the private sector and literacy rate as control variables. However, due to data missing problems, we cannot include them in the model.

Table 2 Description of variables

Abbreviation	Unit	Description	Source
		Dependent variable	
gdppcgrowth	annual %	GDP per capita growth	World Bank national accounts data, and OECD National Accounts data files.
		Variable of interest	
overallscore	Estimate	The degree of economic freedom in the world's nations	The Heritage Foundation and Wall Street Journal
		Control variables	
unemployme~e	% of totallabor force	Unemploymzent, total (modeled ILOestimate)	International Labor Organization

1 Singh and Gal, "Economic Freedom and Its Impact on Foreign Direct Investment."

2 Chris Doucouliagos and Mehmet Ali Ulubasoglu, "Economic Freedom and Economic Growth: Does Specification Make a Difference?," *European Journal of Political Economy* 22, no. 1 (March 1, 2006): 60–81, https://doi.org/10.1016/j.ejpoleco.2005.06.003.

fdi	% of GDP	Foreign direct investment, net inflows	International Monetary Fund, International Financial Statistics and Balance of Payments databases, World Bank, International Debt Statistics, and World Bank and OECD GDP estimates.
export	% of GDP	Exports of goods and services	World Bank national accounts data, and OECD National Accounts data files.
covid	dummy variable = 1 in 2020 and 2021 = 0 otherwise	Time when ASEAN receives effect fromthe global pandemic	Self-constructed

2. CONSTRUCTING VARIABLES

2.1. Dependent variable

GDP per capita growth rate: "Annual percentage growth rate of GDP per capita based on constant local currency. GDP per capita is gross domestic product divided by midyear population. GDP at purchaser's prices is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. It is calculated without making deductions for depreciation of fabricated assets or for depletion and degradation of natural resources."

2.2. Variable of interest

"Overallscore" is the Index of Economic Freedom (IEF).

2.3. Control variables

The field of development studies has long been focusing on the determinants of economic growth; however, little consensus on an over-encompassing model has been found. Prominent findings, thus far, include government efficiency, labor market, financial system, fiscal policies, saving, and investment

3. EMPIRICAL STRATEGY: PANEL DATA REGRESSION

Does economic freedom as defined by the standard of Heritage affect the growth rate of ASEAN Member States? Is it better for ASEAN to push for a more open business environment, or is some level of control required for emerging state economies? The correlation between our dependent variable with variables of interest will be tested, while we control for some potentially confounding variables. Our econometric regression of the panel dataset will be performed by the following model:

gdppcgrowth $it = \alpha + \beta 1$overallscore$it + \beta 2$ unemployme~e$it + \beta 5$ fdi $it + \beta 7$ covidit + μi + εit

in which: i is the Member State and t is the time period. We care about the effect of the independent variable of interest on the dependent variable while controlling for other variables. The dependent variable gdppcgrowth it or the growth rate of GDP per capita within a nation at each point of observation (in this study, we observe it annually). The independent variable of interest in the overallscoreit also known as the Index of Economic Freedom that we discussed. We control for the effect of the unemployment rate with unemployment rateit, Foreign Direct Investment (FDI) with fdi it. We also control for the effect of Covid as the dataset runs through 2020 and 2021 and might potentially distort the result.

We choose panel data to record our sample and this empirical strategy since it can record and track many individuals across time. This decision relies on the fact that a time-series model of one individual (in our case, country) will not be able to fully capture and explain the complex insights of our variables' relationship. Panel data, thus, is seen as a tool to help isolate the effect of policies on our dependent outcome [1]. Other reasons for the application of panel data include controlling for omitted variable bias. As the economic model can never fully account for every element, this method helps reduce the effect of unobserved variable bias. The consistent internal patterns of all individuals make it easier for researchers to eliminate unwanted effects on dependent variables.

IV. RESULT AND DISCUSSION

This part : presents the results and the main findings from the regression model. While the model controls for several variables to obtain a confoundedness assumption, the causal relationship should not be interpreted without caution. Coefficients, thus, should be seen as correlations first and foremost.

1. Result

1.1. Summary of statistics

Table 3: Descriptive statistics

Variable	Obs	Mean	Std. Dev.	Min	Max
Gdp	192	0.04997	0.03623	-0.13126	0.145197
gdppcgrowth	192	0.0353	0.03635	-0.1448	0.12509
overallscore	192	0.61768	0.12543	0.335	0.897
unemployment rate	192	0.0281	0.01715	0.0014	0.0806
fdi	192	0.05861	0.06421	-0.0276	0.2969
export	187	0.71967	0.51911	0.17271	2.28994
covid	192	0.08333	0.27711	0	1

(Source: authors)

1.2. Correlation Matrix

Table 4 Correlation Matrix

	gdppcg~h	overal~e	unempl~e	fdi	export	covid
gdppcgrowth	1					
overallscore	-0.214	1				
Unemployment rate	-0.2081	0.2899	1			
fdi	0.1325	0.6122	0.0137	1		
export	-0.0587	0.7946	0.1976	0.7685	1	
covid	-0.3291	0.1299	-0.0125	0.0522	-0.003	1

(Source: authors)

Next, we move to correlation matrix to drop any value that exceeds the correlation coefficient's cut-off of 0.7. In this case, we need to drop the variable of export as it stands at 0.7946. The logic

1 Cheng Hsiao, "WHY PANEL DATA?," *The Singapore Economic Review* 50, no. 02 (October 2005): 143–54, https://doi.org/10.1142/S0217590805001937.

behind eliminating variables is to drop either of those that are highly correlated with each other. In this case, overallscore and export are correlated. However, overallscore is our variable of interest so we need to eliminate the variable of export instead.

1.3. Multicollinearity Matrix

Table 5 Multicollinearity matrix

Variable	VIF	1/VIF
overallscore	3.12	0.320588
fdi	2.60	0.385132
unemployme~e	1.17	0.853964
covid	1.09	0.916835
Mean VIF	2.46	

(Source: author)

Next, we test for multicollinearity with a universal cut off of 5. There is no problem with our variables in this test, as all of them have coefficients below 5.

1.4. Hausman Test

Table 6 Hausman Test result

	(b) fe	(B) re	(b-B) Difference	sqrt(diag(V_b-V_B)) S.E.
overallscore	-.0038179	-.1089886	.1051707	.0551177
unemployme~e	-.1698442	-.2289571	.0591129	.2677019
fdi	.2165955	.2150488	.0015466	.0615215
covid	-.0456884	-.0395337	-.0061547	.003479

```
                     b = consistent under Ho and Ha; obtained from xtreg
      B = inconsistent under Ha, efficient under Ho; obtained from xtreg

    Test:  Ho:  difference in coefficients not systematic

                  chi2(4) = (b-B)'[(V_b-V_B)^(-1)](b-B)
                          =        3.81
                Prob>chi2 =      0.4329
```

(Source: author)

Hausman Test is executed to decide between the Fixed Effect Model and Random Effect Model. While panel data requires the application of the Fixed Effect Model normally, this result of insignificance leads us to choose Random Effect Model, in which we assume differences in coefficients are not systematic.

1.5. Heteroskedasticity and Serial correlation test

Table 7: Heteroskedasticity and serial correlation test

```
Tests:
   Random Effects, Two Sided:
   ALM(Var(u)=0)         =     4.27 Pr>chi2(1) =  0.0389

   Random Effects, One Sided:
   ALM(Var(u)=0)         =    -2.07 Pr>N(0,1)  =  0.9806

   Serial Correlation:
   ALM(lambda=0)         =     4.38 Pr>chi2(1) =  0.0364

   Joint Test:
   LM(Var(u)=0,lambda=0) =     6.71 Pr>chi2(2) =  0.0349
```

(Source: authors)

Serial correlation coefficient does not show statistically significant results while the heteroskedasticity test has a significant result at 5% level, leading us to implement a strategy to account for it in the next section.

1.6. FGLS

Table 8: Two specifications

Variables	Model RE GDPPCGROWTH	Model GLS GDPPCGROWTH
OVERALLSCORE	-0.109*** (-4.35)	-0.0637*** (-3.45)
UNEMPLOYMENTRATE	-0.229 (-0.580)	-0.467*** (-1.496)
FDI	0.215*** (4.63)	0.161*** (3.50)
COVID	-0.0395*** (-4.71)	-0.0374*** (-6.43)
Constant	0.0997*** (7.60)	0.0838*** (9.72)
Observations	192	192
Number of id	8	8

z-statistics in parentheses *** p<0.01, ** p<0.05, * p<0.1

(Source: authors)

Model (2) or Model GLS is being used to fix the problem of heteroskedasticity that we encountered in the previous section.

The juxtaposition of the Random Effect (RE) specification and the Feasible Generalized Least Squares (FGLS) specification reflects the robustness of the model. Our main result is the second specification; however, seeing both show consistent results without major differences in values proved the model's correct direction. For future research, the same model's framework can be considered, while changing and accounting for more control variables.

First, we analyze control variables and their significance in two specifications. The unemployment rate is the only variable without a consistent effect on GDP per capita growth. While the main specification finds a significant coefficient, Random Effect Model does not produce a similar finding. However, both specifications show how the unemployment rate has negative consequences on growth, as expected with literature in the field and the Okun law. This was also confirmed by studies done by several other researchers [1] [2] [3] [4].

1 Sibusiso Clement Makaringe and Hlalefang Khobai, "The Effect of Unemployment on Economic Growth in South Africa (1994-2016)," MPRA Paper, March 19, 2018, https://mpra.ub.uni-muenchen.de/85305/.

2 Changshuai Li and Zi-juan Liu, "Study on the Relationship among Chinese Unemployment Rate, Economic Growth and Inflation" 1 (March 31, 2012).

3 Tariq Ahmad Bhat and Tariq Ahmad Lone, "The Validity of Okun's Law: Evidences from Indian Economy," n.d.

4 Qamar Uz Zaman, Zhang Donghui, and Muhammad Imran, "Unemployment and Economic Growth of European Union: A Panel Data Analysis," *European Journal of Economic Studies* 15 (March 1, 2016), https://doi.org/10.13187/es.2016.15.292.

FDI has a strong and statistically positive result on growth, which is confirmed by literature in the field from Dabour; Hussian; Quan [1] [2] [3]. COVID has a statistically negative consequence on growth, which can be confirmed also with literature on ASEAN's growth rate during the pandemic.

MAIN DISCUSSION

From our model, the variable of interest or the IEF's overall score for the economic and entrepreneurial environment has shown a statistically significant and negative result on development. This is alarming, given how we discussed the similarity between AEC Blueprint and IEF's main themes toward a more liberalized external environment for businesses. Indeed, of four major pillars, AEC included globalization and integration into the world economy as an outlook towards the future. This plan has ASEAN planned to sign trade agreements and join economic partnerships. Furthermore, several ASEAN countries are preparing to improve their position in the global supply chain [4].

Though alarming, this result is anticipated, whilst contradicting the current state of research in the field. To our knowledge, this is the second paper on the topic of business and economic environment with an exclusive focus on ASEAN as a region. Previous papers, with bigger panel data and more countries, had never grouped ASEAN countries together. This is exactly where this study fills in the gap, as we understand the underlying homogeneity of this region will act as a background for real effects to emerge.

Based on our careful analysis and close scrutiny, the most plausible explanation to explain this negative relationship between our variables lie in the informal economy of ASEAN.

Our observation follows the logic that one-fourth of IEF scores rely on the rule of law, which has been criticized for its inconclusive impact on development. Concurrently, countries that depend on the informal sector receive negative short-term impacts from economic freedom, especially from the rule of law, and ASEAN is such a region. The informal sector is currently at the heart of the ASEAN economy, and while it might be beneficial to eliminate them for future growth, visions to reform the whole economy towards economic and business freedom might need certain adjustments to match the current state of development.

Economic and business freedom and the informal economy have been proven to have a strong negative relationship. In the recent research by Sweidan the informal economy was studied by analyzing a balanced panel of 112 countries over 7 years period [5]. Characteristics that help the informal economy grow will greatly be affected by the current concept of economic and business freedom. The author also suggested that countries with the informal sector to carefully understand their own situation, as implementing economic freedom policies will seize the life of their informal

sector. This argument is also confirmed by D'Agostino et. al as they found how an increase in economic freedom measurement results in the reduction of the shadow economy in countries with high corruption and low democracy [1]. Furthermore, evidence found how the rule of law only matched countries that encourage the concept and not necessarily countries of different structures [2]. Property rights, which are usually regarded as the key component of economic integration, rely on the assumption that it is established due to the existence of the rule of law. However, it is worth noting how the struggle for power comes into play. Property rights existed because the institution that benefits from it wanted it in the first place [3]. Another study by Berdiev et al. also found evidence of underground economy mitigation as five aspects of economic freedom increase [4].

As such, countries and regions with huge informal sectors will be at risk of trying to abruptly implement their policies toward economic and business freedom. ASEAN has been struggling to build its economy from the grassroots with a completely different set of values and institutions. With half of the region's population or 244 millions of people relying on the informal economy for living, amounting to almost 80 percent of the workforce, the ASEAN situation requires careful consideration [5]. This situation was pronounced during Covid as no protection was formally provided for these workers. Any policy targeting this group of vulnerable people, thus, should be carefully considered. Given this context, a paper by Wilson suggested a gradual path toward growth as countries resort to their own informal strengths and build themselves while reforming their environment [6].

CORPORATE SOCIAL RESPONSIBILITIES AND THE ROLE OF THE STATE IN GREEN ECONOMIC DEVELOPMENT IN VIETNAM

PhD. Hoang Thi Bich Loan[1]

Abstract: Corporate Social Responsibility (CSR) has emerged as an expanding global trend and is progressively evolving into a "soft" requirement for businesses amid the ongoing process of integration. In the context of Vietnam, however, this concept remains relatively nascent and has not garnered the level of attention commensurate with its growing significance. The pressing need for social responsibility has been underscored by environmental disasters and adverse consequences linked to business activities. In contemporary Vietnam, the practice of corporate social responsibility aligns seamlessly with the overarching objective of sustainable development. In facilitating the enhanced fulfillment of social responsibilities by businesses, the state plays a pivotal role in steering the economy towards sustainable development, with the advent of a green economy emerging as a noteworthy strategic direction. This article employs qualitative research methods, encompassing analytical, synthetic, and comparative approaches, to offer insights and observations on this subject. The findings of this research endeavor culminate in a set of recommendations aimed at empowering businesses to more effectively embrace their social responsibilities, with a focus on state support as a catalytic mechanism. Furthermore, these recommendations encompass measures designed to propel Vietnam towards the realization of a green economy, encompassing the establishment of requisite legal frameworks and the strategic utilization of financial resources to propel green economic development.

Keywords: social responsibility, green growth, sustainable development...

1. INTRODUCTION

Corporate Social Responsibility (CSR) is a comprehensive concept that includes various aspects such as business ethics, philanthropy, organizational citizenship, sustainability, and environmental responsibility. It's essential for organizations aiming for sustainable development to adhere to standards that ensure not only profitable business operations but also the protection of the natural and labor environment. This includes implementing gender equality, occupational safety, labor rights, employee training and development, and contributing to community development. CSR also involves activities related to social security implementation, such as humanitarian efforts and charity. In essence, CSR represents an enterprise's total responsibility for the societal impacts resulting from its decisions and business activities. It is carried out with respect for the law and commitment to stakeholders, linking business activities with the resolution of social, ethical, and environmental issues. CSR also involves the protection of human rights and addressing customer concerns. The ultimate goal is to maximize the benefits for business owners, stakeholders, and society as a whole while identifying, preventing, and minimizing any potential negative impact from business operations.

The term corporate social responsibility officially appeared when Bowen HR (1953) published his book titled "Social Responsibilities of the Businessmen" for the purpose of propaganda and calling on property managers not to infringe on the rights and interests of others, calling for charity to compensate for the damage caused by businesses to society [3]. Since then, many researchers have offered different views such as: Archie Carroll (1999) introduced a broader concept, saying that " Corporate social responsibility refers to all the economic, legal, ethical and other areas

[1] Duckhoi06@gmail.com, National Academy of Public Administration.

that society expects from a business in a given time." [5]. Matten and Moon (2004) argued that "Corporate social responsibility is a cluster concept, encompassing various concepts such as business ethics, corporate philanthropy, corporate citizenship, sustainability and environmental responsibility [14]. It is a dynamic concept and is always challenged in each specific economic, political, and social context". Today, the issue of corporate social responsibility is increasingly being studied by many people. The Organization for Economic Cooperation and Development (OECD) (2009) stated that: "Corporate social responsibility is the contribution of enterprises to sustainable development, not only the responsibility of enterprises in ensuring income for shareholders, wages for employees, products and services for customers but also responsibility for the values of society and the environment. According to the European Union (2011), corporate social responsibility "is a concept in which businesses voluntarily put social and environmental issues into one of the concerns of their business activities as well as the interrelationships of the business with related objects". In general, these concepts emphasized that corporate social responsibility was the voluntary commitment of enterprises in applying standards and rules to the management and organization of their business activities in the market, it covered all social and environmental issues and required to be incorporated in the business strategy of the enterprise.

Thus, one of the corporate social responsibilities is to protect the environment in order to develop a green economy, towards sustainable development. The term " green economy " was officially used by the international community at the United Nations Summit on Sustainable Development (June 2012) in Rio de Janeiro, Brazil. Previously, the adjective "green" was used quite a lot, associated with many activities towards sustainable development, such as green production, green consumption, green lifestyle, green products... with the main connotation is "environmentally friendly".

There are different definitions of green economy, of which the definition of the United Nations Environment Program (UNEP, 2011) in the book titled "Towards a Green Economy - Roadmap for Sustainable Development and Poverty Alleviation" most cited by scholars in Vietnam: "A green economy is one that enhances people's lives and improves social equity, while significantly reducing environmental risks and deficiencies. Simply put, a green economy is low-emissions, resource-efficient, and socially equitable". Up to now, the concept and perception of green economy is not really clear, there are many different interpretations and names. Western countries identify as green economic model; developing countries towards a green growth strategy (China with transforming its economic development mode with the connotation of green development and building ecological civilization as the focus, Thailand with the "just enough economic model ").

Based on the given text, we can infer that the green economy and sustainable development are closely related concepts. The green economy is a way of expressing sustainable development in the context of climate change, with much emphasis on environmental resources. It not only includes economic goals but also extends to social and ecological goals. In the green economy, environmental resources are considered a decisive factor for economic growth, improving value chains, bringing stability, and long-term prosperity. The focus of the green economy is sustainability in environmental resources and response to climate change. The concept of "green economy" does not replace the concept of "sustainable development," but it is increasingly recognized as a suitable model as the foundation for sustainable development. In other words, a green economy is an economic strategy to achieve sustainable development goals.

Green economic development means achieving economic growth with less fuel use, by focusing on developing industries that are eco-friendly, reducing greenhouse gas emissions to fight climate change, and aiming for poverty reduction, social justice and environmental protection. Green economy has three main aspects: 1) Environmental friendliness; 2) In-depth economic growth; and 3) Social sustainability. In detail: (i) Green economy is an economy that respects the environment, which is shown by lowering greenhouse gas emissions, especially carbon dioxide emissions, to deal with climate change - a major threat to life on earth, including humans and human society. Green economy promotes the use of renewable energy and low carbon technology as alternatives to fossil fuels. Increasing the supply of renewable energy will lower the risks of unstable fossil fuel prices, while also gaining the benefits of cutting down greenhouse gases (GHGs) since the current energy system based on fossil fuels is the main cause of climate change. (ii) Green economy is an economy that grows in depth by using and maximizing all features of natural resources with less consumption of raw materials; enhancing ecological industries through the transition to green and clean technology. Green economy guides economic development towards investing in greener technology industries, towards making production more eco-friendly, reducing the use of natural resources, boosting ecological industries and environmental services, technological innovation. To develop a green economy, it is necessary to restrict the growth of economic sectors that produce large amounts of waste, pollute, and damage the environment; to use natural resources, especially water, land and mineral resources, in a frugal and efficient way; to encourage green economic sectors to grow fast to increase the country's natural capital, and create more jobs and improve people's quality of life; to build sustainable infrastructure, strengthen technological innovation, spread cleaner production. To develop a green economy, international organizations and developed countries are initiating the movement to develop agriculture that is smart for the climate to invest in clean technology, green technology market, information technology standards, cleaner production and resource efficiency, green jobs… (iii) A green economy is an economy with social sustainability (eliminating poverty, reducing poverty, enhancing social justice). An important feature of a green economy is that it aims to provide diverse opportunities for economic development and poverty reduction without depleting the natural wealth of the nation. This is especially important in low-income countries, where the main source of income for rural poor communities is ecosystem goods and services. Ecosystems and services provide a buffer against natural disasters and economic crises.

Confronted by the challenges of climate change and the prevailing environmental pollution issues in Vietnam, the adoption of corporate social responsibility aligns seamlessly with the trajectory of the green economy, all in pursuit of sustainable development.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

Research on corporate social responsibility

Corporate social responsibility is a widely recognized concept across various sectors today. It is commonly understood that contemporary businesses bear a social responsibility that extends beyond their fiduciary duties to shareholders or investors. However, establishing a universally accepted and clear definition remains a challenge. While CSR is not a novel concept, it continues to pose a new and evolving idea, proving elusive for academics and contentious for business managers and stakeholders due to the vast array of definitions and the varied ways in which the term is employed.

Referring to the concept of CSR, some of the following authors must be mentioned: Freeman; Crane and Matten; Welford; Habisch and Jonker. However, the concept of CSR is considered to have first appeared in the 1950s (Carroll; Freeman; Carroll and Beiler; Sturdivant). "Social Responsibilities of the Businessman" (1953) by Bowen H.R is the book in which Bowen first introduced the concept of social responsibility for the purpose of propagating property managers do not infringe on the rights and interests of others and called for charity to compensate for the damage caused by businesses to society. Bowen's definition generated an in-depth discussion of CSR in the first half of the 20th century. In "A Three Dimensional Conceptual Model of Corporate Performance" (1979) by Carroll, A.B provided a conceptual model that comprehensively described the essential aspects of corporate social activities, and at the same time, answerd the following questions: (1) What were the components of corporate social responsibility? (2) How should the organization deal with social problems (3) What was the model of the organization for social responsiveness? In the book "Measuring Corporate Social Responsibility: A Scale Development Study" (2008), Duygu Turker analyzed origins, values, and reliable measurement of CSR, arguing that it reflected the responsibility of an enterprise to different stakeholders. In this publication, data was collected from 269 business professionals working in Turkey. The analysis results provided a four-dimensional structure of CSR, including social responsibility for stakeholders, employees, customers, and the government [12]. Sean Valentine, Gary Fleischman in "Ethics Programs, Perceived Corporate Social Responsibility and Job Satisfaction" (2007) used survey information collected from 313 business experts to draw the conclusion that CSR was the mediator of the positive relationship between ethical law and satisfaction of stakeholders. The results indicated that CSR fully or partially mediated the positive association between the four variables of ethics program and individual job satisfaction, showed that companies can be better if they manage employees' ethical perceptions [21].

In Vietnam, researchers have mentioned many different interpretations of CSR, but they all had one thing in common: they consider CSR not only for economic benefits but also for sustainable development, for the sake of the community. Typical in this direction are Nguyen Dinh Cung, & Luu Minh Duc (2009), in the book "Some theoretical issues and innovation requirements in state management for CSR" [10] ; Hoang Long, "Corporate Social Responsibility - Driving force for development", Trade Newspaper, No. 26/2007 [16]. These authors have demonstrated the importance of CSR to the development of enterprises in society. Also in this direction, when discussing ethical and business issues, author Hong Minh with "Social responsibility and corporate ethics",

Newspaper of Culture and Social Life, No. 2/2007, stated that ethics and social responsibility were clearly indispensable issues in business. It is difficult to convince businesses to perform well on issues of ethics and responsibility with arguments based on immediate economic benefits. Dr. Nguyen Manh Quan, in the Textbook "Business Ethics and Corporate Culture", Labor and Social Publishing House (2004) gave the concept: business ethics and corporate culture were valuable assets that make an important contribution to determine the success or failure of any business. It is a system of values, standards, and methods of thinking that greatly influence the actions of members of an enterprise. [20]

In another study, Prof. Dr. Pham Van Duc (2010) in the article "Corporate social responsibility in Vietnam: Some urgent theoretical and practical issues", Philosophical Journal No.2 [13] argued that, in Vietnam, CSR is understood according to the definition of the World Bank's Private Economic

Development Group. Accordingly, “CSR is an enterprise’s commitment to contribute to sustainable economic development through activities to improve the quality of life of employees and their families as well as the community and society as a whole, in a way that benefits both the business and the general development of society.” The author has also specified CSR into four constituent elements, including environmental protection, contributions to the social community, good performance of responsibilities to suppliers, assurance of benefits and safety for consumers; good relations with employees and the guarantee of benefits for shareholders and employees in the enterprise.

Research on green economy and sustainable development

Up to now, there have been many scientific works, topics, projects ... researchs on green economy and sustainable development. Firstly, studies on the characteristics of the green economy: The article “Green economy - the path to sustainable development of the country” [2] , Journal of Political Theory, No. 4 (2013), p.30-35, analyzed and clarified the concept, position, role and basic contents of green economic development, in which, economic development, social development and environmental protection were ensured balance and harmony, the author believed that converting to a green economic model was a strategy for Vietnam’s sustainable development. In order to successfully transform, it was necessary to carry out a combination of groups of solutions: propaganda, economic restructuring, building of a legal environment, promotion of technological innovation, development of clean energy sources, building of people’s awareness... Nguyen Hoang Oanh (2011) in the work “Green economics - Development trends of modern economic theory” [19], Journal of Economics and Development. The article introduced the general context of the world leading to the birth of the green economic model and the concepts of green economy and green economic development. The article has also given the theoretical basis of green growth such as the Kuznets curve hypothesis on the environment, environmental taxes and dual benefits, the system of environmental regulations and the Porter hypothesis. Secondly, research on green economy, economic development in Vietnam and some countries around the world pointed out the opportunities and challenges that Vietnam may meet in green economic development. Green economic development was one of the development trends of the world economy, and Vietnam was not an exception to that trend. There were a number of articles on green economy development such as: Nguyen Xuan Thang (2013), Ministerial project: “The transition to a green economy: Korea’s experience and some suggestions for Vietnam” [24]. The topic has focused on understanding and explaining the transition to a green economy in the world in the post-financial crisis and global economic recession; exploring Korea’s experience in transitioning to a green economy and draw some suggestions for transforming the growth model and restructuring Vietnam’s economy towards green development. Ministry of Foreign Affairs (2011), Report on Green Economic Development Trends in the World and Impacts on Vietnam, No. 4267/BC-BNG-THKT, Hanoi. The report provided a general concept of green economy, international perspectives and practices on green economic development, opportunities and challenges for Vietnam in green economic development[4]. Nguyen Thi Tham (2011) in the article “Green growth policy and prospects for Vietnam - Korea cooperation” [23], International scientific conference “Korea’s green growth strategy and suggestions for Vietnam”, Institute for Northeast Asian Studies, Hanoi, December 27, 2011, presented the process of developing Korea’s green growth policy and the main contents of the green growth policy such as the green growth implementation strategy, the plans to concretize the green growth implementation strategy and the main content of the country’s green growth framework law. At the same time, the article has analyzed the prospects for cooperation between Vietnam and Korea on green growth. Nguyen Quang Thuan, Nguyen Xuan Trung in “Green economy in growth model innovation and economic restructuring in the coming period" [26], Proceedings of the Spring Economic Forum (2012), co-organized by the Economic Committee of the National Assembly and UNDP in Vietnam, referring to the position of green economic development in the growth model, development possibilities and the choice of green economic development direction in the transformation of the growth model of Vietnam by presenting the concept of green economy, green growth and the position of green economy in growth model innovation and economic restructuring in Vietnam. Nguyen Trong Hoai (2012) in the article "Green growth model: Analytical framework and policy options for Vietnam", Economic Development Magazine, introduced the green growth approach, a more specific approach than the sustainable approach to growth. Based on the green growth analysis framework of the Organization for Economic Co-operation and Development (OECD), the study selected a number of measurable indicators in order to assess the current green growth status of Vietnam and from there made some policy suggestions for this new approach. Research results showed that Vietnam's economy was facing great challenges in moving towards a green growth model. These were reduced productivity in the use of inputs, the economy was less efficient, wasteful, and emit more pollutants. In addition, there were the challenges of resource depletion and degradation of living environment due to industrialization. In that not-so-positive picture, the bright spots that emerge were the improved productivity of pollutant emissions in agriculture, the significant increase in forest cover, and the improvement of clean water conditions, and initially developed and promulgated a policy framework for environmental protection through the legal system. The policy suggestion from this study was that Vietnam should emphasize the combination of various policy instruments, the coordination of actions of the whole society, and international cooperation to achieve the goal of green growth. Doan Thi Hong Van and Bui Thi Van Khanh (2013) in the article "Green growth in Vietnam's rubber industry", Economic Development Magazine, March 2013 showed the development process of the industry was increasingly revealing many inadequacies: Output was too dependent on the Chinese market – which imported more than half of Vietnam's rubber exports, there was widespread deforestation for rubber plantations, ineffective; profits in the rubber value chain were distributed improperly, losing the motivation of rubber growers, etc. The old growth model in the rubber industry was no longer suitable, it's time to switch to a new growth model - green growth. The article focused on clarifying the concept of green growth, assessing the current situation of Vietnam's rubber production and export in recent years, in-depth study of the inadequacies in the industry, on that basis, proposing a solution for green growth, creating a premise for Vietnam's rubber industry to develop sustainably [27]. Nguyen Trong Hoai & Le Hoang Long (2014) in the article "Industrial development towards green growth: A case study of the Mekong Delta", Journal of Economic Development. This study refered to a new approach to development, which was industrial development oriented towards green growth. The study assessed the industrial status of the Mekong Delta region according to the green growth approach, and at the same time evaluated the State's policies to support the green growth approach in industry [15]. Nguyen Van Huy (2011) in "Green growth and some priority orientations for Vietnam", Institute of Strategy, Policy on Natural Resources and Environment gave a general overview of the trend of green economic development and some key contents on green growth of the world. Besides, the article also gave some orientations to promote green growth in Vietnam. Pham Thanh Cong (2011) in "Green economy: orientation for sustainable development in the new century", Economic Studies, Vol 401, No 10 (2011), pp. 22-28 introduced an overview of the green economy - a new economy for the sustainable development of the world in the 21st century as well as the development trends of countries in the world and Vietnam. UNEP (2011) in the report "Towards a green economy

– A road map for sustainable development and poverty alleviation", (Translated by the Institute of Strategy and Policy for Natural Resources and Environment), Agriculture Publishing House, Hanoi, introduced the concept and new measuring tools, focused directions as well as clarified the relationship between development and environmental protection, the role of developing countries in a green economy. Information and Documentation Center (2012), Central Institute for Economic Management (CIEM), Hanoi, "Potential for creating green jobs in Vietnam", provided information on green economy, green jobs; the experience of some countries on green job creation, assessed the green economy and green jobs in Vietnam. Ngo Tuan Nghia (2013) in the article "Restructuring the growth model associated with green economic development in Vietnam", Journal of Political Theory, No. 5, Hanoi, mentioned the trend of green economic development, challenges of green economic development in restructuring the growth model in Vietnam. Ho Thuy Ngoc, Nguyen Tu Anh (2016), "Green Economy Development in Vietnam and Enterprise Participation". The article showed that currently, the Vietnamese economy was in the process of developing and opening up to the world market. Obviously, new strategies were required. The green economy could start from technological innovation and that such innovation was due to both knowledge-based labor and external assistance. It can also be hypothesized that the green economy may be pushed under external pressure on Vietnamese enterprises. This report was designed to test these hypotheses and to address the obstacles to businesses' contribution to green economic development in Vietnam .

3. RESEARCH METHODS

The article aims to explain the social responsibility of businesses and the role of the state in creating institutions and policies that guide businesses in green economic development, towards green growth and sustainable development in Vietnam. The article uses the method of analysis, synthesis and systematization of documents. The research results are based on secondary data collected from published reports, books and journals.

4. RESEARCH RESULTS

4.1. Corporate social responsibility in green economy development

Promoting green economy and green growth in Vietnam is not only a requirement in the current integration process, but more importantly comes from the internal requirements of our economy, with its weaknesses, requires a transformation of growth models. That is the low quality of economic growth, unsustainable development, weak competitiveness of the economy, low efficiency; the link between economic growth and social progress and justice is not very close and sustainable; economic growth depends heavily on investment capital and resource exploitation, generating a lot of waste causing environmental pollution; the situation of food security, social security, epidemics is complicated... Management, exploitation and use of natural resources are wasteful, ineffective and unsustainable. Some types of resources are over-exploited leading to degradation and depletion; environmental pollution is increasing, in some places it is very serious; the remediation of environmental consequences is slow and ineffective; The risk of ecological imbalance is taking place on a large scale, negatively affecting socio-economic development, people's health and life.

The 11th Party Central Committee's Third Conference has examined and identified the limitations and weaknesses in economic restructuring according to the growth model from breadth to depth, and has reached important conclusions, among which the most urgent one is to renew the growth model and restructure the economy, enhancing the quality, efficiency and competitiveness of the economy. Generally speaking, the economic restructuring process consists of three key aspects: restructuring the economic sector; technological innovation; and development governance reform. The simultaneous implementation of these three tasks aims to change the economic growth model, with the core content being to change the mechanism of resource allocation in the economy to create a basis for development. Green economy, in which green growth is a new development model pursued by many countries around the world, intends to not only reduce greenhouse gas emissions, mitigate the negative impacts of climate change, but also improve the quality of growth, change the structure of production and consumption towards sustainability and improve people's lives. Initially, green growth was an idea of integrating environmental issues into the economy, but today it has transcended that narrow concept and become synonymous with sustainable development; it is a method of economic development that is fast, effective and sustainable, while contributing to mitigating and preventing the impacts of climate change. Green growth relies on increasing investment in conservation, development and effective use of natural capital, reducing greenhouse gas emissions, improving environmental quality, thereby stimulating economic growth.

Green growth is not only necessary, but also an integral framework of the economic restructuring process in general and the manufacturing industry restructuring process in particular, in response to the requirements for innovation and sustainable development of the country in the current period. In fact, we cannot separate and isolate the economic restructuring and the green growth model restructuring as two independent steps. In the current context, it is imperative that these two processes be integrated into one to achieve the goal of economic restructuring for sustainable growth and development, and integration with the regional and world economies.

The Government has approved the National Strategy on Green Growth (according to Decision 1393/QD-TTg dated September 25, 2012) and the National Action Plan on Green Growth in 2014-2020 period and vision till 2050 (according to Decision 403/QD-TTg dated March 20, 2014) [4] to achieve the above goal. Accordingly, Vietnam changes its economic growth model to achieve low carbon use, reduce greenhouse gas emissions, and pursue a vision to 2050 issued by the Government, which defines the following primary tasks:

- Greening production: Restructuring the economy towards a shift from extensive to intensive development, reducing the use of natural resources, enhancing ecological industries and environmental services, technological innovation, applying advanced and environmentally friendly technology. Specific tasks include: (i) Greening production through restructuring, especially limiting the development of economic sectors that generate large waste, cause pollution, and degrade the environment; (ii) Using resources economically and efficiently, especially water resources, land resources and mineral resources; (iii) Developing sustainable infrastructure; (iv) Innovating technology, applying and disseminating cleaner production technologies.

- Reducing the intensity of greenhouse gas emissions per unit of gross domestic product growth and increasing the share of renewable energy use, reducing greenhouse gas emissions. Specific tasks include: (i) improving energy efficiency, reducing energy consumption in production, transportation and trade activities; (ii) switching to cleaner fuels in industries and transportation; (iii) enhancing the exploitation of new and renewable energy sources to gradually increase the proportion of clean energy sources in the national energy production and consumption, gradually reducing the dependence on fossil energy sources, improving energy security, environmental protection and sustainable development; (iv) reducing greenhouse gas emissions through sustainable organic agriculture development, limiting the use of pesticides and fertilizers that are harmful to the environment, increasing the competitiveness of agricultural production.

- Greening lifestyle and sustainable consumption: Greening production is linked to greening sustainable lifestyles and consumption patterns of society. Specific tasks include: (i) implementing urbanization policy according to sustainable planning, balanced development, and improved quality of life for people. Urban development planning and management need to meet the criteria of ecological efficiency and social security; (ii) building a new countryside with an environmentally friendly lifestyle, implementing the National Target Program on building a new countryside, integrating economic growth with environmental protection, developing education, health, culture and social justice to ensure sustainable rural development; (iii) promoting sustainable consumption and building a green lifestyle, changing consumption patterns and behaviors towards sustainability of both private, state and social consumption.

One of the paramount tenets of corporate social responsibility lies in the establishment and advancement of an economy intertwined with the principles of sustainable development. The pursuit of a green economy represents a novel trajectory within the realm of sustainable development, and its realization hinges upon the collaborative efforts of both the public and private sectors. In this regard, the state assumes a pivotal role by orchestrating and refining policy frameworks, while enterprises emerge as the primary agents responsible for the practical execution of strategies aimed at fostering green growth.

A noteworthy indicator of the resonance of green and socially responsible practices in Vietnam emerges from the findings of the Sustainable Development Report conducted by Nielsen, a global leader in market research, in 2019. This report unveiled a distinctive trend among Vietnamese consumers, with an impressive 86% of them demonstrating a readiness to allocate a higher expenditure for products and services sourced from suppliers known to exert a positive influence on society and the environment. Furthermore, consumer preferences within the Vietnamese market underscore the substantial influence of sustainability commitments. Products that are perceived as beneficial for personal health, with a 77% endorsement, as well as those composed of natural, fresh, and organic constituents, also receiving a 77% rating, hold particular sway in the purchasing decisions of consumers. Similarly, products adhering to rigorous safety standards command a 76% preference. Furthermore, products produced by companies demonstrating a firm commitment to environmental responsibility and the betterment of the communities in which consumers reside enjoy a commendable 62% endorsement [4].

Moreover, a survey conducted by the National Forest in 2017 serves to underscore the profundity of the commitment to environmentally responsible choices among consumers. A staggering 81% of customers actively opt for environmentally friendly products, while 73% of employees exhibit loyalty towards employers who are actively engaged in charitable endeavors[4]. These compelling statistics reflect not only the evolving landscape of consumer preferences but also the overarching significance of sustainability and social responsibility within the Vietnamese market.

Henceforth, businesses operating within the Vietnamese context find themselves engaged in a multifaceted competition arena that extends beyond the traditional realms of goods, pricing structures, and service quality. Notably, social responsibility has emerged as a pivotal component of sustainable competitive strategies, instrumental in cultivating a loyal customer base. From a community perspective, these enterprises grapple with a dual imperative: safeguarding the environment and community health constitutes the primary undertaking, followed by the execution of social, humanitarian, and charitable endeavors. It is imperative to underscore that the realm of green investments has garnered substantial global attention, particularly within developed nations. The challenges posed by environmental pollution, natural resource depletion, climate change, and contemporary societal issues collectively mandate a shared responsibility, with businesses, in particular, shouldering a significant role in addressing them.

Enterprises dedicated to environmental preservation, in addition to adhering to state regulations, stand to benefit from cost reduction as they mitigate expenditures related to compensation and amelioration of adverse consequences stemming from their activities. Furthermore, it is noteworthy that state regulatory bodies exhibit a predisposition toward favoring businesses that maintain a commendable track record in terms of environmental protection and consumer welfare. This alignment of interests underscores the interconnectedness of business performance, ecological stewardship, and societal well-being, reinforcing the notion that environmental responsibility constitutes a key facet of corporate operations and strategy, thereby influencing not only financial outcomes but also the favor of regulatory authorities.

The process of international economic integration has bestowed upon Vietnamese businesses a unique opportunity to expand their global footprint. However, it has also placed them within a dynamic business environment characterized by a series of transformations. These changes necessitate that Vietnamese businesses not only embrace a global perspective but also commit to operating in a manner that underscores respect for individuals and communities, while simultaneously demonstrating a heightened sense of responsibility towards the environment and society at large.

An illustrative instance of this commitment can be found in the Textile and Garment Agreement inked between Vietnam and the United States in May 2003. Under the provisions of this agreement, Vietnamese authorities are entrusted with the responsibility of promoting the application of social responsibility principles, a precondition for accessing the US market [1]. This underscores the inextricable link between business engagement and social responsibility within the context of international trade agreements.

Furthermore, the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) exemplifies this overarching shift towards greater corporate social responsibility (CSR). This agreement necessitates that member countries proactively encourage businesses operating within their respective territories to voluntarily adopt CSR principles, particularly with regard to environmental considerations. These principles are expected to adhere to internationally recognized standards and validated guidelines. The integration of CSR into trade agreements reflects the growing recognition of the pivotal role that ethical business practices play in fostering international economic cooperation and sustainability.

Evidently, given the imperative to confront the intensifying competition in the contemporary business landscape, where the competitiveness of Vietnamese enterprises and the broader national economy remains relatively modest, and where international customers consistently impose stringent quality standards, it becomes unequivocally clear that the adoption and implementation of Corporate Social Responsibility (CSR) standards represent the singular path for Vietnamese enterprises to not only endure but also prosper.

4.2. The role of the state in supporting businesses to carry out social responsibility to develop a green economy

The transition to a green economy and green growth is a complex process that is influenced by many factors, among which the role of the state is crucial. The state acts as the institution builder, guiding the transition to a green economy; as the investor, focusing investment efforts to lead businesses and people towards a green economy, green consumption, investment in scientific research, and green technology transfer. The role of the state in development is an essential responsibility that belongs to the state for a successful transition to a green economy. Specifically:

Firstly, one of the key steps for the transition to a green economy and green growth is to improve the legal framework in accordance with the economic development orientation towards green growth. The improvement of appropriate institutions will have a significant role in creating an environment that fosters the greening of the economy. This requires the improvement of the economic institution by developing fully and synchronously the market elements and types of markets, including the science and technology market, so that businesses can access new research results and apply them in production and business towards greening production and consumption. In fact, a well-constructed legal framework can establish rights and create incentives to direct green economic activities, as well as eliminate barriers to green investments and regulate unsustainable, environmentally harmful behaviour, by setting minimum standards or outright prohibiting certain activities. Furthermore, the complete legal framework helps to reduce the business risk, as well as increase the confidence of investors in the market. Business operations will be more favourable when standards (especially those related to environmental protection) are clear and effectively enforced, because then, businesses will share a common competitive ground and avoid unfair competition from non-compliant enterprises. Along with the institutional improvement, it is necessary to issue a system of eco-friendly technical and economic norms for each industry and each field of the economy. Building a unified database system on natural resources, environment and climate change according to international standards, and at the same time having an appropriate mechanism to exploit, share information and effectively use the database. These are the orientations for production and business activities of enterprises and people.

Secondly, creating a mechanism to strengthen public-private cooperation and attract resources to develop the green economy. Currently, the state budget is still limited, the capital for investment in green economy development is still modest, so it is necessary to choose a cooperation method under the public-private partnership (PPP) mechanism to meet the demand for investment capital for green economic development. There are many ways to do this, maybe the state chooses a private organization that is able to create links and coordinate to participate in green economic projects or provide solutions for businesses in green production. Or the state makes an agreement with a private organization to provide technology solutions for businesses. The implementation of the public-private cooperation mechanism to socialize resources for green economic development is one of the solutions to increase the mobilization of social resources; attracting domestic and foreign investment for science and technology development, towards green economic development.

Thirdly, the State needs to have preferential policies for businesses to invest in areas that stimulate the greening of the economy. Support and encourage enterprises to apply technological innovation. On the other hand, the state needs to create favorable conditions for all economic sectors to participate in investment and development of new and renewable energy. Development and production of new raw materials, fuels and materials to replace traditional resources. Green subsidies such as price support measures, tax incentives, direct subsidies and loan support can be powerful levers for the transition to a green economy. In addition to green subsidies, it is necessary to limit spending and subsidies in areas that deplete natural capital.

Fourthly, the State should take measures to take advantage of financial support as well as technical, technological and management experience from the international community for green economic areas. To attach importance to exploiting programs and projects supported by international organizations of the United Nations and ODA from developed countries for this field. Continuing to expand and develop ideas and actively participate in activities of international organizations and movements on environmental protection, climate change response, building a green economy. In addition, the state promotes international cooperation in green economic development through the signing of international agreements and conventions on climate change.

Fifthly, the State needs to strengthen the supervision of environmental law enforcement by enterprises; supporting enterprises to access appropriate technology as well as to access preferential financial sources to invest in changing environmentally friendly production technologies; to research, develop and perfect the policy framework to implement new economic models. At the same time, the business community needs to take immediate action against climate change. Specifically: increasing the efficiency of energy consumption in production and business; gradually switch to using renewable energy sources, environmentally friendly energy; control to limit waste and emissions; increasing the use of recycled materials; participating in sharing and contributing to common initiatives.

Sixthly, to achieve the goal of restructuring the economy towards green growth, it is necessary to have an integrated approach to the goal of sustainable production, consumption and business development... all these fields are in great need of the role of the state, in which the restructuring of the industry, especially limiting the development of economic sectors that generate large wastes, cause environmental pollution. The government must develop regulations appropriately, taking into account the pillars of sustainable development such as economic, social and environmental pillars. CSR can serve as one of the "tools," or substitute for regulatory policy. Accordingly, the authorities review the master plan for socio-economic development in key regions, the planning of economic sectors, especially those that affect the environment such as energy, mining, construction, transportation and tourism must soon develop and implement action plans to ensure sustainable development.

5. CONCLUDE

Sustainable development represents an overarching imperative within our nation's developmental trajectory, wherein the harmonious integration of the three fundamental pillars of development - namely, economic sustainability, social sustainability, and the preservation of natural resources and the environment - is paramount. Within this framework, the pursuit of green growth, as a pathway towards a green economy, assumes a pivotal role. It embodies a strategic approach to economic development that is characterized by expeditious, efficient, and enduring progress, while concurrently serving to mitigate and forestall the adverse repercussions of climate change. In the ongoing endeavor to transition towards a green economy through innovation, the significance of CSR takes on heightened importance. Here, the instrumental role of the state emerges as a crucial enabler. The transformation from a traditional economy to a green economy emerges as a global trend pursued by numerous countries worldwide. Vietnam, in particular, has identified and prioritized various imperatives for establishing a green economy, necessitating a prompt infusion of investment capital into sustainable development projects. The promotion of CSR within the realm of green economic development assumes a central role, with the state playing a pivotal part in catalyzing this transformation. Accompanying this process are the requisite transformative solutions that must be implemented throughout the course of transitioning to a green growth model for development. A primary strategy involves the active cultivation of the public-private partnership model, designed to proactively access financial resources from the private sector. This strategic approach is geared towards augmenting the resources allocated to foster green growth.

GREEN FDI – CONTEXT AND POLICY FOR THE PRIORITY IN VIETNAM

PhD. Cao Phuong Thao[1]

Abstract: Green Foreign Direct Investment (FDI) has the potential to greatly advance sustainable development. It is crucial for the enhancement of growth and innovation, through the quality of jobs it creates, and the development of human capital which further raises living standards. Many researches have recently pointed that Green FDI plays a vital role in achieving the Sustainable Development Goals, and its role goes beyond SDG8 and SDG9. The positive effects that occur from FDI can be seen in all 17 of the goals. The enhancement of growth and innovation that creates quality jobs and develops human capital can aid in ending gender inequality, with more employment opportunities being made available for women worldwide. Furthermore, an increase in human capital for the host country means that fewer people will fall under the poverty line and fewer will suffer from hunger. An increase in human capital can also increase the health and wellbeing of citizens. By analyzing the evident benefits of Green FDI for host countries that promoting for increasingly seeking more green investors, authors would like to suggest some recommendations for Vietnamese governments to become attractive destinations for sustainable investment.

Keywords: FDI, green FDI, sustainable development, investment.

1. FDI AND THE LINKAGE OF FDI AND UN'S SUSTAINABLE DEVELOPMENT GOALS

1.1. FDI and the linkage of FDI

At the 2015 United Nations Summit, world leaders made the decision to adopt the 17 Sustainable Development Goals (SDGs) as part of the 2030 Agenda for Sustainable Development. These goals, planned to be achieved within 15 years of coming into force, were built off the previous successes of the Millennium Development Goals (MDGs) and aim to create a stronger mobilization of efforts to end all forms of poverty, fight inequalities and tackle climate change. These goals create a universal call to action for all countries and recognize the importance of strategies that promote economic growth and address a variety of social needs in the fight towards ending poverty, protecting the planet and promoting peace and prosperity for all people (Figure 1).

Source: United Nation

Figure 1: The Sustainable Development Goals

1 Email: Caophuongthao.aof@hvtc.edu.vn, Academy of Finance.

The COVID-19 pandemic has significantly slowed progress toward achieving these goals by 2030. The pandemic pushed an additional 124 million people into poverty in 2020 alone. Over 255 million jobs were lost, and the number of people suffering from hunger increased by approximately 132 million. It is evident that the COVID-19 pandemic both exposed and intensified inequalities globally (United Nation). Therefore, the need for green FDI has now become more pressing than ever, if we are to rebuild after the pandemic and attain the Sustainable Development Goals.

1.2. UN's Sustainable Development Goals

The SDGs were created to be the blueprint for achieving a better and more sustainable future for all. However, achieving the Sustainable Development Goals by 2030 is an expensive goal that requires significant investments in innovation, infrastructure and technology.

Prior to COVID-19, UNCTAD estimated that developing countries' SDG financing gap was 2.5 trillion USD per year. The impact of the COVID-19 pandemic on investment levels has now further compounded the problem. In addition, COVID-19 caused the world to reverse its progress towards the SDGs in 2020 for the first time (United Nation).

2. THE ROLE OF GREEN FDI

According to an OECD survey conducted in 2021, 37% of OECD IPAs report to contribute to the Sustainable Development Goal (SDG) 13 related to climate change (*Sztajerowska and Volpe Martincus, 2021)*. Higher shares report to contribute to broader SDGs that could also be related to green investment (Figure 2).

Source: Sztajerowska and Volpe Martincus (2021).

Figure 2: SDG's and green investment

To achieve the 2030 Sustainable Development Goals, green FDI can be channeled towards related sectors (*Sztajerowska and Volpe Martincus, 2021)*. FDI often makes a positive contribution to the host country's economy through the transfer of money, knowledge, skills, and technology that would otherwise not be present. Green FDI plays a positive role in the achievement of all 17 SD goals, but it has the greatest impact on goal 8, "Decent work and economic growth" and goal 9, "industry, innovation and infrastructure"

SDG 8: Decent Work and Economic Growth

A key benefit of FDI is the employment and economic boost it can provide to host countries.

FDI can create new jobs and opportunities that would not be available without investors creating new companies overseas. Additionally, FDI can be used as a catalyst for stimulating the economy of a host country. This will result in an environment that will be beneficial for companies, investors, and the overall economic growth of the region.

Goal 8 of the sustainable development goals focuses on promoting inclusive and sustainable economic growth, as well as full and productive employment and decent work for all (Unctad, 2015). Green FDI can be used to achieve this goal through the economic and employment boost it provides (Figure 3).

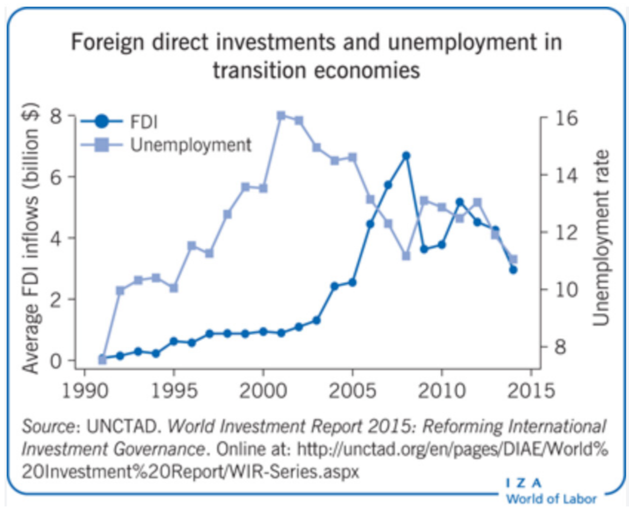

Figure 3: Growth in FDI and employment

A country's employment rate and the amount of foreign direct investment (FDI) it attracts are directly correlated. Investment Monitor studied this correlation from 2003 to 2019, and the data showed that countries with decent employment rates received more FDI projects than those with low employment rates.

Green FDI initiatives ensure that the positive impacts of FDI on employment rates and economic development in a host country will continue, an aspect crucial to the achievement of SDG8. In addition to creating standards for investing in host countries similar to those in developed markets, green FDI encourages investment into sustainable industries.

SDG 9: Industry, innovation and infrastructure

Further benefits of FDI include the exchange of knowledge, technology and skill that occur in areas it would not otherwise be possible. Consequently, the host country's education and human capital are enhanced as workers acquire these skills.

Goal 9 of the sustainable development goals focuses on building a resilient infrastructure, promoting inclusive and sustainable industrialization, and fostering innovation. Foreign direct investment has been a driving force for technological innovation within host countries, but these innovations are often associated with environmental pollution. However, Green FDI is changing this, with initiatives that are focused on sustainable industries and industrialization.

Green FDI promotes investment in sectors that are aligned with the achievement of the SDGs. According to Investment Monitor, Investments in agriculture, climate action, technology and services are some areas that could provide the needed growth to meet the targets for SDG9. FDI initiatives promoting green investment opportunities are targeted towards sectors like electric vehicle manufacturing, renewable energy like hydropower, modular housing, and the emerging green 3D print manufacturing industry (Bruce Takefman, 2022).

3. INCENTIVES – A PRIORITY FOR GREEN FDI

The most popular incentives used by host countries to attract new investments are fiscal FDI incentives. There are many common tax incentives related to FDI, and more that are being introduced specifically for Green FDI – these tax advantages are often a large motivator towards an investors choice to go green. According to FDI Intelligence many of the common tax incentives can be broadly separated into several major categories:

- reduced corporate income tax rates;
- tax holidays (no taxes for a period of time);
- investment allowances and tax credits (reductions in taxes that are based on the amount of investment and are in addition to normal depreciation);
- accelerated or free depreciation (allowing businesses to write off depreciation more rapidly);
- exemptions from indirect taxes, ie, import tariffs on inputs; and
- export-processing zones (special zones for exporters; enterprises in such zones are typically exempt from all indirect taxes or, in some cases, all direct taxes).

Tax incentives for Green FDI vary by host country, with some offering more than others. The EU for example is strongly committed to meeting their ambitious emissions goals, as such they are strongly encouraging the use of renewable energy and have dedicated over a third of their new €1.8 trillion budget towards sustainable development (Bruce Takefman, 2022). Companies can receive subsidies for investing in cleantech, adopting circular economy processes, or greening their supply chains. The EU has even dedicated their €1 billion Innovation Fund to support floating wind farms, carbon capture mechanisms and energy storage with the goal of making sectors such as cement and steelmaking more sustainable.

North American countries have introduced similar incentives to those of the EU, with the US government creating federal incentive programs that allow companies to potentially qualify for 10%-25% tax credits for the cost of their investment for wind, solar and combined heat, and power (Bruce Takefman, 2022). The Canadian government offers incentives through funding that support investments in projects to reduce emissions and investments that create jobs in sustainable fields. These incentives are not only in developed countries, but they are also especially encouraged in developing countries that could benefit the greatest from the effects of Green FDI. The World Trade Organization (WTO) provided five suggestions for initiatives that developing countries specifically should adopt to both make to boost sustainable development.

Green Foreign Direct Investment is clearly playing an important role in the achievement of the 2030 Sustainable Development Goals, and the positive benefits they achieve are vital to the goal of achieving a better and sustainable future for all. It is clear that Green FDI's presence in sustainable development is not going to slow down any time soon, given the high acknowledgment of the benefits it brings to host countries, as well as the new incentives that have been implemented to encourage it.

At 2020 World Economic Forum, the World Trade Organization (WTO) provided five suggestions for initiatives that developing countries specifically should adopt to both make to boost sustainable development, including:

(1) Creating a supplier database with sustainability as a factor. That means taking into account not only traditionally vital information such as business's production capacity, goods and services offered and contact information, but also information regarding the sustainability of domestic supplier operations such as the environmental protection and carbon offset activities, the social impact of the operations and information on their supply chain management.

(2) Adopting 'silent yes' mechanisms to eliminate barriers to investment because of the time it takes to obtain approval. The use of "silent yes mechanisms" could be considered after a certain period of time has passed without any concerns being raised about their application.

(3) Adopting risk-based approaches to administrative approvals with low-risk investments to be approved at an expedited rate.

(4) Creating 'investment alert' mechanisms for any investment complaints or concerns raised to be caught early on – before it negatively impacts the investment appeal.

(5) Providing greater support to investors that contribute to sustainable development.

4. INCENTIVES FOR GREEN FDI - A LESSON FOR VIETNAM

4.1. African Green FDI Initiatives

Ghana and Kenya have followed the suggestions made at the January 2020 World Economic Forum and have implemented new Green FDI initiatives within the past two years in collaboration with the Forum.

Ghana has worked alongside investors to create and adopt a set of standards for sustainable investment. They have a new category under their tax legislation for companies that meet these standards. Investors who are sustainable are provided with additional assistance, including shorter approval timeframes, separate channels for imports and exports, and comprehensive aftercare. Consequently, this supports the investors committed to Ghana's sustainable investment goals and encourages other investors to meet the standards in order to get the same level of support.

Kenya's new Green FDI initiative highlights and measures sustainable businesses and creates two new mechanisms to grow sustainable investments. First, the Kenya Investment Authority has started an ambassador program where they highlight and promote different sustainable businesses to both the public and private sectors to help them gain exposure and showcase their sustainable methods. The second mechanism is a sustainable investment metric for the country. It offers a measurement of what the standards of sustainability are and shows the country's progress towards sustainability. These mechanisms highlight the country's efforts while encouraging the growth of sustainable practices as the norm(Bruce Takefman, 2022).

4.2. Latin American and Caribbean

Latin America and the Caribbean are faced with strong consequences of Climate Change, and as such, they have been the leading areas in green initiatives to combat the effects of climate change. Before the 2020 World Economic Forum, 23 countries, led by Chile, launched a climate ambition alliance. They vowed that by 2050, they would be "net-zero" emitters and launched new FDI initiatives to achieve their goal (Bruce Takefman, 2022). These governments estimated that they would need $77 billion before 2030 to meet their goals, and their public investments would only cover 25% of it. To ensure they would reach their target they implemented new Green FDI initiatives to encourage investment into green projects that would fulfill their sustainable development goals.

However, these countries found that when it came to green projects, investors wanted transparency regarding where their investments were being used and the contributions their investments were truly making. In response they launched the Green Bond Transparency platform, which allows the investors to track their investments and see exactly where and how they are being used. This guarantee of transparency attracted numerous investors and helped the Latin American and Caribbean countries to issue $5 billion of green bonds within the first year of the platforms launch.

Green FDI initiatives are rapidly gaining traction across the globe, with developing countries implementing them at a rapid pace. For developing countries, foreign direct investment has always been a key tool for growth, and now, in recent years, the benefits are expanding to make a sustainable future possible (Bruce Takefman, 2022).

5. GREEN FDI IN VIETNAM – STRATEGY AND POLICY

5.1. Vietnam's FDI Strategy for 2018-2023 period

Vietnam's Ministry of Planning and Investment, with the assistance of the World Bank, is currently drafting a new FDI strategy for 2018-2023 focusing on priority sectors and quality of investments, rather than quantity. The new draft aims to increase foreign investment in high-tech industries, rather than labor-intensive sectors. Manufacturing, services, agriculture, and travel are the four major sectors in focus in the draft.

Sectors in focus

The four major sectors in focus are:

- Manufacturing – It includes high-grade metals, minerals, chemicals, electronic components, plastics and high-tech;
- Services – Includes MRO (maintenance, repair, and overhaul) along with logistics;

- Agriculture – Includes innovative agricultural products i.e. high-value products such as rice, coffee, seafood, milk;
- Travel – High-value tourism services.

5.2. Investment priority

The draft prioritizes FDI investments on a short-term and medium-term basis. In the short-term, industries with limited opportunities for competition will be prioritized.

Industries include:

- Manufacturing/Production – Automotive and transport equipment OEMs and suppliers;
- Environmental-friendly technology – Water conservation, Solar, Wind investments.

In the long-term, the emphasis is on sectors that focus on skills development, including:

- Manufacturing – Manufacturing of pharmaceuticals and medical equipment;
- Services – Services include education and health services, financial services, and financial technology (Fintech);
- Information technology and intellectual services.

Foreign direct investment into Vietnam rose by nearly 7 percent year-on-year to USD 10.55 billion in January to July 2019. In addition, FDI pledges for new projects, increased capital and stake acquisitions - which indicate the size of future FDI disbursements – surged from a year earlier to USD 20.22 billion. The manufacturing and processing industry are set to receive the largest amount of investment (71.5 percent of total pledges), followed by real estate (7.3 percent) and wholesale and retail sector (5.4 percent). Hong Kong was the biggest source of FDI pledges in the first seven months of 2019 (26.9 percent of total pledges), followed by South Korea (15.5 percent) and China (12.3 percent). Foreign Direct Investment in Vietnam averaged 6.35 USD Billion from 1991 until 2019, reaching an all time high of 19.10 USD Billion in December of 2018 and a record low of 0.40 USD Billion in January of 2010.

Majority of the foreign investments in Vietnam are from Korea, Japan, and Singapore. Rather than been over-dependent on Asian countries, Vietnam has to promote itself further and increase investments from the EU, US, and other countries outside Asia-Pacific. With the EU-Vietnam FTA and the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP), Vietnam has an opportunity to increase investments from countries outside Asia (*Vietnam Briefing)*.

5.3. Recommendations

Context for encouraging green growth strategies for Vietnam's industries

Vietnam is one of the countries most affected by climate change, natural disasters, public health challenges, and other external factors. However, the country is also continuing the momentum of innovation, accelerating the transformation of the growth model, promoting quality and efficiency, and doing its best to recover from the pandemic. With that in mind, in the National Green Growth Strategy for the 2021-2030 period with a vision to 2050, ambitious goals to push

Vietnam's sustainable development to greater heights are high-lighted:

The strategy was officially launched just before the United Nations' COP26 in Glasgow, once again highlighting Vietnam's strong commitment via practical actions on localizing greenhouse gas (GHG) emission reduction targets in harmony with sustainable development goals, and restructuring the economy in association with model innovation growth and social justice. Green growth is an important method for sustainable development, directly contributing to the reduction of emissions towards being a carbon-neutral economy in the long term.

Under the strategy, we could limit economic sectors that generate large amounts of waste and cause environmental pollution and degradation, as well as create conditions for the development of new green production industries. Furthermore, we aim to promote the fast development of green economic sectors to create more jobs, increase incomes, and enrich natural capital. Businesses are also encouraged to focus on the application of green technologies, best-practice management and monitoring systems for production activities to save natural resources, reducing GHG emissions, and improving the ecological environment.

One of the key themes in the prime minister's decision is that Vietnam recognizes green growth as an essential approach to ensure sustainable development and improve the quality of people's lives, leaving no-one behind. There are some specific objectives in terms of reducing the intensity of GHG emissions per unit of GDP. For targets towards 2030, Vietnam is set to reduce the intensity of emissions per unit of GDP by at least 15 per cent compared to 2014. Towards 2050, we aim to reduce the intensity by at least 30 per cent compared to 2014.

More specifically, some key targets towards 2030 might be noted, such as primary energy consumption per unit of GDP during 2021-2030 period to reduce by 1-1.5 per cent per year; the proportion of renewable energy over the total primary energy supply to reach 15-20 per cent; the digital economy aiming to reach 30 per cent of GDP; the proportion of forest coverage to be stabilized at 42 per cent; and at least 30 per cent of the total irrigated upland crop area to adopt advanced, water-saving irrigation methods.

All industries are encouraged to implement a circular economic model and digital transformation to improve growth quality, promote competitive advantages, and minimize adverse environmental impacts. On the other hand, under the scheme, people's quality of life and resilience capacity towards climate change would be increased.

Specific recommendations made in the report for Vietnam in the coming time

Previously, we considered China as the largest market in the world and it was very difficult for Vietnam to compete with China in terms of technology as the latter was superior in high-quality human resources, market size, and income per capita. That country has an attractive strategy for international investors. However, more opportunities have recently come to Vietnam. Due to the U.S.-China trade war and China's conflicts with the EU and some G20 countries, the Chinese government attaches importance to the domestic market, encouraging local enterprises to invest at home. Then came global supply chain diversification as part of the "China plus one" trend. The

U.S., Japan, and the EU encourage businesses to move production out of China back home or to neighboring countries like Vietnam and Indonesia. Thus, we see good opportunities. Chinese enterprises may come to invest in Vietnam, which has good relations with the U.S., EU, OECD, and 15 free trade agreements. Vietnam should take advantage of these opportunities.

However, there are two major competitors - India and Indonesia. India's population is about to surpass China's and India's technology is generally of very high quality. India also has abundant human resources, training the most engineers in the world, while wages are much lower, at about 60-70% compared to Vietnam. Indian Prime Minister Narendra Modi's policy is to attach great importance to global integration, and strongly promote investment ties with the U.S. and the EU.

In ASEAN, Vietnam's competitor is Indonesia, whose population and GDP are three times higher than Vietnam. The Indonesian president also attaches great importance to foreign investment and the country has good relations, receiving a lot of investment from the EU and the U.S. For the "China plus one" trend, Indonesia offers many attractive policies to lure FDI. Vietnam has its own challenges domestically in attracting new-generation FDI, including an incomplete legal system, loose law enforcement, and inadequate incentives for MNCs. That is to say, it's hard to retain tech giants if changes are not made. In addition, high-quality personnel is another challenge. And it is still not very convenient for foreign experts to enter Vietnam.

Next is technology. Vietnam attaches great importance to technology and has made great achievements in research and development. Major Vietnamese companies like Hoa Phat, Sungroup, and Vingroup have set up R&D centers, but this is still not enough to promote our transition to the digital economy.

Finally, there are complicated administrative procedures and many types of sub-licenses. They have harmed investor confidence in Vietnam. The country's infrastructure has already developed, but more modern infrastructure facilities are still needed like high-speed railways. Our waterways are still undeveloped, and our seaports are not yet part of a complete logistics system. We're still weak in digital technology and big data, while better policies are needed to encourage residents and businesses to join the digital transformation.

In conclusion, Green economic development has become an increasingly clear trend globally. However, depending on the scale and level of economic development in each country, the speed of transition towards a green economy is very different. For Vietnam, the basic conditions and foundations to move towards a green economy are quite clear, however, we are only in the first phase of a long road ahead. Along with the strong determination from the Government in moving towards a green economy, Vietnam is facing a clear opportunity in attracting FDI capital, especially for investment projects with high technology, less impact on the environment from developed countries. In fact, investors from developed countries are increasingly concerned about environmental and sustainability issues when making investment decisions in Vietnam. What is needed for Vietnam today is a complete legal framework that is comprehensive but also specific enough to ensure the implementation of green economic goals. These legal frameworks need to guide the transformation of production and business models and the application of advanced technology and production processes. Besides, there needs to be a clear corridor with preferential policies to encourage businesses to develop green economy and related fields.

THE ROLE OF ACCOUNTANTS IN THE CONTEXT OF INDUSTRY 4.0

Ph.D Tran Thanh Tam[1]

Abstract: Big Data and Artificial intelligence (AI) technology are considered as one of the important and core technologies of Industry 4.0. The process of organising information in accounting work is strongly influenced by Industry 4.0 because this revolution will completely change this implementation process in businesses. The article focuses on analysing the impact of Artificial Intelligence and Big Data on accounting nowadays and in the future in terms of organisational personnel apparatus, human resources, the degree of application of information technology, and the role of an accountant. Since then, the author has contributed practical notes to future accountants to improve the quality of accounting work, especially management accountants in business management, which is consistent with the development of AI and Big Data.

Keywords: Industry 4.0; Artificial Intelligence; Big data; accountant; management accountant.

1. INDUSTRIAL REVOLUTION 4.0 AND THE IMPACT ON VIETNAMESE BUSINESS ACTIVITIES

Industry 4.0 was first introduced in 2011 at the Hannover Industrial Fair in the Federal Republic of Germany. The introduction of this concept has spurred competition in technological development in other industrialised countries such as the US, China, India, Japan, etc. "Industry 4.0" refers to high-tech strategies, the technologisation of manufacturing and computerisation without human involvement.

At the world's largest economic forum held in 2016, Mr Klaus Schwab, German professor and president of the Davos World Economic Forum, defined the Fourth Industrial Revolution as "a term phrase for organisational technologies and concepts along the value chain" that accompany physical systems in cyberspace, the Internet of Things (IoT) and the Internet of Services (IoS) (Munirathinam, 2019). This concept has completely changed the way that people used to live, work and communicate with each other. Digital technology applied to optimise production processes or production methods is the essence of Industry 4.0. It includes physical networking, the Internet of Things, Artificial intelligence (AI) and cloud computing.

Artificial Intelligence (AI) and Big Data (Big Data) are among the modern technologies that are developing dramatically along with other technologies such as the Internet of Things, cloud computing, Virtual Reality (VR), etc. This technology has transformed the real world into a digital world with experiences that humans have never had before. This is the content of the fourth industrial revolution (Industry 4.0); this digital revolution will strongly promote the development of the digital economy and e-commerce worldwide. Big Data and AI are considered the important and core technologies of Industry 4.0. Accounting works also follow the rules of this development because information technology is widely applied in accounting. The process of organising information in accounting is strongly affected by Industry 4.0 because this revolution will completely change this implementation process in businesses. Specifically, the study focuses on analysing how the influence of Artificial Intelligence (AI) and Big Data technologies will impact accounting in aspects: organisation of human resources, level of application of information technology, the role of accountant... From there, the study contributes practical notes for accountants in the future to improve the quality of accounting, especially management accounting in business management, in line with the development of AI and Big Data.

2. THE IMPACT OF INDUSTRY 4.0 ON THE WORK OF ACCOUNTANTS

Industry 4.0, with the development of the Internet increasingly popular and widely covered in territories applying digital technology, has impacted many professions, especially the accounting profession.

According to the National Electronic Authentication Centre, currently, 100% of businesses have used digital signatures, mainly in services such as tax declaration, customs, social insurance ... In addition, to assess the application of digital technology in the management of production and business activities at enterprises in Vietnam, the Ministry of Industry and Trade of Vietnam surveyed 3,000 enterprises in 2022. In particular, accounting finance software (91%) and human resource management software (57%) are the two most commonly used software by businesses. Some other software, such as customer relationship software (33%), supply system management software (31%), and business management software (22%) are also used by businesses. Through the above figures, it can also be seen that financial accounting in the management of production and business activities at enterprises is the top concern of managers and invest in digital technology to be able to catch up with the development trend of Industry 4.0 (Ministry of Industry and Trade of Vietnam, 2023).

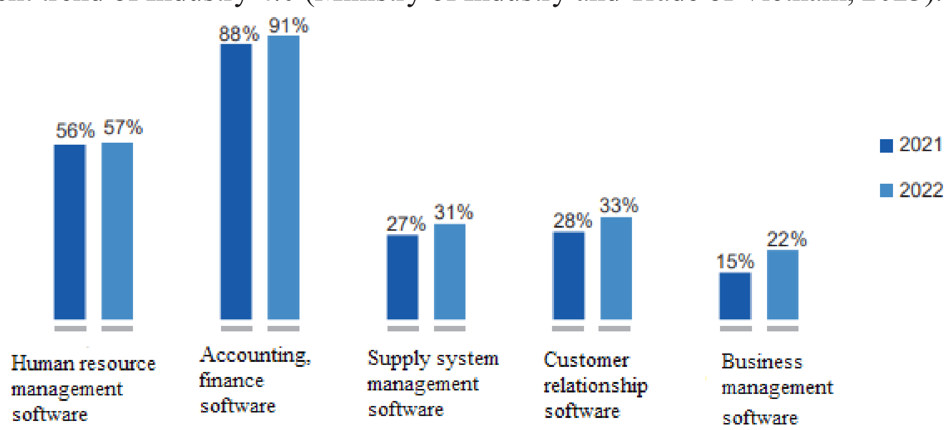

Figure 1: Popular software used by businesses

(Source: E-commerce Association Trade Index Report 2023)

However, preparations for the transformation from Industry 4.0 on a large scale for all businesses in Vietnam are limited. According to statistics conducted by the Ministry of Industry and Trade and the United Nations Development Programme (UNDP) for nearly 2,700 enterprises in 18 industry groups in terms of readiness to access the achievements of the 4.0 Revolution, up to 82% of enterprises are in new positions; 61% of businesses are still on the sidelines, and 21% of businesses are just starting. The handbook cites the report on the readiness of manufacturing enterprises, "Assessment of readiness to approach the industrial revolution 4.0 of enterprises in Vietnamese industries", conducted by the UNDP, the Ministry of Industry and Trade of Vietnam and partners, showing Industry and Trade in general has not been prepared for the industrial revolution (Industry 4.0) with the industry-wide readiness level of 0.53 points on a 5-point scale. (Ministry of Industry and Trade, 2022).

The development of Industry 4.0, in which AI and Big Data are the core technologies has developed dramatically over time. They gradually replace human labour in some special positions in the working environment, including manufacturing, agriculture, services or trade. The advent and gradual replacement of human manual labour is gradually pushing people to develop professional knowledge and skills to find new careers. AI and Big Data create products with high labour productivity, accuracy, standardisation and low cost, even with products with much more complex characteristics that only AI and Big Data can do. The effectiveness of AI and Big Data is gradually widely recognised in many areas of life and the economy.

Big Data is defined as data sets with huge and complex volumes. Traditional software is no longer capable of processing these large numbers in a short period; instead, the advent of artificial intelligence will solve this problem. AI is capable of gathering, analysing, and processing a large set of information at the same time with the most accurate results. Artificial intelligence, or Artificial Intelligence (AI), is a branch of computer science. This type of intelligence was created so that computers can automatically simulate human behaviour through the use of machine learning. Computers with AI technology know how to communicate with humans, understand the language, voices and actions of the opponent to interact, and know how to think, reason, and analyse.

While there is no denying the effectiveness of AI and Big Data, they cannot replicate human intelligence. That is the limit of AI and Big Data. Now, humans are creating them, understanding them and manipulating them with a wonderful combination of machines and humans.

AI and Big Data have also had a very early impact on business and accounting. Process automation and AI are technologies that have an earlier impact on the accounting field in general and the accounting profession in particular (Oanh, 2020). They are capable of handling a huge amount of accounting operations in a short period. They can help businesses produce the metrics that managers need for quick decision-making. Since then, they have replaced some of the job functions of accountants, such as processing figures, preparing reports according to specific requirements, etc.

However, the application of AI in accounting is still in its early stages. Accounting includes stages such as Collecting, processing, analysing and providing information. However, according to the current 4.0 technology trend, all these stages can be replaced by machines. Technology will have an impact on making the work environment change from manual to automated. AI and Big Data will fundamentally change the way of performing accounting tasks by applying electronic documents, applying automatic processing software programs, data synthesis and bookkeeping, and implementing data inspection methods in a computerised environment. With the application of new technologies, data will be stored in large volumes, without limits, automatically backed up to create copies of data to help protect data in case of system failure, data loss or data destruction. Accounting does not take too much effort in classifying documents, handling each economic transaction, and recording accounting books in a certain order, but the concern is to present financial statements and provide financial information according to the most common standards.

Skoulding (2018) không thấy trong tài liệu tham khảo also affirmed that if in the past, the work of accountants and auditors was associated with accounting books and with predetermined processes, in the digital age, the emergence of intelligent accounting software applying artificial intelligence will gradually replace those jobs.

AI and Big Data can process data quickly, but in fact, businesses still need accountants to analyse and interpret AI data as well as provide consulting services. Instead of replacing the role of an accountant, AI is aiding in the tasks accountants are performing efficiently. In a recent study, accountants spend 66% of their time processing documents, compared to 11% of the ideal model. To achieve this ideal model, accounting must be supported by technology. AI technology helps accountants solve manual and repetitive tasks, as well as with fast processing speed, Big Data and AI for quick data sets. Accountants will have time to perform tasks related to strategic management or data analysis. With manual tasks with the help of AI, accountants can use that data to analyse to support decision-making in the most logical way and in real time. Information is provided promptly and immediately, supporting management decisions in assessing past operations, controlling current operations, and planning for the future. In addition, AI will improve the accuracy of information and reduce accountants' liability risks.

At the seminar "Artificial Intelligence and Digital Breakthrough", when discussing the future of the accounting and auditing profession in the era of Artificial Intelligence - AI, Ms Kirstin Gillon said: "AI will greatly change the role of accountants - auditors in the future. AI will help accountants focus on the true values of this profession. The role of accounting and auditing experts in the era of artificial intelligence is not only to record books but to make accurate decisions and help businesses prosper, as well as ensure the accountability of those involved" (Thanh, 2018).

Also at this seminar, Mr. Vu Ngoc Hoang, software solution architect of (International et al.) IBM Vietnam gave remarkable predictions about the accounting profession in the digital future in his presentation on the topic "Digital labour - what will the future of work look like" (Ministry of Industry and Trade of Vietnam, 2018). According to him, up to 66% of SMEs will replace the services that accountants are performing with cloud services. If personnel cannot adapt to this technology, up to 50% of businesses agree to replace personnel accordingly. The software will replace simple and manual, repetitive tasks such as bookkeeping, preparing financial statements, salary reports and year-end financial analysis reports.

The author of several books and radio shows, "The Real Desire of the Customer," James Evangelidis, also argues that advanced technology will help accountants eliminate some businesses but will also create new jobs. This expert said that accounting practitioners should not worry too much because these advanced technologies will make their work faster and more efficient. They help accountants perform accounting operations well, comply absolutely and eliminate all errors in the process, as well as prevent tax evasion (Oanh, 2020).

Thus, AI and Big Data do not replace the job position of accountants, but they help support the tasks of accountants most effectively and effectively, bringing many benefits to businesses. However, it is necessary to have a good combination of accountants and the use of these advanced technologies for accounting to be truly effective.

In short, accountant's work will be affected by AI and Big Data technologies in the following things:

About data storage: Big data (also known as cloud technology) helps store real-time information that arises in huge volumes and is not limited in memory as before, limiting risks such as damage or data loss.

About data analysis and processing: Besides recording highly standardised operations or events, artificial intelligence can also replace humans in some complex operations such as pricing, provisioning, etc. Standardised, iterative records will be technologies to increase operational efficiency. The development of advanced technology will provide more modern and efficient tools and software in data analysis in addition to conventional ones.

3. THE ROLE OF ACCOUNTANTS IN THE CONTEXT OF INDUSTRY 4.0 - RECOMMENDATIONS AND DISCUSSIONS

The application of technology in businesses in Vietnam is also only in the early stages; most businesses still use outdated technology. Therefore, in order to catch up with the development and application of high technology, those working in the field of accounting, the profession that applies technology most widely, need to pay attention to improving their qualifications and skills in applying for advanced software and data analysis tools that support accountant's work most effectively in the new era.

Accountant's work is highly compliant, so technology will have a stronger impact; the software will process the work faster than humans. According to James & Lee (2016), accountants in the industrial 4.0 need to focus on skills in analysis, planning, consulting, and financial management ... rather than bookkeeping jobs, particularly in management accountants. Therefore, management accountants are also increasingly asserting their important position in the organisation because accountants, from performing technical operations, have shifted to the role of solving strategic problems through collecting, analysing and processing specific information to support each decision of business administrators. They have become part of the management apparatus. However, this technology only solves one basic stage of collecting and calculating information, while the intention of processing or processing depends largely on the role of the performer. Management accountants must be able to create business value from data. They must be knowledgeable about the strategy of the business and the short-term and long-term goals of the organisation to create value from the data that has been collected and processed. Management accountants act as a manager in the business. They must be able to connect with all departments in the business and grasp all information from events inside and outside the business to support the analysis of information provided to those who need to make decisions. Management accountants, as consultants and strategic advisors to decision-makers, must be able to use processed data sheets to send a message to managers.

To do this, accountants need to focus on improving their capacity to meet the practice conditions in the period of international technology. Each individual needs to access the technological achievements of Industry 4.0, update knowledge and improve the level of using artificial intelligence for their work. The good combination of humans and artificial intelligence will create the highest work efficiency. In addition, with the current development of technology, the role of accountants has gradually changed from manually performing compliance operations to solving customers' questions and concerns, advising them on business insights, and offering specific solutions for each situation. Therefore, to do this, accountants also need to equip social media skills to work with customers and develop relationships.

Professional ethics is also an extremely important issue for the accounting profession. Confidentiality and truthfulness in reporting are essential, helping to protect shareholder and organisational interests, as well as helping to enhance customer and shareholder value. As manual and technical tasks are replaced by technology, accountants must take on more advanced strategic roles. Mastering technology in their accounting work is an essential task for accountants in the digital era.

4. CONCLUSION

Vietnam is in the stage of deep integration with the world, so the impacts of the Industrial Revolution 4.0 will have significant effects on all fields and industries. Accounting and auditing are highly compliant industries, so that the industrial revolution will have a stronger impact on this industry and human resources in the future. Under the impact of digital technology, accountants must have high professional qualifications, appropriate skills in the technology age and professional ethics to meet the requirements of accounting and auditing careers in the digital age.

ASSESSING MARKETING COMMUNICATION EFFECTIVENESS AT UNIVERSITIES IN THE DIGITAL ERA: AN EMPIRICAL STUDY AT UNIVERSITY OF FINANCE AND ACCOUNTANCY

Ph.D Vo Thi Thu Dieu[1], MBA. Vo Thi Truong Tam[2], MBA. Mai Ba Gia Han[3]

Abstract: *This study aims to assess the effectiveness of marketing communication activities at universities in the digital era. In the empirical study, the data were collected from 396 students studying courses at the University of Finance and Accountancy (UFA). The data were analyzed descriptively. The dependent variables included Aware, Appeal, Ask, Action, and Advocate (5A). The data were calculated using Purchase Action Ratio (PAR) and Brand Advocacy Ratio (BAR). The data were calculated based on the criteria of 5A. The findings show that the level of UFA brand awareness is quite high, the service usage rate is relatively high, but the level of brand support is not as expected. Based on the research results, some solutions are proposed to increase the marketing effectiveness, especially brand communication in the near future.*

Keywords: *marketing communication, effectiveness, university, 5A model.*

1. INTRODUCTION

University education is a pedagogical environment of higher education with an in-depth level of knowledge according to the major or profession that students choose and training at the university level is only for those who have real needs and enough knowledge and social ability to learn. In Vietnam, the 2019 Law on Higher Education has increased the autonomy of higher education institutions, especially in enrollment. Therefore, marketing communication and brand promotion activities have become more necessary and important than ever in the development strategy of higher education institutions. Clearly defining the role of marketing activities will create right and ahead of time direction, help the university plan attractive and well-invested visual communication strategies, and increase the ability to interact with stakeholders and customers inside and outside the university. Regarding educational development in the current context of digital transformation, choosing a university, choosing a career, understanding the university, understanding the profession are of great concern, many university professions are widely known in society.

Therefore, in the period of higher education innovation, scientific research using modern marketing effectiveness indicators in the context of 4.0 to evaluate the current state of enrollment communication is extremely essential. Simultaneously, this study applies the 5A model with an in-depth analysis of indicators to evaluate the implementation process instead of just evaluating the implementation results, in order to find the good and bad points of this activity. By actively promoting enrollment communications, identifying the reasons why brand purchase action (PAR) and brand advocacy (BAR) indicators increase or decrease, the power of communications is effectively exploited. This is a study expected to bring a new approach in evaluating the effectiveness of marketing communications 4.0, especially in the field of educational service. It

3 University of Finance and Accountancy.

not only contributes to enriching the source of knowledge related to marketing management in teaching and learning, but also serves as a basis for building important solutions for the university to reach development goals at a new level in the future.

2. THEORETICAL BACKGROUND

The concept of promotion has developed in recent years. Traditionally, promotion has always been a one-sided affair where companies send messages to customers as audiences. The rise of social media allows customers to respond to these messages. This also allows the customer to talk about the messages with other customers. Digital marketing is not intended to replace traditional marketing. Instead, the two must coexist with roles that are exchanging along the customer's path. One of the earliest and most widely used frameworks to describe customer pathways is AIDA (Attention, Interest, Desire, Action). Derek Rucker from Kellogg School of Management offers a modification of AIDA called 4A (Aware, Attitude, Act, and Act again) (Kotler et al., 2016).

In the digital era or connectivity changes in the customer's path according to the changes formed by connectivity. In this era, the customer path is rewritten as 5A, namely:

1) Aware, at this stage the customer is passively exposed to a long list of brands from past experience, marketing communications, and/ or advice from others. Company driven advertisements and word of mouth by other customers are also sources of brand awareness;

2) Appeal, in a highly competitive industry, brand appeal must be stronger. Some customers respond more to brand appeal than others. An example is young people are usually the first group to respond;

3) Ask, at this stage the customer usually follows up by actively researching brands that are of interest to them to get a lot of information from friends and family, the media, and/ or directly from the brand;

4) Act, if you feel confident with further information in the questioning stage, the customer will decide to act. The customer's desired actions are not just limited to purchases. After purchasing a brand, customers interact more deeply through consumption and use and post-purchase services;

5) Advocate, in this stage there are 3 levels of consumer loyalty. Level 1 is if consumers continue to use that brand called retention. Level 2, if the consumer makes a repurchase called repurchase. The highest level is when consumers are willing to risk their personal reputation to recommend the brand. This stage is called loyalty which is the same as advocacy (Tampi and Pamungkas, 2018).

All the distinctive features of marketing that apply to the service sector apply equally to the higher education sector. Therefore, the concept of customer in higher education services is understood similarly to all other business relationships (Sax, 2004; Svensson and Wood, 2007). Accordingly, customer is the name given by a product or service provider to an individual or organization purchasing that product (Santesmases, 2004).

Initial research begins to evaluate the most appropriate terminology to qualify recipients of services provided by the university. The concept of customer in higher education can henceforth be understood as an individual, or organization, who makes a direct payment to a university in exchange for providing a service, such as receiving classes or research on certain topics (Cliff, 1994). However, there is a view that graduates are the products of higher education institutions and employers are considered customers (Kotler and Fox, 1985; Conway et al., 1994). The outstanding customer difference in higher education lies in the recognition of ownership of the core product. According to Svensson and Wood (2007), ordinary product buyers gain ownership by paying the price, while college students do not automatically receive a degree through paying for enrollment, because they must acquiring knowledge is recognized. For university services, there are many parties who directly or indirectly receive some benefits without having to participate directly in the transaction, or even without having to make any payments to receive those benefits (Brennan and Bennington, 1999).

For other approaches, the expansion of the concept has led to the choice of the more appropriate term “stakeholders”. These are customers who are individuals or organizations that make indirect payments to educational institutions, as they also indirectly receive a range of services. For example, the indirect exchange that takes place between universities and the training of qualified personnel that companies will benefit from, or the investment in education that generates technological innovations. Technology will be beneficial for business development and social welfare, etc. Therefore, many studies have classified customers in universities into different groups including: students; student’s family; social community; organization’s personnel; public and government agencies; organizations and current and potential employers (Greenland, 1994; Bristow, 1998; Sahney et al., 2004; Marzo et al., 2007). Different proposed classifications of customers in higher education use different criteria. Among them, the most frequently used criterion is the distinction between internal customers and external customers, whereby internal customers are considered those who have a close and direct relationship with the university and those who work to achieve external customer satisfaction. The existence of many diverse results in the work developed by universities, as well as in the process of achieving them, means the presence of many customers of these institutions.

The most basic goal of communication activities is to increase public reputation and awareness of the school (Kittle, 2000). In the market economy, competition in the field of higher education is increasingly fierce among universities, so communication activities of organizations are increasingly focused; the importance of communication activities has been clearly demonstrated through the establishment of specialized communication departments at universities as well as increased budgets for marketing activities.

Kotler & Fox (1995) believe that the communications department at higher education institutions, in addition to performing the following tasks: preserving and enhancing the promotion of the school’s image, providing information about training majors, attracting prospective students is encouraging them to apply. There is also a need to build long-term relationships with former students and strengthen their support, attract donors and address misinformation about the school. To carry out these activities, organizations need to use tools to convey information appropriately. In the field of education, tools for communicating with the public of educational organizations include: advertising, public relations, direct marketing and promotions (Ivy, 2008). Meanwhile, according to Nigamananda Biswas and Vipin Bihari Srivastava (2010), communication in education includes: advertising, public relations, word-of-mouth marketing, point-of-sale marketing, direct marketing and websites. These two authors also emphasize that educational organizations need to focus mainly on advertising, direct marketing through websites and word of mouth marketing.

Kotler (2012), Smedescu and colleagues (2016) also provide 8 main commonly used communication tools including: advertising, sales promotion, events and real experiences, public relations, direct marketing, interactive marketing, word of mouth marketing and personal selling. Tools applied in communication activities at higher education institutions with specific activities in recent years (Hanover, 2014): advertising, sales promotion (tuition exemptions, grants, scholarships,..), events and practical experiences (school tour events, charity events, exhibitions, job fairs,..), public relations (seminars, workshops...), direct marketing (email, phone), interactive marketing (via website, social networking sites), word of mouth marketing and personal selling.

The effectiveness of professional marketing communication activities in the University of Finance and Accountancy (UFA) will be evaluated using the marketing productivity indicators:

Purchase Action Rate (PAR) and Brand Advocacy Ratio (BAR). They are metrics to measure the productivity of a marketing strategy. Both of these indicators are consistent with 5A. PAR is a metric that measures how well companies convert brand awareness into purchases. Meanwhile, Brand Advocacy Ratio (BAR) is a metric to measure how well an organization converts brand awareness into brand advocacy (Kotler et al., 2016). These two simple indexes are modeled from the index that financiers use to measure financial situation such as Return On Equity (ROE), to measure profitability per dong of fixed capital in a joint stock company. ROE helps shareholders track the "effectiveness" of the money they have invested. Likewise, PAR and BAR allow marketers to measure the effectiveness of their investment, specifically the process of creating brand awareness.

3. RESEARCH METHODOLOGY

This was a descriptive quantitative study. The statistical analysis used was quantitative descriptive analysis by describing in detail the problem being examined based on the data obtained. Data were obtained through questionnaires that had been filled by respondents. The location of the study was conducted at UFA, Quang Ngai province. The study was conducted in June 2023.

The population in this study was current UFA students with the sampling technique used was random sampling. A total of 400 people were selected for this study using Slovin formula with a margin of error of 0.05. The variables in this study were Aware, Appeal, Ask, Action, and Advocate (5A). As follows, Aware (A1) was the awareness of students about UFA information; Appeal (A2) was the interest of students for UFA information; Ask (A3) was student who will ask about UFA information; Act (A4) was student who become official UFA student; Advocate (A5) was student who will encourage friends or relatives to go to UFA (see in Table 1).

The data were collected through questionnaires survey (see in Appendix). The exclusion criteria were students who did not have access to UFA's promotional information sources. Analysis of the data used is quantitative descriptive data analysis by describing in detail. Data obtained through a questionnaire was used to find out the indicators of 5A (Aware, Appeal, Ask, Act, Advocate) which were the variables in measuring the effectiveness of marketing communication activities.

The data obtained is then analyzed by calculating the total the answer. From these data, the percentage of each indicator is calculated using the following formula:

$$An = \frac{\text{Total value of An}}{\text{Total expectation value}} \times 100\%$$

Information:

An: The value of variable n

A1: The value of Aware variable

A2: Value of Appeal variable

A3: Value of Ask variable

A4: Value of Act variable

A5: Value of Advocate variable

The questionnaire (Appendix) was built on the theoretical basis of the 5A model of Kotler et al. (2016) with two observation groups: an observation group to measure the value of variables and an observation group to serve In-depth interviews to support analysis of conversion rates between stages of the research model.

To strengthen the results of the study, PAR (Purchase Action Ratio) and BAR (Brand Advocacy Ratio) measurements were calculated based on the 5A criteria after the conversion rate of each variable was also calculated.

Table 1. Measurement model

Variable	Items	Purpose
Aware (A1)	1.1: When mentioning the name of a university in Quang Ngai, what comes to mind first? 1.2: When you mention a university training in Economics in Quang Ngai, which school do you think of? 1.3: When you think of a public university under the Ministry of Finance in Quang Ngai, which one comes to mind?	Measure values
	1.4: When choosing a university for yourself, which schools did you think about? 1.5: Have you ever accessed the admission information of the University of Finance and Accounting? 1.6: What source did you learn about UFA?	In-depth interviews
Appeal (A2)	2.1. When you received UFA's admissions information, how did you feel?	Measure values
	2.1. When you received UFA's admissions information, how did you feel?	In-depth interviews
Ask (A3)	3.1. When looking for admissions information or information about UFA, which sources do you usually prioritize?	Measure values
	3.2. When looking for admissions information or information about UFA, which sources do you usually prioritize? 3.3. What channels of UFA have you accessed? 3.4. How would you rate the usefulness of UFA communication?	In-depth interviews
Act (A4)	4.1. Are you considering admission to UFA?	Measure values
	4.2. If so, how do you consider admission to UFA? 4.3. If so, how much do you consider for admission to UFA?	In-depth interviews
Advocate (A5)	5.1. Would you be willing to recommend UFA as a college option for relatives, acquaintances, friends?	Measure values
	5.1. Would you be willing to recommend UFA as a college option for relatives, acquaintances, friends?	In-depth interviews

According to the sampling plan, the sample size needed to be collected is 400 samples corresponding to the total number of questionnaires distributed. In fact, with 400 questionnaires distributed, 396 questionnaires were collected, corresponding to a response rate of 99%. Of the 396 students surveyed, there were 112 1st year students (accounting for 30.81%), 160 2nd year students (accounting for 40.4%), 82 3rd year students (accounting for 20.71%) and 32 4th year students (accounting for 8.08%).

So, based on theory, the sample size is 396 respondents, the total expected value will be 396. An is the value of variables A1, A2, A3, A4 and A5, representing the total number of respondents answering with the brand/product (in this study, the brand of the University of Finance and Accountancy and UFA's higher education services).

4. RESULT AND DISCUSSION

Percentage of 5A Variable

Based on data obtained from filling out the questionnaires by the respondents, obtained several calculation results as Table 2:

Table 2. Result of percentage value of 5A variable

Variable	Value	Percentage value
Aware (A1)	381	$\frac{381}{396}$ x 100% = 96.21%
Appeal (A2)	196	$\frac{196}{396}$ x 100% = 49.5%
Ask (A3)	187	$\frac{187}{396}$ x 100% = 47.22%
Act (A4)	305	$\frac{305}{396}$ x 100% = 77.02%
Advocate (A5)	266	$\frac{266}{396}$ x 100% = 67.27%

In Aware Stage (A1)

The awareness stage was assessed by asking whether the students knew about the presence of the UFA brand in Quang Ngai province or not. Among 396 students, when asked to name a university in Quang Ngai, 299 of them first mentioned the name of University of Finance and Accountancy (UFA), the remaining 97 did not know. And when we continued to be prompted with some related information such as "university in the economic sector" or "state university under the Ministry of Finance", out of 97 respondents, 82 respondents began to remember the UFA and remaining 15 respondents still don't know. Thus, if we consider additional questions assessing the level of brand awareness through keywords, out of 396 surveyed students, 381 respondents are aware of the UFA brand (299 respondents think at the first and 82 respondents remembered through suggested information).

In Appeal Stage (A2)

The student appeal rate of UFA's current communication channels is assessed at an average level (accounting for 49.5%), which means that out of 10 people know about UFA's communication information, less than 5 people feel that information attracts them. Through the results of in-depth interviews with students who have had access to UFA's promotional information, it can be seen that two groups of content have been communicated quite effectively, including: Tuition, Scholarships and Training programs. Information about employment opportunities for UFA students after graduation as well as content shared by alumni are also of interest to students. On the contrary, the location of the training facility and the image of the current faculty and students are content groups that need to be more invested in and promoted by UFA to enhance the effectiveness of communication about the representative image of the UFA brand.

In Ask Stage (A3)

The rate of "Asking" obtained from the results of research is quite low, showing that the rate of the public performing activities to find out detailed information about the university admission in recent years is really not high. In the current marketing communication channels that universities are using in admission activities, the rate of both normal-level and high-level interactions is still low. However, in some businesses, this will not indicate whether the brand has high or low purchasing power. The "Learn" phase of the 5A model is more specifically different from the traditional AIDA model in complexity because of the intersection between online and offline learning methods. In marketing, curiosity arises when customers are given interesting knowledge without being given too much information. To take advantage of curiosity, marketers must create content that can be searched and shared whenever customers search for it (Kotler et al., 2016). This can be a note in planning strategies for building marketing communication content for universities.

In Act Stage (A4)

Of the 396 respondents, 305 students made the decision to study at UFA through the marketing communications information they accessed (accounting for 77.02%), and 91 students became UFA students for reasons from other environmental factors, not from one's own desires. Value of A4 shows the rate of customer purchasing actions, and this study results show that A4 is rated at a good level, but not the desired level of university leaders. Therefore, marketing activities aimed at increasing this ratio in the future become one of the important goals of UFA.

In Advocate Stage (A5)

When asked more deeply about the reasons for the 266 students, they said "competitive tuition", "friendly and enthusiastic lecturers", "because UFA is a public university, reasonable tuition, and lecturers", "friendly university, good teaching equipment", "reputation of the university", "quality of training program" are the reasons why they decide to recommend it to others. However, some still do not decide to recommend it to others because "the facilities are not as good, and there are few exper... to change their learning ... ompleting the university ... ond major university deg ... 's degree (rate 23.6%), ...

The level ...

Based on ... s Table 3:

Conversion stage	Conversion rate value
Aware (A1) → Appeal (A2)	$\frac{\text{Appeal}}{\text{Aware}} = \frac{196}{381} = 51.44\%$
Appeal (A2) → Ask (A3)	$\frac{\text{Ask}}{\text{Appeal}} = \frac{187}{196} = 95.41\%$
Ask (A3) → Act (A4)	$\frac{\text{Act}}{\text{Ask}} = \frac{305}{187} = 163.10\%$
Act (A4) → Advocate (A5)	$\frac{\text{Advocate}}{\text{Act}} = \frac{266}{305} = 87.21\%$

Conversion rate from aware to appeal

The results showed that only 51.44% of 381 students who recognized the UFA brand felt attracted and could initiate research behavior in the next step. This shows that, when implementing multi-channel recruitment communication activities, each communication channel also needs to be reviewed and evaluated periodically to adjust marketing communication policies to suit the needs of receiving information as well as getting the public feedback. Specifically, UFA in the past period has used 5 main communication channels including: Social networks, Word of mouth, Events, Publications, Advertising. Through the survey, students searched information about UFA through the above channels but with different access rates. Most students know information about UFA mainly through admission consulting events organized by UFA, through introductions from acquaintances and through social networks. Among them, access through acquaintances accounts for the highest rate, followed by admission consulting events conducted by UFA and information on social networks. As for media advertisements in publications and mass media such as newspapers, radio and television, they rarely reach students. This situation raises the issue of the university's effectiveness in choosing to use a system of marketing communications media consistent with the marketing communications budget.

Conversion rate from appeal to asking

The results showed that 95.41% of the 196 students who felt attracted to the UFA brand had the behavior of learning more about the university's admission information. This shows that the quality of direct consulting, word of mouth, news content, image design, as well as the way of organizing admission consulting events through media channels maximizes effectiveness. The effect of attracting interaction of information access subjects.

Through the results of in-depth interviews with students, the UFA communication channel most approached by students is "Fanpage" - 143 choices (accounting for 72.95%), "Tiktok channel" - 23 choices (accounting for 16.39%), "Hotline phone number" - 31 choices (accounting for 14.34%), "Direct admission consultation" - 84 choices (accounting for 41.39%), "Enrollment consulting event at high school" - 71 choices (accounting for 42.62%) and 5 choices are accessing information through other channels.

Conversion rate from asking to acting

The above results once again demonstrate another characteristic of the 5A model, that customers can go through different journeys at access points and can completely skip steps, or change the order of steps at middle of the journey. In this case, the majority of people choose to study at university through introductions from acquaintances or family members who have information or have experienced studying at the university before. So, the conversion rate to A4 - Action can completely be considered to come from A1 - Aware.

Conversion rate from acting to advocating

Calculation results show that the conversion rate of the Action (A4) to Support (A5) phase of UFA students reached 87.21%, a relatively good level. This rate shows a high level of loyalty or encouragement from students, thereby influencing the recommendation of UFA's higher education services to others in a positive way. According to Kotler et al. (2016), the low conversion rate of the Action (A4) to Advocacy (A5) stage means that after experiencing the brand, customers do not feel satisfied enough to recommend it to others. Low conversion rates are the result of poor after-sales service or products/services that do not meet customer expectations. Customers can be attracted by the brand and brand communication activities but ultimately feel disappointed when using the product/service. With low conversion rates in the brand advocacy phase, marketers need to improve customers' experiences when using products/services. This will help brands increase their relationship with customers, build loyalty, and support the brand more.

In the 5A model, the number of service users of a brand can be derived from the total number of people who recognize that brand without having to go through the research step because of the brand's availability in the market and the habit of choosing higher education services largely through family recommendation. Purchase Action Ratio (PAR) measures the conversion from awareness to purchase behavior, so it can be said that PAR explains the 5A model at UFA with the value of A4 being significantly higher than the value of A2 and A3.

UFA Marketing Effectiveness seen from PAR (Purchase Action Ratio):

$$\textbf{PAR} = \frac{\text{Act}}{\text{Appeal}} = \frac{305}{381} = 80.05\%$$

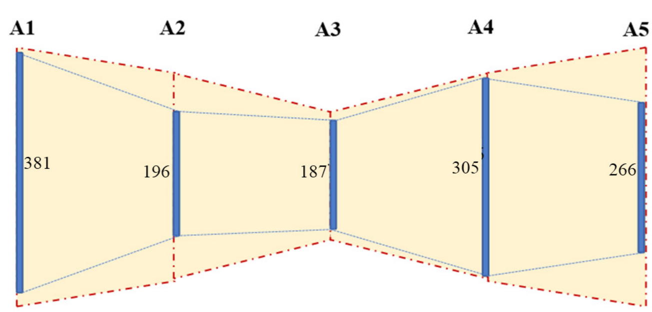
This result is considered positive for UFA's marketing communication activities in recent times. High awareness leads to the action of using UFA's services, accounting for 80.05% of the total number of students recognizing the brand, which is a positive result that needs to be promoted by UFA in the future. Considering the nature of the PAR index, UFA's marketing communications department will be able to estimate the potential for brand market share in the enrollment market to increase when the university promotes awareness, trademark. In the process of planning brand development strategies and future enrollment marketing communications, if the university plans to invest budget to increase UFA brand awareness by 1%, then the PAR is 0.8005 (means UFA has spent 80.05% of the budget to develop market share) and other factors remain unchanged, the UFA brand will be estimated to increase its market share by 0.80% compared to the present. Although this is a preliminary estimate under ideal environmental conditions, this index also helps the university plan its spending budget more appropriately, especially spending on marketing communication in general and brand communication in particular.

UFA Marketing Effectiveness seen from BAR (Brand Advocacy Ratio):

$$\textbf{BAR} = \frac{\text{Advocate}}{\text{Appeal}} = \frac{266}{381} = 69.81\%$$

Accordingly, among the 381 students who recognize the brand, there will be 266 students (accounting for 69.81%) who are willing to introduce and recommend UFA's higher education services to others. This ratio is assessed at an average level, demonstrating the current situation that the brand has not built customer loyalty. Because the BAR index is an index that shows the results of the entire 5A customer journey by measuring the ratio of starting and ending point values, when considering the meaning of the BAR index, it is important to pay attention to conversion rates at stages in that journey. In essence, BAR as well as learner loyalty does not only include the level of awareness and support, but is a long and complex experiential process that includes: creating attraction, creates curiosity, ensures commitment and enhances the level of connection through relationships with learners.

Based on Kotler's theory of the 5A ideal model, Bow Tie Pattern - The bow shape represents the main characteristics of a perfect brand with a BAR index of almost 1 (awareness = support); and perfect attractiveness result in a conversion rate from attraction to action of almost 1, meaning that any customer who is attracted will buy/use the product/service of this brand. Other types of patterns (such as the Knob, Goldfish, Trumpet or Funnel) all strive to achieve this perfect bow pattern (Kotler et al., 2017). The conversion rates between customer behavioral phases in the communication activities represented as a knob, based on the findings of the UFA research on the 5A customer journey model.



--------- Main model --------- Ideal model

Figure 1. Compare main model with ideal model in customer journey

When we insert a perfect model within are shown in the form of a knob. When we superimpose an ideal model within main model, we can see to need improve the customer journey through marketing communications solutions. Correctly changing the restricted contact point will usually improve the PAR and BAR index closer to 1. The purpose of all this is to improve the effectiveness of marketing communications and avoid unnecessary waste in the university's marketing budget. Therefore, in order to increase BAR in the future, the university needs to have solution systems to improve conversion rates at all stages of UFA's customer journey, especially problematic bottlenecks, as like as conversion rate from aware to interested and conversion rate from acting to advocating. Instead of trying to improve every stage of the customer journey, marketing communications can focus attention on what's truly important according to the goals of the organization's marketing strategy.

From these results it can be seen that the response of students to the UFA promotional information is quite good. Also, promotion through social media is an effective promotion. The university can continue to increase promotion information through social media.

5. CONCLUSION

In the current context of fierce competition in enrollment, marketing and brand promotion activities have become more necessary and important than ever in the development strategies of higher education institutions. In this study, the authors evaluated the achievements and shortcomings that need to be overcome in recent enrollment activities. To be able to objectively evaluate the effectiveness of marketing communication activities, the authors used the 5A model in evaluating and conducting a survey of 396 students. From the survey results, it shows that the marketing communications in recent times have brought positive results such as: The University of Finance and Accountancy brand is highly recognized in the province today; Social network media channels are highly appreciated by high school and college students for their quality of information, images and high level of attraction; as well as the rate of brand selection after recognizing the brand in the market is relatively high. In addition, although marketing communication efforts on brand awareness brought positive results, after officially experiencing the service at the university, the proportion of learners who suggested their own brands dropped sharply (accounting for rate 69.81%).

On the basis of evaluating the effectiveness of marketing communication activities in student enrollment, the author proposes three groups of solutions: (1) Group of marketing communication solutions to increase the level of brand attraction: brand repositioning, build a marketing communication strategy associated with core values; (2) Group of marketing communication solutions to enhance the brand's customer relationship level: improve the quality of customer care services, build a customer loyalty program and create a customer relationship management system (CRM); (3) Group of solutions to support marketing communication activities in university enrollment, including: fostering high-quality human resources, building working processes that meet professional characteristics and modernizing facilities quality suitable for marketing communications 4.0.

Due to limitations in capacity and implementation time, research certainly cannot avoid shortcomings and inadequacies. In the future, in order to do more perfect the research subjects, expand the scope of both space and research content, aiming to perfect the solution system to develop enrollment communication activities and brand communication activities of higher education and training institutions, legacy researches related to marketing communication activities at university can focus on exploring issues such as marketing communication goals and strategies, evaluation and insight analysis into current customer satisfaction and the system of related partners in the process of providing higher education services. In addition, this study has a shortage because it has not been deeply studied before as the effectiveness and productivity theories measured using PAR and BAR metrics are still new. So, it needs to be further investigated by other researchers using a larger sample in a longer time.

FINANCIAL SUPERVISION FOR STATE-INVESTED ENTERPRISES IN LAO PEOPLE'S DEMOCRATIC REPUBLIC; REALITY AND RECOMMENDATIONS

Master's degree. Saleumxay Phommixay[1]

Abstract : *Undoubtedly, state-invested enterprises (SIEs) have become more prominent in the global economy over the last decade. A growing role for state-invested enterprises in the marketplace is not in itself onerous. According to an OECD consensus, as expressed through the Organisation's legal instruments, SIEs can be operated according to similarly high standards of governance, transparency and efficiency as private companies, in which case the ownership issue is moot. Nevertheless, in order for SIEs operate in harmony, it is suggested that financial supervison should be executed in reality. In fact, financial supervision for state-invested enterprises helps state management agencies, capital owner representative agencies and enterprise management entities to come up with effective management solutions to ensure safety and develop state capital as well as improve the efficiency of business performance of enterprises. The empirical analysis of the research depicts the reality of financial supervision for state-invested enterprises as well as the demerits when applying this concept. As a result, the article indicates some effective suggestions for enhancing the efficiency of financial supervision for SIEs in Lao People's Democratic Republic.*

Keywords: *Enterprise, corporate finance, corporate financial supervision, state- invested enterprises, governance, objectively verifiable Indicators*

1. INTRODUCTION

In recent years, the Party and Government of Lao People's Democratic Republic (Laos) have paid great attention to the reform and development of state-owned enterprises, which are clearly shown in the Party's policies and guidelines to promote and develop state-owned enterprises. Starting from the Party's innovation policy and the 5th Conference of the Central Executive Committee of the Lao People's Revolutionary Party, term IX, it was implemented into Resolution No. 05 on innovation and enterprise building in the new period. In the resolution of the 7th Conference of Lao People's Party Central Committee, term X, the Government has had variety of solutions to promote the improvement and recovery of state-owned enterprises, which are the foundation of the economy to recover state-owned enterprises. Then, it helps to create favorable conditions for business activities and increase competitiveness with other enterprises participating on the market. As a result, state-owned enterprises may bring benefits to society, create a stable and sustainable source of revenue for the state budget.

By the end of 2022, there are a total of 162 state-invested enterprises, including 89 centrally-run and 73 locally-run enterprises. 89 centrally-run enterprises do business in three sectors such as trade-service, financial-banking, and strategic-public service ones.

Among the 89 centrally-run enterprises, excluding enterprises under the Ministry of Public Security and the Ministry of National Defense, there are 39 enterprises operating in 3 sectors such as: 18 enterprises in trade-service, 5 enterprises in financial and banking sector, 16 enterprises in the public service sector.

1 Email: Saleumxay.phommixay@gmail.com, Ministry of Finance, Lao People's Democratic Republic.

Table 1: Overview of the scale of centrally-run state –invested enterprises

Unit: Kip

Sector	Charter Capital	Equity	Total asset	Total Liabilities	State dividends
Trade-service	959.091.814.993	(176.936.001.213)	11.327.812.219.044	11.537.990.876.723	202.927.396.285
Financial-Banking	2.432.675.935.412	3.851.562.652.975	94.378.800.245.286	90.918.553.558.802	81.210.492.139
Strategic-Public service	9.462.335.817.087	593.015.923.151	88.578.142.582.644	87.936.400.717.725	322.090.859.847
Total	12.854.103.567.492	4.267.642.574.913	194.284.755.046.975	190.392.945.153.249	606.228.748.271

Source: Data collected from the Department of State Reform and Insurance,

Ministry of Finance of Laos

The negative equity in the trade-service sector is due to the negative equity of the Lao Airlines, Post Office, Import-Export Enterprise and the Fertilizer Enterprise with the total amount of -2,280,617,530,830 kip, of which Lao Airlines alone accounts for -2,277,414,096,566 kip.

State dividends are only 0.14% compared to equity capital, which is a very small proportion. Because various businesses are making losses such as: 10 businesses in Trade and Service sector, 2 businesses in Financial-Banking sector, and 6 businesses in Strategic-Public Service sector.

2. OBJECTIVES OF FORMING AND DEVELOPING STATE-INVESTED ENTERPRISES

The formation and development of state-invested enterprises helps to build strong economic entities with the ability to compete well in the context of international economic integration and to effectively serve the industrialization and modernization of the country. To achieve long-term goals, in the immediate future, state-invested enterprises must promote economic growth, improve operational efficiency, management, technology, and competitiveness.

There is a need to promote the formation and development of a number of state-invested enterprises operating in multi-industries and multi-sectors, including main industries with many kinds of owners but state ownership plays a dominant role. Thus, the policy of forming enterprises must be in industries and sectors with favorable conditions and strengths, where state ownership is crucial. To do that, it is necessary to limit the number of businesses that have the abilities to invest capital, technology, human resources... to create real strength to first compete in the domestic market and create benefits for people and society.

- Building key and selective state-invested enterprises: Although in the world, state-invested enterprises have had a history of development for hundreds of years, the model of state-invested enterprises is still quite new in Laos and some other countries. The issue is still debated, therefore the Government and chosen businesses have not had enough necessary experience. To the Government as well as the Ministry of Finance: Policy mechanisms are trying to build and amend to create a legal corridor for relationships in the most suitable model. The complicated relationships in the model of state-invested enterprises based on ownership by the entire people have not been fully revealed, along with limitations in management, which are issues of concern. Besides, resources for developing enterprises with state investment capital need to be carefully calculated to be effective.

Regarding state-invested enterprises: They have not had much time to accumulate experience in global competition, and their internal relationships are still in the process of being built. Their current scale achieved mainly thanks for the investment and support from the state. The capacity of many state-invested enterprises is still limited. The formation and development of economic corporations in Lao People's Democratic Republic needs to be begun from the requirements of the economy, and should not be constrained by the impacts of private investors. The Government needs to grasp development trends based on scientific reports and analysis. On that basis, it is necessary to implement mainly promotion and support measures, creating favorable conditions, transparency, and equality to promote state-invested enterprises to be established and develop.

- Creating a good connection between the development of state-invested enterprises and the process of innovating management mechanisms. The model of state-invested enterprises with new relationships must be consistent with the process of innovating management mechanisms in the context of current reform pressure. That does not mean building state-invested enterprises according to its own methods and criteria, but it is necessary to pay attention to widely recognized standards, thereby creating pressure for institutional reform and the impact of institutions contributes to promoting the development of every state-invested enterprise in Laos today.

3. THE REALITY OF FINANCIAL SUPERVISION FOR STATE-INVESTED ENTERPRISES

The financial supervision for state-invested enterprises in Lao People's Democratic Republic is expressed through the supervisory subject, supervisory methods, content and objectively verifiable Indicators (OVIs):

➢ ***Supervisory subject***

In state-invested enterprises, the State is the owner, so the State is the subject of financial supervision. The State assigns financial supervision tasks to the Ministry of Finance. With the assigned task, the subject of financial supervision for state-invested enterprises is the Ministry of Finance, and the Department of State Enterprise Reform and Insurance is the advisory unit in financial supervision. The Ministry of Finance organizes the implementation of financial supervision for enterprises with state investment capital through the establishment of a subcommittee to be in charge of collecting information and data of enterprises and sending documents to Ministries, provinces, localities and enterprisess to submit financial reports and information of enterprises as required by the Ministry of Finance.

In reality, financial supervision of enterprises with state investment capital has not yet established a mechanism or financial supervision system. At the same time, awareness of financial supervision as well as the role of financial supervision has not been properly recognized both in its nature and importances among enterprises.

➢ ***Financial supervisory methods***

The Ministry of Finance carries out the financial supervision for enterprises with state investment capital after the business activities of the enterprises have ended, and then requires enterprises to submit financial reports. Basing on the financial information, the Ministry of Finance evaluates the performance of enterprises.

➢ ***Content and objectively verifiable Indicators (OVIs)***

The content of supervision is used to monitor the business performance of enterprises and to monitor the management and preservation of state capital and assets in the enterprises.

+ In terms of business performance content, the applied criteria are Return On Equity (ROE), Return On Assets (ROA) and total revenue to total expenses.

+ Regarding the content of monitoring the management and preservation of state capital and assets in the enterprises, the ability to repay debt has been monitored through the debt-to- asset index D/A, debt-to-equity index D /E and current assets to current liabilities ratio.

Table 2. Criteria for evaluating and ranking businesses

1	Debt repayment ability criteria	Sectors	Evaluation Result		
			A=Good	B=Average	C=Bad
	Debt-to-total asset index D/A		≤1	>1-≤1.5	>1.5
	Debt-to-equity index D/E	Trade-Service	≤1	>1-≤2.5	>2.5
		Financial-Banking	≤5	>5-≤10	>10
		Strategic-Public service	≤1	>1-≤2.5	>2.5
2	Profitability index	Sectors	Evaluation Result		
			A=Good	B=Average	C=Bad
	Return On Equity (ROE)	Trade-Service	≥14%	≥10%-<14%	<10%
		Financial-Banking	≥14%	≥10%-<14%	<10%
		Strategic-Public service	≥10%	≥7%-<10%	<7%
	Return On Assets (ROA)	Trade	≥5%	≥2%-<5%	<2%
		Banking	≥1.5%	≥0.5%-<1.5%	<0.5%
		Public service	≥2%	≥1%-<2%	<1%
	Total revenue and expenses	Trade-Service	≤75%	>75%-≤85%	>85%
		Financial-Banking	≤75%	>75%-≤85%	>85%
		Strategic-Public service	≤85%	>85%-≤90%	>90%

4. LIMITATIONS OF FINANCIAL SUPERVISION FOR STATE-INVESTED ENTERPRISES IN LAO PEOPLE'S DEMOCRATIC REPUBLIC

- Regarding the legal framework: the mechanism and legal framework greatly affect the organization and implementation of financial supervision. In countries in the region, there are guiding documents and legal mechanisms on financial supervision of state-owned enterprises. The functions and tasks of each agency are clearly defined and the legal system is always reviewed to suit the socio-economic situation of each period.

- In terms of supervisory methods, content and objectively verifiable Indicators (OVIs) which are being implemented are not consistent, comprehensive, and too few. They do not clearly reflect the financial situation of state-invested enterprises

- Supervision support tools: The Ministry of Finance is using manual tools to synthesize supervision. Currently, there is no software installed for financial monitoring. Compiling data into Excel tables for each enterprise affects the effectiveness of financial supervision and when entering data, it can cause confusion.

- With regard to information disclosure of enterprises with state investment capital after supervision: After financial supervision of enterprises with state investment capital, the results of supervision work are not published on the website of the Ministry of Finance. There is only a general report on completing supervision to the Minister of Finance or reporting to the National Assembly as required and there are no comments or opinions for state agencies and businesses about the status, risks, financial threats what are happening.

5. ORIENTATION FOR IMPROVING FINANCIAL SUPERVISION FOR STATE-INVESTED ENTERPRISES

Firstly, strengthen financial supervision capacity for state-invested enterprises

Currently, financial supervision of state-invested enterprises in Lao People's Democratic Republic is carried out by the Ministry of Finance. The Department of State Enterprise Reform and Insurance is an apparatus that helps in the financial management and supervision of enterprises with state investment capital. Therefore, in order to improve the effectiveness of monitoring financial activities for enterprises with state investment capital, in the upcoming time it is necessary to strengthen the ability to monitor financial activities of organizations. Supervision here is also understood as improving the qualifications and supervision capacity of the officers in charge of performing this task.

Secondly, concerning financial supervision organization

Every year, the Board of Directors and General Directors of enterprises with state investment capital must organize financial supervision of their enterprises and send the results of financial supervision to affiliated ministries. Then the ministries must be responsible for synthesizing and sending them to the Ministry of Finance.

Financial supervision for state-invested enterprises helps state management agencies, capital owner representative agencies and enterprise management entities to come up with effective management solutions to ensure safety and develop state capital as well as improve the efficiency of business operations of enterprises. In addition, the rights and obligations of the representative of state capital in enterprises have been more clearly established, the management and supervision methods have been changed in association with the classification and evaluation of enterprises, etc. Especially, with enterprises operating ineffectively, showing signs of financial insecurity, there must be clear regulations to include special financial supervision, moreover, state audit or government inspection must be allowed to inspect that enterprise.

Thirdly, synchronously develop the content, methods, and targets of financial supervision activities

The financial supervisory system of state-invested enterprises in Lao People's Democratic Republic has not been a complete supervisory system to reflect the risks and problems businesses are facing. It also has not helped to show a comprehensive picture of the financial situation of businesses. Therefore, Laos needs to focus on researching, building and synchronously developing a financial monitoring system which is more suitable for state-invested enterprises.

6. RECOMMENDATIONS TO IMPROVE THE EFFICIENCY OF FINANCIAL SUPERVISION FOR STATE-INVESTED ENTERPRISES IN LAO PEOPLE'S DEMOCRATIC REPUBLIC

- The function of representing the owner of state capital invested in an enterprise must be separated from the function of state management and business administration of the enterprise; Clearly define state management functions and corporate governance functions to end the direct intervention of state administrative agencies in production and business activities.

- Accelerate the process of restructuring state-invested enterprises. Ministries as well as localities, and Member Councils have to proactively research and propose to competent authorities measures to resolve arising problems and issues together with issues that need to be adjusted relating to mechanisms and policies.

- Financial supervision of enterprises with state investment capital must have a mechanism, clearly defining the subject of supervision, the contents and methods of organizing supervision. Each country has different mechanisms, management policies and financial management requirements appropriate to the economic, political, social situation and traditional customs of that country. When there are legal mechanisms, state-invested enterprises operating in Lao territory must comply with Lao law. They must fully comply with the State's regimes, policies and regulations, and be the subject to inspection and control by Lao competent functional management agencies.

- To identify financial risks of enterprises with state investment capital, it is necessary to supplement and complete a number of contents and indicators such as: capital mobilization situation such as debt ratio; indicators reflecting solvency such as current ratios (short-term debt payment ratio), cash ratios; indicators reflecting capital use efficiency such as business efficient capital, working capital turnover; Profit indicators such as operating Earnings Power, asset Earnings Power, and equity Earnings Power. In addition, monitoring indicators need to be supplemented with indicators related to the specifics of the business industry, because the specifics of the business industry will affect the performance and operational efficiency of enterprises. They are indicators that relate to exploitation and exploration output; labor productivity on revenue, etc. Besides, strategic enterprises that perform public services must develop non-financial targets.

- Strengthen the activities of inspection, supervision, and financial audit for enterprises to prevent loss of state capital and state assets; Implement openly, transparently, and legally in investment, financial management, procurement, and income distribution. Complete internal control and audit mechanisms, strictly implement financial supervision regime, evaluate operational efficiency and disclose financial information. Strictly handle business leaders and representatives of state capital in enterprises who do not seriously implement or do not comply with regulations, for wrong purposes, ineffectively, causing loss of capital and assets of the State...

- Develop regulations on equitization, sale, dissolution, and bankruptcy of enterprises in accordance with the newly issued law system. Focus on removing difficulties and obstacles in the process of arrangement and equitization;

- The system of financial supervisory indicators is established in association with the sectors and industries of the enterprise and the requirements of the owner's representative agency. Accordingly, for manufacturing enterprises, they will have to be associated with indicators for evaluating results (profit of the production and business process in the period). On the contrary, businesses operating with the goal of providing goods, and public services are associated with public performance indicators (the quantity as well as the quality of goods and services, etc.). Therefore, supervisory indicators need to include both financial and non-financial indicators.

- Financial supervisory indicators include both general monitoring indicators and specific supervisory indicators. In which, general supervisory indicators are the most basic, most popular indicators which also most generally reflect the operating situation, production and business efficiency. Specific indicators reflect the particular contents of an enterprise in its production and business activities that have an important impact on the results of the enterprise's production and business activities.

- The supervision report form needs to be full of general and specific financial supervisory indicators, in which the relationship between specific indicators in terms of value and quantity is the foundation criterion, the basis to determine criteria for general ones. The establishment of a form system should originate from the management requirements of the enterprise and follow the pyramid shape, in which the top of the pyramid is the requirement of the national financial management agency.

To implement the above recommendations, the Government and enterprises with its investment capital need to:

- **To the Government:**

Financial supervision for enterprises with state investment capital is one of the important tasks of the process of enterprise reform, innovation and improvement of enterprise performance. This work has been actively implemented for several years and the Government hopes to bring positive results. However, facing the current modern situation, it is necessary to strengthen financial supervision for enterprises with state investment capital.

- The Ministry of Finance and other Ministries together with provinces must proactively monitor macro-financial activities on the basis of innovating strategic policies to suit the innovation situation.

- The Ministry of Finance must quickly develop and promulgate full regulations on financial supervision for state-invested enterprises. It also needs to have mechanisms and policies to enhance the transparency of financial reports, financial information, business and administration of state-invested enterprises. It is necessary to trengthen the responsibilities of the Board of Directors and Executive Board and decide responsibilities if they do not comply with regulations; Along with that, it is also important to develop a form for financial supervision by state management agencies for enterprises with state investment capital;

- Guide, urge and inspect the implementation of legal regulations in financial supervision at enterprises with state investment capital.

- Restructure the organization, apparatus and corporate governance capacity of each state-invested enterprise such as reviewing and redefining their main business tasks.

- The Board of Directors of enterprises with state investment capital should not be allowed to hold two concurrent positions: civil servant and member of the Board.

- **To state-invested enterprises**

- Restructuring the organization within the enterprise, assigning tasks to leaders and employees in the enterprise in the direction of combining benefits with responsibilities.

- Researching, developing and promulgating new regulations as a legal basis for supervision activities.

- Enterprises must regularly organize supervision, and periodic inspection of their law enforcement and the implementation of their goals, strategies, plans, and tasks.

- Training and fostering financial supervision knowledge and skills for specialized departments in financial supervision.

- Enhancing dissemination and raising awareness for officers in charge of supervision as well as those in charge of finance.

- Complying with regulations of state management agencies and requirements of competent authorities.

To carry out supervision task, supervisors need to be trained with the necessary knowledge about reading financial reports such as reading balance sheets, reading business results reports, cash flow statement to explain. Moreover, they need to understand about financial analysis such as analysis content, how to determine indicators, economic content of indicators, analysis methods, financial analysis process. Last but not least, they must update knowledge regularly and continuously. It is also a part of professional ethics so that they will have the appropriate knowledge to advise and give the most reasonable supervision opinions.

APPLYING FINANCIAL ANALYSIS METHODS AND PROCEDURES FOR SMALL AND MEDIUM ENTERPRISES (SMES): LESSONS FOR VIETNAM

Dr. Tran Van Hai[1], Assoc. Prof. Dr. Hoang Van Quynh[2],
PhD student. Nguyen Thi Mo[3]

Abstract: *The importance of financial analysis in assessing the performance of Small and Medium Enterprises (SMEs) is undeniable. This research delves into the traditional and contemporary financial analysis techniques, applying them to SMEs in Vietnam to gain a deeper understanding of their financial situation and operational efficacy. Through extensive analysis, the study offers insights into crafting a conducive business environment for Vietnamese SMEs. Simultaneously, it serves as a comprehensive guide for enterprise managers and investors to understand the potential and challenges faced by SMEs in Vietnam's current economic scenario.*

Keywords*: Financial analysis, Commercial banks, Effectiveness, Analytical methods, Organizational culture, Technological advancements*

1. INTRODUCTION

The role of Small and Medium Enterprises (SMEs) in the economic landscape is undeniably pivotal, serving as the backbone for many emerging and established economies. Particularly in developing countries like Vietnam, SMEs play a crucial role in employment generation, GDP contribution, and social stability. Despite their significance, these enterprises often grapple with numerous challenges, among which financial management stands out prominently. Efficient financial management and analysis can be a determinant factor in the sustainability and growth of SMEs.

In essence, this research not only contributes to the academic discourse on financial management for SMEs but also offers practical insights for enterprise managers, policymakers, and investors keen on understanding and navigating the vibrant SME sector of Vietnam.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

Financial analysis has long been a central theme not only for researchers but also for businesses and policy-makers due to its broad application in extracting insightful financial information. A plethora of studies concerning methods of financial analysis have emerged both internationally and within Vietnam. This review delves into some of the most pivotal contributions in this realm.

The DuPont Model (1914): Crafted by scientist F. Donaldson Brown in 1914, the DuPont model stands as one of the most acclaimed methodologies for financial analysis in contemporary times. The model elucidates the intricate interrelationships between various financial metrics, primarily concentrating on assessing a company's return on equity.

Accounting, Auditing, and Financial Analysis of Enterprises (1995): Authored by Prof. Dr. Ngo The Chi, Prof. Dr. Doan Xuan Tien, and Prof. Dr. Vuong Dinh Hue, this seminal work accentuates the significance of financial analysis for businesses. It delves deep into a myriad of analytical methodologies aimed at evaluating a company's financial standing.

[2] Academy of Finance

[3] Email: mo.nguyenthi@phenikaa-uni.edu.vn, Phenikaa University

Accounting and Economic Activity Analysis in Construction Enterprises (2005): A dedicated exploration by Prof. Dr. Nguyen Dinh Do and Assoc. Prof. Dr. Nguyen Trong Co, this work applies numerous analytical methodologies to dissect the economic endeavors of construction-centric enterprises, underscoring the sector-specific relevance of financial analysis.

World Bank Research (2008): The study titled "Bank Financing for SMEs around the World: Drivers, Obstacles, Business Models, and Lending Practices" by Thorsten Beck, Asli Demirguc-Kunt, and Maria Soledad Martinez Peria articulates the burgeoning role of SMEs in the global financial landscape. Analyzing empirical findings from 91 banks spanning 45 countries, the researchers spotlight the paramountcy of financial analysis for banking institutions when formulating financial resolutions related to SMEs. A notable revelation from the study is the global predilection of banks to bifurcate sales from assessment, championing centralized risk assessment juxtaposed with decentralized sales strategies. Furthermore, the research evinces the widespread employment of scorecard methodologies to appraise SME loans.

Forecasting and Data Analysis in Economics and Finance (2009): In this intricate exploration by Nguyễn Trọng Hoài, Phùng Thanh Bình, and Nguyễn Khánh Duy, the spotlight is on forecasting models, emphasizing their indispensable role in financial analytics.

Financial analysis, while universally essential, varies in its application and interpretation across different contexts and regions. This literature review delves into various studies and practices related to financial analysis, focusing on its applicability to Small and Medium Enterprises (SMEs) globally and its specific relevance to the Vietnamese context.

Global Credit for SMEs:

World Bank Study (November 2008): An extensive investigation conducted by the World Bank, surveying 91 banks from 45 countries worldwide, shed light on the financial patterns and creditworthiness of SMEs on a global scale. This study provided a holistic overview of the financial health, credit risks, and financial behaviors of SMEs, emphasizing the importance of robust financial analysis to ascertain the creditworthiness and viability of these enterprises.

Financial Analysis Techniques:

Thornson Reuters Approach: In collaboration with Thornson Reuters, financial reports were constructed based on primary accounting frameworks. These included the Balance Sheet, Profit and Loss Statement, and a meticulous analysis of financial ratios and their corresponding trends. An in-depth case study of the Liberty Medical Group demonstrated Thornson Reuters' approach to financial analysis. By juxtaposing the company's financial reports over several fiscal years, a comparative analysis was conducted, offering insights into the financial dynamics, year-on-year growth, and potential areas of concern for the enterprise.

Specific Analysis Framework:

Asian Development Bank (ADB) Methodology: The method proposed by Yoshino and Taghizadeh-Hesary at the ADB introduces a comprehensive set of financial indicators. The five key financial metrics included liquidity, profitability, leverage, impact level, and operational ratios. These indicators are instrumental in assessing the credit risk of SMEs. By leveraging these metrics, analysts can gain a more profound understanding of an enterprise's financial health, thereby making informed decisions about credit risks and investment potentials.

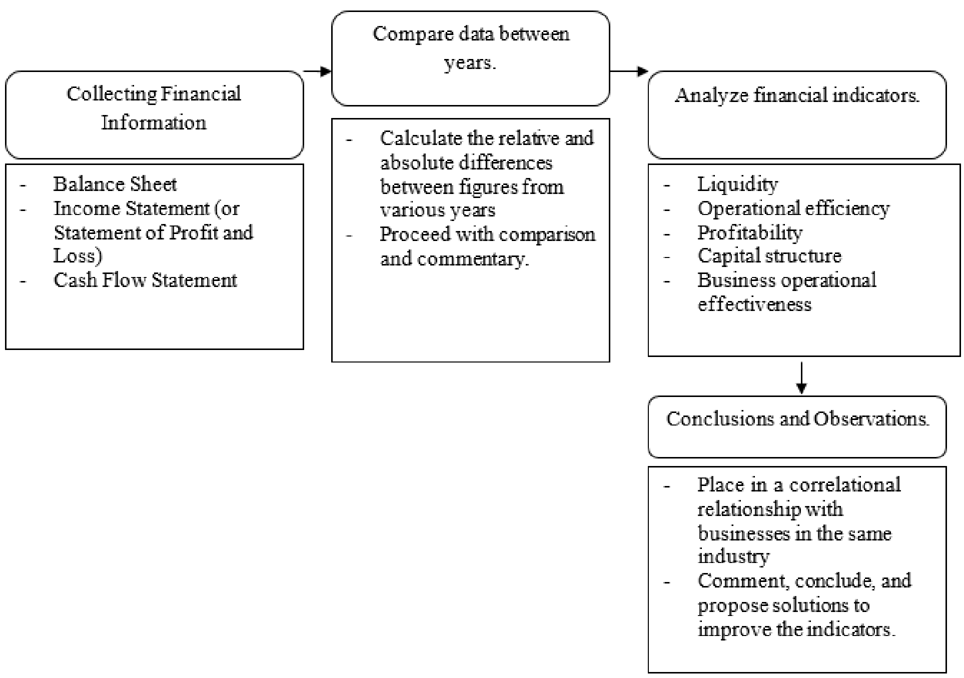
3. FINANCIAL ANALYSIS METHODOLOGIES AND PROCEDURES OF FOREIGN INSTITUTIONS

According to the World Bank's study "Lending to Small Enterprises Worldwide" (November 2008), based on a survey conducted across 91 banks from 45 countries, the SME (Small and Medium Enterprises) segment was perceived to offer high profitability. However, it was also viewed as less stable under the volatile macroeconomic conditions prevalent in developing nations. One of the principal concerns of foreign financial institutions when lending to SMEs is the credit assessment and risk management. To accurately assess loans and manage potential risks associated with lending to SMEs, it is imperative to conduct financial analysis through a structured, scientific, and efficient approach.

3.1. Experience of Thomson Reuters in Financial Analysis

For the financial organization Thomson Reuters, financial analysis reports are formulated based on key metrics derived from the Balance Sheet, Income Statement, Ratio Analysis, and the trend variations of these ratios. As a case in point, the analysis for the Liberty Medical Group was undertaken by Thomson Reuters by accumulating data from the firm's financial statements and placing it in a comparative annual framework. The process of constructing such an analytical report can be expounded as follows:

Figure 1: Financial Analysis Process for Enterprises by Thomson



Above is the financial analysis procedure of the company Thornson Reuter, aiming to gain a quick and comprehensive perspective on the financial status of Liberty Medical Group operating in the pharmaceutical field.

3.2. Experience from the ADB Bank

The financial health of a business can be evaluated based on its credit risk. At the Asian Development Bank (ADB), the method proposed by Mr. Yoshino and Taghizadeh-Hesary employs five financial indicators: liquidity, profitability, leverage, volatility, and operational ratios to analyze the overall credit risk perception of businesses in the market. Two statistical techniques, namely principal component analysis (PCA) and cluster analysis, are used to simplify data and reduce the complexity of economic variables utilized to evaluate a company's financial condition. These techniques are employed by the ADB to classify SMEs based on financial strength and potential.

PCA is a standard data simplification technique. This method identifies factors in the data, emphasizing the similarities and differences between observations. When the data comprises many variables, PCA can be seen as a valuable tool for data analysis in such situations.

With cluster analysis, SMEs with common characteristics are grouped together. This method is beneficial when comparing businesses with similar features, grouping them together, and comparing businesses across different clusters.

3.3. Experience from Japanese Commercial Banks

With 99.7% of Japanese businesses being SMEs, Japan has significant experience in implementing a relatively standardized procedure across commercial banks in analyzing financial reports, specifically for SMEs. In 2001, the Japanese government established and developed the Credit Risk Database project. This project gathered data of SMEs in Japan from 52 credit institutions and credit rating agencies, forming the Credit Risk Database (CRD). Commercial banks, as CRD members, can easily access and utilize this data to evaluate a business's financial status. As of July 1, 2015, the association had grown to 175 members. These members have collected data from 2,210,000 affiliated SMEs and 1,099,000 private SMEs. With a large reference sample and government support, the input database of Japanese commercial banks is deemed reliable, comprehensive, and assured for assessing the financial condition of SMEs. This model is also being studied and implemented in Thailand.

CRD Construction Process

The Credit Risk Database (CRD) system's establishment is a meticulous and multi-step process aimed at comprehensively assessing the financial health and credit risk of SMEs. This process can be broken down into the following detailed steps:

**** Comprehensive Data Collection***

- Financial Data Collection:

Balance Sheet and Income Statement: These provide a snapshot of the financial position and performance of SMEs.

- Key Financial Ratios Calculation:

Capital to Asset Ratio: Measures how much of the company's assets are financed by equity.

Degree of Borrowing on Lending: Assesses the extent to which an entity relies on borrowed funds to finance its operations.

Ratio of Interest-Bearing Liabilities: Provides insight into the company's debt levels relative to its assets.

Ratio of Current Profit to Assets: Indicates profitability concerning the assets employed.

- Non-financial Data Collection:

Real Estate Ownership: Helps determine the tangible asset base and collateral potential.

Succession Status: Determines if the business leadership is hereditary, which can impact business continuity and strategy.

CEO's Year of Birth: Can provide insights into leadership experience and generational business perspectives.

- Loan Data Collection:

Short-term Liabilities: Debts that are due within a 3-month timeframe.

Legally Mandated Defaults: Debts recognized as defaults by legal standards.

Actual Defaults: Amounts that have not been paid as agreed upon.

Debt Collateral Rights: Pertains to the rights of credit guarantee institutions to seize assets if the debtor defaults.

Sub-standard Debts: Debts that show signs of becoming unrecoverable.

Potential Bad Debts: As categorized by Basel II guidelines, debts that might become irrecoverable after April 2003.

**** Database Construction & Model Development***

- Initial Data Storage:

All raw data collected from SMEs, including both financial and non-financial metrics, are stored in a preliminary, unprocessed state.

- Data Cleaning & Consolidation:

The raw data undergoes rigorous cleaning to remove discrepancies, errors, and outliers.

It is then consolidated to ensure a coherent and comprehensive dataset that ensures the integrity and consistency of information.

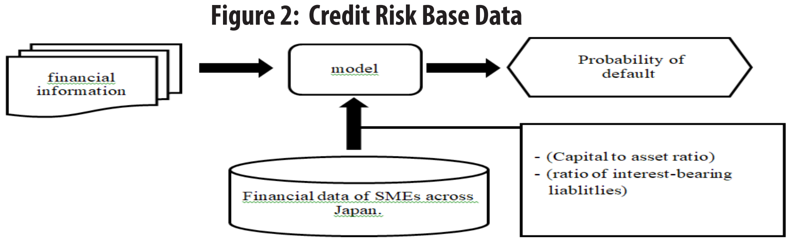
- Scoring Model Development:

With a rich and cleaned dataset in place, scoring models are crafted to evaluate SMEs' credit risk.

These models leverage vast amounts of data to provide accurate, consistent, and predictive insights into SMEs' creditworthiness.

Regular testing and validation processes are carried out to ensure the models remain robust and relevant, adjusting for changing economic conditions and company dynamics.

Figure 2: Credit Risk Base Data



3 types of construction models:

Table: Scoring Model

Model Type	Base Data	Analysis Method
Type A	- Macroeconomic environment; Market conditions	- Expert assessment
	- Payment history data	
	- Financial reports	
Type B	- Payment history data (Primary data)	- Statistical model analysis and event impact assessment
	- Financial reports (Alternative data)	
Type C	- Financial reports	- Statistical model analysis

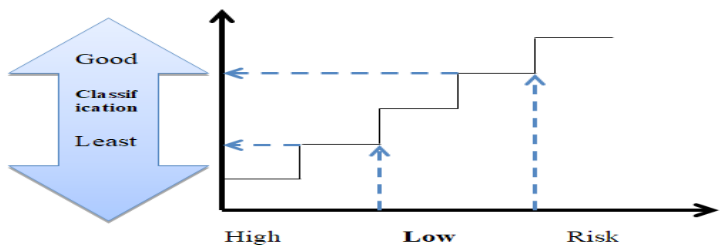
(1) Type A Model: Expert-based assessment model

Experts analyze and evaluate the macro environment and the market conditions of the business, scoring component (0-30 points) <1>

Experts review the company's payment history and transactions, scoring component (0-30 points) <2>

Experts assess the company's financial statements, scoring component (0-40 points) <3> From the total of <1> + <2> + <3>, the company's rating is classified based on the following model:

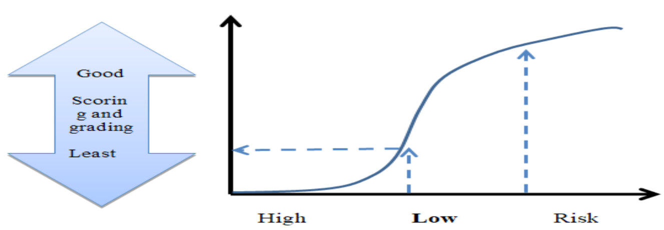
Type A model



(2) Type B Model: Model based on credit history assessment data: Using financial statement data and evaluating impactful events to input into statistical model analysis: The business's default probability (Probability of default) is calculated according to the following logistic model formula: P = 1/(1+e^(-βX))

From the model analysis and impact event assessment, the company's classification score is constructed as follows:

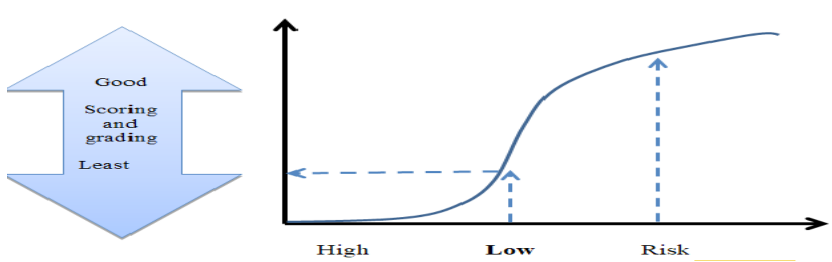
Type B model



(3) Type C Model: Model based on CRD credit risk foundational data: Using financial statement data to compute statistical model analysis figures: The business's default probability (Probability of default) is calculated according to the following logistic model formula: P = 1/(1+e^(-βX))

Based on the logistic model analysis, the company's classification score is structured as follows:

Type C model



(4) Providing Data to CRD Members As members of the CRD, banks and credit institutions, as well as credit rating companies, can avail services from the CRD, including: i. Credit scoring activities:

Members of the association can utilize the CRD scoring models to assess the default potential of borrowers and prospective borrowers. From April 2006 onwards, CRD models were integrated for evaluating credit guarantee fees within the credit granting system. ii. Provision of reference data: Member banks of the CRD can leverage reference data from the CRD repository to: Evaluate essential data in internal credit scoring activities.Conduct individual bank's internal credit scoring.

Develop new financial products. iii. Providing statistical information: Association members can use statistical data like businesses' financial indicators to compare figures with other companies within the CRD database, aiming to enhance credit risk management. iv. Management consultancy support system: Association members can utilize consulting tools built from the CRD scoring models and CRD data analysis. The CRD scoring model employs financial indicators computed from financial statements, considering aspects like profitability, stability, growth potential, efficiency, and the business operations of SMEs. These financial metrics closely interrelate and are chosen as explanatory variables for the scoring model. For an accurate scoring model, data is aptly processed given the distribution characteristics of the financial metrics. Miyamoto et al. (2012) scrutinized and compared data processing methods like the Box-Cox transformation, neglog transformation, common neglog transformation using the CRD. A downside to bank-constructed scoring models is their inability to assess exclusion conditions from variables and their inapplicability across all SME conditions. Hence, the Bank of Japan often encourages these banks to supplement their analyses with additional risk factors beyond the model.

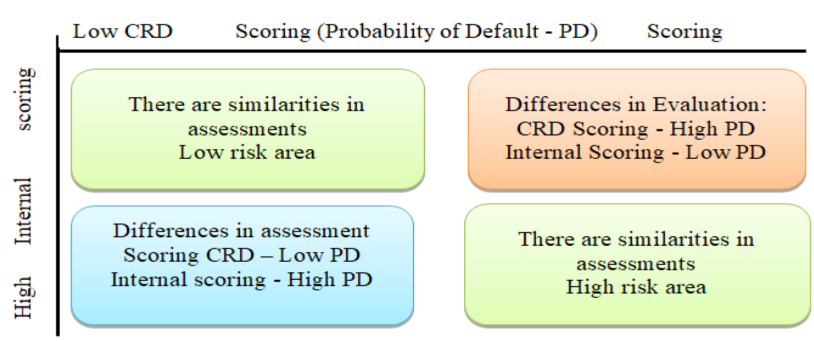
(5) Update and Maintain CRD Scoring Model Quality To manage the quality of CRD's scoring model and data updates, the CRD undertakes:

Quality management guideline development: issuing model development, operation, and approval guidelines; establishing a third-party evaluation committee for CRD scoring models.

Regular approval and evaluations: the CRD models are annually approved based on issued guidelines and regulations from FSA and Japan's SME credit charter: reviewing actual transactions compared to model data; model accuracy checking; comparing default probabilities with real default rates; model stability assessments; explanatory variable reasoning checks for errors. Moreover, the third-party evaluation committee re-examines approval results.

Publicizing the third-party evaluation committee's reviews. Most Japanese banks adopt the CRD scoring model, integrating it into the bank's internal scoring model as a basis for assessment; a benchmark or a comparison standard; focusing on the difference in the outcomes of the two scoring models and understanding the reasons behind such disparities.

Identifying risk areas through CRD scoring



3.4. Experience of ICICI Bank

India Established in 1955 as a development financial institution, ICICI Bank has since grown to become the second-largest bank in India. In the Indian market, approximately 70-80 banks have approached the SME customer segment, with ICICI Bank holding around 4-9% of this market share, serving nearly 1 million SME businesses.

ICICI classifies its SME customers into three groups: (1) commercial establishments affiliated with companies: these are SMEs linked to ICICI's current corporate clients, whether as sellers or distributors of products and services, (2) Branch Banking Transaction Group which includes pre-selected customer branches in identified industries, representing potential market opportunities in India, and (3) Business Banking Service Group, encompassing the remaining customers.

This segmentation approach helps ICICI overcome challenges like risk management and knowledge development. For instance, SMEs affiliated with corporate clients are a lower risk segment since ICICI is familiar with the corporate clients and can offer lending products based on this information. Similarly, by choosing 12 sectors out of 165 to focus on at a national level, ICICI can delve deeper into understanding the most potential SME groups.

4. LESSONS LEARNED FOR CONSTRUCTING FINANCIAL ANALYSIS METHODS AND PROCEDURES FOR SMES IN COMMERCIAL BANKS

Drawing from the financial analysis experiences of international financial institutions, several recommendations can be made for the financial analysis of SMEs in commercial banks of Vietnam:

Segmentation and Risk Assessment Using PCA and Cluster Analysis: Vietnamese commercial banks could analyze the operations of groups of SMEs with similar characteristics using methods such as PCA (Principal Component Analysis) and Cluster Analysis to derive evaluations of credit risk of the enterprises studied. In the case of the Asian Development Bank (ADB), both PDA and Cluster Analysis methods were employed to provide general financial assessments of SMEs by ranking their creditworthiness. Specifically, PCA is a statistical technique used to transform a group of correlated observations into a set of values of linearly uncorrelated variables, often referred to as principal components.

Data Center Development: There's a need to either establish new or improve and develop enterprise data centers (following the Japanese model – Data Association) to provide a rich database for banks. This would not only expedite data collection but also diversify data sources, providing a comprehensive view of clients and a reliable basis for evaluations and business analyses.

Diverse Analytical Methods for SMEs: Financial analysis of small and medium enterprises necessitates the use of various analysis methods such as evaluation methods, factor analysis, and forecasting. Comparative methods offer insights into the fluctuations of metrics when assessed horizontally. To ascertain a company's position within its industry, comparisons can be made with the analytical metrics of competitors.

These lessons underscore the importance of adopting advanced analytical techniques, fostering a data-driven culture, and ensuring diversified approaches to gain a comprehensive understanding of SMEs' financial health and associated risks.

5. DISCUSSION AND CONCLUSION

In the realm of financial analysis, especially concerning SMEs within commercial banks, the dynamics present an intriguing confluence of statistical methodologies, information architecture, and industry benchmarks. This discussion seeks to delve deeper into the lessons drawn from the experience of international financial institutions, juxtaposing them with the unique socio-economic landscape of Vietnam.

* Statistical Methodologies in SME Analysis: The adoption of PCA and Cluster Analysis underscores the increasing complexity of financial behaviors exhibited by SMEs. While traditional financial metrics and evaluation methods continue to be foundational, the nuances and inherent variations within the SME sector necessitate a more granular approach. The use of PCA, for instance, can help banks dissect the multifaceted financial behaviors of SMEs, streamlining them into principal components that are easier to monitor and evaluate. This becomes especially pivotal in a market like Vietnam, where SMEs often display a wide range of operational modalities, stemming from factors like regional disparities, varied access to resources, and differences in business culture.

* Data-driven Approach: The mention of constructing or refining enterprise data centers resonates with the global shift towards data-driven decision-making. With the digital transformation wave sweeping across sectors, the banking industry cannot remain immune. Establishing robust data centers would not only centralize information but also enable banks to leverage data analytics and machine learning tools for predictive analysis. This is crucial in a dynamic market environment where risks and opportunities evolve rapidly.

* Comparative Analysis and Industry Positioning: The significance of understanding an SME's position vis-à-vis its competitors cannot be overstated. This provides banks with a dual advantage. Firstly, it helps gauge the SME's industry relevance, offering insights into its operational strengths and weaknesses. Secondly, it aids in calibrating the bank's risk parameters, ensuring that credit decisions are aligned with industry benchmarks.

The landscape of financial analysis for SMEs in commercial banks, particularly in Vietnam, poses unique challenges and opportunities. Drawing from international experiences and methodologies provides invaluable insights, yet a one-size-fits-all approach may not yield the desired outcomes in a distinct market ecosystem like Vietnam's.

Embracing Advanced Methodologies: The need for advanced statistical methods, such as PCA and Cluster Analysis, is no longer a luxury but a necessity. The varied financial behaviors of SMEs demand sophisticated tools to effectively discern patterns and predict trends. This not only helps in robust financial analysis but also in tailoring financial products and services that resonate with the unique needs of SMEs.

The Power of Data: In today's digitized era, data is undeniably the most valuable currency. Vietnamese commercial banks should prioritize establishing and enhancing their enterprise data centers. Such a data-driven approach will empower them to make informed decisions swiftly, anticipate market shifts, and enhance their customer experience, especially for the SME segment.

Contextual Analysis: While international benchmarks provide a direction, it's imperative for banks to conduct a contextual analysis, understanding the SME's relative position in its industry and the local market. Such a perspective offers a more holistic view, ensuring that banks are not just reactive but also proactive in their strategies.

In essence, as the Vietnamese commercial banking sector navigates its journey towards better serving the SMEs, it must marry global best practices with localized insights. Such a harmonized approach will not only propel the growth of SMEs but also fortify the banks' position in a competitive market, ensuring they remain agile, resilient, and responsive to evolving market demands.

FINANCIAL LEASING VIEWS FROM FOREIGN ENTERPRISES AND SUGGESTIONS FOR VIETNAMESE PRIVATE COMPANIES

Dr. Tran Duc Trung[1]

Abtract: For private enterprises, especially small and medium-sized enterprises, approaching capital from banks and the stock market still faces many barriers. In fact, one of the biggest difficulties for businesses is lack of capital. Lack of capital, especially medium and long-term capital, leads to lack of financial capacity, difficulty accessing modern technology, high-quality human resources and reaching out to large markets. Financial leasing, also known as capital leasing, for businesses is both a capital source decision and an investment decision. Faced with the strong demands of the integration process, financial leasing is considered one of the smart choices of corporate finance directors. The research paper's main content revolves around the experience of raising capital by financial leasing of businesses in a number of countries, thereby providing suggestions for businesses in Vietnam, helping businesses can access this source of capital with much room for development.

Key words: Financial leasing, capital mobilization, corporate, private, leasing

1. Introduce the research problem

In the market, a necessary and sufficient amount of capital is always an urgent requirement for most businesses. To be able to turn business ideas and plans into reality, businesses need to mobilize financial resources and organize those resources well. The business development of enterprises on an increasingly large scale also means expanding the scale of capital and diversifying funding sources. Business capital of an enterprise is considered to be the parts and elements containing capital, which can meet the needs of the enterprise when administrators use appropriate methods to mobilize. Currently, with the strong development of the economy in general and the financial market in particular, the diversification of both capital sources and mobilization methods has helped businesses be proactive in choosing Choose appropriate capital sources.

Financial leasing is a form of medium and long-term capital mobilization. In other words, a financial lease is the receipt of a medium or long-term credit through leasing machinery, equipment and other real assets from a financial leasing company, through which the lessee can use leased property and pay the rent in installments throughout the agreed term. The financial lessee does not have the right to cancel the contract. When a financial lease is signed, the tenant immediately receives an inflow of cash, so the tenant does not need to spend money to buy the asset. The tenant must commit to paying the rental fees specifically specified in the rental contract. Therefore, the cash flows of financial lease contracts and loans are similar.

In recent times, access to and use of financial leasing has helped solve capital difficulties for businesses and the whole economy. However, besides the advantages and benefits, financial leasing, like all other financial activities, has certain potential risks and limitations. Reality in Vietnam shows that complex problems arise such as: credit supply and demand imbalance, bad debt or risks, legal or operational limitations of entities that have been and are being posed.

1 Email: trungpt.hvtc@gmail.com, Academy of Finance

Difficult problems need solutions... On the other hand, capital mobilization by financial leasing is still in potential form, in terms of both scale and its impact on the economy. For many businesses, financial leasing is still a new concept. Recently, in addition to practical issues, there have also been a number of domestic and international scientific works, topics, and conferences researching this issue. The conclusions may be different, but all aim to evaluate the current situation, identify causes and propose solutions to help stabilize and develop the financial leasing market, improving the ability to mobilize capital. business through financial leasing. However, for solutions to be feasible, there needs to be orientation and necessary conditions.

2. RESEARCH CONTENT AND RESULTS

2.1. Some basic issues about financial leasing and the financial leasing market

Financial leases are viewed from many angles, but we can mention some of the following concepts: According to Standard No. 06 (Asset Lease) - Vietnam Accounting Standards System (VAS): "A financial lease is an asset lease in which the lessor transfers most of the risks and benefits associated with ownership of the asset to the lessee. Ownership of the asset can be transferred to the lessee at the end of the lease term". The International Accounting Standards Committee (IASC) has issued four standards. All asset lease transactions that satisfy one of these four criteria are called financial leases. The remaining transactions are called operating leases (operating leases). Some main features: (i) Property ownership is transferred to the tenant at the end of the lease contract. (ii) The contract stipulates the option to buy the asset at the end of the contract at a symbolic price. (iii) The term of the lease covers the majority of the useful life of the leased asset. (iv) The current value of the entire minimum rent paid by the tenant is greater than or equivalent to the market value of that asset at the time of signing the contract. Based on the IASC classification standards, each country has specific regulations on standards for recognizing financial leases suitable to the specific conditions of their country. From the business side, managers need to identify methods of leasing assets to take advantage of the advantages of leasing methods suitable to the situation of the business, as well as to have appropriate management measures to adapt to the situation. State characteristics and regulations for each form of lease.

Table: Distinguishing financial leasing from some forms of capital mobilization other medium and long term

Types and requirements and procedures for businesses	Medium and long-term loans at banks	Issuing stocks and bonds	Financial lease
Requirements for businesses	- The enterprise has experience in business activities; - Profitable business operations, healthy financial situation; - Have mortgaged assets.	- The enterprise has experience in business activities; - Profitable business activities, attractive stocks in the market; - The minimum level of equity capital must comply with regulations.	- Irrespective of the type and length of operation of the enterprise; - Effective projects and investment plans; - The investment in leased assets is feasible and balances the source of debt repayment; - There is reciprocal participation money set at a flexible level.

Procedure	Complex, including: - Legal and financial records; - Investment project profile; - Mortgage property records.	Complex, including: - Legal and financial records (audited); - Investment project profile; - Documents and legal procedures as required by the State Securities Commission.	More simply, including: - Legal and financial records; - Investment project profile.

With the current trend of integration and high competition, the need to innovate machinery, equipment, and technology lines of businesses in Vietnam is becoming increasingly urgent. Some businesses operating in key sectors of the economy are always required to be equipped with modern assets in order to initially improve their competitiveness in the market, especially the international market. Some businesses in the fields of transportation, telecommunications, construction... have pioneered financial leasing such as leasing aircraft for the purpose of transporting passengers, goods and services; renting ships by installment purchase method; renting telecommunications equipment and satellites under business cooperation contracts; renting bored pile concrete drilling equipment for hydroelectric projects from hydroelectric construction companies, etc.

Regarding financial leasing, an indispensable part of the financial leasing market and directly linked to financial leasing: This activity has been around for a long time in the world. Currently, financial leasing is being used in hundreds of countries and has an annual transaction value of over trillions of USD. This is considered a highly developed form of hire-purchase credit because of its unique advantages. Therefore, it can be said that the presence of financial leasing in Vietnam is a turning point in the process of diversifying banking and financial services. It contributes to creating diversity and increasing choices for Vietnamese businesses before deciding to mobilize capital. Since its inception, financial leasing has always been evaluated as a new form of credit financing with much potential compared to traditional methods. With outstanding advantages such as proactive selection, limited risk, cost savings, relatively simple procedures, no mortgage, modernization of production... this will be a type of business. The service is popular around the world, especially in developing countries or economies in transition, including Vietnam. However, the Vietnamese financial leasing market has undergone more than 20 years of formation and development. But up to now there are only 8 companies operating in the market. Although still small in scale, the compounded annual growth rate (CAGR) in the past 5 years is relatively high at 20.4%. Among them, a significant contribution to the overall growth of the market is BIDV Financial Leasing Company Limited - SuMi TRUST (BSL) with a CAGR of up to 110% in the past 3 years. This shows that, if there are reasonable policies to promote and promote, financial leasing will be an effective tool to mobilize medium and long-term resources, helping to reduce the burden of financing the system. bank.

In fact, the total annual sales of the top 50 financial leasing countries in the world amount to more than 1,300 billion USD (at the end of 2019) . In the US, over 30% of all equipment is equipped under lease contracts, more than 80% of companies - from small start-up companies to enterprises on the Fortune 500 list - rent part or all of the equipment. hook their equipment. In Japan, annual financial leasing sales are around 50 billion USD and more than 90% of businesses use financial leasing to invest in machinery and equipment. Meanwhile in Vietnam, financial leasing is still a small-scale market, with the entire market's outstanding debt by the end of 2020 only at 29,500 billion VND (about 1.27 billion USD), accounting for only about 0 .3% of total outstanding loans to credit institutions. With those advantages, small and medium-sized businesses are considered the most suitable customers for this type. By the end of 2022, outstanding financial lease debt will reach nearly VND 45,000 billion, equivalent to 0.33% of the total outstanding debt of the entire economy. While in many other economies, such as China, financial leasing accounts for 10% of outstanding debt, Germany 18% of outstanding debt, and the United States about 22%.

Currently, in Vietnam there are more than 800,000 businesses, of which small and medium enterprises account for over 98% (according to the Vietnam Association of Small and Medium Enterprises). From the above numbers, it shows that the potential to develop financial leasing in Vietnam is huge . Therefore, researching and understanding financial leasing activities of businesses in countries around the world is an important and necessary requirement for businesses, especially private businesses in Vietnam. The lessons learned will help managers and businesses effectively select and access capital from financial leasing.

2.2. Financial leasing from businesses in some countries in the world

2.2.1. Financial leasing in American businesses

Financial leasing is very developed in the US. This form was born with the leasing of assets to finance capital for businesses in the transportation industry. After that, capital mobilization in the form of financial leasing really developed in most other industrial countries after World War II. According to statistics, the total value of machinery and equipment rented annually in the US reaches trillions of dollars and has an increase rate of 8% each year. The value of leases in the US accounts for approximately 30% of the total amount financed for annual equipment purchases. The main form of financial leasing in the US is two-party, three-party leasing or sale and re-lease, in which the option to buy the asset belongs to the lessee. The lease term is usually over 75% of the useful life of the leased asset and must not exceed 30 years. Financial leased assets with less than 25% of their useful life remaining cannot be used in financial lease transactions. In 2022 alone, the scale of capital mobilized from financial leasing in US businesses has reached 473 billion USD, accounting for about 1/3 of the total capital mobilized from financial leasing globally.

Unlike many businesses in developing countries, most American businesses prefer to rent rather than buy assets. For businesses in the US, business efficiency and time saving are top priorities. When the need for assets arises, businesses often offer options: new purchase and financial leasing. Before renting, corporate financial administrators often carefully consider the benefits of each option, based on the analysis of financial coefficients and financial indicators related to the leased assets. In particular, the effects of inflation, interest rates... on leasing contracts and financial reports are also paid close attention to by leasing businesses. Searching and selecting suitable assets is one of the tasks that businesses in the US pay a lot of attention to when the need for financial leasing arises. In addition to collaborating with financial leasing companies, businesses in the US also hire consulting companies to search, select, and independently value assets to meet financial leasing requirements in the policy. sponsor. In the US, the development of the rental-purchase industry also means the birth of many rental companies, up to tens of thousands of businesses. Due to the large number, after making the decision to lease finance, leasing businesses in the US attach great importance to choosing capital and asset supply partners. The service of providing capital in the form of lease-purchase credit in the US is very convenient for leasing businesses, from which financial leasing businesses can be proactive and save a lot of time in negotiating and finding earn assets.

Financial leasing for businesses in the US is understood in a broad sense as asset leasing. For businesses, from large corporations, famous brands such as Southwest Airlines, Johnson & Johnson cosmetics, General Electric electronic equipment, Bechtel construction... to small and medium enterprises. are familiar customers in the financial leasing market. Renting equipment, real estate, especially headquarters, offices and factories... are transactions with huge quantity and value. These are also types of financial leased assets favored by businesses in the US, especially small and medium-sized private enterprises. In addition, large assets such as aircraft to specialized means of transport, even airline tickets... are also rented by companies in the US as capital financing options for production and business activities.

2.2.2. Financial leasing in Japanese enterprises

Since the early 70s, raising capital in the form of financial leasing has gradually become popular in Japan. In Japan, leasing businesses have the right to proactively choose leased assets and are not subject to any influence from the leasing credit grantor. Leased businesses can choose from many different service packages from consulting departments that represent the provision of credit to businesses. Besides, in Japan, businesses that lease finance often have to work with brokers and valuation organizations to be able to make the most reasonable and objective decision for the finance lease option.

The rapid growth of Japanese businesses causes them to face a shortage of capital, so raising capital through financial leasing is an attractive form of financing. It can be said that financial leasing has become an effective capital mobilization tool for the Japanese economy, from large corporations with Japanese characteristics (Keiretsu) to small and medium-sized enterprises. Famous businesses in fields such as Japan Airlines, electronics Sony, Hitachi, Panasonic or automobile companies Toyota, Yamaha... have all used financial leasing. The financial leasing market in Japan has become one of the world's largest markets, ranking second after the US. According to statistics from the Japan Leasing Association (JLA), the total value of financial leased assets in 2022 in Japan will reach nearly 65 billion USD. The proportion of financial leased assets varies between industries and focuses on leasing machinery and equipment in manufacturing industries and commercial service industries. Financial lease assets in Japan are also very diverse such as transportation equipment, information technology, medical equipment, industrial production and especially real estate with high value contracts. Always innovating science and technology is one of the top goals of Japanese businesses, that's why businesses often lease assets for a minimum term of 60 -70% of economic life and no more than 120%. design service life (technical life).

The legal environment in Japan is quite stable, legal documents provide very detailed regulations and support for lease-purchase credit, but there is a similarity with developing countries that is the support for the lessee, Specifically, businesses are still not strong enough. Enterprises that mobilize capital from financial leasing mainly still proactively search for assets, choose capital (asset) supply partners and negotiate and sign contracts. Risk management is one of the highlights in financial leasing of Japanese businesses. From assessment and identification to forecasting and risk management... related to leased assets, businesses pay close attention. Therefore, risks from financial leasing in Japan are often very tightly controlled by the leasing businesses themselves and do not leave serious consequences like in countries with transition economies.

2.2.3. Financial leasing in Chinese enterprises

China is an Asian country with many similar characteristics to Vietnam. Currently, China is a country with the world's leading economic development rate. Mobilizing capital through financial leasing has been used by businesses in China since the early 1980s. With the fastest economic development in the world, the need for capital mobilization by Chinese businesses is also increasing at a rapid pace. The strong development of the financial leasing market has contributed to releasing capital for the economy and creating conditions for businesses to expand and invest deeply in machinery and equipment.

Financial leasing has become a popular financing option for Chinese enterprises, especially small and medium-sized enterprises. When the need to hire-purchase arises, only a small number of businesses hire independent companies for valuation and guarantee consulting, the remaining businesses often receive support from hired credit officers at the same time. Benefits from financial leasing are also carefully considered by financial directors compared to financing from other capital sources. In 2022, the total value of financial lease contracts in China will reach over 341 billion USD, accounting for more than 10% of total outstanding debt in the country. In particular, financial leasing deals focus on groups of small and medium enterprises, fields such as transportation, construction, information technology... account for a large proportion, about over 30% of the total contract value. financial leases of businesses.

Mobilizing capital through financial leasing for Chinese businesses helps businesses and the banking system relieve credit pressure, on the other hand, it helps businesses innovate machinery and equipment, improve their capabilities. compete. In China, although businesses are free to compete, and improve business efficiency. However, the use of financial leasing by enterprises always receives quite specific management and guidance from the State. In many cases, leasing businesses must cooperate with suppliers and credit providers to be able to operate equipment and assets, bringing greater efficiency to the lease contract. Due to the dynamism of the economy and due to the intangible depreciation characteristics of fixed assets in enterprises, the financial lease term of Chinese enterprises is often limited, fluctuating between 3 and 7 years, more specifically for some specific types of assets with great value such as aircraft and commercial complexes. It can be said that financial leasing has become a highly competitive choice compared to other forms of capital mobilization for businesses in China in the trend of integration and development.

2.3. Some suggestions on financial leasing for private companies in Vietnam

Financial leasing has been used by many businesses around the world as an effective capital mobilization option. In fact, financial leasing also has international practices with large cross-border contracts. However, businesses as well as corporate financial policies in each country and in each period have their own characteristics. To contribute to promoting capital mobilization by financial leasing for private enterprises, through lessons from foreign enterprises, we can apply them selectively, flexibly, creatively and effectively. suitable for actual conditions in Vietnam. Some suggestions for businesses in Vietnam:

Firstly, businesses need to clearly identify their asset needs and financing options through financial leasing. Referencing financial leasing activities of businesses in countries with developed economies, we see that determining capital needs and corresponding assets is of top concern to businesses. Financing policy and the principle of financial balance can only be clearly expressed when leasing finance and other capital mobilization options must be based on the actual situation of the enterprise. Financial leasing is a form of capital mobilization, an option for capital financing. Therefore, corporate financial administrators need to quantify and carefully consider the benefits that can be brought and the risks that may occur during use.

Second, businesses should hire independent consulting partners when accessing and using financial leasing. In raising capital through financial leasing, issues related to leased assets, from asset selection, cash flow calculation to asset use, are very important and comprehensively affect the business. value and terms of the lease contract. Therefore, businesses should look to independent consulting organizations and units with high expertise in related fields to support, ensure objectivity and limit risks for businesses in setting up projects. Establishing and implementing financial lease contracts.

Third, businesses need to be responsible in using leased assets, proactively balance resources, and effectively manage financial lease risks. Risks can be hidden at any stage, stage and financial lease contract. Risks can originate from objective or subjective reasons, from the capital raising enterprise or supply company. Judging, identifying and preventing risks is very important for financial leasing businesses. Businesses need to consider applying modern risk management models or software. On the other hand, the connection between Vietnamese businesses is also very necessary in the current situation when mobilizing capital through financial leasing. For businesses choosing financial leasing, balancing resources to ensure periodic rental repayment according to the contract is an issue that needs attention. Because the financial capacity of businesses is different and the business situation is volatile, businesses need to prioritize and be flexible in balancing resources and cash flow to ensure good contract performance. financial lease.

Economy is continuing to grow steadily, creating great demand for machinery, equipment and technology. It is forecasted that in the period 2021 - 2025, Vietnam's GDP growth rate will reach about 7%/year (National Center for Socio-Economic Information and Forecasting - NCIF). The macroeconomy is basically stable, inflation is at 3.5 - 4.5%/year, creating great demand for machinery and equipment, especially in the manufacturing, construction, and processing industries. processing, manufacturing... and road transport vehicles for investment and development. Therefore, mobilizing capital by financial leasing is assessed to have much potential for application and development in Vietnam. Financial leasing has a relatively flexible rental period and simple administrative procedures. Renting businesses can also own and receive back the leased assets at a symbolic price. In particular, this is also a sales promotion channel for businesses. Financial leasing will be an important solution to help businesses overcome barriers to accessing capital, especially medium and long-term capital. In the context of banks increasing risk control over credit granting, small businesses will face more difficulties due to lack of collateral, as well as financial capacity and solvency when considering loan. At that time, raising capital by financial leasing is necessary and will be effective.

3. CONCLUSION

In recent times, the number of businesses in Vietnam has tended to increase rapidly. Besides the benefits to the economy, the rapid increase in the number of businesses also poses many problems that need to be resolved. High capital needs, the impact of the pandemic and changes in the economy, as well as the business environment, make the operations of Vietnamese businesses face many challenges. This situation leads to potential financial and business risks for businesses. Reviewing and evaluating the advantages and limitations of financial leasing, combined with consulting the experiences of businesses in a number of countries around the world, will help businesses' financial leasing activities. Vietnam is increasingly expanding and becoming more effective.

EXPERIENCE IN FINANCIAL SUPERVISION OF STATE-OWNED ENTERPRISES - LESSONS FOR THE LAOS PDR.

Master's degree. Saleumxay Phommixay[1]

Abstract: Apparently, state-owned enterprises (SOEs) or the enterprises having state-owned capital are a type of enterprise existing nations worldwide. Some of which even are large-scaled pillars of national economy. Nevertheless, these enterprises, due to their different characteristics from the ones of private sector enterprises, pose numerous drawbacks and challenges in the management and supervision of activities. In reality, financial supervision of state-owned enterprises (SOEs) is seen as one of the useful management tools, in which management agencies and owners adopt the content, methods and monitoring indicators to carry out financial supervision of the enterprises activities. Through this process, the companies can evaluate operational efficiency and detect risks to warn businesses. In the introduction part, the article indicates the definition of SOEs. The second part of the article introduces the role of state-owned enterprises. This part is also a premise for the next part: the experiences of countries in the world including countries in the Organization for Economic Cooperation and Development (OECD) in operating and applying models that picture. The last part is the valuable things that Lao PDR can learn from the experiences of these countries.

Keys word: Financial supervision, Lao PDR, State-owned enterprises, OECD, experience

1. CONCEPTS

Regarding the concept of state-owned enterprises, differences in each country, although in terms of management regime, researchers will come up with different concepts.

As underlined in the SOE Guidelines, national practices differ with respect to which entities the authorities consider "SOEs", and Asia is no exception. The SOE Guidelines offer detailed guidance in this respect, putting forward that an SOE is "any corporate entity recognised by national law as an enterprise and in which the state exercises ownership. This includes joint stock companies, limited liability companies and partnerships limited by shares. Moreover, statutory corporations with their legal personality established through specific legislation should be considered as SOEs if their purpose and activities, or parts of their activities, are of a largely economic nature". Activities of a "largely economic nature" are defined as those which involve "offering goods or services on a given market and which could, at least in principle, be carried out by a private operator in order to make profits".

In Lao PDR, the state capital held in an enterprise may not be the state but has invested financial resources from the state budget or other capital sources, it may be state assets, resources that the state allows domestic and foreign investors to operate and exploit or the state allows or licenses investors to establish a company operating in the Lao PDR, then those investors give a portion of capital to the state to hold and will divide profits according to its capital portion.

So a state-owned enterprise can be a state-owned enterprise that holds 100% state capital or a portion of state capital, can operate according to its charter but must be in accordance with the law that has been promulgated and the state may promulgate it. Decree law to manage and operate under separate laws depending on the field in which the business is established.

[1] Email: Saleumxay.phommixay@gmail.com, Ministry of Finance, Lao People's Democratic Republic.

2. ROLE OF STATE-OWNED ENTERPRISES

The role of state-owned enterprises is linked to participation in economic activities of the State. This game can take place in three aspects: economic, political, and social. The content of these three roles can be displayed as follows:

It is the main tool to create material strength for the State to maintain social stability, regulate and guide the economy to develop in a socialist direction.

support other economic sectors to develop, promoting the rapid growth and development of the entire economy.

Undertake strategic areas of activity for socio-economic development. Providing essential goods and services, especially in the fields of infrastructure (transportation, irrigation, electricity, water, communications), society (education, healthcare) and security, naitional defense.

3. THE SUPERVISION OF STATE-OWNED ENTERPRISES

Financial supervision of state-owned enterprises is an activity carried out continuously to collect and analyze information, thereby helping management agencies and owners know for sure the financial activities of enterprises. With foreign investment capital, will it be implemented on schedule and with results according to the plan and will the necessary intervention measures be promptly taken to overcome difficulties and problems.

Financial supervision is carried out to obtain an appropriate picture of the economic and financial situation of State-owned Enterprises, reflected in the level of profitability, efficiency and financial risk.

4. EXPERIENCE OF COUNTRIES IN FINANCIAL SUPERVISION OF STATE-OWNED ENTERPRISES

4.1. Korean experience

As per the Act on the Management of Public Institutions in Korea, the Ministry of Finance and Strategy designates which public institutions are classified as SOEs, according to their relative levels of self-generating revenue and government grants. SOEs are then classified into three categories according to their asset value, level of self-generating revenue and number of employees: (i) public corporations; (ii) quasi-governmental institutions; and (iii) and non-classified public institutions.

❖ **Subjects and methods of supervision**

In Korea, financial supervision and performance evaluation of businesses are supervised by the Ministry of Strategy and Finance. Every year, the Ministry will establish a subcommittee to be responsible for evaluating each enterprise, in which the Ministry of Strategy and Finance is responsible for the overall assessment, while ministries and branches carry out supervision from a professional perspective.

Evaluation of the performance of SOEs is carried out annually for the previous financial year. For example, the performance of state-owned enterprises from January 2022 to December 2022 must be evaluated for performance in 2023.

❖ **Content and monitoring criteria**

Every year in Korea, we will evaluate and re-research the situation of businesses and the economic prospects of the industry in the following year to build a set of targets/indicators for each business in the coming year. However, some indicators can be removed to reduce pressure on businesses.

Monitoring the operations of businesses in Korea is conducted at three levels: evaluating the effectiveness of the entire enterprise, evaluating the operating effectiveness of the CEO and evaluating the effectiveness of the auditor. For each level, qualitative and quantitative indicators are used, and for each group of indicators, different financial monitoring methods are worked.

Financial indicators include basic financial indicators such as: Number of employees, revenue, profit, profit margin, wages...; Non-financial indicators: Non-financial indicators are established specifically for each enterprise to evaluate the performance of that enterprise. In addition, non-financial indicators also include indicators such as "Customer satisfaction level", business impacts on society...

4.2. Experience from China

❖ **Subjects and methods of supervision**

China established the State Asset Supervision and Administration Commission (SASAC) to operate under a ministerial-level mechanism, directly under the State Council (Government) but different from the Government's administrative agencies. SASAC is an organization with special authority. The functions of this Commission include managing and supervising owned assets, promulgating relevant policies and mechanisms, appointing and dismissing key positions in SOEs.

In China, supervision will be carried out according to the management order. In the "pre-supervision" stage, businesses autonomously decide according to pre-standardized regulations and procedures (different from before when reporting was required and awaiting approval from SASAC). The "internal supervision" stage will be strengthened by supervision agencies; while the "post-supervision" stage will be enhanced with questioning and prosecution (especially with the participation of the Party inspection committee). As for "post-supervision", China has introduced stricter regulations on the feedback mechanism in supervision and the mechanism to question the responsibility of supervising state assets in enterprises; The anti-embezzlement and corruption mechanism is effective in the long term.

❖ **Content and monitoring criteria**

SASAC is responsible for monitoring the preservation and development of the value of State assets at enterprises, building and improving an index system to monitor the preservation and development of the value of State assets. At the same time, it also establishs criteria for evaluating enterprise efficiency, monitor and manage the preservation and growth of the value of state assets at enterprises through statistics and conducting audits. In addition, this commission is in charge of salary management , wages at businesses, building adjustment policies, income distribution of business leaders and organizing the implementation of these policies.

Over the past many years, China has improved and applied a set of criteria to evaluate the performance of state-owned enterprises. Indicators to evaluate the performance of SOEs are divided into 4 levels, including 2 large groups (level 1) on capital management situation and capital use efficiency. The scoring rate for these two groups of criteria is 30 - 70%. Each group of level 1 indicators is divided into 2 groups of level 2 indicators.

The financial indicators applied to monitor SOEs are built on the 80 - 20 principle, evaluated at a rate of 100% of all groups, of which quantitative indicators account for 80%, quantitative indicators account for 80%. calculated to account for 20%.

Quantitative indicators include 10 groups: (1) Capital use situation; (2) Profit indicators (value); (3) Solvency (20%); (4) Revenue; (5) Capital preservation criteria; (6) Indicators of receivables/payables; (7) Enterprise development capacity; (8) Current use of short-term assets; (9) Targets on budget collection and payment; (10) Targets on income of employees and management board.

Qualitative criteria are divided into 5 levels: Excellent (A), good (B), average (C), low (D) and other. Each level corresponds to a parameter: 1; 0.8; 0.6; 0.4 and 0.2.

4.3. Experience from Vietnam

In Vietnam, financial supervision of SOEs is currently carried out in accordance with Decree 87 and Circular 200. In addition, the Ministry of Finance of Vietnam has also developed a handbook to guide financial supervision.

❖ **Subjects and methods of supervision**

The Ministry of Finance is responsible for monitoring and supervising the performance assessment of SOEs. Performance evaluation is carried out annually according to a three-step process: (1) self-assessment of state-owned enterprises; (2) assessment by a line ministry or provincial government, State Capital Investment Corporation (SCIC) or State Economic Group (SEG) responsible for state ownership in SOEs ; and (3) assessment by the Department of Corporate Finance, Ministry of Finance. Evaluation reports prepared by relevant ministries and local authorities as well as appraisal reports prepared by the Ministry of Finance are mainly based on the self-assessment of SOEs.

Regarding financial supervision methods in Vietnam, there are direct supervision methods, indirect supervision methods, prior supervision, internal supervision, and post supervision. There is also special financial supervision with this method, which is a supervision process for businesses showing signs of financial insecurity that need to be monitored and corrected by competent authorities. Cases where businesses will be subject to special financial supervision include: businesses operating at a loss, having a debt-to-equity ratio that exceeds the safety level according to regulations; There are losses arising from 30% of equity or more or accumulated losses greater than 50% of equity; Have a debt repayment capacity ratio of less than 0.5; Inaccurate financial reporting, greatly distorting the business results of the enterprise.

❖ **Content and monitoring criteria**

- Supervise the preservation and development of state capital at enterprises.

- Supervise the management and use of state capital and assets at the enterprise according to the following contents: Investment activities of capital and assets at the enterprise and capital investment activities outside the enterprise (mobilized capital sources attached to the enterprise, investment project implementation progress, investment capital disbursement progress); Situation of capital mobilization and use of mobilized capital; release Stock; Situation of asset management, debt management at the enterprise, ability to pay debt of the enterprise, ratio of liabilities to equity; Cash flow situation of the enterprise.

- Supervise the business activities of the enterprise: Business performance results: Revenue, profit, return on equity (ROE), return on total assets (ROA); Fulfillment of obligations to the state budget.

- Supervise the implementation of plans to divest state capital, recover state capital, collect profits and dividends distributed from enterprises.

5. SOME LESSONS FOR LAO PDR

Many governments in Area have taken important steps towards improving performance monitoring systems for SOEs, in most cases bringing practices more in line with relevant recommendations of the SOE Guidelines. The SOE Guidelines notably call for the state as an owner to (i) set SOEs' financial and non-financial objectives; (ii) establish reporting systems to monitor performance against those objectives and (iii) report to the public on results. By establishing and formalising performance evaluation systems, most of the countries surveyed in this stocktaking have, to varying degrees, taken steps forward in all of these areas.

Firstly, Performance contracts and Performance indicators.

Performance contracts: A few Asian countries have formalised performance evaluation systems through performance contracts or their functional equivalent, such as agreements or memorandums. These are generally documents outlining yearly performance targets, usually signed between the ownership entity and executive management. This approach has reportedly been useful in clarifying objectives, strengthening the accountability of SOE managers for enterprise performance and granting them greater autonomy to oversee daily operations. By helping to clarify objectives, the use of performance contracts has arguably facilitated the implementation of one fundamental recommendation of the SOE Guidelines, notably that the state should "allow SOEs full operational autonomy to achieve their defined objectives and refrain from intervening in SOE management" (Guideline II.B). However, it is essential that boards of directors play an adequate role in this process, thus fulfilling their essential functions of setting strategy and supervising management.

Performance indicators: All countries undertake performance evaluations against quantitative indicators measuring both financial and non-financial performance. Examples include standard financial performance indicators as well as numerical indicators of customer satisfaction or number of beneficiaries served. A smaller group of countries also uses qualitative indicators to measure financial and non-financial performance, for example assessments of SOEs' risk management or corporate governance practices. Assessing the effectiveness of individual indicators is beyond the scope of the present stocktaking. However, it can be concluded that better defining the state's objectives through clear performance indicators – including those related to financial performance, but also non-financial performance such as the delivery of public service obligations – introduces greater transparency to the process and is in line with international good practice.

Second, Auditing and reporting on performance

Reporting on SOE performance – at both the company level and through annual aggregate reports on the SOE sector as a whole – is an important means to strengthen the accountability of the state as an owner and ultimately promote improved performance. To ensure the accuracy and quality of reporting, SOEs should establish an internal audit function and subject SOEs' financial statements to an independent external audit.

Third, Linking evaluation results to executive incentives

A majority of the Area countries s of performance evaluations to inform executive incentives and/or sanctions. In a plurality of cases, this takes the form of performance-based pay for senior management. This practice diverges somewhat from the standards of the SOE Guidelines, which would normally call for the SOE board of directors (and not the state ownership entity) to oversee and incentivise management. However, given the relatively weaker degree of corporatisation of SOEs in the region, and the more limited mandates of boards, it can reasonably be concluded that this reflects differences in corporate governance arrangements rather than fundamental policy divergences. Formalising performance-based pay systems through explicit, published pay scales has arguably introduced greater transparency to the state's policy on executive remuneration levels, bringing practices more in line with the SOE Guidelines.

BOARD INDEPENDENCE AND THE PERFORMANCE OF STATE-OWNED ENTERPRISES: AN ANALYSIS OF VIETNAM

Dau Huong Nam, PhD; Dinh Trung Sơn, MA[1]

Abstract: *This study assesses the relationship between board independence and board size on the business performance of state-owned enterprises in Vietnam. With a dataset of 50 state-owned enterprises listed on the stock market during the period from 2016 to 2020, the research employs Ordinary Least Squares (OLS), Fixed-effects, and Random-effects regression models to examine the relationship. The regression results indicate that the relationship between independent members and firm performance is not statistically significant. However, board size exhibits a statistically significant negative relationship with firm performance.*

Keywords: *board independence; board size; firm performance; Vietnam state-owned enterprises.*

1. INTRODUCTION

The issue of board independence holds a central position in the ongoing corporate governance reform initiatives globally. This concern is grounded in the fundamental problem of corporate governance, which stems from the separation of ownership and control within organizations. The board of directors plays a crucial role in mitigating this problem, as it is responsible for overseeing the management and aligning the interests of shareholders with the decisions made by the executives (Sarkar, 2009). A board that comprises outside independent directors is perceived as being more effective in addressing agency conflicts compared to boards with predominantly executive directors (Weisbach, 1988; Fama, 1980). Beyond its role in resolving agency conflicts, independent directors offer additional advantages through their experience and connections with other companies, enabling them to bring valuable resources, suppliers, and customers to the organization (Pfeffer, as cited in Sarkar, 2009). Consequently, this institution is believed to enhance the overall performance of the firm.

However, an alternate perspective questions the true independence of these directors from the management and controlling shareholders. This skepticism arises from the fact that independent directors are typically nominated, selected, and appointed by the management in alignment with the majority shareholders (Varma, 1997; Varottil, 2010). This perspective casts doubt on the effectiveness of boards in promoting good governance within organizations. The existing empirical literature also fails to provide a definitive answer regarding the impact of board independence on firm performance.

Several studies have found that board independence has a positive impact on firm value (Jackling and Johl, 2009; Black and Khanna, 2007; Chakrabarti et al., 2010; Brown and Caylor,

1 Ho Chi Minh National Academy of Politics

2006; Black et al., 2006). Weisbach (1988) has noted that boards dominated by outside directors can enhance firm value through their influence on CEO changes. However, other research, such as studies by Dey and Chauhan (2009), Prasanna (2006), Bhagat and Black (2002), and Lawrence and Stapledon (1999), have found no evidence to suggest that firms with a higher proportion of independent directors achieve improved profitability. Some studies, like Rebeiz (2008), have even reported non-linear impacts, while Garg (2007) and Ghosh (2003) have explored non-linear influences of board independence on Indian firms. These conflicting findings highlight the need for further exploration and understanding of the benefits and effectiveness of independent directors.

In light of these gaps in the existing literature, this research aims to empirically investigate the impact of board independence on firm value in the context of Vietnam. The following sections will provide an in-depth examination of the relationship between board independence and firm performance, and the subsequent development of hypotheses. The research methodology, data analysis, and conclusions will also be presented in subsequent sections to contribute to our understanding of corporate governance and its implications for business operations in Vietnam.

2. LITERATURE REVIEW

Corporate governance is a fundamental aspect of modern business management, and the composition of a firm's board of directors plays a pivotal role in shaping its performance and decision-making. One of the key elements in corporate governance is the inclusion of independent board members, whose primary role is to provide objective oversight and guidance to enhance a company's performance and protect the interests of its shareholders. This literature review examines various studies and perspectives on the relationship between independent board members and firm performance.

Several theoretical frameworks inform the relationship between independent board members and firm performance, including Agency Theory, Resource Dependency Theory, and Upper Echelons Theory. Agency Theory posits that the presence of independent board members can mitigate agency problems by aligning the interests of managers (agents) with those of shareholders (principals). Independent board members, not having substantial ties to the company, are expected to monitor management more effectively and reduce agency costs. This theory suggests that firms with a higher proportion of independent board members are likely to exhibit better performance. Resource Dependency Theory emphasizes the external resources and expertise that independent board members bring to a firm. These individuals can provide valuable knowledge, networks, and legitimacy, which, in turn, enhance a company's performance. Their external connections may help firms access essential resources and navigate a competitive business environment. Upper Echelons Theory posits that the attributes, experiences, and cognitive frames of top executives, including independent board members, influence decision-making and, consequently, firm performance. The theory suggests that independent board members' backgrounds and experiences may impact their effectiveness in shaping the strategic direction of a firm.

The empirical evidence concerning the relationship between independent board members and firm performance is multifaceted, with studies offering diverse findings. Research by Brown and Caylor (2006) in the United States found that firms with independent boards reported higher returns on equity, profit margins, and stock repurchases. This study suggests a positive association between independent boards and various measures of firm performance. In the aftermath of the Asian

Financial Crisis, Choi et al. (2007) studied the impact of introducing outside directors in Korea. They found that board independence had a significant and positive effect on firm performance. The presence of independent directors was particularly crucial in emerging markets subject to external shocks and liquidity constraints.

Numerous studies have provided mixed results regarding the value relevance of board independence. Some have shown a positive relationship between independent directors and firm performance, while others found no convincing evidence of such a relationship. The impact of independent directors may be contingent on various factors, including the type of company and its environment.

In some cases, studies have indicated a negative relationship between board independence and firm performance. For example, research conducted in New Zealand suggested that a higher number of non-executive directors on the board led to lower firm performance, particularly when they had limited influence over decision-making. In the United States, studies have shown mixed results, with some suggesting that boards with a high proportion of independent directors did not necessarily lead to improved profitability.

The relationship between independent board members and firm performance is complex, influenced by various theories and contextual factors. While some studies suggest a positive association between board independence and firm performance, others provide mixed or negative results. The effectiveness of independent board members may depend on the specific context of the firm, its industry, and the regulatory environment. Future research should delve deeper into these complexities, considering the nuances of different markets, industries, and firms, to gain a more comprehensive understanding of the impact of independent board members on firm performance.

3. DATA AND METHODOLOGY

3.1. Sample selection

The research team uses the sample of top 50 state-owned enterprises currently listed on the stock market for the period 5 year as of December 31, 2020 backward. The research team employs the definition of state-owned enterprises according to the 2020 Enterprise Law, which states, "State-owned enterprises include enterprises in which the State holds over 50% of the charter capital, the total shares with voting rights as prescribed in Article 88 of this Law." Subsequently, companies were excluded from the sample based on the following criteria: 1) Companies operating in the banking and insurance sectors were excluded due to differences in accounting methods and financial reporting indicators compared to other non-financial companies, which would affect the research results (7 companies). 2) Companies in which the state did not hold 50% of the capital during the period 2016-2020 (6 companies). 3) Companies that were not continuously listed on the stock market during the period 2016-2020 (14 companies). In total, 27 companies were excluded from the sample. Finally, the research team utilized a research sample consisting of the 50 largest state-owned enterprises listed on the stock market as of 2020.

3.2. Model specification

To examine the relationship between board independence and firm performance, we employ the following regression model:

$$ROA/ROE_{it} = B_{0\,+}\, B_1 Board\ independence_{it} + B_2 BoardSize_{it} + B_3 FirmAge_{it} + B_4\ Firm\ size_{it} + B_5\ Firm\ leverage_{it} + B_6\ GrowthOppor_{it} + Sector\ Dummy_{i} + Year + \varepsilon_{it}$$

In the above model, i represents the firm, t denotes the point in time, and ε is the error term. In this study, we utilize accounting-based measures of profitability such as ROA (Return on Total Assets) and ROE (Return on Common Equity) to proxy firm performance. ROA assesses the ability to generate profit per dollar of company assets, while ROE, crucial for shareholders, gauges profit per dollar of common equity. The primary independent variable in the model is Board Independence, measured as the percentage of independent members on the board of directors. Additionally, we investigate the relationship between board size and firm performance. This study also controls for firm-specific characteristics like Firm Age, Firm Size (Total Assets), Firm Leverage, and Firm Growth. Finally, we control for industry and time effects.

This research employs ordinary least squares (OLS), fixed-effect models, and random-effect models to analyze the association between board independence and firm performance. Diagnostic tests indicate the presence of heteroskedasticity and autocorrelation issues in the models. Consequently, the models are tested with the cluster (id) option to address these concerns.

Table 1. Variable definition

Variable	Definition
ROA	Return on Assets = Net profit (after tax) / Average total assets x 100%
ROE	Return on Equity = Net profit (after tax) / Average total owner's equity x 100%
Board independence	Proportion of independent members on the board of directors
Board size	Number of board members
Firm Age	The number of years since the establishment of the business
Firm size	Natural logarithm of total assets
Firm leverage	Debt-to-Asset ratio
Growth opportunity	Cumulative net revenue growth in the past 3 years
Sector Dummy	Wholesale, Retail, Manufacturing, Real Estate Business, Mining, Science and Technology, Agriculture, Electricity-Gas, Warehouse and Transportation industries.

4. RESULTS:

4.1. Descriptive statistics

Table 2 shows descriptive statistics for the dependent and independent variables. Firm-level variable values are restricted to the first and ninth percentiles to reduce the influence of outliers. The average ROA and ROE values in the study sample indicate that state-owned firms have profitability levels of around 8,076% and 14,605% of total assets and total equity, respectively. The percentage of board independence is around 13,649%. Companies with an average establishment age of 33 years have five members on its board of directors. The typical enterprise's three-year revenue growth rate is at 34%.

Table 2. Descriptive Statistics

Variable	Obs	Mean	Std. Dev.	Min	Max
ROA	250	8.076	8.183	-8.092	47.515
ROE	250	14.605	12.487	-30.797	59.017
BoardDe	250	13.649	16.474	0	60
BoardSize	250	5.492	.962	3	11

FirmAge	250	33.16	19.74	7	128
logAsset	250	28.503	1.178	26.183	31.756
FirmLev	250	.475	.201	.104	.867
GrowthOppor	250	34.7	139.51	-102.719	1104.557

4.2. Regression results

This section reports the findings of the relationship between board independence and firm performance. Correlation matrix and Collinearity Diagnostics is conducted to check for the correlations amongst the explanatory variables. As a rule of thumb, a variable whose VIF values are greater than 5 may merit further investigation. The results of Collinearity Diagnostics test show that all VIF values are less than 5, which indicate that there is no collinearity issue in the regression analyses.

Table 3. Matrix of correlations

Variables	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
(1) ROA	1.000							
(2) ROE	0.851***	1.000						
	(0.000)							
(3) BoardDe	-0.137**	-0.142**	1.000					
	(0.031)	(0.025)						
(4) BoardSize	-0.206***	-0.179***	0.142**	1.000				
	(0.001)	(0.005)	(0.025)					
(5) FirmAge	-0.131**	-0.085	-0.135**	-0.146**	1.000			
	(0.039)	(0.182)	(0.033)	(0.021)				
(6) logAsset	-0.333***	-0.287***	0.136**	0.281***	-0.001	1.000		
	(0.000)	(0.000)	(0.031)	(0.000)	(0.982)			
(7) FirmLev	-0.555***	-0.222***	0.023	0.173***	0.092	0.194***	1.000	
	(0.000)	(0.000)	(0.719)	(0.006)	(0.146)	(0.002)		
(8) GrowthOppor	0.034	0.077	0.047	-0.019	-0.143**	-0.190***	-0.036	1.000
	(0.596)	(0.223)	(0.456)	(0.761)	(0.023)	(0.003)	(0.571)	
*** p<0.01, ** p<0.05, * p<0.1								

The findings of all models show that board independence negatively influences firm performance. Because of our panel data, we prefer the Fixed effect model and random effect model over OLS regression. As suggested by Hauman test, we should follow the results of Fixed effect model. The results of model (3) and (4) indicate that board independence has a negative impact on firm performance, however the coefficient is not significant at any level. The results are in line with those of (Adams, Hermalin et al. 2010) and (Rashid 2018), all of which find that board independence may not be able to improve firm performance. Even though, agency theory describes firms can improve their performance if they have a large number of independent directors (Terjesen, Couto et al. 2016) but when independent directors are from outsiders, they do not have the formal authority to influence CEOs to perform actions on behalf of them. Meanwhile, it can be observed that board size exhibits a statistically significant positive relationship with firm performance.

6. CONCLUDING REMARKS

This empirical research on the relationship between independent board members and firm performance in Vietnam has provided valuable insights. While theoretical models and several empirical studies suggested that independent board members could improve company performance, our findings show that board independence is neutral, while board size exhibits a statistically significant negative relationship with firm performance in the context of Vietnam. Despite the complicated nature of this relationship, it highlights the significance of taking regional and industry-specific aspects into account when evaluating corporate governance methods. To garner a more thorough understanding of the impact of independent directors on business performance, further research is needed to delve into the complexities of board effectiveness in varied settings and regulatory frameworks. Another research direction is the extend the dataset to cover a larger set of companies of Vietnam.

ACCOUNTING FOR ESOP IN VIETNAMESE ENTERPRISES

PhD. Bui Thi Thu Huong[1]

Abstract: *ESOP is an Employee Stock Ownership Plan that has been introduced and implemented quite commonly by Vietnamese enterprises in recent times. However, the instructions for recording, measuring, and disclosing information about these transactions lack comprehensiveness/are not comprehensive and consistent/do not align with international practices. This has resulted in companies recording and presenting financial statements that are not genuinely useful. This study aims to analyze and assess the current actual situation of ESOP accounting in Vietnamese enterprises and also proposes some recommendations for improvement.*

Keywords: *ESOP accounting, accounting for share-based payments, accounting for share options.*

1. INTRODUCTION

ESOP stands for Employee Stock Ownership Plan. In an ESOP, the companies often commit to entitling their employees to the Employee Stock Options (ESO) at discounted prices or to issue bonus shares with additional conditions (such as a required length of employment or meeting performance targets related to profitability and stock price). ESOP is a program that benefits both companies and their employees in multiple ways. It helps companies retain talented employees, boosts motivation, and improves the overall roles, responsibilities, and rights of the employees. Additionally, it reduces the burden on the cash flow to pay employees traditional bonuses and allows the company to retain profits for reinvestment and business expansion. For these reasons, ESOP is commonly used in large corporations and companies in the world and Vietnam. According to a study by KPMG, statistics from the National Center for Employee Ownership (NCEO) indicate that in the US, there will be approximately 6,600 Employee Stock Ownership Plans (ESOPs) with up to 14 million employee participants by 2021. In recent years in Vietnam, ESOP has been widely known and used, especially in listed companies such as the Refrigeration Electrical Engineering Corporation (REE), Mobile World Investment Corporation (MWG), Elcom Technology Communications Corporation (ELC), HAGL Joint Stock Company (HAG)...

Considering the characteristics of an ESOP mentioned above, when it comes to an ESOP, it is important for the accounting ESOP to accurately record, measure, and present the company's financial statements to reflect the true nature of the transactions and provide useful information to the users of these financial statements, especially the existing shareholders of the issuing company. This study gathers existing research on ESOP accounting while assessing the current state of ESOP accounting in Vietnamese enterprises and proposes some recommendations to enhance ESOP accounting in Vietnamese enterprises.

2. RESEARCH BACKGROUND

ESOP represents a transaction where employees devote their time and intelligence to the company and in return, they are entitled to purchase the stock at discounted prices and receive shares as a reward. Thus, it is inherently a share-based payment transaction. For this reason, accounting for ESOP needs to assess the value of the stock options or stock rights given to employees as

1 Email: buithuhuong@hvtc.edu.vn, Academy of Finance.

bonuses and record them as expenses that align with benefits brought to the companies by the employees. Therefore, the International Accounting Standards Board (IASB) started studying accounting for share-based payment transactions in 2001 and published IFRS 2 – Share-based payments with the effective date of 01/01/2015, which provides guidance on the measurement and recognition of share options or share appreciation rights fair value in expenses. This is done in line with the value that employees bring to companies. Some countries, including the US, Australia, and the UK, also published similar standards to guide the measurement and recognition of ESOP shares in 2004. These standards were applied in 2005 and had similar content to IFRS02.

After IASB published IFRS2, there have been numerous foreign studies on the recognition, measurement, and presentation of shares under ESOP. One such study, conducted in 2005 by Fayez A. Elayan, Kuntara Pukthuanthong, and Richard Roll (US), titled "*Investors like firms that expense employee stock options and they dislike firms that fail to expense*" found that the companies that choose to record expenses incurred by ESO experience an increase in stock prices compared to companies that do not record such expenses. A study conducted by Ewout de Vaere (2008) titled "*Recognizing Employee Stock Options: the impact of IFRS2 on Dutch listed companies*" reveals that the implementation of recording expenses from ESO in accordance with IFRS 2 will have a negligible effect on the financial ratios.

In Vietnam, the accounting standards and principles do not provide instructions on accounting for ESOP. However, there have been some studies that look at acknowledging IFRS02 and the orientation of applying IFRS02 in Vietnam. One such study, conducted by Ngo Thi Phuong Duyen, titled "Applying IFRS 02 in accounting for employee share options in listed Vietnamese companies". In this study, the author discusses the basic content of IFRS02, examines the current state of ESO accounting in some Vietnamese companies, and suggests the adoption of Vietnamese accounting standards based on IFRS02 for share-based payments accounting. Moreover, the author provides some recommendations and solutions for addressing the issues faced during the implementation of these standards. However, the research lacks adequate evaluation and recommendations regarding the recognition and presentation of ESOP shares for the listed Vietnamese in current times and also, directions for standards that can guide the measurement and recognition of employee share-based options.

3. RESEARCH METHOD

To conduct the research, the author uses desk research methods, which involve studying secondary documents from publicly published previous research and analyzing financial statements of Vietnamese listed companies. This allows the author to gather information, analyze, evaluate, and present the research results.

4. RESEARCH RESULTS ON ACTUAL ESOP ACCOUNTING SITUATION AND RECOMMENDATION

4.1. Research results on actual ESOP accounting situation

+ An ESOP operates in a cycle that follows these steps:

1. Issuance of share options
2. Rights Entitlement
3. Exercising rights
4. Vesting of rights
5. Selling ESOP shares.

Normally there is a period of time between when the shares are issued and when the rights are entitled. During this time, the company often requires its employees to fulfill certain conditions in order to meet (satisfy) the vesting requirements for the share options or share appreciation rights. After the entitlement date, the employees will have a period of time to exercise their rights, which will extend until the expiration date for exercising those rights. Following the exercise of rights, there are often restrictions on employees from selling the shares for a specific period, such as one or two years. Having such ESOPs, Vietnamese enterprises like Elcom Technology Communications Corporation (ELC), Mobile World Investment Corporation (MWG), etc are performing measurement, recognition, and presentation in their financial statements as follows:

+ About measurement and recognition:

Companies that offer ESOP do not perform measurement of share options or share appreciation rights at fair value at the date of right issuance. Since then, joint stock companies have **not recorded** the value of share options and granted shares given to their employees or key leaders as expenses for employee salaries which align with the revenues or other benefits that employees bring to the company during a transition period. Joint stock companies only determine the value of granted share transactions for employees when they exercise their right of share options (which also means when the granted shares are issued to employees with vested rights), the price of exercising the share options is equal to the price of the right issuance. This is done through a put-through agreement between the joint stock company and the employees (for example, ELC Corporation in 2014 and 2015). According to the price of share options, journal entries are:

Dr. 111,112: Value of exercising share options

Cr. 4111: Share capital at par value

Cr. 4112: Surplus equity

In the case where the issuance of appreciation shares or share options for employees includes conditions related to business efficiency, the accounting is determined based on the agreement between the company and the employees, the exercising prices and sources for bookkeeping:

- Issuance of appreciation shares from profit after tax:

Dr. 421: Undistributed after-tax profit

Cr. 4111, 4112: Newly issued shares

Cr. 419: Re-issuance of treasury shares

(Mobile World Investment Corporation made this journal entry in December 2016)

- Issuance of appreciation shares from Treasury shares without collecting money, the journal entry according to the accounting system is as follows:

Dr. 4112: Share capital surplus

Cr. 419: Treasury shares

- Issuance of appreciation shares with discounted prices from Treasury shares, the entity records according to the guide of the accounting system:

Dr. 111,112: Based on issuance price

Cr. 4112: If issuance price < book price

Cr. 419: Book price

Cr. 4112: If issuance price > book price

+ About information disclosure:

Listed companies that offer ESOP are required to disclose specific information as per the regulations set forth by the State Securities Commission, the resolutions made by the Board of Directors or the general meeting of shareholders; the list of participating employees, and the results of the share issuance for these employees. In the financial statements, listed joint stock companies only disclose information about the number of exercised employee share options or the number of appreciation shares that the employees received. This disclosure is similar to the ordinary issuance of common shares. Joint stock companies do not provide adequate disclosure of information related to the issuance of share options and appreciation share plans. This includes details such as determining the value of the share options and their impact on other financial information such as profits, revenue in future years, and diluted earnings per share…

4.2. Assessment of current situation

The study shows that while the guide for ESOP accounting in Vietnam's legal accounting framework is inadequate, listed Vietnamese joint stock companies with ESOPs have carried out measurement, recognition, and presentation of information in their financial statements in line with current regulations. However, the study on ESOPs and the accounting for ESOPs in Vietnamese enterprises still has some limitations:

First, in recent times, although listed joint stock companies have been actively researching and conducting share-based payment transactions for their employees, these transactions are currently facing backlash from existing shareholders (especially foreign shareholders). That is because publicly traded companies such as Mobile World Investment Corporation, Masan Group, and Vinamilk Joint Stock Company are offering share options to their key managers pricing at VND 0 or significantly lower prices which are funded from profits after tax, share capital surplus, or Treasury shares. Issuing share options at VND 0 will increase the company's charter capital, but it will not result in any new cash flow into the company. Instead, the company will allocate a portion of its retained earnings or surplus capital to owner's equity. Simply put, it is using a portion of the shareholder's fund to reward key managers. Therefore, if the percentage of ESOP issuance is 5% and the selling price is VND 0, utilization of shareholders' interests will be higher. For this reason, shareholders of many large companies often disagree with the program of share appreciation rights for key managers using profits after tax or other sources of owner's equity, without any accompanying conditions or an initial commitment to devote time or demonstrate business efficiency. This greatly affects the retention of managers and talents, as well as the company's management, operational capabilities, and overall development.

Secondly, the accounting treatment of ESOP by listed joint stock companies has not accurately reflected the nature of the transaction. The accounting treatment and presentation of the financial statements in listed companies can potentially create opportunities for executives and key managers to manipulate information in order to meet certain conditions set by shareholders. This includes falsifying information in the income statement, manipulating prices, and taking actions that allow them to purchase shares, or share options and sell them for profit. Because of this, some accounting and stock experts believe that it is crucial to establish appropriate accounting treatment for ESOPs in listed companies. One of them is Dr. Vu Thi Kim Lien, the former Vice Chairman of the State Securities Commission, whose opinion was published in Sai Gon Investment Newspaper on

October 13th, 2013 stated: "ESOP can also create incentives for manipulating prices and pushing up stock prices, especially when the rights of share options are exercised. The huge benefits of share options can lead to a willingness to violate ethical practices, such as concealing information and lacking transparency in financial statements. This can result in driving up prices until there is a significant difference between the stock price and the exercise price of the share options. In certain countries, accounting regulations specify that any discrepancies must be shown in the financial statements, which means that they will be recorded as expenses for employee salaries and bonuses. Then, investors can immediately see its impact on the financial statements. This will act as a deterrent against rent-seeking behavior when implementing ESOPs".

Thirdy, with the ESOP that listed companies are conducting, the presentation of financial statements is still incomplete. The enterprises do not disclose any information when employees are not entitled to share options or when employee share rights are not exercised, even if the conditions for entitlement may have been met or certainly have been met. In specific, when calculating diluted earnings per share, companies do not calculate the possibility of issuing share options or share rights. In the event that shares rights or share options are exercised, the company only provides a general overview in the "Situation of changes in owner's equity" section. However, there is a lack of detailed information regarding the prices for exercising the rights, the number of vested rights, the number of rights that are not vested and exercises, as well as information about the impact of vesting on stock prices and other related details.

The limitations mentioned above may originate from objective factors within the legal document system or management mechanism, as well as subjective factors that stem from within the company. Through actual surveys and references from experts, several possible causes have been identified, including:

Firstly, the system of legal documents pertaining to stocks, capital instruments, and tax legal documents related to capital instruments has not been adequately published and provided with specific instructions. As a result, businesses are still in perplexity when it comes to their application.

Secondly, the shareholders have not been fully aware of the impact of the compensation programs for the employees by means of share rights or share options, on the company's development and their own interests. As a result, they tend to easily approve programs that are harmful to them or struggle to reach an agreement on plans that would benefit both employees and shareholders.

Thirdly, Vietnam currently lacks a comprehensive system of legal documents that provide guidance on how to measure the value of share options and properly recognize and present financial statements.

Fourthly, this issue arises because senior management of listed companies does not recognize the value of share options as expenses. This is because expenses can have a negative impact on the information presented on the income statement, which in turn affects the benefits received by management personnel.

5. RECOMMENDATION

For the foreseeable future, as long as the legal documents on Vietnamese accounting, particularly the accounting standards, have not been updated or issued in alignment with international financial reporting standards, the accounting for ESOPs in Vietnamese-listed companies should follow the following guidelines:

First, ESOP needs to be included in the Notes of the Financial Statement in the "Other notes" section (Section VIII). This section should provide information on the following: Subjects eligible for the rights, vesting rights, vesting date, estimated number of vested rights, estimated number of exercised rights, prices of exercised rights and estimated number of shares to be issued for vested subjects in the upcoming fiscal year. Also, clear notes should be provided on the impact of exercised rights on the ratio of "diluted earnings per share" in the income statement. This will ensure that existing investors, potential investors, and other users of information have complete information about the financial position and operational activities of the listed joint stock companies. In addition, it can be further explained how the share-based compensation programs for key employees have improved the company's performance compared to the previous year and other companies in the industry.

Secondly, when share options and share rights are exercised, listed joint stock companies should provide more detailed information in the "Statements of Changes in Equity" section. This should include notes on the prices at which the rights are exercised, the market price at the time of exercise, and the source of the shares used for exercising (whether they are newly issued or Treasury shares). If Treasury shares are used, it is important to include the book value and issuing price of these shares. This additional information will enable investors to analyze the impact of this plan on their interests and understand the contribution of employees with vested share rights in the listed companies.

Thirdly, in order to minimize conflicts of interest between employees participating in ESOP and existing shareholders in listed joint stock companies, while also achieving growth targets, retaining talented individuals, and attracting competent employees, it is recommended that companies consider implementing ESOP programs that are linked to factors such as working time, business efficiency, and restrictions on share transfer for a specific period of time. This approach can help generate employee motivation, align their interests with those of the company, and ultimately maximize share value while also saving cash for the company. Studies around the world have shown that companies that provide share options to their top-performing employees and key managers tend to experience higher revenue growth rates, typically 2-3% higher. In addition, these companies also see a growth rate of returns on assets that is usually around 2-2.7% and their stock prices in the market tend to increase (article published on May 2nd 2003 on http://vietstock.vn/PrintView.aspx?ArticleID=1802).

Fourthly, in case joint stock companies use Treasury shares or purchase shares by cash for issuing to employees exercising share rights or share options at a price lower than the book value of the Treasury shares, recording the difference in decrease in "Surplus share capital" is not reasonable. Because joint stock companies incur costs to compensate employees for their services, these costs should be recognized as expenses rather than as a decrease in owner's equity. This recognition is necessary to match expenses with the corresponding revenues in a given period. This directly affects the interests of the current shareholders, as it inaccurately portrays the financial performance of the joint stock company during this period and also significantly influences the decisions made by users of the financial statements.

Recommendation for the future (from 2025 onwards)

The implementation of ESOP is gaining popularity among Vietnamese-listed joint stock companies. This is particularly evident as international economic integration strengthens, competition among businesses intensifies, the need for good corporate governance grows, and the importance of retaining top employees and managers is increasingly emphasized. As the stock market advances and policies for attracting foreign investment are liberalized and opened, more strategic investors and major shareholders are participating in both direct and indirect investments in listed Vietnamese companies. Consequently, the provision of information regarding the financial position of publicly traded firms in general and share-based payment transactions in particular must be transparent, comprehensible, and in line with more stringent international investment practices and standards.

In compliance with the Ministry of Finance's guidance on researching and promulgating Vietnamese accounting standards, accounting standards for share-based payment transactions require researching, promulgating, and instructing for measurement of value, recognition, and presentation on the financial statements. This should be in accordance with Vietnamese conditions and international practices to ensure that the information is sufficient, useful, transparent, and reliable for investors and other users of information. Actual surveys showed that 100% of the questioned accounting and audit experts were in favor of a comprehensive accounting system for share-based payment transactions in Vietnamese publicly traded companies. The accounting standards for share-based payments are completed based on IFRS02 with amendments so that the standards are appropriate to Vietnam's political and market conditions. Subsequently, transactions paid by capital instruments are also known as share options, with which joint stock companies must do the following steps:

- Evaluation according to one of the methods such as the Black-Scholes model, binomial models, and Monte-Carlo model. However, Vietnam currently has not provided enough factors to meet the requirements of these valuation models. Therefore, Vietnam's share-based payment standards can regulate and provide guidance on the theory of these valuation models. The businesses can also be encouraged to apply these standards if they have sufficient and reliable information. Besides, Vietnamese accounting standards for share-based payments allow the application of the method of valuing capital instruments based on their intrinsic values, which has a higher feasibility.

Intrinsic value: The difference between the fair value of the shares that the partners have the rights (conditional or unconditional) to purchase or receive and the price (if any) that the partners are required to pay for these shares. For example, one share option has an exercise price of VND 10.000, the fair value of the share on the market is VND 25.000 and the intrinsic value of the share option is VND 15.000.

Through this method, the value of share rights or share options is measured and recognized at their intrinsic value and is adjusted whenever each financial statement is presented based on the changes in its intrinsic value until the share options are exercised, canceled, or expire.

- Recorded in appropriate accounts of expenses and owner's equity

The Ministry of Finance needs to add an equity account to recognize the value of share options or share rights for the employees as below:

Account 410 – Share options/rights

Structure of this account:

Credit side: Reflects the value of share options or share rights that have not been exercised during the vesting period.

Debit side: Reflects the value of share options or share rights that have been exercised, canceled, or expire.

Credit balance: Reflects the residual value of share options or share rights that are not exercised during the vesting period.

This account must be opened in detail and tracked for each entitlement of rights in terms of both quantity and value.

The balance at the end of the period (end of quarter, end of year) of this account must be reflected as a separate item on the owner's equity section of the balance sheet, namely "Share options/rights"

The journal entries are recorded as below:

+ Record expenses during the transition period according to the value of share options allocated each year:

Dr. 627,641,642,622...

Cr. 410

+ When the share options/rights are exercised:

Dr. 111, 112: Based on the price of exercising rights

Dr. 410

Cr. 4111: Based on the par value

Cr. 4112: Surplus equity (if any)

+ In the case that the share options are measured based on their intrinsic value, it is necessary to make adjustments every time the financial statement is prepared or during the exercising period. The accounting treatment then is as follows:

+ Adjustment to an increase during the financial reporting period with unexercised share options:

Dr. Salary expense: 627,641,642…

Cr. 410

+ Adjustment to a decrease during the financial reporting period with unexercised share options:

Dr. 410

Cr. Salary expense: 627,641,642…

+ Adjustment to share options exercised at market stock price at the exercising time that is greater than the fair price during the financial reporting period of the adjacent year:

Dr. 111, 112: Based on the exercising price

Dr. 410: Based on book value

Dr. 642, 627, 641..: Difference in market price at the time of exercising - fair price at the financial reporting period of the adjacent year

Dr. 4111: Based on par value

Cr. 4112: Surplus equity (if any)

+ Adjustment to share options exercised at the market stock price at the time of exercising that is greater than their fair price during the financial reporting period of the adjacent year:

Dr. 111, 112: Based on the price of exercising rights

Dr. 410: Based on book value

Cr. 4111: Based on par value

Cr. 4112: Surplus equity (if any)

Cr. Salary expense: Difference of fair price during the financial reporting period of the adjacent year - market price at the time of exercising the rights

+ If the share options are not exercised:

Dr. 410

Cr. 4211

+ In the case that a company issues Treasury shares instead of new shares to employees with share options to be exercised, when employees exercise share options, the recording is as follows:

Dr. 111, 112: Based on the price of exercising rights (if any)

Dr. 410

Cr. 419: Based on book value

Cr. 4112: Surplus equity (if any)

+ Disclosure/presentation on financial statements:

Publicly traded companies must fully disclose information related to share-based payment transactions in accordance with the provisions of the standards, even if the share options have not been exercised, including:

+ Category and scope of share-based payment transactions.

Method for measuring the fair value of share-based payment transactions, particularly payment transactions using capital instruments, the fair value of capital instruments with specific description.

Presentation of the effect of share-based payment transactions paid by equity instruments, especially share options. This includes the effect of share options on the company's financial information such as profit and loss, the effect on diluted earnings per share, the ratio of profit growth, etc.

PERFECTING LEGAL REGULATIONS CONTRIBUTING TO IMPROVING THE EFFECTIVENESS OF THE FIGHT AGAINST CRIMES OF MANUFACTURING AND TRADING OF COUNTERFEIT GOODS.

Master, PhD candidate Nguyen Van Hieu[1]

Abstract: The article outlines and analyzes a number of practical issues and inadequacies when applying the Penal Code to handle crimes of manufacturing and trading of counterfeit goods in practice. The perception and application of the Penal Code in some cases does not guarantee accuracy, which may stem from imprecise provisions of various legal documents. From there, the author of the article proposes solutions that contribute to improving the provisions of criminal law and a number of other related legal documents to ensure that the provisions of the Penal Code are recognized and applied properly and synchronously in the fight against crimes of manufacturing and trading of counterfeit goods in the coming time.

Keywords: Crime of manufacturing and trading of counterfeit goods; Counterfeiting; Crimes violating economic management order in the fields of production, business and commerce; 2015 Penal Code;

1. CURRENT STATUS OF CRIMES OF MANUFACTURING AND TRADING OF COUNTERFEIT GOODS IN VIETNAM IN RECENT TIMES AND SHORTCOMINGS, LIMITATIONS IN THE LEGAL PROVISIONS ON CRIMES OF MANUFACTURING AND TRADING OF COUNTERFEIT GOODS IN THE PROVISIONS OF THE CURRENT PENAL CODE.

- Current status of crimes of manufacturing and trading of counterfeit goods in Vietnam in recent times: According to the report of the Police Department of investigating crimes of corruption, economics, and smuggling, Ministry of Public Security, from 2012 to 2022, the Economic Police force discovered and handled 9,716 cases of manufacturing and trading of counterfeit goods with 11,971 detained; Of these, 3,186 cases were prosecuted with 4,401 defendants; 6,281 cases with 7,036 subjects have been administratively handled; 349 cases with 534 subjects have been transferred to other forces to handle. The amount of goods seized was estimated to be worth over 338 billion VND (1): Crime statistics report of the Police Department of investigating crimes on corruption, economics, and smuggling). In recent years, the Economic Police force has actively and proactively conducted many activities to prevent and combat crimes of manufacturing and trading of counterfeit goods. However, in the process of fighting against the crime of manufacturing and trading of counterfeit goods, there are still many difficulties and obstacles that demand research into solutions, especially for shortcomings and limitations within regulations in criminal law and other legal documents related to the crime of manufacturing and trading of counterfeit goods in recent times.

In the chapter on economic offences, prescribed in the 2015 Penal Code amended and supplemented in 2017, crimes related to manufacturing and trading of counterfeit goods are specified in section I, group Criminal offences against regulations of law on production, business, and trade. Crimes of manufacturing and trading of counterfeit goods have particularly strict penalties, with penalties up to life imprisonment or death penalty, such as the crime of manufacturing and trading of counterfeit food or food additives Article 193 or the crime of manufacturing and trading of counterfeit medicines for treatment or prevention of diseases, with the remaining crimes of manufacturing and

---

[1] Faculty of Law, People's Police Academy.

trading of counterfeit goods all have penalties of up to 15 or 20 years in prison. That demonstrates the level of danger this type of crime is. The perpetrator of the crime can leave behind particularly devastating consequences for the victim, and in many cases leading to fatalities in many cases of manufacturing and trading of counterfeit goods. That consumers can use, such as counterfeit food or counterfeit medicines for treatment or prevention of diseases.

In addition, in terms of ethics, the acts of manufacturing and trading of counterfeit goods, especially goods such as food or medicine, seriously violate human ethics. In a civilized society, those who manufacture and trade counterfeit food have full knowledge that they are dangerous to society, and consumers will peruse those foods or food additives harmful to the health and lives of consumers, yet for profit and personal gain, they still commit such acts. Even more dangerous are those who produce and sell counterfeit medicines for treatment or prevention of diseases. They prey on sick people, patients who are suffering in every way to manufacture and trade counterfeit drugs, profiting on their bodies and suffering during their illness. It can be said that these acts are immoral and are heavily condemned by society.

Therefore, regulating these crimes with very strict penalties will have a great deterrent effect on criminals, but in reality, manufacturing and trading of counterfeit goods can bring in huge profits, so the criminals still disregard the prohibition, disregard the strict penalties, trample on human dignity and morality, to commit crimes blinded by the profit brought by manufacturing and trading of counterfeit goods. It is required that the measures taken against crime must be more drastic in the coming time to minimize the consequences caused by this type of crime.

Crimes of manufacturing and trading of counterfeit products include: Article 192: Manufacturing and trading of counterfeit goods; Article 193: Manufacturing and trading of counterfeit food or food additives; Article 194: Manufacturing and trading of counterfeit medicines for treatment or prevention of diseases and Article 195: Manufacturing and trading of counterfeit animal feeds, fertilizers, veterinary medicines, pesticides, plant varieties, animal breeds

Based on the provisions of the Penal Code, it can be understood that: Crimes of manufacturing and trading of counterfeit products are socially dangerous acts, specified in Section I, group Criminal offences against regulations of law on production, business, and trade, are the act of producing (making), trading (exchanging) products with complete knowledge that they arre counterfeit goods to gain profits that violate the economic management order, through that damaging the economy and harming consumer rights.

Researching crimes of manufacturing and trading of counterfeit productse of counterfeit goods as well as the handling of these crimes in practice in recent years, the author has noticed a number of inadequacies in the provisions of law leading to incorrect and inaccurate application, causing many difficulties in combating crimes.

First, there is no specific definition of counterfeit goods, crimes of manufacturing and trading of counterfeit products.

Currently, to identify counterfeits, one can refer to account 1, Article 7 of Decree No. 98/2020/ND-CP dated August 26, 2020 of the Government regulating penalties for administrative violations in commercial activities. , manufacturing and trading of counterfeit and banned goods and protection of consumer rights (Decree No. 98/2020/ND-CP) for 06 groups of counterfeit goods. However, this is only a regulation on handling administrative violations. In addition, crime of manufacturing and trading of counterfeit products is only regulated in Article 192 of the 2015 Penal Code, amended and supplemented in 2017 (2015 Penal Code), without a specific definition of crime of manufacturing and trading of counterfeit products

According to the provisions of the Penal Code, the signs of criminal acts of crimes of manufacturing and trading of counterfeit products are quite clear, determining the crime for (convicting) the criminal violations of these crimes is (probably) undisputed. However, a rising problem is that criminals are engaged in cross-border trading of counterfeits. The act of trading counterfeit goods across borders will be prosecuted for smuggling (Article 188 of the Penal Code) or crimes of producing and trading in counterfeit goods (according to Articles 192 to 195 of the Penal Code, depending on the corresponding counterfeit goods specified in these Articles) with aggravating factor "cross-border trading" (point l, clause 2, Article 192 or point e, clause 2, Articles 193, 194, 195 of the Penal Code)?

In reality, "possibly" due to incorrect perception of the law, there are cases where criminals have committed acts of trading (importing) counterfeit medicines across the border, but during trial, the Court convicted the offender of smuggling (2 Le Dinh, former General diirector of VN pharma, having imported counterfeit cancer medicines, was sentenced to 12 years in prison http://baophapluat.vn/phap-dinh/nguyen-tong-giam-doc-vn-pharma-nhap-thuoc-tri-ung-thu-gia-nhan-12-nam-tu-351090). However, when responding to frustrations of the public about the crime in this case, there exists opinions that, "Regarding the crime, there are opinions that it should be handled as a crime of "smuggling" or "Manufacturing and trading of counterfeit medicines for treatment or prevention of diseases".

Thus, from this real case, it has been found that the provisions of the current Penal Code do not stipulate the definition of crimes of manufacturing and trading of counterfeit products or what the definition of counterfeit goods. Therefore, there are many cases where there is confusion in determining whether it is smuggling or trading of counterfeit products, because for smuggling the first and most important object is commodity. But the law does not specify or limit what kind of goods they are, must they be genuine goods or not, the law has not specified and there is no guiding document. As such, there are cases of illegal cross-border trading of goods that cannot be determined whether it is a case of smuggling or trading in counterfeit goods. Here, the key issue is whether the sign of "goods" (object of smuggling) specified in Article 188 of the Penal Code include counterfeit goods or not? If "goods" does not include "counterfeit goods", then incorrect perception of law is due to insufficient level of laww enforcement offices. However, if "goods" include "counterfeit goods", then the assessment of the act of cross-border trading of "counterfeit medicines" is possible. Because of that, iis necessary to redefine goods in smuggling to include specific types of goods, to avoid confusion in determining the crime between smuggling and manufacturing and trading of counterfeit goods when there is a factor of illegal cross-border trading.

Second, there is still confusion with some other crimes.

- Confusion with crimes of infringement of industrial property rights (3.Check Article 226 infringement of industrial property rights, 2015 Penal Code amended and supplemented in 2017): Up to now, distinguishing crimes of counterfeit goods from crimes of infringement of industrial property rights has always been a controversial issue. Based on the concept of counterfeit goods specified in Clause 7, Article 3 of Decree No. 98/2020/ND-CP, it can be classified into the following three types: (i) Counterfeit goods in terms of content (or quality, use value of goods); (ii) Counterfeit goods in terms of appearance (counterfeit designs, brands, names, origin... of goods); (iii) Counterfeit goods in terms of both content and form.

Affected objects of the crime of infringement of industrial property rights are goods with counterfeit trademarks and geographical indications that are registered for protection in Vietnam. The affected objects of counterfeit goods crimes are, of course, counterfeit goods. However, there is an overlap when there are cases of criminal acts of counterfeiting in terms of form or counterfeiting in terms of both content and form, more specifically, how to handle using counterfeit trademarks or geographical indications printed on product labels?

Up to now, the competent authority has not yet issued a guiding document unify the handling of which goods are considered counterfeit trademarks and which goods are considered infringing on industrial property rights on trademarks and geographical indications. Many people believe that if one produces goods bearing the brand name of another manufacturer or violating geographical indications that are protected in Vietnam (only counterfeit in terms of form) yet the quality or use valueof the goods is equivalent to genuine goods, that is considered an infringement of industrial property rights. In cases where goods are produced under the brand name of another production facility or the origin, geographical indication of the goods is incorrect and the quality of the goods (use value) is not guaranteed, this must be considered manufacturing of counterfeit goods

- Confusion with the crime of smuggling (4 Check Article 188 the 2015 Penal Code amended and supplemented in 2017) in the case of illegally trading goods across borders, because the determination of the content of goods in the crime of smuggling is not clear in the provisions of the current Penal Code.

- Confusion with the crime of obtaining property by fraud (5 Check Article 174 the 2015 Penal Code amended and supplemented in 2017): Because the nature of the criminal acts in these two crimes is deceitful, therefore, in theory as well as in practice, the distinction between the two is necessary.

- Confusion with the crime of deceiving customers (6 Check Article 198 the 2015 Penal Code amended and supplemented in 2017): in the crime of deceiving customers, the offender’s act of weighing, measuring, gauging, counting incorrectly is clearly distinct from the crime of manufacturing and trading of counterfeit goods, but the issue of whether the act of utilizing fraudulent tricks overlap with the act of trading of counterfeit goods needs to be clarified.

Third, there is no clear distinction between poor quality goods, imitating goods and counterfeit goods.

Regarding this issue, currently in practice and theory there is the use of terms such as imitating goods and poor quality goods, especially in cyberspace, the sale of poor quality goods is rampant on the market, but in terms of current legal regulations, there are no documents defining and distinguishing these types of goods from each other, leading to difficulties in fighting and handling these violations. . In Joint Circular No. 10/2000/TTLT-BTM-BTC-BCA-BKHCNMT dated April 27, 2000 of the Ministry of Trade, Ministry of Finance, Ministry of Public Security, Ministry of Science, Technology and Environment guiding implementation of Directive No. 31/1999/CT-TTg dated October 27, 1999 of the Prime Minister on fighting against the manufacturing and trading of counterfeit goods introduces the concept of counterfeit and poor quality goods. Currently, current legal documents no longer have records of the term poor quality goods, but only regulate counterfeit goods in Decree No. 98/2020/ND-CP. However, in practice, it is necessary to distinguish between poor quality goods and counterfeit goods. In addition, the 2015 Penal Code is in effect, but the basis for distinguishing the aforementioned crimes is unclear, and at the same time, with the current complicated crime situation, if there is no unified guidelines, it will hinder proceedings-conducting agencies in investigating, prosecuting and adjudicating counterfeit goods cases.

Fourth, problems when handling criminal liability of commercial legal entities.

A new factor in the group of crimes related to counterfeit goods is that commercial legal entities can also be the subject of this crime. However, the question is, when will the criminal liability of legal entities be handled? When researching cases of counterfeit goods, the author found that in many cases criminals established legal entities and, on behalf of legal entities, manufactured and traded counterfeit goods. So, in what cases will a commercial legal entity be criminally responsible for this act?

According to Clause 2, Article 75 of the 2015 Penal Code: "The fact that corporate legal entity has criminal responsibility does not exempt criminal responsibility of individuals," there is no change to defendants being prosecuted for criminal liability. Article 75 of the 2015 Penal Code stipulates the conditions for the criminal liability of commercial legal entities with the following three conditions: (i) The criminal offence is committed in the name of the corporate legal entity; (ii) The criminal act is committed in the interests of a commercial legal entity; (iii) The offense was committed under instructions or approval of the commercial legal entity. However, the condition of whether the criminal act is committed in the interests of the commercial legal entity or not needs to be considered.

Many commercial legal entities jointly commit crimes, the issue of personalizing criminal responsibilities of members of the criminal commercial legal entity needs to be more clearly defined to benefit the process of law enforcement.

2. RECOMMENDATIONS FOR PERFECTING LEGAL REGULATIONS CONTRIBUTING TO IMPROVING THE EFFECTIVENESS OF THE FIGHT AGAINST CRIMES OF MANUFACTURING AND TRADING OF COUNTERFEIT GOODS.

First, it is necessary to introduce the concept of counterfeit goods; Counterfeit goods that are food, and food additives; Counterfeit goods that are medicines for treatment or prevention of diseases; Counterfeit goods that are animal feeds, fertilizers, veterinary medicines, pesticides, plant varieties, animal breeds. In reality, identification of counterfeit goods is based on Decree No. 98/2020/ND-CP. However, this is only a decree regulating the sanctioning of administrative violations, and in this decree, only groups of counterfeit are introduced without a definition of counterfeits for practical application. To avoid getting overlap between laws when applied, it is necessary to soon have guiding document in regard to this. On the other hand, if the current concept of counterfeit goods is invoked, distinguishing it from some other crimes, especially the crime of infringing upon industrial property rights, is quite difficult when the object is a counterfeit product of the act of manufacturing and trading of counterfeit goods (in terms of form) and of acts of infringing upon industrial property rights both have the same content, that is, using counterfeit trademarks or illegally using geographical indications printed on goods labels. . Thus, in cases of counterfeit in terms of form and intellectual property infringement of industrial styles and commercial indication objects such as: Trademarks, names of origin of goods, address indications. ... How to handle these crimes has not yet been resolved.

Accordingly, if the concept of counterfeit goods is introduced as the object of activities of counterfeit goods crimes, it is necessary to specifically stipulate: "Goods in one of the following cases are counterfeit goods: (i) Cases of counterfeit goods in terms of content: Goods have no use value, utility or use value and utility inconsistent with the natural origin and name of the goods; has use value, utility inconsistent with declared or registered use value, utility; Goods that have at least one of the quality criteria or technical characteristics that create use value and utility of the goods only reach 70% or less of quality standards and technical regulations that are registered, declared or recorded on labels and packaging of goods; Medicines for treatment and prevention of diseases for humans and animals do not contain residues, have pharmaceutical ingredients inconsistent with the registered amounts, insufficient registered pharmaceutical ingredients, medicinal ingredients different from those listed on the label or packaging; Pesticides without active ingredients, or with active ingredients that only reach 70% or less of the registered quality standards and technical regulations, and with active ingredients different from those listed on the label or packaging rowization. (ii) Cases of counterfeit in terms of appearance (counterfeiting goods and packaging), including: Goods with labels or packaging impersonating another trader's name and address r; Goods with labels or packaging containing falsified instructions on the origin of the goods, place of production, packaging, and assembly of goods whose quality does not correspond to the quality standards of genuine goods; goods with counterfeit trade names, goods names, deed registration codes, bar codes, industrial styles, and goods packaging of other traders. (iii) In case the products are counterfeit stamps, labels, and packaging, they are also considered counterfeit goods.

It is necessary to quickly amend documents that contain (definitive) regulations on "counterfeit goods". Specifically, consider amending and introducing the concept of counterfeit goods in a number of specialized laws, such as the Pharmacy Law, foreign trade management law, and Product Quality Law. In addition to these documents, other documents with regulations related to counterfeit goods, counterfeit drugs, and other counterfeit products must also be quickly examined and edited by the agencies (which have promulgated documents) to ensure accuracy of regulations, through that enauring correct perception and unified law application in practice.

Second, it is necessary to issue an unified guiding documents to distinguish between crimes related to counterfeit goods or other types of crimes, especially crimes of infringing on industrial property rights. Currently, the 2015 Penal Code has taken effect, but the basis for distinguishing the above crimes is unclear. At the same time, with the current complicated crime situation, the lack of a guidance unified document will prove very difficult for proceedings- conducting agencies in investigating, prosecuting and adjudicating counterfeit goods cases in particular and other crimes in general.

Third, it is necessary to issue unified guidance documents on quantifying the value of goods such as "counterfeit goods are equivalent to genuine goods", "illegitimate profits" and "causing property damage" and legal responsibilities of commercial legal entities when committimg acts of manufacturing and trading of counterfeit goods to ensure consistency in the process of fighting against the crime of manufacturing and trading counterfeit goods.

A STUDY ON ENVIRONMENTAL ACCOUNTING INFORMATION DISCLOSURE AT DEVELOPED COUNTRIES AND IMPROVEMENT MEASURES FOR VIETNAM

MSc. Ngo Quang Tuan[1]

Abstract: *Natural resources and ecological environment are the basis for human survival. With the increasing severity of the contradiction between economic development and environmental protection, the public is paying more and more attention to environmental information of the companies. From the perspective of disclosure regulation, discosure content and disclosure mode, this paper study the differences in environmental accounting information disclosure in some developed countries: the United States, Great Britain, Germany, Japan, and China, and then puts forward some suggestions for improving the environmental accounting information disclosure system in Vietnam.*

Key words: *Environmental accounting information, Information disclosure, Sustainable development, Listed Company.*

1. INTRODUCTION

In situation of development of the economy, the contradiction between human society and the natural environment is becoming increasingly obvious. As the main subjects participating in economic activities, companies must have the main responsibility in promoting sustainable development. The sustainable development of the economy cannot be separated from the behavior of companies. Environmental protection activities and environmental accounting information disclosure behavior of companies play a vital role in creating a transparent, healthy and sustainable development environment. Currently, the disclosure of environmental accounting information in Vietnamese enterprises still has many limitations, so it is necessary to improve the disclosure of environmental accounting information in Vietnam. The paper selects some of countries which have relatively good environmental accounting information disclosure systems, including the United States, Great Britain, Germany, Japan and China and then conduct to analysis the environmental accounting information disclosure systems in those countries from many different aspects including: legal regulations, accounting standards, disclosure content and disclosure forms. From the study, the author puts forward some suggestions for improving the environmental accounting information disclosure system in Vietnam.

2. THE ENVIRONMENTAL ACCOUNTING INFORMATION DISCLOSURE SITUATION IN DEVELOPED COUNTRIES

2.1. Environmental accounting information disclosure in the United States

Environmental accounting in the United States appeared in 1972, after the Environmental Summit in Stockholm - Sweden in 1972, but at that time it only focused on accounting at the national level, also known as Environmental National Accounting. Environmental accounting in businesses began to be researched in 1990, and the US Environmental Protection Agency conducted a project on environmental accounting in 1992. The task of the project were encouraging and promoting enterprises to fully aware of aspects of environmental costs, the relationship between environmental and cost and environmental factors in business decisions. Environmental accounting in the United

[1] Email: tuannq@hvnh.edu.vn, Banking Academy of Vietnam.

States was born from public pressure and environmental protection movements. The public pressure requires businesses to pay attention to environmental issues during their operations, thereby it impact on the environmental policy of the US Government. The policy requires businesses to compensate for damage causing environmental incidents; the policy also requires businesses to limit waste and must clean up waste from businesses operations. It affect to businesses by increasing costs, impacting potential debt therefore affecting stock prices and shareholder benefits.

Subsequently, bills related to environmental disclosures were introduced which required companies to disclose data of pollution emissions and clarify those companies are responsible for environment pollution causing by their activities. The most important point is that government holds companies responsible for not only current environmental problems but also for pollution caused in the past which giving rises to environmental legal liability (Li, 2013). Those bills are built on the basis of a complete and synchronous legal system, primarily based on laws such as: Law on National Environmental Policy, Law on Environmental Cleaning, Law on Water Cleaning, Dangerous Species Law, Sarbanes - Oxley Law (This law affects the recording and reporting of environmental information in corporate financial statements). An important feature of the requirements of accounting system for environmental accounting information disclosure is combination of mandatory information disclosure and voluntary information disclosure, the United States has done relatively well in mandatory disclosure. The Securities and Exchange Commission requires listed companies to disclose environmental accounting information in their 10-K financial statements, a comprehensive report filed annually by listed companies to make a public of financial activities which is required by the US Securities and Exchange Commission from 1973. In addition, this agency issued "Staff Accounting Bulletin No. 92," a summary of the US Securities and Exchange Commission staff's position on how to adopt Generally Accepted Accounting Principles (GAAP) in 1993, requires companies to privately disclose information on environmental legal liability, environmental costs and environmental compensation. The environmental accounting framework issued by the US Environmental Protection Committee is the basis document for building the environmental accounting framework of the United Nations Division for Sustainable Development, the International Federation of Accountants and the Institute of Management Accountants.

The type of environmental accounting disclosure information can be divided into qualitative and quantitative information. The United States companies primarily address environmental issues from legal liability perspective, so they need to explain the impact of uncertain environmental issues on their future operations. Therefore, the United States companies take care to quantitative information. The United States companies often disclose environmental data in their financial statements because environmental liabilities and environmental costs are closely related to their financial statements. Besides financial statements, companies also disclose environmental accounting information through out other methods such as press conferences and internet (Fu, 2018).

2.2. Environmental accounting information disclosure in Great Britain

In Europe, the implementation of environmental accounting is not yet mandatory which means it is not within the scope of accounting standards. However, Great Britain is one of the countries that require businesses to publish environmental reports. In the 1950s, the London smog incident directly prompted the creation of the "Clean Air Act". Since then, the government has enacted a number of environmental laws. Among some of the bills which is most relevant to environmental disclosure is the environmental protection law introduced in 1990. The bill stipulates that companies must provide information related to environmental goals, Environmental protection measures and environmental performance results in financial reports. The act of disclosing environmental information becomes the legal responsibility of enterprises. However, accounting standards in Great Britain mainly encourage and guide companies to disclose environmental information voluntarily; there are relatively few mandatory measures. In addition to issuing guidelines, there are national competitions and awards to encourage companies to disclose high-quality environmental accounting information which Great Britain has already done. Morover, Great Britain also attaches importance to quantitative information to ensure the quality of environmental information. Enterprises can voluntarily disclose environmental accounting information in accordance with government guidance and quantitative financial information mainly related to environmental costs and environmental obligations. The disclosure methods of companies in Great Britain are similar in the US, with financial statements as the main channel and other channel as supplementary methods.

2.3. Environmental accounting information disclosure in Germany

Environmental accounting in Germany was introduced in 1980 by the Statistical Office of the Federal Republic of Germany, but they focused on the accounting for environmental costs and energy flows at the national level. Environmental accounting in Germany was raised from the pressure of global environmental issues such as: Greenhouse effect, ozone layer depletion, scarcity of water and energy resources..., these are expected to affect the sustainable development of the business in the future. In 1995, in Germany, we researched and implemented the Input - Output Table project, which reflected the flow of materials and energy within the economic system and between the economic system and the natural environment within human activities. In 1996, the Ministry of the Environment of the Federal Republic of Germany published a guidance document on environmental accounting mainly focusing on serving corporate governance. Environmental accounting in Germany was introduced and built on the basis of a complete and synchronous legal system, which is primarily based on laws such as: National Environmental Law, Recycling and Waste Law (This law stipulates that enterprises must reduce waste, analyze the Input - Output Table in each stage of operation and all activities in the enterprises), Law on environmental debts, Law binding companies to be responsible to the environment throughout the product's life cycle...

The publication of environmental accounting information mainly focuses on the content of material flows, analyzing input - output tables, determining the amount of raw material, energy, and water used annually, and determining the amount of emissions, wastewater, and solid waste every year. Environmental accounting of Germany focuses on the use of physical measures (Physical Accounting). The Federal Republic of Germany is the world's leading country in material accounting and material flow cost accounting models. According to the experience of companies in Germany, applying environmental protection measures and applying environmental accounting will increase overall costs and also environmental costs. However, this application will help businesses make decisions on technical changes, management system, product strategies towards green products, and the use of environmentally friendly materials. This change leads to the cost saving for raw materials, energy, water, waste treatment, improving productivity and operational efficiency (Huynh Duc Long, 2015).

2.4. Environmental accounting information disclosure in Japan

Environmental accounting in Japan was born from the pressure of scarcity and stress on resources and environment that affect Japan's sustainable development. A particularly urgent task for Japan is to solve the problem of waste from production and consumption processes. Every year Japan releases about 450 million tons of waste into the environment, and landfills have run out of space. This pressure requires Japanese businesses and the Government to pay attention to environmental issues and environmental accounting (Huynh Duc Long, 2015). Environmental accounting in Japan was first researched by the Ministry of Environment in 1997. In 1998, the Japanese Institute of Certified Public Accountants researched the situation of using environmental cost information to manage environmental issues. 1999 was the first year that environmental accounting was applied in Japan. In detail, in March 1999, the Committee on Environment issued guidance on measuring and reporting environmental costs in businesses. In July 1999, the Japan Business Administration Association established an Environmental Accounting research group, carrying out research projects on 12 leading Japanese companies such as: Toyota, Fuji, Ricoch, Canon, Fujitsu, etc. , this group has developed methods and techniques of Environmental Accounting to serve the internal management of businesses. In September 1999, the Japanese Ministry of Industry and Trade established a committee on Environmental Accounting to research and develop tools on Environmental Accounting. In 2000, the Japanese Ministry of the Environment released Environmental Accounting guideline to encourage companies to voluntarily public environmental information through corporate environmental reporting. In 2002, this guide was supplemented, revised, and republished. In March 2002, the Committee on Environmental Accounting of the Ministry of Industry and Trade of Japan, after 3 years of research, completed a project on environmental management accounting and in June 2002 published a document guiding accounting practices on environmental governance. The application of Environmental Accounting in Japanese businesses has the following characteristics:

According to the experience of Japanese companies, applying environmental protection measures and applying environmental accounting will increase the economic efficiency of the business and the effectiveness of environmental protection. In 2001, Toyota applied environmental accounting and benefited billions of yen each year due to reducing energy use, reducing waste treatment costs and cleaner production technology. Canon initially applied material flow accounting for a process, then for a product and expanded to the entire corporation, so it has reduced glass waste, waste, etc. and researched to produce thinner and better quality for glass material. In 2000, Ricoch implemented environmental protection measures and applied environmental accounting to calculate the cost of environmental protection and management activities to be 66 million USD, but the benefits were 79 million USD. This shows that Japanese companies apply environmental accounting focusing on material flow accounting, environmental cost and income accounting, ecological balance sheet analysis, and product life cycle analysis, determine the amount of raw materials, energy, and water used annually, determine the amount of wastewater emissions and solid waste annually. Japanese environmental accounting emphasizes the use of both physical measures and value measures in the accounting process. Japan is a latecomer in researching and applying environmental accounting, but has made the most of the experiences of other countries such as the United States, Germany, and England, so it has applied it very successfully at the business, region and country level. With various measures to encourage the disclosure of environmental accounting information, the rate of Japanese companies preparing environmental reports has increased dramatically in recent years.

Japanese environmental accounting was built and developed on the basis of a complete and synchronous legal system, with special attention from Government agencies, specifically the Ministry of Environment and Ministry of Industry. The Ministry of Environment focuses on Environmental Accounting in terms of providing environmental information to audiences outside of businesses. The Ministry of Industry and Trade focuses on Environmental Accounting in terms of providing environmental information to managers within businesses. Japanese law specifies the respective environmental responsibilities of nations, localities, businesses, and individuals, and grants local public groups certain powers to develop environmental regulations that are suitable for the locality.

Accounting standards in Japan mainly encourage companies to voluntarily disclose environmental information with relatively few mandatory measures. Authorities have established a number of guidelines to help companies know how to disclose environmental information to the public, which makes environmental information more standardized and valuable. For example, the "Environmental Accounting Guidelines" and "Environmental Reporting Guidelines" in Japan have greatly helped companies in disclosing environmental information in a standard manner.

Japan's environmental accounting information is more detailed than that of some other countries. The information includes two main parts: environmental costs and environmental benefits, divided into more detailed information types (Lai, 2016). Environmental information of Japanese companies is presented in the Annual Environmental, Social and Financial Reports.

2.4. Environmental accounting information disclosure in China

The promulgation of the "Environmental Protection Law" in the late 1970s marked the beginning of the construction of China's environmental legal system. Since then, the government has enacted a series of environmental laws and regulations to apply water management, air management, oceans management, minerals management, noise management and waste management. When it comes to the disclosure of environmental information, most of these laws reflect an administrative management perspective, requiring pollution companies to report environmental information to environmental management agencies. For companies that exceed emissions standards are required information disclosure more stringent. It shows that Chinese government is especialy interested in environmental accounting with the basis of a synchronous legal system which will facilitate for construction and development of environmental accounting.

Regarding accounting standards, agencies that build regulations to environmental accounting information disclose include the Ministry of Environmental Protection, the Ministry of Finance, the Securities Commission and the Stock Exchange. The Ministry of Environmental Protection has issued many regulations that limit companies's environmental accounting information disclosure. There are also regulations on the method and content of information disclosure as well as special regulations for enterprises causing heavy pollution and regulations related to the assessment of environmental behavior of enterprises. Compared with the regulations of the Ministry of Environmental Protection, the regulations of the Securities Commission and the Stock Exchange are relatively simple. They primarily require companies to provide necessary environmental accounting information in documents such as prospectuses and legal opinions when issuing stock to the public. The Stock Exchange also issued a number of documents regulating companies's environmental information disclosure such as "Guidelines for disclosing environmental information of listed companies". The Ministry of Finance stipulates that businesses must separately list "emission fees" and "green fees" in the notes of their financial statements.

The content of Chinese companies's environmental accounting information disclosure is quite diverse. Research by Shen & Chen (2020) clearly shows that diversity through the data in the table 1, companies are highly proactive in choosing the content of environmental information disclosure and the quality of environmental information disclosure is currently uneven. The rate of disclosure of qualitative information is generally higher than quantitative information and the rate of disclosure of beneficial information to businesses such as environmental protection certificates and awards is also much higher than negative information such as environmental protection fines and environmental violations.

Source: Shen & Chen (2020)

Content classifications			Number of companies	Proportion of companies
Monetary information	Environmental asset	Environmental facilities	139	42.12%
		Emission rights&mining rights	102	30.91%
	Environmental liability	Environmental governance deposit	42	12.73%
		Contingent liabilities	37	11.21%
	Environmental cost	Total environmental expenditure	128	38.79%
		Emission fees&greening fees	139	42.12%
		Resource tax	97	29.39%
		Environmental fines	10	3.03%
	Environmental benefit	Environmental rewards and subsidies	236	71.52%
		Tax incentives	52	15.76%
Non-monetary information	Quantitative information	Resource consumption&pollution discharge	170	51.52%
		Energy conservation	89	26.97%
	Qualitative information	Environmental concerns	312	94.55%
		Environmental risks	147	44.55%
		Environmental emergency plan	161	48.79%
		Environmental protection agency and management system	168	50.91%
		Environmental technology and facilities	249	75.45%
		Environmental protection publicity and training	75	22.73%
		Environmental violations	16	4.85%
		Environmental certification and honor	140	42.42%

Table 1: Content of environmental accounting information disclosure in China

To understand exactly how Chinese enterprises disclose environmental accounting information, Shen & Chen's (2020) study uses data from companies in heavy polluting industry listed on the Shanghai stock exchange in 2017 as research evidence. The data show that Chinese enterprises disclose environmental accounting information using a variety of means such as annual financial reports, social responsibility reports, sustainable development reports, environmental reports and governance, social and environmental reports of 330 companiesa. The data were obtained from the Shanghai Stock Exchange website and the companies' official websites. In addition to reporting on the media, social networks and other transmission methods, companies mainly disclose environmental accounting information through reports such as annual financial reports, social responsibility reports, sustainable reports, environmental reports and environmental, social and governance reports. The results of measuring the information disclosure rate of these 5 reports are shown in Table 2. It can be seen that, in addition to financial statements, companies mainly disclose environmental accounting information through social responsibility reports and sustainable development reports. It is worth noting that although environmental accounting reports are the most professional way of environmental information disclosure but the current participation rate in providing environmental accounting information is still low.

Source: Shen & Chen (2020)

	financial report	social responsibility report	sustainable development report	environmental report	environmental, social and governance report
Number of companies	322	133	6	9	5
Proportion of companies	97.58%	40.30%	1.82%	2.73%	1.52%

Table 2: Form of environmental accounting information disclosure in China

3. IMPROVEMENT MEASURES FOR THE ENVIRONMENTAL ACCOUNTING INFORMATION DISCLOSURE IN VIETNAM

Through the analysis of environmental accounting in some of the above countries, including long-standing developed countries and countries with similar geographical locations to Vietnam, can be applied to build environmental accounting at Vietnamese enterprises as follows:

Firstly, to apply environmental accounting in businesses requires the improvement and system of legal policies that are complete, synchronized and with close cooperation of government agencies related to environmental and accounting issues, environmental protection organizations, professional associations such as: Accounting Association, Environmental Protection Committee, etc., for developing countries like Vietnam which need support from international financial organizations such as: World Bank, International Monetary Fund, etc.

Secondly, goverment shoud be encouraging the public to pay attention to envionmental protection and disclose environmental accounting information. Because applying environmental protection measures and environmental accounting will lead to saving materials costs, energy, water, and waste treatment costs. It helps businesses to make decisions on technical changes, management organization systems, product strategies towards green products, and using of environmentally friendly materials, thereby improving business efficiency associated with effectiveness of environmental protection.

Thirdly, in the early stages, the application of businesses environmental accounting in many countries is voluntary; government agencies only issue instructions for businesses to implement environmental accounting. In reality, companies that implement environmental accounting have increasing business efficiency, creating motivation for all other businesses to apply environmental accounting, so government agencies that related to environmental and accounting issues, it is necessary to promulgate environmental accounting standards and regulate environmental information presented in reports provided to outside businesses which ensure unification of environmental management. It is also very important to promote environmental auditing to improve the reliability of environmental information.

Finally, depending on the technical facilities, capacity and management level at each period of each enterprise, contents of environmental accounting can be emphasized differently, but basically the content of environmental accounting including: material flow accounting; product life cycle analysis; environmental cost and income; evaluate responsibilities in environmental management and present environmental information in corporate reports.

Vietnamese companies still have differences, depending on the technical facilities, capacity and management level at each period; they can implement the contents of environmental accounting in each stage, each product, and each department or for whole enterprise.

CONCLUSION

Environmental information matters a lot. The government uses environmental information for decision making, the public uses environmental information to care about the earth's ecological environment, and companies shape an eco-friendly image by using positive environmental information. Knowing the source and content of environmental information, especially the environmental accounting information provided by the company, is helpful to environmental protection. Through content analysis method , this paper research the characteristics of environmental accounting information disclosure from many different aspects at some developed countries. The study concludes that there are valuable results of environmental accounting information disclose in some developed countries and proposed some improvement measures in Vietnam.
