ACADEMY OF FINANCE

The Academy of Finance (AOF) is a public and research-oriented university, affiliated to the Ministry of Finance, Vietnam. The AOF was officially established under the Decision No 120/2001/ QD-TTg dated August 17th, 2001 of the Prime Minister by integrating Hanoi University of Finance and Accounting (founded in 1963), the Finance Research Institution (founded in 1961) and the Financial Training Center (founded in 1995). The main campus of the Academy of Finance is located in Hanoi.

The mission of Academy of Finance is to provide expertise in research and training of professional finance and accounting to the society. This mission has been defined for our 55-year history with outstanding achievements and contributions branded by our lecturers, researchers and students. The AOF established self-evaluation council since 2006 according to regulations of MOET Vietnam. This council significantly helped to improve the academic performance, and in April 2016, AOF was accredited by Center for Education Accreditation (CEA) – Association of Vietnam Universities and Colleges (AVUC). The accreditation result was published according to the Decision 10/QD-KDCLGD dated February 20th, 2017 of AVUC ranking AOF in top 5 best universities in Vietnam. The Academy of Finance offer a high quality of training and research through 14 faculties including Fundamental Sciences, Political theories, Public Finance, Tax and Customs, Corporate Finance, Banking and Insurance, International Finance, Accounting, Business Administration, Economic Information, Foreign Languages, Economics, Postgraduate Education, In-service training, and 02 centers: Center for Languages and Informatics Training, Information Technology Center, 2 research institutes: Institute for International Finance Education (IIFE) and Institute of Economics and Finance and 13 support divisions. AOF offers a rich training programs included ordinary undergraduate/graduate programs spread in 06 academic majors: Finance and Banking, Accounting and Auditing, Business Administration, Management Information, Economic and Financial English, Economics. The AOF also offer to international and Vietnamese students with different choices partially/totally taught in English such as High Advanced Program or Dual Degree Programme (DDP - a Joint Training Progamme between the Institute of International Finance Education - Academy of Finance and the University of Greenwich (UK). Throughout its history, AOF's qualified scientists and lecturers have been supporting more than 85,000 students including 5,000 masters and 300 doctors and additionally 500 international students for Laos and Cambodia for the past 55 years. Significantly, a large number of AOF's graduates are leaders of the Government, ministries, local authorities and businesses. The academy has also been recognized for conducting thousands of valuable research projects for the policy makers in economic development of the State. The rich tradition and custom makes AOF unique among the other universities and colleges in Vietnam and attracts thousands of learners to study at the academy annually. The valuable contributions of AOF to the development of the State in training and doing research has been respected publicly, therefore, the academy has been recognized with national unique awards. Many AOF alumni are key people in the Government and Local Administrations. In the process of globalization and the advent of the Industry 4.0, the AOF Management Board sets out the following major development directions:

- Intensively develop training and research performance, maximize the core values to adapt to the emerging demands of the intellectual economy and the Industry 4.0.

- Diversify training courses, renovate academic management measures, improve the professional capacity, and improve self-study spirit with creativity and experience.

- Improve the research capacity in the manner that harmonizes fundamental studies with applied studies. Actively and comprehensively integrate into regionalization and globalization process regarding training, capacity building and research activities.

- Conduct academic management reform in close relation with financial autonomy and social accountability, create a new academic environment with high openness, creativity and internationalism, continuously attract excellent staffs and scholars to work and do research at AOF.

THE NATIONAL INSTITUTE FOR FINANCE

The National Institute for Finance (hereinafter referred to as the NIF), formerly the Financial Science Institute, was established in 1961. NIF is a public organization of science and technology, engages in fundamental and comprehensive research and studies on domestic and international issues in fiscal and economic fields, specialized in policy matters, as a think-tank of the Ministry of Finance.

Key missions of NIF assigned by the Finance Minister include (1) Research and develop the national financial strategies, fiscal and monetary policies; (2) Conduct basic and applied scientific research in the field of finance; (3) Organize financial and economic analysis and forecasting activities; research and assess the impact of financial policies on socio-economic development and sustainable growth; (4) Organize the establishment of financial databases and information systems, edit and publish journals, research publications, and documents on strategic and financial policies; (5) Manage the research and technological activities of the financial sector; (6) Participate in training and consulting in the field of finance; (7) Propose and organize the implementation of international cooperation activities and (8) Perform other tasks assigned by the Finance Minister.

Vietnam has entered a new period of development, intensified international integration, and opened up numerous opportunities as well as challenges. NIF has played a crucial role in shaping financial policies and improving financial legislation. NIF has analyzed and evaluated the impacts of important policies such as corporate income tax, personal income tax, excise tax, state-owned enterprise restructuring, and budget management. Acknowledged by the leaders of MOF for the experience and success in constructing the Finance Development Strategy for the period 2001 – 2010 and 2011-2020, NIF continues to be trusted to lead and coordinate with related departments of MOF to develop the Finance Development Strategy by the year 2030. The Finance Development Strategy by the year 2030 aims to concretize major policies and orientations of the Communist Party and the State regarding the finance-budget sector for the period. On March 27th 2022, the Prime Minister officially signed a Decision to approve the Finance Development Strategy by the year 2030. Beside, NIF actively joins with various departments under the MOF in developing sectoral strategies such as: Tax Reform Strategy, Custom Development Strategy; Public Debt Strategy; Strategy for Development of Vietnam's Insurance Market; Strategy for Development of the Stock Market; National Reserve Development Strategy; Strategy of Accounting – Auditing.

Over the past 60 years, NIF has established collaborative relationships with a variety of domestic and international organizations and collaborators in the economic and financial fields such as the WB, IMF, ADB, GIZ, UN, AMRO and PRI, etc.

UNIVERSITY OF FINANCE - MARKETING (UFM)

University of Finance - Marketing (UFM) is a public higher education institution governed by the Ministry of Finance, having the right to autonomy and self-responsibility of a non-business unit. The forerunner of the University of Finance - Marketing is the Central School of Pricing Officers in the South, established under the Decision No. 210/VGNN-TCDT dated September 1, 1976 by the State Pricing Commission

It then became a Vocational School before turning into a college and then a university as it is today. UFM has undergone over 45 years of establishment and development as a highly-ranked institution in the higher education system of Vietnam with a scale of nearly 20,000 students and 6 campuses in Ho Chi Minh City. UFM is traning students to become human resources that meet national and regional standards; it has also transferred scientific achievements in the field of business and management, and has participated in strategic and policy planning for the Finance sector, for businesses and for social organizations. Currently, UFM is offering both undergraduate and postgraduate programs via various training modes full-time and part-time in 15 majors. In addition to conducting mass regular programs, UFM has also implemented high-quality, special, international, and international cooperation programs. The number of articles and projects at all levels implemented over the years has been gradually increasing in both quality and quantity. UFM's international cooperation activities have made remarkable progress. In addition to training cooperation, UFM has signed several cooperation agreements on student exchange and scientific research with various universities around the world.

University of Finance - Marketing has set development goals to become an application-oriented university by the end of 2026 while maintaining national standards at educational institution level and training program level with at least 4 programs that will meet the quality standards of the ASEAN University Network (AUN-QA). By the end of 2030, the University will reach the level of a state-of-the-art university in the ASEAN region, UFM is expected to be ranked among the top 500 prestigious universities in Asia (according to prestigious ranking standards) by the end of 2045 and will become the leading application-oriented educational institution in Vietnam and in the region of ASEAN.

UNIVERSITY OF FINANCE AND ACCOUNTANCY

Belonging to the Ministry of Finance, University of Finance and Accountancy (UFA) is an undergraduate and postgraduate training institution. Its mission is training, fostering, providing learners with quality training programs with application orientation in the fields of business, administration and law; it also carries out scientific researches and transfers these scientific research results into practice; contributing to human resource and community development, serving the socio-economic development of the Central and Highlands provinces, the whole country and the Central provinces of Lao People's Democratic Republic in the context of global economy integration.

With the main campus in Quang Ngai province and a branch in Thua Thien Hue province, the training scale of the University is increasing day by day. In the field of undergraduate training, the University is specialized in Accounting, Auditing, Economic Law, Finance - Banking, Business Administration, International Business. In the field of postgraduate training, the University is specialized in Finance and Banking at Master level. Along with improving the quality of professional skills, the University devotes a great deal of effort in connecting with businesses to create jobs for graduate students; creating an environment for students to practice essential skills through yearly activities of the Youth Union, the Student's Association, professional academic competitions, clubs, etc. Many remarkable achievements have been obtained by UFA students in recent years: 02 "January Star" Awards, 01 Consolation Prize in the national final round of the contest "Students with Financial Management Skills 2019", 01 Third Prize and 01 Consolation Prize at the contest "Start-up Ideas" in Quang Ngai province, Top 20 "National Student Leader Contest", 01 third prize and 01 consolation prize in the "2022 National English Olympics", participating in some competitions and get remarkable prizes: "Looking for startup ideas", "Festival of English clubs, teams and groups in Quang Ngai Province 2023", "Contest of Marxist-Leninist sciences and Ho Chi Minh ideology - Light illuminating the way 2023", etc.

With a long history of over 47 years of construction and development (1976-2023), the University has trained and fostered nearly 62 thousand students with practical knowledge and skills sought by employers. Many students of the University have been affirming their contribution to the financial system in the Central and Central Highlands region as well as in Vietnam. The University has received a large number of noble awards from the Vietnamese State. This is the recognition of the social community for the quality and the University's brand with its identity: "Quality - Friendliness - Creativity - Integration".

UNIVERSITY OF FINANCE AND BUSINESS ADMINISTRATION (UFBA)

The University of Finance and Business Administration (UFBA) is a public tertiary education institution under the Ministry of Finance, established under Decision No. 1320/QD-TTg dated September 18, 2012 of the Prime Minister on the basis of upgrading the College of Finance and Business Administration. The university's mission is to provide high-quality training and scientific research products with domestic and regional brands in the fields of economics, finance, accounting, and business administration, contributing to the national industrialization and modernization and international integration.

Currently, the University specializes in 7 tertiary-level majors: Economics, Accounting, Auditing, Business Administration, Finance - Banking, International Business, Management Information Systems and one post-graduate major in Finance – Banking, with the training scale of 4000 graduate and post-graduate students. Over the period of 58 years of construction and development (1965-2023), the University lecturers, officials and employees have constantly strived, with unity, creativity, efforts to overcome all difficulties and challenges, to fulfill all assigned work, contributing to the general development of the Finance field and the cause of education and training. The efforts of generations of the University lecturers, officials and employees have been recognized and awarded many noble titles by the Communist Party and the Government such as the Independence Medals, First Class, Second Class and Third Class; Labor Medals, First, Second, Third Class and many other noble awards.

INSTITUTE OF FINANCIAL TRAINING (IFT)

The Institute of Financial Training (IFT) under the Ministry of Finance was established by the Prime Minister in 2006. The Institute is not only responsible for training civil servants in accordance to professional standard, but also contributes to socio-economic solution. Hence, the school helps to develop and plan strategies and policies for the financial sector. The IFT has built a reputation for its intensive training programs, which are tied to the country's current economic and financial management practices, the application of information technology, and the trend of globalization.

Training at IFT improve ones' knowledge, qualifications and skills in order to become managers and higher professional - level officials. They are equipped to serve up to high professional standards, to become experts in economics and finance, and lastly, to be professional, diligent, intelligent and flexible civil servants, who meet the requirements of the country's economic development in this period of industrialization, modernization and international economic integration.

On average, IFT has trained over 17,000 students in the financial sector with over 250 different classes annually. IFT is known as the largest and most prestigious institute in the country in terms of providing training, retraining, financial and accounting consulting services to the society.

MỤC LỤC

REMARKS OF THE 5TH INTERNATIONAL CONFERENCE "FINANCE AND ACCOUNTING FOR THE PROMOTION OF SUSTAINABLE DEVELOPMENT IN THE PRIVATE SECTOR" (FASPS5)

In the era of Doi Moi, the Party and State have recognized the position and role of private economy in the development of a multi-component economic system. As a result, the private economy has continued to grow and become one of the key factors contributing to rapid economic growth. In recent years, the private economy has not only recovered but has also made progress in terms of both quantity and quality. Resolution 10/NQ-TW dated June 3, 2017, of the 5th Central Committee Plenum of the 12th Party Congress on the development of the private economy set the requirement for the private economy to develop alongside the state and collective economies, becoming a significant driving force for a market-oriented socialist economy. However, the global economic landscape is extremely complex, unpredictable, and full of challenges, compounded by existing economic issues. The fourth industrial revolution, with its advancements in digital technology, has rapidly transformed daily life, and the changing political landscape around the world adds to the complexity. This presents substantial challenges for both the private and state-owned sectors.

The strong development of the private economic sector, in terms of quantity, quality, effectiveness, and sustainability, has been emphasized. The government has issued Resolution No. 45/NQ-CP, an action plan to implement Resolution No. 10-NQ/TW of the 12th Party Central Committee on developing the private economy as a crucial driving force for a market-oriented socialist economy. The overall goal of this program is to develop the private economy into a significant driving force for a market-oriented socialist economy, contributing to the rapid and sustainable socioeconomic development, while enhancing self-reliance and self-sufficience.

In a context where the state budget faces difficulties and there is a trend of declining foreign capital inflows, policies to encourage private sector investment are necessary. The 10-year socio-economic development strategy for 2021-2030 aims to significantly develop the private sector in terms of quantity and quality. It encourages the formation and growth of large private economic groups with strong competitive capabilities regionally and internationally. By 2030, it targets having at least 2 million enterprises with the private sector contributing 60-65% to GDP. To achieve this, an average of at least 143,000 new businesses must be established each year, alongside various corresponding measures to promote business formation, reactivation, and reduce business closures. In a market-oriented socialist economy, the development of the private sector is not only crucial for maintaining high GDP growth rates and generating state revenue, but also for addressing a range of social issues such as job creation, poverty reduction, hunger eradication and human resource development.

In order to propose solutions and recommendations to promote the development of the private economy in the new context, Academy of Finance, in collaboration with the University of Finance and Marketing, the University of Finance and Accountancy, the University of Finance and Business

Administration, the National Institute for Finance, the Institute of Financial Training, organized the fifth International Workshop with the theme: "Finance and Accounting for Accelerating the promotion of Sustainable Development of the Private Economy." The conference has attracted a significant number of scientists and researchers from universities, academies, and research institutes in and outside the country. The organizing committee received nearly 140 articles and selected, edited 136 high-quality articles for publication in the proceedings of this international conference. The submitted articles focused on analyzing and evaluating various aspects of the economy, finance, management, human resources, accounting, and auditing, both in the context of general economic development and specifically within the private sector.

The research articles demonstrated a high level of scientific content and reflected diversity in approaches to promoting the rapid and sustainable development of the private economy. With the hope that the workshop serves as a platform for scientists, managers, business leaders, and professional organizations, both nationally and internationally, to exchange and share information and directions for finance, accounting, and economics to accelerate the fast and sustainable development of the private sector. The ultimate goal is to achieve the aspirations set for 2030: Vietnam as a developing country with modern industry, high average income, and by 2045, becoming a developed nation with high income.

We extend our best wishes to all delegates and esteemed scientists for good health, happiness, and success!

With sincere appreciation,

THE WORKSHOP ORGANIZING COMMITTEE

ANALYZING THE CASH FLOW DISRUPTIONS CAUSED BY COVID-19 IN VIETNAM'S FOOD AND BEVERAGE SECTOR

PhD. Nguyen Thi Thanh Phuong[1], MA. Tran Thi Thuy Anh[2]

Abstract: *The COVID-19 pandemic's impact on cash flows in the food and beverage industry is a critical research area. To investigate this, a group of researchers utilized financial data from the Fiin Pro database, focusing on 33 Vietnamese food and beverage companies spanning from 2017 to 2022. The study employed a regression model analysis, specifically the data regression analysis using the Feasible Generalized Least Squares (FGLS) method based on the multi-regression model. The research findings suggest that the COVID-19 pandemic negatively affected operating cash flow while positively influencing cash flow from investing and cash flow from financing activities in these food and beverage businesses..*

1. INTRODUCTION

The food and beverage industry is a multifaceted sector encompassing various activities, from production to service provision (Gomes, 2001; Demir & Dincer, 2020). Historically, it has contributed to economic growth and, more recently, evolved to provide diverse and artistic culinary experiences (Pfitzer & Krishnaswamy, 2007). The COVID-19 pandemic has profoundly impacted various sectors, including the food and beverage industry, with supply chain disruptions, reduced demand, and changing consumer preferences (McKibbin & Fernando, 2020; Lee, 2020).

Cash flow is critical for a company's financial health and sustainability, especially in the food and beverage sector (Karas & Režňáková, 2020; Brealey, Myers, & Allen, 2017). Effective cash flow management is vital for a company's well-being, and the pandemic significantly disrupted cash flow dynamics within the industry (O'Brien & Putnis, 2020). This study investigates the impact of the pandemic on cash flows in Vietnamese food and beverage companies (Ha, Nguyen, & Nguyen, 2020). Given the industry's importance to the Vietnamese economy, understanding the pandemic's effects on cash flow is crucial for stakeholders (General Statistics Office of Vietnam, 2021). The research aims to identify specific areas of impact on cash flows, providing guidance for business sustainability and policy support (Brigham, 2016; O'Brien & Putnis, 2020).

The study addresses three main research questions:

1. How has the Covid-19 pandemic affected cash flow in Vietnam's food and beverage industry?

2. What effects will the pandemic have on cash management strategies in the sector going forward?

There's a need for ongoing research on how the pandemic uniquely affects the Vietnamese food and beverage industry, as existing studies often do not cover the evolving situation and its long-term implications (Gomes, 2001; McKibbin & Fernando, 2020).

2. LITERATURE REVIEW

2.1. Empirical Studies

Research on the relationship between a firm's cash flow and various financial aspects is well-documented. Some studies suggest a positive link between cash flow and leverage (Ross, 1977; Harris & Raviv, 1991; Jensen, 2014), while others propose a negative correlation (Myers & Majiuf, 1981; Chaplinsky & Niehaus, 1993). Shenoy & Koch (1996) conducted a comprehensive study on the matter, highlighting the existence of both positive and negative signals between leverage and cash flow.

Cash flow and liquidity have also been subjects of research. Tangngisalu et al. (2022) used signaling theory to find a significant positive relationship between cash flow and liquidity. Kirkham (2012) and Durrah et al. (2016) reported similar findings, while Lancaster and Steven (2011) identified a significant negative relationship between CFO and liquidity. The relationship between cash flow and Return on Assets (ROA) has been explored as well. Akumu (2014) found a negative relationship between FCF and ROA, whereas Hubbard (1998) reported a short-term positive correlation between free cash flows and ROA. Similarly, Ali (2018) and Shaharuddin et al. (2021) discovered a positive correlation between cash flow and ROA. Mong'o (2010) observed an inverse relationship between cash flow from operating and bank profit, with CFI and CFF having positive impacts.

Cash flow, especially during financial crises like the Covid-19 pandemic, is critical. Altman Z-score is considered an efficient model for assessing financial distress, and cash flow plays a vital role in helping companies overcome challenges (Unegbu & Adefila, 2013; Almamy et al., 2016). Studies directly addressing the impact of Covid-19 on a firm's cash flow are limited. Song et al. (2021) and Ding et al. (2021) found a positive relationship between cash flows and Covid-19 in the context of the restaurant business. However, Castanho (2022) reported a significant decline in textile firms due to Covid-19. Vo & Tran (2021) conducted a study in Vietnam, focusing on the food and beverage industry, and found that the pandemic led to decreased cash flow, with effective cash flow management being crucial for business survival.

2.2. Signaling theories

Signaling theory, proposed by Spence in 2002, explores how two parties communicate and interpret information in commercial transactions, particularly in the context of a seller influencing a buyer's decisions. The party providing information decides what and how to communicate, while the other party, including shareholders and investors, interprets these signals. Tangngisalu et al. (2022) highlight that information in these transactions often involves information asymmetry, with interested parties relying on financial statements from the company. These disclosures can be used for promotion and attracting investors. Signal strategies are the actions signal generators take to influence investors and stakeholders, and the impact can be positive or negative depending on the signal's favorability. Research, such as Kintsch & Van Dijk (1978), Rennekamp (2012), and Shah & Oppenheimer (2007), suggests that an individual's reading ability influences their perception and decision-making. Easily readable and understandable reports are seen as positive signals that inform decision-making, while complex information can hinder comprehension and judgment, potentially impacting decision-making.

3. RESEARCH METHODOLOGY

The study employs a quantitative approach, utilizing panel data extracted from the financial reports of publicly listed food and beverage firms. Through the computation of financial metrics, the researcher performs regression analyses, encompassing Ordinary Least Squares (OLS), Random Effects Model (REM), Fixed Effects Model (FEM), and ultimately, the Feasible Generalized Least Squares (FGLS) method, to assess how the governance of Net Working Capital (NWC) management influences the profitability of these companies. To measure and assess the effectiveness of cash flow management of the business, the research uses the "Cash Flows To Total Assets Ratio'. It is chosen because it allows to evaluate how efficiently a business manages its cash flows generated from core operations in relation to its asset base. This ratio provides insights into financial stability, liquidity, and the company's capacity to generate cash, which are all essential aspects of cash flow management and overall financial performance:

Table 1: Description of all variables and Abbreviation

Variables	Concepts	Prior studies
Dependent varriables		
Cash flows from Operating (CFO)	Cash flows from Operating activities / Total Assets	Shaharuddin et al., (2021) Azhar Farooq & Ahmed Sheikh, (2021)
Cash flows from Investing (CFI)	Cash flows from Investing activities / Total Assets	Calculated according to CFO
Cash flows from Financing (CFF)	Cash flows from Financing activities / Total Assets	Calculated according to CFO
Independent variables		
Covid-19 (COVDEAD)	Natural logarithm of deaths recorded	Bollyky et al., (2023)
Leverage (LEV)	Debt to Equity ratio	Shaharuddin et al., (2021)
Liquidity (LID)	Current Assets / Current Liabilities	Dirman, (2020)
Return on Assets (ROA)	Profit after tax/ Total Asset	Shaharuddin et al., (2021)
Z-Score (ZS)	Z-Score is defined by using data in its model for the fiscal period.	Huang et al., (2022) ;Almamy et al., (2016)

Source: Author's compilation

From above defined research variables, the research has built the regression model based on the previous regression model of Aggarwal & Padhan, (2017) and Huynh. D, (2022)

$$\mathbf{CFit = \beta0 + \beta1COVDEADit + \beta2LEVit + \beta3LIDit + \beta4ROAit + \beta5ZSit + \varepsilon it}$$

Where: *CF: Cash flow, is defined by three alternative proxies for cash flow (CFO to Total Assets ratio, CFI to Total Assets ratio and CFF to Total Assets ratio)*

i is the enterprise i, and t is the year t ; ε is the error term of the model*;* β *0* β *1,* β *2,* β *3,* β *4,* β *5 are the regression model coefficients.*

The research sample is derived from the data of 198 observations from 33 Vietnamese food and beverage firms in HOSE, HNX over 6 years from 2017 to 2022, from Fiin Pro database the summary of descriptive statistics will be conducted in two stages, including before and during COVID-19.

3. RESULT AND DISCUSSION

3.1. Descriptive Statistic

The Descriptive Statistics provide an overview of various variables utilized in the research model, presenting information such as the mean, standard deviation (SD), as well as the minimum and maximum values for each variable.

Table 2: Descriptive statistics of variables before Covid-19

Variable	Mean	Std. Dev.	Min	Max
CFO	0.0863822	0.1315411	-0.2276097	0.4556233
CFI	-0.0543938	0.1268782	-0.4554636	0.5994391
CFF	-0.035627	0.1542588	-0.7979246	0.4359427
LEV	0.2465096	0.1963493	0	0.6178116
LID	0.0218253	1.337436	-2.830343	11.64915
ROA	0.0923831	0.0871471	-0.1898779	0.3209624
ZS	3.937786	3.233259	0.3152303	16.72627

Source: Author's compilation by using STATA 14

Table 3: Descriptive statistics of all variables during Covid-19

Variable	Mean	Std. Dev.	Min	Max
CFO	0.0663722	0.176387	-0.6668978	0.8147394
CFI	-0.0343347	0.105843	-0.3240159	0.666782
CFF	-0.0243244	0.1464836	-0.7487932	0.498234
COVDEAD	7.742185	3.009528	3.555348	10.38465
LEV	0.2285383	0.1933606	0	0.7328339
LID	-0.0176286	1.548201	-11.53948	8.220154
ROA	0.0713214	0.0745997	-0.2670474	0.2412853
ZS	3.729964	2.413106	-1.063052	12.49565

Source: Author's compilation by using STATA 14

In summary, the table reveals significant shifts in CFO (Cash Flows from Operating activities) values before and during the Covid-19 pandemic. The lowest CFO value went from -0.2276097 pre-Covid to -0.6668978 during the pandemic, reflecting F&B firms' struggle to cover expenses from sales alone. Conversely, the highest CFO value nearly doubled, suggesting benefits for many food and beverage companies due to their essential products.

The highest CFI (Cash Flows from Investing activities) value also rose from 0.5994391 to 0.666782, indicating some firms sold assets or securities to compensate for reduced CFO. CFF (Cash Flows from Financing activities) showed less change. Mean values of specific firm variables decreased post-Covid-19, notably LID (current ratio), which shifted from positive to negative. This suggests F&B firms may have faced increased debt burdens and cash balance challenges. Z-scores indicate Vietnamese food and beverage businesses remain financially stable, with values falling between 3 and 4.

3.2. Multi- collinearity analysis

The author employs Variance Inflation Factor (VIF) data to assess the presence of multicollinearity. The VIF values derived from the regression analysis are presented in the table below.

Table 4: Summary results of multi-collinearity (VIF)

Variables	VIF	1/VIF
ZS	2.40	0.417421
ROA	2.05	0.488003
LEV	1.40	0.712369
LID	1.02	0.977247
COVDEAD	1.02	0.978810
Mean VIF	1.58	

According to the results of Table 4, VIF value of all variables are less than 10, showing that there is no multicollinearity

3.3. Regression analysis

The Fixed Effect Model (FEM) has been chosen as the preferred model for analyzing the results related to CFO and CFF, while the Ordinary Least Square (OLS) model is considered the most suitable for CFI regression. Nevertheless, the authors have compiled the results from all three approaches for each alternative proxy of Cash flow

Table 5.: Regression results for OLS, FEM, REM model of CFO

CFO	OLS	FEM	REM
COVDEAD	-0.0041327* [-1.86]	-0.0062956*** [-2.90]	-0.0041327* [-1.86]
LEV	-0.2266979*** [-3.82]	-0.7099913*** [-5.87]	-0.2266979*** [-3.82]
LID	-0.0204921*** [-3.00]	-0.0216752*** [-3.19]	-0.0204921*** [-3.00]
ROA	0.4890555*** [-0.02]	-0.1321579 [-0.52]	0.4890555*** [2.86]
ZS	-0.0001078 [3.59]	-0.00811 [-0.82]	-0.0001078 [-0.02]
_cons	0.1066475	0.3113437	0.1066475
N	198	198	198
R-sq	0.2475	0.2356	0.1355

Note(s): The numbers in parentheses are standard errors. *, **, *** indicate significance levels at 10%, 5%, 1%

Source: Author's compilation by using STATA 14

Table 5 presents regression results for Cash Flow from Operating (CFO) using a dataset of 33 Vietnamese food and beverage firms with 198 observations. The OLS, FEM, and REM models consistently show a negative association between Covid-19 and CFO, with significance levels ranging from 1% to 10%. Notably, the coefficient value of Covid-19 (-0.0062956) in the FEM model is the smallest among the independent variables. Among other independent variables, all significantly impact CFO, except for Z-score, which, despite its negative effect, lacks statistical significance. The FEM model is the preferred choice for CFO analysis. Liquidity (LID) and leverage (LEV) have strong negative impacts on CFO at a 1% significance level, while ROA surprisingly lacks a significant relationship with CFO. The model's R-squared value is 0.2356, explaining 23.56% of CFO variation. In summary, all independent variables negatively affect CFO, with only three—COVDEAD, LEV, and LID—reaching statistical significance levels below 1%.

Table 6: Regression results for OLS, FEM, REM model of CFI

CFI	OLS	FEM	REM
COVDEAD	0.0020267 [1.20]	0.0017605 [1.00]	0.0020267 [1.20]
LEV	-0.1003542*** [-2.24]	-0.1691874* [-1.72]	-0.1003542*** [-2.24]
LID	0.0304616*** [5.90]	0.0303949*** [5.51]	0.0304616*** [5.90]
ROA	-0.4798652*** [-3.71]	-0.5166252*** [-2.52]	-0.4798652*** [-3.71]
ZS	0.0025194 [0.63]	-0.0011228 [-0.14]	0.0025194 [0.63]
_Cons	0.0011821	0.0355347	0.0011821
N	198	198	198
R-sq	0.2391	0.2242	0.2210

Note(s): The numbers in parentheses are standard errors. *, **, *** indicate significance levels at 10%, 5%, 1%

Source: Author's compilation by using STATA 14

Table 6 summarizes regression results for Cash Flow from Investing (CFI) using data from 198 observations of 33 listed food and beverage companies in Vietnam. All three modeling approaches (OLS, FEM, and REM) indicate a positive correlation between Covid-19 and CFI, although it is not statistically significant. The coefficient value of Covid-19 (0.0020267) in the OLS model, selected as the most suitable, is the smallest among the independent variables. Regarding the other independent variables, all significantly impact CFI, except for Z-score. In the OLS results related to CFI, three independent variables—leverage, liquidity, and ROA—demonstrate clear relationships with CFI. Specifically, all three variables have significance levels below 1%, with leverage and ROA negatively affecting CFI, while liquidity has a positive influence. The model's R-squared value is 0.2391, indicating that it can explain 23.91% of the variation in CFI. In summary, in the OLS model, the variable COVDEAD has a positive but insignificant relationship with CFI. However, three variables—LEV, LID, and ROA—display statistically significant relationships with CFI at levels below 1%.

Table 7: Regression results for OLS, FEM, REM model of CFF

CFF	OLS	FEM	REM
COVDEAD	0.0035438 [1.57]	0.0059737*** [2.78]	0.0035438 [1.57]
LEV	0.2962598*** [4.93]	0.8250846*** [6.90]	0.2962598*** [4.93]

LID	-0.008717 [-1.26]	-0.0093307 [-1.39]	-0.008717 [-1.26]
ROA	0.1359327 [0.78]	0.747465*** [2.99]	0.1359327 [0.433]
ZS	-0.0029178 [-0.54]	0.0131972 [1.34]	-0.0029178 [0.587]
_Cons	-0.1139847	-0.3608362	-0.1139847
N	198	198	198
R-sq	0.1693	0.2673	0.1833

Note(s): The numbers in parentheses are standard errors. *, **, *** indicate significance levels at 10%, 5%, 1%

Source: Author's compilation by using STATA 14

Table 7 summarizes regression results for Cash Flow from Financing (CFF) based on data from 33 listed food and beverage businesses in Vietnam, comprising 198 observations. Three modeling approaches, including OLS, FEM, and REM, were employed. All models indicate a positive correlation between Covid-19 and CFF, with the Fixed Effect Model (FEM) demonstrating statistical significance at the 1% level. However, the Covid-19 coefficient in the FEM model (0.0059737) is smaller than other independent variables.

Liquidity negatively impacts CFF, while Z-score positively affects it, although these effects lack statistical significance. The model's R-squared value is 0.2637, explaining 26.37% of CFF variation. In conclusion, within the FEM model, COVDEAD significantly relates to CFF at the 1% level. Only two other independent variables out of four have a statistically significant impact on CFF.

3.4. Test for autocorrelation

Table 8: Summary results of autocorrelation

Autocorrelation test (Wooldridge test)		
CFO (FEM model)	CFI (OLS model)	CFF (FEM model)
F (1,32) = 1.733	F (1,32) = 0.086	F (1,32) = 7.574
Prob>F = 0.1974	Prob>F = 0.7717	Prob>F = 0.0097

The presence of autocorrelation in panel data was investigated using the test proposed by Wooldridge in 2010. Table 8 indicates that only one CFF model exhibits autocorrelation, with a P-value of 0.0097, which is below the significance threshold of 0.05

3.5. Test for heteroscedasticity

Table 9: Summary results of heteroscedasticity

Heteroscedasticity test (Wald's test)		
CFO (FEM model)	CFI (OLS model)	CFF (FEM model)
chi2(33) = 1752.59	chi2(20) = 79.73	chi2(33) = 18735.26
Prob>F = 0.0000	Prob>F = 0.0000	Prob>F = 0.0000

Source: Author's compilation by using STATA 14

The presence of heteroscedasticity in the models utilizing three different proxies of cash flow, namely CFO, CFI, and CFF, was assessed using the Abraham Wald test, as suggested by Abraham Wald in 1940. Table 9 reveals that all three models exhibit heteroscedasticity.

3.4. Fixing model with the Feasible generalized least squares (FGLS)

The previous part showed that there are many flaws in OLS, FEM, REM results, consisting of autocorrelation and heteroscedasticity. Therefore, the research applied the feasible generalized least squares (FGLS) approach to overcome the defects of the model.

Table 10: Regression results with FGLS method for CFO alternative proxy

CFO	Coef.	Std. Err.	z	P>z	[95% Conf.	Interval]
COVDEAD	-0.0040468	0.0009671	-4.18	0.000	-0.0059424	-0.0021513
LEV	-0.1542154	0.0323383	-4.77	0.000	-0.2175973	-0.0908334
LID	-0.0020867	0.0074574	-0.28	0.780	-0.016703	0.0125295
ROA	0.5862292	0.0901988	6.50	0.000	0.4094428	0.7630157
ZS	0.0001419	0.0014952	0.09	0.924	-0.0027888	0.0030725
_cons	0.0804445	0.0172491	4.66	0.000	0.046637	0.1142521

Source: Author's compilation by using STATA 14

Table 10 presents regression results for CFO using the FGLS method. The analysis shows that Covid-19 continues to have a negative impact on CFO at a significance level of 1%. However, there are some changes in the relationships with other independent variables. In this analysis, ROA has become a statistically significant variable with a positive relationship with CFO at the 1% level, which is consistent with Shaharuddin et al. (2021). Leverage is found to have a negative effect on CFO, with statistical significance at the 1% level, contrary to the findings of Shenoy & Kock (1996). LID negatively impacts CFO, but its statistical significance is weak, which does not align with the results of Tangngisalu et al. (2022). ZS, on the other hand, has a positive relationship with CFO, in line with Huang et al. (2022), but its statistical significance is weak. The results of the remaining variables, LID and ZS, do not align with previous studies, and only ZS has a positive effect on CFO, while both LID and ZS lack statistical significance.

Table 11: Regression results with FGLS method for CFI alternative proxy

CFI	Coef.	Std. Err.	z	P>z	[95% Conf.	Interval]
COVDEAD	0.0027625	0.0009207	3.00	0.003	0.000958	0.004567
LEV	-0.0516603	0.0294412	-1.75	0.079	-0.109364	0.0060434
LID	0.0252054	0.0064444	3.91	0.000	0.0125746	0.0378362

Source: Author's compilation by using STATA 14

Table 12 shows the regression results for CFF by using the FGLS method. There are few significant mutations in the regression results of this model. Overall, the appearance of Covid-19 still positively impacted on the CFF, however, the level of significance changed from 1% to 10%. Moreover, there is only one variable of LEV that has statistical meaning with CFF.

4. CONCLUSION AND RECOMMENDATIONS

4.1. Conclusion

The research examines how Covid-19 affected cash flow in Vietnam's food and beverage industry from 2017 to 2022. Using the FGLS approach and a panel data regression model to address issues like autocorrelation and heteroskedasticity, we found some intriguing results. While the results regarding CFO align with prior research in Vietnam, our findings for CFI differ from our initial assumptions based on signaling theory. In reality, Vietnamese food and beverage businesses seem inclined to seek investment opportunities rather than curtailing investments.

As CFO decreases and CFI rises, CFF also increases, covering a portion of business operations, as indicated by our regression results. These cash flow dynamics can be attributed to significant factors. Firstly, shifts in consumer shopping habits have influenced operating cash flow. Secondly, supply chain disruptions have caused production delays and export issues. Lastly, market supply and demand changes have played a role.

Businesses, in response, explore new revenue streams through financial instruments or adapt production to target the domestic market. With declining CFO and increasing investment cash flow, businesses must seek alternative funding sources. Our research contributes by examining three distinct proxies of cash flow (CFO, CFI, CFF) during the Covid-19 pandemic, in contrast to previous studies that focused on general cash flow or free cash flow (FCF). However, there are limitations to consider. The sample size is small, involving only 33 Vietnamese food and beverage businesses. Additionally, our regression model utilizes only financial variables, lacking macroeconomic or other variables for greater reliability.

4.2 Recommendations

For enhancing cash flow management for Vietnam's food and beverage businesses during systematic risks like the Covid-19 pandemic include:

- Effective Inventory Management: Given the negative impact of liquidity (LID) on CFO, it is crucial to focus on bolstering cash flow during crises. Food and beverage companies should consider strategies to reduce finished goods inventory, particularly for perishable products, to prevent spoilage and financial losses.

- Emphasis on Working Capital Management: Working capital management involves inventory, payables, and receivables. Businesses should adopt a holistic approach that prioritizes prompt payment collection from customers and extends payment timelines to suppliers, while being mindful of trade-offs and potential impacts on supplier relationships and creditworthiness.

- Diversify Revenue Streams: To reduce reliance on a single revenue source, expand product or service offerings. Revenue diversification can help stabilize cash flow during turbulent times. Adaptability and the ability to pivot based on market feedback and changing conditions are crucial for success in diversifying revenue streams.

ASYMMETRIC IMPACT OF PUBLIC DEBT ON CREDIT SUPPLY TO PRIVATE SECTOR IN VIETNAM - A NARDL MODEL APPROACH

Ph.D Le Thi Thuy Hang[1], Assoc. Prof. PhD Phan Thi Hang Nga[2], Assoc. Prof. PhD Nguyen Thi My Linh[2], MSc Nguyen Xuan Dung[2]

Abstract: *The primary objective of this study is to examine the uneven effects of state debt on loan provision for the private sector in Vietnam. This study employs the NARDL model to assess the extent to which public debt affects the provision of credit to the private sector. Additionally, it incorporates control variables such as private sector capital demand, the expansion of the broad money supply, and the economic growth rate. The data were collected at a quarterly frequency over the period spanning from the first quarter of 2000 to the first quarter of 2021. The findings indicate that the influence of public debt on the private sector is not uniformly good. The impact of public debt on the private sector has both positive and negative consequences. However, it is important to note that when public debt exceeds a particular threshold, adverse effects may arise. Specifically, the increased public debt can lead to a phenomenon known as crowding out, wherein the credit supply for the private sector is constrained, hence impeding the capital demand of private enterprises. This paper proposes the implementation of prudent measures to manage public debt within an acceptable threshold, with the aim of mitigating the adverse consequences and minimizing the potential crowding-out effects of the public sector on the private sector.*

Keyword: *Asymmetry; Public debt; Credit; Private sector; Vietnam.*

1. INTRODUCTION

Public borrowing in fiscal policy is a crucial element of the financial framework of the macroeconomy. Specifically, public debt can serve as a mechanism for implementing expansionary fiscal policy during periods of economic difficulty. Public debt serves as a primary mechanism for financing government deficits, sourced either from domestic or global markets. Nevertheless, despite its potential benefits, the detrimental consequences of this phenomenon can be substantial and may precipitate a significant public debt crisis if not well controlled, as exemplified by the experiences of Venezuela (2017), Argentina (2005–2016), and Greece (2009–2018). The accumulation of public debt over a period of time has the potential to undermine the efficacy of fiscal budget operations, as a substantial amount of the budget may be allocated towards servicing the debt. Hence, the act of borrowing should be contemplated solely under circumstances of genuine necessity, such as to facilitate the revitalization of the economy during periods of crisis or to fulfill the requirements of public infrastructure initiatives (Deshpande, 1997).

Furthermore, the adverse consequences of governmental debt on the private sector manifest when investors experience apprehension regarding the potential taxation and diversion of investment returns for debt repayment purposes. This observation implies the potential for governmental debt to exert a detrimental influence on the private sector. The gradual growth of public debt is also regarded as detrimental to investment activity, potentially leading to crowding out effects from the public sector to the private sector. Furthermore, if not effectively managed, it can impose a burden on future generations. The phenomenon of public debt crowding out private

2 University of Finance – Marketing

investment is widely recognized as a bad outcome for the economy. Apart from the impact of governmental debt, there are other factors that exert influence on private investment. The issues under consideration encompass interest rates (Wuhan & Adnan, 2015; Iheonu & Nwakeze, 2016), economic development, and public capital expenditure (Nyoni & Bonga, 2017; Combey, 2016). In an alternative area of investigation, it has been suggested that public debt could potentially exert a favorable influence on the private sector (Abubakar & Mamman, 2020; Brown-Collier & Collier, 1995). The existence of divergent perspectives suggests a dearth of agreement regarding the influence of public debt on private investment.

The issue of elevated public debt is a matter of apprehension for nations in Southeast Asia. As per projections by the World Bank, it is anticipated that the public debt and debt guaranteed by the public sector of Vietnam will persist at a level that is both sustainable and stable, amounting to approximately 36% of the country's Gross Domestic Product (GDP) by the year 2023. One of the inquiries that has been raised pertains to the potential impact of escalating governmental debt on the provision of credit capital to the private sector. Does private investment exhibit a negative or inverse response to a rise in public debt, regardless of its magnitude? The utilization of debt to fund government spending on infrastructure and education has the potential to attract supplementary private investment by bolstering both physical and human capital. Nevertheless, in the event that the government opts to obtain funds from the domestic market, the presence of a substantial government debt may potentially diminish the amount of credit accessible to individuals and businesses, thereby leading to an increase in interest rates for private investment. Moreover, the accrual of debt coupled with volatility in financial stability and sustainability can have a detrimental impact on investor confidence. In such circumstances, investors may anticipate reduced potential revenue as a result of increased tax burdens aimed at servicing public debt in the forthcoming period.

Hence, there is a need for increased focus on investigating the nonlinearity in the correlation between governmental debt and the private sector. The response of private investment may exhibit disparate reactions in the face of increasing or decreasing levels of public debt, thereby suggesting asymmetric effects of public debt on the private sector. The implementation of debt reduction measures has the potential to enhance investor confidence, leading to a substantial rise in private investment. Conversely, the augmentation of domestic debt has the potential to engender elevated interest rates, resulting in diminished investment levels. Nevertheless, in the event that investors anticipate favorable returns, the decrease in investment may not be equivalent to the rise in investment resulting from a reduction in public debt. Through an examination of the current body of literature pertaining to the correlation between public debt and the private sector, it has been seen that there are certain gaps in research regarding the asymmetric effects of public debt on the provision of credit to the private sector within the context of Vietnam. This study provides further empirical data regarding the uneven effects of state debt on the availability of credit for the private sector in Vietnam. The subsequent sections of the paper are structured in the following manner: Section 2 of this paper provides a comprehensive literature review, while Section 3 includes the data and research model. The findings of the research are presented and analyzed in Section 4, while Section 5 provides overarching conclusions regarding the research.

2. THEORY AND RESEARCH ON THE IMPACT OF PUBLIC DEBT ON THE PRIVATE ECONOMIC SECTOR

There is a lack of consensus among scholars about the theoretical ideas around the correlation between public debt and the private sector. The examination of the theoretical linkage between the variables can be approached from three distinct angles. The initial trend is characterized by the presence of arguments pertaining to the crowding-out hypothesis. The hypothesis posits that the accumulation of public debt results in heightened competition for borrowing capital between the private and public sectors, resulting in upward pressure on interest rates. Consequently, this phenomenon leads to a decrease in private investment. Government borrowing has the potential to displace private investment as it involves the transfer of capital resources from the private sector to the public sector, which is generally characterized by lower efficiency in its operations. In the context of a market economy, the necessity of government intervention is often debated, with the argument being that prices will naturally adapt to restore real income levels to their full employment potential. When the government heavily relies on borrowing sources due to limited financial resources, it reduces the available capital for private organizations. Consequently, this leads to an increase in borrowing costs for private businesses, ultimately displacing private investment (Majumder, 2007). According to neoclassical theory, public debt has an additional negative impact on private investment. This occurs when the government borrows funds to address a deficit, leading to a transfer of the tax burden onto future generations. Consequently, this shift in taxation results in heightened consumption levels and diminished savings. In order to achieve equilibrium between savings and investment within the capital market, it is seen that an increase in interest rates occurs, resulting in a decrease in investment capital (Bernheim, 1989; Khan & Gill, 2009). According to Paudyn (2013), the augmented public debt leads to a decline in private sector investment, causing a decrease in the country's credit rating. Consequently, this diminished credit rating leads to a drop in investor confidence, which subsequently results in a decrease in private sector investment.

The second trend pertaining to the relationship between governmental debt and the private sector can be attributed to the principles of Keynesian economics. Keynes posited that the accumulation of governmental debt has a favorable influence on the private sector. This theory posits that the government engages in borrowing as a response to a decrease in investment. Consequently, when the borrowed funds are allocated towards capital expenditure, the intended outcome is to stimulate the development of public infrastructure. There exists a positive correlation between the expansion of public infrastructure and the augmentation of economic growth. Government expenditure has the potential to generate a positive impact on private investment by means of the multiplier effect. This effect results in an overall increase in spending across both the public and private sectors, thereby fostering economic growth. As a consequence, investor confidence in the business environment is enhanced, subsequently leading to an upsurge in private sector investment (Musgrave, 1997; Baddeley, 2003). In addition, it has been argued that public debt-funded capital projects play a crucial role in attracting private investment by establishing infrastructure that fosters investment (Musolesi, 2011). According to Makin (2015), economic growth and the expansion of private investment can be facilitated through the utilization of borrowing and governmental spending. These measures serve to stimulate demand and effectively respond to its growth by encouraging further investment.

The third perspective on the relationship between public debt and private sector investment is provided by the superior debt theory, which suggests that public debt has an asymmetric impact on the private economy. This theory, proposed by Krugman (1988) and Sachs (1989), asserts that initial increases in public debt have a positive impact and provide substantial support for the growth of the private economic sector. A nonlinear relationship exists between public debt and the private economic sector once public debt exceeds a certain threshold. The reason public debt exceeding a certain threshold discourages investment is because investors fear that their investment returns will be taxed to service public debt and related interest (Deshpande, 1997). The decline in investor confidence decreases private economic sector investments. Furthermore, a rapid increase in public debt causes credit rating agencies to evaluate nations less favorably. These lower evaluations tend to diminish investor confidence, thereby impeding private sector investments (Calvo, 1998).

The empirical evidence regarding the effects of public debt is heterogeneous, with studies yielding varying results. An important finding is that a rise in public debt frequently has negative effects on private sector investment. Using an instrumental variable approach, Huang and colleagues (2016) demonstrated that local public debt is inversely correlated with the capital investment ratio of domestic private manufacturing enterprises in China; the effect is more pronounced for domestic firms that heavily rely on credit funding. Investments at the enterprise level are more sensitive to internal capital in cities with high public debt, possibly due to limited access to external credit. Origin and colleagues (2021) and Picarelli and colleagues (2019) have demonstrated that excessive public debt has a negative impact on the investment and expansion of the private sector. Philip and coworkers (2017) examined the relationship between domestic debt and private sector credit in Nigeria using a structural VAR model and annual data from 1970 to 2015. The results of impulse response functions indicated that Nigeria's public debt has a long-lasting negative effect on the domestic private sector credit market. Findings by King'wara (2014) and Lidiema (2018) in Kenya are consistent with the crowding-out hypothesis, although the negative relationship diminishes in the long term. Using a panel dataset of 20 OECD countries, Salotti and Trecroci (2012) argued that high public debt is associated with a substantial and nonlinear decline in both aggregate investment expenditure and productivity growth. Using a VEC model and Granger causality analyses, Asogwa and Okeke (2013) investigated the relationship between public debt and investment in Nigeria. The research confirmed both the crowding-out effect of public debt on domestic investment and the existence of a Granger-causal relationship between public debt and investment.

The theory of excessive debt posits a third perspective on the correlation between public debt and private sector investment, highlighting the presence of asymmetric effects of public debt on the private sector. The idea put forth by Krugman (1988) and Sachs (1989) is that an initial increase in public debt has a favorable effect on the private sector, facilitating its development. Nevertheless, once public debt exceeds a specific threshold, it will impede the private sector, indicating a non-linear correlation between public debt and the private sector. One potential factor contributing to investment hurdles is the presence of substantial public debt, since investors may be apprehensive about the potential taxation of their investment returns to service the public debt and associated interest (Deshpande, 1997). The decrease in investor confidence precipitates a corresponding decrease in private sector investment. Furthermore, the overutilization of public debt has the potential to alter a nation's debt composition and impact the demand for domestic financial assets (Da Silva et al., 2014). Moreover, the study conducted by Imimole and Imoughele (2012) revealed a noteworthy adverse effect of domestic debt on investment. The study conducted an observation, which revealed that a 10.0% rise in domestic debt corresponded to a 2.2% decline in investment.

Nevertheless, certain empirical investigations have yielded evidence supporting the notion that public debt might have a favorable effect on private investment. For instance, Thilanka and

Ranjith (2018) observed such a relationship in the context of Sri Lanka. According to a study by Thilanka and Sri Ranjith (2018), increased private investment in Sri Lanka was a result of public debt. Within the specific context of Sri Lanka, the authors put forth the argument that public debt has a beneficial influence, which is manifested through the facilitation of subsidies, transfers, and substantial microcredit. According to Manda's (2019) research, it was contended that public debt exerted little influence on investment or impeded economic growth, and there was a lack of substantiating evidence for the occurrence of crowding-out effects. Şen and Kaya (2014) posited that the utilization of public debt to fund economic development, public services, infrastructure, and capital support had a favorable impact on the source of money for private sector investment. Furthermore, the research conducted by Hajian, Mohamed, and Habibullah (2017) yielded neither substantiation of the detrimental consequences of public debt on private sector investment nor any indication of crowding out effects resulting from public debt in the context of Malaysia. Checherita-Westphal and Rother (2012) observed that there was no discernible influence of public debt on the private sector in several European nations. However, they did identify a non-linear association between average GDP per capita growth and public debt. According to the study conducted by Lau et al. (2019), it was discovered that public debt not only has a detrimental effect on investment, but there is also a nonlinear association between these two variables. In their study, Ebi and Imoke (2017) discovered a non-linear correlation between the origin of capital for private sector investment and public debt. Their findings indicate that moderate levels of public debt have a stimulating effect on the source of capital for private sector investment. However, high levels of public debt have a detrimental impact, eroding the positive influence of the private sector.

3. RESEARCH METHODS AND DATA

The NARDL model

The study tests the asymmetric impact of public debt on bank credit supply for the private sector in Vietnam using A Nonlinear Autoregressive Distributed Lag Model (NARDL):

DCB = f(LIA, CLP, BMG, GDP)

The NARDL model shows the asymmetric impacts in the short and long term through the decomposition of positive and negative coefficients of the explanatory variables. The asymmetric model is suitable for testing the nonlinear impacts of the factors:

$$y_t = \beta^+ x_t + \beta^- x_t + u_t \quad (1)$$

$$\Delta x_t = v_{t'} \quad (2)$$

To perform the NARDL model, the series x_t and y_t must be stationary with the highest order of difference that is 1. x_t is decomposed into: $x_t = x_0 + x_t^+ + x_t^-$. Where, x_t^+ and x_t^- represent the positive and negative impacts of the independent variable x on the dependent variable y:

$$x_t^+ = \sum_{j=1}^{t} \Delta x_j^+ = \sum_{j=1}^{t} \max(\Delta x_j, 0)\text{, } x_t^- = \sum_{j=1}^{t} \Delta x_j^- = \sum_{j=1}^{t} \min(\Delta x_j, 0) \quad (3)$$

The static linear combination of the components:

$$z_t = \beta_0^+ y_t^+ + \beta_0^- y_t^- + \beta_1^+ x_t^+ + \beta_1^- x_t^- \quad (4)$$

In expression (4): $\beta^+ = -\beta_1^+ / \beta_0$ and $\beta^- = -\beta_1^- / \beta_0$.

The NARDL model (p, q):

$$y_t = \sum_{j=1}^{p} \phi_j y_{t-j} + \sum_{j=0}^{q} (\theta_j^{+'} x_{t-j}^{+} + \theta_j^{-'} x_{t-j}^{-}) + \varepsilon_{t'} \quad (5)$$

$$\Delta y_t = \rho y_{t-1} + \theta^{+'} x_{t-1}^{+} + \theta^{-'} x_{t-1}^{-} + \sum_{j=1}^{\rho-1} \gamma_j \Delta y_{t-j} + \sum_{j=0}^{\rho-1} (\varphi_j^{+'} \Delta x_{t-j}^{+} + \varphi_j^{-'} \Delta x_{t-j}^{-}) \quad (6)$$

$$= \rho \zeta_{t-1} + \sum_{j=1}^{\rho-1} \gamma_j \Delta y_{t-j} + \sum_{j=0}^{q-1} (\varphi_j^{+'} \Delta x_{t-j}^{+} + \varphi_j^{-'} \Delta x_{t-j}^{-})$$

Where $\rho = \sum_{j=1}^{p} \phi_{j-1}, \gamma_j = -\sum_{i=j+1}^{p} \phi_i$ với j=1,…,p-1,

$\theta^{+} = \sum_{j=0}^{q} \theta_j^{+}, \theta^{-} = \sum_{j=0}^{q} \phi_j^{-}, \varphi_0^{+} = \theta_0^{+}, \varphi_j^{+} = -\sum_{i=j+1}^{q} \theta_j^{+}$ với j=1,…,q-1

$\varphi_0^{-} = \phi_0^{-}, \varphi_j^{-} = \sum_{i=j+1}^{q} \theta_j^{-}$ with j=1,…,p-1 và $\zeta_t = y_t - \beta^{+'} x_t^{+} - \beta^{-'} x_t^{-}$ is the asymmetric ECM coefficient.

The reduced form of expression (6) is as follows:

$$\Delta x_t = \sum_{j=1}^{q-1} \Lambda_j \Delta x_{t-j} + \upsilon_{t'} \quad (7)$$

$$\varepsilon_t = \omega' \upsilon_t + e_t = \omega' (\Delta x_t - \sum_{j=1}^{q-1} \Lambda_j \Delta x_{t-j}) + e_{t'} \quad (8)$$

If substitute expression (8) into (6), we obtain an asymmetric ECM::

$$\Delta y_t = \rho \zeta_{t-1} + \sum_{j}^{p-1} \gamma_j \Delta y_{t-j} + \sum_{j=0}^{q-1} (\pi_j^{+'} \Delta_{t-j}^{+} + \pi_j^{-'} \Delta_{t-j}^{-}) + e_{t'} \quad (9)$$

Where $\begin{matrix} \pi_0^{+} = \theta_0^{+} + \omega, \pi_0^{-} = \theta_0^{-} + \omega, \pi_j^{+} = \varphi_j^{+} + \omega' \Lambda_j \\ \pi_j^{-} = \varphi_j^{-} + \omega' \Lambda_j \end{matrix}$ with j=1,..,q-1

Equation (9) is the NARDL asymmetric regression model showing the nonlinear impacts of the independent variables x_t on the dependent variable y_t.

Description of Model Variables

This study investigates the asymmetric effects of public debt on bank credit allocated to the private economic sector in Vietnam. The analysis incorporates five variables, namely public debt (LIA), bank credit allocated to the private sector (DCB), capital demand of the private sector (CLP), growth in broad money supply (BMG), and the rate of economic growth (GDP). The data has been gathered on a quarterly basis, spanning from the initial quarter of 2000 to the first quarter of 2021, and procured from the International Monetary Fund (IMF). The variables of state debt (LIA), bank credit supplied to the private sector (DCB), and capital demand of the private sector (CLP) deviate from a normal distribution and display pronounced right-skewness in their tails, which is statistically significant. In order to fulfill the input data criteria of the model, the study employs the transformation of these variables into natural logarithms, resulting in a distribution that closely approximates normality.

4. RESEARCH RESULTS AND DISCUSSION

Table 4.1 presents the results of unit root tests. The results indicate that GDP, BMG, LIA, CLP, and DCB are stationary at either the I(0) or I(1) difference level. For the NARDL model, unit root tests are essential because the autoregressive distributed lag model is applied to series that are stationary at I(0), I(1), or a combination of I(0) and I(1). The model cannot be applied when any variable is stationary at the second difference level, I(2). The results confirm that there are no series stationary at the second difference level, allowing for the application of the NARDL model in this study.

Various tests were conducted, including the Ramsey test for functional form, the Jarque-Bera test for residuals, and the Breusch/Pagan test for heteroskedasticity. The NARDL model is presented in Table 4.2, and the results confirm that the model does not suffer from any of the mentioned issues; thus, this study can be used to estimate the NARDL.

Additionally, Table 4.3 presents the results of non-linear cointegration between variables based on Pesaran's F-statistics and t_BDM. The null hypothesis, Ho: no cointegration, is tested. The F-statistics value is greater than t_BDM, confirming the existence of a long-term relationship between public debt and bank credit supplied to the private economic sector. Therefore, the long-term relationship can be further analyzed when nonlinear cointegration estimates are available.

Table 4.4 demonstrates the existence of an asymmetric impact of public debt on bank credit supplied to the private economic sector in Vietnam over the long term. When public debt increases by 1 unit, it has a negative effect, causing a decrease of -0.006656 units in bank credit supplied to the private economic sector. Conversely, a 1-unit decrease in public debt leads to an increase of 0.044296 units in bank credit supplied to the private economic sector.

The respective coefficients in Tables 4.2 and 4.4 show the directional influence of the independent factors on the dependent variables. This influence might be either positive or negative. In contrast, independent variables with positive or negative signs indicate whether they have a positive or negative impact, which results in unequal effects on the dependent variables as seen in the associated covariate coefficients.

To test the significance of the study, NARDL statistics are used. The study assesses the stability of estimated parameters using Cusum and Cusumsq statistics, as shown in Figures 4.1 and 4.2. The results confirm that Cusum and Cusumsq fall within the critical bounds with a significance level of 5%, indicating model stability without sudden shifts or structural breaks.

The findings of the study suggest that a rise in public debt by one unit has a detrimental effect on the private economic sector, leading to a reduction of around -0.006656 units in the provision of bank credit to the private sector. The real-world ramifications of this phenomenon lie in the potential deterrence of investments due to worries about the redirection of investment proceeds towards increased taxes resulting from an increase in debt servicing expenses. On the contrary, a reduction of 1 unit in public debt facilitates an augmentation in the availability of capital to the private economic sector, resulting in a corresponding increase of 0.044296 units in bank credit provided to the private sector. The research findings presented in this study align with established theoretical frameworks and are in line with earlier empirical studies. The theoretical framework, drawing upon the perspectives of New Classical economists Krugman (1988) and Sachs (1989), posits that in its first stages, public debt yields positive benefits and provides support for the operations of the private economic sector. Nevertheless, once the level of public debt exceeds a certain threshold, it starts to impede the private sector, illustrating the non-linear correlation between public debt and the private economic sector. The presence of public debt has been found to have crowding-out effects and asymmetric repercussions for the private sector. This occurs as investor confidence is eroded and the nation's credit ratings are lowered, resulting in a subsequent reduction in the amount of bank credit that is made available to the private sector. The findings of this study align with previous empirical research conducted by Vincent and Clem (2013), Gicheru and Nasieku (2016), Kamundia et al. (2015), and Mabula and Mutasa (2019). These studies have also indicated that an excessive amount of public debt has a detrimental impact on the private economic sector by redirecting capital that would have otherwise been allocated to private sector activities. The diminished ability to borrow is a consequence of the displacement of private economic activity by the state sector, sometimes referred to as crowding-out effects. Moreover, the presence of substantial debt servicing expenses indicates that funds that could have been designated for infrastructure initiatives and economic stimulus are instead diverted towards debt repayment, thus exerting a negative impact on private investment.

5. CONCLUSION

The study investigates the asymmetric impact of Vietnam's public debt on bank credit extended to the private sector. In order to accomplish this objective, the analysis applied an asymmetric

Nonlinear Autoregressive Distributed Lag (NARDL) model. The research findings demonstrate that when governmental debt exceeds a specific level, it has negative consequences for the availability of credit to the private economic sector. The findings of the study also suggest that the reduction of domestic public debt has a positive impact on the long-term accessibility of loans to the private economic sector. The study highlights the importance of implementing measures to decrease government borrowing and reduce public debt as a means to promote private sector capital. The findings of the study indicate that the judicious utilization of both domestic and international public debt has the ability to stimulate economic activity and hence facilitate economic growth. However, on a broader scale, the allocation of government expenditures will play a crucial role in determining the relationship between public debt and economic growth. For instance, the act of borrowing funds with the intention of repaying debt, engaging in recurrent spending, or engaging in wasteful spending may not effectively stimulate the economy. Conversely, borrowing funds for the purpose of financing development projects, boosting capital expenditure, and making reasonable long-term investments in production projects has the potential to foster economic growth. Vietnam, akin to numerous emerging economies, predominantly engages in borrowing for the aforementioned purposes. Consequently, the public debt levels of such nations persistently escalate, leading to a decline in credit accessibility and investment opportunities for the private economic sector. This, in turn, results in an upsurge in unemployment rates, a decrease in national output, and a substantial portion of the population being confined to impoverished conditions. The inadequacy of the debt-driven model in effectively assessing the influence of public debt on the private economic sector underscores the fact that elevated levels of debt can impede economic growth, mostly as a result of less credit availability from the banking system and reduced investment in the private economic sector.

The examination of the relationship between the public sector and the private sector, particularly in developing nations and growing markets such as Vietnam, presents a captivating area of study. The research team plans to extend the scope of the study in the future to investigate the influence of regional public sector issues, such as public debt, taxation, and government expenditure, on the growth and development of Vietnam's private economic sector.

KEYNOTE - HARMONIZING SUSTAINABILITY REPORTING: AN OVERVIEW OF THE RECENT DEVELOPMENTS AND A RESEARCH AGENDA

Simone Scagnelli [1]

INTRODUCTION

In recent years, heightened concerns about climate change have underscored the imperative for governments, organizations, and individuals to alter their conduct towards more sustainable practices. This paradigm shift emphasizes the critical role of information pertaining to corporate sustainability initiatives in shaping economic and political landscapes, guiding private investments, and ensuring the well-being of both consumers and workers by mitigating business-associated risks (de Colle et al., 2013; Schaltegger & Burritt, 2015).

Accordingly, information related to organisations' sustainability practices is getting increasing, driven by the potential business value generated through enhanced accountability, and communication that can be used to satisfy investor and stakeholder interests (Larrinaga, 2007). Despite, the controversial and critical debate about the role of CSR and corporate sustainability, often being used as reputational strategies to attract customers or impress external audiences (Simunic & Colleoni, 2022) (Cambra-Fierro et al., 2008; Friedman, 1962; Higgins & Larrinaga, 2014; Lii & Lee, 2012; Melo & Garrido-Morgado, 2012; Porter & Kramer, 2011), a growing stream of literature is demonstrating that ESG-related disclosure and reporting to improve corporate transparency, build trust and better engage with such stakeholders and audiences (Truant et al., 2017).

However, sustainability reporting has led to a proliferation of different frameworks and guidelines, resulting in a growing number of companies preparing sustainability reports using different frameworks (Mynhardt et al., 2017; Siew, 2015). This lack of standardization hinders comparability and makes it difficult for stakeholders to assess the impacts of business activities on the environment and society (Ramanathan & Isaksson, 2022; Unerman et al., 2010). Additionally, the accuracy and materiality of indicators used in sustainability reporting are often insufficient, further hindering comparability and the usefulness of the reports (Unerman & Zappettini, 2014). The complex multi-dimensional nature of accounting harmonization, including cultural, enforcement, tax, and legal differences, also presents barriers to achieving complete convergence of national accounting standards (Cherepanova, 2017).

Harmonization can address the problem of reduced comparability caused by the plurality of reporting standards, allowing for better analysis and decision-making and can ensure the reliability and validity of indicators, addressing the issue of accuracy in reporting (Ferrer et al., 2020). Furthermore, harmonization can provide common approaches for verification, ensuring the quality of sustainability reporting in both traditional and responsible financial markets (A. Ali & Jadoon, 2022; Beerbaum, 2022). By promoting standardization, harmonization can facilitate information

1 Edith Cowan University, Australia.

sharing, conformity assessment, and business networking, enabling companies to achieve economic and environmental objectives while minimizing trade barriers (Shad et al., 2019). Overall, it can contribute to the development of a sustainable economy, where companies take responsibility for their actions and report on their economic, social, and environmental impacts.

Hence, the key drivers of the harmonization of sustainability reporting standards include the need for reduced comparability due to the plurality of reporting standards and improved capital allocation based on better understanding of organisations' risk and challenges in today's complex World (I. Ali et al., 2023; Stolowy & Paugam, 2023).

The recently formed ISSB-International Sustainability Standards Board (part of the IFRS Foundation), the Global Reporting Initiative (GRI), the US Sustainability Accounting Standards Board (now consolidated in the ISSB), the International Integrated Reporting Council (now consolidated in the ISSB), the Climate Disclosure Standards Board (now consolidated in the ISSB), the Carbon Disclosure Project (CDP), are some of the framework and bodies that have shaped the recent sustainability reporting landscape. In the last ten years, several efforts have been made to combine frameworks and their guidelines and standards with the aim to achieve a higher level of harmonization in sustainability reporting.

One of the most influential initiatives to promote consistent and comparable climate reporting by companies is the Task Force on Climate-related Financial Disclosures (TCFD), which was established by the Financial Stability Board (FSB) in 2015 and has developed a framework to help public companies and other organizations disclose climate-related risks and opportunities (TCFD, 2023). The TCFD framework consists of four pillars: governance, strategy, risk management, and metrics and targets. The TCFD has also published guidance on metrics, targets, and transition plans for different sectors. The TCFD standards are widely supported by investors, regulators, and companies around the world. Another initiative is the International Sustainability Standards Board (ISSB), which was established by the IFRS Foundation in October 2022 following the merge with the Value Reporting Foundation (resulting from merger of the SASB and the IIRC) and the Climate Disclosure Standards Board to set global baseline standards for sustainability disclosure (IFRS, 2023.). The ISSB issued its first two standards, IFRS S1 and IFRS S2, on general and climate-related disclosures in July 2023. A third initiative is the European Sustainability Reporting Standards (ESRS), which were developed by the European Financial Reporting Advisory Group (EFRAG) as a technical adviser to the European Commission (EFRAG, 2023). The ESRS although aligned with the ISSB standards and the Corporate Sustainability Reporting Directive (CSRD), which requires companies in the EU to report using a double materiality perspective. The ESRS were adopted by the European Commission as delegated acts in July 2023. A fourth initiative is the proposed US SEC climate rule, which would require SEC registrants to disclose information on their greenhouse gas emissions, climate risk management, and scenario analysis (SEC 2023). These initiatives aim to improve the quality, comparability, and reliability of sustainability information for investors and other stakeholders.

The following sections provide more information about the IFRS Sustainability Disclosure Standards developed by ISSB and the European Sustainability Reporting Standards (ESRS) developed by the EFRAG, while the final section propose a research agenda for accounting and finance scholar based on such sustainability standardisation context.

IFRS SUSTAINABILITY DISCLOSURE STANDARDS S1 AND S2

IFRS S1 General Requirements for Disclosure of Sustainability-related Financial Information[1]

The standard S1 released by the ISSB aims to provide investors and other stakeholders with useful information about how an entity's sustainability-related risks and opportunities affect its prospects and value creation (IFRS 2023). The standard requires an entity to disclose information about:

- **Governance**: the processes, controls and procedures the entity uses to monitor, manage and oversee sustainability-related risks and opportunities;
- **Strategy**: the entity's strategy for addressing sustainability-related risks and opportunities, including its objectives, targets and actions;
- **Risk management**: the entity's process for identifying, assessing and managing sustainability-related risks and opportunities, including its risk appetite, risk exposure and risk mitigation;
- **Metrics and targets**: the entity's performance indicators and measures for assessing and managing sustainability-related risks and opportunities, including quantitative and qualitative information.

This standard applies to all sustainability-related risks and opportunities that could reasonably be expected to affect the entity's cash flows, access to finance or cost of capital over the short, medium or long term. The standard also allows for flexibility in how an entity determines the materiality of such information, taking into account the nature and size of its business, its industry and its stakeholders' expectations.

An important principle in S1 is the "connectivity" approach, requiring companies to disclose how their sustainability-related risks and opportunities are connected to their financial performance and position. This means that firms should explain how their sustainability strategy, governance, risk management, and metrics and targets affect their financial results and value creation. Importantly, it also implies that companies should issue their sustainability disclosures at the same time as their financial statements and cover the same reporting period (Mac Cormac, 2023)

IFRS S2 Climate-related Disclosures[2]

IFRS S2 is a global standard for climate-related disclosures issued by the International Sustainability Standards Board (ISSB) in June 20231. It applies to annual reporting periods beginning on or after 1 January 2024, with earlier application permitted as long as IFRS S1 is also applied. Its objective is to require an organisation to disclose information about its climate-related risks and opportunities that is useful to users of general purpose financial reports in making decisions relating to providing resources to the organisation. These are climate-related risks and opportunities that could reasonably be expected to affect the entity's cash flows, its access to finance or cost of capital over the short, medium or long term.

The S2 standard two types of climate-related risks: (i) physical risks and (ii) transition risks. Physical risks are the risks arising from the physical effects of climate change, such as extreme weather events, changes in temperature and precipitation patterns, and sea level rise. Transition risks are the risks arising from the process of adjustment towards a low-carbon economy, such as

[1] Available at https://www.ifrs.org/issued-standards/ifrs-sustainability-standards-navigator/ifrs-s1-general-requirements/

[2] Available at https://www.ifrs.org/issued-standards/ifrs-sustainability-standards-navigator/ifrs-s2-climate-related-disclosures/

policy changes, technological innovations, market shifts, and reputational factors. The standard also applies to climate-related opportunities available to the organisation, such as resource efficiency, new products and services, access to new markets, and enhanced reputation.

Consistent with IFRS S1, the requirements for disclosing information about an entity's climate-related risks and opportunities are in four areas: governance, strategy, risk management, and metrics and targets. For each area, IFRS S2 specifies the objective of the disclosures, the minimum disclosures required, and additional guidance on how to prepare and present the disclosures. A summary of the requiremens according to these four areas is provided below (IFRS S2:5-33, 2023):

- **Governance:** information disclosure about the governance body(s) (which can include a board, committee or equivalent body charged with governance) or individual(s) responsible for oversight of climate-related risks and opportunities as well as identification of the body(s) or individual(s); information about management's role in the governance processes, controls and procedures used to monitor, manage and oversee climate-related risks and opportunities.
- **Strategy:** information disclosure about the strategy for managing climate change, including identification, assessment, and response to climate-related risks and opportunities. How climate change affects the organisation's prospects, business model, value chain, decision-making, transition plan, financial position, financial performance, cash flows, and climate resilience in the present and in the future.
- **Risk management:** information disclosure about risk management processes related to climate change, including how they are integrated into the overall risk management process. Policies, inputs, parameters, methods, criteria, priorities, changes, and the monitoring of these processes for both climate-related risks and opportunities; whether and how there is use of climate-related scenario analysis to inform the identification of climate-related risks and opportunities.
- **Climate-related metrics and targets:** information disclosure about greenhouse gas emissions (GHG, scope 1, 2 and 3 as metric tonnes), climate-related risks and opportunities, capital deployment, internal carbon prices, and remuneration related to climate change (also with reference to cross-industry categories). Details about amount, percentage, approach, and changes of these metrics and how they are measured, classified, disaggregated, and aligned with the Greenhouse Gas Protocol[1] and eventually other standards. Climate-related targets that have been set and how they will be monitored and assessed.

EUROPEAN SUSTAINABILITY REPORTING STANDARDS (ESRS)

The European Sustainability Reporting Standards (ESRS) are a set of EU compliance and disclosure requirements adopted on July 31, 2023 by the European Commission (European Commission, 2023), and developed by the European Financial Reporting Advisory Group (EFRAG). The ESRS are the sustainability reporting standards that underpin the EU Corporate Sustainability Reporting Directive (CSRD 2022/2464/EU)[2], which aims to bring sustainability reporting on par with financial reporting for European large companies. The ESRS cover the full range of environmental, social, and governance issues, including climate change, biodiversity and human rights.

---

1 Available at https://ghgprotocol.org/

2 Available at https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32022L2464

The ESRS consist of 12 standards, each covering a specific sustainability topic. The first standard, ESRS 1, provides general requirements for sustainability reporting, such as materiality assessment, reporting boundaries, assurance and presentation (Denkstatt, 2023). The other 11 standards, ESRS 2 to ESRS 12, provide topic-specific disclosure requirements for pollution, water, climate, biodiversity, resource use and circular economy, own workforce, workers in value chain, affected communities, consumers and end-users, business conduct and governance. The standards also include indicators deriving from other EU regulations, such as the Sustainable Finance Disclosure Regulation (SFDR), the Benchmark Regulation (BMR) and the Capital Requirements Regulation/Directive (CRR/CRD).

The ESRS apply to all companies subject to the CSRD, which are all large and listed companies in the EU. From 2028, non-EU companies operating in Europe must also report their impacts using the ESRS or equivalent standards. The reporting requirements will be phased in over time for different companies, starting from financial year 2024, depending on their size and sector. The ESRS are designed to be consistent with the EU legal framework and interoperable with global standards, such as those developed by the International Sustainability Standards Board (ISSB) and especially the Global Reporting Initiative (GRI). Accordingly, the cost of adopting ESRS for companies may be reduced by leveraging such existing reporting frameworks given their interoperability; especially that GRI and ISSB are developing tools to simplify the reporting process and support companies to report in accordance with both ESRS and their own standards within a single sustainability report (Mac Cormac, 2023).

The ESRS aim to provide information not only for investors but also the other stakeholders to understand the sustainability impact of the companies in which they invest or interact with (Giner & Luque-Vílchez, 2022) and more information will be provided in the next section.

Key approach distinctions.

The IFRS-ISSB standards and ESRS are the most recent sets of sustainability reporting standards that aim to provide information for investors and other stakeholders on the environmental, social and governance (ESG) performance of companies. However, there are some key distinctions that will be presented in the following paragraphs, also including some reference to GRI standards.

Materiality approach:

- **IFRS-ISSB** adopts "financial materiality" (consistent with the definition of materiality included in the IFRS Accounting Standards). Information is material if omitting, misstating or obscuring it could reasonably be expected to influence investor decisions.

- **ESRS** are based on the double materiality principle, which means that organisations have to report on both the impacts of sustainability matters on their financial performance and position, and the impacts of their activities on people and the environment.

- **GRI** standards are based on the impact materiality principle, which means that organisations have to report on the most significant impacts of their activities on the economy, environment and society.

Target audience (stakeholders):

- The **ISSB** primarily aims to fulfill the needs of a specific stakeholder group: investors. It focuses on creating standardized sustainability reporting guidelines that cater to the interests of the investment community on a global scale.

- **ESRS** (consistent with GRI) takes a more inclusive multistakeholder approach, recognizing the varied concerns of different stakeholders within the European context. It seeks to engage a broad spectrum of stakeholders, including governments, businesses, civil society, and investors, to ensure comprehensive sustainability reporting standards that reflect diverse regional perspectives.

CONCLUSIONS AND RESEARCH AGENDA

In conclusion, the harmonization of sustainability reporting standards represents a significant milestone in the corporate reporting landscape. These developments should bring greater clarity and comparability to sustainability reporting, benefitting organizations, investors, and stakeholders. These developments pose significant opportunities for accounting and finance scholars and their research endeavours.

How do the new sustainability reporting standards affect the decision-making and behaviour of companies, investors, and other stakeholders?

The new standards change the incentives, expectations, and accountability of different actors in the sustainability reporting ecosystem. For instance, they influence the strategic choices, resource allocation, and performance management of companies by requiring them to disclose their sustainability impacts, risks, and opportunities. They also affect the information needs, preferences, and usage of investors and other stakeholders by providing them with more relevant, reliable, and comparable data on sustainability performance and outcomes. In addition, they shape the regulatory environment, supervision, and enforcement of sustainability reporting by setting common rules, principles, and indicators for sustainability disclosure and assurance.

How do the new sustainability reporting standards interact with existing financial reporting standards and practices?

The new standards aim to integrate financial and non-financial information in a coherent and consistent way. For instance, evaluating how the new standards enhance or reduce the quality, comparability, and reliability of financial and non-financial information by addressing the gaps, overlaps, and inconsistencies. Or assessing the value relevance of information and the cost of capital by examining how the new standards affect the market valuation, risk perception, and investment decisions.

How do the new standards impact the corporate governance, risk management and internal control systems of companies?

Analysing the impact on the roles and responsibilities of board members, managers, auditors, and other internal stakeholders in relation to sustainability reporting. Understanding if they enhance or impair the effectiveness and efficiency of internal control systems for ensuring the accuracy, reliability, and security of sustainability-related information. If they improve or worsen the performance and reputation of companies in terms of sustainability outcomes.

How do the new sustainability reporting standards affect the development and innovation of sustainable finance products and services?

Studying if they create or constrain opportunities for developing and offering sustainable finance products and services, such as green bonds, social impact investing, or ESG funds. Or facilitate or hinder the access to and allocation of capital for sustainable finance products.

How do the new sustainability reporting standards contribute to the transition to a low-carbon and circular economy?

Understanding if they encourage or discourage the adoption of low-carbon technologies, practices, and behaviours by companies, investors, regulators, and other stakeholders. Or stimulate or inhibit the creation of value from waste reduction, reuse, recycling, and regeneration by companies. And if their adoption accelerate or slow down the progress of a specific area or jurisdiction towards a low-carbon and circular economy at different levels (e.g., sectoral, regional, national).

How do the new sustainability reporting standards address the diversity and complexity of sustainability issues across different sectors, regions and contexts?

Studying the diversity and complexity of sustainability issues across different sectors (e.g., energy, agriculture, manufacturing), across different regions (e.g., developed vs developing countries) and the impact across different contexts (e.g., social, cultural, political).

Additionally, Accounting and finance educators can face various challenges and opportunities given the developments in this sustainability reporting context. Some of the challenges include updating their knowledge and skills, designing relevant and innovative curricula, ensuring the quality and diversity of education and research, and attracting and developing qualified faculty and staff. Some of the opportunities include leveraging new technologies and platforms, engaging with various stakeholders, fostering a culture of excellence, innovation, and diversity, and preparing future-ready professionals.

PROPOSED RESEARCH MODEL OF BUSINESS DIGITAL TRANSFORMATION IN VIETNAM

Ph.D Nguyen Thi Nhu Mai[1], MBA Diep Quynh Tram[2]

Abstract: *Research through the process of synthesizing and analyzing previous studies to have a deeper insight into the digital transformation concept, the factors affecting digital transformation as well as digital transformation in businesses that have an impact to business performance. The article proposes a research model on enterprises digital transformation in Vienam with influencing factors including Leadership, Digital business strategy, Employee capacity, Corporate culture, Technology platform, Enterprise pressure, Information security, Technology readiness, and Compatibility. Moreover, the study also proposes to consider the Business performance as the digital transformation result in enterprises.*

Keywords: *Digital transformation, Business performance, Technology, Business*

1. INTRODUCTION

Today, competition between businesses is increasingly fierce, especially in the digital age, requiring businesses to continuously innovate and improve to adapt to changes of customers and the economy. Therefore, businesses need to pay attention to transforming appropriate business models, combined with innovative thinking to determine long-term strategies and competitive advantages of each business in the new situation. In addition, with the trend of globalization, along with the strong development of the Fourth Industrial Revolution (Industry 4.0), digital transformation has become one of the key goals and indispensable development strategies for businesses around the world.

Industry 4.0 has impacted on all aspects of the economy, causing rapid changes in all business areas of enterprises. In addition, objective factors such as epidemics, natural disasters, ...forcing businesses to face difficulties that were never there before. This has required businesses to carry out a transformation process, transforming from traditional and manual management and production to the use of tools with higher science and technology content – known as the process of "Digital Transformation". According to Berman (2012), digital transformation affects many aspects of society, especially the development of businesses and the creation of new business models.

Indeed, the rapid development of the field of digital technology is becoming a guideline in changing the national governance of each government, changing the mode of governance - production and business activities of each enterprise and the way of life, communication of each individual in society. Today, the term "digital transformation" has gradually become familiar to the public. Experts said that digital transformation will become a mandatory trend for businesses in the era of globalization and the booming internet. This is not only a trend but also an inevitable of the times, if you stand outside, businesses will not succeed.

Stemming from practical requirements, high application and requirements for digital transformation play an important role in the survival and development of businesses. This study

[1] Email: nguyenthinhumai@tckt.edu.vn, University of Finance and Accountancy.

[2] University of Finance and Accountancy.

hopes to build a model of factors affecting businesses' digital transformation, thereby affecting business performance. From there, it helps businesses recognize the importance of converting arguments to meet the construction and development needs of businesses.

2. THEORETICAL BASIS AND RESEARCH FRAMEWORK

2.1. Concept of Digital transformation in business

Digital transformation has recently emerged as a new issue, facing practical needs that require both theoretical and practical research. In the world, research on digital transformation activities is being conducted extensively. According to Stolterman and Fors (2004), digital transformation is defined as the use of technology to radically improve an organization's performance or reach. McDonald and Rowsell-Jones (2012) argue that digital transformation is not just about digitizing resources, but about creating corporate value on the basis of digital assets. In view of this, Fitzgerald et al. (2013) defines digital transformation in an enterprise as the use of new digital technologies, such as social media, smart mobile devices, new analytics techniques, or automated alignment systems to implement major changes in business operations such as improving customer experience, Optimize operations and create new business models. Moreover, Demirkan et al. (2016) said that the digital transformation activity in question is a rapid and far-reaching transformation phenomenon, in which this transformation is based on digital advances to apply to production and business activities, processes and business models. Similarly, Hess et al. (2016) also mentioned an important feature of digital transformation that is the application of changes in digital technology, from which it is possible to develop new production and business models, thereby creating newer products and services to meet customer needs or apply advances digital in the transformation of organizational structures, processes - workflows towards automation (automatic). According to Micic (2017), the definition of digital transformation is referred to as the integration of digital technology into business activities that leads to changes in business operations and provides value to customers, while the author emphasizes that the subject of digital transformation is the application of digital technologies and activities. The main of the enterprise is the production, processing and transfer of information flow. The application of digital technology is based on the development of many different types of technologies including telecommunication networks, computing technology, software techniques (Micic, 2017).

According to Dao My Chi & Le Thanh Tiep (2022), there is currently no unified definition that can be generalized about digital transformation. At each stage associated with a different perspective, the authors come up with a different concept. From a corporate perspective, the authors share the same view that digital transformation is the application of new technology to optimize resources, operational processes and better satisfy customer needs. The concept of digital transformation is expressed by organizations, individuals and businesses based on their own definitions and development directions. Digital transformation is theapplication of digital technological advances, thereby changing the mode of operation of enterprises in the production, business and management process of enterprises (Dao My Chi & Le Thanh Tiep, 2022)

Thus, based on previous researches, digital transformation can be defined as follows Digital transformation is the integration of digital technologies into all areas of operation of an enterprise, taking advantage of technologies to fundamentally change the way it operates, business model and provide new values to its customers as well as accelerate the development of business activities.

Therefore, digital transformation is also a change in the culture of businesses, requiring businesses to constantly change, experiment with new things and comfortably accept failures to adapt themselves to changes in the environment.

So far, many authors have tried to define the exact concept of digital transformation but there has not been a widely accepted official concept, so its boundaries are often very blurred. Some concepts related to digital transformation are summarized by the author in Table 1 below.

Table 1. Synthesis of concepts related to digital transformation

Authors	Define
Stolterman & Fors (2004)	Digital transformation is the changes that digital technology causes or affects all aspects of human life
Martin (2008)	Digital transformation is now often understood as the use of information and communication technology, not only that conventional automation is carried out but basically creates new possibilities in business, public government as well as the lives of people and society
Westerma, et al. (2011)	Digital transformation is the use of technology to radically improve the performance or reach of a business, it is becoming a hot topic for companies across the globe. Executives across all industries are embracing digital advancements such as analytics, mobility, social media, and smart devices – while improving the use of traditional technologies to transform customer relationships, internal processes, and valuable propositions
McDonald's & RowsellJones (2012)	Digital transformation is not merely about digitizing resources but also leading to the value and revenue generated from digital assets
PwC (2013)	Digital transformation describes the fundamental transformation of the entire business world through the establishment of new internet-based technologies with a fundamental impact on society as a whole.
Mazzone (2014)	Digital transformation is the process of deliberate and ongoing digital development of a company, business model, conceptual process, or methodology, both strategically and tactically.
Schweer & Sahl (2016)	Digital transformation is the consistent network of all sectors of the economy and the adjustment of participants to the new reality of the digital economy. Decisions in networked systems include exchanging and analyzing data, calculating and evaluating options, as well as initiating actions and producing results
Demirkan et al. (2016)	Digital transformation refers to a rapid and far-reaching transformation phenomenon in which this transformation is based on digital advances for application to production activities, businesses, processes and business models
Micic (2017)	Digital transformation is referred to as the integration of digital technology into business operations that leads to changes in business operations and provides value to customers, and the author emphasizes that the subject of digital transformation is the application of digital technologies and the main activities of that business is the production, processing and transfer of information flows. The application of digital technology is based on the development of many different types of technologies including telecommunications networks, computing technology, software techniques
Ismail, Khater, and Zaki (2017)	Digital transformation is a process through which companies converge many new digital technologies, enhanced with ubiquitous connectivity, with the aim of achieving superior performance and sustainable competitive advantage, by transforming many aspects of business, including business models, customer experiences (including digital transformation, products and support services), and operations (including processes and decision-making), and impacting people (including talent, skills, and culture) and networks (including the entire value system)
Schwertner (2017)	Digital transformation is the application of technology to build new business models, processes, software and systems that bring more profitable revenue, greater competitive advantages and greater efficiency
Deloitte (2018)	Digital transformation is the use of technology to radically improve an organization's performance or reach. In a digitally transformed business, digital technologies enable improved processes, talent attraction, and new business models

Kotarba (2018)	Digital transformation can be defined as the modification (or adaptation) of business models, derived from the pace of development of technological progress and innovation, creating changes in consumer behavior and society.
OECD (2018)	Digital transformation refers to the impacts of digitalization on the economy and society. Digitization is the conversion of analog data and processes into a computer-readable format. Digitalization is the use of digital technologies and data and their connectivity that leads to new activities or changes to existing ones
Lesher & Associates (2019)	Digital transformation is the result of the digitization and digitization of economies and societies
Vietnamese Government (2019)	Digital transformation is the use of data and digital technology to comprehensively and comprehensively change all aspects of socio-economic life, reshaping the way we live, work and relate to each other
European Commission (2019)	Digital transformation is characterized by a combination of advanced technologies and the integration of physical and digital systems, the predominance of innovative business models and new processes, and the creation of intelligent products and services
Kozarkiewicz (2020)	Digital transformation is a process in which digital technologies play a central role in creating and reinforcing the disruptive changes that take place in the industry (sector) and in society.
Dao My Chi & Le Thanh Tiep, 2022	Digital transformation is the application of technological advances in digital, thereby changing the mode of operation of enterprises in the production, business and management process of enterprises

(Source: Author's Compilation, 2023)

Kozarkiewicz (2020) emphasizes that disruption can drive strategic responses, organizations increase competitiveness, use digital technologies to create higher new value and achieve strategic entry goals, and overcome barriers in digital transformation that need structural change. These changes not only lead to positive organizational outcomes, but can also be accompanied by undesirable outcomes (Vial, 2019).

There are many definitions provided by academics, government agencies, and business professionals. Some of them are summarized in Table 1. The digital transformation of a company requires a fundamental organizational change. Based on the views of Bostom Consulting Group experts, "Digital transformation requires instilling a culture that supports change while supporting the company's overall strategy" (Hemerling et al., 2018). The sole focus should be on customers and their needs (Schwertner, 2017; Dahlstrom et al., 2017). Many researchers have carried out literature reviews to study the concept of digital transformation, one of the main differences between the current study and the previous one is that the authors used most of the most recent publications to collect data, and the concept was also considered from representatives of the business sector, those who have participated in the digital transformation implementation process.

In order to classify the research results on the concept of digital transformation in a conspicuous way, the internal factors within the concept of Digital transformation, the factors that trigger the digital transformation process as well as the potential results that can be achieved for businesses and society from digital transformation are summarized in Table 2 (Verina & Titko, 2019).

Table 2. Contents and internal factors of the concept of "Digital Transformation"

Technology	Management/Process	Human being
-Data	- Business model	-Customer
- Big Data	- Operating model	- Employees/workforce/people
- Cloud applications	- Operational process	-Administer
- Mobile devices	-Strategy	- Chief Executive Officer
- Social Media	- Business activities	-Talent
-Software	- Organizational structure	- The owners
-Analyze	- Organizational culture	- Suppliers
- Embedded devices	- Coordination mechanism	-Partner
- Artificial intelligence	- Products	- Stakeholders
- The Internet of Things	- New services	-Ability
- Cybersecurity		
- App marketplaces

2.2. Factors affecting the digital transformation ability of businesses

Currently, due to the versatile nature, the study of the role of digital transformation in the world has received great attention from academia. However, in Vietnam, current research is still relatively limited and sketchy (Dao My Chi & Le Thanh Tiep, 2022).

The study by Chatterjee et al. (2002) argues that for digital transformation to be successful, leaders must believe in the value and benefits of new technologies and support their implementation in organizational operations. Another perspective, Lanzolla and Anderson (2008) emphasized the application of digital technologies as a driving factor in digital transformation. Digital technologies may include big data, mobile, cloud computing, or search-engine-based applications (White, 2012). In this view, Hess et al. (2016) emphasized the role of human factors, especially managers, in promoting transformation processes, and there should be a match between human resource capacity and digital technology applications to make optimal use of those technology applications. In addition, research by Nadkarni et al. (2020) compiled from previous studies shows that the internal factors affecting the digital transformation ability of businesses are divided into 3 groups: 33% focus on technology, 34% focus on organizational issues, and 33% focus on both technology and organizational issues. In organization-focused studies, 4 factors are mentioned a lot and directly affect the expected results of digital transformation of businesses: (1) leadership, (2) digital business strategy, (3) employee competence, and (4) corporate culture. For technology-focused research, the use of technology platforms for business activities such as systematic storage of data information, interaction with customers, internal communication and communication, and other activities affecting the digital transformation ability of enterprises is called (5) technology platforms.

The study of Cu Ba Quyet (2021) is a rare study when the study explores the factors affecting the successful digital transformation of businesses in Vietnam. In particular, digital transformation of enterprises is built based on the model of 3 different groups of factors including technology factors, factors belonging to businesses and factors belonging to the environment. Contrary to the research of Chu Ba Quyet (2021), the research of author Pham Thi Thanh Huyen (2021) conducted an analysis of factors affecting digital transformation in tourism in Vietnam and proposed a model of digital transformation affected by 3 large groups of factors including e-commerce and digital platforms, big data and intelligent systems, artificial intelligence and the internet of things. In addition, Dao My Chi and Le Thanh Tiep (2022) also proposed 12 factors affecting the digital transformation of businesses in Ho Chi Minh City, including process digitization; Safety and security; The availability of digital data and technology; Compatibility; Strategy of the enterprise; Human resources of the enterprise; The structure and processes of the enterprise; Enterprise innovation; Customer choice; Competitive pressureh; Supportive government policy; and The impact of the Covid-19 pandemic. In the research of Nguyen Thi Kim Anh (2022), it has proposed a research model of factors affecting the digital transformation ability of businesses with 6 factors and scales of each factor including Leadership, Digital Business Strategy, Employee Capacity, Corporate Culture, Technology platforms, and Pressure on the business. The above are rare studies in Vietnam that mention the factors affecting digital transformation in Vietnam.

2.3. Digital transformation affects business performance

Improving business performance is an essential goal of every business, therefore, factors related to improving operational efficiency have become core issues in management studies (Simon et al., 2019). The business is committed to growth to ensure survival (Teece, 2007). Performance is the evaluation of the performance of an enterprise, either through the results it has achieved or through the potential to achieve future achievements (Tseng et al., 2014). Good performance is fundamental to the survival and development of businesses (Leitch et al., 2010). Performance from digital transformation can be judged by a variety of factors, such as operational performance (Karimi et al., 2015). Digital transformation can improve organizational performance. Wamba and

Mishra (2017) argue that manufacturing businesses invest in digitization to enable reduced data processing costs by automating data collection, storage, and diagnostics. Helfat and Raubitschek (2018) propose that improving the use of digital tools will enhance customer engagement and development of product service systems, including improvements in remote diagnostics and process management. Hong et al. (2019) show that enterprises achieve mass production through digitization and reducing product costs. Dubey et al. (2020) proposed in their research on manufacturing organizations that big data analytics and artificial intelligence can improve operational performance under the influence of environmental dynamics.

Digital transformation is a tool that not only boosts productivity but also enhances commercial competitiveness (Paiola et al., 2021). Digital transformation is essential to help businesses create better customer experiences as well as improve operational process efficiency through automation (Coskun-Setirek &; Tanrikulu, 2021).

Current studies show that digital transformation has an impact on corporate financial performance (Keawphang, 2014). Digital transformation of businesses has a positive impact on their operational performance (Shahbaz et al., 2019). The positive impact of digital transformation on business performance is more evident in large enterprises, state-owned enterprises, mature enterprises and non-manufacturing (services) enterprises (Teng et al., 2022). Moreover, some of the benefits of digital transformation for businesses are the transformation and optimization of traditional business operations through digital technology; raise the level of large-scale production and trading of traditional products; and realizing value benefits, such as improved efficiency, reduced costs, and improved quality (Teng et al., 2022).

In many studies it has been proven that digital transformation has a positive impact on the performance of companies (Mubarak et al., 2019; Teng et al., 2022; Chouaibi et al, 2022). These Industry 4.0 tools can solve businesses' technological challenges, and can ultimately increase sustainable business performance. Moreover, they drive performance and significantly impact production and services. Studies have proven that digital transformation has a positive effect on production and services, and increases business operational efficiency (Shahbaz et al., 2019; Mubarak et al., 2019). In addition, a study by Do et al. (2022) on the impact of digital transformation on the bank's operational efficiency has shown that digital transformation has a positive impact on the operational efficiency of businesses.

Bảng 4. Summary of previous studies related to digital transformation and Business performance

Author	Dimension	Business performance
Digital transformation	Chen et al. (2016)	Positive
	Nwankpa & Roumani (2016)	Positive
	Mubarak et al. (2019)	Positive
	Guo & Xu (2021)	Positive
	Jardak & Ben Hamad (2022)	Positive
	Zhang et al. (2022)	Positive
	Ren et al. (2023)	Positive
	Phan Thi Hang Nga et al. (2023)	Positive

2.4. Research models and hypotheses

Through the process of synthesizing and analyzing previous studies, the author found that the main factors affecting the digital transformation ability of businesses in Vietnam include 9 factors: Leadership, Digital Business Strategy, Employee Competence, Corporate Culture, Pressure on Businesses and Technology Platform; Pressure on business; Safety and security; The availability of digital data and technology; Compatibility.

❖ Leadership: The change in thinking and actions of leaders greatly affects the digital transformation ability of businesses. Such changes include: rapid optimization of leadership decision-making processes thanks to instant access to expanded information and data (Mazzei & Noble, 2017), new communication principles, and changes in leadership learning and development (Sia et al., 2016). Moreover, leaders need new digital thinking to lead the digital transformation journey of the business. In the past, leadership training programs primarily focused on leadership and communication skills. But in times of digital transformation, executives must become technological visionaries and develop their adaptability. Transparency in management and communication through media, along with the dissemination of information and the speed at which data is disseminated online, are important challenges of digitalization for managers that require them to constantly learn and interact more face-to-face.

❖ Digital business strategy: Bharadwaj et al. (2013) argue that information technology plays an increasingly important role in business operations. It is not merely a support for governance but has evolved into an essential element in building corporate strategy. The development and implementation of a business strategy to achieve the long-term goals of the business on a digital technology platform is called a digital business strategy.

❖ Employee qualifications: To accelerate the digital transformation process, there will be additional elements and elements that need to be refined both organizationally and management. For employees and managers, there should be a process for carrying out activities at a faster pace, more accurate, more effective when digital transformation. Therefore, it is required that employees are competent, willing to access, develop and use new technologies in work improvement and performance (Bharadwaj et al., 2013). Moreover, depending on business conditions such as industries and operating models of the organization, employees as well as managers must develop the ability to feel and flexibly exploit the network system and connectivity in the digital environment (Kohli and Melville, 2019) to identify new ideas, evaluate, modify, and ultimately come up with new business models (Berman, 2012; Daniel &; Wilson, 2003).

❖ Organizational culture: Digital transformation is not only a technology-driven challenge but also requires a profound cultural change in the business.

Everyone in the business must be prepared with adaptive skill sets and digital literacy. First, digital transformation requires a corporate culture that consistently verifies data and shares verified data (Dremel et al., 2017). Data must be seen as a great asset and a factor driving the digital transformation of businesses. This will require greater transparency in day-to-day business and workflow as well as data-driven thinking among employees. On the other hand, digital transformation can cause cultural conflict between younger digitally savvy but inexperienced employees and older employees with a long track record in traditional business but lagging behind technologically (Kohli & Johnson, 2011). Management to prevent conflicts between two different cultural subjects from arising within the same organization through facilitating a culture of academic friendliness and openly supported and trusted by executives can effectively mitigate potential cultural divides (Kohli and Melville, 2019).

❖Technology platform: Digital transformation will change the structure of work (Loebbecke & Picot, 2015), job roles and workplace requirements (White, 2012). Digital interconnectedness allows for the emergence of cross-location groups across the entire scope of the business. In this context, the traditional hierarchical work structure gradually disappears and new opportunities emerge beyond the boundaries of the business, such as the integration of other external services (Loebbecke & Picot, 2015). In addition, implementing a working environment based on digital technology becomes essential. According to White (2012), a digital workplace must be relevant, principled, imaginative, and independent of location. Thus, how businesses have a technology application platform in current operations will greatly affect the ability of businesses to successfully transform their arguments in the future.

❖Competitor: In the face of competitive pressure in better meeting customer needs, the prolonged epidemic situation, new government regulations, businesses are increasingly fully identifying the problems they are facing, forcing businesses to improve and optimize management, implementation process and use of resources (Nguyen Thi Kim Anh et al., 2022).

❖Security Concern: Information security concerns are defined as the extent to which virtual worlds are considered unsafe for conducting business activities, such as corporate data exchanges, meetings, and collaboration activities (Zhu et al., 2006). According to trade journals, virtual worlds are considered unsafe to conduct business activities (Lynch, 2008; Naone, 2008). According to Chu Ba Quyet (2020), in reports on information technology application limitations in Vietnam, information security factors are always considered as obstacles. Today, most data runs on public platforms or is stored externally, and as such, organizations have limited options to protect their corporate data in the cyber world. In addition, in the virtual world, collaboration and meetings involving sensitive corporate information cannot be kept confidential (Naone, 2008). As a result, organizations may be concerned about the lack of security in Economy 4.0. Several studies on Internet use show that security concerns are a deterrent factor to an organization's use of the Internet for business purposes. Walczuch, Braven and Lundgren (2000) and Cecilia (2020) argue that if organizations have greater concerns about information security on the Internet, such as unauthorized access to internal networks, insecure information exchanges, and insecure technology platforms, they will be less willing to accept the Internet for business.

❖Technology readines: The technological readiness of organizations, i.e. technology infrastructure and information technology human resources, affects the adoption of new technologies (Kuan *and* Chau, 2001; To and Sir, 2006; Oliveira and Martins, 2010; Wang et al., 2010). Technology infrastructure refers to installed enterprise network technologies and systems, providing a platform for building cloud computing applications. Information technology human resources provide knowledge and skills to deploy information technology applications related to cloud computing (Wang et al., 2010). Cloud computing services can only become part of value chain operations if companies have the necessary infrastructure and technical capacity. As a result, companies that are technologically ready will be better prepared for cloud adoption.

❖Compatibility: Compatibility refers to the degree to which innovation is consistent with the potential adopter's current values, previous practices, and current needs (Rogers, 1983). Compatibility has been considered an essential element for innovation adoption (Cooper and Zmud, 1990; Wang et al., 2010). When technology is recognized as compatible with job application systems, companies are often likely to consider adopting new technology.

❖Based on discussion and survey of business experts and managers, the study proposed the research model as Figure 1.

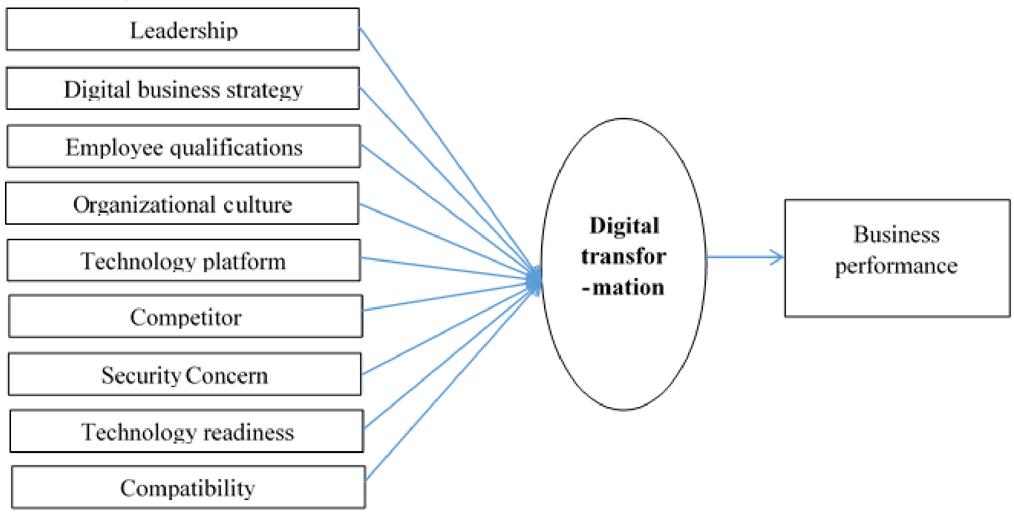

Figure 1. Proposed Research Model

RESEARCH HYPOTHESES

H1: Leadership has a positive impact on the digital transformation

H2: Digital business strategy has a positive impact on the digital transformation

H3: Employee capacity has a positive impact on the digital transformation

H4: Corporate culture has a positive impact on the digital transformation

H5: The technology platform has a positive impact on the digital transformation

H6: The pressure on businesses has a positive impact on their digital transformation

H7: Information safety and security have a positive impact on the digital transformation

H8: Compatibility has a positive impact on the digital transformation

H9: The availability of digital data and technology has a positive impact on the digital transformation

H10: Compatibility has a positive impact on the digital transformation

H11: Digital transformation has a positive impact on business performance

3. CONCLUSIONS

In this article, we analyze the pre-existing studies on digital transformation systematically. The article analyzed contributions related to research topics, their findings to have a deeper insight into digital transformation in businesses. The analysis leads to the proposal of a research model on digital transformation for Vietnamese businesses, including factors affecting digital transformation in enterprises, Leadership, Digital Business Strategy, Employee Capacity, Corporate Culture, Technology Platform, Pressure on Business, Information Security, Digital Data and Technology Availability, and Compatibility. In addition, the model also proposes to study the impact of digital transformation in enterprises on business performance.

However, in the future, the above model needs to be tested in practice to have practical conclusions. Empirical research on factors affecting digital transformation in Vietnam to be able to clearly determine the impact of each factor related to digital transformation in businesses. From there, it can help Vietnamese businesses have a more comprehensive view of their businesses' digital transformation capabilities.

IMPACT OF THE PANDEMIC SHOCK ON THE VIETNAMESE STOCK MARKET AND POLICY IMPLICATIONS

MSc. Vuong Duy Lam, Luu Anh Nguyet[1], **Nguyen Ngoc An**[2]

Abstract: *This paper investigates the impact of the COVID-19 pandemic on the Vietnamese stock market (VNX). Historically, pandemics have often caused major disruptions to the economies of many countries, and stock markets are quick to reflect these impacts. The COVID-19 pandemic has created major challenges for the VNX, even though Vietnam has successfully controlled the pandemic. This paper uses the Vector Autoregression (VAR) method to quantify the impact of COVID-19 on the VNX. The VAR model is used to analyze the dynamic interactions between time series variables. The study helps to better understand the relationship between macroeconomic factors and the stock market in the context of the pandemic, and to identify solutions and implications for enhancing the sustainability of the VNX.*

Keywords: *COVID-19 pandemic, Vietnamese stock market, impact, shock, sustainable development, Vector Autoregression (VAR) method.*

1. INTRODUCTION

In the history of the world economy, pandemics have always been major shocks, causing strong fluctuations and challenges for the economies of many countries. The stock market, a complex and sensitive system, is often the place that reflects the impact of such events most quickly and profoundly.

Before the COVID-19 pandemic, the world had witnessed many similar events such as the 1973 oil shock, the 2008 global financial crisis, and many other events. Each event has provided valuable lessons, helping leaders, investors, and the academic community to better understand the relationship between macroeconomic factors and the stock market.

The COVID-19 pandemic, one of the largest and most complex pandemics of the 21st century, has not only caused far-reaching negative impacts on the global economy, but has also created unprecedented challenges for the stock market. Vietnam, a country that is on the path of development and deep integration, is no exception to this rule. Although it has controlled the epidemic better than many other countries, the instability of the stock market has still occurred, causing negative impacts on the economy.

Analyzing the impact of the pandemic shock on the Vietnamese stock market not only helps us to better understand the relationship between macroeconomic factors and the stock market in this special context, but also to find solutions and implications for the sustainable development of the stock market in the future.

2. LITERATURE REVIEW

COVID-19 pandemic has caused negative impacts to the global economy, including the stock market. Many empirical studies have been conducted to assess the impact of COVID-19 pandemic on the stock market activities in different countries, using various econometric methods.

---

1 Email: vuongduylam@mof.gov.vn, National institute for finance.

2 Military Commercial Joint Stock Bank.

Some studies use regression methods to assess the impact of COVID-19 pandemic on stock market. For example, He et al. (2020) used t-tests and non-parametric Mann-Whitney test to assess the direct and spillover effects of COVID-19 on stock markets in China, Italy, South Korea, France, Spain, Germany, Japan, and the United States (US). They found that COVID-19 pandemic has negative but short-term impacts on stock markets of these countries; and the impact of COVID-19 on stock markets has two-way spillover effects between Asian countries and European and American countries.

Similarly, Liu et al. (2020) used event study method and found that stock markets in these countries have declined sharply after the outbreak of the virus. They also noted that stock market reaction in low-income Asian countries is more negative than other countries.

Some studies use qualitative methods to assess the impact of COVID-19 pandemic on stock market. For example, Yan, Tu, Stuart, and Zhang (2020) analyzed the impacts that COVID-19 may cause on stock market and proposed investment strategies for investors. They concluded that, typically, stock markets overreact to such outbreaks in the short run but in the long run, the market eventually self-adjusts and rebounds.

In addition, some studies use other methods to assess the impact of COVID-19 pandemic on stock market. For example, Baker et al. (2020) used text-based qualitative method to examine the unprecedented impact of COVID-19 on stock market in the US. They found that while previous pandemics, including Spanish flu, only left mild impacts on the US stock market, COVID-19 has had a significant impact on the US stock market.

In general, stock market (SM) is a complex system that reflects the interactions of many economic and financial factors. One of the important aspects of SM is its ability to absorb and respond to shocks.

SM Sensitivity: One notable point is the ability of SM to absorb shocks. If SM has the ability to absorb shocks, the negative consequences can be mitigated, helping the market to avoid negative transmission shocks to the real economy (Chakraborty, T., 2012).

Factors Affecting Shock Absorption Capacity: Chakraborty, T. (2012) and Tripathi, P. (2016) have approached this issue by considering a range of factors, including diversification, interconnectedness, size of financial system, asset structure, debt structure, complexity and transparency, as well as leverage. These factors all affect the ability of SM to absorb and respond to shocks.

Investor Psychology: Investor psychology plays an important role in shaping the value of stocks and market volatility. Unprecedented events such as the Covid pandemic can lead to overreactions from investors, causing strong volatility in the market (He et al., 2020; Liu et al., 2020).

SM Infrastructure: The SM infrastructure system, including both technical and legal infrastructure, plays an important role in determining the market's shock absorption capacity.

Level of Economic and Financial Development: Amstad, Cornelli, Gambacorta, and Xia (2020) have shown that the global stock market is sensitive to changes in the risk-taking index, especially in more financially developed economies. Liu et al. (2020) also emphasize that low-income countries have a more negative response to shocks.

The COVID-19 pandemic has had a significant impact on the global stock market. The impact of the pandemic varies across countries and sectors, and the ability of the stock market to absorb shocks is affected by a number of factors, including investor psychology, the SM infrastructure, and the level of economic and financial development.

2. DATA AND METHODOLOGY

To quantify the impact of COVID-19 on the Vietnamese stock market (VSM), the Vector Autoregression (VAR) method was selected. VAR is a system of autoregressive regression equations widely used in econometric research to analyze the dynamic interactions between time series variables. The VAR model can be employed to predict time series data, analyze data characteristics, and understand interactions between variables. This method is commonly utilized in macroeconomic and financial research (Sims, 1980).

In the context of the COVID-19 pandemic, several studies have applied the VAR model to assess the pandemic's impact on stock markets. For instance, Al-Awadhi et al. (2020) employed the VAR method to explore the impact of COVID-19 on the stock markets of G7 countries. Goodell and Huynh (2020) also applied the VAR method to investigate the relationship between the COVID-19 pandemic and the global stock market.

In Vietnam's context, the VAR model is an appropriate choice to evaluate the impact of COVID-19 on the VSM due to the method's multidirectional interaction capabilities. Especially in this case, the selection of variables in the VAR model was meticulously considered to accurately reflect the factors influencing the VSM during the pandemic phase.

The equation for the VAR model is:

$$REt = \alpha01 + \alpha02CPIt + \alpha03UERt + \alpha04Newcaset + \alpha05Newdeatht + \alpha06Vaccinedt + \varepsilon ot$$

Where:

• REt: The primary dependent variable, representing the VSM's returns, indicating market fluctuations during the pandemic.

• CPIt and UERt: These are significant economic variables reflecting inflation and employment conditions, directly influencing the VSM.

• Newcaset and Newdeatht: These micro indicators directly measure the pandemic's severity, affecting the economic situation and the VSM.

• Vaccinedt: This micro variable reflects the community's vaccination rate, crucial as it indicates the control level and recovery progress from the pandemic.

These variables were chosen as they offer a comprehensive view of both the economic and health impacts of the pandemic on the VSM. Simultaneously, the selection of these variables also adheres to economic and financial theories and previous research addressing the impact of similar variables on the VSM.

Data was collected from official sources such as the National Statistics Office, the Ho Chi Minh City Stock Exchange, and several international data sources. The data includes daily stock indices, COVID-19 infection cases, death cases, and other macro variables from January 2019 to December 2022.

The VAR model allows us to consider interactions between multiple time series variables simultaneously, especially useful when examining the impact of a significant event like COVID-19 on various different variables. Additionally, the VAR model also helps assess the spillover effects between variables.

3. DATA DESCRIPTION

Utilizing data collected from official sources of the Vietnamese Stock Market (VSM) and the National Statistics Office, we present the following analytical overview:

Table 1: Descriptive statistics of the data series after natural logarithm transformation

Variable	Obs	Mean	Std. dev.	Min	Max
lnvnindex	749	6.944566	.183346	6.491042	7.31376
lncpi	749	.8530801	.6081964	-1.660731	1.860975
lnuer	749	.9634642	.2060171	.7654678	1.381282
newcase	487	2491.61	5048.682	0	39132
newdeath	359	66.13092	121.3015	0	804
vaccined	204	2.40e+07	2.76e+07	955	7.74e+07

(Source: Stata)

This dataset provides information on six variables: lnvnindex, lncpi, lnuer, newcase, newdeath, and vaccinated. These variables are measured on a daily level from January 1, 2019, to December 31, 2022.

1) lnvnindex: This is the dependent variable, representing the returns of the Vietnamese stock market (VNIndex) measured in natural logarithm. The average value of lnvnindex is 6.94, with a standard deviation of 0.18. This suggests that the returns of the VNIndex tend to fluctuate around the average, with relatively low volatility.

2) lncpi: This is the first independent variable, representing inflation measured in natural logarithm. The average value of lncpi is 0.85, with a standard deviation of 0.61. This indicates that inflation in Vietnam tends to fluctuate around the average, with relatively high volatility.

3) lnuer: This is the second independent variable, representing the unemployment rate measured in natural logarithm. The average value of lnuer is 0.96, with a standard deviation of 0.21. This suggests that the unemployment rate in Vietnam tends to fluctuate around the average, with relatively low volatility.

4) newcase: This is the third independent variable, representing the daily number of new COVID-19 infections. The average value of newcase is 2491, with a standard deviation of 5049. This indicates that the daily number of new COVID-19 infections in Vietnam has a significant fluctuation.

5) newdeath: This is the fourth independent variable, representing the daily number of COVID-19 related deaths. The average value of newdeath is 66, with a standard deviation of 121. This suggests that the daily number of COVID-19 related deaths in Vietnam has a significant fluctuation.

6) vaccinated: This is the fifth independent variable, representing the daily number of individuals vaccinated against COVID-19. The average value of vaccinated is 2.4 million, with a standard deviation of 2.76 million. This indicates that the daily number of individuals vaccinated against COVID-19 in Vietnam has been increasing over time.

4. RESULTS

After estimating the VAR model, we proceed to validate the model through various tests such as the residual series test, stability test, and impulse response test. The objective is to ensure that the model is estimated accurately and holds statistical significance.

Subsequently, we will conduct a linear regression analysis, followed by a VAR analysis for the data series. The results are show in **Appendix 1.**

When evaluating the entire period before and after the outbreak of the pandemic (2019-2022), which spans 4 years, the linear regression model based on table data provides more accurate insights into the pandemic's impact over the entire period. This is especially true when considering micro variables such as the daily number of new infections, daily COVID-19 related deaths, and the number of fully vaccinated individuals. The results indicate that the R-squared value for the VNIndex in relation to all variables is above 80%, underscoring the model's persuasiveness and the appropriateness of the chosen variables.

However, the regression model's results somewhat contradict traditional economic theories. The VNIndex correlates positively throughout the period with all macroeconomic variables. This means that an increase in the CPI or unemployment rate also leads to an increase in the stock index. Notably, even with rising daily infection and death rates due to COVID-19, or with increasing numbers of fully vaccinated individuals, the stock index continued to rise throughout the period.

This study reveals that the Vietnamese stock market reacted differently than other global stock markets during the COVID-19 pandemic. Previous research has shown that pandemics typically destabilize stock markets, leading to a decline in stock indices. However, this study's findings indicate that the Vietnamese stock index increased during the pandemic. While prior studies have highlighted that pandemics typically destabilize stock markets, leading to a decline in stock indices due to reduced consumer demand, investment, and increased business risks, the Vietnamese stock index experienced growth during the pandemic. This can be attributed to several factors, including:

(i) Government support policies: The Vietnamese government implemented numerous policies to support businesses and citizens during the pandemic, stabilizing the economy and stock market.

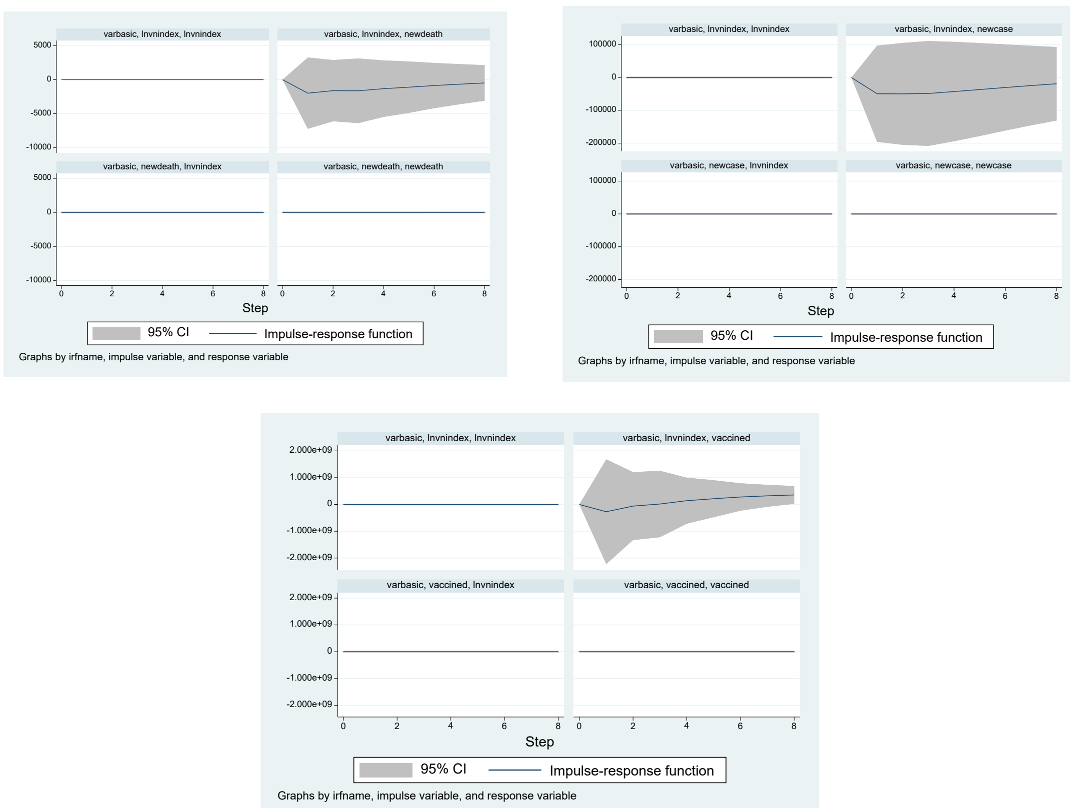
(ii) Economic growth: Vietnam was among the fastest-growing economies in the world during the pandemic. This fostered investor optimism, leading to a rise in the stock index.

(iii) Participation of foreign investors: Foreign investors increased their purchases of Vietnamese stocks during the pandemic, contributing to the stock market's growth.

Based on the VAR model (**Appendix 2**), it is evident that the COVID-19 pandemic has induced significant fluctuations in the Vietnamese stock market. Specifically, for every 10% increase in new infections, the stock index declines by approximately 1.5%. Similarly, with every 10% rise in deaths, the stock index further decreases by 0.8%. Other macroeconomic variables, such as inflation and employment, also exhibit a comparable correlation with the stock index. Moreover, the results indicate a short-term inverse relationship between micro variables and the stock market. This can be attributed to the negative impact of pandemic-related micro variables on the stock market. These micro variables encompass infection rates, mortality rates, and the number of vaccinated individuals. The VAR model's outcomes suggest that these micro variables all possess negative regression coefficients, implying their detrimental effects on the stock market. Specifically, the infection and mortality rates exert a more pronounced negative influence on the stock market, while the number of vaccinated individuals has a positive impact. This aligns with the observed reality. In 2020, COVID-19 outbreaks led to significant downturns in the Vietnamese stock market. The VN-Index plummeted by 25.77% in March 2020 and declined by 11.48% over the entire year. However, once the pandemic was controlled, the Vietnamese stock market rebounded and exhibited robust growth in 2021. The VN-Index surged by 11.48% in 2021, reaching a new record of 1,500.81 points in November 2021.

Subsequently, we will examine the Impulse Response Function (IRF) of the micro variables in relation to the returns of the Vietnamese stock market.:

Figure 1. Impulse response function (IRF) of micro variables on returns of Vietnam stock market (2019-2022).



(Source: Stata)

Through the Impulse Response Function (IRF), for the macro variables in the model, specifically the CPI and UER, their Beta coefficients relative to the VNIndex are 0.001 and 0.08, respectively. These results suggest that the unemployment rate has a stronger impact on the stock market, while inflation also influences but to a lesser extent. This is consistent with prior international studies on the correlation between inflation rates and stock markets or unemployment rates and stock markets, indicating that inflation rates are typically consolidated and announced after integrating various factors. In contrast, unemployment rates have a more immediate impact on stock markets as they reflect the strength of businesses through labor and production.

For the micro variables, which include information on new infections, deaths, and the number of individuals vaccinated against COVID-19, based on the above VAR vector regression analysis, the infection and mortality rates negatively impact the stock market, with the mortality rate having a higher Beta coefficient. Thus, it can be concluded that information on the mortality rate negatively affects stock market returns in the short term. Additionally, while new infections also negatively influence stock market returns, the impact is milder compared to the death rate. Conversely, given the positive Beta coefficient of the number of vaccinated individuals, this variable indicates a positive correlation with changes in stock market returns, suggesting that stock market investment sentiment heavily relies on positive societal reactions, media coverage, and government-provided information. In reality, the Vietnamese stock market is rated among the top ten stock markets worldwide in terms of resilience to the COVID-19 pandemic and its subsequent recovery. Furthermore, Vietnam has officially become the largest market in the MSCI Frontier Markets Index. This is expected to attract substantial investments from large foreign funds using the MSCI Frontier Markets Index as a benchmark.

Through the VAR model, the study finds that micro variables influence stock market returns before macro variables do. This is consistent with prior arguments and empirical studies, such as those by the IMF (2020) and the World Bank (2020).

Overall, this research provides additional evidence on the impact of significant events on stock markets, especially in the context of a pandemic. This is crucial in aiding investors and regulatory bodies in better understanding market fluctuations and making informed decisions.

However, this model still has limitations that need improvement. While the model for the entire pre- and post-COVID-19 period has shown a high R-squared value, incorporating other macro variables could offer a more in-depth and enriched perspective for the study. This would not only provide more insights into the impact of COVID-19 on the Vietnamese stock market but also offer significant policy implications for policymakers and portfolio managers.

5. DISCUSSIONS

First, the sensitivity of the Vietnamese stock market to information. The results of the model show that the correlation of the Vietnamese stock market with macroeconomic variables is stronger than before the pandemic. In fact, the Vietnamese stock market also showed a stronger reaction of VNIndex, HNIndex to economic, policy shocks... in 2022. This shows that the Vietnamese stock market is becoming increasingly sensitive to the global financial and economic situation, macroeconomic conditions, and macroeconomic policy. The reasons for this increase in sensitivity can be explained by a number of factors, including: (i) The recovery of the market after the direct impact of the Covid-19 pandemic was mainly due to the context, without accompanying the upgrading of the underlying conditions of the market such as the growth of listed companies, technical infrastructure conditions, market structure, investor conditions; (ii) Vietnam is currently deeply and widely integrated with the economies of the world, so the Vietnamese stock market will also be affected and influenced by the global stock market; (iii) The war in Ukraine, the pandemic, the tightening of fiscal and monetary policies in the world will also lead to a decline in global economic growth, including Vietnam. The sensitivity of the Vietnamese stock market to information is increasing, making the market more vulnerable to economic and policy shocks. This requires regulators to take measures to mitigate risks and enhance the sustainability of the market.

Second, the quality of information on the Vietnamese stock market. From the conclusion of the regression model, it can be seen that information is an important factor affecting the stock market. Good news will boost the market, while bad news will cause the market to fall. On the Vietnamese stock market, the quality of information still needs to be improved in many ways. Some specific issues include: (i) Incorrect, opaque information: This is a common problem on the Vietnamese stock market. Much of the information that is released is incorrect, opaque, leading to investors making wrong investment decisions; (ii) Information is distorted, manipulated: Some individuals take advantage of insider information to manipulate the market, causing losses to small investors; (iii) Information is not transmitted to investors in a timely and complete manner: This makes it difficult for investors to make accurate investment decisions.

Third, the issue of price manipulation on the Vietnamese stock market has made the Vietnamese stock market go against the world in the Covid-19 period. Price manipulation is a serious problem on the Vietnamese stock market. According to the results of a study by the Institute for International Economic and Political Research (VEPR), in the period 2017-2021, about 70% of price manipulation cases on the Vietnamese stock market involved shares of state-owned enterprises. Price manipulation has made the Vietnamese stock market go against the global trend in the Covid-19 period. While stock markets around the world fell due to the impact of the pandemic, the Vietnamese stock market rose sharply. This has made the Vietnamese stock market an attractive destination for foreign investors.

Fourth, the information and price of the stock market do not match the state of the economy and do not reflect the true value of the enterprise. The information and price of the Vietnamese stock market still do not match the state of the economy and do not reflect the true value of the enterprise. Some of the causes of this situation include: (i) The quality of information still has many problems, making it difficult for investors to make accurate investment decisions; (ii) The stock market is still small and underdeveloped, making information and prices affected by psychological factors; (iii) Investors still lack knowledge and experience, making them easily led by the crowd. The fact that many businesses and banks took advantage of the rising stock price to issue more shares to increase capital, not only created risks for investors but also affected the overall capital mobilization efficiency. The strong participation of individual investors has contributed positively to the recovery and growth of the stock market, but also poses unpredictable risks. In fact, there have been cases of businesses that have lost money, been severely affected by the pandemic, but the stock price has still risen sharply. In addition, taking advantage of the high stock price, many businesses and banks are pushing to issue more shares to increase their charter capital. The situation of weak businesses raising capital thanks to rising stock prices not only poses a risk to investors, but also affects the efficiency of mobilizing and using capital of the economy as a whole.

Despite significant improvements in recent years, the policy of preventing shocks in the Vietnamese stock market still has some limitations. Temporary measures to respond to emergencies have not been implemented effectively.

Regarding the criteria for public companies and the process of issuing securities, the Government has issued Decree No. 155/2020/ND-CP amending and supplementing some articles of Decree No. 108/2015/ND-CP on the issuance and trading of corporate bonds. This decree specifies the criteria for public companies and the process of issuing securities to ensure transparency and publicity of the market. However, in practice, there are still some shortcomings in the implementation of these regulations, including some regulations that are not yet in line with reality, making it difficult for businesses to meet the criteria for public companies and the process of issuing securities, and the implementation of regulations is not yet serious, leading to the situation where some businesses violate regulations but are not seriously punished.

Regarding information transparency in the stock market, the Government has issued Decree No. 186/2021/ND-CP detailing the Law on Securities on the information disclosure activities of listed organizations, registered organizations for trading and public companies. This decree specifies the responsibilities of organizations and individuals on the stock market to disclose information. However, in practice, there are still some shortcomings in the disclosure of information on the stock market, including some organizations and individuals have not fully fulfilled their disclosure obligations under regulations, and the handling of violations of regulations on information disclosure is not yet serious, leading to the situation where some organizations and individuals violate regulations but are not seriously punished.

Regarding the law on protecting the interests of investors, the Government has issued Decree No. 156/2020/ND-CP detailing the Law on Securities on the protection of the interests of investors. This decree specifies the specific measures to protect the interests of investors, including measures to deal with violations of the law on securities, the stock market, and measures to compensate for losses to investors. However, in practice, the implementation of these regulations is still difficult due to the regulations are not yet complete and lack feasibility, and the coordination mechanism between relevant agencies in protecting the interests of investors is not yet tight.

Regarding IT infrastructure in the stock market, the project to build a new securities trading system is still under implementation and does not have a specific plan for completion. However, the Government has approved this project with a total investment of VND 1,200 billion. The project is expected to be completed in 2025 and will replace the current trading system of the Vietnam Securities Exchange (VNX).

Regarding foreign ownership limits, the Government still does not have a specific plan to expand foreign ownership limits for listed companies. This could affect the liquidity and development of the Vietnamese stock market.

Regarding emergency response policies, the Ministry of Finance has issued a number of measures to support businesses and investors, including reducing the cost of securities services, reducing fees and levies in the securities field, and liquidity support[1]. These policies have helped to reduce the difficulties for businesses and investors, contributing to stabilizing the market. However, there are still some limitations to these policies, including: (i) The scope of support is limited, and it has not met the needs of businesses and investors; (ii) The emergency intervention mechanism for the market is still not perfect, and there are no specific regulations on liquidity support measures.

Regarding policies with a macroeconomic stability nature, Vietnam has implemented a series of monetary and fiscal policy measures, including maintaining high liquidity, reducing

1 Circular No. 14/2020/TT-BTC expired on December 31, 2021. However, the Ministry of Finance issued Circular No. 219/2022/TT-BTC, reducing the price of 15 types of securities services from January 1, 2023 to December 31, 2023.

Circular No. 37/2020/TT-BTC expired on December 31, 2021. However, the Ministry of Finance issued Circular No. 220/2022/TT-BTC, reducing 50% of fees and levies in the securities field from January 1, 2023 to December 31, 2023.

The Vietnam Securities Depository Center (VSD) continues to reduce 30% of E-voting service fees for issuers.

The State Securities Commission (SSC) issued Circular No. 12/2022/TT-UBCK, which regulates the emergency intervention mechanism for the securities market. This mechanism includes measures such as:

• Adjusting the price fluctuation range of securities.

• Temporarily suspending trading.

• Purchasing shares of listed companies.

• Liquidity support for investors.

interest rates, providing timely credit, and creating favorable conditions for reducing capital costs and lending rates.

6. RECOMMENDATIONS

First, strengthen monitoring and inspection of information disclosure by listed companies. To reduce the occurrence of inaccurate and opaque information, the Ministry of Finance needs to coordinate closely with the State Securities Commission and the Stock Exchanges in monitoring, inspecting, and strictly handling violations. At the same time, there should be a policy to encourage the disclosure of accurate and complete information, such as tax reduction for companies that comply well with information disclosure.

Second, improve the quality of IT infrastructure of the stock market. The Ministry of Finance needs to accelerate the implementation of the new securities trading system, and at the same time increase investment in upgrading IT infrastructure to ensure the stability, security, and efficiency of the system.

Third, develop and issue specific regulations on expanding foreign ownership limits for listed companies. This will help to improve the liquidity and development of the Vietnamese stock market, attracting more foreign investment into the market.

Fourth, strengthen education and propaganda about the stock market for investors. The Ministry of Finance needs to coordinate with relevant agencies to organize training and propaganda programs to raise awareness and knowledge of investors, helping them to make smart and effective investment decisions.

Fifth, develop and issue specific regulations on strictly handling manipulative price and other violations on the stock market. At the same time, it is necessary to strengthen monitoring and inspection to detect and handle violations in a timely manner.

Sixth, consider adjusting monetary and fiscal policies to support production and business and reduce the flow of capital into investment and speculation channels in securities. At the same time, there should be measures to support businesses to overcome difficulties, such as tax and fee reduction, timely provision of credit.

Seventh, strengthen international cooperation in the field of securities. The Ministry of Finance needs to coordinate with relevant agencies to organize international conferences and seminars on securities, and strengthen cooperation with international securities organizations to learn from experience and apply effective policies and management measures from developed countries.

7. CONCLUSIONS

The COVID-19 pandemic has had a profound impact on the global economy, and the Vietnamese stock market was no exception. Despite Vietnam's relatively good control of the pandemic, the stock market still reflected the instability, negatively impacting the economy. Using the Vector Autoregression (VAR) method, the study analyzed the interactions between macroeconomic, microeconomic, and stock market factors. The results showed a strong relationship between the variables and the stock market, especially in the context of the pandemic.

To ensure the sustainable development of financial markets in the future, it is necessary to understand and prepare for shocks similar to COVID-19. The solutions and implications proposed in the study aim to enhance the market's ability to absorb shocks in the future.

In general, the evaluation and analysis of the impact of the COVID-19 pandemic on the Vietnamese stock market not only helps us to better understand the relationship between macroeconomic, microeconomic, and stock market factors, but also provides valuable implications for the sustainable development of the stock market in the future.

ORGANIZING THE REWARD, DISCIPLINE SYSTEM ACCORDING TO MANAGERIAL RESPONSIBILITY AT HOA PHAT'S IRON AND STEEL MANUFACTURING SUBSIDIARIES

Ph.D. Nguyen Thanh Huyen[1], Ph.D. Nguyen Thi Dao[2], MA. Bui Thi Van[2]
MA. Dao Thi Hang[2], M.A. Nguyen Thi Phuong Hoa[2], M.A. Hoang Van Thang[2]

Abstract: Reward is a form of encouraging employees in an enterprise when their assigned tasks are well implemented. On the other hand, disciplinary measures help prevent employees from committing acts that harm the enterprise reputation and efficiency and go against collective benefits or the law. The article employs numerous data collection methods such as observation, questionnaires, interviews... and data analysis methods including statistics in order to generate the current situation of organizing reward systems according to managerial responsibility in iron and steel manufacturing enterprises of Hoa Phat Group, thereby suggesting solutions to perfect the organization of this reward system, contributing to improving business administration efficiency.

Keywords: reward, discipline, responsibility center, Hoa Phat

1. INTRODUCTION

One of the most important contents of business administraiton is building an appropriate reward and discipline system, motivating administrators and employees to develop their abilities, contributing to improving operational efficiency of each department. Building a reward and discipline system is part of the enterprise's human resource strategy. Organizing the reward and discipline system according to the enterprise's responsibility centers contributes to improving the operational efficiency of the responsibility centers.

Currently, Hoa Phat is the group that leading industrial production group in Vietnam. Starting from a company specializing in trading construction machines in August 1992, Hoa Phat gradually expanded into other fields such as furniture, steel pipes, construction steel, refrigeration, real estate and agriculture. In November 15, 2007, Hoa Phat Group officially listed their shares on the Vietnamese stock market with the stock code HPG (Hoa Phat Marketing Strategy, n.d). By 2023, Hoa Phat has 10 iron and steel manufacturing enterprises are distributed in the provinces in the North, Central and South. At Hoa Phat's iron and steel production enterprises, responsibility centers are also established. However, the organization of the reward system according to responsibility centers does not really motivate the managers and employees to develop their capabilities and effort to improve the efficiency of the responsibility centers and the performance of the entire enterprise. This study employs some survey data on the managers at 10 iron and steel manufacturing enterprises of Hoa Phat Group to evaluate the current situation of organizing the reward, discipline system according to responsibility centers, thereby providing complete solution to the organization of the reward system, creating work motivation for administrators and employees, and improve the organizational performance.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

Though research on reward and discipline systems is quite extensive in the world and in Vietnam. However, there are not much research on rewards and discipline associated with responsibility centers. A number of typical works related to the research may be mentioned below.

Gross et al (2004) point out that reward system is an important part of human resource strategy in any organizations. Since traditional reward models no longer work in today's business environment, modern organizations must design their reward systems that incorporate organizational strategy to achieve higher performance, at both individual and organizational levels. An appropriate reward system can help an organization deliver the right amounts to the right people, at the right time, for the right reasons.

According to Mello (2014), salaries and rewards affect the organization through the employer's ability, ensuring optimal levels of employee performance to achieve the organization's strategic goals.

Hsieh et all (2011) believe that businesses need to apply a contribution-oriented human resource strategy and need to increase the portion of alternative output rewards. In addition, enterprises should have a combination of business competitive strategies, human resource strategies and reward systems. The authors believe that businesses need to develop appropriate alternative rewards, which include human capital rewards, output rewards and position rewards.

According to Kaplan et al (2015), part of the control process includes preparing performance reports, which compare actual and budgeted data to identify reasons for unsatisfactory performance or whether resources can be improved. These performance reports can also be used to evaluate and reward employees.

D. Hansen (2006) emphasizes that regular management rewards include performance-related incentives whose objective is to encourage managers to act in the best interests of the business. Forms of management rewards include pay rises, bonuses based on reported earnings, stock options, and non-cash bonuses.

It can be seen through a number of studies on reward systems that there has been orientation on building a reward system according to management responsibilities and reward forms. However, there has been no specific research on the reward system at Hoa Phat Group's iron and steel production enterprises. Each business has its own characteristics, so perfecting the organizational reward system in each enterprise needs different models. The article aims to perfect the model of organizing the reward system according to responsibility centers in iron and steel manufacturing enterprises of Hoa Phat Group.

3. METHODOLOGY AND PROPOSED MODEL

The research methodology used throughout the study is the dialectical methodology of historical materialism. Research methods used by the authors used to accomplish the research objective is data collection and data analysis methods to accomplish the research objectives.

+ Data collection methods include such numerous methods as secondary data collection method, observation method, typical case study method, interview method, and questionnaire.

The researchers conduct in-depth interviews with the managers of Hoa Phat Hai Duong Steel Joint Stock Company, Hoa Phat Dung Quat Steel Joint Stock Company, Hoa Phat Steel Pipe Company Limited and conduct case studies at these three enterprises.

The authors conducted a survey on the managers and accountants of all the 10 iron and steel manufacturing enterprises of Hoa Phat Group during July 2023.

The questionnaires are designed to investigate some content about the organization of the reward system at the enterprises. The 5-level-Likert questionnaires include both closed questions and open questions. The number of questionnaires distributed was 376, 344 of which was returned, with response rate of 91%.

+ Data analysis method: descriptive statistical method

The result from the questionnaires helps the researchers determine the average value of the content of the organizational reward system, on which some evaluation of the organization of the reward system at the researched enterprises is made.

4. RESEARCH RESULTS

4.1. Organizing the reward, discipline system according to management responsibilities

According to Nguyen Ngoc Quang (2014), a responsibility center is a operating organizational department where the department manager is responsible for all activities of his or her department to senior managers. In an enterprise, based on financial decentralization, many different types of responsibility centers arise such as cost centers, revenue centers, profit centers, and investment centers.

Rewarding is the praising, recognizing, honoring merit, encouraging material benefits for collectives and individuals with achievements and benefits brought to the business. The reward system is an important part of an organization's human resource strategy. Organizing the reward system according to management responsibility is an important content in organizing responsibility accounting in businesses. A good reward system will help businesses gain the efforts of managers at all levels in implementing the common goals. An appropriate reward system can help an organization deliver the right amount, to the right people, at the right time, for the right reasons (Gross et al., 2004).

Forms of reward according to management responsibilities

- Cash Reward
- Stock Reward
- Rewards based on income and reports
- Non-cash rewards

(i) Cash Reward

Cash rewards include salaries and bonuses. One way a company can reward good management performance is through periodic pay rises. Business profits and individual performance are the most common bases for deciding bonus amounts. Financial measurement methods are often used to measure short-term performance such as cost and profit targets. At the same time, there can be non-financial methods such as quality or time indicators. Using non-financial measurement methods will help reward recipients control long-term performance (Kaplan et al., 2015).

However, bonuses are more flexible than salary increases. Many companies use a combination of salary and bonuses. Then, the base salary is the same, and the bonus fluctuates according to reported earnings. Managers' rewards can be tied to the department's net income to motivate them to increase net income. Hence, when building a corporate reward system, it is necessary to carefully consider the positives and negatives from specific policies, and need to share risks from the owners to the business managers (D Hansen, 2006).

(ii) Stock reward

The company can reward managers with shares. Theoretically, the reward value should increase when the company performs well and decrease when the company performs poorly. However, the limitation of this type of reward is that stock prices can decrease because they are beyond the control of the managers. When stock prices fall, managers worry about the employees' morale. To keep morale high, the company creates a bonus fund that is distributed to meet sales and earnings goals. The goal of awarding stock options is to encourage managers to focus on the long term goals. The price of stock options is usually set approximately at the market price at the time of issuance. Then, if the stock price increases in the future, the manager can exercise the option, thereby purchasing the stock at a below-market price and receiving an immediate return (D Hansen, 2006).

(iii) Reward with stock purchase rights

Stock options give executives the right to buy a company's stocks at a specified future date, at a specified price. Stock options are created with the purpose of motivating executives to work. To create incentive value, the option price should be greater than the current price of the stocks. With stock options, directors may attempt to increase the future stock prices rather than focusing on short-term profits. Stock options are an option with virtually no downsides and unlimited growth potential. Therefore, executives may be incentivized to undertake high-risk projects which is hoped to pay higher rewards. (Kaplan et al., 2015).

(iv) Reward with performance shares

Companies use performance shares to reward their employees for achieving a specific (usually long-term) goal. The most common goal is to achieve EPS growth over a period of three to five years (typically 9% to 15% cumulative growth). Executives typically do not receive additional bonuses for exceeding the EPS increase range but instead receive a certain percentage of the bonus. Performance shares are affected by restrictions such as stock options: management risks and factors beyond the administrator's control. Performance stock rewards are said to cause managers to focus on making decisions that improve accounting metrics rather than economic value for the company (Kaplan et al., 2015).

(v) Rewards based on income and reports

The fundamental goal of a company using earnings-based rewards is goal congruence between owners and managers. To the extent that a company's owners want the net income and stock prices to increase, rewarding management based on these increases will help encourage managerial efforts. However, managers can increase short-term measures by using long-term ones such as keeping net income levels high by refusing to invest in more modern and efficient equipment, changing accounting methods (depreciation method, inventory valuation method, etc.), changing early income to increase profits... Thus, with compensation based on income, reporting encourages managers to be short-term oriented (D Hansen, 2006).

(iv) Non-cash rewards

Non-cash rewards are an important part of the management reward structure. There are many forms of non-cash rewards; for example, managers can have autonomy in carrying out daily business activities, have effective assistants or effective tools to support task solving... (D Hansen, 2006).

Rewards may be cash or cash equivalents or may be privileges or other benefits. Privileges can come in several forms. As a matter of fact, the most popular privileges in practice are vacations, priority parking, health insurance, club memberships, and special health insurance packages. In some special cases, privileges are provided depending on the position within the company. In other words, privileges are awarded based on an informal performance appraisal. The granting of privileges, such as vacations, may be directly tied to the results of formal performance appraisals, often in the form of a contest. Other non-monetary rewards include official recognition in the form of a trophy, informal recognition in the form of social invitations from long-time executives. Senior managers are often rewarded based on informal performance evaluations (Kaplan et al., 2015).

The choice of any forms of reward in an enterprise must come from the level of implementation of responsibility accounting in each enterprise, must be consistent with the characteristics of production and business, management organization at the enterprise and most importantly must aim to encourage managers to act in the best interests of the enterprise.

Disciplinary forms according to management responsibilities

Discipline is the orderly behavior of members in complying with the rules and regulations of the organization. The reason for applying disciplinary measures in businesses is to prevent or correct unfavorable situations for the business. Basically, discipline is a form of personnel training. According to Kaplan et al. (2015), there are several forms of discipline as follows

- Light discipline: Reprimand, suspension, fine...

- Serious discipline: Salary cut, demotion, dismissal...

(i) Light discipline

+ Reprimands

Reprimands can be given in oral or written forms. In case the management results are below the estimate due to some reasons belonging to the first management responsibility, the senior managers can give a warning by expressing disapproval to the managers at lower level. It is important to grasp the principle that verbal warnings should always be given calmly, objectively and privately. The conversation should be recorded in a formal document or recorded in the manager's personnel file.

A written reprimand is given after a verbal reprimand. By this way, senior managers send a written warning to lower-level managers when their management results are two or more times lower than estimates due to a number of reasons that fall within their management responsibility, and at the same time ask them to specifically explain their management responsibilities (directly in oral or written forms). Next, the reprimanded manager will send a report to the human resources department. This is a common process in many organizations.

+ Discipline by suspension

Suspension is applied to serious violations of management responsibilities. The suspension may last a few days. Accordingly, some senior leaders will apply suspension from the first violation and sack lower-level managers for the next violation. In addition, higher-level managers will let lower-level managers improve their performance and behavior with multiple suspensions, each longer than the previous, before finally applying the form of dismissal.

+ Loss of privileges

With this form of discipline, some privileges such as priority in job assignment, vacations, flexible hours, choice of work equipment, etc. can be revoked for a certain period of time.

+ Fine

Fines are applied to certain violations that cause damage to goods, machinery, or certain assets of the company or to compensate for the lost money due to incorrect accounting by deducting money or paying fine with managers.

+ Work transfer

When violating discipline, a manager can also be transferred to a farther location or another department. The transfer has been definitely discussed in advance by system administrators. This form is often applied by non-governmental organizations.

(ii) Serious discipline

+ Salary cut

Salary cuts are applied to managers at all levels for violations related to damage or loss of property. The damages caused by them are then recovered from their wages.

+ Demotion

Demotion is applicable in cases where managers at all levels show their unsuitability for the current position. They are demoted to a lower job with lower salary and responsibility. This seriously affects the morale and motivation of managers.

+ Temporary suspension during conclusion of investigation

Temporary suspension during conclusion of investigation is applied to serious behavior of managers at all levels. At that time, the manager's regular salary was withheld for the duration of the investigation. The suspension could last for more than several months until the investigation is completed. Managers who are temporarily suspended will only receive a living allowance during the suspension period.

+ Dismissal

When managers at all levels commit serious violations related to integrity, professional ethics, etc., dismissal is applied. The dismissal affects the manager's reputation, making it difficult for them to apply for a job elsewhere. Before deciding to sack a manager, superior managers need to review the personnel file and all relevant documents to consider before deciding whether to sack or not.

4.2. Current situation of organizing the reward, discipline system according to management responsibilities

The authors conducted a survey on managers and accountants at 10 iron and steel manufacturing enterprises under Hoa Phat Group. The survey results are shown in table 1:

Table 1. Survey results on reward, discipline system organization according to management responsibilities

(Note: 1: Very low, 2: Low, 3: Average, 4: High, 5: Very high)

No.	Questions	1	2	3	4	5	Mean

6	The reward/ discipline system is renewed:						
	yearly	0	0	319	25	0	3.07267
	quarterly	0	0	0	0	0	0
	others	0	0	0	0	0	0

(Source: Research results)

As shown in the table, the reward, discipline system at Hoa Phat Group's iron and steel manufacturing enterprises is relatively consistent with management responsibilities. The reward forms can increase department managers' efficiency and the department managers are satisfied with the reward system.

The enterprises have issued written reward and disciplinary regulations with quite a high Mean of 4.00872, which means Hoa Phat Group's iron and steel manufacturing enterprises have issued clearly written reward regulations. The reward/discipline system in accordance with the manager's responsibilities has a Mean of 3.0843, showing that the compatibility is not high. The form of reward/discipline is not really diverse with Mean equal to 3.0843. The reward/discipline system enhances work efficiency (Mean = 3.77907), proving that administrators' reward/discipline measures have significantly contributed to increasing work efficiency. Department managers are satisfied with the reward/discipline system of the enterprise (Mean = 3.73837), proving that managers are relatively satisfied with the reward/discipline system. The reward/discipline system has an annual review with a Mean of 3.07267.

The results of in-depth interviews with managers at all levels at Hoa Phat Steel Joint Stock Companies in Hai Duong, Dung Quat and Hoa Phat Steel Pipe Company Limited show that the enterprises have attractive reward policies, which satisfy the managers. The reward/discipline system is built to ensure openness, fairness and benefits of all the officers and employees. The main form of reward is monthly unexpected bonuses if there are criteria such as excessive sales targets, etc. At the end of each year, cash bonuses are offered.

Disciplinary measures, according to the interview results, include such forms as warning, reprimand, demotionand dismissal, and administrative discipline such as fines, warnings, salary deductions, dismissal,... For example, employees who come to work late must evaluate their performance and deduct their year-end bonuses. According to the Group's regulations, employees who damage a product due to the employee's fault must pay material compensation according to the severity of the violation.

Beside, the managers participating in the interviewe agree that, at Hoa Phat Group enterprises, the employees being late for work must be evaluated in terms of emulation, resulting bonus deductions at the end of the year. The form of reward/discipline, however, is said to not really diverse. Some forms of reward have not been applied such as stock rewards. The companies have not based on the level of exceeding the plan of the departments to determine the reward level according to each level of exceeding the plan. Therefore, this has not encouraged the department managers to improve the operational efficiency of the department radically.

Additionally, some disciplinary action has been issued, but the discipline has not been tied to the level of non-fulfillment of each department which the manager is in charge of.

5. DISCUSSION AND CONCLUSION

5.1. Discussion

** Organizing the reward and discipline system at Hoa Phat Group's iron and steel production enterprises has achieved the following results:*

- The reward and discipline system is relatively consistent with management responsibilities, contributing to enhancing the work efficiency of department managers. Department managers are satisfied with the reward and discipline system.

- The reward/discipline system is built to ensure openness, fairness and benefits of all officers and employees of the company. The main form of monetary reward is to increase the motivation of employees and managers. The main form of discipline is excluding emulation, excluding year-end rewards or material compensation for employees who are at fault for causing damaged products, which also limits violations of working time and improves labor quality in the enterprise. .

** Some limitations in organizing reward and discipline systems at iron and steel manufacturing enterprises of Hoa Phat Group:*

According to the results of the current situation, the reward system according to management responsibility at Hoa Phat enterprises is designed with not highly diverse reward/discipline forms which is not associated with the performance of departments as well as department managers. Stock rewards have not been applied in recent years. The main form of reward at these companies is a monetary reward based on the employees' salary. The reward has varied in the organization due to different salary levels, whereby the higher the managers, the higher the bonuses.

Some forms of discipline have been applied, however, when the departments do not complete the planned targets, there is no form of fine payment, instead tenure bonuses are reduced but regular annual bonuses. This has not motivated the managers to put more efforts and be more responsible in completing the plans of their departments and increasing the efficiency of the department's operation. Therefore, it can be seen that the forms of discipline are not associated with the management results of department managers, and the forms of discipline are not diverse and inconsistent.

** Solutions:*

The authors proposes a number of forms of reward and discipline according to the characteristics and management features of each type of responsibility center as follows:

Reward system

The overall reward system and regular management rewards are an extremely important factor in promoting management performance. The reward/ discipline system at iron and steel manufacturing enterprises of Hoa Phat Group is not associated with the performance and management efficiency of managers at all levels in the enterprises. Therefore, it is necessary to organize the reward/ discipline system associated with performance results. The appropriate reward system will have a positive impact, creating a great motivation to motivate managers to come up with better implementation solutions to achieve high efficiency in the operation of the department and the whole organization.

Hoa Phat Group's iron and steel manufacturing enterprises can reward management in the form of salary increases, bonuses based on reported income, stock options and non-cash rewards. Each different management level, iron and steel manufacturing enterprises of Hoa Phat Group can choose appropriate reward forms:

- For investment center managers, in order to both increase responsibility and management efficiency, it is possible to apply the form of reward based on reported income, and ROI, RI, EVA investment efficiency indicators,... associated with stock rewards.

- For profit center and revenue centers managers, it is possible to reward based on reported income, revenue targets, profits, and customer satisfaction levels,... incorporating non-cash rewards. There are many forms of non-cash rewards. For example, the managers can have autonomy in the day-to-day conduct of their business, or have effective assistants and effective tools to support job solving...

- For cost center managers, monetary rewards can be given based on the IA report, the rate of cost savings,...

Disciplinary system

In order to bind the responsibilities of managers at all levels at iron and steel manufacturing enterprises of Hoa Phat Group, it is necessary to promulgate a disciplinary system associated with the performance results of managers at all levels. Currently, at Hoa Phat enterprises there is no form of disciplinary action to fine managers when the departments they are in charge of fail to fulfill assigned tasks. That has not put enough pressure on the managers in performing their responsibilities and implementation in order to result in the departments' achievements. Therefore, at Hoa Phat Group's iron and steel manufacturing enterprises, it is necessary to issue specific fines to managers whose departments are in charge of failing to fulfill their tasks.

There also should be a positive form of discipline, that is, self-discipline or self-control. It helps businesses own an atmosphere of mutual trust and all employees strive for their common goals. Then, the companys' plans must be developed methodically, reasonably and disseminated to all the employees and managers at all levels in order for them to understand the companys' rules and the plans to be implemented. Accordingly, they will take positive action to implement positive discipline. Self-discipline developed within the whole enterprises will form work spirit and teamwork, becoming a positive culture of the business.

When building the disciplinary system, the iron and steel manufacturing enterprises of Hoa Phat Group should notice that if the accountability accounting system focuses too much on evaluating the department managers' responsibility, they may not try to realize the common goals of the organization; and in turn, they find ways to cope and do not trust the evaluation system. In addition, if the responsibility accounting system focuses on information, the department managers will know the reasons for the results of the department, thereby handling limitations, improving and increasing efficiency and operational results. Therefore, it is necessary to collect, process, analyze and provide information according to the responsibility centers in a reasonable way in order to find out the causes of limitations in each department and help department managers find out solutions to limitations.

5.2. Conclusion

The reward system is one of the most important strategies in an organization. To stimulate employees, it is possible to build a reward system with various forms. In order to prevent behavior against to the benefits of the organization, the disciplinary system should also be strengthened. Hoa Phat Group's iron and steel manufacturing enterprises have made efforts in building their reward and discipline systems to enhance the management efficiency of the responsibility centers. However The Group need to diversify forms of reward and discipline associated with managerial responsibilities to improve the management efficiency of the department and the whole Group.

ASSESSMENT OF EFFECIENCY OF AGRIBANK'S SUPPORT POLICIES FOR PRIVATE SECTOR OPERATIONS IN FIELD OF AGRICULTURE, FORESTRY AND FISHERIES

M.Fin Hoang Minh Tuan[1]

Abstract: *This article aims to analyze the effectiveness of the support policies of the Bank for Agriculture and Rural Development of Vietnam (Agribank) to support the private sector operating in the fields of agriculture, forestry and fisheries. By using the comparative method, the author has used two factors affecting the effectiveness of the above support policies, namely total outstanding loans and overdue loans. The results of this research will be the basis for Agribank to continue to extend or build preferential credit packages to promote the development of the private sector operating in the fields of agriculture, forestry, and fisheries in both scale, quality and efficiency.*

Key words: *Agribank, agriculture, forestry, fisheries, preferred products, private sector.*

1. INTRODUCTION

Peace, cooperation, association and development are still major trends, but strategic competition between major countries is very complex and fierce, the multipolar situation is increasingly clear. Globalization and international integration continue to progress but encounter many obstacles and challenges, populism and protectionism tend to increase. Policy adjustments and foreign relations of major countries in the region and the world are evolving unpredictably. Sustainable development has become an overarching trend in the world; Digital economy, circular economy, and green growth are development models chosen by many countries. The United Nations' 2030 Agenda for Sustainable Development has a great influence on the way of growth, economic cooperation, trade and investment in the world. Transition to renewable energy and green energy will be a clearer trend in the coming period. The 2021-2030 socio-economic development strategy has determined that by 2030 (the 100th anniversary of the founding of the Communist Party of Vietnam), Vietnam will be a developing country with modern industry, high average income, and both Vision to 2045 (the 100th anniversary of the country's founding) to become a developed, high-income country. Therefore, it is necessary to create conditions for the private economy, especially the private economy operating in the fields of agriculture, forestry and fisheries, to develop in a socialist direction to realize these goals. As one of the state-owned commercial banks that plays a leading role in the banking system, Agribank always promotes the pioneering and exemplary role of a state-owned commercial bank in leading the system of credit institutions. Agribank seriously and effectively implement the national monetary policy and the Party and State's guidelines and policies on currency and banking, especially credit policy to meet the needs of the private economy operating active in the fields of agriculture, forestry and fisheries and oriented to build relationships with businesses that are sustainable, long-term partnerships, for the benefit and development of businesses. Since the end of 2021, when the Covid-19 epidemic situation became complicated, Agribank promptly implemented preferential credit programs for the agriculture, forestry and fisheries sectors. This has initially shown effectiveness, but there is

1 Agribank, Email: tuanhoang.vba@gmail.com.

still a need for specific research on the effectiveness of the support policies that Agribank has applied recently to evaluate more accurately, from there as a basis for proposing extensions time to apply or develop other support policies.

2. Research Methodology

The research method used by the author to evaluate the effectiveness of Agribank's preferential credit policies for the private sector is the comparative method. This method is widely used in general economic analysis. Commonly used comparison techniques are absolute numerical comparison, relative numerical comparison, vertical comparison and horizontal comparison. The absolute numerical comparison is the result of subtracting data between the periods of analysis, it represents the variability of the economic phenomenon. The relative numerical comparison is the result of dividing the absolute comparison value by the base period value, which reflects the rate or rate of change of the analytic indicator. Vertical comparison is the relative numerical comparison of each part to the whole or one part to another. The technique of vertical comparison reflects the structure of the whole. Horizontal comparison is a comparison of quantity on the same criterion, used to reflect the growth and development of events and phenomena.

3. CREDIT STATUS OF THE PRIVATE SECTOR OPERATING IN THE FIELDS OF AGRICULTURE, FORESTRY AND FISHERIES AT AGRIBANK

3.1. The period before the support policy

Unit: Billion VND

Time	Total outstanding balance of Agribank	Agriculture, forestry and fisheries					
		Outstanding balance	Proportion	Short-term	Medium-term	Long-term	Bad debt
31/12/2020	1,209,693	323,286	26.72%	137,314	171,738	14,233	2,983
31/12/2021	1,319,520	339,500	25.73%	149,416	175,909	14,175	3,496

Table 1. Agricultural, forestry and fishery Outstanding at Agribank December 31, 2020 and December 31, 2021

(Source: Agribank internal data)

- As of December 31, 2020, total outstanding at Agribank reached 1,209,693 billion VND, of which outstanding of customers in the fields of agriculture, forestry and fisheries reached 323,286 billion VND, accounting for 26.72% /Total outstanding of Agribank, of which short-term loans reached 137,314 billion VND, accounting for 42.5%, medium-term loan balance reached 171,738 billion VND, accounting for 53.1%, long-term loans accounts for the lowest proportion, reaching 14,233 billion VND, equivalent to 4.4%.

Overdue debt for customers in the agricultural, forestry and fishery sectors is 2.983 billion VND, accounting for 0.92% of total outstanding loans in this sector, accounting for 0.25% of Agribank's total outstanding.

- As of December 31, 2021, total outstanding loans at Agribank reached 1,319,520 billion VND, of which outstanding loans to customers in the fields of agriculture, forestry and fisheries reached 339,500 billion VND, accounting for 25.73% /Total outstanding loans of Agribank, of which short-term loans reached 149,416 billion VND, accounting for 44.0%, medium-term loan outstanding loans reached 175,909 billion VND, accounting for 51.8%, long-term loan outstanding accounts for the lowest proportion, reaching 14,175 billion VND, equivalent to 4.2%.

Overdue debt for customers in the agriculture, forestry and fisheries sector at this time increased to 3,496 billion VND, accounting for 1.03% of total outstanding debt in this field, accounting for 0.26% of Agribank's total outstanding.

3.2. The period after the support policy

3.2.1 Agricultural, forestry and fishery Outstanding at Agribank in 2022 and the first 7 months of 2023

To provide opportunities to access preferential loans, helping customers restore business operations after the period affected by the COVID-19 epidemic, especially corporate customers. in the fields of agriculture, forestry, fisheries, etc., thereby contributing to the banking industry implementing the policies of the Government and the State Bank on supporting the promotion of production and business, recovery and development. the country's economy. Agribank deploys preferential credit packages with a scale of up to 35,000 billion VND

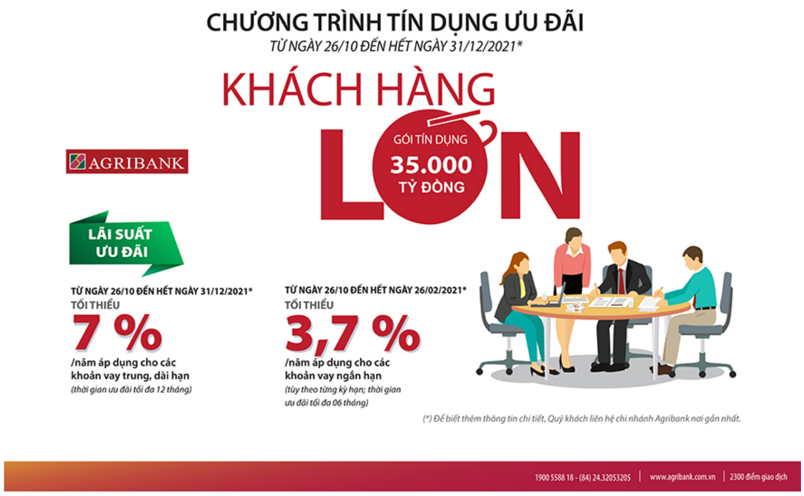

Figure 1. Preferential credit program for businesses in the fields of agriculture, forestry and fisheries of Agribank

(Source: www.agribank.com.vn)

In addition, Agribank is very active in implementing linked loan programs and loans for high-tech agricultural development under the direction of the Government and the State Bank. Agribank provides unsecured loans with assets to customers who meet the conditions with a maximum unsecured loan amount of 80% of the value of the project. Regarding the high-tech agricultural loan program, Agribank spends a minimum scale of 50,000 billion VND (about 2.2 billion USD) to invest in lending to this field.

Unit: Billion VND

Time	Total outstanding balance of Agribank	Agriculture, forestry and fisheries					
		Outstanding balance	Proportion	Short-term	Medium-term	Long-term	Bad debt
31/12/2022	1,425,731	370,515	25.99%	167,142	189,802	13,571	3,019
31/7/2023	1,444,731	380,846	26.36%	169,081	197,561	14,204	3,308

Table 2. Statistics of outstanding for agriculture, forestry and fisheries at Agribank 2022 and the first 7 months of 2023

(Source: Agribank internal data)

- As of December 31, 2022, total outstanding at Agribank reached 1,425,731 billion VND, of which outstanding loans to customers in the fields of agriculture, forestry and fisheries reached 370,515 billion VND, accounting for 25.99% /Total outstanding of Agribank, of which short-term loans reached 167,142 billion VND, accounting for 45.1%, medium-term loan outstanding loans reached 189,802 billion VND, accounting for 51.2%, long-term loan outstanding loans term reached 13,571 billion VND, equivalent to 3.7% .

Overdue debt for customers in the agriculture, forestry and fisheries sector increased to 3,019 at this time. billion VND, accounting for 0.81% Total outstanding loans in this field account for 0.21 % of Agribank's total outstanding loans.

- As of July 31, 2023 , total outstanding loans at Agribank reached 1,444,731 billion VND, of which outstanding loans to customers in the fields of agriculture, forestry and fisheries reached 380,846 billion VND, accounting for 26 billion VND. .36% /Total outstanding loans of Agribank, of which short-term loans reached 169,081 billion VND, accounting for 44.4%, medium-term loan outstanding loans reached 197,561 billion VND, accounting for 51.9%, long-term loan outstanding loans term reached 14,204 billion VND, equivalent to a rate of 3.7 % .

Bad debt for customers in the agriculture, forestry and fisheries sector increased to 3,308 billion VND, accounting for 0.87% Total outstanding in this field, account for 0.23% of Agribank's total outstanding.

3.2.2. Proportion of agricultural, forestry and fishery loans in the "Big 4" and the entire industry

Unit: Billion VND

TT	Bank	31/12/2022			31/7/2023		
		Loan balance	Proportion/ Total utstanding	Proportion/ entire industry	Loan balance	Proportion/ Total utstanding	Proportion/ entire industry
1	Agribank	370,515	26.0%	41.6%	380,846	26.4%	41 .9%
2	Vietinbank	46,775	3.7%	5.2%	52,383	3.9%	5 .8%
3	BIDV	261,915	17.6%	29.4%	284,948	17.9%	31 .3%
4	Vietcombank	229,513	20.2%	25.7%	237,187	20.3%	26 .1%
5	Entire Industry	890,502	7.5%	100.0%	910,069	7.3%	100.0%

Table 3. Statistics on the proportion of loans to agriculture, forestry and fisheries at the "Big 4" and the entire industry

(Source: Agribank internal data)

According to collected data, as of December 31, 2022, Agribank's agricultural, forestry and fishery outstanding reached 370,515 billion VND, accounting for 26.0% of Agribank's loan balance, the highest among credit institutions in Vietnam, accounting for 41.6% of the entire banking system , outstanding in this sector only accounts for 7.5% of total outstanding of the entire industry. Meanwhile, outstanding loans for agriculture, forestry and fisheries at BIDV and Vietcombank are only 261,915 billion VND and 229,513 billion VND , accounting for 29.4% and 25.7% of the total loan balance of the entire industry in this field. Vietinbank has the lowest loan market share, only 5.2% market share with loan balance reaching 3.7% of Vietinbank's total outstanding, equivalent to 46,775 billions VND.

As of July 31 , 2023 , while BIDV and Vietcombank maintained the 2nd and 3rd positions with market shares of 31.3 % and 26.1 % respectively, Agribank still maintained the 1st position with outstanding of agriculture, forestry and fisheries reached 380,846 billion VND, accounting for 26.4% of Agribank 's loan balance, accounting for 41.9% of the entire banking system .

4. EVALUATE THE EFFECTIVENESS OF AGRIBANK'S SUPPORT POLICY FOR THE AGRICULTURE, FORESTRY AND FISHERIES SECTORS

As the Covid-19 epidemic reached its worst level since the beginning of the pandemic, the downturn in Vietnam's manufacturing industry became even more severe. This is also the main reason for the number of field customers Agriculture, forestry and fisheries at Agribank decreased from 2,067,226 customers as of December 31, 2020 to 1,944,809 customers as of December 31, 2021. Although total outstanding debt increased from 323.286 billion VND December 31, 2020 up 339.500 billion VND on December 31, 2021, but the loan proportion on total outstanding decreased from 26.72% to 25.73% as of December 31, 2021 .

Bad debts for the agriculture, forestry and fisheries sectors as of December 31, 2020 and December 31, 2021 reached VND 2,983 billion and VND 3,496 billion, respectively, corresponding to an increase in bad debt ratio from 0.92% increased to 1.03%. Through the process of disbursement of preferential credit capital to support the agriculture, forestry and fisheries sectors to overcome difficult times, bad debt balance in this sector also increased proportionally to the amount of capital accessed, at the same time reached 339,500 billion VND. This is also reasonable because Agribank then accelerates disbursement so that customers in the agricultural, forestry and fishery sectors can quickly access capital, while also solving temporary difficulties of businesses due to the impact of the pandemic. Covid 19.

At the end of 2021 and early 2022, when the Covid-19 epidemic is basically controlled and businesses restore production and business, Agribank also applies measures to control and restructure disbursed capital and bad debts in the fields of agriculture, forestry and fisheries decreased to 3,019 billion VND. In 2022, credit institutions have lent loans to many key agricultural sectors in localities in the Mekong Delta region with a growth rate of over 13% such as: seafood (112,000 billion VND, increased 16%), rice (89,000 billion VND, up 13%), vegetables (19,000 billion VND, up 14%)... In this area alone, Agribank - a friend of farmers has invested about 217,000 billion VND in capital. Credit with outstanding loans to the agricultural and rural sector is estimated at about 180,000 billion VND. Agricultural production enterprises applying high technology in An Giang and Vinh Long have recently accessed more than 4,000 billion VND in capital with preferential interest rates to develop food, vegetable and agricultural product processing factories. At the same time , after implementing support policies, only Agribank branches in Ho Chi Minh City in the first two months of 2023 has lent more than 15,960 billion VND to the agricultural and rural sector. In particular, for the preferential interest rate loan program to serve agricultural economic restructuring, the Agribank system in suburban districts of Ho Chi Minh City such as Cu Chi and Hoc Mon has accumulated loans of 1,600 - 3,200 billion VND to serve projects and plans for converting crops and livestock. Realizing that customers in the agriculture, forestry and fisheries sector are still heavily affected by the Covid-19 pandemic, to support customers operating in the forestry and fisheries sector to overcome difficulties, the Bank The State has just launched a credit program of VND 15,000 billion for this field. Borrowers are customers with projects/plans serving production and business activities in the field of forestry and fisheries. Loan interest rates in Vietnamese Dong are at least 1% - 2%/year lower than the average lending interest rates for the same term (short term, medium, long term) of lending commercial banks applied from time to time. period. Implementation period is until June 30, 2024 . Immediately after the program was implemented, Agribank committed to participating in the program with an expected scale of about VND 3,000 billion, while also exempting and reducing service fees for customers participating in the program, helping businesses ensure financial health, thereby maintaining stable production and ready raw material sources when the consumer market recovers.

5. RECOMMENDATIONS AND SOLUTIONS TO IMPROVE THE EFFECTIVENESS OF AGRIBANK'S SUPPORT POLICIES

To improve the effectiveness of Agribank's support policy, the author proposes some recommendations and solutions as follows:

Firstly, increase information to propagate Agribank's support policies, coordinate to provide timely information to customers in the fields of agriculture, forestry and fisheries. At the same time, improve the lending process, loan procedures, enhance appraisal capabilities to shorten loan processing time, create conditions for customers to access capital while still ensuring loan safety.

Secondly, coordinate with socio-political organizations and relevant local agencies, departments and branches to coordinate and review customers in the fields of agriculture, forestry and fisheries as a basis for implementing preferential policies, creating conditions for beneficiaries to quickly and promptly access Agribank's preferential capital.

Thirdly, improving the quality of human resources. In preferential credit activities for customers in the fields of agriculture, forestry and fisheries, the human factor plays an important role, determining the quality, credit efficiency, reputation and position of Agribank. Therefore, to improve the effectiveness of preferential policies, training and fostering staff is a very important solution. It is necessary to train Agribank staff to have the capacity, professional qualifications, political courage, good skills, professional ethics, good health, and meet the requirements of developing and applying science and technology, information technology, a sense of discipline, work skills, life skills, communication, behavior, dedication, and good customer service.

6. CONCLUSION

Demonstrating a pioneering and exemplary role in seriously and effectively implementing national monetary policy and the Party and State's guidelines and policies on currency and banking, especially credit policy, right from the beginning of 2020 when the Covid-19 epidemic began to break out in the country, following the direction of the Government and the State Bank, Agribank quickly stepped in to support and remove difficulties for businesses and customers affected by the Covid-19 epidemic including restructuring debt repayment terms, exemption or reduction of interest, fees, new loans... according to Circular 01/2020/TT-NHNN and Circular 03/2021/TT -SBV. As of September 23, 2021, Agribank's outstanding debt affected by the Covid-19 epidemic is more than 222,000 billion VND. To date, Agribank has restructured debt repayment terms for 10,714 customers with outstanding debt (principal and interest) of VND 26,086 billion; Exempt and reduce interest for 1,466 customers with outstanding of 3,717 billion VND.

With the mission of serving the development of "Tam Nong", Agribank is the main bank in investing in agriculture, farmers, rural areas, and the fields of agriculture, forestry, and fisheries. Currently, Agribank lends to the fisheries sector with outstanding loans of about 59,000 billion VND, accounting for about 4% of Agribank's outstanding loans to the economy, with 142,870 customers, focusing on processing, business, and export industries in seafood. For the forestry and wood processing sectors, the current outstanding debt is more than 55,400 billion VND, with more than 74,300 customers.

Although a commercial bank must compete to mobilize capital according to market mechanisms, each year with the Bank's financial resources, Agribank still spends thousands of billion VND to support customers with low-interest loans, work with customers to overcome difficulties, restore and develop production and business. Facing the situation of "exhaustion" and the risk that businesses will find it difficult to recover, joining hands with the Government, the State Bank and the community to implement the 10-year socio-economic development strategy 2021-2030, Agribank has proactively taken the initiative, proactively and promptly deploy many solutions to support the private sector, especially in the fields of agriculture, forestry and fisheries, becoming a solid fulcrum for businesses and entrepreneurs. Agribank also implemented an interest rate support policy of 2%/year above the actual loan interest rate from the state budget for loans from enterprises, cooperatives, and business households, including the fields of agriculture, forestry and fisheries. Along with policies to restructure debt repayment terms and maintain the same debt group according to Circular 02/2023/TT-NHNN of the State Bank, exempt and reduce interest and fees to support customers in paying off bad debts and debts that have had their risks resolved during the post-pandemic recovery period. Recently, Agribank launched a preferential credit program to finance export and import customers, applicable to businesses exporting rice, meat, aquatic products, coffee, agricultural products, handicrafts..., with interest The preferential interest rate is up to 1%/year lower than Agribank's current lending interest rate floor. In addition to interest rate incentives, customers participating in the program also enjoy attractive incentives on foreign currency exchange rates and service fees. In the coming time, Agribank is committed to focusing resources to continue supporting customers in the fields of agriculture, forestry and fisheries , contributing to strongly promoting the private sector, towards the goal of by 2030, Vietnam will be a developing country with modern industry, high average income and a vision to become a developed, high-income country by 2045 .

FINANCIAL RESOURCES FOR COOPERATIVE DEVELOPMENT IN VIETNAM

PhD.Le Tuan Hiep[1], PhD. Nguyen Quang Hiep[2], MA. Dao Thi Hong Xiem[3]

Abtracts: *Cooperatives and the collective economy increasingly play a clear role in the sustainable development of Vietnam's economy. In recent years, with the support of the state through policies, cooperatives across the country have reaped many achievements, but in the development process there are still certain limitations and obstacles, especially on financial resources. Based on the analysis of the current situation of financial resources, the article has pointed out the limitations and causes leading to the problems, thereby proposing a number of solutions and recommendations to contribute to promoting the mobilization of financial resources. Financial resources serving cooperative development in Vietnam.*

Keywords: *financial resources, development, cooperatives*

1. INTRODUCTION

Cooperatives have an important role and position in socio-economic development in general and in the agricultural and rural areas in particular. This is an economic organization that not only supports cooperative members to participate in the new rural construction program, but also implements the goal of restructuring the agricultural sector towards enhancing value and sustainable development. Developing and improving the efficiency of collective economic activities is the task of the entire political system. Based on the internal strength of the organization, the State builds and perfects institutions and policies to support and encourage development, develop.

The cooperative development strategy identifies the goal for the period 2021-2030 that the whole country will have about 140,000 cooperative groups with 2 million members, 45,000 member cooperatives. In which, the number of cooperatives operating fairly and well accounts for 60 - 70% of the total number of cooperatives in the country, striving to have over 5,000 cooperatives and 500 cooperative groups applying high technology to production by 2030. export and consumption of agricultural products, traceability. At the same time, strengthen the value chain link between businesses and cooperatives, striving to have about 50% of agricultural cooperatives link with businesses along the value chain.

To achieve the above goals, capital is considered one of the most important factors. Cooperatives need to have diverse investment capital sources to be proactive in production and business activities. This article will analyze and offer some solutions to mobilize financial resources to develop cooperatives.

2. THEORETICAL BASIS

a) Concepts

Cooperatives are conceived as economic organizations formed by economic entities who voluntarily contribute capital and contribute; Activities are mainly aimed at serving the economic

1 University of Finance and Business Administration, Email: hieptcqtkd@gmail.com.

2 University of Finance and Business Administration.

3 University of Finance and Business Administration

activities of participating members with the motto of helping each other; The basic principles of cooperatives are voluntariness, equality, mutual benefit and democratic management...

Forms of cooperatives include: Support service cooperatives; Centralized production cooperatives; Cooperatives combine member support services and centralized production; New-style cooperatives according to industry, according to the connection needs of the community.

Financial resources are a type of resource necessary for investment and development in all aspects of cooperatives, formed from contributions and monetary support (or assets that can be quickly converted into money) from the state, of the people, members of the cooperative,... and is managed and used appropriately for the economic development of the cooperative.

Financial resources mentioned here include currency, material resources and other assets converted into money to promote cooperative development. Financial resources for cooperative development are formed from main sources such as: equity capital, credit capital...

b) Factors affecting financial resources for cooperative development

- Factors inside the cooperative:

+ Number of years of operation: affects the cooperative's ability to access capital. Young cooperatives need to build reputation in the market to be highly appreciated by banks and considered to lend equally to long-standing cooperatives.

+ Field of activity: Each industry is different and will have different levels of risk, so it will affect the ability of different cooperatives to access bank loans, each cooperative needs different business fields. Be flexible and sensitive in planning the development of your cooperative to make the best use of preferential policies and support from the State.

+ Charter capital: The cooperative's charter capital affects the cooperative's ability to access capital. Currently, the charter capital of cooperatives is still low, charter capital of up to 01 billion VND accounts for the majority. To increase the ability to access bank capital for investment, production and business, cooperatives need to consider increasing their charter capital.

+ Revenue growth rate: this helps the cooperative create an attractiveness to attract external investment capital, including bank loans.

+ Collateral: With loans, loan conditions as well as bank management and supervision will be stricter. If the cooperative meets the requirements, the opportunity to access capital will be increased because the collateral assets are more abundant and the value of the collateral assets is also greater.

+ Profit: When there is a suitable strategy and business plan that allows the cooperative to make the most of resources for production and business, this will increase the efficiency of the cooperative's operations, contributing to increased profits, which Increasing profits will mean higher and easier access to bank loans.

+ Social relationships: Through social relationships, cooperatives can easily learn about the State's mechanisms, policies and laws regarding their business fields, market information as well as information. credit easier.

- Besides the factors inside the cooperative, there are also external factors that affect the attraction of financial resources for cooperative development such as: local socio-economic conditions; State support policies for economic development, attracting investment to develop cooperatives...

3. CURRENT STATUS OF FINANCIAL RESOURCES FOR COOPERATIVE DEVELOPMENT INVIETNAM

3.1. Current status of cooperative activities in Vietnam

According to the 2020 White Paper on Vietnamese Cooperatives of the Ministry of Planning and Investment, as of December 31, 2019, the country had 22,204 cooperatives, the number of operating cooperatives with production results was 14,388, including 7,418 agricultural cooperatives., forestry and fisheries (accounting for more than 51% of the total number of cooperatives, an increase of 5.5% compared to the same period in 2018). The number of newly established cooperatives nationwide continues to increase. In 2019, there were 2,732 newly established cooperatives nationwide, an increase of 6.3% compared to 2018. In the period 2016-2019, each year the country had 2,380 newly established cooperatives. , an increase of 72.1% compared to the period 2013-2015.

In 2020, according to the 2020 Annual Report of the Cooperative Alliance, the whole country had 25,454 cooperatives, the number of newly established cooperatives was 2,138, with 65%, equivalent to 16,520 cooperatives, being agricultural cooperatives. In the first 6 months of 2021 alone, the whole country established 843 new cooperatives, 92 cooperatives higher than the same period in 2020, reaching 56.2% of the 2021 plan target, of which, the agricultural sector is 635 cooperatives (accounting for 75.32%). It is estimated that by December 31, 2022, the whole country has 29,021 cooperatives, 123,241 cooperative groups and 125 cooperative unions. Cooperatives attract 6.94 million household members, mainly in rural areas, and 2.6 million workers; Total charter capital reached 54.15 trillion VND, an average of 1.86 billion VND/cooperative; Total asset value reached 187.75 trillion VND, an average of 6.5 billion VND/cooperative.

Regarding organizational and operational models: Cooperatives have been more proactive in the market economy and international economic integration; Cooperative members have clearly demonstrated their roles and responsibilities through contributing capital and using the cooperative's services to develop the household economy. Many cooperatives have proactively built plans to choose production and business plans suitable to the local capacity and strengths, sought or strengthened links between members and member households in the cooperative and each other. between cooperatives and cooperatives, businesses, other economic sectors, scientists... affirming their role in supporting the economic development of member households.

Regarding business results: The number of effectively operating cooperatives accounts for about 57% of the total number of cooperatives. For cooperatives operating with business results, in 2019, the total net revenue of the entire operating cooperative area with production and business results reached VND 99,928 billion, an increase of 12.9% compared to 2018. , increased much higher than the rate of capital increase of cooperatives (down 0.3%). On average in the period 2016-2019, each year the cooperative generated 85,952 billion VND in net revenue, an increase of 21.5% compared to the average period 2011-2015 (Ministry of Planning and Investment, 2021). In 2022, most cooperatives and cooperative unions will be profitable, although not high due to increased input costs; Many agricultural cooperatives achieve revenue of 350 - 400 million VND/ha; Non-agricultural cooperatives' income increased by 6% over the same period in 2021.

Regarding production methods and application of science and technology: The number of agricultural cooperatives producing along the value chain and applying high technology in production is increasing and is gradually becoming the optimal production method for development. sustainable development. In 2018, the country had nearly 1,200 cooperatives organizing production associated with the value chain, applying high technology and food hygiene and safety standards; Many cooperatives cooperate with supermarkets and large enterprises to expand consumption markets, contributing to improving product quality and competitiveness. The number of agricultural cooperatives applying high technology in the country has increased very rapidly from 199 cooperatives in 2017, in 2018 reaching 520 cooperatives and by the end of 2020, the whole country had 1718 cooperatives applying high technology.

3.2. Current status of financial resources for cooperatives in Vietnam

Currently, the main financial resources for cooperatives to use in production and business activities come from the following main sources:

a) *Owner's capital*

This source is formed from the capital contributions of cooperative members and the cooperative's self-additional capital from annual after-tax profits.

The initial capital contribution of members is in the form of capital contribution in cash, in kind or by industrial property rights depending on the agreement between members. According to Clause 3, Article 4 of the 2012 Law on Cooperatives, Charter capital is the total capital contributed or committed to be contributed by members and member cooperatives within a certain period of time and recorded in the cooperative charter. Contributed capital is Vietnamese Dong, other assets are converted into Vietnamese Dong including foreign currencies, artifacts, value of land use rights, intellectual property rights and valuable papers at the time. capital contribution point. The value of capital contributions in other types of assets is determined according to the principle of agreement between the cooperative and its members or through an appraisal organization. For cooperatives, members' capital contributions are made according to the agreement and charter but must not exceed 20% of the cooperative's charter capital. The term, form and level of charter capital contribution are according to the provisions of the charter, but the time limit for full capital contribution does not exceed 06 months from the date the cooperative is granted a registration certificate or from the date of admission.

For cooperatives, mobilizing charter capital is very important, especially cash contributions, which directly affect the cooperative's operations. Cooperatives that mobilize charter capital from the beginning and continue to supplement it as they operate also contribute to helping members be more responsible for the cooperative's business activities. However, current reality shows that the capital contribution of cooperatives in our country is still very modest. When members join cooperatives, they lack capital, techniques and knowledge about economic management and the market... The motivation that makes them join cooperatives is to take advantage of economies of scale and Cooperation brings better benefits to them in production and business activities. Therefore, the amount of capital contributed by investors is basically guaranteed in terms of regulations at a minimum level, causing current cooperatives to still lack capital, making it difficult to be proactive in activities.

Cooperatives in our country today mostly operate in the field of agriculture, small-scale production, outdated technology, and ineffective operations, so revenue and profits are not high. Therefore, the annual after-tax self-additional capital is very limited.

b) *Sources of credit capital*

In addition to equity capital, cooperatives also mobilize loans from other financial and credit institutions. According to the regulations of the State Bank, cooperatives can access capital from banks, non-bank credit institutions, microfinance institutions, and people's credit funds. Sources from credit include: State development investment credit capital and commercial credit capital used for activities in the New Rural Construction Program. The purpose is to promote stable economic growth, so this source often has many incentives for borrowers.

Regarding capital access policy

Currently, the market economy sector is equal with other economic sectors in accessing bank credit capital, and is considered by credit institutions for secured or unsecured loans according to the provisions of law. The State Bank of Vietnam prioritizes credit investment and has deployed and issued many mechanisms and policies to create conditions to remove difficulties for market economy and cooperatives in accessing credit capital, specifically focusing on : (1) Reduce interest rates, stabilize exchange rates, increase liquidity to support credit institutions, open up credit capital flows and synchronously deploy solutions to overcome difficulties for cooperatives; (2) Amend, supplement and improve the credit mechanism in the direction of creating conditions for cooperatives to expand production and business and access credit capital sources; (3) Develop specific mechanisms for a number of industries that use a lot of labor effectively, especially in the agricultural sector; (4) Lending processes and procedures at credit institutions are simplified in the direction of creating conditions for the market economy sector to expand production and business and access capital at credit institutions.

In addition, the State Bank has a mechanism and policy to support preferential credit for agricultural cooperatives according to Decree No. 55/2015/ND-CP dated June 9, 2015 on credit policy to serve agricultural cooperatives. agricultural and rural development, effective from August 1, 2015 and Decree No. 116/2018/ND-CP dated September 7, 2018 amending and supplementing a number of articles of Decree No. 55/2015 /ND-CP (on the basis of overcoming the shortcomings of Decree No. 55/2015/ND-CP).

It can be said that bank credit capital has contributed to promoting the development of cooperatives, improving the material and spiritual life of cooperative members. Outstanding credit debt for the market economy sector has tended to increase in recent times, especially after the process of transformation and reorganization of operations under the Law on Cooperatives in 2012. Cooperatives have access to credit capital sources to expand. production and business activities in many forms: many cooperatives have built good business plans and have feasible production projects, so they have been granted loans by credit institutions in the form of mortgaged assets. from loan capital or can receive loan interest rate support or post-investment interest rate support from the State or the province implements a policy of exempting and reducing income tax for a certain period of time for cooperatives that relocate and invest in industry zones…

By the end of 2018, the credit balance for these customers of credit institutions reached 6,269 billion VND, with 1,808 customers (1,479 Cooperatives with outstanding debt of 4,609 billion VND, 18 LH Cooperatives with 825 billion VND and 311 THT with 768 billion VND). In the period 2013-2016, outstanding loans to cooperatives under Decree No. 55/ND-CP reached about 3,200 billion VND, of which unsecured loans to cooperatives reached about 70 billion VND, for 35 cooperatives, accounting for a very small proportion (about 2.18%) of the total outstanding loans according to Decree No. 55/ND-CP.

About the Cooperative Development Support Fund: The Cooperative Development Support Fund system is organized from central to local levels.

At the Central level, the Cooperative Development Support Fund is assigned to the Vietnam Cooperative Alliance to manage. The initial charter capital allocated by the state budget is 100 billion VND to support the operations of cooperatives. As of the end of 2018, the total capital of the Central Cooperative Development Support Fund was 136.4 billion VND, of which the initial state budget charter capital was 100 billion VND, additional capital during the operation process. is 36.4 billion VND. Total loan turnover of the Central Cooperative Support Fund since its establishment (2006) up to now is 258.7 billion VND for 110 projects, of which loan balance is 99.3 billion VND, bad debt is 5,025 billion VND, accounting for 6.06% of total outstanding debt. The Fund's loan projects focus mainly on the agricultural sector, rural, mountainous, and remote areas (accounting for 70% of the total number of projects) in 35 provinces and cities.

On June 22, 2017, the Prime Minister issued Decision No. 23/2017/QD-TTg, according to which the charter capital of the Cooperative Development Support Fund is allocated by the state budget from development investment expenditure sources, in 2018 it increased to 500 billion VND and by 2020 it reached 1,000 billion VND. In this Decision, the Cooperative Development Support Fund has two additional tasks: Credit guarantee and post-investment interest rate support to support cooperatives in accessing credit capital at commercial banks. trade to develop production and business activities. In 2019, the Central Cooperative Development Support Fund was granted an additional charter capital of VND 300 billion from development investment capital.

Locally, most provinces and cities have established Cooperative Development Support Funds and have initially operated effectively. As of the end of 2019, 53/63 provinces across the country have established local Cooperative Development Support Funds.

The total operating capital of local cooperative development support funds is about 1,544 billion VND, of which charter capital granted or loaned by the state budget is 769.7 billion VND, capital mobilized from borrowing members. , organizations, individuals or self-additional capital from the results of production and business activities is 774.3 billion VND. Total loan turnover of local Cooperative Funds since their establishment is 10,437 billion VND (including short-term, medium-term and long-term) for 5,730 cooperatives and 607,837 cooperative groups and members. members and employees of the cooperative, loan balance is 1,314 billion VND. Loan projects from local Funds focus mainly on developing production and business, innovating technical technology, expanding production scale, and expanding product consumption markets.

The establishment and operation of the Cooperative Development Support Fund has created an additional capital support channel for cooperatives. Basically, after borrowing capital from the Cooperative Development Support Fund, cooperatives have developed quite effectively, growing in scale and production and business efficiency: revenue and after-tax profit increased by an average of 50% - 60%; The number of members increased by an average of 4%; The number of employees increased by an average of 37%; Average income increased by 35%; Budget payments increased by an average of 74%.

3.3. Some difficulties in mobilizing financial resources of cooperatives in Vietnam

- Many cooperatives have difficulty accessing capital from credit institutions.

The reason comes from the following reasons:

+ The cooperative does not meet the loan terms and procedures. Currently, most cooperatives are in the following situation: No headquarters; very little charter capital; Production and business plans have not yet been developed; lack of publicity and transparency, failure to properly implement regulations on financial and accounting management; The cooperative management board really does not meet the requirements for cooperative management and administration; Some cooperatives ineffectively use loan capital, use loan capital for the wrong purpose, have long overdue debt, and have a mentality of dependence and hope for support from the State.

+ On the Bank side: Some commercial banks are not enthusiastic in creating conditions for cooperatives to borrow capital; For loan procedures according to Decree No. 55/2015/ND-CP, cooperatives must submit a certificate of land use rights or a certificate confirming that they have not been granted a certificate of land use rights, while cooperatives do not have documents.

- The capital allocated by the state budget to the Central Cooperative Development Support Fund is still limited, so far only 400 billion VND has been allocated, the amount of capital mobilized from voluntary contributions is insignificant (only about 367 million VND), while the annual loan demand of cooperatives reaches tens of thousands of billions of VND; Loan procedures according to regulations are still strict and complicated.

For local Cooperative Support Funds, implementation still faces difficulties due to: There is no unified legal framework for the establishment, organization and operation of the Fund, so many localities are still confused in the establishment and operation of cooperatives. organize activities. The Funds' financial capacity is limited, operating capital is low, and they mainly depend on the state budget. Personnel implementing professional activities are basically limited in both professional capacity and work experience, so the quality of the Fund's credit activities still poses many potential risks; The coordination of activities of the Central and local Funds is still lackluster and cannot take advantage of their network.

- Capital contributions from cooperative members are limited because members still face many difficulties when joining the cooperative. Besides, they also encounter barriers when accessing credit sources such as procedures, collateral, worries about debt burden, risks, etc. The phenomenon of cooperatives not focusing on mobilizing capital common or forming undivided assets, profits or business results of the cooperative are divided immediately among members during the period, not cumulative, which also happens in many places.

3.4. Some solutions for mobilizing financial resources for cooperatives in Vietnam

- Unify the concept of "collective ownership" in innovation and development of collective economy and cooperatives

The concept of "collective ownership" needs to be unified on two aspects of capital and profit, as a basis for forming undivided assets and common income in collective economic organizations and cooperatives. That is the foundation to increase the strength of cooperatives, helping them proactively innovate and have the potential to implement innovation.

- For equity capital:

+ Encourage members to increase the amount of capital contribution in many forms such as mobilizing personal credit, household economic development support programs from the state and organizations, ...

+ Research and apply progressive production and business models to improve efficiency, speed up capital turnover, and increase profits to increase annual additional capital.

+ Develop unified regulations in cooperatives in mobilizing and using capital sources. In addition, cooperatives need to enhance the consensus of members through action programs, propagandize and disseminate knowledge, and enhance the sense of responsibility of members for the common activities of the cooperative.

- For credit capital sources:

+ Cooperatives need to build reputation in the market to be highly appreciated by credit institutions such as banks and consider lending more easily.

+ Cooperatives should find reputable partners with long-term credit relationships with banks to transact, through which the cooperative will build relationships with banks.

+ Strengthen relationships with other cooperatives at home and abroad to jointly implement projects where cooperatives can participate in the common value chain and take advantage of financial resources from the parties.

+ Take full advantage of credit capital sources to meet the capital needs for the development of the cooperative.

4. CONCLUSIONS AND RECOMMENDATIONS

4.1. Conclusions

In recent times, cooperatives have mobilized capital to basically serve the development of production and business of cooperatives. Cooperatives have mobilized capital contributions from cooperative members, loans from the Cooperative Development Fund, loans from banks and credit institutions; subsidies and support from the State, domestic and foreign organizations and individuals; donated amounts, donations and other legally mobilized sources.

Mobilizing capital has helped cooperation develop relatively stably over time. The socio-economic efficiency of cooperatives contributes to creating jobs for workers, creating stable income, and improving people's lives. Cooperatives have gradually innovated and are an important factor in transforming the agricultural and industrial economic structure to promote the process of building new rural areas locally.

4.2. Recommendations

- On the state side:

The State needs to review, amend and supplement the system of support policies in accordance with specialized laws and the needs and actual development situation of cooperatives. Unify regulations on the content of support policies that are currently scattered in specialized legal documents such as: tax and fee policies; training and fostering human resources, trade promotion and market expansion, credit capital, ... into synchronous policy groups for economic organizations including: Policy group to support development orientation; Group of support and incentive policies to create motivation; Risk prevention and damage mitigation policy group. In addition, the state needs to build policy mechanisms to attract domestic and foreign investment for cooperative development. The state needs to support capital and assets for cooperatives participating in the chain to form assets and through these assets can invest in production and mortgage when borrowing capital.

- On the cooperative side:

Cooperatives need to make more efforts, be more active and proactive, and not rely on or depend on the State's support policies. Cooperatives must make the most of financial resources to serve the innovation of management processes and production technology. In addition, cooperatives also need to strictly implement the provisions of the Cooperative Law and the cooperative charter that has been agreed upon.

SUSTAINABLE EXPORT SOLUTIONS OF VIETNAM TO 2030

Prof. The Chi Ngo, PhD. Thu Hien Nguyen, PhD. Ngo Van Hau[1]

Abstract: To sustainably develop Vietnam's export of goods up to 2030, enhance Vietnam's position in the global value chain, and create motivation for rapid and sustainable economic development, it is necessary to find solutions to promote sustainable and feasible exports in the coming time. The article analyzes perspectives and orientations for export development and proposes solutions for sustainable export development until 2030. The research results are a reference source to help state management agencies build and promulgate appropriate mechanisms and policies to develop sustainable exports according to the objectives of the proposed strategy.

Keywords: Sustainable export; export policy; Vietnamese goods brand.

1. INTRODUCTION

In recent years, Vietnam's export of goods has developed strongly, achieving outstanding achievements and making an important contribution to the country's socio-economic growth. Export turnover increased continuously at a high level, directly reflecting the increase in the scale of export goods and the sustainable growth of exports in terms of value. The export structure of goods has shifted strongly from raw exports to deeply processed and technological goods exports. The export market develops diversely and stably, etc. This is evidenced by the total import and export turnover of goods in 2011-2020, increasing 2.7 times, from 203.6 billion USD in 2011 to 545.3 billion USD in 2020. Average growth of export turnover reached 14.6%/year. Remarkably, in 2022, export turnover will reach 371.3 billion USD, an increase of 10.5% compared to the previous year. Relatively positive export growth in both the domestic economic sector and the FDI sector (enterprises with 100% domestic capital reached 95.4 billion USD, up 6.8%; FDI enterprises (including crude oil) reached 275.9 billion USD, an increase of 11.8%). Of which, the group of processed industrial goods reached 319.2 billion USD, accounting for 86% of total export turnover, and recorded an increase of 10.1% compared to the previous year. The export market continues to grow in both breadth and depth, especially exports to some markets that are FTA partners increased sharply, such as ASEAN reaching 34 billion USD, an increase of 17.8% compared to 2021; Korea reached 24.3 billion USD, up 10.7%; Japan reached 24.2 billion USD, up 20.4%; EU reached 46.8 billion USD, an increase of 16.7%, etc. (Ministry of Industry and Trade, 2023).

Besides the achieved results, Vietnam's export of goods still has certain limitations, such as the scale of exported goods is still small; although growth is relatively high, it is not sustainable in the long term; the source of export goods is unsustainable, lacks connectivity, and is susceptible to the negative impacts of fluctuating foreign markets; competitiveness is limited at all three levels: product, enterprise, and national. Many essential export products are still processed goods; Vietnam's export goods depend heavily on FDI enterprises, etc. Therefore, to solve the above problems and ensure sound implementation of the goal of sustainable export development based on

[1] Email: ngothechi@hvtc.edu.vn, Academy of Finance.

a balanced and harmonious structure, promoting competitive advantages, comparative advantages, and developing brand of Vietnamese goods, enhancing Vietnam's position in the global value chain, being a driving force for rapid and sustainable economic development according to the import-export strategy of goods to 2030 approved in the Decision No. 493/QD-TTg of the Prime Minister, state management agencies, as well as policymakers, need to find practical solutions to promote sustainable and feasible exports in the coming time and by 2030.

The article analyzes perspectives and orientations for export development and proposes solutions for sustainable export development until 2030, thereby helping state management agencies in the process of building and promulgating mechanisms, appropriate policies to develop sustainable exports, enhance the country's position in the global value chain and be the driving force for rapid, and sustainable economic growth according to the objectives of the proposed strategy.

2. CURRENT STATUS OF COMMODITY EXPORT STRATEGY FOR THE PERIOD 2011-2020

In recent times, Vietnam's commodity export activities have achieved impressive achievements, making important contributions to the country's innovation and economic development. The scale of commodity exports is constantly expanding, making a major contribution to implementing the Socio-Economic Development Strategy while increasing Vietnam's position and influence in the international arena. During 2011-2020, the total import and export turnover of goods increased 2.7 times, from 203.6 billion USD in 2011 to 545.3 billion USD in 2020. The average growth of export turnover of goods reached 14.6%/year. Regarding export scale, in 2011, Vietnam was in the 41st position; by 2015, it had risen to the 32nd position, and by 2020, it was in the 22nd position. Export products are increasingly diverse and rich. The number of items with an export turnover of 1 billion USD or more has increased over the years: in 2011, there were 21 items with an export turnover of over 1 billion USD; in 2016, it increased to 25 items, and in 2020, there will be 31 items (Ministry of Industry and Trade, 2023).

However, besides the achieved results, goods export activities in the 2011-2020 period still have some shortcomings and limitations as the scale of exported goods is still small; although growth is relatively high, it is not sustainable in the long term. The source of export goods is unsustainable, lacks connectivity, and is susceptible to the negative impacts of fluctuating foreign markets; export growth is high but not sustainable when the export market structure is still slow; bilateral trade balance with some large markets is not reasonable; the economy has not fully exploited its export competitive advantages based on technology, labor skills, management, etc. to create export product groups that are highly competitive and have high scientific and technological content (Ha Anh, 2022).

3. SOLUTIONS FOR SUSTAINABLE EXPORT DEVELOPMENT OF VIETNAM UNTIL 2030

3.1. Viewpoints, orientations, and goals for sustainable export development of Vietnam until 2030.

Starting from the current situation of the commodity export strategy for 2011-2020 and in accordance with the export strategy for the new period, focusing on growth quality and sustainability of export development. On April 19, 2022, the Prime Minister issued Decision No. 493/QD-TTg approving the Goods Import and Export Strategy until 2030 (Prime Minister, 2022) with many important highlights in terms of Points, goals, directions, specifically as follows:

(1) Strategic perspectives: the strategy mentions three perspectives corresponding to factors related to export development: growth quality, drivers of growth, and growth methods and orientations.

Firstly, embark on sustainable export development based on coordination in commodity structure, market structure, and trade balance with each market and market area; coordination between short-term and long-term goals; coordination between opportunities to participate in and enjoy the fruits of export growth; coordination with green trade, fair trade, environmental, biodiversity conservation and adaptation to climate change.

Secondly, develop the export of goods in association with investment in the development of economic–technical infrastructure, science-technology, digital transformation, development of digital economy, development of the green, sustainable, and circular production system, and improvement of the quality of human resources. Increase the innovative and creative content in exported products; build and develop trademarks of Vietnamese goods for export.

Thirdly, export development is associated with industry and local development planning and plans to promote competitive advantages and efficiency, effectively exploit and take advantage of opportunities, and limit the impact of difficulties and challenges in implementing commitments to international economic integration, profoundly participating in the global supply chain and value chain.

(2) Specific goals of the strategy: compared to the Export Strategy for the period 2011-2020, Vietnam's strategic goal of sustainable export development by 2030 focuses on sustainable export development and is the driving force of rapid and sustainable economic growth, that is, "Sustainable development of import and export with a balanced and harmonious structure, promoting competitive advantages, comparative advantages, developing Vietnamese goods brands, enhancing the national position in the chain global value, is the driving force of rapid and sustainable economic growth. This has been concretized in the perspective of sustainable import-export development based on harmonizing commodity structure, market structure, and trade balance with each market and market area. In addition to the goals of export and import growth in terms of scale and trade balance goals, the strategy adds goals on export structure and export and import market structure. As follows:

Firstly, exports grow steadily, and the trade balance is healthy and reasonable, with an average growth rate of commodity exports expected to reach 6-7%/year in the period 2021-2030, including the average export growth rate in the period 2021-2025, which is expected to be 8-9%/year; the average export growth rate in the period of 2026-2030 which is expected to be 5-6%/year; Maintain the trade balance in the period of 2021-2025; strive to maintain a sustainable trade surplus from 2026 to 2030; look forward to a healthy and reasonable trade balance involving key trade partners.

Secondly, sustainable export with a balanced and harmonious product structure and market structure will increase the export proportion of export processing and manufacturing technology goods to 88% of total export turnover by 2025 and 90% by 2030. Of these, the proportion of medium and high technology exports is 65% by 2025 and 70% by 2030. Increase the proportion of the European export market to 16-17% of total export turnover by 2025 and 18-19% by 2030; the Americas region to 32-33% by 2025 and 34-35% by 2030. The proportion of the Asian region's export market will be about 49-50% of total export turnover by 2025 and 46-47% by 2030;

In the coming time, focus on developing product industries, specifically as follows: (i) merchandise exports in the agriculture, forestry and aquaculture industry: Increase the proportion of products created by deep processing systems and of high economic value; improve the ability to meet quality, food hygiene and safety regulations, standards and corporate social and environmental responsibility criteria; proactively adapt to and overcome trade barriers and trade remedies in overseas markets; (ii) merchandise exports in the processing and manufacturing industry: Increase the domestic content of exported goods, reduce dependence on imported raw materials, spare parts and components; increase the proportion of products in the medium- and high-tech industry; rapidly increase the proportion of exported products with high technology and innovation content; (iii) make more investment in developing export of green and eco-friendly products.

According to the requirements of sustainable export development, promote comparative advantages and transform a reasonable growth model in depth; effectively use resources associated with protecting the ecological environment and solving social problems; promote the structure of export goods in depth; Increase the proportion of exported goods with high scientific and technological content, added value, green economy products, circular economy, and environmentally friendly products.

Thirdly, diversify export markets. Actively participate in production networks and global value chains; focus on producing and developing high-value-added, branded goods on domestic and foreign markets; avoid excessive dependence on a single market; strive for a healthy and reasonable bilateral trade balance, ensuring sustainable growth in the long term. Effectively exploit market opening opportunities from economic integration commitments in free trade agreements to boost exports into major markets, such as EU, Japan, China, South Korea, ASEAN, etc., robustly exploit potential markets, such as the United States, Russia, Eastern Europe, Northern Europe, India, Africa, the Middle East, Latin America, etc., and aim to build stable and long-lasting trade frameworks.

(3) From the above perspectives and goals, Vietnam has determined major orientations for exporting goods and developing export markets until 2030 as follows:

Firstly, sustainably develop the export subsector, bring into full play its competitive advantages, shift to a rational in-depth growth model, effectively use resources, protect the ecological environment, and successfully address social issues and problems.

Secondly, promote the export of goods in-depth, promote the process of industrialization and modernization of the country, increase the proportion of exported products and goods with added value and high science and technology content, high innovation content, green economic products, and environmentally friendly.

3.2. Solutions for sustainable export development of Vietnam until 2030

To overcome shortcomings and limitations in the Export Strategy for the period 2011-2020 towards sustainable export development, it is necessary to focus on synchronously implementing the following leading solutions:

Firstly, review to supplement and edit economic mechanisms and policies. Reviewing economic and trade mechanisms and policies must be carried out regularly to ensure compatibility with the socio-economic context in each stage of socio-economic development as well as the national context. Maintaining the stability of the macroeconomic environment through improving investment and financial policies, balancing the budget, stabilizing the currency, controlling inflation, promoting socio-economic development, simplifying administrative procedures, import and export procedures, etc.

Accordingly, it is necessary to review the system of legal documents, mechanisms, and policies to detect limitations that are no longer consistent with reality as well as inconsistent with international regulations and commitments in bilateral and multilateral trade agreements. Remove barriers in the legal system and economic and financial policies for goods export activities. Strengthen state management in export activities to facilitate trade, combat trade fraud, and move towards fair trade; guide and support businesses to apply and achieve certificates on green growth and sustainable growth in accordance with international standards and standards of target markets; ensure security and fairness in export activities. On that basis, supplement and edit accordingly. Actively participate in developing common rules and laws of the International Trade Organization (WTO), ASEAN Economic Community (AEC), and Asia-Pacific Economic Cooperation Forum (APEC); Actively protect the legitimate interests of the State, Vietnamese businesses and consumers in international economic, trade and investment disputes. Building modern Vietnamese market economic institutions, ensuring systematicity, openness, transparency, and stability; ensuring favorable conditions for sustainable exports; promoting deep processing with high technology content.

Secondly, develop production, create an adequate and sustainable supply for export; restructuring of manufacturing and service industries; encourage projects and research on new materials, production and export of environmentally friendly products and products with high scientific and technological content.

Thirdly, enhances national competitiveness in export activities. Innovate the growth model in depth and increasingly improve quality; restructuring the industry and restructuring businesses based on effectively using advanced scientific and technological achievements, especially the Fourth Industrial Revolution and digital technology. Invest in developing synchronous, modern, highly connected infrastructure; transforming the economy from exploiting and using raw resources to deep processing, increasing the added value of goods; build regional and national logistics centers to participate in regional and international logistics networks; analyze and evaluate the competitiveness of each industry, each type of product, service, and each locality to have plans to improve competitiveness; vigorously develop the private sector into the economy's primary and fundamental driving force, developed economic links increase investment resources for the in-depth development of commodity production. Invest in developing national brands and ensure State support for businesses registering for trademark protection in the international market; Encourage the formation of concentrated key export production areas, creating a large-scale source of high-quality export goods that meet international standards.

Fourthly, improve the competitiveness of products, services, and export enterprises. Accordingly, enterprises need to innovate their strategies and methods of production and business, strengthen relationships and actively participate in the process of international division of labor, participate in regional and international production and distribution networks, participate in the global value chain, accelerate the process of digital transformation and business on digital platforms of enterprises. Develop and diversify export methods, combining traditional methods with modern export methods; promote the application of cross-border e-commerce and participate in international e-commerce platforms.

Organize modern production processes, apply advanced management methods to save input costs to reduce the cost of exported goods and services, and innovate specifications, product designs, and packaging designs to suit consumer tastes in each market area, etc. On that basis, improve the competitiveness of exported products and services.

Fifthly, diversify export markets. Promote bilateral and multilateral negotiations with key and potential markets and market areas. Strengthen export promotion activities with a focus on expanding markets to developing countries, potential markets, and emerging markets; Develop exports in depth to traditional markets such as China, the US, the EU, ASEAN countries, etc.

Sixthly, effectively take advantage of the advantages brought by FTAs. The imposition of low or 0% tax rates on Vietnamese export goods in the FTAs Vietnam has signed and implemented is a driving force to promote the export activities of Vietnamese enterprises. Enterprises need to carefully research and take advantage of incentives provided by FTAs to penetrate the market and increase export growth effectively and sustainably.

Seventhly, invest in science and technology development. Focus on building high-tech centers, attracting foreign investment from multinational companies to shorten the technology gap with countries around the world gradually; develop the science and technology market to create conditions for enterprises to access and increase the liquidity of investment capital sources for research and development; Enhance technological innovation and creative products. Implement mechanisms to encourage organizations and individuals of all economic sectors to invest in science and technology development.

Eighthly, strengthen information and communication activities in exports. Promote communication information about exports, international markets, and Vietnam's export products. The Ministry of Industry and Trade needs to preside over and coordinate with agencies and units to issue information publications on export. The state needs to make adequate investments to have a database and strongly develop a shared and nationally interconnected electronic database to support exports.

4. CONCLUSION

In recent times, Vietnam's export activities have achieved significant results; however, this activity has also faced difficulties in the context of many unpredictable developments in the world economy, such as purchasing power decreasing significantly due to increased economic difficulties in developed countries, inflation increased in most economies, many products supply disruptions or had sharp increases in prices due to political conflicts or strict measures to prevent the Covid-19 epidemic. Although export turnover has increased continuously at a high level, there are still some shortcomings, such as the source of export goods is unsustainable, lacks connectivity, and is susceptible to the negative impacts of fluctuating foreign markets; high but unsustainable export growth; the economy has not fully exploited the competitive advantages of exports based on technology, labor skills, management, etc. Therefore, for export activities to develop sustainably and create export product groups that are highly competitive, with high scientific and technological content, water management agencies and policymakers need to focus on implementing several solutions such as reviewing, amending, supplementing, and perfecting mechanisms, economic policy; enhance national competitiveness in export activities; improve the competitiveness of export products; diversify export markets; investment in science and technology development; strengthen information and communication activities in export; develop and restructure manufacturing industries, creating an adequate and sustainable supply for export.

STRATEGIC MANAGEMENT ACCOUNTING IN THE CONTEXT OF DIGITAL TRANSFORMATION

Prof. Dr. Chuc Anh Tu[1], Chuc Khanh Linh[2]

Abstract: *Understanding the contents and roles of strategic management accounting (SMA) is very necessary, in order to enhance applications and businesses in today's increasingly competitive conditions. On the basis of comparing TMA and SMA to see the purposes, effects, content and conditions of application. Especially in terms of applying the results of the Industrial Revolution 4.0 to SMA. The relationship of strategic management accounting and the management of business activities of enterprises*

Keywords: *Strategy Management Accounting, Traditional Management Accounting, Industrial Revolution 4.0; Digital Transformation*

1. INTRODUCTION

In the period before 2010, Management Accounting appeared in Vietnam and received attention because of the limitations of Management Accounting focusing only on the completion of the General Cost Management Accounting model and how to combine it with the Financial Accounting system (mixed model). In this period, the Ministry of Finance issued Guiding Circular No. 53/2006/TT-BTC.

In the period from 2010 to 2015, Management Accounting gradually added cost-related content such as classifying costs according to cost behavior, building a cost estimation system, cost determination methods, break-even analysis, analyzing the relationship between three factors volume, cost and profit, cost information analysis for short-term and long-term decisions, especially the improvement of the Management Accounting reporting system to provide more detailed information for managers. In this period, there were studies related to Strategic Management Accounting.

In the period from 2015 to now, Management Accounting has been applied a lot to improve the efficiency of businesses in practice. In this period, there is a clear appearance of the content of Strategic Management Accounting due to the increasing global competition in general and competition between businesses in particular, also increasing the challenges for managers, Management Accounting therefore must also change to meet the constantly arising and changing needs of management. Therefore, TMA information has not met the requirements of corporate governance, gradually revealing many shortcomings in supporting managers because the information it brings is only internal and exists within the scope with short-term forecasting time. The process of making strategic decisions, executing strategies and evaluating strategies needs a lot of relevant information inside and outside the business, so SMA appears as an urgent need of businesses.

---

[1] Email: chucanhtu@hvtc.edu.vn, Academy of Finance.

[2] Ha Noi – Amsterdam high school

The change of business environment in the 1980s led to the change of TMA and therefore, SMA was formed with many techniques to solve the existing problems of TMA. Along with the development of technology and the application in business and decision-making of Management Accounting, many motivational factors are identified as reasons for the application of SMA tools in the business. Access to competitive information and tools to support the decision-making process is the process of managing and controlling the cost of the product lifecycle. The development of SMA and the application of intelligence such as AI, data analysis, and the improvement of business processes are factors identified as the main reasons for businesses to apply SMA

2. LITERATURE REVIEW

SMA was first mentioned by Simmonds in 1981, who stated the following about SMA: "Providing and analyzing Management Accounting data about the business and its competitors, for use in controlling and developing business strategy."

In 1988, Bromwich echoed Simmonds' views and emphasized that the business should focus on external issues, since "the business makes a profit in the market and competitors also create challenges for the business in this market."

Studies by Bromwich 1990 have shown that the concept relates to SMA: "Provision and analysis of financial information in the production market of the business, the costs of competitors, the cost structure, the strategic control of the business and of competitors in the market for a number of periods."

Dixon & Smith (1993) point out that the provision and analysis of information regarding the internal operations of the business, current and future competitors, and market trends assist in evaluating the strategic process.

The authors Foster & Gupta (1994), Roslender (1996), and Wilson (1995) argue that SMA is related to marketing issues of businesses such as market share and market share development, image development of the business or issues related to the analysis of benefits from customers.

Other authors Foster & Gupta (1994) and Wilson (1995) argue that Strategic Management Accounting deals with marketing issues of the business such as market share and market share development, image development of the business or issues related to the analysis of benefits from customers.

Roslender (1995), "Accounting for strategic positioning is a term that can be usefully used to describe developments in Management Accounting, designed to assist senior managers in securing and maintaining a competitive advantage".

The authors Lord (1996), and Dixon & Smith (1993) argue that SMA is the intersection of Management Accounting and corporate strategy.

Ittner &; Larcker, (1997), "Management Accounting is increasingly being called upon to take an active role in informing strategic decision-making and monitoring the implementation and success of strategic plans".

According to Roslender & Hart (2003): "Strategic Management Accounting is defined as a general approach to strategically positioned accounting, defined by the effort to integrate Management Accounting and market governance within the strategic management theoretical framework."

According to Langfield-Smith (2008): "Strategic Management Accounting – SMA requires a strategic orientation to generate, interpret, and analyze Management Accounting information and competitor activities, in order to provide important characteristics for comparison."

According to Tillmann & Goddard (2008), Strategic Management Accounting is broadly defined as the use of Management Accounting systems in supporting strategic decision-making;

The Perspective of Ma & Tayles (2009) Strategic Management Accounting: Management Accountants themselves are concerned with strategically oriented information for decision-making and control.

Akhmetzianov &; Sokolov (2020) argue that the application of Strategic Management Accounting is a fundamental matter for evaluating the accounting product life cycle, target costs, cost allocation and direct costs.

According to Shaqqour (2020), Strategic Management Accounting requires the preparation and application of a variety of policies, practices, methods and tools to adjust the internal and external strategic directions of the organization to ensure that relevant and reasonable information is provided for the business to achieve.

According to Duci (2021), Strategic Management Accounting is an evolution of Management Accounting and a retention role to inform decision-making and have perspectives on prospects, not historical perspectives such as Management Accounting and strategic Management Accounting with focus and multiple periods, orientation and competition.

Research by Visedsun and Terdpaopong (2021) concludes that the strategy and objectives of businesses have metrics that specifically affect financial and non-financial information, in order to show the results of the organization, Strategic Management Accounting systems with appropriate techniques should be applied and the use of Traditional Management Accounting should be minimized.

Lyudmila & Emil (2022) detect the pattern of accounting, information precisely owned by the company used to administer, evaluate and record business activities.

3. RESULTS AND DISCUSSIONS

First, studies on Strategic Management Accounting have shown that due to the emergence of Traditional Management Accounting, it is focused only on internal issues and has no strategic direction. Based on studies from 1982 to 2022, there is no consensus on Strategic Management Accounting, as Coad (1996) states Strategic Management Accounting is an area of interest and there is an increase in profitability among researchers. The characteristic is that there is no clear concept, so there is no uniform view of Strategic Management Accounting or the development of Strategic Management Accounting in the future.

Second, according to Lord (1996), the following functions will be related to SMA, that is, to collect information related to competitors; use accounting in making strategic decisions; Cut costs based on strategic decisions and leverage competitive advantages. Wilson and Chua (1993) tabulated the 10 differentiating factors between TMA and SMA, Table 1

Table 1. Comparison of Traditional Management Accounting and Strategic Management Accounting

No.	TMA	SMA
1	Historical	Prospective
2	Single Entry	Relative
3	Introspective	Out-ward looking
4	Manufacturing focus	Competitive focus
5	Existing activities	Possibilities
6	Reactive	Proactive
7	Programmed	Un-programmed
8	Data orientation	Information oriented
9	Based on existing systems	Unconstrained by existing systems
10	Built on conventions	Ignores conventions

Source: Synthesized by the author

Third, there are 04 periods of Strategic Management Accounting: strategic identification of business units; analysis of cost strategies; Market strategy analysis and strategy evaluation. Strategic Management Accounting is a process that requires each period to be completed before executing with next-level analysis. For example, is an ineffective attempt to analyze the role of a unit cost strategy if the appropriate concept of a business unit is not completed first. Moreover, the process does not end with the evaluation strategy being a follow-up cycle. The concept of the business unit may change, and the role of strategic costing of the business unit may change, however, the business will not be aware of these changes if Strategic Management Accounting is considered an annual task of the business.

Table 2. Techniques used in Strategic Management Accounting

Group name	Techniques
Cost	Attribute Costing
	Life Cycle Costing
	Quality Costing
	Target Costing
	Value Chain Costing
	Activity Based Costing
Estimating control and measuring effectiveness	Benchmarking
	Balanced Scorecard
Strategy execution	Strategic Costing
	Strategic Pricing
	Branch Value
Competitor	Competitor Cost Assessment
	Compititive Position Minitoring
	Compititor Performance Appraiser
Customer	Customer Profitability Analysis
	Lifetime Customer Profitability Analysis
	Valuation of Customers as Assets

Source: Synthesized by the author

Fourth, the role of Strategic Management Accounting is manifested in businesses as follows:

+ Provide information directed outside the unit: it is to provide information about competitors by comparing the cost structure of competitors, comparing with the cost structure of their units, at the same time, managing the achievements of main competitors to help managers identify business strategies of competitors, from there, it is possible to build a better business strategy of their unit, thereby improving operational efficiency; Provide information about customers through comparing revenue achieved from customers or customer groups with costs related to that revenue, analyzing customers' profits, etc. to find the right potential customers, product markets and distribution channels. Because customer information is a concern of businesses, improving customer relationships, satisfying customers and enhancing customer value is enhancing competitive advantages for businesses

+ Provide information within the Unit: collect and report information related to internal resources in order to maximize the resources of the Business to bring business efficiency and create sustainable competitive advantages through ABC / ABM techniques; Life cycle costs; Quality cost; Target cost; Value chain costs. The use of ABC/ABM, price chain costs

Fifth, according to studies, Strategic Management Accounting includes the following 05 contents: strategic costs; strategic planning, control and measurement of results; strategic decisions; competitive accounting and customer accounting

+ Cost strategy: marketing strategy and information based on cost database, classified by businesses and ensuring the effectiveness of the strategy to achieve competitive content. There are 05 techniques used cost allocation, product life cycle, cost quality, target cost and chain value cost

+ Strategic planning, control and measurement of results: The theories that identify the issues necessary for businesses are to give attention to the planning, control and measurable characteristics of Management Accounting, which is important in orienting the market approach to operations. Will include Benchmarking and Balanced Scorecard

+ Strategic decision-making: Strategic Management Accounting tools make strategic decisions to support strategies. The range of options for strategic decision-making includes cost strategy, selling price strategy and brand valuation strategy

+ Competitor's accounting: There are 03 accounting tool templates of competitors: managing competitor accounting positions and evaluating competitors

+ Customer accounting: related to the goal of increasing profits, sales and costs related to customers or customer departments. Customer accounting techniques will include profit analysis, customer profit lifecycle analysis, and customer evaluation

Sixth, the manifestation of the digital era in Strategic Management Accounting: technologies that must be considered for the application of Strategic Management Accounting

Table 3. Technologies applied in Strategic Management Accounting

Technology	Contents
Software Packages/Business Resource Planning (ERP)	A Complete software solution package is installed for cost management, payroll processing, inventory management, human resource management, customer relationship management, financial report preparation…

Cloud Computing	Customized cloud-based solutions are used in control reporting, analytics, monitoring and data governance
Big Data, Internet of Things (IoT) and Analytics	High-volume, high-velocity, high variety of structured-unstructured data consisting of emails, messages, social media posts, texts, audio, video, images etc. Moreover, the use of IoT (e.g., sensing, self-acting devices) in production, logistics, transportation etc. produces a huge amount of unstructured data that needs to integrate with structured data. Big data requires new analytics, hence, the emergence of big data analytics to process and generate relevant information from the big data
Blockchain	The emergence of digital currency, cryptocurrency, and blockchain technologies is expected to have an impact on accounting. Besides traditional double-entry book-keeping, in blockchain technology, there may be a need for a third entry for a cryptographic signature for the validity of the transactions. The pervasive effect of blockchain technology in MAC is not clear yet.
Artificial Intelligence	Machine learning and natural language process can be used for better predictions, regular business decisions, vendor selection, cost estimation…

4. RECOMMENDATIONS AND SOLUTIONS

For State management agencies

State management agencies should soon issue documents on Management Accounting in general and types of Management Accounting in particular, including Strategic Management Accounting. Especially the digital environment of the industrial revolution 4.0. Guide Management Accounting models suitable for each type of business, guide the implementation and application of new Management Accounting techniques in each business.

For professional organizations

It is necessary to specialize more in demonstrating the role and implementation process to facilitate support for businesses in propagating and introducing SMA techniques through seminars, helping businesses to be aware of the role and effects of SMA.

For training institutions

Develop programs and contents of each level to have a roadmap to bring SMA techniques into training in Accounting - Auditing and some other related majors.

For businesses and management accountants

It is necessary to be aware of the role of Strategic Management Accounting in businesses, to have investment in facilities, equipment, human resources as well as information technology, in order to apply Management Accounting in general as well as SMA. Using the information of Management Accounting at the request of the manager, the management will be effective.

Increased application of technology

In the 4.0 technology environment, it is necessary to increase the application of technology in Strategic Management Accounting in order to implement the management and analysis process effectively. See technology as experts in data analytics to translate data into business processes.

At the same time, forming a digital environment, technology affected by the Industrial Revolution 4.0 can be mentioned Big Data or Data Analytics, Cloud Computing, AI, Blockchain, the Internet of Things (IoT), and Robotic Process Automation. Let's consider them in more detail, in Table 4

Table 4. Elements of the 4.0 Technology Revolution and Strategic Management Accounting

Big Data	The biggest impact on Industry 4.0 accounting will be Data Analytics or Big Data – data analytics associated with relational databases in an accounting information system. Big Data identification allows accounting and finance to take on a more strategic role and help shape the future
Cloud Computing	The evolution of accounting is changing the expectations of clients and accountants are forced to adjust the way they do it to meet the requirements. People are willing to do less paperwork as they need to focus on what they are passionate about in the things they want to do. This means that people will have to depend on technology to help them work in a more integrated way
Artificial Intelligence (AI)	Artificial intelligence is the science of designing, creating and constructing a machine (computer) or computer program that would have an intelligence similar to that of a person. Intelligence in this case is the ability to act or solve problems in the way that people use their intelligence. The scope of intelligence covers many aspects of the abilities of the human intellect, such as reflection, knowledge, planning, learning, natural language processing, and the ability to manipulate objects. With artificial intelligence, the machine is expected to have general intelligence, just like humans
BlockChain	Blockchain is a digital data storage system consisting of many servers (multiserver). In blockchain technology, data created by one server can be replicated and verified by another server, which is why blockchain is often compared to a bank's cash book containing all customer transaction data. However, this general ledger is available to all blockchain users and is not limited to authorized bank employees
Robotic Process Automation	Robotic Process Automation is the application of technology that allows employees to configure computer software or «robots» to capture and interpret existing applications for transaction processing, data manipulation, response initiation and communication with other digital systems (IRPA & AI, 2017)
Industry 4.0 and ERP-systems	An ERP (Business Resource Planning) system is a business process management software that manages and organizes a company's business processes, all in a single integrated platform. Activities that can be managed with an ERP system include finance, sales, customer relations, manufacturing, inventory management, supply chain management, human resources, payroll, etc. (Trunina et al., 2018)
The Internet of Things (IoT)	With the support of IoT, all other Industry 4.0 technologies could be linked to ERP systems. IoT should be the point of integration between Industry 4.0 and ERP systems. The integration of this technology in Industry 4.0 is closely related to communication protocols between machines and different frameworks, which should be harmonized in the future.
Industry 4.0 and Intellectual Capital (IC)	Under the conditions of Industry 4.0 in the current digital ecosystem, accounting may face the problem of measuring intangible assets and Intellectual Capital (IC). After all, intangible assets will be focused on big data. As mentioned earlier, the structure of the big data set, which consists of audio, images, and video, will be difficult to record in a traditional accounting system. The problem depends on how to measure intangible assets, which for the most part cannot be reflected in the financial statements.
Industry 4.0 and Extensible Business Reporting Language (XBRL)	It is believed that for Industry 4.0, real-time credentials will be presented to users with information faster and more efficiently. In today's system, this is visible in real-time when credentials are provided to information users via XBRL (Extensible Business Reporting Language). XBRL is a financial reporting language that is rapidly spreading around the world. XBRL is the name of a framework that allows real-time presentation of financial information on the Internet and enables electronic communication (Toraman and Abdioglu, 2008)

FINANCIAL STATEMENTS' RELIABILITY AFFECT FIRMS' PERFORMANCE LISTED IN VIETNAM

Ph.D Nguyen Kim Quoc Trung[1], Ph.D Tran Hong Van[2], MAc Le Van Tuan[2]
MAc Nguyen Thi Ngoc Oanh[2], MBA Nguyen Minh Hang[2]

Abstract: The paper aims to estimate the effect of financial statement reliability on listed firms' performance in Vietnam, particularly on the Ho Chi Minh City Stock Exchange, from 2015 to 2022. Reliability is a crthe listedattribute of information quality in financial statements, and by using the quantitative method (feasible generalized least squares – FGLS), the findings show that reliability positively affects listed firms' performance with a confidence interval of 95%. On the platform of agency theory, reliability of financial statements is considered a tool for managers and board of directors to fulfill their duties to external users, while stakeholder theory emphasizes the advantages of reliable financial statements in gaining performance.

Keywords: firm performance, reliability, agency theory, stakeholder theory, Vietnam.

1. INTRODUCTION

The International Financial Reporting Standards (IFRS) framework defines the purpose of financial statements as "to provide useful financial information about an enterprise to existing and prospective investors, potential lenders, and other creditors in making decisions about the provision of resources to the business" (IASB, 2010a). Furthermore, reliable financial statements provide useful information to users in making their decisions (Naser & Nuseibeh, 2003; Shahwan, 2008; Socea, 2012; Tontiset & Kaiwinit, 2018). According to (Kewo & Afiah, 2017; Safkaur et al., 2019), highly reliable financial statements help increase the firm's performance and positively influence the strategic decisions of investors and managers. Thus, the reliability of financial statements is a concern for many stakeholders, such as administrators, investors, customers, banks...

Prior studies have shown that financial statements' reliability increases companies' performances efficiently, especially in large companies (Abd-Elnaby et al., 2021; Akgün, 2016b; Al-Dmour, 2018; Alesaaa et al., 2020; Bukenya, 2014; Evana & Dewi, 2017; Kharuddin et al., 2010; Tontiset & Kaiwinit, 2018). These authors conduct their studies with primary data by using the questionnaire survey, except for the studies by Al-Dmour (2018); Alesaaa et al. (2020). Based on some theories and empirical studies, the current work estimates the effect of financial statements' reliability on listed firm's performance in HOSE from 2015 to 2022. The research question needs to be clarified as follows "To what extent, how does financial statements' reliability affect listed firm's performance in Vietnam from 2015 to 2022".

Significantly, this paper highlights two contributions: First, the study explores the relationship between the reliability of financial statements and listed firms' performance on the Ho Chi Minh City Stock Exchange (HOSE) under the IASB's fundamental qualitative characteristic framework. Second, the study addresses the role of financial statements' reliability in improving firms' performance based on agency and stakeholder theories.

2. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

[1] Email: nkq.trung@ufm.edu.vn, University of Finance – Marketing.

[2] University of Finance – Marketing

2.1. Literature review

From the practical point of view, owners' constraints have related to management and operation ability (Quoc Trung, 2021). Besdies, Eisenhardt, (1989) emphasizes that an appropriate and good corporate governance system can reduce conflicts within the agency problem. Because it requires managers and board of directors regulating the diclosed information in transparent and reliable, so that stakeholders can make their own evaluations and investment decisions (Gaa, 2009; Glassman, 2006). So, agency theory suggests the disclosure of information to reduce information asymmetry between principals and agents and it sees managers as accountable to principals. This theory considers the reliability of financial statements as a tool to fulfill the duties and responsibilities of managers and board of directors to external users, while stakeholder theory considers the advantages from the disclosure of reliable financial statements in terms of gaining support from outside communities (Arcas-Pellicer et al., 2022). In particularly, stakeholder theory of Freeman (1984) mentions that the increased quality of the information in financial statements is a sign of public accountability and commitment to the users of these reports (Coy & Dixon, 2004), because this is a critical way to improve the confidence of stakeholders in the entities via the reliability of financial statements (Freeman & Reed, 1983; Freeman, 1984; Donaldson & Preston, 1995; Michelon & Parbonetti, 2012). As a result, the higher the reliability of financial statements can be obtained (Arcas-Pellicer et al., 2022; Ntim et al., 2017).

2.2. Empirical research

Some researchers have focused on the factors that impact on the reliability of financial statements of listed manufacturing companies. Evana & Dewi (2017) and Tontiset & Kaiwinit (2018) found that audit committees, accounting professional ethics, the quality of the accounting information system, the effectiveness of the audit committee, and the audit firm's quality significantly influence the reliability of financial statements. In Vietnam, Nguyen Thi Thanh Tram (2021) identified factors affecting the quality of financial reporting information for small and medium-sized enterprises in Binh Dinh Province, including internal control, regulatory environment, accounting work process, information disclosure, audit, and accountant qualifications. Furthermore, Abd-Elnaby et al., (2021) investigates the impact of financial reporting quality on corporate financial performance. According to Bukenya, (2014), the study listed the characteristics of the information quality, including reliability, relevance, accuracy, timeliness, and intelligibility that affects firms' performance.The result of Al-Dmour's study, (2018) prove the reliability of accounting information system take a positive impact on the financial performance signgificantly.

To sum up, even though there are many scholars concerned about the role of financial statements' reliability in the operation and how to improve the financial statement quality. However, just only the research of Abd-Elnaby et al. (2021) investigates the impact of financial reporting quality on corporate financial performance under applying IFRS. However, in Vietnam, the financial statements are based on the Vietnamese accounting standards, which were adopted as part of international accounting standards. So, finding the impact of accounting information's reliability on financial performance is quite important in the Vietnamese context.

2.3. Factors affect firm's performance

2.3.1. Financial statements' reliability

Reliability of financial statements is defined as published financial statements that are being reliably prepared to provide information useful to users in making economic decisions that result in an efficient allocation of resources for enhancing firms' performance (Naser & Nuseibeh, 2003; Shahwan, 2008; Socea, 2012; Tontiset & Kaiwinit, 2018). Prior studies have shown that financial statements' reliability increases companies' performances and operations efficiency, especially in large companies (Abd-Elnaby et al., 2021; Akgün, 2016b; Al-Dmour, 2018; Alesaaa et al., 2020; Bukenya, 2014; Evana & Dewi, 2017; Kharuddin et al., 2010; Tontiset & Kaiwinit, 2018).

According to An (2015), conservatism is an important measure of financial reporting quality because conservatism decreases opportunistic managfement behaviours and mitigates information asymmetries. According to Arsenijević (2020), conservative reporting "can increase the reliability of financial information because conservatism results in fewer estimates (and, thus, more objective measurement)" (Balachandran & Mohanram, 2011). So, conservatism as a proxy for financial reporting quality (Ball & Shivakumar, 2006). Accruals measures at the firm-year level are equal to averaged (non-operating) accruals scaled by total assets over the previous five years (with a minimum of two years) or centred on the observation year, multiplied by negative one. According to (Givoly & Hayn, 2000), the reliability of financial statemetns is measured based on the conservatism model which is calculated by the following formula [1].

$$reliability = non - accruals \times (-1) = \left[\frac{Non-Operating\ accruals}{Total\ assets}\right] \times (-1) \quad [1]$$

Where:

Non-operating accruals = total operating Accruals (before depreciation) - operating accruals

operating accruals = different between the changes in current assets and the changes in current liability

Based on the discussions, the following hypothesis is proposed.

Hypothesis 1: the reliability of financial statements *positively affects listed firms' performance in HOSE.*

2.3.2. Control factors

Based on previous studies, they mentioned some control factors such as firm size (Liu, 2020; Yadav et al., 2021); firm age ((Dang et al., 2020; Liu, 2020; Pervan et al., 2019); audit firm type (Amahalu, 2020; El-Dyasty & Elamer, 2020; Zahid et al., 2022); liquidity (Alarussi & Gao, 2021; Pervan et al., 2019); growth domestic product (Ghazavi & Bayraktar, 2018; Hasan et al., 2018) and inflation (Matar et al., 2018; Pervan et al., 2015; Saif-Alyousfi, 2022) impact to the firm's performance.

3. RESEARCH METHODOLOGY

3.1. Sample

Applying circular 200/2014/TT-BTC " On guidelines for accounting policies for enterprises" issued on December 22nd, 2014. So, the research time is from 2015 to 2022, with 235 non-financial listed firms on HOSE were analyzed, excluding those companies that have not yet released audited financial statements for 2022.The sample size is 235*8=1,880 observations, but after eliminating unobtained data, the number decreased to 1,868. Data was gathered from financial statements, annual reports, bank websites, and FiinPro database. Macro-economic factors come from the World Bank website.

3.2. Research model

The research model is used in this paper as follows:

$$performance_{i,t} = \alpha_0 + \alpha_1 reliability_{i,t} + \sum_2^n \alpha_j control\ variables_{i,t} + \varepsilon \qquad [2]$$

Table 1: Variables in model

Variables	Index	Formula
Dependent variable		
$firm\ performance$	return on equity	$roe = \frac{\text{Net income}}{\text{Owner's equity}}$
Independent variable		
FS's reliability	rel	rel = $non-accruals \times (-1) = \left[\frac{Non-Operating\ accruals}{Total\ assets}\right] \times (-1)$
Control variables	Firm size	size = Ln(total assets)
	Audit firm type	audit = 1 if Big4, auditfirm = 0 otherwise
	Firm age	age = Length of time that a company has existed
	Liquidity ratio	$liq = \frac{\text{Current assets}}{\text{Current liabilities}}$
	GDP growth rate	World Bank
	Inflation rate	

3.3. Methodology

The study employs quantitative methodology like the Pooled ordinary least squares (OLS), fixed effects model (FEM), random effects model (REM), and feasible generalized least squares (FGLS) to estimate the effect of financial statements' reliability on firm performance. The article conducts an F-test to select the optimal model between Pooled OLS and FEM models. If the probability value Prob (Chi-square) is less than 5%, FEM is chosen. Then, a Hausman test is conducted to determine the preferred FEM and REM models. If Prob (Random) is less than 5%, FEM is chosen. After that, the model is tested for defective phenomena like multicollinearity, autocorrelation, and heteroscedasticity, and FGLS regression is used to ensure unbiased results.

4. MODEL ANALYSIS AND DISCUSSION

4.1. Model analysis

Table 2: Descriptive statistics

Variable	Obs	Mean	Min	Max
roe	1,868	0.079	-40.890	1.590
rel	1,868	-0.016	-1.770	1.130

Variable	Obs	Mean	Min	Max
size	1,868	28.214	24.910	33.990
age	1,868	3.216	1.950	4.550
liq	1,868	2.710	0.100	52.260
audit	1,868	0.414	0.000	1.000
gdp	1,868	0.062	0.030	0.080
inf	1,868	0.030	0.010	0.040

Table 2 shows the descriptive statistics of all variables in the model. ROE has the mean value of 0.079, its maximum, minimum value and standard deviation are 1.590, -40.890 and 0.992, respectively. The maximum value of return on equity (1.590) belongs to Truong Thanh Furniture Corporationat the year of 2019 whist this company has the lowest loss on 2018, -40.890. Concerning the FS's reliability, its minimum and maximum values are -1.770 and 1.130, respectively. The lowest value the highest reliability is. This number belongs to the Sieu Thanh Joint Stock Company in 2022, while Japan Vietnam Medical Instrument Joint Stock Company in 2015 has the lowest reliability.

Table 3. Correlation matrix and VIF

	roe	rel	size	age	liq	audit	gdp	inf	VIF
roe	1.000								
rel	0.272	1.000							1.070
size	0.123	-0.161	1.000						1.230
age	-0.035	-0.025	0.025	1.000					1.010
liq	-0.001	-0.019	-0.031	-0.074	1.000				1.010
audit	0.116	-0.067	0.349	0.008	-0.060	1.000			1.160
gdp	0.131	0.175	0.072	-0.026	-0.006	0.104	1.000		1.050
inf	0.415	-0.002	0.231	0.063	0.004	0.089	0.001	1.000	1.070

According to Hair Jr et al. (1995); Montgomery et al. (2021); O'brien (2007) INTRODUCTION TO LINEAR REGRESSION ANALYSIS A comprehensive and current introduction to the fundamentals of regression analysis Introduction to Linear Regression Analysis, 6th Edition is the most comprehensive, fulsome, and current examination of the foundations of linear regression analysis. Fully updated in this new sixth edition, the distinguished authors have included new material on generalized regression techniques and new examples to help the reader understand retain the concepts taught in the book. The new edition focuses on four key areas of improvement over the fifth edition: New exercises and data sets New material on generalized regression techniques The inclusion of JMP software in key areas Carefully condensing the text where possible Introduction to Linear Regression Analysis skillfully blends theory and application in both the conventional and less common uses of regression analysis in today's cutting-edge scientific research. The text equips readers to understand the basic principles needed to apply regression model-building techniques in various fields of study, including engineering, management, and the health sciences. https://github.com/citation-style-language/schema/raw/master/csl-citation.json"} , a VIF coefficient of less than 10 is acceptable. As a rule of thumb, all VIF values are smaller than 10 (Table 3). Thus, there is evidence of the absence of multicollinearity phenomenon. Besides, the correlation matrix confirms linear relationship between variables in a dataset, with a Pearson correlation coefficient below 0.7, indicating low collinearity in the model (Ratner, 2009; Shrestha, 2020).

Table 4. Test of autocorrelation and heteroskedasticity

No.	Test	p-values	H0
1	Wooldridge test for autocorrelation in panel data	0.008	Reject
2	Breusch-Pagan / Cook-Weisberg test for heteroskedasticity	0.000	Reject

The residuals are tested for autocorrelation and heteroscedasticity to ensure they are independent and there is no systematic change in their spread. Table 4 shows the presence of heteroskedasticity and autocorrelation. Thus, FEM and REM methods are used to solve these problems. A Hausman test is conducted to determine the preferred method, FEM, which is chosen based on a probability value Prob (Random) of 0.000, less than the 5% significance level. Besides, feasible generalized least squares (FGLS) regression is used to solve the remaining defective issues and ensure unbiased results.

Table 5: Results of FGLS for two models

roe	Coef.	P>z
rel	0.591	0.000
size	0.039	0.071
age	-0.207	0.009
liq	0.063	0.724
audit	0.251	0.000
gdp	0.488	0.001
inf	0.893	0.075

Note: rel is reliability; roe is return on equity; size is firm size; age is firm age; liq is liquidity ratio; audit is audit firm; gdp is the growth of gross domestic product; inf is the inflation rate.

4.2. Discussion

The findings show that the research model has four statistically significant variables at 5%. The reliability of financial statements directly impacts performance (coefficient = 0.591), with higher reliability resulting in better performance. The finding is supported by the studies Abd-Elnaby et al. (2021); Akgün (2016a); Jianu & Jianu (2021). Adediran et al. (2013) argued that managers are more willing to report profit than loss in terms of profitability, as it can impact share price and other indicators. This aligns with agency theory, as managers in large companies seek higher efficiency in financial performance and seek to gain personal benefits, such as position and compensation (Inchausti, 1997). Besdies, financial performance is measured by roe, it reflects the return on equity, it means the financial reports' reliability plays an important role for the owners, especially the shareholders and investors. Higher reliability can reflect the companies' information that are disclosure on financial reports to help the investors/ owners make suitable decisions.

Regarding control variables, firm age negatively impacts listed firms' performance in HOSE (coefficient = -0.207). This finding is consistent with previous studies by (Liu, 2020) as the negative coefficient indicates that firm performance decreases as the firm gets older. Audit firm type positively impacts listed firms' performance in HOSE. Another line of studies observed a positive relationship between audit firm type and firms' performance (Amahalu, 2020; Zahid et al., 2022). High-ranking audit firms release reliable, authentic financial statements to consolidate investor confidence. Besides, those authors find that firms with higher disclosure quality after auditing by Big Four accounting firms show significantly better performance. Gross domestic product has a significant positive effect on firms' performance. The result is consistent with the studies by Ghazavi & Bayraktar, (2018); Hasan et al., (2018). An increase in GDP is interpreted as a sign that the economy is doing well, which promotes firms' performance. Those authors demonstrate that expanding economies allow companies to run more effectively.

5. CONCLUSIONS AND LIMITATIONS

The study examined the significant positive effect of financial statements' reliability on listed firms' performance in Vietnam, using FGLS. The results are explained based on agency theory and stakeholder theory, which are considered mechanisms to reduce asymmetric information between insider and outsider investors and leverage the disclosure of reliable financial statements to improve performance.

Although the research results are obtained, the study may have some limitations. First, to provide a comprehensive outlook, the data set should include all listed firms on both the Hanoi Stock Exchange and the Ho Chi Minh City Stock Exchange. Second, the model is regressed without a mediating or moderating factor, making it crucial to investigate the relationship between financial statements' reliability and firms' performance, which is mediated or moderated by the firm size factor. Finally, endogeneity needs to be addressed in the model by using the generalized method of moments (GMM).

TRAINING HUMAN RESOURCES IN THE FIELD OF ACCOUNTING IN THE CONTEXT OF INDUSTRIAL REVOLUTION 4.0

Ph.D Tran Thanh Tam[1], Ph.D Bui Thi Yen Linh[2]

Abstract: *The industrial revolution 4.0 has a strong impact on all professions and fields, including accounting. Industry 4.0 is based on digital technology, integrating intelligent technologies to optimize production processes, business processes, business processes, production methods and new technologies, including accountants' information processing and information provision processes. The context of digital technology gives rise to new requirements for accounting human resources.*

The article researches the impact of the industrial revolution 4.0 on accounting and new trends of the accounting in the era of digital transformation. From there, the authors offer solutions to improve accounting human resources in the context of Industrial Revolution 4.0.

Keywords: *Industrial revolution 4.0; digital transformation, accounting, human resources.*

1. INDUSTRIAL REVOLUTION 4.0

The essence of the industrial revolution 4.0 (Industry 4.0) is based on digital technology and integrates smart technology to optimize processes, production methods, 3D printing technology, biotechnology, new materials, automation technology, robotics,... Therefore, today not only encapsulated in the field of pure production, but Industry 4.0 also has a strong impact on the financial sector of countries around the world.

Before approaching Industry 4.0, the stage of artificial intelligence and robotization, the industrial revolution has undergone the following remarkable milestones:

The 1.0th Industrial Revolution (late 18th century) → revolution in mechanization, steam engines;

The 2.0th Industrial Revolution (early 19th century) → revolution in electrification and electricity;

The 3.0th Industrial Revolution (around the 1960s → revolution in automation, the field of electronics.

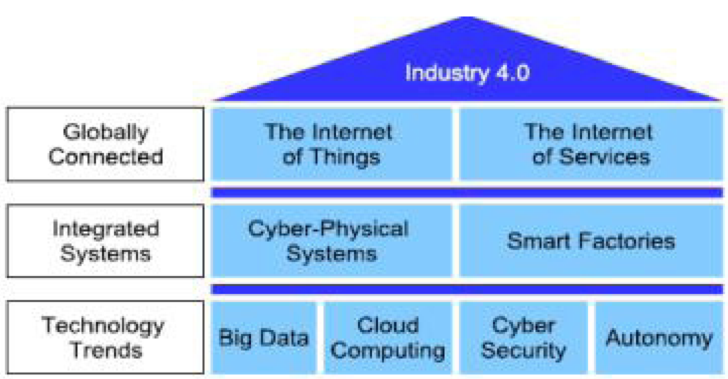

Figure 1: Vision of technology 4.0

(Source: Flynn, Dance & Schaefer, 2017)

1 Email: tranthanhtam@tckt.edu.vn, University of Finance and Accountancy.

2 University of Finance and Accountancy .

The term "Industry 4.0" is associated with the advent of the Fourth Industrial Revolution. It has accompanied by changes to machines, technologies, processes and employees. The core elements of digital in Industry 4.0 will be: Artificial Intelligence (AI), Internet of Things (IoT) and Big Data. The concept of Industry 4.0 is used in European manufacturing introduced by Germany. English-speaking countries such as the Entityed States or the Entityed Kingdom use the phrase "Internet of Things" or "Industrial Internet". Although the terms are different, it can be generally understood that the added value of the business can be ensured through the connection of digital processes (Josef Horák, 2016). Industry 4.0 provides an approach in which people, information and communication technologies evolve more closely together (Gabriel and Pessl, 2016). However, it is predicted that Industry 4.0 will lead to a significant reduction in human labor, which could cause high unemployment (Baygin et al., 2016).

2. NEW TRENDS IN THE FIELD OF ACCOUNTING IN THE DIGITAL TRANSFORMATION ERA

** Innovate accounting processes*

Under the impact of digital technology, the accounting work at each accounting entity will have quite a lot of changes. According to the Vietnam Accounting Law 2015 Accounting is the collection, processing, examination, analysis and provision of economic and financial information in the form of value, in-kind and labor time", thus accounting is the process of collecting, processing, examining, analyzing and providing economic and financial information to subjects wishing to use information to make economic decisions. The breakthrough of technology significantly affects the accounting process when most accounting practices apply information technology, including bookkeeping and financial statement preparation activities.

About data collection: The collection of data is carried out through accounting vouchers. Currently, accounting documents used include paper and electronic documents. In the coming time, electronic documents will gradually be popularly used. The process of recording information on electronic documents is done through data entry and data transfer on the system. The check of documents is supported by accounting software before storing. Unlike paper documents, electronic documents are reviewed by electronic signatures. The Law on Accounting of Vietnam 2015 has regulations on storing electronic documents to ensure information safety and security, avoid forms of exploitation, intrusion, theft and use of electronic documents in accordance with regulations. In the coming time, the explosion of cloud computing technology, Blockchain technology and big data will help process information and store information systematically, scientifically and achieve the best efficiency.

Regarding inspection and processing of accounting data: Blockchain technology has impacted the methodology, manner of checking and processing accounting data. The first blockchain was invented and designed by Satoshi Nakamoto in 2008 and realized a year later. Blockchain is a technology that stores and transmits information by means of blocks that are linked together and expand over time. Blockchain possesses a special feature that data transmission does not require an intermediary to confirm information, information cannot be changed and can only be added when there is a consensus of all nodes in the system. In the field of accounting, Blockchain technology serves as an open and decentralized accounting ledger capable of recording and verifying transactions without the need for an intermediary. This technology is designed to be neutral with data modification and cannot be retroactive, ensuring the integrity of the data, improving the safety and confidentiality of accounting information. In addition, Blockchain technology also helps users easily access accounting data that has been recorded multidimensionally in the data chain instead of the current form of double bookkeeping.

About data storage: Cloud technology and Blockchain make stori accounting data easy, fast, systematic, scientific and cost-effective. With the application of new technologies, data will be stored in large and unlimited volumes, automatically backed up to create copies of data to help protect data in case of system failure, data loss or data destruction.

Regarding analysis and provision of accounting information: The automatic storage and updating of accounting data changes on the basis of digital technology with the ability to collect big data and fast data processing speed, ensuring that accounting data is always available, timely serving the processing and analysis process, provide information. On the basis of the information provided, accounting entity managers have a deeper understanding of their entity's operations, helping them identify which stages and areas of the entity will have to improve to increase efficiency, reduce costs and better manage risks.

** The increasing proliferation of accounting software solutions.*

The application of technology solutions in the field of accounting is and will change the face of this field. Software engineering platforms with different levels of functions and jobs help optimize and minimize accounting tasks. Jobs are easily replaced by software such as: recording entries, bookkeeping, preparing financial statements, salary, financial analysis ,... With the cloud-based accounting system, accounting entity administrators can easily access the system at any time to retrieve data related to their entity's operations such as inventory; accounts receivable and payable; revenue and expense situation,... With bookkeeping system management technology platforms, spreadsheets also help control and better manage cash flow; Increase efficiency in analyzing, reporting complete financial status for heads of entitys. Moreover, this system also helps entitys save time in building workflows. With such benefits, the switch to using an accounting system based on cloud computing technology,... will be a big trend in the field of accounting.

3. CHALLENGES FOR ACCOUNTING IN THE CONTEXT OF INDUSTRY 4.0

Vietnam has now signed bilateral and multilateral free trade agreements, gradually entering the era of Industrial Revolution 4.0. That process also poses new problems for the field of accounting, specifically:

The process of digitizing the field of accounting.

The digitalization process has become one of the current global trends, especially after the industrial revolution 4.0. The digitization process is of decisive importance for the processing, storage and transmission of data. Digital data can be transmitted without loss of quality or data loss, which is a way of preserving information in an organization today. In the current era of digital transformation, many new types of businesses based on digital platforms appear; economic activities are increasingly diverse and abundant; The number of transactions in the economy will grow rapidly, putting a lot of pressure on the accounting sector to change its focus from checking the authenticity, conformity of transactions with regulations, accounting standards and preparing financial statements to providing more in-depth information for the process decision of accounting entity administrators. The digitization of Vietnam's accounting sector is inevitable.

Digital infrastructure and information security issues in the field of accounting

In the field of accounting, processing and analysis of accounting data plays an extremely important role and is the core of providing economic and financial information in the form of reports to those wishing to use the information to make appropriate economic decisions, promote the development of economic activities. In addition, increasing access to and sharing of data is crucial for the free and unlimited exchange of information globally. Therefore, it is required that each country, including Vietnam, must invest in building digital infrastructure to ensure quality and readiness for connectivity.

Along with the rapid development of digital technology and the trend of cloud computing, security vulnerabilities are also increasing. This leads to risks in accounting activities, especially in management accounting activities. Therefore, in order to ensure information security for the activities of entitys, each entity needs to focus on equipping and upgrading security tools and measures to keep up with the development trend of technology; at the same time raising awareness and awareness of officials and employees in this issue. In addition, information security and cybersecurity in accounting activities in the current era are extremely important, both ensuring national financial security, creating trust, peace of mind and protecting the interests of accounting service users.

Roadmap for transformation and application of International Financial Reporting Standards

In the context of international economic integration, free trade and fair competition, economic and financial information requires transparency, reliability and presentation in accordance with international accounting standards. Vietnam Accounting Standards (VAS) were developed based on International Accounting Standards from the years 2000 to 2005 according to the principle of selective application of international practices, suitable to the characteristics of the economy and management level of Vietnamese enterprises at the time of issuance of the standard. Up to now, Vietnam has developed and issued 26 accounting standards. VAS has basically approached International Accounting Standards (IAS) and International Financial Reporting Standards (IFRS), reflecting the majority of transactions of the market economy, improving the openness and transparency of information about financial statements of entitys. However, VAS currently still has a significant gap with IFRS, which is reflected in some main manifestations such as VAS does not have regulations allowing the revaluation of assets and liabilities at fair value or revocable value at the time of reporting, this makes the value of assets and liabilities not reflect the actual fluctuations of the market, there are no regulations to present the Equity Fluctuation Report into a separate report, ... One of the reasons for this disharmony is that VAS has not updated the changes of IFRS. Currently, the Ministry of Finance has issued Decision 345/QD-BTC approving the scheme to apply financial reporting standards in Vietnam in order to complete the legal framework on finance and accounting; contribute to improving the transparency and efficiency of financial information, contributing to promoting the integration of Vietnam's economy with the world. Therefore, in the coming time, Vietnam needs to continue to implement solutions to directly adjust the system of Vietnamese accounting standards as well as solutions related to the economic and legal environment.

Human resources development for the field of accounting.

When applying digital technology, artificial intelligence can replace manual tasks of accountants such as collecting, processing and calculating data,... However, technology is only a tool to support work in accounting that works according to pre-programmed programming. For complex stages such as analysis, finding causes to provide solutions for each specific situation, even unprecedented situations ... human involvement is always required. Although artificial intelligence cannot replace humans, it is changing the working environment and circumstances of accountants. That requires the development of new skill groups needed for human resources in the field of accounting. Accountants will again have to be people who understand technology, use technology for their work. Therefore, in addition to the deep expertise of accounting professions, competencies, emotional indicators, human resources in the field of accounting also need to supplement technology skills (artificial intelligence, cloud computing, Blockchain,...), knowledge of law, communication, management and vision,...

4. THE CURRENT SITUATION OF HUMAN RESOURCES TRAINING IN THE FIELD OF ACCOUNTING IN VIETNAM

According to experts, the quality of human resources in the field of accounting in Vietnam is still limited. Statistics from the Accounting and Auditing Supervision Administration (Ministry of Finance) as of April 28, 2023 show that more than 420 practicing accountants have been granted certificates of registration to practice accounting services by the Ministry of Finance and more than 200 accounting service enterprises have been granted certificates of eligibility to provide accounting services by the Ministry of Finance. According to Dinh The Hung (2022), Vietnam's accounting human resources have certain limitations such as: knowledge and thinking of accountants are mainly professional and compliant; limited initiative and creativity; Working style and working mindset are not really professional.

Graduates are relatively fully equipped with accounting theory but lack methodical practice, resulting in limited working skills. In addition, soft skills such as communication skills, teamwork skills, problem-solving skills and especially foreign language ability of students majoring in accounting are lacking and weak. Therefore, students after graduating and working often lack confidence, lack creativity and cannot immediately adapt to work.

According to Tran Thi Hang (2018), the training program is not really associated with the training capacity as well as the requirements of the international integration period, the training program is heavy on theory, the content of specialized subjects is still spread, there is a lack of subjects on soft skills, there has not been much exchange with businesses, with national and international universities. Luong Thi Yen (2019) also criticized the general training programs of schools that are slow to improve innovation, theory is not associated with practice, the duration structure is not reasonable, leading to students learning too much but knowledge is not suitable with reality. Therefore, the development of training objectives, training programs and outcome standards for Accounting students is still formal, not really associated with the training capacity as well as the requirements of training quality of the market economy in the stage of international integration. These programs do not directly serve the development of specialized knowledge, making the program heavy in theory, lacking cohesion with practice.

In addition, although not much, most large universities in the current period have clearly identified the changes and challenges in the upcoming industry 4.0 context, so they have begun to change their training programs towards integrating with professional certificates of international professional associations, expand cooperation with businesses as well as exchange and exchange students with schools abroad, and also began to transform when introducing a number of technology subjects into the accounting and auditing training program. Partnerships between schools and professional organizations and auditing firms are expanding. Typically, since 2018, the Institute of Chartered Accountants of England and Wales (ICAEW) and KPMG Auditing Company (KPMG) have signed a memorandum of cooperation with the University of Economics and Law (UEL), Foreign Trade University Campus II in Ho Chi Minh City, University of Economics - Hanoi National University (UEB) and Banking Academy (BA) to implement the "KPMG - ICAEW STAR Program". This partnership opens up opportentityies for talented accounting and auditing students to receive professional training in some subjects of CFAB professional certificates from the time they are still in the lecture hall, along with the opportentityy to do an early internship and work at KPMG, one of the Big 4 in Vietnam. In addition, some large and prestigious universities have implemented the teaching of subjects in English to overcome language barriers, develop English skills for students, and help students better integrate into the international working environment. Specifically, training programs integrated with CFAB professional certificate of ICAEW at UEL and Hanoi National Economics University (NEU) implemented since 2015 or certificate of certified public accountant - ACCA integrated in the training program of Foreign Trade University... However, the number of schools changing training programs and teaching methods is not much, most other higher education institutions are still using academic curricula and few innovations and updates.

5. HUMAN RESOURCES TRAINING ACTIVITIES IN THE FIELD OF ACCOUNTING IN THE CONTEXT OF DIGITAL TRANSFORMATION

The Industrial Revolution 4.0 will dramatically change the relationships of people, living, working and educating. This technology is disrupting every industry worldwide at an unprecedented rate, and the accounting is not out of the loop. Therefore, to ensure graduates can get jobs, the teaching and learning activities of accounting students need to be adapted to the expectations of employers of accounting graduates in the Industry 4.0 environment (Bonekamp and Sure, 2015). To be ready to participate in a world alongside intelligent machines, how will they need to receive a different education than before?

Redefining the purpose of education

Throughout time, education has developed based on the needs of society in each period. Now, as we move further into the future, education will need to support learners to develop the skills and mindset to do anything in the future rather than a specific "something."

The American philosopher John Dewey said, "If we teach students today as we taught yesterday, we will rob them of tomorrow." Instead of teachers distilling information for learners and then memorizing them, teachers will become guides, guides, and facilitates learners in learning and applying knowledge in research. Failure needs to be accepted as an essential step to learning. In addition, teaching will be much more personalized, which will be supported by the inclusion of technologies such as AI, creating creative spaces for schools. In the learning and teaching process, new programs help facilitate the teaching process. Mastering some good systems will give you an edge for career development. For example, SAP ERP (Enterprise Resources Planning), a software adopted by large companies to manage their business operations, if one can use this software will be able to help himself not only in his current job but also take advantage of himself when looking for new jobs in other companies that also use SAP.

Development of human potential

Although machines are mastering many tasks typically performed by humans, humans are still better at creative endeavor, imagination, critical thinking, social interaction, and physical dexterity. The education system of the future needs to develop these inherent human abilities, so they are equipped to cooperate with machines of the future rather than compete with them. According to the 2018 Jobs Report from the World Economic Forum, executives expect employees with critical thinking and collaboration skills even more than employees with technology skills.

According to Jaroslav Vrchota's research (2019) on the necessary skills and competencies of the workforce for the 4.0 technology era, skills are divided into personal and technical, classified into "Must have skills", "Need skills" and "Can have skills".

About teaching

Accountants of the future increasingly need to be taught and improved skills in digital technologies (including cloud computing and the use of big data), about globalization and ever-evolving regulations (tax regulations, new forms of corporate reporting, integrated reporting regulations, etc.).

According to ACCA research, knowledge of digital technologies is an area where accountants are weak (Muhammad Islam, 2017). Currently, few universities build curricula for accounting students tailored to their future needs. Universities will need to develop or incorporate external entitys, new entitys in cloud computing, big data, digital technologies, integrated reporting etc. for accounting students. Universities should consult with professional accounting organizations to recruit more professionals/lecturers in new fields and organize new courses. At the same time, schools should invest in existing faculty, training, learning to coordinate and teach for new programs.

Lecturers must innovate in teaching methods, equip specialized knowledge associated with reality so that learners have a more specific view of future work. The practice stage should be divided into groups to discuss, exchange and support each other. The practical content covers all activities in the entity, from practicing the actual set of documents on software, practicing books and making financial reports.

Industry 4.0 requires accounting graduates to focus more on IT abilities. This is because many jobs in the Industry 4.0 era performed by humans will be replaced by IT. Educational institutions have started implementing or using various strategies related to IT in their teaching and learning process so that accounting graduates can equip themselves with a variety of IT skills, which will provide accounting graduates with an advantage in securing employment.

Table 1: Classification of skills and competencies required for Industry 4.0

	Must-have skills	**Need skills**	**Can-have skills**
Technique	- IT skills -Data processing and analysis capabilities - Analytical knowledge - Ability to use new equipment	-Knowledge Management -Interdisciplinary general knowledge of technology - Understanding of data security and information security -Specialized knowledge of the production process	- Programming -Specialized knowledge of technology - Understanding of the law

Individual	- Personal Time Management - Adaptability to change - Team skills - Social skills - Communication skills	- Trust new technology - Lifelong learning	

(Source:Jaroslav Vrchota, Human Resources Readiness for Industry 4.0, 2019)

In addition, training institutions should strengthen thematic meetings, practical exchanges, and share specialized experiences with businesses and affiliates. Through activities that both help teachers expand the reality in teaching and help learners have a more specific and clear view of the amount of theory learned in the curriculum.

THE IMPACT OF MACROECONOMIC VARIABLES ON THE FINANCIAL RESOURCES OF ENTERPRISES IN VIETNAM

PhD. Pham Quynh Mai[1], Dao Ngoc Uyen Trang[2], MA. Dao Thi Lan Anh[3]

Abstract: In the context of globalization and a rapidly growing economy, financial resources play an extremely important role in maintaining and developing business activities of enterprises. In particular, in Vietnam, one of the countries witnessing strong economic development, it requires businesses to have abundant and sustainable financial resources. However, the fluctuations in the macro market economy also have a significant impact on the financial resources of businesses. This study uses the VAR model to analyze the effect of macroeconomic variables on the financial resources of enterprises in Vietnam, thereby proposing some policies to improve the quality of financial resources of enterprises and expanding sources of mobilizing financial resources of Vietnamese enterprises for growth and development goals.

Keywords: Macroeconomic variables, financial resources, enterprises in Vietnam.

1. INTRODUCTION

Financial resources are not only a key factor in the operation of the entire economy, but they also have a vital impact on many businesses. In particular, for Vietnamese businesses to move towards integration and globalization, it requires sustainable financial resources.

However, in the current context of many fluctuations in the macro-economy, along with the innovation of the market economy and increasingly fierce competition between economic sectors, it has caused difficulties and challenges to the financial resources of enterprises. According to the Vietnam Chamber of Commerce and Industry, nearly 10% of Vietnamese businesses are in a situation of shortage of capital and business cash flow, especially medium, small and micro enterprises. Or in Resolution 126/NQ-CP, the Government assessed that the world situation is complicated leading to recession, reduced growth, potential financial and debt risks. Under that pressure, the situation of domestic trade activities is also affected, especially inflation, exchange rates, increased production costs, shrinking export market demand,...

All of these have an impact on financial resources of enterprises operating in our country. To stabilize the economy, the Government has closely monitored macro indicators to ensure a great balance of the economy. Thanks to that, the situation is gradually stabilizing again, and market sentiment and confidence are gradually being consolidated.

It can be seen that macroeconomic variables have significant effect on the financial resources of enterprises. Therefore, the topic *"The impact of macroeconomic variables on the financial resources of enterprises in Vietnam"* was selected for this study.

2. LITERATURE REVIEW AND RESEARCH MODEL

2.1. Literature review

According to the acceleration theory of JM Clark (1917) and Gordon (2009), investment depends on changes in output expectations (GDP). This theory argues that any change in output/

---

1 Email: maipqkinhte@hvtc.edu.vn, Academy of Finance.

2 Academy of Finance

3 University Hai Duong

GDP will lead to a change in investment capital flow decisions. Besides, from the foundation of the investment function of John Hicks (1937), James Tobin (1969) continued to consolidate and confirm that business investment depends on the level of change in GDP and interest rates. In other words, Tobin's investment function model supports the argument that GDP has a proportional effect on investment.

In the study "The impact of monetary policy tools on domestic investment and economic growth of Nigeria: 1970 – 2018" by Okoroa for OK David (2020), the author used the ARDL model combining the next method ADF and PP with the number of rows of data variables that are domestic private investment, economic growth rate, money supply, commercial bank credit, commercial bank interest rate, interest rate,.... to show that money supply negatively impacts financial resources for private domestic businesses. The results also assumed that the ratio index, interest rate and economic growth rate do not have a significant influence on domestic investment during the study period.

Many empirical studies have been conducted with the goal of evaluating the impact of macroeconomic variables on businesses' financial resources, specifically capital coming from foreign investment. Yang, Xiong, and Ze (2013) examine the determinants of foreign direct investment (FDI) and foreign portfolio investment (FPI) in 13 developing countries in Asia and the US - Latin from 1981 to 2011. Regression results show that in emerging Asian economies , FPI is mainly affected by exchange rates and risk fluctuations of the stock market.

In Vietnam has a topic by Associate Professor, Dr. Le Thi Lanh, MSc. Huynh Thi Cam Ha and MSc. Le Thi Hong Minh that researched "The impact of macroeconomic indicators on foreign porfolio investment (FPI) flows". This article examines the impact of macroeconomic variables on foreign porfolio investment in Vietnam during the period 2005 - 2012. ADF and Philips - Perron test with delay 3 is used to test the properties of time series variables, GLS regression method is applied instead of OLS to increase the efficiency of the model. Macroeconomic indicators considered include: GDP, inflation, interest rates, exchange rates and stock market index of stock prices. Among macroeconomic variables, GDP and inflation are significantly significant in explaining FDI inflows in Vietnam, but GDP and inflation have opposite reactions to foreign portfolio investment (FPI). The study recommends that the implementation of a reasonable macroeconomic policy and the planning of the country's investment strategy will enhance the efficiency in obtaining foreign portfolio investment.

Research "Effect of macroeconomic factors on investment: Evidence in Vietnam" by Le Thanh Tung (2013) aims to evaluate the influence of macro variables on the investment decisions of firms in Vietnam. The author used the Panel data analysis method and collected data from 60 Vietnamese enterprises listed on the Ho Chi Minh Stock Exchange in the period from 2005 to 2010. The macro variables selected for the study include GDP, interest rates, exchange rates and stock market prices. The results show that GDP and stock market prices have an influence. The study also shows that the impact of macro variables on business investment varies depending on the specific economic sector.

Research "Macro factors affecting FPI capital flow attraction in Binh Duong province" by author Dang Van Cuong (2021) aims to find empirical evidence on local-level macroeconomic indicators of Binh Duong province affecting FPI capital flows into the locality. Through series data from 1997 to 2020, the article uses the error correction model (ECM) co-integration analysis method to estimate the impact of these macro factors. The estimation results show that the province's annual gross product (GDP) and public investment have a positive impact on FPI capital flows in both the short and long term.

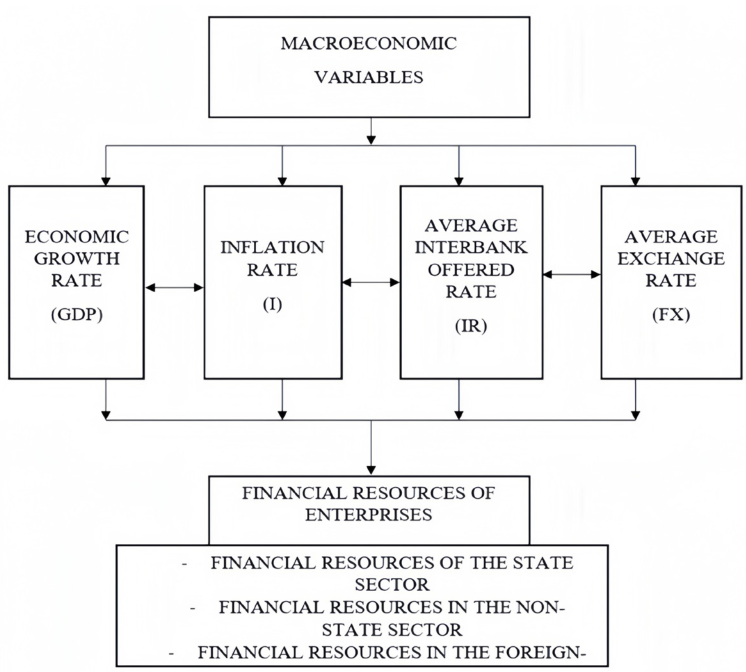
2.2. Research model

This study focuses on analyzing how macroeconomic variables affect the financial resources of enterprises in Vietnam. The model is chosen for regression is the Vector Autoregressive (VAR) models - models are widely used in time series research to examine the dynamic relationships that exist between variables that interact with one another.

The data included in the model is a continuous time series of 18 years from 2005 to 2022. However, due to data limitations, the study selected macro factors to be included in the model. including: economic growth rate (GDP), inflation rate (I), average 6-month interbank interest rate (IR), average exchange rate VND/USD (FX) and financial resources (LIC). In which, the financial resources variable (the dependent variable) represents the increase in financial resources of enterprises and analyzes the impact of the dependent variable: economic growth rate, inflation rate, average interbank interest rate and VND/USD exchange rate to this index. However, to increase accuracy in assessing the relationship between macroeconomic variables and the enterprise's financial resources, the authors consider the dependent variable in 3 separate areas:

- State Sector (LSIC)
- Non-state sector (LNIC)
- Foreign Investment Sector (LFIC)

General research equation: ***LIC = f (GDP, I, IR, FX)***



(Source: Proposal from the authors)

Figure 1: Research model

Table 1: Description table of variables

Variable	Measurement method	Expectation sign	Hypothesis	Source
Dependent variables				
Ln(SICt)	The value of natural logarithm of the financial resources of the State Sector in the year t			GSO
Ln(NICt)	The value of natural logarithm of the financial resources of the non-state sector in year t			GSO
Ln(SICt)	The value of natural logarithm of the financial resources of the foreign-invested sector in year t			GSO
Independent variables				
Ln(GDPt)	The value of the natural logarithm of Vietnam's GDP at a time t	+	The coefficients of the variables will have a positive sign depending on the estimated results. When the coefficient is positive, the economic growth rate increases, leading to the financial resources of enterprises increases and vice versa.	GSO
Ln(It)	The value of the natural logarithm of Vietnam's inflation at a time t	-	When the coefficient is negative, it means when the inflation rate increases, the financial resources of enterprises decrease and vice versa.	GSO
Ln(IRt)	The value of the natural logarithm of Vietnam's average interbank offered rate	-	When the coefficient is negative, it means when the interest rate increases, the financial resources of enterprises decrease and vice versa.	Vietstock
Ln(FXt)	The value of natural logarithm of Vietnam's average exchange rate	-	When the coefficient is negative, it means when the exchange rate increases, the financial resources of enterprises decrease and vice versa.	Vietstock

3. RESEARCH RESULTS ON THE IMPACT OF MACROECONOMIC VARIABLES ON THE FINANCIAL RESOURCES OF BUSINESSES IN VIETNAM

3.1. Testing Stationarity

Augmented Dickey - Fuller (ADF) Unit root tests and Phillips - Perron tests are used to test the stationarity of the variables.

Table 3: Result of stationarity test

Variable	ADF	P-value	Stop chain	Result	Critical value (t-statistic)		
					1%	5%	10%
Ln(SIC)	-3.925275	0.0115 (**)	DLn(SIC)	Stop	-4.004425	-3. 098896	-2.690439
Ln(NIC)	-8.519854	0.0000 (**)	DLn(NIC,2)	Stop	-3.959148	-3.081002	-2.681330
Ln(FIC)	-5.083147	0.0011 (**)	DLn(FIC)	Stop	-3.920350	-3.065585	-2.673459
Ln(GDP)	-3.889516	0.0106 (**)	Ln(GDP)	Stop	-3.920350	-3.065585	-2.673459
Ln(I)	-5.182122	0.0011 (**)	DLn(I)	Stop	-3.959148	-3.081002	-2.681330
Ln(IR)	-3.673192	0.0161 (**)	DLn(IR)	Stop	-3.920350	-3.065585	-2.673459
Ln(FX)	-3.286406	0.0377 (**)	DLn(FX)	Stop	-4.057910	-3.119910	-2.701103

Source: Results from Eviews 10

Comment:

Testing the stationarity of the series at 5% significance level (**), the result shows that SIC, FIC, I, IR, FX stops when taking the first difference and NIC stops when taking the second difference. Particularly, GDP stops when taking the difference of order 0.

3.2. Test for Optimal Lag Structure

Table 4: Results of Optimal Lag Structure testing of 3 areas

- **State sectors**

Lag	LogL	L.R	FPE	AIC	SC	HQ
0	-231.3160	NA*	4643246.	29.53949	29.7809*	29.55186
first	-202.4541	36.07736	3469979.*	29.05676*	30.50536	29.1309*

- **Non-State sectors**

Lag	LogL	L.R	FPE	AIC	SC	HQ
0	-241.9240	NA	1.37e+08	32.92320	33.15922	32.92069
first	-201.4415	48.5789*	2198724*	30.8588*	32.27497*	30.84378*

- **Foreign-invested sector**

Lag	LogL	L.R	FPE	AIC	SC	HQ
0	-224.8561	NA*	2070807*	28.73202*	28.97345*	28.74438*
first	-205.6303	24.03226	5161274.	29.45379	30.90240	29.52797

Source: Results from Eviews 10

Comment:

Based on AIC, the model has an optimal delay of 1. From the results of the stop calculation and the optimal delay, the VAR model is selected as a suitable model to analyze the impact of macroeconomic variables on the financial resources of enterprises in different regions.

3.3. Assessing Stability of the VAR Model

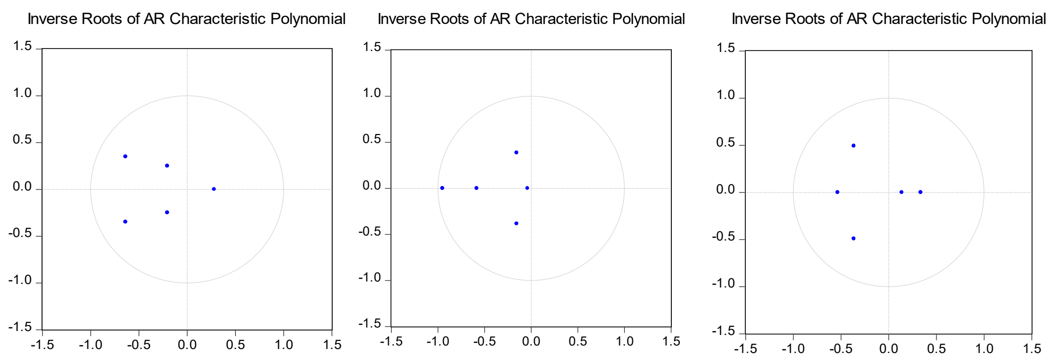

Figure 2: Stability of the model

Source: Results from Eviews 10

Comment:

The results of testing the stability of the VAR model through the Inverse Roots of AR Characteristic Polynomial test. The eigenvalues are all in a single circle (or they are all less than 1), which implies that the VAR model is stable and the estimated results from the VAR model can be trusted.

3.4. Testing for Residual Autocorrelation

Table 5: Results of residual test of 3 areas

- **State sector**

Lag	**LRE* stat**	**DF**	**Prob.**	**Rao F-stat**	**DF**	**Prob.**
first	38.75098	25	0.0390	1.910643	(25, 5.2)	0.2369

- **Non-State sectors**

Lag	LRE* stat	DF	Prob.	Rao F-stat	DF	Prob.
first	151.1759	25	0.0000	6734.916	(25, 1.5)	0.0012

- **Foreign-invested sector**

Lag	LRE* stat	DF	Prob.	Rao F-stat	DF	Prob.
first	32.04044	25	0.1568	1.209924	(25, 5.2)	0.4531

Source: Results from Eviews 10

Comment:

The results of the autocorrelation test show that the P-values of the State sector and the foreign-invested sector in Lag1 are both more than 0.05. So, at the significance level of 0.05, the model in these two regions has autocorrelation. Meanwhile, in the non-state sector, the P-value is less than 0.05. So at the significance level of 0.05, the model does not have autocorrelation.

3.5. Evaluating Granger Causality

In the multivariable VAR model, the Granger causality test tells us which variable a change in the model is affected by. The results of the causality test are:

Table 6: Synthetic of Granger causality relationship of variables to financial resources of the State sector

Dependent variable	D(LNSIC)	LNGDP	D(LNI)	D(LNIR)	D(LNFX)
D(LNSIC)		0.0974	0.6390	0.9174	0.5194
LNGDP	0.0378		0.1077	0.6020	0.9479
D(LNI)	0.1168	0.5463		0.5551	0.8003

D(LNFX)	0.5134	0.0047	0.8406	0.6408	

Source: Results from Eviews 10

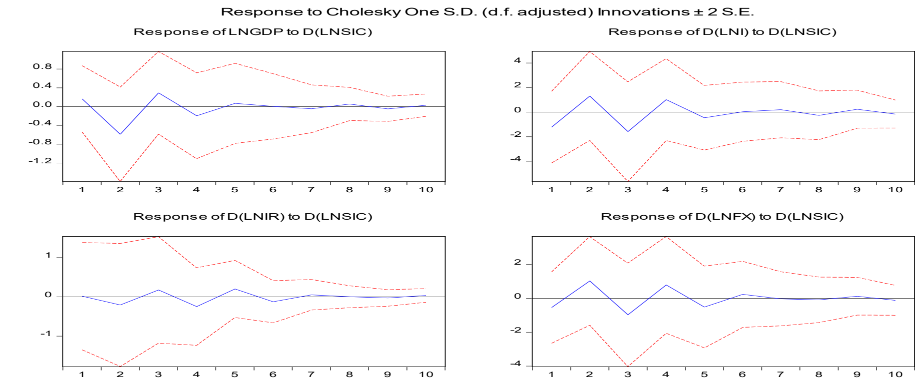
Table 8: Summary of Granger causality relationship of variables to financial resources of Foreign - invested sector

Dependent variable	D(LNFIC)	LNGDP	D(LNI)	D(LNIR)	D(LNFX)
D(LNFIC)		0.6500	0.1827	0.4060	0.7570
LNGDP	0.1828		0.0762	0.5506	0.8986
D(LNI)	0.1559	0.5036		0.5297	0.8333
D(LNIR)	0.1550	0.8088	0.8493		0.9432
D(LNFX)	0.4748	0.0782	0.8306	0.6492	

Source: Results from Eviews 10

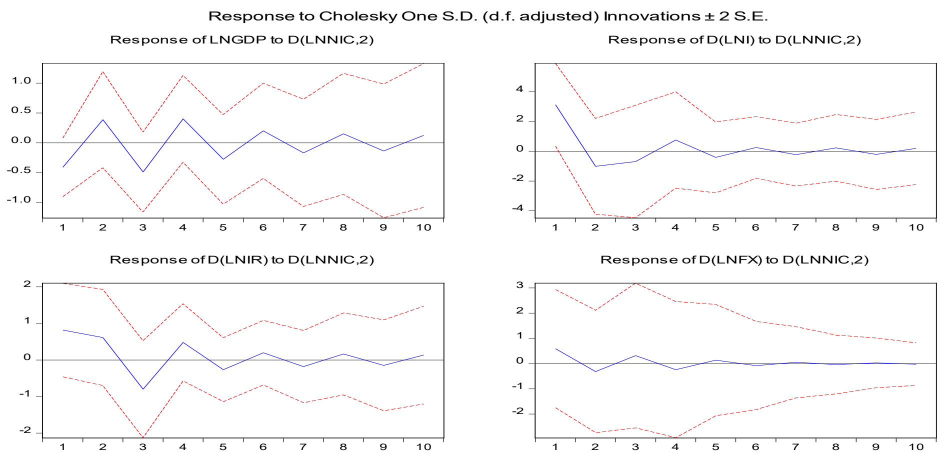
Comment: At the 10% significance level, Prob of all variables is less than 5%. Therefore, all the independent and dependent variables: GDP, IR, I, FX all have an impact on the financial resources of Vietnamese enterprises in different regions and vice versa.

3.6. Impulse response function (IRF)



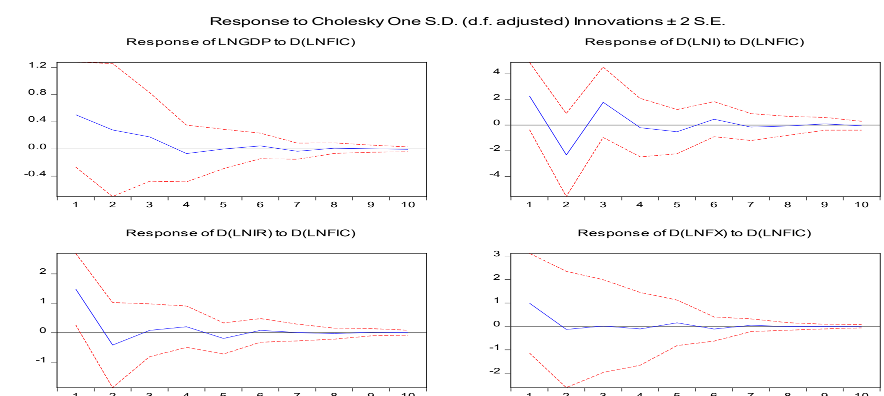
Source: Results from Eviews 10

Figure 3: Results of impulse response function in the State sector



Source: Results from Eviews 10

Figure 4: Result of impulse response function in the non-State sector



Source: Results from Eviews 10

Figure 5: Result of impulse response function in the foreign-invested sector

Overall, the push reaction results show:

In the State sector: All indicators have strong fluctuations and in the last years, these indicators tend to decrease. The push reaction results show that GDP and IR initially cause the state sector's financial resources to decrease in year 1 and from year 2 to year 5 it fluctuates strongly. However, after that, from the 5th year onwards, it decreased and remained stable. The reason is that from the later period, the economic growth rate decreased while interest rates increased, causing the economy to develop slowly, thereby negatively affecting the financial resources of enterprises.

In the non-state sector: The results of the push reaction show that GDP, I and IR have a great impact on the financial resources of enterprises in the non-state sector, causing financial resources in this area to always fluctuate. strong for 10 years. The reason is abnormal economic growth causes other macro factors to be affected, interest rates and inflation increase very high or decrease very low, leading to the ability of businesses to mobilize financial resources is also affected and tends to fluctuate unevenly between years.

In foreign-invested sectors: The push reaction results show that the decline in GDP in the first 4 years and FX in the 1st and 2nd years makes financial resources of businesses in this area also decreased. During the following period, GDP increased slightly, mainly maintaining stability and slightly decreasing at the end. From the 5th year onwards, the financial energy in foreign-invested areas also remains stable until the final year. In addition, the average interbank interest rate IR and inflation rate I have a stronger fluctuation range, but at the end of the period, the response of financial resources of enterprises in these two areas is almost the same. .

3.7. Variance Decomposition Test

To assess the impact of the past values of each variable more accurately, we conduct variance decomposition according to Sim's Recursive Cholesky method.

Table 9: State sector Variance decomposition results

Variance Decomposition of D(LNSIC):						
Period	**SE**	**D(LNSIC)**	**LNGDP**	**D(LNI)**	**D(LNIR)**	**D(LNFX)**
first	26.21126	100,0000	0.000000	0.000000	0.000000	0.000000
2	39.57710	54.16817	35.86618	3.479257	0.081441	6.404952
3	45.21433	43.51687	33.92071	15.71623	0.166248	6.679943
4	47.98644	38.65816	34.08081	17.85994	0.332206	9.068887
5	48.85029	38.01591	33.48607	17.61054	0.376814	10.51066
6	49.28067	38.37378	32.90432	17.39978	0.372120	10.95000
7	49.62639	38.52522	32.61667	17.61320	0.372161	10.87275
8	49.88506	38.39923	32.55359	17.90260	0.380528	10.76406
9	50.03061	38.22877	32.56763	18.06452	0.388543	10.75054
ten	50.09139	38.13638	32.57688	18.10817	0.392532	10.78605

Source: Results from Eviews 10

The result of the analysis of variance shows that, during the 10-year period of the study, the financial resources of the state sector are greatly affected by the shock created by itself (38.14%). GDP has the most explanatory role for the financial resources of the State sector and has a decreasing role (from 35.87% in the 2nd year to 32.58% in the 10th year) leading to financial resources decline. The second influencing factor is inflation (I) with the explanation role increasing sharply and keeping at 17 ~ 18%. Along with that, FX also shows its influence on financial resources. The role of IR explains the increase and stabilization of about 0.3% of fluctuations in financial resources of the State sector.

This result is completely reasonable because financial resources are proportional to GDP and inversely proportional to I, IR, FX. Therefore, when GDP decreases and the remaining 3 variables increase, it makes financial resources in this area decrease in line with the direction of impact between variables.

Source: Results from Eviews 10

The results show that, during the 10-year period of the study, financial resources in the non-state sector are mainly explained by itself and FX. In which, the explanatory level of FX is more than that of other variables (ranging over 14% and reaching 53.65%) by the 10th year. On the other hand, the influential role of FX is completely opposite to financial resources in the non-State sector. While FX tends to increase, financial resources tend to decrease and by the last year, the role explained by financial resources itself no longer accounted for the largest share. Next, GDP and IR tend to increase and remain more stable than other variables, but still explain only below 20%. The smallest explanatory role is the inflation rate, which remains below 5% and does not affect financial resources in the non-state sector much.

Table 11: Foreign-invested Sector Variance decomposition results

Variance Decomposition of D(LNFIC):						
Period	SE	D(LNFIC)	LNGDP	D(LNI)	D(LNIR)	D(LNFX)
first	28.51348	100,0000	0.000000	0.000000	0.000000	0.000000

Source: Results from Eviews 10

The results of the analysis of variance show that, during the 10-year period of the study, the financial resources of the foreign-invested sector are mainly explained by itself. If its own explanation is the largest and gradually decreasing (from 81.9% in the 2nd year to 72% in the 10th year), the independent variables I, IR, FX all tend to increase. Specifically, in the 10th year, the explanation of inflation I only increased by 0.003% over the previous year, IR increased by 0.0004% over the previous year, and FX reached 5.9%. GDP growth rate also has an effect on the financial resources of the foreign-invested sector. However, it accounts for only a small part and unstable over the years and always remains below 5.5%.

4 . DISCUSSION AND CONCLUSION

The model results are completely consistent with previous studies and the hypothesis proposed by the author. Besides, the tests show that the VAR model is appropriate, stable and provides reliable results. Specifically, the model testing results show that macroeconomic variables have an impact on the financial resources of enterprises in Vietnam: GDP has a proportional relationship with the financial resources of businesses, while inflation, interest rates and exchange rates produce results that are inversely proportional to the financial resources of businesses. This result coincides with the initial hypothesis of the model.

4.1. Some achievements

In recent years, the increase in GDP has contributed to increasing income for the economy, thereby increasing investment of businesses, contributing to expanding financial resources for interprises. Meanwhile, interest rates are kept at a stable level by the State Bank, ensuring businesses can access financial resources from financial institutions to expand production and business activities. Although inflation levels fluctuated, especially in the period 2011-2015, basically with the application of flexible and proactive fiscal and monetary policies, inflation was gradually controlled, prices wewe stabilized. Changing the exchange rate management mechanism to the central exchange rate helps reflect the correct market value and helps businesses easily participate in the international market.

From the estimation results, it can be seen that among the macro factors affecting the financial resources of state-owned enterprises in Vietnam, the economic growth factor has the strongest impact. When GDP increases and contributions to the State Budget increase, the State has the conditions to increase financial resources for state-owned enterprises. For the remaining businesses, GDP also has certain effects on the increase in financial resources of businesses. Especially with the non-state enterprise sector, which is considered the growth engine of the economy, the role of GDP tends to increase over the 10 years of research, reflecting an expanding economy over time, businesses in this area also accumulate more and more renewable energy for production and business.

In addition, Vietnam controls inflation quite well and does not adversely affect the financial resources of businesses. In general, for the period from 2005 to 2022, the inflation rate is always under the control of the Government, always maintaining a rate that is neither too high nor too low. However, in some periods such as from 2011 to 2014, inflation decreased deeply but was still within the allowable adjustment level of the State, did not cause the economy to stagnate, and at the same time still helped enterprises' financial resources. industry increased slightly.

Finally, the decrease in interest rates and thanks to the market regulation of the Government have also contributed to helping businesses save costs and increase profits. Opening economy policies and operating the central exchange rate mechanism flexibly according to market fluctuations have helped non-state sector enterprises expand their consumption markets and gain advantages in the international market. Accordingly, businesses can increase financial resources from operating in these markets.

4.2. Some limitations

Besides the achieved results, some limitations still exist. Specific:

Firstly, the influence of GDP on the financial resources of non-state and foreign-invested sector' s enterprises are still quite modest while they have much influence on state-owned enterprises, showing positive results that the growth results have not really created a positive transmission mechanism to businesses in these two sectors.

Secondly, inflation in the research period fluctuated, showing that despite the government's control policies, the economy is still easily affected by external shocks.

Thirdly, interbank offered rates in Vietnam are not stable, increase or decrease erratically, often changing, affecting the business operations of the enterprise.

Fourthly, the VND/USD exchange rate in recent years has concentrated to decrease but remains at a high level, making firms unable to save input costs, thereby reducing profits. The influence of the exchange rate on the financial resources of non-state enterprises is very large, showing the great dependence of these enterprises on the foreign market.

In summary, the research results have confirmed the impact of macroeconomic variables on the financial resources of businesses. This result is completely consistent with the original research hypothesis. Therefore, it is necessary to combine macroeconomic policies, including fiscal policy, monetary and other policies, to control macro indicators. In this way, the financial resources of enterprises for their operation and development are ensured.

A RESEARCH ON THE IMPACT OF REDUCING VALUE-ADDED TAX ON THE PRIVATE ECONOMY IN VIETNAM FROM THE PERSPECTIVE OF EQUITY- EFFICIENCY - FEASIBILITY

MA. Nguyen Thanh Phuong Thao[1]

Abstract: This article aims to analyze the impact of VAT reduction on the private economy from three perspectives of efficiency, fairness, and feasibility of VAT through the application of Decree No. 15/2022/ND-CP dated December 28, 2022, and Decree No. 44/2023/ND-CP dated July 1, 2023. These Decrees were implemented to promote the strong development of Vietnam's economy in the current difficult context and have shown certain effects, especially meaningful to the private economy. The study analyzed the impact of the VAT reduction policy on the private economy and showed that it ensures equity - efficiency - feasibility and based on that it made policy implications to help the private economy be supported development in the further.

Keywords: Reducing VAT rate, private economy, equity-efficiency-feasibility of taxation.

1. INTRODUCTION

In 2022, to support the recovery of the country's socio-economic development after the impact of the Covid-19 pandemic, the National Assembly and the Government have issued legal documents on fiscal and monetary policies to support this recovery. Accordingly, the Government issued Decree No. 15/2022/ND-CP dated January 28, 2022, stipulating the Value Added Tax (VAT) exemption and reduction policy effective from February 1, 2022 until the end of the year, based on Resolution No. 43/2022/QH15 issued on January 11, 2022, of the National Assembly. The biggest purpose of Decree No. 15/2022/ND-CP is to reduce VAT to reduce commodity prices and stimulate consumption in the economy. Although implemented in a short time, this policy has had certain effects. In 2023, Vietnam's economy will continue to face many difficulties and major challenges such as: The economic growth rate has begun to show a downward trend from the fourth quarter of 2022, and economic growth in the first quarter of 2023 has not improved yet [11]. A number of key industries and many key industrial localities declined or had low growth. In addition, the world economic, political, and security situation continues to become complicated and unpredictable: global economic growth is declining; The risk of recession, the escalating war between Russia and Ukraine, increased risks in financial, currency, real estate markets, etc. are also external disadvantages that have a major impact on the Vietnam economy. Therefore, to contribute to reducing the cost of goods and services, promoting production and business for businesses, and creating jobs for workers, the Government continues to issue Decree No. 44/2023/ND-CP July 1, 2023, stipulates a 2% VAT reduction policy according to Resolution No. 101/2023/QH15 dated June 24, 2023 of the National Assembly. Accordingly, a series of goods and services have a VAT rate of 10% reduced to 8% until the end of 2023 (except for the following: telecommunications, information technology, financial services, banking, securities, insurance, real estate trading, metals, fabricated metal products, mining products, refined petroleum, chemical products and items subject to excise tax.) The Government assessed that in the short term, if the 2% VAT reduction policy is applied in the last 6 months of 2023, the expected state budget revenue will be reduced equivalent to about 24 trillion VND [14], but it will help economic sectors in general and private economic in particular benefit and overcome difficult times. Therefore, this policy receives

1 University of Finance and Accountancy, Email: nguyenthanhphuongthao@tckt.edu.vn.

support from the people, experts, and enterprises in the country. Previous studies by Sajadifar et al. (2012), Miller, Webster, & Yanti (2013), Erero (2015), Zhang et al. (2018), Chuanwang Sun et al. (2020), Yue Mei Guo et al (2021), ... research from an overall national perspective have shown that policy reducing taxes in general will help support businesses' production and business activities to recover soon and reduce inflationary pressure, leading to economic growth. However, currently, there are not many in-depth works focusing on researching the impact of VAT reduction policies on enterprises in the private economic sector in Vietnam. Hence, this paper was conducted to analyze and evaluate the impact of VAT reduction policies on the private economy sector in Vietnam in the period 2022-2023, the study approached from equity, effectiveness, and feasibility. On that basis, some recommendations are made to promote private economic development in Vietnam in the future.

2. THEORETICAL FRAMEWORK AND LITERATURE REVIEW

2.1. THEORETICAL FRAMEWORK

2.1.1. THE VALUE ADDED TAX

A value-added tax is a tax imposed on the added value of goods or services; it is levied on the price of an item at each stage of importation, production, processing, and trading. Accordingly, the tax bearer is an organization or individual that ultimately consumes goods and services in the Vietnamese territory through the purchase of goods and services at prices inclusive of VAT. Tax declarers and payers (essentially an intermediary for collection and payment) are the organizations and individuals that manufacture, trade taxable goods and services in Vietnam and individuals that import goods or purchase services from abroad. This tax plays an important role in mobilizing state budget revenue [4].

There are three VAT tax rates in Vietnam, including: 0% (applied to exporty goods and services, and considered exported), 5% (applied to essential goods and services), and 10% (applies to remaining goods and services). Reducing the VAT rate leads to a reduction in the amount of VAT payable by VAT payers.

Joseph E. Stiglitz et al. (2015) proposed five basic characteristics of a good tax: efficiency, simplicity, flexibility, transparency, and fairness and they submitted that those five characteristics there can be condensed into three extremely important characteristics of a tax: Equity, efficiency, and feasibility. Specifically:

(i) Equity: Policy-makers often refer to two types of fairness of taxation: the one is horizontal equity of taxation, i.e. taxpayers have the same legal status and participate in the same activities that give rise to legal tax obligations, they have the obligation to pay taxes to the state. The other is vertical equity of taxation, i.e. taxpayers with the unequal incomes will be taxed differently [4].

(ii) Efficiency: The effectiveness of a tax is measured by the Deadweight loss (DWL) caused by the tax, also known as the social loss. This concept is more clearly defined in microeconomics: DWL is the decrease in total social surplus including producer surplus, consumer surplus and government surplus caused by taxation. The effectiveness of a tax will decrease if the DWL is greater and vice versa. This means that, for all taxes in general and indirect the VAT in particular, most of them create DWL. The DWL increases when the price of goods and services is more elastic or the tax rate of goods and services is higher [26].

(iii) Feasibility: In a broad meaning, the feasibility of a tax is the ability of the provisions in tax legal documents to be implemented in practice and whether it is likely to be highly effective or not. In a narrow meaning, the feasibility of a tax is understood as the amount of tax collected must be greater than the total costs spent to implement that tax. The cost of the tax includes administrative expenses and compliance costs. Administrative expenses are the costs for the state to organize tax collection, compliance costs are the costs which taxpayers and others incur in meeting obligations imposed under tax legislation. In addition, feasibility also refers to issues related to the process of implementing tax collection policies, indirectly affecting state budget revenue [25].

2.1.2. THE PRIVATE ECONOMY

The private economy is the segment of a national economy that is owned, controlled, and managed by private individuals or enterprises. That mean the private economy is an economic sector outside the state economic sector, including domestic and foreign enterprises, in which the private sector holds over 50% of investment capital.

The private economy is associated with the type of private ownership, including the individual economy, the smallholder economy and the private capitalist economy based on private ownership of the means of production. The private economy exists in forms such as private enterprises, limited liability companies, joint stock companies and individual business households.

Resolution of the 5th Plenum of the 9th Central Committee determined: The private economy is an important component of the national economy. Private economic development is a long-term strategic issue in socialist-oriented multi-sector economic development, making an important contribution to successfully implementing the key tasks of economic development, industrialization, modernize and enhance the country's internal strength in international economic integration.

For nearly 40 years of renovation, Vietnam's economy has been gradually asserting its position in the region and in the world. A significant contribution to that success is the strong development from the private sector - the area which is considered the most dynamic sector and plays a big role in promoting national economic development [30].

2.1.3. THE IMPACT OF THE VAT REDUCTION POLICY ON PRIVATE ECONOMY

In terms of the impact of VAT reduction on businesses, the VAT has the effect of encouraging businesses to develop production, export, and investment, promote business accountings, and contribute to increasing revenue. Strengthen the management of business activities of the enterprise. In other words, the VAT reduction policy contributes to reducing production costs and product prices, thereby helping businesses increase their ability to recover and expand production and business activites [4].

In general, the VAT reduction policy can help reduce the tax burden on enterprises and improve the vitality of their in the market, thereby reducing recessionary pressure on the economy. Other documents also point out that reducing VAT is an important measure to optimize the tax structure and strengthen supply-side structural reform [33]**.** Besides, the VAT reduction policy can help expand markets, stimulate investment, and improve production efficiency of businesses [3]**.**

The VAT reduction is applied to stimulate consumer demand, in accordance with the difficult economic context, thereby promoting production and business activities of enterprises to soon recover and develop to contribute again to the state budget revenue as well as the economy.

2.2. LITERATURE REVIEW

To study the impact of increasing or decreasing VAT on the economy from an overall perspective, previous studies have taken many different approaches such as Tao Thi Hoang Anh (2007), La Xuan Dao (2012), Urzua (2001), Emran & Stiglitz (2005), Sajadifar et al. (2012), ... They researched the impact of VAT on the country's economy by using econometric models to verify and evaluate the impact of increasing or decreasing VAT on national economy. Specially, Urzua (2001) studied the welfares received in tax reforms in Mexico and shown that the tax system is progressive so it satisfies vertical equity. In some other studies such as Zaman (2012) has pointed out that increasing VAT raises concerns that the relevant social aspects are completely ignored and therefore the increase in VAT is not optimal in terms of society, it causes inequality in society because most of the revenue of these taxes comes from poor households, increasing taxes will affect people with low income because VAT is regressive in income. On the other hand, Chuanwang S., et al. (2020) explore the impact of VAT incentives at the micro-enterprise level according to the DID (Difference In Difference) method and the financial panel data of Chinese listed companies. The results of the study indicate that VAT incentives are ineffective in stimulating corporate returns on equity (ROE) and the authors also find that the policy impact has a time lag and change significantly over time. Nguyen Thi To Nga (2022) researches the VAT reduction policy from the perspective of public finance. The results show that the VAT reduction policy ensures fairness and effectiveness, but the level of feasibility is reduced.

Some other authors' research using Computable General Equilibrium (CGE) models to simulate and forecast tax policy impacts such as Nguyen Chan et al. (1999) used the CGE model in evaluating tariff policy in Vietnam, the study focused on VAT reform. The results indicate that Vietnam can gain benefits from direct VAT reform, but the redistributive effects associated with these reforms are large and may overshadow those benefits. Giesecke J., A. & Tran. N., H., (2009) developed a model that models some of the intricacies of the VAT system as it is implemented by tax authorities in the Vietnamese economy. The authors modeled multiple tax rates, multiple exemptions, and multiple refund levels for commodity users and multi-product businesses. Detailed VAT framing is important for accurate VAT modeling in a general equilibrium model. Such a framework is also valuable in accurately representing the distribution of indi.rect taxes in the general equilibrium model database, a prerequisite for accurate welfare analysis. The authors use this model to analyze the impact of simplifying Vietnam's complex VAT system, simplifying the system by moving from three tax rates to a tax rate. Yue Mei Guo et al. (2021), using a CGE model to estimate the impact of a VAT reduction policy on local fiscal pressures in China in the COVID-19 pandemic, the authors show that reducing VAT helps reduce the operational burden for businesses and enhances their vitality in the market, but it will certainly lead to a significant decrease in tax revenue for the local budget, thereby leading to increasing the local financial pressure. Nguyen Thi Huong (2022) studied the reduction of VAT on changes in macroeconomic indicators based on the use of the Dynamic Computable General Equilibrium model (DCGE) and concluded that the reduction of VAT from 10% to 8% does not reduce state budget revenue in the long term but also increases GDP and trade surplus. As a result, with the VAT reduction policy, it not only increases people's welfare, stimulates consumption, but also promotes investment and removes difficulties for businesses. The Government will achieve the goal of restoring the economy after the impact of the Covid-19 epidemic. In the long term, total state budget revenue from taxes will be improved more. Institute for Economic Research and Policy (VERP) (2018) combines CGE and Demand Function models to forecast the impact of increasing VAT on the economy and household welfare. The results show that increasing taxes increases budget revenue and total investment, but it sharply reduces total income and total household expenditure.

Thus, it can be seen that there are many previous studies researching the impact of increasing or decreasing VAT on the economy from different methods, but there is no research on this issue on the firms of the private economic sector from the perspective of equity, efficiency, and feasibility in the period 2022 - 2023 in Vietnam. This article uses the methods of analysis, synthesis, comparison, and secondary data collection to determine this issue.

3. ANALYZING THE IMPACT OF VAT REDUCTION ON THE PRIVATE ECONOMY IN EQUITY, EFFECTIVE, AND FEASIBLE TAXATION

3.1. IN TERMS OF EQUITY OF TAXATION

In horizontal equity of taxation, the reduction of VAT for items with VAT rates from 10% to 8% ensures equality among all sectors of the economy. Because, according to regulations, all enterprises in the private economic sector or state economic sector are the same VAT obligations (they are all allowed to buy goods and services with reduced VAT capacity). This means that all kinds of firms are treated equally in fulfilling tax obligations and reducing VAT equally.

In vertical equity of taxation, reducing VAT rates improves vertical equity of taxation. Considering the nature of VAT, it does not ensure vertical fairness but reducing the VAT rate will reduce the unfairness of this tax, leading to increased vertical fairness for VAT. This is because tax rates on goods and services are generally regulated for all taxpayers, so businesses in general or enterprises of private economic in particular, which are facing difficulties or disadvantages (have poor business results or negative profits...) all pay the same tax rate according to regulations with businesses in general or private economic in particular that have more advantages (good business results, positive profits, enjoy preferential policies, ect). Thus, this does not ensure vertical equity of taxation because vertical equity means that taxpayers with the ability to pay more tax must pay more tax than other subjects. But when the VAT rate is reduced, it means that the amount of VAT payable by all businesses is reduced equally for consuming the same items, however, when it comes to the ratio of tax payable to profit, there is a difference among businesses because the reduction rate of difficult businesses will be higher than the businesses with advantages. Thus, reducing VAT rates leads to improved vertical fairness of taxation, which is especially meaningful for taxpayers who are enterprises in the private economic sector, they are more vulnerable and receive less support than enterprises belonging to the state economic sector or foreign investment sector. After applying Decree No.15/ND-CP, March 30, 2023, there are about 897,297 enterprises doing business: There are 50,113 newly established enterprises; the number of businesses terminating business decreased by 3.83% compared to 2022 (31,356 businesses); the number of businesses temporarily suspending business decreased by 15.14% compared to 2022 (29,029 businesses). They are mainly private businesses, the support for VAT reduction also creates more favorable conditions and increases fairness for them return to the market [10].

3.2. IN TERMS FEASIBILITY OF TAXATION

In a broad meaning, in the context of needing to stimulate economic recovery, the implementation of VAT reduction according to Decree No. 15/2022/ND-CP and Decree No. 44/2023/ND-CP is considered a solution to support businesses because they were reduced a part of the burden tax causing of VAT, therefore, it has a positive impact and is highly appreciated and responded to by businesses, ensuring the feasibility of taxation.

In a narrow meaning, the VAT reduction policy is still feasible when the total amount of tax VAT collected is still higher than total the costs incurred, even though though VAT reduction has an indirect effect on state budget revenue in the short term, but reducing VAT stimulates consumer demand, from which the government will collect additional taxes involving such as income tax, excise tax, fees, ect. from the increased amount of goods and services consumed to compensate for the reduced state budget revenue. For example, product A has a selling price of 1,000,000 VND/piece and customers consumes 1 million of product A. When product A has a 2% VAT rate reduction means the price of this product is reduced by 200,000 VND/piece, to 800,000 VND/piece but thanks to that, the number of product A consumed increased to 1.2 million pieces. As a results, the government collects VAT on 1 million products A initially and collects VAT on 200,000 products A extra, and also collects taxes involving such as corporate income tax, excise tax, fees, etc. arising from 1.2 million products A instead of 1 million products A initially. This demonstrates the superiority of the VAT reduction policy and shows its multi-dimensional impact, helping businesses increase consumption of products, and helping the economy develop, which in turn increases state budget revenue for the government. Thus, reducing the 2% VAT rate ensures the feasibility of VAT when applied.

According to the report on the results of implementing the VAT reduction policy according to Resolution No. 43/2022/QH15 on results achieved in 2022, the government shown this policy has supported enterprises and people about 44.5 trillion VND in 11 months of application (an average monthly decrease of about 4 trillion VND). The implementation of VAT reduction according to Resolution No. 43/2022/QH15 has indirectly stimulated domestic consumption demand to increase, total retail sales of goods and services revenue in 2022 increased by 19.8% compared to the previous year, domestic VAT collection did not decrease but increased by 10% over the same period [14].

If this policy is applied for a longer period of time, it is clear that businesses will benefit and the economy will recover faster, but this policy also needs to be appropriate in the economic context and especially necessary must come from the provisions of law. That means tax reduction does not change the state budget revenue balance approved by the National Assembly. If taxes are reduced for too long a time and for all goods and services, it will affect the picture of state budget revenues and expenditures and lead to many other problems. However, in the current context of needing to stimulate economic recovery, the VAT reduction policy has many effects and ensures good feasibility.

In addition, initially, the implementation of Decree No.15/2022/ND-CP caused great difficulties for enterprises due to confusion when making separate invoices for goods and services with reduced 2% VAT rates. This might be the cause of increased tax compliance costs for enterprises and tax collection costs for tax authorities. However, this difficulty has been promptly resolved by the Government with Decree No. 41/2022/ND-CP. Accordingly, enterprises do not have to issue separate invoices, that is, if they sell many items with different tax rates, the invoice must clearly state the tax rate of each good and service. With such regulations, businesses save time making invoices, save costs of using invoices, and are convenient in accounting and tax declaration. Thereby, reducing administrative procedures for businesses, reducing the cost of using invoices, reducing tax compliance costs, facilitating production and business activities of businesses, indirectly helping to increase the feasibility of VAT reduction policy.

3.3. IN TERMS EFICIENCY OF TAXATION

According to the concept of DWL of microeconomics above, goods and services with high tax rates cause large DWL or large social losses. Therefore, when VAT rate is reduced, prices of goods and services go down and the DWL of VAT will decrease. That is, when the VAT rate is reduced, the effectiveness of the VAT will increase because of the decrease in DWL. Described in Figure 1. follows: the initial VAT rate which is symboled (T), the initial DWL will correspond to the area of trapezoid BCED, if the tax rate T is reduced from T to T', new DWL after reducing the tax rate at T ' will correspond to the area of triangle ABC. Observing in the figure bellow, seeing that the area of triangle ABC is smaller than the area of trapezoid BCED. This means that the DWL is reduced or in other words, the effectiveness of VAT is increased.

After 7 months of 2023, applying Decree No. 44/ND-CP on reducing 2% of VAT, the total retail sales of goods and consumer service revenue of enterprises is estimated to reach over 3 million billion VND, an increase of nearly 11 billion VND. % compared to the same period in 2022. In Ho Chi Minh City's market, in the first 6 months of 2023, the total retail sales of goods and consumer service revenue of businesses reached more than 560,000 billion VND, an increase of more than 7% compared to the same period in 2022. It is estimated that in the last months of 2023, this number will increase further according to according to the expectation of the 2% VAT reduction of Decree No. 44/ND-CP [11].

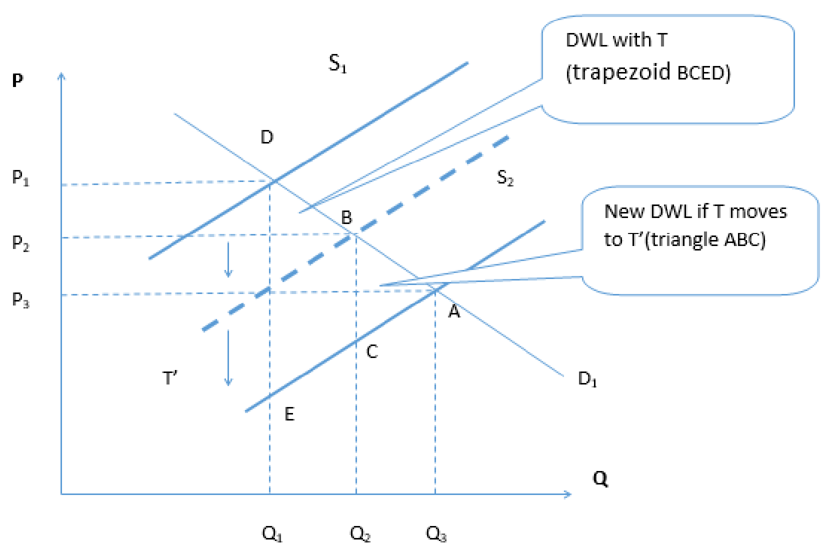

Figure 1. The reducing VAT affects DWL

3.4. THE DISADVANTAGES OF VAT REDUCTION ON THE PRIVATE ECONOMY

Although, the policy of reducing VAT from 10% to 8% from July 1, 2023 to December 31, 2023 of Decree No.44/2023/ND-CP according to Resolution 101/2023/QH15 is being implemented. It is expected to help businesses overcome economic difficulties in the current context. However, besides the achievements, some limitations of the VAT reduction policy are still revealed as follows:

First, Decree No.44/2023/ND-CP still only allows a 2% VAT reduction for some goods and services instead of the entire. While the economy is a continuous entity, if there are difficulties, every industry will face difficulties, more or less. Therefore, if the 2% VAT reduction policy is only selective for a number of industries according to current regulations as applied in 2022, it will create discrimination among businesses, thereby leading to decreasing fairness of this VAT reduction.

Second, the 2% VAT reduction according to Decree No.44/2023/ND-CP only applies in the last 6 months of 2023, which is obviously significantly shorter than Decree No.15/2022/ND-CP lasts for nearly the whole of 2022. During the VAT reduction period, the current economic context has not yet improved due to major impacts from the end of the third quarter of 2022 until now. Thus, if the tax reduction period is short, the size is not deep enough, the final consumer does not benefit in the long term, and it does not have enough impact on manufacturing enterprises when the price of goods is faster and lasts longer, leads to not enough for a basic economic recovery process. Hence, the effectiveness of VAT reduction may be affected. The impact of this policy will be somewhat limited, making it difficult to promote the effect of stimulating demand and providing growth like in 2022.

Third, nowadays, enterprises have been operating in multiple industries, buying and selling many items so reducing VAT rates on only a few goods and services makes tax declaration and payment very complicated for enterprises. They are worried that if they incorrectly determine the items being reduced, they will risk being fined and disciplined later, which in turn partly affects the feasibility of the 2% VAT tax reduction policy.

4. CONCLUSIONS AND POLICY IMPLICATIONS

After implementing the decrees stipulating tax exemption and reduction policies according to Resolution No. 43/2022/QH15 of the National Assembly on fiscal and monetary policies to support the socio-economic recovery program in the following context after the Covid-19 pandemic, although these decrees have urgent and some problems, they have shown that the policy is to come to life as quickly and conveniently as possible. This policy has had many effects. From a business perspective, the VAT reduction policy has shown certain effectiveness in supporting increased demand for goods, stimulating the circulation of goods, helping businesses release inventory, and return to business production again. When businesses have recovered and developed production, they will create more jobs and better resources, and the Government will collect additional related taxes. Compared to other policies, VAT reduction has shown to be the most direct support solution of the Government for taxpayers, especially, this policy will best support businesses in the private economic sector, which are the most vulnerable compared to the state economic and investment foreign sectors to overcome the crisis period.

The study analyzed the impact of the VAT reduction policy on the private economy from the perspective of: Equity - efficiency - feasibility and based on that it made policy implications to help the private economy be supported development in the further:

Firstly, the Government should consider expanding the scope of subjects eligible for VAT reduction to all groups of goods and services that are currently subject to a 10% tax rate because currently, all types of business sectors are facing difficulties not just any field. Thus, expanding the scope of subjects eligible for VAT reduction will be consistent, creating comprehensiveness in implementation and increasing the feasibility of VAT reduction itself.

Secondly, the Government needs to consider extending the VAT tax reduction policy until the end of 2024 so that the 2% VAT tax reduction policy has enough time to have a deep enough impact. Both the final consumer and manufacturing businesses can benefit for a long time when cheaper commodity prices last longer. Thereby, the effectiveness of the new VAT reduction policy is increased, helping the economy recover.

Thirdly, to put the policy into practice more effectively and avoid causing problems that may cause difficulties in tax compliance for businesses as in the case of Decree No. 15/2022/ND-CP, the tax authorities should issue a Circular with clearer instructions. In addition, tax officials should also have programs to update tax policies and specifically answer the question of enterprises so that the process of implementing new policies can be quickly, practical, and effective.

In addition, although the VAT reduction policy is appropriate for the current context, however, it has directly affected state budget revenue (expected state budget revenue in 2023 will decrease by VND 20,000 billion), so the Government needs to continue its actions. Measures to stimulate demand include removing bottlenecks to increase disbursement and promote the effectiveness of public investment spending in the economic recovery package rather than continuing policies that impact budget revenue reduction. Along with that is strengthening inspection and supervision to prevent tax loss. These amounts will ensure budget balance.

Moreover, the Ministry of Finance should continue to reform and modernize the tax system in accordance with international practices. To have an effective tax system, taxes need to have low and appropriate tax rates, therefore, with VAT, it is necessary to expand the VAT base by reducing the number of essential goods and services that are not subject to VAT, and goods and services are subject to a tax rate of 5%; moving towards basically applying a tax rate below 10%.

CORPORATE SOCIAL RESPONSIBILITY IMPACT ON TAX AVOIDANCE: EMPIRICAL EVIDENCE IN VIETNAM

MBA Thai Tran Van Hanh, Ph.D Ngo Nhat Phuong Diem[1]

Abstract: The study was conducted to evaluate the impact of corporate social responsibility (CSR) on tax avoidance in Vietnam, when having moderating effect of chief executive officers' power (CEO power). The study uses a data sample of 499 listed non-financial companies in the period 2016 to 2022 with 3,493 observations. We use the feasible generalized least squares model to assess the impact of CSR with the moderating effect of CEO power on tax avoidance. The research results confirm that if listed companies which have powerful CEO disclose more CSR information, tax avoidance behaviors increase. In addition, the study acknowledges that audit firm quality, financial leverage have a negative impact on tax avoidance, but there is no evidence showing that industry has impact on tax avoidance. The article has added empirical research to the background theory of tax avoidance, providing a basis for other future studies.

Keywords: Corporate social responsibility (CSR), tax avoidance, CEO power, Vietnam

1. INTRODUCTION

Corporate social responsibility (CSR) has become a decisive factor in business efficiency, determining the sustainable existence of businesses in the competitive environment (Buckingham, 2012; Mark, 2012; Yinyoung et al., 2016; Enric, 2018), and it is a concern in the context of worry about social and environmental issues. Therefore, Vietnam recently has issued many legal documents related to promoting social responsibility disclosure, such as Circular 155/2015/TT -BTC, Circular 96/ 2020 / TT -BTC replaces Circular 155 on social responsibility disclosure, requiring businesses to carry out social responsibility in their business activities. Then, CSR compliance in Vietnam is compulsory, that is one of factors contributing to fair presentation of financial reporting.

With the increasing in awareness of the international community and related parties about environmental and social issues, the aim of businesses is not only increasing profits and benefits for investors, or increasing the level of contribution to the budget, but also paying attention to the environment and contributing to the community, as well as reaching the goal of sustainable development (Carol, 1979; Chapple & Moon, 2005). Therefore, in the 1970s, there was a view of research that the obligation to pay taxes is the social responsibility of businesses, and Friedman (1970) represented that viewpoint when admitting "The main responsibility of an enterprise is to generate profits to fulfill tax obligations for the State, and the responsibility of governments is to spend taxes effectively for community and society. An enterprise is considered to perform well on social responsibility when it has fulfilled its tax obligation to the State and its business activities must be transparent and comply with the provisions of the law".

Basing on both orientation of sustainable development and regulations on corporate social responsibility, the leader of an organization – for example, the chief executive officer (CEO) in a company - plays the important role in building a culture of ethical behavior and social responsibil-

1 Email: ngodiem@ufm.edu.vn, University of Finance - Marketing.

ity. If a business is run and led by CEOs who have professional vision, reputation, experience, always adhere to business ethics, and always aim for the common interests of the community, it will create a strong connecting with employees, connecting with stakeholders, thereby helping the unit realize its sustainable development goals. Senior managers can influence policy implementation regarding CSR (Waldman & Siegel, 2008). From these basis, we conduct an empirical analysis to see whether the abiding by CSR regulations helps entities behave more responsibly, by transparently presenting relevant information on financial statements and complying with regulations on corporate income tax. At the same time, we also use superiority theories to analyze whether CEO characteristics can predict differences in CSR among companies. Therefore, this study was conducted to test whether businesses complying with CSR regulations do tax avoidance or not, and if CEO power really moderates this relationship?

After the introduction, the article mentions the overview and hypothesis. Then, the article describes the data, methods, and scales of variables in the model. The next part of the paper is the research results and finally the conclusions and related policy implications.

2. LITERATURE REVIEW AND HYPOTHESES

Legitimacy theory holds that for a company to continue to develop sustainably, it must comply with legal regulations, and it must operate within the boundaries and norms that society defines. Unerman & Deegan (2011) define legitimacy as a social contract between an organization and the society in which it operates, understood as an explicit social desire or an implicit understanding between the organization and another organization. This theory also believes that when a company complies with legal regulations in business activities, it will maintain the social trust from community and contribute to sustainable development. Companies disclose information through CSR reports to ensure transparency and to gain social recognition (Omran & Ramdhony, 2015).

There are some concepts of tax avoidance, but the term tax avoidance lacks a common definition because it can mean "different things to different people" (Hanlon & Heitzman, 2010). In fact, many scholars argue that corporate tax avoidance activities are often misdefined (Desai & Dharmapala, 2009b), because it is difficult to distinguish practices of tax avoidance and tax evasion, then the difference between the two is vague (Weisbach, 2003), while there are views that tax avoidance is a legal action, but tax evasion is illegal. However, terms "tax management" and "tax planning" are used interchangeably in the previous reseaarch mean tax avoidance (Chen et al., 2010; Dyreng et al., 2008; Lanis & Richardson, 2011 ; 2012; Minnick & Noga, 2010)

Agrawl (2007) states that "Tax avoidance is considered the act of reducing tax liability while still complying with the provisions of the law rather than in writing through tax planning". Dyreng et al. (2008) stated that tax avoidance is "the ability to pay a low tax per dollar of reported pre-tax accounting income", while Desai & Dharmapala (2009) state that "tax avoidance is the use of legal method, exploiting loopholes in tax regulations to minimize the amount of tax payable by an individual or a business. This is usually done by making the most of reasonable expenses, restructuring transactions in a way that reduces tax liability, such as purchasing local bonds, using tax deductions and take advantage of tax incentives" or as Armstrong et al. (2012), argue that "tax avoidance is the avoidance achieved by arranging personal or professional affairs to take advantage of loopholes, uncertainties clarity, irregularity or other deficiencies of tax law".

Legal tax avoidance reduces tax costs, and these reduced costs may lead to increase managers' compensation or serve shareholders (Aminad et al., 2018), then it is considered managers' motivation to perform tax avoidance behavior. But this activity in the long run will affect the reputation and value of the business.

Thus, tax avoidance is legal action based on the use of loopholes in the law to reduce the amount of tax payable. Meanwhile, the act of tax evasion is an act of an organization or individual through illegal activity to avoid paying enough a true tax liability. However, the distinction between the two has led to much debate because it is difficult to clasify them, and in many cases it is not possible to confirm an action is a tax avoidance or tax evasion (Slemrod & Yitxhaki, 2000).

The theory of social responsibility and tax avoidance behavior points out the complex relationship between these two issues. Carrol (1979) believes that CSR is the entire scope of a company's responsibility to society in terms of economic responsibility, legal responsibility, ethical responsibility and other responsibilities. Huseynov & Klamm (2012) argue that paying enough tax obligations is a topic within the scope of CSR. If an enterprise fulfills its tax payment obligation, it is an important contribution to society; if it does not pay attention to its tax obligation to contribute economically to society, then social responsibility is at risk of not reachable. Nevertheless, if enterprises reduce income tax costs, there is an increasing in profits, then tax avoidance can basically be seen as a kind of CSR in economic terms, the first and most important responsibility of enterprises (Carrol, 1979).

When enterprises carry out activities related to CSR, it will incur higher costs and then reduce their profits, so they may deal with this problem through other adjustment activities to cover the costs. These activities may be input choices, pricing strategies, or illegal practices such as non-compliance with labor regulations, environmental restrictions, or tax laws. It means that those companies try to avoid paying taxes through appropriate transfer pricing policies, offering appropriate location options, or using appropriate tax legislation. When taxes are reduced, profits increase, helping the company better position when entering the market. So, in those cases a reduction in tax payments can be considered a socially acceptable activity (Huseynov & Klamm, 2012).

Besides, views on tax avoidance also differ between companies (McIntyre et al., 2011), so it is found that the issue of tax avoidance is still a controversial topic.

Hoi et al. (2013) examined whether aggressive tax evasion behaviors are related to CSR practices. The study used a sample of US companies in the period 2003-2009. Its results acknowledge that firms that do not disclose CSR information are more likely to deliberately evade taxes. With the same results, Lanis & Richardson (2015) used a data sample of 434 observations in the period 2003 - 2009 (including 217 observations of businesses with tax avoidance behavior and 217 observations of businesses without tax avoidance behavior) to consider if enterprises disclosing social responsibility information relate to tax avoidance or not. In this study, the authors measured independent variable representing tax avoidance using book tax difference (BTD). Empirical results admit that if US companies do more CSR activities, their tax avoidance would be lower. The result is similar to that of the researches of Ki (2012) in Korea and Liu & Lee (2019) in China.

Fuadah & Kalsum (2021) used a data sample of 29 manufacturing companies in Indonesia, in the period 2017 - 2019 to evaluate the impact of CSR disclosure and tax liability on corporate value. The study uses a linear structural model based on partial least squares. The tax avoidance variable is measured using the effective tax rate (ERT). The research results confirms that CSR and tax avoidance have a negative and significant impact on corporate value, and the lower the level of CSR disclosure is, the higher corporate income tax avoidance is. However, this study only uses data of listed manufacturing companies, then it does not reflect the relationship between social responsibility and tax avoidance behavior in general.

Contrary to the above results, Davis et al. (2016) uses 5,588 annual observations of US companies in the period 2006-2011 to find that companies that disclose more CSR information are more likely to avoid taxes. This study interprets their findings that CSR and taxes act as substitutes because firms engaged in tax avoidance deliberately increase their CSR activities to offset any negative perceptions from community. Watson (2015) uses corporate profits as a moderator to explain relationship between CSR and tax avoidance. Using 7,297 annual observations of US companies for the period 2003-2009, he finds that there is a significant relationship between CSR and tax avoidance in low-margin firms, but this relationship weakens or disappears in highly profitable firms. Then the research concludes that the relationship between CSR and tax avoidance depends on the company's profits.

Zeng's study (2018) was conducted basing on companies in different countries with the aim of examining the impact of CSR on tax avoidance activities of enterprises in different countries. This study found strong evidence that CSR is positively related to tax avoidance. In countries with weak national governance, firms with higher CSR scores are less likely to evade taxes, implying that CSR and national governance are related. In the meanwhile, Abid &Dammak (2021) admit that firms with high CSR scores are more likely to engage in tax avoidance behavior. Besides, the findings show that companies audited by high-quality auditors have less tax avoidance behavior.

For reviewing studies related to the topic, Issah & Rodrigues (2021) collected research published from 2003 to 2020 to build a map explaining the relationship between social responsibility and tax avoidance behavior. The authors' report shows that there were not many publications before 2012 on social responsibility and tax avoidance. The number of publications related to social responsibility and tax avoidance increased slightly from 4% to 9% from 2012 to 2018 with an average of five to twelve articles per year. The number of publications has skyrocketed in 2019 with 24 articles and 39 articles in 2020. Research results have acknowledged that concerns about social responsibility and tax avoidance are gaining more academic interest, in the context of publication of the Global Reporting Initiative (GRI) Tax Standards.

CEO is considered the most powerful person in an organization, he or she is the person who sits at the top of the management team. CEOs can lead companies in pursuing goals and getting positive opportunities (Barnard, 1983), and control the financial structures and strategies of the companies (Woodward, 1965; Lawrence & Lorsch, 1967). As the external business environment changes rapidly, becoming more volatile, CEOs play more important role when they are expected to create jobs, provide quality products and services, and give high return on investment for shareholders (Boatright, 2009). Previous studies have suggested that CEOs who are founders and have financial-accounting expertise will be the most powerful CEOs (Gao & Jain, 2012 ; Gounopoulos & Pham, 2018; F. Li & Mr. Srinivasan, 2011). F. Li & Srinivasan (2011) find that in companies where the CEO is the founder, he or she is given more privileges than that in the other companies, then they have more power that affects process of decision making (Adams et al.,

2009) , and it also impact on the strategies and goals of the company (Stockmans et al., 2010) . In addition, superiority theory (Hambrick & Mason, 1984) argues that CEO characteristics influence the process of making decisions in joint stock companies (Sanders & Carpenter, 1998) . Another study suggests that if the process of decision making is more complicated, the characteristics of CEOs have higher impact on that process (Bernard et al. , 2018 ; Zhang et al., 2021) . Wernicke et al. (2021) contributes to these results of relationship when showing that CEO characteristics explain about 30% of the variation in CSR.

Therefore, with the opinions of the authors and the issues presented above, we propose the following hypothesis:

H1: CSR disclosure with the moderator of CEO power has a negative effect on tax avoidance.

3. RESEARCH METHODS

3.1. Research database

The data sample in this study is all companies listed on HOSE and HNX with a fiscal year starting from January 1 and ending on December 31 of the year from 2016 to 2022. The data for the period of 2016 – 2022 is collected for the reason that Circular 155/2015/TT -BTC took effect January 1st 2016. The data excludes the following cases:

- Financial institutions and insurance companies (because this field is regulated by a completely different financial mechanism and regulations);

- Enterprises that do not have enough financial statement data for the year 2016 to 2022, because a lack of data will lead to unbiased panel data and affect the results of the regression model and; and

- Enterprises with negative accounting profit because there is not enough data to determine the dependent variable of tax avoidance in the research model.

This data sample includes 499 companies with 3.493 observations.

3.2. Regression model

Using quantitative research method, based on table database, using stata 16 software, this research was conducted to build regression model with dependent variable (Tax – Tax avoidance) and independent variable (CSR with moderating of CEO power) and control variables (company size – Size; financial leverage – Lev and Industry -IND). Our model testing research hypothesis is formatted as follows:

$$TAX_{it} = \alpha_0 + \beta_1 CSR{*}\ CEOPOW_{it} + \beta_2 SIZE_{it} + \beta_3 LEV_{it} + \beta_4 BIG4_{it} + \beta_5 IND_{it} + \pounds_{it}$$

Where:

- TAX is the tax avoidance, tax avoidance is measured by using the calculation of Effective Tax Rate (ETR)
- CSR*CEOPOW is independent variable in the model.
- SIZE, LEV, BIG4, IND are controlling variables.
- $\beta_{1,} \beta_2, \beta_3, \beta_4, \beta_5$ are coefficients of regression.
- $\boldsymbol{\varepsilon}_{it}$: is the error term.

3.2. Measuring the dependent variable in the regression model

Dependent variable In this study, tax avoidance is measured by using Effective Tax Rate - ETR (Chen et al., 2010; Dyreng et al., 2017; Kurniash et al., 2017). It is calculated as follows.

$$\text{ETR} = \frac{\textit{Income tax expense}}{\textit{Earning before income tax}}$$

In the view of the above researchers, when the ETR rate is lower than the current statutory tax rate, the business is likely to avoid the tax. Then we use a dummy variable to represent the ETR with the rule that if the ETR is less than 20% (current tax rates apply to companies), the value is 1, otherwise, the value is zero.

Independent variable

Independent variable CSR

Literature provides several methods for measuring CSR: content analysis of CSR measurement through independent CSR reports (Dhaliwal et al., 2011 -2012); measure CSR through the number of CSR pages in the annual report (Cowen et al. , 1987); measure CSR through the number of keywords in annual reports and CSR reports (Gamerschlag et al., 2011); measuring CSR through the use of databases covering three aspects: economic, environmental and social (Nguyen Thi Minh Thuy, 2016). In Vietnam, with the introduction of Circular 155/2015/TT-BTC on guidance about information disclosure on the stock market, regulations on the presentation of annual reports clearly state general standards on CSR disclosure in the appendix. IV. Therefore, within the scope of the study, the authors base on the CSR disclosure rules prescribed by the Ministry of Finance for listed companies as the basis for calculating and measuring CSR. At the end of 2020, the Ministry of Finance issued Circular 96/2020/TT -BTC on instructions for information disclosure on the stock market, effective from January 1, 2021 to replace Circular 155/2015/TT -BTC. Compared to Circular 155, Circular 96 changes the scope and time of corporate information disclosure, but it does not change content of CSR information need to dislose. Therefore, in this study, our team decided based on the criteria in Appendix IV circular 155 to measure CSR. Specifically, there are 20 criteria in 3 aspects: environmental issues, human issues and community service activities. Current studies show that disclosure can be quantified using a weighted or unweighted approach (Bose et al., 2018). In this study, we use the unweighted approach. Basing on Ben Amar & Chakroun (2018) and Rashid et al., (2020) , we apply a binary variable measuring CSR disclosure, the company is assigned value "1" if a regulatory entry is published in the annual report, otherwise value is "0" if it is not declared. With a total of 20 items to be disclosed, CSR is measured as the ratio between the total number of information receiving the value 1 to the number of items related to the social responsibility disclosure.

$$CSR_i = \frac{\sum_1^n SCORE_i}{\text{n}}$$

Measuring the moderator variable (CEOPOW)

Previous studies have shown that there are many factors that constitute important characteristics of a CEO; among these factors, founder and financial expertise are the most important factors that constitute a CEO with most powerful (Gao & Jain, 2012; Gounopoulos & Pham, 2018; Li & Srinivasan, 2011). Li and Srinivasan (2011) found that companies with a CEO who is a founder provide more perks to the CEO than companies where the CEO is not a founder. Founders, based on their position, will participate in all financial and business policies of the company and have a great influence on the company's culture, strategy, and goals (Stockmans et al., 2010).

CEOs with financial expertise understand accounting policies and tax regulations, so they take advantage of their related knowledge and skills to influence profits for many different purposes (Fraser & Greene, 2006); Gounopoulos & Pham, 2018). Therefore, in this study, we combine two characteristics CEO is founder (CEFOUND) and CEO has financial expertise (CEOEXP) [1]into a composite variable CEO (CEOPOW). Then the CEO will have full authority, and it is a composite index representing the role of CEO with two characteristics. If CEO is the founder, it receives value 1, otherwise it receives value 0; if CEO have financial expertise, it takes value 1, otherwise it takes value 0. *Thus, the CEO composite index (CEOPOW) is a dummy variable that takes the value 1 if the company's CEO is also the founder (CEOFOUND) and has financial expertise (CEOEXP), otherwise the value is 0.*[2]

Controlling Variables

The controlling variables are selected based on prior studies. This study includes four variables to control other factors influencing tax avoidance. According to Dewi and Jati (2014), firm size is the size of a company as reflected in its total assets (Khairunisa et al., 2017). Hidayanti (2013) argues that the larger the company's size, the more likely it is to use its resources for good tax planning (Hadi & Mangoting, 2014). Financial leverage is a ratio measuring a company's debt financing (Kasmir, 2013). Companies with high debt ratio tend to avoid tax (Sari, 2019). In addition, audit quality variables also impact tax avoidance. Therefore, we add the audit quality variable measured by BIG4 as a control variable with the argument that audit quality limits tax avoidance behavior (Richardson et al., 2013; Gaaya et al., 2017; Abid & Dammak, 2022). IND represents the business sector. According to Alkurdi (2020), some industries have a strong connection between CSR disclosure and tax avoidance. If a company operates in the manufacturing sector, then IND takes the value of 1 and otherwise takes the value of 0.

4. EMPIRICAL RESULTS

4.1. Descriptive statistics of variables

First, the study will use descriptive statistical techniques to summarize the characteristics of the variables in the research model. The statistical results shown in Tables 1 and 2 provide full information about the variables in the model. Specifically, out of a total of 3,493 observations, there are 1,623 observations with tax avoidance behavior, accounting for 46.48%, there are 968 cases audited by Big Four with a proportion of 27.71%, and CEOs with expertise in finance, accounting and founders account for 31.75% of listed companies. Besides, there are companies that disclose information about CSR with the highest rate of 95% of items requiring information disclosure, but there are also companies that just disclose very little information about CSR with about 5% of information items needs to be announced. In addition, out of the total 3,493 observations, 1,288 observations are in the manufacturing industry, accounting for 63.13%, the rest are non-manufacturing industries.

---

[1] According to Aier et al. (2005), the author measures the CEO's financial expertise using past experience as a CEO or experience as a chief financial officer; degrees and certificates related to finance and accounting

[2] Based on the research of Le et al. (2020) on building a composite variable representing CEO

Table 1: Descriptive statistics of quantitative variables

Variable	Observations	Mean	Std. Dev.	Min	Max
CSR*CEOPOW	3.493	0.2279	0.3445	0	0.95
LEV	3.493	0.4771	0.2067	0.1	0.97
SIZE	3.493	11,9999	0.7031	10.18	14.76
CSR	3.493	0.5215	0.2137	0.05	0.95

Note: *Where in table 1, CSR*CEO: The degree of social responsibility disclosure with the regulation of CEO power; LEV is financial leverage; SIZE is company size; CSR is degree of social responsibility.*

Table 2: Descriptive statistics of qualitative variables

TAX	Frequence	Percentage
0	1. 869	53.52%
1	1,624	46.48%
Total	3.493	100.00 _
BIG4	Frequence	Percentage
0	2. 525	72.29%
1	968	27.71%
Total	3.493	100.00 _
CEOPOW	Frequence	Percentage
0	2. 384	68.25%
1	1.109	31.75%
Total	3.493	100.00 _
IND	Frequence	Percentage
0	2. 205	63.13%
1	1,288	36.87%
Total	3.493	100.00 _

Note: Tax is tax avoidable; Audit is audit quality; ceopow is the power of the CEO; IND is industry of business.

4.2. Correlation Analysis

Next, the study examines the correlation between the variables in the research model with the results shown in Table 3. The analysis results admit that the correlation between the independent variables is within the allowable limit, which is difficult multicollinearity can occur (correlation coefficient < 0.8 and VIF < 10). Therefore, the model is valid enough to predict the impact of CSR with moderating of CEO power on tax avoidance.

Table 3: Pearson Correlations and VIF Values

	TAX	CSR*CEOPOW	BIG4	LEV	SIZE	IND	VIF
TAX	1						
CSR*CEOPOW	0.0469	1					1
BIG4	0.0517	-0.0198	1				1.28
LEV	-0.1620	0.0016	0.0101	1			1.17

SIZE	0.1071	-0.0053	0.4455	0.3370	1		1.45

Mean VIF							1.18

4.3. Multiple Regression Analysis

Table 4 : Estimating regression using POOLED OLS , FEM, REM, FGLS

TAX	POOLED OLS		FEM		REM		FGLS	
	Coef.	P>t	Coef.	P>t	Coef.	P>t	Coef.	P>t
CSR*CEOPOW	0.04842	0.0042***	0.0499	0.035**	0.0498	0.003***	0.04842	0.0042***
BIG4	-0.0436	0.035**	-0.045	0.029**	-0.045	0.029**	-0.0436	0.035**
LEV	-0.5496	0.000***	-0.5569	0.000***	-0.5569	0.000***	-0.5496	0.000***
SIZE	0.1536	0.000***	0.1567	0.000***	0.1565	0.000***	0.1536	0.000***
IND	-0.0017	0.919	-0.0119	0.908	-0.0019	0.909	-0.0017	0.919
_cons	-1,118	0.000***	-1.152	0.000***	-1.149	0.000***	-1,118	0.000***
Statistics F/Waldchi2	F(5, 3486)=43.67***		F(5, 3480) =44.70***		Wald Chi2(5) = 223.62***		Wald chi2(5) =218.74***	

Table 4 shows that three models POOLED OLS, FEM and REM all have F and Wald values with Prob values less than 1%, so all 3 models are considered appropriate. At the same time, we performed the F test, LM test, Hausman test with the results Prob>F = 0.000, Prob>Chibar2 =0.000; Prob>Chi2 = 0.9979 respectively. The test results have confirmed that the REM model is the most suitable model to explain the results.

In addition, in order for the research model to have sufficient estimated value, we perform two tests of variance and autocorrelation. The results of the White test and Woolridge test have Prob>Chi2 = 0.000 (less than 5%) and Prob>F = 0.1938 (greater than 5%). This means that the model violates the variable variance assumption and this reduces the effectiveness of the REM model. In case the model is violated with variable variance assumption, we use the feasible generalized least squares (FGLS) estimation method for the result estimation, as Beck and Katz (1995) suggest, the study was unbiased and efficient.

According to the FGLS regression results in Table 4 , it can be assumed that CSR disclosure with the moderating of CEO power has a positive impact on tax avoidance at 1% significance level. This means that in companies with powerful CEOs, the more information about CSR is disclosed, the greater the possibility of tax avoidance is. This issue can be explained that if CEOs have expertise in finance and accounting, they will understand the provisions of the law on information disclosure as well as understand the policies used to regulate the tax obligation to avoid as much taxes as possible. This research result is contrary to previous research views that the more information a company discloses about CSR, the less tax avoidance behavior it have (Lanis &Richardson, 2015; Ki, 2012; Liu et al., 2019; Fuadah & Kalsum, 2021); the result agrees with the view that when publishing more information increases costs, increases tax avoidance (Davis et al. , 2016; Zeng, 2018; Abid & Dammak , 2022). Therefore, this study gives evidence which shows that the firms disclosing more CSR information with the moderating effect of CEO power tend to have more tax avoidance. The results indicate that CSR is a subsitute for tax amount rather than a complement for it. This is supported by the view that high tax amounts deter innovation in organizations, reduce employment, and lower the firms' contribution to social welfare, which aligns with characteristics of Vietnam's economy.

Besides, the FGLS regression results in Table 4 also show that audit quality and financial leverage have a negative impact on tax avoidance at the significance level of 10%, 5%, respectively. This shows that if companies are audited by Big Four companies, or if they have highger debt ratio, they have less tax avoidance behaviour. Meanwhile, firm size is positively related to tax avoidance at 1% significance level, meaning that the larger the firm size, the higher the tax avoidance ability. In addition, the study also found no evidence that manufacturing or non-manufacturing sectors have an impact on tax avoidance.

5. CONCLUSIONS

The main objective of this study is to examine the impact of social responsibility with the moderation of CEO power on tax avoidance. The study has provided evidence that the level of CSR information disclosure with regulation by CEOs with expertise in accounting and finance and being founders increases tax avoidance behavior. Furthermore, the study also acknowledges that audit quality and debt ratio limit tax avoidance behavior, but lager companies do more tax avoidance than the smaller ones.

Paying enough taxes is also demonstrating the responsibility of enterprises to society, which is the foundation for sustainable development. Therefore, listed companies should try to limit tax avoidance to comply with the law and have a good image about their CSR. From the results of the study, the board of directors need to consider appointing the founder of the unit to hold the CEO position to avoid excessively increasing power, increasing tax avoidance behavior. Besides, companies may use financial leverage, or use auditing services from Big4 to reduce tax avoidance.

However, the research also has some limitations. That research has not mentioned ownership characteristics, company culture, CEO profile as well as corporate governance characteristics related to tax avoidance. We hope these issues will be studied in the future.

SUSTAINABLE FINANCE IN THE CONTEXT OF GLOBALIZATION AGAINST CLIMATE CHANGE

MA: Bui Thi Hoa[1]

Abstract: *As the level of globalization increases, business risk, uncertainty and change, has forced firms to consider adopting sustainable development strategies to survive competitively. Adopting technological innovations has, without doubt, open the door for old and new firms to thrive, however, this transformation process has occurred as a result not solely of businesses adopting new technologies, however, shifting their business culture. Behind the globalization of business activity there is not only a business transformation but an entrepreneurial cultural reinvention. This process has been accelerated by globalization, as the survival of businesses has become linked to how they achieve sustainable development through the management of greater social, cultural, political, and economic interdependence. Vietnam has made significant progress in its energy sector with widespread electrification and a diverse energy mix dominated by hydropower, gas, and coal. However, to sustain these achievements and meet climate targets, substantial investments, especially in renewables, are needed. Failing to do so will increase reliance on imported coal, with negative environmental, health, and economic impacts. Recommendations include fostering private investment and strengthening the domestic financial market to support the energy sector's funding needs.*

Keywords: *Globalization, Climate change, Renewable energy, Sustainable finance, Sustainable Framework,*

I. INTRODUCTION

In recent decades, humanity has slowly begun to realize that the unregulated development or growth that has taken place in the environment of our planet's limited resources has been unsustainable for a long time. It is necessary to replace it with something more sustainable in the interest of both humanity and the biosphere. In 1987, the UN General Assembly adopted the report "Our Common Future", in which sustainable development was defined as a development that is capable of meeting the needs of current generations without jeopardizing future generations' ability to meet their own needs. In particular, this definition contains the basic principle of sustainability, an ethical leitmotif, the principle of accountability to future generations. We always talk about sustainable development when we realize the link between human needs and natural resources. Sustainable development is the way to find and find solutions that benefit people, the economy and the environment in the long term. Thus, sustainable development is, rather than a scientific solution, a moral challenge for society. It responds to the current and important need for future development, based on a new relationship between people and their relationship to the environment in which they live. She refuses to overcome the idea that economic, technical and environmental goals are against each other.

II. RESEARCH OVERVIEW AND METHODOLOGY

- **Urgency of the study:**

The development of sustainability and climate change mitigation is a top concern and priority for international organizations and countries worldwide. Since late 2008, the United Nations Environment Programme (UNEP) has launched the "Green Economy Initiative" with the goal of enhancing international cooperation to address financial crises alongside global issues, aiming for sustainable economic development in a post-crisis world.

---

[1] Bank for Investment and Development of Vietnam (BIDV), Email: hoabt@bidv.com.vn.

In Vietnam, the National Green Growth Strategy, approved by the Prime Minister in Decision No. 1393/QD-TTg on September 25, 2012, has identified green growth as a crucial element of sustainable development, ensuring rapid, efficient, and sustainable economic development.

Some previous studies in Vietnam such as those of the General Department of Environment (2013), Nguyen The Chinh (2014), Assoc.Prof.Dr. Tran Thi Thanh Tu and a group of authors from the University of Economics - Hanoi National University (2017) also pointed out solutions to learn from experiences from countries with developed economies to build sustainable finance in Vietnam. But so far it has not been possible, because each country and each market has a different approach depending on the institution, the need for green capital as well as the investor base. Therefore, sustainable financial development in Vietnam should be considered based on the internal aspects of the current financial system. Besides, in Vietnam, there has not been any research that fully considers the potential of the components that make up sustainable finance, specifically financial intermediaries and capital markets. . For the reasons above, the author has chosen the research topic on sustainable financial development in Vietnam, especially in the field of sustainable financial intermediary development and green capital markets, applying suitable for practice in Vietnam.

- **The objectives, scope, and research methods:**

Research Objectives: The objective of the thesis is to provide a theoretical basis for green finance, evaluate the current status of green finance development in Vietnam, and make recommendations and policy proposals for green finance development in Vietnam, particularly in the development of sustainable financial intermediaries and green capital markets.

Research Subjects, Methods, and Scope: The research subject of the thesis is the current status of green finance development in Vietnam. The research primarily utilizes qualitative research methods, involving data collection, synthesis, analysis, comparison, and drawing implications. The specific scope of the research is as follows:

- Regarding the timeframe, the data studied covers the period from 2012 to 2022.

- Regarding the spatial scope, the thesis researches the current state of sustainable finance development in Vietnam.

- **Summary of Research Situation:**

Based on the research objective, the thesis first provides a comprehensive theoretical framework for sustainable finance, including the definition, characteristics, and the role of sustainable finance in the economy. The paper also elucidates the components of the sustainable financial market and the development areas surrounding these components. Through the statistical results compiled from government documents, literature, and related materials on the topic of sustainable finance, the author also clarifies the current state of green finance in Vietnam with specific data.

In addition, the author conducts comparisons and relates the findings to other countries in the Southeast Asia region to better understand the potential for sustainable finance development in Vietnam. After analyzing the assessed status quo, the author identifies opportunities and challenges for sustainable finance development in Vietnam in the future and proposes comprehensive solutions. These solutions serve as the basis for Vietnam to formulate appropriate policies for sustainable finance development.

III. THE CONTEXT OF GLOBALIZATION AND SUSTAINABLE FINANCE

1. The context of globalization on sustainable development against climate change

The context of globalization in sustainable development against climate change involves the interaction between the processes of globalization and the goals and principles of sustainable development. Globalization refers to the increasing interconnectedness and integration of economies, cultures, societies, and technologies worldwide, and it has deep implications for achieving the objectives of sustainable development. This context encompasses both opportunities and challenges arising from globalizing trends and their impacts on environmental, social, and economic aspects.

The impact of globalization on sustainable development against climate change:

Positive Impacts:

Technology Transfer: Globalization facilitates the transfer of climate-friendly technologies and innovations across borders. This can accelerate the adoption of renewable energy, energy-efficient practices, and sustainable agricultural techniques in various regions.

International Cooperation: Globalization fosters collaboration among countries, businesses, and organizations in addressing climate change. International agreements and platforms provide opportunities to share knowledge, resources, and best practices.

Access to Resources: Globalization allows for the sharing of resources and expertise needed to address climate challenges. Countries can access funding, expertise, and technology from global partners to implement sustainable development projects.

Green Finance: Global financial markets provide avenues for raising capital for sustainable projects and initiatives. Green bonds, sustainable investment funds, and other financial instruments enable funding for climate-resilient infrastructure and clean technologies.

Awareness and Advocacy: Globalization enables the rapid spread of climate awareness and advocacy efforts. Social movements, such as youth-led climate strikes, can gain international attention and drive policy changes.

Challenges and Considerations:

Climate and Environment: Globalization can lead to increased resource use and pollution in production and transportation. This conflicts with efforts to combat climate change and protect the environment.

Economic Vulnerability: Reliance on global markets for essential resources can make countries economically vulnerable to disruptions caused by climate-related events.

Supply Chain Emissions: Globalized supply chains can lead to increased emissions from the transportation of goods across long distances. This poses challenges for achieving emission reduction targets.

Trade-offs in Policy Goals: Trade-offs between economic growth and environmental protection can arise in the pursuit of globalization. Striking a balance between these goals is crucial for sustainable development.

Inconsistent Regulations: Different countries have varying levels of environmental regulations and climate policies. This can create regulatory disparities that impact sustainable development efforts.

Social Inequality: Globalization can exacerbate social inequalities within and between countries. Vulnerable populations may be disproportionately affected by climate change impacts due to limited resources and unequal access to adaptation measures.

Loss of Cultural Diversity: Globalization can lead to the homogenization of cultures and the loss of traditional practices and knowledge that could contribute to sustainable development and climate resilience.

Thus, the impact of globalization on sustainable development in the context of addressing climate change is a complex interplay of opportunities and challenges. Balancing the positive and negative aspects of globalization requires international cooperation, regulatory alignment, equitable resource sharing, and holistic policies that prioritize social, economic, and environmental well-being. Effective strategies must navigate these dynamics to ensure that sustainable development is promoted while addressing the urgent need to combat climate change.

2. Sustainable Finance

2.1 Sustainable finance definition:

Sustainable finance definition refers to the integration of environmental, social, and governance (ESG) criteria into financial decision-making processes. It involves considering not only the potential financial returns of an investment but also its impact on environmental and social factors, as well as the overall governance and ethical practices of the companies or projects being invested in.

The main goal of sustainable finance is to align financial activities with long-term sustainable development objectives. This can include investing in companies that have positive environmental and social practices, avoiding investments in industries that are harmful to the environment or society, and actively supporting projects that contribute to a more sustainable and equitable future.

The growing awareness of climate change and environmental issues has led to increased interest in sustainable finance from both businesses and investors. Governments, financial institutions, and international organizations are working to create frameworks and standards to facilitate the expansion of sustainable finance, encouraging more sustainable practices across various sectors of the economy.

Sustainable finance can take various forms, including green loans, green bonds, sustainability-linked loans, and other financial products that encourage environmentally responsible activities. These financial instruments often come with specific criteria and requirements that ensure the funds are used for eco-friendly purposes:

Green Loans: Financial institutions provide loans for projects with environmental benefits.

Green Bonds: Debt securities fund projects with positive environmental impacts.

Sustainability-Linked Loans: Interest rates are tied to achieving sustainability goals.

Eco-Friendly Investment Funds: Investors support environmentally responsible companies or projects.

Carbon Offset Financing: Funds are invested in emissions-reducing initiatives like reforestation and clean energy.

Sustainable finance benefits both the environment and businesses. It enables companies to access capital for green projects while improving their sustainability profile, which can attract environmentally conscious investors and customers. As the urgency to address climate change grows, sustainable finance plays a pivotal role in driving positive environmental and economic outcomes.

2.2 Why institutions need to implement sustainable finance?

First, risk Mitigation and Long-Term Resilience: Sustainable finance helps institutions identify and manage risks associated with environmental, social, and governance (ESG) factors. By integrating these considerations into financial decisions, institutions can assess potential risks such as regulatory changes, climate-related impacts, and reputational issues. Addressing these risks proactively enhances the institution's ability to navigate challenges, minimize losses, and maintain stability over the long term.

Second, alignment with Regulatory Trends and Fiduciary Duty: Regulations are increasingly demanding that institutions incorporate ESG factors into their strategies. Compliance with these regulations ensures that institutions are not only meeting legal requirements but also fulfilling their fiduciary duty to act in the best interests of their clients or beneficiaries. Recognizing that ESG factors can materially affect investment outcomes, institutions demonstrate their commitment to prudent financial stewardship.

Third, capturing Market Opportunities and Stakeholder Expectations: Embracing sustainable finance allows institutions to seize emerging market opportunities in the transition to a more sustainable economy. This includes investing in renewable energy, sustainable technologies, and projects that contribute positively to society and the environment. As clients and investors become more conscious of sustainability, institutions that cater to this demand can attract and retain a broader customer base. Moreover, sustainable finance practices enhance stakeholder relationships by demonstrating a commitment to ethical and responsible business practices, thereby fostering trust and collaboration.

Forth, client Demand: Investors are showing growing interest in sustainable investments. Meeting this demand can attract and retain clients, enhancing the institution's reputation and market position.

2.3 Implementation Sustainable Finance in finance institution

Enhancing strategy and governance structures

Banks consider their sustainable objectives and organizational models to select the appropriate strategy and governance structure. This proactive approach ensures that sustainable finance is embedded within the core operations of the banks, leading to enduring success.

In the context of promoting sustainable financial practices, governance plays a pivotal role in shaping a bank's effectiveness in the long run. Consequently, banks have taken steps to reinforce their strategy and governance structures:

Comprehensive Sustainability Strategy: Banks are developing all-encompassing sustainability strategies that include investment approaches and organizational activities.

Reinforced Governance Structure: To effectively implement sustainable finance, banks are appointing Chief Sustainability Officers (CSOs) in some cases. These CSOs oversee sustainability initiatives and ensure alignment with the bank's overarching goals. Additionally, banks are establishing dedicated departments for promoting sustainable finance, adopting either an integrated approach that covers all sustainability aspects or a specialized approach focusing solely on sustainable finance activities for clients.

Enhance the ability to evaluate environmental and social risk management systems

A Environmental and Social Management System is a set of policies, procedures, tools and internal capacity to identify and manage a financial institution's exposure to the environmental and social risks of its clients/investees.

To enhance the capability of assessing environmental and social risk management systems, it's important to understand that an Environmental and Social Management System (ESMS) comprises a collection of policies, procedures, tools, and internal expertise. Its purpose is to identify and effectively manage the exposure of a financial institution to the environmental and social risks associated with its clients or investees.

In simpler terms, an ESMS is a structured framework that enables a financial institution to recognize and address potential environmental and social risks tied to its clients' or investees' activities. This system empowers the institution to make informed decisions, apply appropriate risk mitigation measures, and ensure that its operations align with sustainable and responsible practices.

By strengthening the capacity to assess ESMS, financial institutions can better navigate the complexities of environmental and social risks, align with international sustainability standards, and contribute to more sustainable economic practices.

Implementing Sustainable Finance Frameworks

Implementing Sustainable Finance frameworks involves integrating environmental, social, and governance (ESG) factors into banking operations and decision-making processes.

This framework plays a vital role in two distinct capacities:

- It is instrumental for specific transactions, such as issuing green bonds to secure investment capital. In such cases, the issuer must formulate and disclose a Green Bond Framework.

- It extends to encompass the range of financial products offered by the bank to its customers. For instance, the bank might establish a Sustainable Loan Framework (encompassing green loans, social loans, and sustainable linked loans) for its corporate clients.

Due to banks' limited ability to independently evaluate scientific and technical sustainability data, the development of sustainable accounting necessitates the involvement of ESG consultants. These experts assess and verify the alignment of sustainability practices with established market standards, ensuring accurate "labeling" of sustainability.

IV. SUSTAINABLE FINANCE PROSPECTIVE IN ASEAN. IMPLEMENTATION IN VIETNAM

1. ASEAN context

Given its location and proximity to oceans, ASEAN is one of the most vulnerable regions to the impact of global warming. In recognize the risks, the region has set decarbonization targets, climate reduction plans in their nationally determined contributions (NDCs), and passed laws and policies to address change.

In 2022, the green, social, sustainability, sustainability-linked, and transition (GSS+) debt market across ASEAN experienced a 32% year-on-year contraction, mirroring the global trend of a 24% YoY reduction (USD858.5 billion in 2022 compared to USD1.1 trillion in 2021). Despite this decline, volumes remained robust, nearly doubling the levels observed in 2020. Notable positives include increased sovereign issuances and a variety of policy and market development initiatives that have bolstered the regulatory and technical framework. Significant growth in GSS+ issuance was particularly evident in Indonesia and the Philippines, attributed mainly to strong sovereign issuance and substantial amounts issued in the categories of green Sukuk and social bonds.

The ASEAN region witnessed larger deal sizes and longer tenors in 2022. A notably higher portion of deals (71% in 2022 versus 52% in 2021) were benchmark-size (USD500 million and above), and a notable milestone was reached with the issuance of the first sustainability bond with a tenor of over 20 years (excluding perpetual) in the Philippines. Among the six covered markets (Indonesia, Malaysia, Philippines, Singapore, Thailand, and Vietnam), Singapore led in most debt segments, accounting for 63% of the cumulative volume and 60% of the total volume in 2022.

Sovereign issuances played a pivotal role in stimulating market activity and development across the ASEAN region. Singapore and the Philippines joined the ASEAN's Sovereign club in 2022. Sovereign issuance was particularly concentrated in sustainability bonds, which enable governments to secure funds for both green and social projects.

The year 2022 was marked by active policy and market development initiatives in the ASEAN region. This included the introduction of regional ASEAN Sustainability-Linked Bond Standards and stakeholder consultations on the inaugural version of the ASEAN Taxonomy, conducted throughout the year. Additionally, individual ASEAN Member States pursued a range of national-level sustainable finance initiatives and measures, spanning disclosures, transition finance, and taxonomies.

Key Highlights of ASEAN Member States:

Singapore: Singapore boasts the largest and most diverse thematic debt market in ASEAN, with USD81bn issued from 127 issuesrs (the latter being one of the highest country figures globally), and heavily dominated by green debt and SLLs, representing 96% combined in terms of amount issued.

Malaysia: Malaysia has seen issuances across the thematic debt spectrum throughout the years, with sustainability bonds accounting for 99% of the 2022 volume, attributed to issuers seemingly keen to finance the social dimension along with projects delivering environmental benefits.

Indonesia: Indonesian deals and issuers are relatively large, with the issuance volume dominated by its sovereign transactions. The largest green sovereign Sukuk issued thus far by the Indonesia Government came in 2022 worth USD1.5bn; but there were no sustainability sovereign bonds during the year, following one in 2021.

Thailand: Whilst Thailand's market has had diversity overall in terms of thematic issuances, the country has been dominated by sovereign sustainability issuance in recent years. Thailand has seen social bond issuance every year since 2019 (which is scarce across the rest of ASEAN).

Philippines: The Philippines has a growing and increasingly diversified thematic debt market. 2022 was an important year with its inaugural sovereign issuances: three deals totalling USD2.3bn. All were sustainability bonds financing a variety of green and social categories. This complemented volumes in other segments, including green and sustainability-linked instruments.

Vietnam: Vietnam's plans and commitments align with global efforts to mitigate climate change and reduce dependence on fossil fuels. The targets set by the Power Planning Development and the net-zero commitment signal the country's proactive stance towards a sustainable energy future.

2. SUSTAINABLE FINANCE IN VIETNAM

Overview

Vietnam has been making significant strides in its renewable energy efforts. Renewable sources, including wind, solar, and biomass, contributed 26.88 billion kWh of electricity, equivalent to 11.5% of total production in 11 months of 2021. This achievement aligns with Vietnam's Power Planning Development VIII strategy, spanning 2021-2030 with a vision to 2050, aiming for renewable energy to comprise 30.9% - 39.2% of the energy mix by 2030 and increase further to 67.5% - 71.5% by 2050. To fulfill these goals, Vietnam engages in international collaborations, notably through the Joint Public-Private Task Force (JPTP), leveraging partnerships to reach its target of 47% renewable energy by 2030. This commitment aligns with Vietnam's participation in COP26, where the Prime Minister pledged to achieve net-zero emissions by 2050, signifying a resolute commitment to combating climate change and transitioning towards cleaner energy sources.

Vietnam is one of 8 ASEAN countries has announced national targets to achieve net-zero GHG emissions or to become carbon neutral by 2050, respectively to the 1.5°C target set by the Intergovernmental Panel on Climate Change (IPCC). Vietnam has seen an increasing diversification of thematic issuances in recent years, both in terms of instrument types and themes.

Policy and Development

Supportive efforts and policies on sustainable finance were advocated by the Vietnamese Government, with the release of a guidance on environmental risk management in credit extension activities by the State Bank of Vietnam, alongside the announcement of a national programme to support private enterprises in sustainable business development till 2025

Building on the Just Energy Transition Partnership, which will see an initial USD15.5bn of financing to transition the Vietnam's energy sector, the government is also committed to improve the country's green finance legal framework to further spur interest in this space2

Issuance

Only loans (green and sustainability-linked) were issued during 2022, with five deals all from different issuers.

The largest was a USD500m green loan from automotive company Vinfast Trading and Production (a subsidiary of the larger conglomerate Vingroup JSC), its second transaction following a USD400m green loan in 2021. Another Vingroup subsidiary, Vinpearl JSC, had come to market with a USD425m sustainability bond in 2021, the only one from Vietnam so far.

2.1. Motivations for Accelerating Sustainable Finance in Vietnam

The motivations to accelerate sustainable finance in Vietnam encompass environmental concerns, climate action, economic vitality, global recognition, regulatory compliance, energy security, social progress, SDG achievement, market competitiveness, and the pursuit of enduring prosperity.

Environmental Preservation: Vietnam is committed to addressing environmental challenges and reducing its ecological footprint. By integrating sustainable finance practices, the country aims to channel investments into projects that promote environmental protection, energy efficiency, and sustainable resource management.

Climate Change Mitigation: As a climate-vulnerable nation, Vietnam recognizes the urgency of mitigating climate change. Accelerating sustainable finance enables the funding of climate-resilient infrastructure, renewable energy initiatives, and emission reduction projects.

Economic Resilience: Sustainable finance contributes to building a resilient economy. Investments in green projects enhance resource efficiency, create jobs in emerging sectors, and foster long-term economic stability.

Global Reputation: Embracing sustainable finance enhances Vietnam's global reputation as a responsible and forward-thinking nation. International investors are increasingly prioritizing environmentally and socially responsible investments.

Regulatory Alignment: With global shifts towards ESG-focused regulations, aligning with sustainable finance positions Vietnam as a proactive player in the international financial landscape, potentially attracting more foreign investments.

Energy Security: Developing sustainable energy sources and reducing reliance on fossil fuels through sustainable finance enhances energy security, reducing the nation's vulnerability to energy price volatility.

Social Development: Sustainable finance supports socially inclusive projects, such as affordable housing, healthcare, and education. These investments improve the overall quality of life and well-being of Vietnamese citizens.

Sustainable Development Goals (SDGs): Integrating sustainable finance aligns with Vietnam's commitment to achieving the United Nations' Sustainable Development Goals, contributing to poverty reduction, social equality, and environmental stewardship.

Market Competitiveness: Businesses embracing sustainable practices are likely to gain a competitive edge in the evolving market. By integrating sustainable finance, Vietnamese companies can position themselves as leaders in responsible business practices.

Long-Term Prosperity: Sustainable finance ensures investments are directed toward endeavors that generate positive impact over the long term, contributing to a more prosperous and resilient future for Vietnam.

2.2. Financing for renewable energy projects in Vietnam

2.2.1. Key Policy Regulations Related to Renewable Energy Financing

Starting from 2011, the Vietnamese government has introduced a series of regulations aimed at facilitating the financial support for the implementation of renewable energy (RE) projects within the country.

Additionally, the Vietnamese government has taken further regulatory actions to address the escalating concerns regarding national climate change risks. The global emphasis on achieving low-carbon and climate-resilient development within the country has also contributed to this focus. Pertinent policies and regulations in this context encompass:

The National Target Program to Respond to Climate Change (NTP-RCC): In 2008, the Government of Vietnam underscored climate change actions by prioritizing them through the issuance of Decision No. 158 by the Prime Minister. This program lays out strategic measures for responding to climate change on a national scale.

Establishment of the Vietnam Environment Protection Fund (VEPF): Decision No. 82/2002 set up the VEPF, aimed at collecting funds for environmental protection initiatives. The Ministry of Finance and the State Bank of Vietnam were designated as members of the VEPF. Subsequently, Decision No. 35/2008 elevated the VEPF's legal status, converting it into a revolving fund with VND 500 billion in charter capital.

Support Program to Respond to Climate Change (SP-RCC): Decision No. 5613/VPCPQHQT introduced this program, specifically designed to mobilize climate finance from international sources. The program's primary objective is to provide support for national climate change programs and infrastructure investment projects. The SP-RCC has been widely regarded as a successful initiative in Vietnam due to its substantial funding support and extensive involvement of various donors and government entities, both at the national and local levels.

2.2.2. Renewable Energy Investment in Vietnam

Vietnam had been making significant efforts to promote renewable energy investment and transition towards cleaner sources of power. The Vietnamese government recognized the need to reduce its reliance on fossil fuels and address environmental concerns. Here are some key points about renewable energy investment in Vietnam up to that point:

Feed-in Tariffs (FiTs): The Vietnamese government introduced attractive feed-in tariffs to encourage investment in renewable energy projects. These tariffs guaranteed a fixed price for renewable energy generated over a certain period, providing investors with a predictable return on their investments.

Wind Energy: Vietnam has substantial potential for wind energy, particularly along its coastline. The country had been actively developing wind farms, with various projects in different stages of planning, construction, and operation.

Solar Energy: Solar energy had seen rapid growth in Vietnam, driven by declining solar panel costs and supportive government policies. The country was working on both utility-scale solar projects and rooftop solar installations.

Hydropower: While hydropower is a renewable energy source, it had faced environmental and social concerns due to the displacement of communities and ecosystem impacts associated with large dams. Despite this, hydropower had been a significant contributor to Vietnam's renewable energy capacity.

Biomass and Bioenergy: Biomass and bioenergy projects, utilizing agricultural waste and other organic materials, were being explored as well. These technologies can help address waste management issues while producing energy.

Investment Opportunities: Vietnam was considered an attractive market for renewable energy investment due to its growing energy demand, supportive government policies, and abundant renewable resources.

Challenges: Despite the positive momentum, Vietnam faced challenges related to grid integration, infrastructure development, regulatory complexities, and financing. Additionally, ensuring a reliable and stable grid to accommodate intermittent renewable sources was a concern.

International Support: International organizations and financial institutions had been collaborating with Vietnam to support its renewable energy goals through funding, expertise, and knowledge sharing.

2.2.3. Financial Incentives for Renewable Energy Projects in Vietnam

In the context of unlocking Vietnam's renewable energy potential, feed-in tariffs (FITs) play a pivotal role as financial incentives that can drive a surge of renewable energy adoption within the market. In addition to FITs, the regulations encompass investment incentives to foster renewable energy developments:

Long-Term Standard Power Purchase Agreement (20 yrs PPA): A standardized power purchase agreement is established for a duration of 20 years.

Income Indexed to Exchange Rate (except for small hydro): Income is tied to the exchange rate quoted in US dollars, excluding small hydro projects.

Import Duty Exemption on Equipment: Imports of goods for constructing fixed assets, such as raw and manufactured materials, are exempt from import duties.

Corporate Income Tax Exemption and Reduction: New investment projects for renewable energy production benefit from a corporate income tax rate of 10% for the initial 15 years.

Land-Related Incentives: Investors may be exempt from land use fees for up to 11 years or, in regions facing extreme socioeconomic challenges, up to 15 years. During the capital construction phase (up to 3 years from the effective date of land lease contracts), investors are exempt from land and water surface rents. The government also provides land clearance compensation and support in accordance with the Law on Land. Provincial People's Committees handle land leases and allocations for renewable power projects.

Although the Vietnamese government introduced a feed-in tariff for various types of renewable energy, where the Electricity of Vietnam (EVN) holds sole responsibility for purchasing the entire electric output from these projects, the current subsidized tariff is considered less attractive compared to other ASEAN countries. For instance, wind power FITs are 19 US cents/kWh in Thailand and 21.8 US cents/kWh in the Philippines. Moreover, concerns have been raised by potential foreign producers about purchasing prices, as the current cost of electricity generated from renewable power plants remains relatively high due to substantial technical investments. Without raising FITs to regional levels and a clear roadmap for power purchase agreements (PPAs), attracting private investment could prove challenging.

2.2.4. Financial Instruments for Promoting Green Energy Deployment in Vietnam

A central objective of the Macro Economic Reform, notably the Green Financial Sector Reform Component, is to establish a policy framework and financial instruments that channel funds for sustainable development in Vietnam through innovative financial tools. The government is focusing on introducing pivotal instruments within the financial market to bolster the development of renewable energy (RE).

a. Green Bond for Long-Term Loan Instruments

Vietnam aims to embrace sustainable development and combat climate change through green finance, particularly green bonds. These bonds fund eco-friendly projects and align with the UN's Sustainable Development Goals. However, concerns about 'greenwashing', or misleading claims, have arisen. To address this, Vietnam needs a clear green bond 'taxonomy' based on ASEAN and EU standards.

Vietnam's commitments were highlighted at COP 26 and COP 27, where it pledged to transition to a green economy and achieve net-zero emissions by 2050. The government plans to increase renewable energy production significantly. Despite being a major green bond issuer in ASEAN, the lack of a legal framework remains a challenge.

Collaborations with international organizations and a pilot program with the German International Cooperation Agency (GIZ) reflect Vietnam's dedication. Yet, obstacles like limited application of global standards persist. To ensure credibility, attract foreign investment, and promote genuine sustainable development, a well-defined green bond taxonomy is essential. Balancing stringent regulations with incentives for issuers is key to achieving these goals.

b. Green Credit Programs to Facilitate Access to Finance for RE Projects and Green SMEs in Vietnam

Creating an enabling framework, encompassing clear rules, economic incentives, and information, is crucial. Traditional banking norms, like the strict Basel II standards mandating higher reserves for risky loans, have led banks to be cautious about lending to specific sectors, including renewable energy and energy efficiency. This is especially the case for newer technologies, which are less familiar to Vietnamese banks accustomed to dealing with state-owned enterprises and conventional business activities.

Moreover, while larger firms have predominantly engaged in large-scale grid-connected projects, the potential role of Small and Medium Enterprises (SMEs) in RE development is gaining recognition. With SMEs comprising 98% of total enterprises, their involvement can significantly contribute to achieving the goals of greening the energy sector. To facilitate this, the State Bank of Vietnam (SBV) initiated a pilot green credit program for SMEs, amounting to approximately $100 million. Participating banks offer loans to renewable energy, waste management, and organic agriculture projects at rates 1%–3% lower than market rates. The SBV refinances the participating banks at rates 1% lower than usual.

c. Provincial Green Index

The Provincial Green Index evaluates and ranks environmentally friendly regions in Vietnam based on their business practices. It considers factors like eco-friendly technology adoption, environmental governance, and commitment from local authorities. The index's main purpose is to promote a balance between economic growth and environmental protection. It provides information to aid local governments in policy planning, foster eco-friendly business environments, and attract sustainable investments.

Announced by the Vietnam Chamber of Commerce and Industry (VCCI), the first edition was launched in April 2023. It includes various indexes for 2023, covering pollution reduction, climate change mitigation, compliance with environmental standards, provincial governments' environmental roles, and support for businesses' environmental efforts.

The Green Index complements the Provincial Competitiveness Index, enhancing environmentally friendly business and investment environments. Its results will be part of the annual Provincial Competitiveness Index report.

A workshop highlighted the need for eco-friendly investment environments. Input from local agencies, businesses, and associations will refine indicators for future assessments. Tra Vinh province's high Green Index score showcased its commitment to environmental protection and sustainable development.

The Green Index reflects Vietnam's dedication to a green economy, aligning with climate change strategies. It recognizes and rewards regions prioritizing environmental responsibility, encouraging sustainable practices nationwide.

2.3 Challenges for renewable energy development in Vietnam

The development of renewable energy (RE) in Vietnam faces several significant challenges, including issues related to policies and mechanisms, economic and financial constraints, and technological aspects:

2.3.1. Challenges on Supporting Policies and Mechanisms

First, the RE market lacks clear policies and legal procedures, deterring investor interest. Stable policies and predictable revenue streams are needed to create an attractive investment environment.

Second, support mechanisms have not provided a long-term orientation. Changes in support mechanisms, such as the transition from feed-in tariffs (FiTs) to bidding mechanisms for solar and wind power projects, can create uncertainty for investors.

Third, the uniform application of FiT prices across the country leads to concentration development in areas with high economic potential, straining power grids and causing imbalanced investments.

Forth, the application of FiT prices regardless of project size can lead to inefficiencies. A differentiated approach based on project scale is proposed to ensure fair compensation.

Fifth, shortcomings in supporting rooftop solar power projects include regulations that limit system capacity for certain users and a requirement for selling all produced electricity, leading to double taxation. Recommendations include separating regulations for different users and adopting net metering mechanisms.

2.3.2. Economic and Financial Constraints:

First, RE projects require high initial capital, face a lack of financial institutions, limited investors, competition from fossil fuels, and fewer subsidies.

Second, Difficulty accessing domestic credit due to perceived riskiness, high capital ratios, and high interest rates.

Third, domestic investors often collaborate with foreign counterparts to access foreign loans with lower interest rates.

Forth, Insufficient budget subsidies for RE projects. The suggestion is to impose environmental fees on fossil fuel use to support the Sustainable Energy Development Fund.

2.3.3. Technological Problems:

First, asynchronous development between RE projects and the transmission grid leads to bottlenecks in transmission capacity.

Second, lack of synchronization between RE source development and grid expansion requires improved coordination between stakeholders.

Third, variable capacity of wind and solar projects impacts power system operations as their share in the energy mix grows. Solutions are needed to ensure grid stability.

Forth, to address these challenges, a holistic approach is required, involving policy reforms, financial incentives, improved coordination among stakeholders, and technological innovations. These efforts aim to create an environment conducive to RE investment, allowing Vietnam to tap into its renewable energy potential while ensuring a stable and sustainable energy supply.

2.4 Solutions to promote the development of renewable energy for Sustainable Finance in Vietnam

To achieve net zero emissions by 2050, Vietnam needs to dramatically increase RE capacity, especially solar and wind power. This will require significant investment: Vietnam's Power Development Plan 8 recently estimated annual financial needs of more than $11 billion, much of which will be devoted to energy regenerative. Historically, almost all RE investments in Vietnam have come from domestic and regional sources. However, sustaining the rapid expansion of RE depends on Vietnam's ability to expand international investment.

Vietnam has made an impressive record of attracting domestic private investment to rapidly scale up solar from virtually nothing in 2017 to more than 16,000 MW in 2017- 2022, far beyond the Government's targets. While it is not clear exactly how much solar and wind energy will be included in Power Development Plan 8 in the future, it is clear that this energy system is developed to scale up energy.

Here are some solutions to promote the development of RE in Vietnam in the coming time:

2.4.1 Revise the energy erice policy to result in a more reasonable energy price and feed-In Tariff

The need to revise Vietnam's energy price policy and Feed-In Tariffs (FITs) is highlighted. Adopting market mechanisms for electricity pricing and privatizing power generation and transmission could attract private investors and sustain state-owned entities' profitability.

The current low electricity price hampers private sector involvement in renewable energy. Revising energy pricing to be more reasonable and supportive of bankable renewable projects is suggested. While concerns about fossil fuel subsidy removal's impact on remote areas and vulnerable businesses exist, research suggests the benefits outweigh the drawbacks, boosting GDP and long-term social welfare.

The government's commitment to market-oriented pricing is encouraged to reduce coal demand and promote cleaner energy alternatives. This move is deemed cost-effective, enhancing social welfare instead of energy subsidies. To ensure EVN's financial sustainability and investment attraction, a yearly energy price increase of about 10% is proposed, exceeding inflation. Reworking electricity pricing and reducing fossil fuel subsidies would foster renewable technology investment and equitable competition.

In summary, updating Vietnam's energy pricing and FITs is crucial for private investment, renewable energy growth, and sustainability targets.

2.4.2 Increase the Creditworthiness of EVN

Enhancing the creditworthiness of EVN is crucial to support pricing reforms and attract private investment in Vietnam's renewable energy sector. This requires comprehensive reforms, including reducing and phasing out government subsidies and restructuring energy State-Owned Enterprises (SOEs). These changes demand substantial government commitment.

Improving EVN's financial health is essential to build private investor trust in RE development. The key threats to EVN's financial stability are the debt and asset imbalance and the vulnerability to exchange rate fluctuations.

To ensure sustainability, restructuring the debt portfolio with an appropriate balance between short-term and long-term loans is essential. Effective risk management strategies, especially concerning foreign exchange rate risks, are vital if foreign currency-denominated debt remains a significant part of the total debt.

While addressing these issues, policies should be developed to elevate the creditworthiness of EVN and other SOEs. This multifaceted approach contributes to fostering a favorable environment for private investment, ensuring financial stability, and advancing the development of renewable energy projects in Vietnam.

2.4.3 Implement Fiscal Policy Reform Discouraging CO2-Intensive Sectors and Facilitating the Deployment of RE Technology

Securing funding for renewable energy projects within limited budgets, especially in developing countries with constrained state finances, remains a significant challenge. One key solution is the implementation of a carbon tax system, where taxes collected are used to finance green energy technologies.

In the context of electricity, particularly renewable energy, being a public good, governments bear the responsibility of investing in infrastructure projects to maximize their potential. Alternatively, offering sufficient investment incentives is essential to attract private funding. Utilizing the spillover effect from carbon taxes to redirect funds toward renewable energy projects, which the private sector can finance, is a promising approach. This fiscal strategy, executed through taxation, serves the dual purpose of curbing CO2 emissions and creating a funding source for domestic renewable energy initiatives.

For Vietnam, according to the revised Power Development Plan 7 (PDP 7), fossil fuel subsidies are projected to exceed $540 million in 2025 and $2.56 billion in 2030. Thus, it becomes crucial to establish a viable financial source generated from taxes or fees associated with fossil fuel consumption and generation to offset these expenditures. A possible action could involve imposing a carbon tax of $5 per ton on fossil fuels such as coal, oil products, and natural gas, proportionate to their consumption levels. The resulting revenue could be channeled into a Renewable Energy Development Fund, enabling investments in renewable energy projects.

2.4.4 Develop a Wide Range of Financial Vehicles to Facilitate Long-Term Finance and Risk Mitigation

To address the challenge of financing renewable energy (RE) projects with limited budgets, especially in developing countries, various financial strategies need to be developed. One major solution is to establish a carbon tax system, utilizing the taxes collected to fund green energy technologies.

Yoshino and Taghizadeh-Hesary (2018) emphasize that as electricity, especially from renewables, is a public good, governments should invest in infrastructure projects. Alternatively, providing attractive incentives for private investment is crucial. A successful approach involves using the spillover effect from carbon taxes to redirect funds towards renewable energy projects. This fiscal policy not only discourages CO2 emissions but also creates a financial source for RE initiatives.

In the context of Vietnam, where fossil fuel subsidies are substantial, it’s important to establish a reliable financial source derived from taxes/fees related to fossil fuel consumption. Implementing a carbon tax, such as $5/ton on coal, oil, and natural gas, could generate revenue for a Renewable Energy Development Fund to reinvest in RE projects.

In conclusion, the introduction of a carbon tax system combined with reallocating funds from carbon tax revenues towards renewable energy projects offers a promising solution to funding constraints for RE initiatives in countries like Vietnam.

V. CONCLUSION

Environmental protection has become a serious issue. Transforming environmental protection into business objectives is now a necessary step, not just a sign of goodwill. Various solutions are already available in the world enough to make a company willing to change its situation and invest its time and money. One of the biggest polluters is transport, which is part of logistics. The gradual transition to green logistics is a successful foundation where a business can benefit from cost cutting, improving competitiveness, expanding a good image on the market, possible tax breaks, or other state bonuses.

Sustainable finance refers to the integration of environmental, social, and governance (ESG) considerations into financial decision-making processes. It encompasses a range of financial activities and instruments that aim to promote positive environmental and social impacts while ensuring long-term financial stability and returns. The core goal of sustainable finance is to align financial practices with broader sustainability objectives, including addressing climate change, promoting social equity, and supporting responsible business practices.

The pursuit of Vietnam's green growth strategy, as committed by its government, hinges on the development of renewable energy (RE). Integrating RE into the energy system serves as a crucial step towards ensuring national energy security, a response to the growing reliance on energy imports. Additionally, the severe consequences of climate change and local environmental pollution, partly driven by fossil fuel usage, necessitate the adoption of alternative sources. Vietnam, with its potential richness in wind power, solar power, and biomass, stands poised to benefit.

However, Vietnam lags significantly behind neighboring countries in terms of non-hydro RE investments. Meeting the annual 13% growth in energy demand requires substantial investments in the green energy sector. But given the constraints of the state budget and the low creditworthiness of energy State-Owned Enterprises (SOEs), it's projected that 50% of the total RE investment must come from the private sector. The government has sought to attract private investment through incentives like Feed-In Tariffs (FITs), preferential tax rates, and fees. Nonetheless, these incentives, coupled with a low electricity tariff driven by subsidies, raise concerns about the viability of RE projects. These projects demand significant initial investments and remain susceptible to political and environmental shifts.

Compounding these challenges are underdeveloped domestic financial systems, inadequate finance infrastructure, and limited financial avenues for securing long-term loans.

THE INTEGRATION OF CLIMATE-RELATED FINANCIAL RISK INTO CREDIT RISK MANAGEMENT- INTERNATIONAL EXPERIENCE AND POLICY IMPLICATIONS FOR VIETNAM

Dr. Nguyen Thi Thuy Dung[1], Student Ha Minh Dung[2]

Abstract: Climate change can create significant risk for banks, which potentially alter the borrowers' capacity to repay their debts. As the impact of climate change becomes severe, it is of paramount importance for financial institutions to integrate climate-related financial risks into their credit risk management. This article reviews the inclusion of climate-related financial risks during credit risk management process conducted by international financial institutions. The article, then, provide some implications for the credit institutions in Vietnam to integrate the climate-related financial risks in credit management process in the future. These solutions involve the development of the analytical framework as well as preparation of data, expertise and other related resources to integrate climate-related financial risk into credit risk modelling.

Key words: climate change, credit risk, modelling, credit institutions, environmental risk

1. INTRODUCTION

1.1. Background of the research

Over the past decade, there has been an escalation in climate-related financial hazards, impacting both the micro and macro levels. At the microeconomic level, these factors already provide a potential risk to the stability and integrity of financial institutions such as banks, insurers, and the broader financial system. This finding holds significant consequences for the financial system. With the observed rise in occurrences of severe weather events and alterations in climate patterns, there is a likelihood for these hazards to amplify in the near future. Consequently, the significance of incorporating measures to mitigate climate-related financial risks into the current regulatory and supervisory frameworks has escalated in recent years.

Banks assume significant and proactive functions in the realm of sustainable development primarily due to their intermediary function in the allocation of capital for the purpose of industrial expansion and development. The international evidence has demonstrated that financial and reputational risks can be imposed onto a bank as a result of environmental and health detriments stemming from the activities conducted by its clients. By employing environmental risk management strategies and utilizing proactive tools, the banking sector possesses the potential to facilitate advancements in environmental management across various industries. Furthermore, it may play a pivotal role in promoting the adoption of cleaner technology through investment initiatives.

In the context of Vietnam, there has been a recent recognition among commercial banks regarding the potential dangers and opportunities linked to environmentally sustainable development. There is a discernible trend towards heightened expectations for banks to assume a more proactive stance in addressing environmental concerns. The management of environmental

[1] Academy of Finance, Email: Nguyenthuydung@hvtc.edu.vn.

[2] Vin University

credit risk plays a crucial role in mitigating environmental risks for banks, enhancing the utilization of economic instruments for governmental environmental management, and fostering the advancement of green growth in Vietnam.

Against this backdrop, the paper aims to examine the current international best practices in integrating climate-related financial risk into credit risk management then provide some implications to the Vietnamese commerical banks.

1.2. Literature review

There is a few publications on the topic of intergrating climate-related financial risk into credit risk management adopted by commerical banks in the world. A handbook published by the Network for Greening the Financial System (NGFS) (2020) provide the theoretical foundation as well as an overview of Environmental Risk Analysis by Financial Institutions. NGFS (2020) also summarises some current practices adopted by banks all over the world when these banks integrate climate-related financial risk into their credit risk management.

There are some papers providing more detailed analysis of country context as well as banks' specific practices. For instance, examining Chinese commerical banks, Emtairah et al. (2005) report that in the early awareness of environmental risks, many Chinese commercial banks, remains in a defensive phase, wherein it mainly disregards the importance of environmental risks and possibilities in its economic operations. Additionally, if some banks desire to incorporate environmental considerations, they often experience anotable absence of a structured methodology and effective distribution of internal resources and training capabilities.

Reviewing the Canadian commericial banks, Weber (2012) conclude that Canadian banks demonstrate a proactive approach towards doing environmental assessments of loans, highlighting the necessity for enhanced accounting-based reporting on environmental risk management within financial institutions.

Adopting several approaches and sampling South African banks, Bimha (2020) confirms that during the period from 2010 to 2017, banks have shown a lack of comprehensive integration of environmental risk throughout the loan value chain or process. Nevertheless, the examination of carbon risk reveals a significant reliance on carbon sources for essential inputs in the manufacturing processes of South African enterprises. Failure to address this issue will have repercussions on the credit portfolios of banks.

Feridun and Güngör (2020) provided some recommendation to integrate the environmental risks into the management of banks. Firstly, there needs to be a focus at the board level on recognizing and understanding climate risks, and incorporating them into the internal governance structures of the organization. Secondly, climate risks should be integrated into the overall strategies and risk management frameworks of the organization, ensuring that they are considered in decision-making processes. Thirdly, it is important to identify material exposures to climate-related risks and disclose relevant key metrics to stakeholders. Lastly, organizations should assess the potential impact on capital from climate risks by conducting scenario analysis and stress testing.

1.3. Reasearch method

The paper relies on the review of the current practices in environmental credit risks management adopted by several international banks. This step aims to highlight some of the best existing practices in the industry. Then, the paper adopts the content analysis of the Vietnamese banks' Annual Reports, and other sources of reliable information to provide the assessment about the current state of this practice among Vietnamese banks. Given the different between the interntional best practices and the current situtation in Vietnam, the paper finally provides some recommendations to improve the practice.

2. CLIMATE-RELATED FINANCIAL RISK AND ITS POTENTIAL IMPACT ON CREDIT RISKS

2.1. Definition of climate-related financial risk

Climate change can create significant risk for banks, investors, and the economy. There are two main drivers of the climate-related and environmental risks (FSB 2022)

• Physical risk refers to the financial impact of a changing climate, including more frequent extreme weather events and gradual changes in climate, as well as of environmental degradation, such as air, water and land pollution, water stress, biodiversity loss and deforestation. This can directly result in, for example, damage to property or reduced productivity, or indirectly lead to subsequent events, such as the disruption of supply chains.

• Transition risk refers to an institution's financial loss that can result, directly or indirectly, from the process of adjustment towards a lower-carbon and more environmentally sustainable economy. This could be triggered, for example, by a relatively abrupt adoption of climate and environmental policies, technological progress or changes in market sentiment and preferences.

2.2. The potential impact of climate financial risk on credit risks

Credit risks are often evaluated based on the borrower's general capacity to make timely and agreed-upon loan repayment. The ability of the borrower to earn sufficient income to service and repay its debt, its capital, and the collateral available to support the loan all play significant roles in assessing credit risk.

+ The first dimension is reliant on the cash flows of the borrower. Financial institutions examine a company's historical cash flow records to estimate expected operating profits. This takes into account a number of factors, including the borrower's profitability, how its working capital is managed, or its financial capability to handle operations and expansion.

+ Based on the financial resources of the borrowers, the second dimension evaluates the business's financial structure, the size of its equity, and its capacity to raise more equity, if necessary.

+ The nature and worth of the collateral is the third dimension of credit assessment.

Given that they have an impact on all three of the aforementioned dimensions, climate-related hazards are increasingly important risk factors that could increase both the probability of default (PD) and the loss given default (LGD), which are the two key elements to quantify the impact of credit risks. The former refers to the probability that the obligator or counterparty will default on its contractual obligations to repay its debt. The latter refers to the percentage of exposure the bank might lose in case the borrower defaults.

3. APPROACH TO INTEGRATE CLIMATE-RELATED FINANCIAL RISK INTO CREDIT RISK MANAGEMENT- SOME INTERNATIONAL EXPERIENCE.

3.1. Climate financial risk identification

Some examples of the potential impacts of climate-related risk on credit risk is presented in Table 1. Table 1 also reveals some potential sources of credit risks originated from climate financial risks, which can be used by financial institutions during the first stage of credit risks management (i.e risk identification).

Table 1: The financial impact of climate-related and environmental risks on credit risks

	Transition risk	Physical risk
Impact on firms' cash flows	Transition risks can affect cash flows in several ways, including: + R&D expenditures in new and alternative technologies. + Costs to adopt and deploy new practices and processes. + Reduced demand for carbon-intensive products and services. + Increased production costs due to changing input prices (e.g. for energy and water) and output requirements (e.g. for carbon emissions and waste treatment).	Physical risks can have a negative impact through several channels such as: + Reduced revenue from decreased production capacity (e.g. due to supply chain interruptions and worker absenteeism) and lower sales (e.g. due to demand shocks and transport difficulties), + Increased operating costs (e.g. due to the need to source inputs from alternative more expensive supplies) and increased capital costs (e.g. due to damage to facilities).
Impact on capital and collateral	The transition to a low-carbon economy can also significantly affect the value of households' and firms' assets through: + Potential re-pricing of stranded fossil fuel assets + Changes in real estate valuation (e.g. due to stricter energy efficiency standards).	Physical risks can reduce the value of households' and firms' assets both through: + Direct damages on assets (e.g. to houses and factories during extreme weather events) +Write-offs of assets situated in high-risk locations.

2.2 Credit risk measurement

At the second stage of the credit risk management process, financial institutions often measure the sizes of their exposures to climate financial risks (e.g., 15% loans exposed to certain risks) as well as estimate the probabilities and magnitudes of financial losses arising from these risks (using traditional methods such as scenario analysis and stress test). The results of these exercises could feed into risk mitigation at the following stage.

2.2.1. Physical risk quantification

To quantify the physical risk impact, financial institutions first develop some specific climate/ disaster scenarios; then develop financial models to capture the impact of climate risks on company financials. The climate/ disaster scenarios could be constructed in line with IPCC's climate scenarios [1]or adjusted specifically for the type of local disasters. The financial impact, such as declining revenues or rising costs, can be the direct result of environmental or climate events that cause property and other damages, or an indirect or secondary effect of physical events. The most common secondary impact is business interruptions and reduced economic activities. The resulting changes in financial statements are then integrated into financial models (e.g., PD and LGD models) to quantify the financial risks both on a portfolio basis and individual transaction/ client basis.

For instance, the Tsinghua University followed this approach to develop a climate physical risk assessment framework for banks to analyze credit risks arising from the impact of physical risks (NGFS, 2020). The university assessed the impact of future typhoons on the PD, LGD, and EL of

1 https://www.ipcc.ch/report/emissions-scenarios/

mortgage loans for properties in 40 coastal cities in China under various stress scenarios. It first estimated the outstanding amounts of mortgages loans in these cities, then mapped the geographical locations of the properties to potential disaster damages. A simulated model was then used to assess the impact of typhoons' frequency and intensity under various climate scenarios on bank credit loss. To model the financial impact, the university identify household income and loan-to-value ratios (LTV) as the key determinants of the mortgage PD and LGD model. The study shows that under the worse climate scenario, the expected credit loss of mortgage loans in 2050 could increase by 260% compared with the base-line scenario (assuming no change in climate conditions).

2.2.2. Transition risk quantification

In a climate-related transition risk analysis, the typical first step is the creation of temperature-based or event-based scenarios using underlying models, such as sector-specific models, macroeconomic models. Given these scenarios, the financial models can then quantify the impact of energy transition policies (e.g., increasing carbon prices and contracting demand for fossil fuel products) and technology changes (e.g., causing downward pressure on the sales and prices of fossil fuel products) on companies' revenues and costs in carbon-intensive sectors such as oil & gas, coal mining, coal-fired power generation, steel, cement and transportation. These changes in corporate financial statements are then integrated into risk models to assess financial risks (e.g., credit and market risks) both on a portfolio basis and an individual transaction/client basis.

In 2015, the Industrial and Commerce Bank of China (ICBC) developed its first environmental stress test to analyze the impact of environmental policy changes – a type of transition risk related to environmental policy change – on banks' credit risk (NGFS, 2020). It was first applied to loans extended to sectors such as thermal power and cement that generate significant air pollution. The first step of this process is to construct scenarios related to environmental-policy and regulatory changes (i.e. government levies on air pollution), which would have an impact on the costs and/or revenues for companies in high-polluting sectors. The impact of such policy changes on companies' financial statements are estimated, and the resulting changes in financial variables, such as costs, revenues, profits, and asset/liability ratios are fed into valuation models or PD models to quantify the changes in credit risks of the affected companies. The environmental stress tests show that, for both the thermal power and cement industries, tougher environmental standards would impose cost pressure on firms, especially on small- and medium-sized firms, and would generate impact on their credit risk. For those thermal power companies currently with a AA rating or above, 81% would experience a rating downgrade under the heavy stress scenario, 75% would experience a rating downgrade under the medium stress scenario, and 68% would experience a rating downgrade under the light stress scenario. For the cement industry, under the heavy, medium and light stress scenarios, percentages of credit rating downgrades of firms that currently have a rating of AA or above might amount to 81%, 62% and 48%, respectively.

2.2.3. Credit risk mitigation

Given the output of the risk quantification stage, financial institutions will take action to mitigate the credit risk impact. One of the possible immediate responses is to adjusting the internal credit rating system to account for the impact of physical risk and transition (i.e lower credit rating of borrowers that are highly affected by these climate financial risks with assumptions that no mitigation policies are implemented). Following this adjustment, banks could adjust their loan pricing; they can either charge higher interest rate or lower loans to value ratios for these borrowers. At the wider scale, banks can also set aside proper amount of loan loss provisioning or even adjust capital adequacy ratio to account for the future impact of these climate financial risks in the longer term.

3. CURRENT PRACTICES TO INTEGRATE CLIMATE-RELATED FINANCIAL RISK INTO CREDIT RISK MANAGEMENT IN VIETNAM

Vietnam is one of the most vulnerable countries to climate change with the increase in extreme weather events (storms, heavy rains, floods, droughts, high tides...) being predicted. Given the current economic model, if Vietnam's GDP doubles, then environmental pollution will increase three times; for every 1% increase in GDP, the damage caused by environmental pollution will lead to a loss of 3% of GDP (ADB, 2018).

Recognizing the importance of promoting green bank credit to contribute to green growth towards sustainable development, the Government has directed the banking sector to promulgate many documents, policies and implement them. Specifically, the Decision No. 1393/QD-TTg (2012) on "Approval of the National Strategy on Green Growth 2011-2020 and Vision to 2050", issued by The Prime Minister serve as the highest legal framework for green credit activities in Vietnam. Under this vision, in 2015, the State Bank issued Directive No. 03/2015/CT-NHNN "*On promoting green credit growth and managing environmental and social risks in credit granting activities*" then issue a handbook (i.e a manual) on environmental - social risk management for 15 economic sector. Recently, The State Bank of Vietnam also issued the Circular 17/2022/TT-NHNN dated December 23, 2022 guiding the implementation of environmental risk management in credit extension activities of credit institutions and foreign bank branches. These documents provide legal framework for financial institutions in Vietnam to integrate environmental or climate-related risks during its credit appraisal and decision making.

As guided by the legal framework, several credit institutions have actively researched and gradually applied environmental and social risk management in credit granting activities such as: promulgating regulations; regulations on environmental and social management contents; integrating environmental and social risk assessment into the credit appraisal process; adding content about customers' compliance with regulations on environmental protection into the credit agreement.

According to reports of credit institutions, as of June 30, 2022, credit outstanding for green projects has increased 2.54 times compared to 2017; in which, medium and long-term loans accounted for 92.79% of green credit balances, short-term loans accounted for 6.21% of green credit outstanding loans. Green credit loans mainly focus on green agriculture (accounting for 31% of total green credit outstanding), sustainable water management in urban and rural areas (12.05% of total green credit outstanding), sustainable forestry (accounting for 5.18% of total outstanding loans) and renewable energy, clean energy (accounting for more than 47% of total green credit outstanding). Outstanding credits that have been assessed for environmental and social risks are about VND 2,283 trillion, with more than 1.1 million loans; in which short-term credit balances assessed for environmental and social risks reached more than 1,276 trillion VND with more than 446 thousand short-term credit items, medium and long-term credit balances assessed for environmental and social risks reached more than 1,006 trillion VND with more than 700 thousand credit facilities (Vu 2022).

Given this background, it appears that credit institutions in Vietnam has been gradually aware of the importance and necessity of environmental risk assessment in credit granting activities. These institutions have also included the credit screening for environmental risks for some specific borrowers in some specific sectors during its credit appraisal process.

4. SOME RECOMMENDATIONS FOR CREDIT INSTITUTIONS TO INTEGRATE CLIMATE-RELATED FINANCIAL RISK INTO CREDIT RISK MANAGEMENT IN VIETNAM

In the future, credit institutions in Vietnam could take further step to take into account of the climate-related financial risks into their existing credit management system. These are some of relevant recommendations to prepare for this practice:

+ Developing analytical framework to integrate climate-related financial risk into credit risk modelling.

Credit institutions should develop an analytical framework to analyze the impact of climate-related financial risks. Technically, the first step could be defining the set of physical climate change scenarios and the measures that will be taken to manage the transition to a low-carbon economy. At the second step, economic agents (e.g. firms and households) affected by the climate change scenarios should be identified; the direct and indirect economic impacts on these economic agents are assessed. Subsequently, these impacts will be reflected on the borrower's cash flows and balance sheets. At the final stage, once the assessment of financial impacts on the economic agents is finished, it is then necessary to compute how changes in cash flows and balance sheets will affect borrower's creditworthiness. This can be measured in terms of the probability of default (PD), the loss given default (LGD) and the credit ratings.

Given the internal credit risk management, credit institutions should tailor and adjust their existing system step by step to incorporate these technical requirements for a climate-financial risk management framework.

+ Preparing databases to integrate climate-related financial risk into credit risk modelling.

International experience shows that one of the main challenges is a lack of historical data to assess the impact of climate change on credit risk losses. Past data is a poor predictor of future evolutions of physical risks. Similarly, no long-term transition policy experiments have been tested or observed. As a result, credit institutions should develop its own databases as soon possible based on their existing internal data system (i.e personal and corporate loans histories) as well as collect environmental or climate-related data provided by local authorities or international bodies.

+ Provide training, capacity development program to prepare its human resources.

Credit institutions should ensure that a growing share of its staff are equipped with sufficient climate-related financial risk knowledge to effectively integrate these climate risks into their current work. The training programs could take form of internal seminars where those most involved with climate risk speak with their colleagues, but they can also include external training and support. The objective of these trainings should be to highlight the relevance of climate-related financial risks, the best industry practices in modelling and quantification of their impact on credit risks, etc…

+ Promote international co-operation.

There are various international bodies providing support to the central banks and financial institutions around the world to cope with arising climate issues. Some notable examples are the

"Network for Greening the Financial System- NGFS" and Finance UNEP Initiative. Over the past few years, financial supervisors and institutions around the world have worked to develop good practices regarding climate-related risk management and modelling. The credit institutions in Vietnam can benefit from the experiences of peer institutions on these topics to develop relevant climate/ environmental scenarios, model the financial impact of climate risk and overcoming other climate-related data challenges./.

5. CONCLUSION

Climate change can create significant risk for banks, which potentially alter the borrowers' capacity to repay their debts. As the impact of climate change becomes severe, it is of paramount importance for financial institutions to integrate climate-related financial risks into their credit risk management. To further improve this practice among Vietnamese commerical banks, some solutions are provided including the development of the analytical framework as well as preparation of data, expertise and other related resources to integrate climate-related financial risk into credit risk modelling.

THE FACTORS AFFECTING JOB SATISFACTION – CASE STUDY IN STATE COMMERCIAL BANK OF VIETNAM

Ph.D Tran Van Hung, Ph.D Tran Viet Anh, MBA Tran Xuan Hoang Hai[1]

Abstract: *The role of employees is vital for service businesses. Therefore, maintaining employee satisfaction plays a significant role in the performance of service companies. The topic shows a comprehensive picture of the level of job satisfaction of officers and employees working in the commercial banking system in Ho Chi Minh City through 09 aspects of satisfaction. Regression results of the study prove that job satisfaction in the aspect of "Communication of information" has the most substantial impact on the "General satisfaction" of employees. Meanwhile, the "Income" aspect has the lowest impact on the "General satisfaction level." From the above research results, there is a basis for employers to develop solutions to improve the overall satisfaction level of employees at their agencies.*

Keywords: Labor, satisfaction, motivation, banking.

1. INTRODUCTION

The 4.0 Industrial Revolution had a profound impact on every industry, and banking was not outside the influence of this revolution. In the future, the most obvious consequence of the impact of Industry 4.0 on the banking sector is that modern technology banks will gradually replace traditional banking systems. In the context of promoting industrialization, modernization, and international integration, especially when Vietnam is in the period of the 4.0 Industrial Revolution, the issue of human resources is considered a breakthrough, and human resource development has become the foundation for sustainable development and increase the national competitive advantage. According to a report by the International Labor Organization (ILO), the need for new training of human resources in the Finance and Banking industry in the period 2016 - 2020 of Vietnam is over 1.6 million people. By 2020, the total number of human resources About 300,000 people work in the banking industry. The primary and existing challenges of the Banking industry before the 4.0 Industrial Revolution are the scarcity of high-quality human resources - the decisive factor for success and competition for high-quality resources is the factor that makes success possible in integration (Brett King, 2017).

According to the Ho Chi Minh City Human Resource Forecasting Center, despite high salaries, the Finance - Banking industry has the highest rate of employee resignations. Some studies show that to deal with high turnover rates, and businesses must take action right from when personnel are still attached to the business and pay attention to signs of "rifts" in relationships. A raise or promotion is one of many solutions because it only has a temporary effect. The core to increasing employee engagement, effort, and loyalty must still be to combine 'pull and push' strategies. 'Pull' employees' emotional and rational efforts through the working environment, stimulating employee group cohesion. 'Push' with self-motivation through supporting and helping them better feel the five factors that increase motivation: work meaning, mental and physical health, compatibility, connection, and self-esteem owner," the report recommends…. Ho Chi Minh City is a locality with the most vibrant banking system in the country, and the demand for human resources in the banking industry is also on the rise. According to data from the Center for Forecasting Human

1 Email: tranvanhung@dhv.edu.vn, Hung Vuong University.

Resource Needs in the City. HCM, in the period 2016-2025, only in City. Ho Chi Minh City will have an additional 10,800 working positions in finance, banking, credit, insurance ... However, the personnel situation at banks also has constant fluctuations. Incidents causing loss of customer assets and irresponsible handling by management serve as a reminder for "following instructions," a widespread behavior at banks. In addition, credit risks that have frequently occurred recently are also a factor that significantly impacts the psychology of Bank employees in general.

2. LITERATURE REVIEW

According to Maslow's individual needs perspective, job satisfaction exists when the job and surroundings meet an individual's needs. The hierarchy of needs focuses on five types of needs arranged in ascending order of importance: physiological, safety, social (communication), esteem needs, and self-actualization needs, achievements). After a particular need has been satisfied, the next higher-level need will appear. Although no need is ever completely satisfied, there is no more motivation if a need is essentially satisfied. Therefore, when one of the above needs is satisfied, the following needs dominate. Maslow divided five types of needs into high and low levels. Basic and safety are lower-order needs, and social, esteem, and self-actualization are higher-order needs. The difference is that higher-order needs are satisfied internally (within the person), while lower-order needs are easily satisfied externally (by things like salary, contract, and position).

Research on job satisfaction became more complicated with the introduction of Herzberg's two-factor theory. This theory divides factors into two categories: motivating factors and maintaining factors. Motivational factors include achievement, recognition of others, nature of work, job responsibilities, promotion, progress, and prospects for growth. If employees are satisfied, it will bring satisfaction in their work, and vice versa; employees will not have satisfaction. Sustaining factors include company policy, supervisory supervision, salary, relationship with superiors and Co-workers, working conditions, personal life, job position, and job security. If it is met, there will be no job dissatisfaction; on the contrary, it will lead to dissatisfaction. Thus, Herzberg (1959) has relatively separated these two groups of factors and said that only motivating factors can bring satisfaction to employees, and if not done well, maintenance factors will lead to employee dissatisfaction.

Vroom's Expectation Theory (1964): Victor Vroom's Expectation Theory states that people's behavior and work motivation are not necessarily determined by reality but by people's perception of expectations—their hopes for the future. Unlike Maslow and Herzberg, Vroom does not focus on human needs but on results (Robbins, 2002).

John Stacey Adams (1963) suggested that employees tend to judge fairness by comparing their efforts with what they receive and comparing their proportions with their peers' careers in the company. If the result of that comparison is equality, then they will continue to maintain their efforts and performance. If the remuneration received exceeds their expectations, they will tend to increase their effort in the job; conversely, if the remuneration they receive is lower than their contribution, they will tend to decrease effort or find other solutions, such as being absent during working hours or quitting their job.

The theory mentioned above can also be considered from the perspective of the topic of this thesis. Employees can only be satisfied if they realize they are being mistreated from salary, training, and promotion opportunities to support from superiors.

Quarstein, McAfee, and Glassman (1992) developed the conditional performance theory of job satisfaction. The two main components of this theory are condition characteristics and condition manifestations. Qualifying features include salary, advertising opportunities, working conditions, company policies, and supervision. Individuals tend to evaluate the characteristics of conditions before they accept a job.

Conditional expressions are evaluated after accepting a job. Conditional expressions can be positive or negative. Positive manifestations include giving workers a break for particular work or placing a microwave oven in the workplace. Such negative manifestations include, for example, confusing emails and harsh comments from Co-workers. The authors hypothesized that overall job satisfaction combines conditioned features and conditional expression. The results of their study support the above hypothesis. According to the researchers, a combination of condition characteristics and condition expression may be a stronger predictor of overall job satisfaction than individual factors of the condition itself.

Job satisfaction

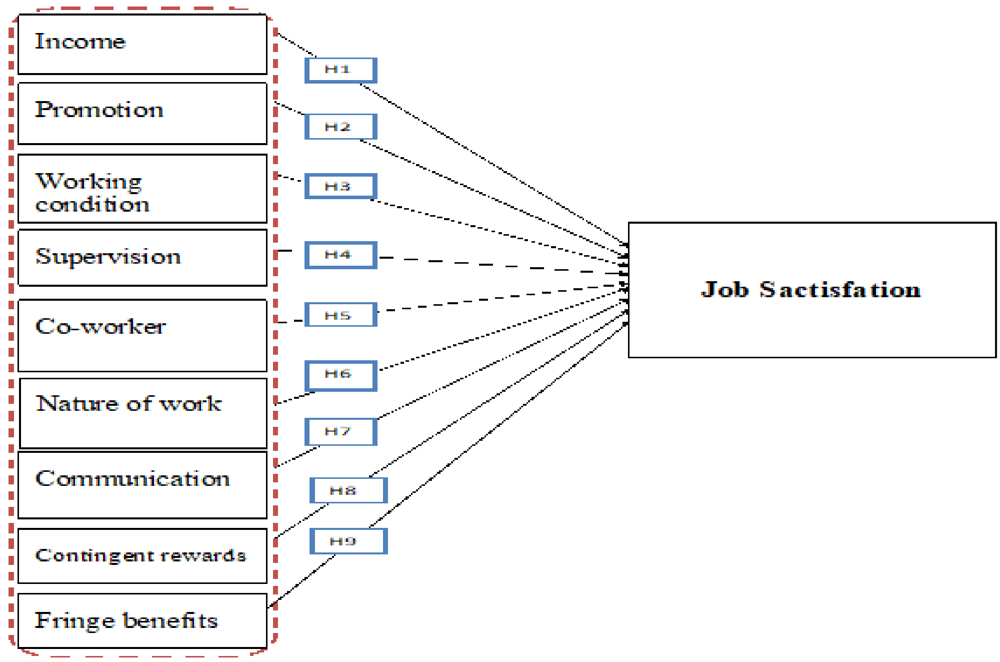
According to Ellickson (2002), job satisfaction is the degree to which employees love their work, which is an attitude based on the employee's perception (positive or negative) about the job or their work environment. Simply put, the more the work environment meets the employee's needs, values, and personality, the higher the job satisfaction.

Schermerhorn (2002) considers job satisfaction an emotional response to different aspects of an employee's job. The author emphasizes the causes of job satisfaction, including job position, supervision by superiors, relationships with co-workers, job content, compensation and rewards, promotions, the working environment's physical conditions, and the organization's structure.

According to Kreitner and Kinicki (2007), job satisfaction mainly reflects the degree to which an individual enjoys his or her job. Thus, there are many definitions of job satisfaction, but if a person is considered to have job satisfaction, that person will feel comfortable and at ease with his work.

In this research topic, job satisfaction is how much people enjoy their jobs and aspects of their jobs. It is an attitudinal variable because it is a general evaluation (Spector, 1997). According to Maslow's (1943) personal needs perspective, job satisfaction is said to exist when work and the surrounding environment meet an individual's needs..

Proposed research model:



The Factors affecting job satisfaction

H1: As the level of satisfaction with income increases, the overall satisfaction level of agency employees also increases.

H2: As the level of satisfaction with promotion increases, the overall level of satisfaction of agency employees also increases.

H3: As the level of satisfaction with working conditions increases, the overall satisfaction level of agency employees also increases.

H4: As the level of satisfaction with supervision increases, the overall satisfaction level of agency employees also increases.

H5: As the level of satisfaction with co-workers increases, the overall satisfaction level of agency employees also increases.

H6: As the level of satisfaction with the nature of work increases, the overall level of satisfaction of agency employees also increases.

H7: As the level of satisfaction with information communication increases, the overall satisfaction level of agency employees also increases.

H8: As the level of satisfaction with Contingent reward increases, the overall satisfaction level of agency employees also increases

H9: As the level of satisfaction with fringe benefits increases, the overall satisfaction level of agency employees also increases.

3. RESEARCH METHODS:

The research was carried out through 2 phases: preliminary and formal. Preliminary research with in-depth interview techniques of employees working in the banking sector to correct the survey form in terms of semantics and adjust the scales in the survey. The draft survey was then conducted to test 30 employees. The formal study was conducted quantitatively with the survey method by structured questionnaire with 38 variables by the convenience sampling method because of the limitation in constructing the sample frame. The number of samples is 212, guaranteeing the minimum sample size when conducting EFA analysis. The study used linear regression analysis to find out the research results.

4. THE RESEARCH RESULTS

Two hundred fifty questionnaires were distributed, and 230 were collected. After removing 18 unsatisfactory survey questionnaires, the results of 212 questionnaires were entered. After conducting data cleaning, the remaining primary data set with 212 tables was selected for analysis. All 212 questionnaires were coded and entered into SPSS software, then AMOS was used to test the scale and research hypothesis. Table 1.1 shows the results of descriptive statistics of the study sample:

Correlation analysis and multiple linear regression

Consider the linear correlation relationships between the dependent variable and each independent variable as well as between the independent variables through Pearson correlation analysis. If the correlation coefficient between the dependent and independent variables is significant, it proves a relationship between them, and regression analysis is appropriate. On the contrary, if the independent variables also have large correlation coefficients with each other, multicollinearity may occur in the regression model under consideration. The results of the correlation analysis are shown in the following table:

**. Correlation with statistical significance level 1%											
*. Correlation with statistical significance level 5%											

Through Table 4, we see a correlation between the independent variables and the dependent variable. This correlation is relatively high, especially the INFORMATION COMMUNICATION (COM) variable has a pretty high correlation with GENERAL SATISFACTION LEVEL (SPSS) (0.684), and the lowest correlation level is the variable INCOME (INC) (0.239). Through preliminary correlation analysis results, it is found that independent variables can be included in the model to explain factors affecting the GENERAL SATISFACTION LEVEL (SPSS). However, checking for multicollinearity among the multiple regression analysis variables is necessary.

Multiple Linear Regression Analysis

The multiple linear regression method tests the fit between the nine influencing factors INC, PRO, WKC, SUP, COW, NOW, COM, COR, and FRB on the SPSS dependent variable. The values of the factors used to run the regression are the mean values of the observed variables. Through regression analysis, the model.

After building the linear regression model, the first concern is to consider the model's suitability for the data set through the value. To test the suitability of the overall regression model, we need to test the hypothesis Ho: β¬i= 0 (where β¬i are the regression coefficients of the independent variables, respectively). Table 4.30 shows that the statistical value with a significance level of 0.000 is much smaller than the significance level of 0.01, so we reject the Ho hypothesis with 99% confidence. Thus, it can be concluded that the independent variables in the regression model have a linear relationship and explain the variation in the "GENERAL SATISFACTION LEVEL."

Table 5: ANOVA cho kiểm định F

ANOVAa						
Model		Variability	Df	Average	F	Sig
1	Regression	73.845	9	8.205	108.150	.000b
	Phần dư	15.325	202	.076		
	Tổng	89.170	211			

Table 6 evaluates the model's fit with coefficients and corrections (Adjust R Square). The adjustment will be safe when evaluating the model's suitability because it will increase when adding independent variables. The model's calibration is 0.82, which means that the independent variables explain 82% of the variation in Overall Job Satisfaction. Thus, the fit of the model is relatively high.

The linear regression equation predicts factors affecting overall job satisfaction as follows:

SPSS=0,063+0,145*INC+0,153*PRO+0,198*WKC+0,121*SUP+0,222*COW+0,204*NOW+0,295*COM+0,141*COR+0,138*FRB + ε

Statistics of variables, checking for multicollinearity, introducing sample characteristics, and regression analysis are presented in this chapter. Of the 36 observed variables, all 36 variables are qualified to explain the model, extracted into nine factors: Income (INC), Promotion (PRO), Working conditions (WKC), Supervision (SUP), Co-workers (COW), Nature of work (NOW), Information communication (COM), Contingent reward (COR), Fringe benefits (FRB). The results of multiple regression analysis in Table 4.31 show that at the 5% significance level, all 09 independent variables are meaningful in explaining 72.055% of the variation of the dependent variable: General satisfaction level (SPSS). The most vital influencing factor is the Information Communication variable (COM), and the lowest is the Income variable (INC).

Statistical results describe quantitative data variables of factors affecting job satisfaction. In the Income factor, "Opportunity to get a raise" has the highest level of agreement; In the Promotion factor, "Correlation between promotion and suitable job" has the highest level of agreement; In the Working Conditions factor, "Work is hindered by bureaucracy" has the highest level of agreement; In the Supervision, "Supervisor's ability at work" has the highest level of agreement; Co-worker factor, "Relationship with Co-worker" and "Working together with Co-worker" have the highest level of agreement; In the Nature of Work factor, "Job Interest" has the highest level of agreement; In the Information Communication factor, "Complete level of explanation in work assignment" has the highest level of agreement; Contingent reward factor, "Recognition of a job well done" had the highest level of agreement; In the Welfare factor, "Lack of fringe benefits received" has the highest level of agreement.

About factors affecting overall job satisfaction

Multiple linear regression method was used to determine the level of impact of each aspect of job satisfaction on the overall level of satisfaction; the results of all nine independent variables are statistically significant with a confidence level of 95% are Income, Promotion, Working Conditions, Supervision, Co-worker, Nature of Work, Communication, Contingent reward, Fringe benefits. The Information Communication variable has the highest influence on the Overall Satisfaction (SPSS), and the lowest is the Income variable.

One of the critical objectives of the study is to give recommendations to employers to improve job satisfaction for officials and employees working in the commercial banking system in Ho Chi Minh City. Therefore, the results of this study have specific meanings. First, with the average overall job satisfaction level of 3.85 being relatively low, employers need to take many measures to increase the job satisfaction of their employees. When there is high job satisfaction, employees will strive to complete their work better, always trust, and be loyal to their organization. Thus, employees' performance and work efficiency will be higher, helping the organization survive and thrive in today's very competitive economic environment.

Regression results show that 09 factors affect job satisfaction, including income satisfaction, promotion, working conditions, supervision, Co-worker, nature of work, communication, Contingent reward, and fringe benefits. The intensity of the influence of these factors is reflected in the regression coefficients of the variables in the regression equation to help employers see what they should impact and which factors to improve job satisfaction faster the work of officials - employees who are working in the State-owned commercial bank system in Ho Chi Minh City.

5. DISCUSSION AND CONCLUSION:

The research results of the project "Measuring factors affecting job satisfaction of officials - employees working in the state-owned commercial banking system in Ho Chi Minh City" provide information about the subjects working here and show that employers and managers in banks need to have reasonable solutions and behaviors to improve the level of job satisfaction of their employees. Because once employees are satisfied with their work, this helps them persistently strive to complete their work better, trusting and loyal to the organization they are serving. Therefore, employee performance and work efficiency will be higher, helping the organization survive and develop in today's very competitive economic environment.

The topic shows a comprehensive picture of the level of job satisfaction of officers and employees working in the state-owned commercial banking system in Ho Chi Minh City through 09 aspects of satisfaction. The regression results of the study demonstrate that job satisfaction in the aspect of "Information communication" has the most substantial impact on the "General level of satisfaction" of employees. Meanwhile, the "Income" aspect has the lowest impact on the "General satisfaction level." The above research results provide a basis for employers to develop solutions to improve the overall satisfaction level of employees at their agency.

Information communication

Regarding satisfaction with Information Communication, because this is the most influential or essential factor in improving the job satisfaction of bank employees, employers need to pay attention. According to the statistical table describing observed variables measuring Information Communication factors, the average satisfaction level is relatively low. According to Maslow (1943), information communication belongs to the group of social needs; it is a type of higher-level need that is satisfied within a person, so it is more difficult to satisfy than groups of needs that are satisfied externally. Therefore, employers need to strengthen information communication channels. The priority employers need to implement in this factor is enhancing organizational communication (COM1). The organization needs to share information between two or more individuals or groups to achieve a common understanding, and the organization's common goals need to be shared to achieve a common understanding.

Co-workers

Regarding satisfaction with colleagues, this is also the second most vital influencing factor in improving job satisfaction, so employers also need to pay attention. According to Herzberg (1959), relationships with colleagues belonging to the maintenance group, if met, will not result in job dissatisfaction; on the contrary, it will lead to dissatisfaction. Based on the statistical table describing the observed variables measuring Colleague factors, the average level of satisfaction is at a relatively low level, especially the two observed variables "Colleagues' incompetence" and "Colleagues' incompetence" and "Colleagues' incompetence." Arguing and arguing at work." Therefore, to improve the satisfaction level of this factor, priority should be given to improving the two issues mentioned above. To improve the abovementioned problem, organizations need to create more fairness in work assignments. To ensure fair and transparent work assignments, employers first need to assess the capacity of each employee, to ensure that work assignment is appropriate to each person's ability. Avoid having employees feel like they must do more work because their colleagues need more work capacity. Besides, because the district is newly established, building a culture of behavior within the agency is also necessary, creating a civilized, fun, and sociable working environment.

Nature of work

The nature of work is the third most vital influencing factor on the overall job satisfaction level of officers and employees. According to Herzberg (1959), the nature of work belongs to the group of motivating factors. If met, it will bring job satisfaction; otherwise, employees will not be satisfied (not dissatisfied as the group of factors maintains). According to the statistical table describing the observed variables measuring the Nature of Work factor, the satisfaction level of the variables is at an average level. However, to increase the satisfaction level of this factor, priority should be given to the job content (which has the lowest satisfaction level in the group Mean = 3.79).

Employers need to assign their employees jobs that suit their abilities and strengths, help them clearly understand their work, and let them see the importance of their work, as well as empower them to decide on several things that are within their ability. Employees will only have high job satisfaction if they clearly understand the nature of their work and their relationship with other employees in the same agency. Employers must convey to their employees the awareness that each job position in the organization has particular importance to the organization's overall operations to help them feel the meaning of their work, creating excitement in their work.

Working conditions

Satisfaction with working conditions, in general, is when a job can bring that employee general satisfaction and good work performance. The statistical table describing variables measuring working conditions related to job design must have clear regulations and administrative procedures that do not make work difficult or are not hindered by bureaucracy. In general, job satisfaction in this aspect is relatively low, especially the observed variables "Procedures hinder work performance" and "Work is hindered by bureaucracy." Therefore, to improve the satisfaction level of this aspect and increase overall job satisfaction, priority should be given to enhancing the two observed variables mentioned.

Promotion

According to the statistical table describing the observed variables measuring the Promotion factor, the level of satisfaction in this aspect is average. Promotion refers to employees' satisfaction with their opportunities for promotion. According to Maslow (1943), advancement is the need for self-actualization, a high level in his hierarchy of needs that is difficult to satisfy compared to other needs.

Most employees want to be promoted or improve their working capacity after a certain period. Organizations must create conditions for employees to enhance their knowledge and working skills and create promotion opportunities for capable employees. Organizations must demonstrate to all employees that those with the ability and effort will be allowed to advance. When a vacant management position or a new one appears, the organization must prioritize reviewing, thoroughly evaluating, and publicly disclosing those who have contributed to the organization. This will help motivate capable people to try to do a good job and even give those who have not done well the motivation to develop better.

Income

According to Maslow's theory of needs (1954), income belongs to human physiological and safety requirements, and only when employees' needs are met can they be satisfied at work. The regression results show that income (INC) is one of three variables with a low influence on the overall job satisfaction of officials and employees at the Bank. Statistical results describing the observed variables measuring the income factor show that the satisfaction level of this factor is lower than other factors. The order of priority that employees need to do in this factor is to create more fairness in the distribution of rewards for work (INC1- Fair rewards depending on performance (Mean = 3.7)).

Fairness here depends significantly on the organization's employees' awareness, so employers must find ways to help employees realize that they are paid relatively income and bonuses. According to Adams (1963), employees tend to evaluate fairness by comparing the effort they put in with what they receive and comparing their ratio with that of their colleagues in the organization. They will try to complete the job if the comparison results are fair. Moreover, employees can only be satisfied with their work when treated fairly. Therefore, organizations need a detailed job description for each position, helping employees see their posts, roles, contributions, and other organization members. Doing so will help employees feel that they are paid their income fairly. In addition, employers must be careful to avoid providing income incentives to people with (public) relatives because this will affect other employees' perception of fairness.

Regarding creating fairness in employee rewards, organizations need to develop a clear and comprehensive reward and punishment policy with specific reward levels for each achievement and receive comments to improve the above procedure. Organizations will implement rewards and penalties based on the issued regulations when considering bonuses and penalties.

Rewards

According to Maslow (1943), reward is a higher need that is satisfied within humans and is very difficult to satisfy. The statistical table describing the observed variables measuring the Reward factor shows that the level of satisfaction in this aspect is average. According to the regression results, the Reward variable is one of three variables that have the same impact on overall job satisfaction. The priority order that organizations need to improve in this factor is "Reward for effort" and "Proper evaluation of work performed."

Research results show that survey respondents feel their work is not appreciated and their work efforts are not adequately rewarded. Therefore, the recommendations here are similar in terms of income factors. For employees to feel appropriately valued, the organization needs to have a detailed job description, responsibilities, and authority of each position and publicize it. In addition, organizations need to develop a scale to evaluate work completion results to have a basis for classifying employees' work. On that basis, there is an accurate and fair reward and punishment regime.

Welfare

Benefits are the benefits a person gets from their organization and the money they earn. Welfare includes monetary and non-monetary interest. According to statistical results, the table shows that the current level of satisfaction with employee benefits could be higher. Therefore, to increase satisfaction with this benefits aspect, priority should be given to improving the current employee benefits organization. Organizations need to consult, review, and compare the benefits of employees in their organization with employees of other organizations operating in the same industry, correctly assessing the position and role of each employee to Determine appropriate benefit levels for each employee.

Supervision

Supervision refers to the supervisor's ability to provide emotional support, technical support, and guidance with relevant job tasks. Control in this topic relates to the satisfaction with the supervision of direct management. Statistical results show that employees' perception of their boss's fairness is low. At the same time, in employees' perception, the boss pays too little attention to subordinates' feelings.

Therefore, superiors must pay more attention to employees, protect them from others when necessary, recognize their contributions, and treat them fairly. Leaders must learn about their employees' strengths, weaknesses, and preferences. They can only show appropriate and proper care when superiors clearly understand their subordinates. Adequate care from superiors will create respect for their employees. In addition, superiors need to recognize employees' efforts when they achieve set goals, and praise and rewards are necessary when subordinates do good work. At the same time, superiors need to create fairness in treating employees.

In addition, superiors should regularly learn and improve their qualifications and professional knowledge. When necessary, show subordinates your abilities because associates will truly feel admired by their boss when they see their supervisor's leadership talent and professional expertise.

EFFECTS OF EXECUTIVE DIRECTORS' AGE AND DUALITY TO THE QUALITY OF FINANCIAL REPORTS AT INDUSTRIAL GROUP OF COMPANIES – EVIDENCE FROM VIETNAM

MAc Nguyen Thu Hien, MAc Tran Thi Nguyet Nga[1]

Abstract: Research objectives are to measure the influence of age and duality of the CEO to the quality of financial reports of industrial group of companies listed on the Ho Chi Minh City Stock Exchange (HOSE). The official study sample includes 89 industrial group of companies listed on HOSE with a sample size of 267 observations between 2018 and 2020. The panel data regression methods POOL, FEM, REM, and FGLS are used to validate the research model. The study result provides further empirical evidence on the quality of financial reports of industrial group of companies that are negatively influenced by the age of the CEOs. The result also recommends that industrial group of companies should not recruit or appoint CEOs who are too old to increase the quality of financial reports.

Keywords: quality of financial report, chief executive officer (CEO), age of CEO, CEO concurrent positions

1. INTRODUCTION

The financial report plays an important role and provides useful information for users (Mackenzie et al., 2012). The quality of the financial report is of interest to many domestic and foreign researchers because quality financial reports will increase investment efficiency (Biddlw and Halary, 2006). The Chief Executive Officer (CEO) is the executor who represents the business owner in related tasks and policies, is responsible for all production and business activities of the enterprise, and is directly responsible for the information presented on the financial report or the quality of them. Some CEOs may for self-interest abuse their authority to manage profits in a way that benefits individuals, invisibly falsifying information on financial reports, leading to the quality of financial reports being affected.

Many studies indicate that CEOs' behavior is governed by their characteristics, such as age, gender, work expertise, tenure, ownership ratio, and incentives of salary, bonus, and other long-term benefits (Hambrick and Mason, 1984; Nirosha, 2011; Bao et al., 2021; Huang et al., 2012; Cheng and Farber, 2008). Scholars point out that these characteristics of the CEO have a significant impact on the performance of the business and can be used to predict the transparency and accuracy of financial reports. Thus, the CEO's behavior will affect the quality of the financial report. CEO behavior is influenced by CEO characteristics (Knechel and Sharma, 2012), including the factors of CEO's age and duality.

The industrial group has with large investment capital and production scale. Company size is in the same direction as profit quality because large companies often incur fixed costs to maintain internal control procedures during the financial reporting process (Ball and Foster, 1982). In contrast, small companies often have weak internal control systems and are more likely to have to revise previously reported profit targets.

---

1 University of Finance - Marketing, Email: trannga@ufm.edu.vn.

The study focuses on measuring the age and duality of the CEO affecting the quality of financial reports, the research results will be one of the arguments for investors as well as users of financial reports to be able to partially evaluate the quality of financial report through the age and tenure attributes of the CEO. On the other hand, this will also be one of the bases for businesses to recruit CEOs or appoint CEOs who need to separate two functional positions: Chairman of the Board of Directors and CEO.

2. THEORETICAL BASIS AND PREVIOUS STUDIES

2.1. Theoretical basis

Management theory: Hypothesize that managers are not influenced by personal goals, they have motivations that align with the owner's goals. Managers who act in the best interests of shareholders are considered good managers. This theory argues that executives can operate effectively not only because they are competent, but also because they share the same goals as beneficiaries (Donalson and Davis, 1991).

Agency theory: Developed by Berle and Means (1932), the focus of agency theory is based on the relationship between the proprietor (who has ownership) and the agent (who has control). Jensen and Meckling (1976) analyze the conflicting relationship between the proprietor and representative (manager), managers who do not always act in the best interests of the owner. Therefore, the business owner must supervise the manager and cost supervision. At the same time, managers will accept to bear the binding costs. Conflicts of interest also create additional losses due to unmaximized welfare. The total cost of monitoring, binding costs, and additional losses are called representative costs. The difference in interests between the proprietor and the agent leads to a potential conflict of interest, which incurs costs to resolve (authorization costs). To limit the authorization costs, companies need to create an effective internal control system that separates management decisions from control decisions (Fama and Jensen, 1983). In addition, separating CEO duality can establish better monitoring and control mechanisms.

Asymmetric information theory: The asymmetry of information is that there is a difference in the amount of information held between the manager (the representative) and the business owner (the authorized party). The International Accounting Standards Board (IASB) mentioned that the more clearly the information on the financial reports reflects the economic conditions and business performance of the enterprise, the more it helps reduce the information asymmetry between investors, managers and business owners (shareholders). To reduce asymmetry information in joint stock companies, managers must provide useful information to shareholders. On the other hand, it is necessary to establish a monitoring mechanism through the shareholder's representative, the board of directors. Therefore, it is recommended that businesses should separate the two positions of CEO (with executive functions) and Chairman of the Board of Directors (with supervisory functions).

2.2. Perspectives on the financial report quality

Many scholars studied the quality of financial reports. Besides, the methods used to measure the quality of financial reports are also diverse such as methods of measuring accruals; reaction coefficient of income; timeliness of information disclosure; representation of financial report; and information characteristics according to accounting standards... The study focused on exploiting the quality of financial reports through the quality of information on financial reports from the perspective of the

International Accounting Standards Board (IASB, 2018), information quality characteristics include: (1) Relevance: accounting information must be able to make a difference in the decision-making of users. The information must have the predictive value, validation value, or both; (2) Faithful representation: information that is fully described, neutral, without subjective opinions, and more substantive than formal; (3) Comparability: comparability allows users to distinguish and understand the similarity or difference in items, information about one business will be more useful if it can be compared with similar information in another enterprise or in the same enterprise in different periods; (4) Verifiability: helps to assure users that the information presented truthfully concerning economic phenomena; (5) Timeliness: means having information available for users to make timely decisions; (6) Understandability: the information that can be classified, described and presented concisely.

2.3. Role of Chief Executive Officer (CEO)

The Chief Executive Officer (CEO) is the highest executive position of an organization, in charge of the general management of a company; is the representative of the business when speaking to shareholders, government agencies, and the public; responsible for giving direction, strategic vision, setting and implementing goals of the enterprise, coordinating, and monitoring the company's activities. Thus, the managers must perform different roles and are classified into 3 groups: Human Relations Role Group, Information Role Group, and Decision Role Group (Mintzberg, 1973). In Vietnam, the CEO is known as "General Director" or "Director". According to the National Assembly (2020), the CEO is the person who runs the day-to-day business of the company; reports to the Board of Directors; takes responsibility before the Board of Directors and law for the exercise of assigned rights and obligations. The CEO is responsible for all issues related to the preparation and presentation of financial reports. Therefore, it can be said that the role of the CEO greatly affects the quality of financial reports that business publishes.

2.4. Overview of the Studies

Here are some studies by the authors that show the influence of factors CEO's age and duality on the quality of financial reports.

There exists a multidimensional result demonstrating the relationship between CEO's age and financial report quality. The typical studies on CEO's age affects the quality of financial reports include Hambrick and Mason (1984), Peterson et al. (2001), Sundaram and Yermack (2007), Huang et al. (2012). There exists a positive link between age and morality, profit management behavior is widely interpreted as unethical, especially after the famous accounting scandals of the early 2000s and the introduction of the SOX Act in the US (Grasso et al., 2009). Ali and Zhang (2015) argue that CEOs are more likely to manipulate income when they are young or nearing retirement age. Hambrick and Mason (1984) argue that older CEOs are less likely to make high-risk decisions, they are more cautious, and ethical behavior increases with age. In the same vein are researchers such as Mudrack (1989), Dawson (1997), Peterson et al. (2001), Sundaram and Yermack (2007). According to Huang et al. (2012), the age of the CEO has a relationship in the same direction with the quality of financial reports, In the research sample of 3413 enterprises in the period 2005 – 2008, the quality of financial reports is measured through the representation of financial report – Financial restatement.

Ali and Zhang (2015) agree that CEOs are more likely to manipulate earnings when they are young or close to retirement age. To manipulate earnings, CEOs will have a negative impact on the quality of financial report. It means the CEO's age has a negative relationship with the quality of financial reports when the CEO is young or too old. Gibbons and Murphy (1992) show that the level of career interest of CEOs will gradually decrease as they near retirement. These authors also show that retiring CEOs will receive a higher salary ratio according their performance. This may further increase their motivation to engage in profit management. According to research by Isidro and Gonçalves (2011), older CEOs tend to manage earnings more, it means the older the CEO is, the lower the quality of financial reports.

In Vietnam, Vo Van Nhi (2016) shows that the older CEOs are, the more mature and ethical behavior they have to prepare high-quality financial reports, and they demonstrate their role with the responsibility to disclose information for relevant parties.

On that basis, the research hypothesis about duality is set up as follows: Hypothesis H1: Older CEOs have higher financial report quality.

The studies on CEO's duality affect the quality of financial report include Dechow et al. (1996), Byard et al. (2006), Firth et al. (2007), Alves (2021), Donaldson and Davis (1991), Abed et al. (2012). The first view emphasizes the need to separate the positions of CEO and chairman of the board to ensure independence and improve transparency within the company (Jensen, 1993). According to Dechow et al. (1996), if there is a concurrent position between the CEO and Chairman of the Board, it will increase the likelihood of violations of accounting principles in businesses. Byard et al. (2006) argue that the presence of a CEO who is also chairman of the board is associated with poor-quality of financial information. Similarly, Beekes et al. (2004); and Firth et al. (2007) indicate that a financial report is more appropriate in the case of separation of the positions of CEO and chairman of the board for UK and Chinese businesses. Klein et al. (2002) argue that abnormal accruals have an inverse relationship with the quality of financial report information, the more concurrently the chairman of the Board of Directors, the more abnormal accrual behavior increases and the more the quality of financial report information decreases. Some other studies have similar results such as Wang and Liang (2008), Roodposhti and Chashmi (2010), Nekhili et al. (2016), ... they said that the abnormal level of accrual increased when leading the Board of Directors and CEO. Alves (2021) studies the relationship between CEO's duality right and profit quality. The study used a fixed-effect regression model to examine the effect of the CEO's duality right on profit quality for a sample of non-financial companies in Portugal listed between 2002 and 2016. Research results show that a CEO's duality will reduce the quality of profits; The second view is that the duality of the chairman of the board creates consensus and unity when decisions need to be made, it is better and faster than separating two different people between the two positions (Donaldson and Davis, 1991). Other studies have similarly suggested that a CEO duality business performs better than a non-CEO duality business (Tian and Lau, 2001). However, contrary to these two views, other authors did not significantly detect a link between CEO duality and information quality in different contexts of the study (Moradi and Salehi, 2012; Abed et al., 2012; Nguyen Ha Linh, 2017).

From the above theoretical basis, a basis for the authors to build a research hypothesis: Hypothesis H2: duality rights will have a negative impact on the quality of financial report.

Methods for measuring the quality of financial report: Methods for measuring the quality of financial reports such as methods for measuring accruals (Healy and Wahlen, 1999; Dechow et al., 1995), the response factor of income (Holthausen and Watts, 2001; Nichols and Wahlen, 2004;

Schipper and Vincent, 2003), timeliness of disclosure (Leuz et al., 2003; Barth et al., 2008; Ball and Shivakumar, 2005), representation of financial report (Wu, 2001), each of them has its advantages and limitations. In this study, the authors selected the financial report quality characteristic scale according to the method based on the information quality characteristics of Beest et al. (2009) and the information quality regulations of the IASB.

According to Beest et al. (2009), the technique of measuring information quality characteristics is to check the usefulness of information on financial reports, with the advantage of focusing on and directly measuring the quality of financial reports. The IASB specifies information quality characteristics as "understandable", "appropriate", "reliable" and "comparable".

3. RESEARCH MODEL, METHODOLOGY, AND DATA

3.1. Research model

The proposed research model is based on the theoretical framework and empirical research results of Beest et al. (2009), Jensen and Meckling (1976), Huang et al. (2012), Alves (2021).

Detailed research model:

Financial Report Quality ($FRQ_{i,t}$) = $\beta_0+\beta_1 Age_{i,t}+\beta_2 Dual_{i,t}+\beta_3 Size_{i,t}+\beta_4 Big4_{i,t}+\varepsilon_{i,t}$

Therein:

i: the number of companies (i runs from 1-89); t: the number of years (t runs from 1-3).

Table 1. Research scales and hypotheses

Variable (variable code)	Measure	Hypothesis	Expectations	Bibliography
Financial Report Quality * (FRQ)	Measurement of information characteristics according to the IASB			Beest et al. (2009)
Independent variables				
CEO Age (Age)	Fiscal Year - The year of birth of the executive	H_1	positive	Huang et al. (2012), Serfling (2014), Yim (2013), Isidro and Gonçalves (2011), Hambrick and Mason (1984), Peterson et al. (2001)
Concurrent rights (Dual)	The value is 1 if the CEO is the chairman of the board, the opposite is 0	H_2	negative	Alves (2021), Abed et al. (2012), Fama et al. (1983), Klein (2002), Firth et al. (2007), Dechow et al. (1996), Byard et al. (2006), Beekes et al. (2004)
Control variables				
Enterprise Size (Size)	Logarithmic total assets			Ball and Foster (1982), Kazemian and Sanusi (2015), Zalata and Roberts (2017),
Big4 auditing firm (Big4)	The value is 1 if the auditing firm is Big4, the others are 0			Huang et al. (2012)

*The FRQ variable scale was designed according to Beest et al. (2009), and measured based on IASB information quality characteristics. The scale has 21 items consisting of 5 quality characteristics: appropriate, truthful presentation, comparable, understandable, and timeliness. In Vietnam, some items cannot collect data such as explanation of data on the balance sheet and income report, page number of the glossary; adjustment of data from previous accounting periods; the metric compares to other units so the authors removed these attributes. After eliminating non-conforming items, in the end, there were only 17 items left to measure the quality of financial report. The study uses a 5-point

Likert scale to evaluate each item, of which a score of 1 is for the item with the weakest level and a score of 5 for an item that meets the very good level of the set standard.

The authors evaluated the quality of financial reports based on 17 quality attributes in two steps. Step 1, the authors conducted observations of related documents (annual reports and financial reports) to score each attribute. The scoring of each attribute of the financial report information quality characteristics was based on the "Question" and "Scale" columns to determine the score level from 1 to 5, to reduce subjectivity in the scoring process, the authors proceeded to step 2. Step 2, scored qualitative attributes, then compared them with the first scores. In case there is a difference between the scorings, the authors will review each attribute again to get the final score.

3.2. Research methodology and data

To perform the audit, the authors used quantitative methods, and regression techniques on table data including POOL, FEM, and REM. Data was collected from the financial reports of 89 industrial group of companies listed on HOSE from 2018 - 2020 with a total of 267 observations (3 years * 89 companies). The data was analyzed on the Stata 14.0 software in the following order: (i) Descriptive statistics (ii) POOL, FEM, and REM model regression, (iii) Verification of appropriate model selection, (iv) Testing the assumption of constant variance and independence between cross units are violated, (v) Remedy model defects using FGLS method (Feasible Generalized Least Squares).

4. RESEARCH RESULTS

4.1. Data Descriptive Statistics Results

Table 2. Descriptive statistics of research indicators

Quota	Unit of measurement	Average	Standard deviation	Largest	Smallest
Financial Report Quality (FRQ)	Point	58,38	6,27	72,00	43,00
CEO Age (Age)	Age	49,92	8,21	77,00	27,00
Enterprise Size (Size)	Billion VND	4.895,49	10.023,66	83.176,37	200,86

Statistical results (Table 2) show that the general characteristics of industrial group of companies have *relatively high CEO age (on average* nearly 50 years old*), relatively large enterprise size* (on average nearly 5000 billion VND, so they are classified as large-scale companies), *concurrently with a low ratio (65/267 observations = 24.34%), the* quality of financial reports is good *(average score of 58.38 points, get 72% higher than the largest score),* Big4 auditing company with a low ratio *(75/267 observations = 28%, proving that the reports of companies are almost audited by other companies)*.

4.2. Regression results and tests

Table 3. Correlation between variables in the study model

	FRQ	Age	Dual	Size	VIF
FRQ	1,00				
Age	0,02	1,00			1,02
Dual	-0,02	0,07	1,00		1,01
Size	0,46***	0,08	0,01	1,00	1,19
Big 4	0,19***	0,09	-0,06	0,40***	1,20

Note: Notations ***; ** and * respectively represent significance levels of 1%, 5%, and 10%. The results of the correlation coefficient test (Table 3) show that do not have the pair of independent and control variables have a correlation coefficient greater than 0.5, This indicates that there is no self-correlation between the variables. According to Gujarati (2004) the VIF coefficient (Variance Inflation Factor) – is an important indicator to identify the ability of multicollinearity in the model, if this index is greater than 10, it is an indication of the phenomenon of high multicollinearity. The results (Table 3) show that the factor components in the model for the VIF coefficient are all very small (VIF < 2), demonstrating that the model does not cause serious multicollinearity.

Table 4. Regression results according to models

Dependent variables Financial Report Quality (FRQ)	**Regression model**			
Independent variables	POOL	FEM	REM	FGLS
Age (Age)	-0,017	0,018	-0,004	-0,042*
	[-0,40]	[0,29]	[-0,09]	[-1,85]
Concurrent rights (Dual)	-0,338	-1,551*	-1,077	-0,511
	[-0,42]	[-1,74]	[-1,45]	[-1,48]
Enterprise Size (Size)	5,100***	4,851***	5,202***	5,131***
	[7,64]	[2,65]	[5,63]	[13,99]
Big4 auditing firm (Big.4)	0,201	-2,299	-0,845	-0,153
	[0,24]	[-1,50]	[-0,83]	[-0,53]
Constant	-3,345***	-1,017	-4,744	-2,966
Model fit	F (4,262)	F (4,174)	Wald chi2 (4)	Wald chi2 (4)
Statistics F/Wald chi2	17,76***	2,91**	36,29***	208,682***
Hausman accreditation Hausman test (chi2 (4))			2,68	

*Note: Notations ***; ** and * respectively represent significance levels of 1%, 5%, and 10%. Statistics t in brackets [ ].*

The results of Table 4 show that all 3 models POOL, FEM, REM have statistical indicators F, Wald with Prob value < α = 5%, so all 3 models are evaluated as suitable.

POOL or FEM selection: The F test results with a Prob value of > F = 0.023 (< α = 5%) with F (4.174) = 2.91 (Table 4) demonstrating a significance level of 5%, There are sufficient grounds to prove that there exist specific differences between companies in the study model. The FEM model is selected.

FEM or REM selection: The Hausman test results show a value of Prob>chi2 = 0.613 (> α = 5%) with chi2(4) = 2.68 (Table 4), the REM model is more suitable than the FEM model when studied on the data of the study. Therefore, the REM model will be used for further analyses.

Table 5. Check for self-correlation and variance changes

Verify the phenomenon of variable variance	Chibar2	Prob > chibar2
Breusch and Pagan Lagrangian multiplier test	142,15***	0,0000
Verify the phenomenon of self-correlation	F (1, 88)	Prob > F
Wooldridge test	43,669***	0,0000

The test results in Table 5 show that the Chibar2 value has Prob > chibar2 less than 5% and F (1.88) has Prob > F less than 5%, showing that the REM model has the phenomenon of variable variance and self-correlation. This will reduce the effectiveness of the REM model. In the condition that the assumptions of constant and independent variance between cross units are violated, the Feasible Generalized Least Squares (FGLS) is the most suitable choice, so that the estimation results are not skewed and effective (Beck and Katz, 1995). The estimation results of the REM model are adjusted by the FGLS method (Table 4) showing that Age and Size variables have an impact on the quality of financial Report (FRQ).

Discuss regression results:

Table 6. Aggregate expected results and statistical significance levels

Variables	Hypothesis	Expectation	Result	Significance level	Hypothesis testing
CEO Age (Age)	H_1	+		10% of the significance level	Accepted
Concurrent rights (Dual)	H_2	-	-	Do not make sense	Not accepted

The hypothesis H1 is accepted (Table 6). This means that the CEO Age variables are inversely related to the quality of financial reports (FRQs). From FGLS estimation, the research model is formulated as follows: $FRQ_{i,t} = - 2.966 - 0.042\ Age_{i,t} + 5.131\ Size_{i,t} + \varepsilon_{i,t}$

The study found evidence of an inverse correlation between CEO age and financial reporting quality. The results of the FGLS estimate show that the beta coefficient of -0.042 indicates that under the condition of other factors remains constant if the age of the CEO increases by 1, the quality of financial report decreases by 0.042 points, and vice versa (with a significance level of 10%). This result is consistent with the research of Isidro and Gonçalves (2011): CEOs age and nearing retirement age, the behavior of profit management increases. The implication is that the older the CEO gets, the more negative it will have on the quality of financial report. Because the older the CEO is and the closer he is to retirement age, the possibility of fraud will be higher due to the psychology of not having to take responsibility once he leaves his job.

5. CONCLUSIONS

Many studies focus on the relationship between the characteristics of executives or characteristics of the board and the quality of information reported. However, few studies show the impact of a CEO's age and duality on the quality of financial reports. This study analyzed the influence of age and duality of executives on the quality of financial reports of industrial group of companies listed on the stock market in the period 2018 –2020. The appropriate FGLS method was used in this study. The audit results show that the age variable of the CEO negatively affects the quality of financial reports and the CEO's duality right does not impact the quality of financial reports. By assessing the influence of age and the duality of the CEO, the authors propose the following recommendations:

Firstly, on the part of listed companies, especially companies belonging to industrial groups listed on the Ho Chi Minh City Stock Exchange. To recruit CEOs, age data is extremely important, and the results of the study can be a reference in CEO appointment and recruitment policy. Listed companies of industrial groups should not hire or appoint CEOs who are too old.

Second, on the part of investors, to evaluate the quality of financial report of the enterprise, they can consider the behavior of influential people in the business or people involved in the preparation of the financial report and the CEO is an influential person, directly responsible for preparing and presenting the financial report. The results of the study contribute a part to these supporting documents and serve as a basis for stating that: the older CEO, the lower the quality of financial report.

ROLE OF BANK CREDIT TO THE PRIVATE SECTOR AND PRIVATE INVESTMENT IN LOW – CARBON ECONOMY TRANSITION: EMPIRICAL EVIDENCE IN VIETNAM

M.A Nguyen Thi Quy[1], Assoc. Prof. PhD Nguyen Chi Hai[2]

Abstract: *This paper examines the role of bank credit to the private sector and private-sector investment in the transition to a low-carbon economy in Vietnam regarding other macroeconomic factors, such as GDP growth rate and electricity consumption from renewable energy. From 1986 to 2021, chronological classification was used. Through the ARDL regression model, the experimental results show that in the short term, credit to the private sector and private-sector investment initially help the economic transition to be effective. However, in the long run, the activities of the private sector lead to more emissions, such as CO2. Therefore, to reduce pollution, it is necessary to adopt policies on financially supporting the production and use of environmentally friendly technologies and to establish effective environmental regulations concerning the production and consumption of energy, especially the energy extracted from renewable resources.*

Keywords: *bank credit to the private sector, private invstmnet, CO2 emissions, Vietnam*

1. INTRODUCTION

Due to global warming, in the past two decades, climate change has become an issue that has received much special attention. Many believe that the increase in carbon dioxide emissions (CO2) has led to climate instability, causing global warming (Cho et al., 2013; Gozgor, 2017; Haseeb et al., 2017; Kasman & Duman, 2015). To tackle this issue, the priority is to balance the development of macroeconomic variables and climate change risks since most economic variables affect the emissions of CO2 (Sallahuddin Hassan, 2018). With their efforts, the governments of many nations have come to many agreements, decisions, and regulations to achieve net-zero emissions in 2050. This has become a more significant concern for developing economies such as Vietnam, where the growth of economic variables and environmental sustainability are both important.

From one of the poorest countries in the world to a dynamic emerging market, Vietnam might face increasingly severe risks from climate change, threatening the country's goal to become a high-income economy by 2045 (World Bank Report, 2022). Vietnam's rapid economic growth, urbanization, and industrialization have depended on the energy from coal, which is mainly the cause of greenhouse gasses (GHG) emissions. Although it does not contribute much to the global emissions rate, accounting for only 0.8%, in the past two decades, Vietnam has become one of the countries with the fastest-growing GHG emissions per capita (WB, 2022). In November 2021, at COP26 in Glasgow, the Prime Minister of Vietnam made many commitments, including the goal of achieving net-zero greenhouse gas emissions by 2050. In this regard, the private sector - an essential contributor to the economic growth and industrialization of the country - is indispensable. With about 800,000 businesses in operation, the private sector contributes nearly 45% of the country's GDP and more than 40% of investment in improving society, creating jobs for 85% of the total labor force (Ministry of Finance, 2021). The private sector plays an increasingly important role in the economy, thereby

[1] University of Finance – Marketing, Email: nguyenquy@ufm.edu.vn.

[2] University of Economics and Law, Vietnam National University HCM.

having a significant impact on environmental issues. However, domestic and foreign empirical studies rarely mention the examination of the private sector's activities on the environment. Because of these reasons, this study aims to analyze the role of bank credit in the private sector and private-sector investment. Controlling the impact of bank credit activities are other macro variables, such as the annual GDP growth rate and energy consumption, in terms of Vietnam's transformation into a low-carbon economy through the ARDL (Auto Regressive Distributed Lag) model from 1986 to 2022. In conclusion, some recommendations are made to ensure sustainable linkages in the private sector's economic activities towards environmental issues.

2. THEORETICAL AND LITERATURE REVIEW

2.1. Theories

Theoretically, Yuxiang & Chen (2011) argued that financial development through banked credit in the private sector can impact CO2 emissions through four channels. (i) *The first channel is called the capitalization effect*, whereby financial development can reduce CO2 emissions by investing in and consuming sustainable products. However, this can have adverse effects because it increases the use of goods that consume energy; (ii) *The second channel is called the technology effect,* but it has both positive and negative impacts on CO2 emissions: on the one hand, financial development supports innovators to develop green products (Hoang and al., 2019), on the other hand, new technology may increase the demand for natural resources. (iii) *The third channel is called the income effect*. Expanding bank credit helps many households buy and use more environmentally friendly products. However, this channel can also increase CO2 emissions as higher income leads to higher demand for energy-containing products. (iv) The last channel is the *regulatory effect*, whereby bank loans are regulated to finance environmentally friendly investment projects that can help reduce CO2 emissions.

The STIRPAT model proposed by York et al. (2003) is based on the IPAT model (Paul Ehrlich, 1971) on the random effects of macro variables: affluence, population, and technology on environmental quality. This model examines the leading causes of CO2 emissions; however, over the years, according to different research purposes, the STIRPAT model has been expanded with many additional variables such as economic growth, economy, foreign direct investment, trade openness, industrialization, urbanization… Investment is a prerequisite for economic activities, therefore leading to changes in CO2 emissions (X. Zhao et al., 2016). With economic growth and technology spillover, investment activities can effectively create production scale effects due to the improved level of science and technology. On the other hand, it can have an ambivalent effect on CO2 emissions (Shao et al., 2016), as it can either increase or reduce CO2 emissions, depending on whether the investment objective is to save energy or to scale up production and improve productivity.

2.2. Literature Review

The relationship between bank credit activities and CO2 emissions has been analyzed in many academic studies since the 2007-2008 global financial crisis (Tamazian et al., 2009; Tamazian & Rao, 2010, Al-murali et al., 2015; Shahbaz et al., 2013; Shahbaz et al., 2014; Ziaei, 2015, Dogan & Seker 2016; Shahbaz et al., 2017, Shahbaz & Hoang, 2019, Abbasi et al., 2022; Aljadani, 2022). The results of experimental research on the relationship between bank credit to the private sector and CO2 emissions are divided into two main groups, as the theory previously proposed by Yuxiang & Chen (2011). *Firstly,* an increase in the private-sector bank credit will increase CO2 emissions, therefore slowing the process of transforming Vietnam's economy to a low-carbon one. Using PMG to study the G7 countries in the period 1990-2014, (Raheem et al., 2019) argued that financial development (measured through the ratio of private-sector bank credit to GDP) is the cause of the slight increase in emissions. However, in India during 1980-2019, using the ARDL regression model, (Qayyum et al., 2021) confirmed that the credit to the private sector significantly increased emissions in this country. Similar results were also confirmed in the research of Pata, U.K. (2018) on Turkey, Maji et al. (2017) on Malaysia's transportation and oil and gas industry, Duan et al. (2023) and Jian et al. (2019) on China.

In contrast, *the second group* believes bank credit to the private sector will reduce emissions. Using The Principal Component Analysis method when studying the impact of bank credit on the private sector at the provincial level in China during 2001–2020, B. Zhao & Yang (2020) confirmed that the credit activity could slow down the increase in CO2 emissions. Similar observations were made in the study of Lahiani, A. (2020) on China, Islam et al., 2013 on Malaysia, and Shahbaz et al., 2013 on Indonesia. From 2000 to 2016, in 37 Sub-Saharan Africa (SSA) countries, through Regression Analysis Techniques - the pooled mean group ARDL calculator - Emenekwe et al. (2022) also showed that this credit activity reduced CO2 emissions in the nearby region and supported the Environmental Kuznets Curve (EKC) hypothesis. An increase in bank credit to the private sector positively affects CO2 emissions by affecting scale and structure, but adverse effects by technology account for the majority (Xu et al., 2022). Thus, the influence of private-sector bank credit on CO2 emissions has not come to a consistent result when researching different countries and regions.

Private-sector investment is a variable rarely discussed in studies concerning CO2 emissions. Some of the case studies are those of Hassan, S. (2018), Zhao et al., 2016), Fu et al. (2014), and Meisner (2001); the relationship between private sector investment and CO2 is also not explicit enough to clarify the role of this activity in the transformation into the low-carbon economy in several countries. In a case study, Fu et al. (2014) say that investment activity increases CO2 emissions in China, and most emissions are generated from the construction and manufacturing sectors. From 1976 to 2013, Hassan, S. (2018) researched the private sector›s investment in energy consumption and financial development variables; then, he studied the impact of economic growth on CO2 emissions in Malaysia using an autoregressive distributed lag model. The results showed a long-term correlation between the different variables and proved that private investment positively impacted CO2 emissions in Malaysia.

3. DATA AND METHODOLOGY

3.1. Data

Tim series data from 1986 to 2022 was collected from secondary sources (with annual frequency) as the materials for the analysis of the study. Specifically, data on bank credit to private (BCP) and annual GDP growth rate is collected from the World Bank (WB) statistics; data on the private investment in fixed assets (INP) is collected from the International Monetary Fund (IFM); and data on the amount of CO2 per capita and electricity consumption from renewable energy (EC) is collected from https://ourworldindata.org/.

3.2. Methodology

Based on the research of Hassan, S. (2018); Meisner (2001), Fu et al. (2014), Abbasi et al. (2022), Ahmad et al. (2018), Aljadani (2022), Chishti & Sinha (2022); Nguyen (2023), this study assesses the influence of private investment and bank credit in the private sector on two control variables, GDP growth rate and energy consumption per capita, during the process of transforming into a low-carbon economy through an econometric model as follows:

$$CO2 = f(BCP, INP, GDP, EC) \quad \textbf{(1)}$$

Note: CO2 is the average carbon dioxide emissions per capita, BCP is bank credit in the private sector (% compared to GDP), INP: is private sector investment (Ratio of total fixed capital compared to GDP: %), GDP: annual GDP growth rate (%), EC: is the amount of electricity consumption from renewable energy per capita (TWh). According to Shahbaz et al. (2012), the linear model in logarithmic form provides more accurate results than the simple linear model. Therefore, in this study, model 1 is rewritten as follows:

$$lnCO2_t = \propto_0 + \propto_1 lnBCP_t + \propto_2 lnINP_t + \propto_3 lnGDP_t + \propto_4 lnEC_t + \varepsilon_t \quad \textbf{(2)}$$

With $\propto_0$ - $\propto_4$ are regression coefficients, are statistical error, ln: natural logarithm of the variables.

ARDL method

The research used the ARDL cointegration technique developed by Im et al. (2003) and Pesaran et al.(2001) to quantify the relationship between variables. The ARDL approach, from holistic to analytic, has many advantages over the cointegration approach of Johansen (1988), as the model avoids the integration order problem, is suitable for both large samples and small samples, and provides unbiased estimates even when some of the explanatory variables are endogenous. Besides, the F-Bound tests in ARDL analysis estimate the long-run equilibrium relationship through an error correction model. Thanks to that, the calibrated ARDL parameters can provide more accuracy regarding short-term and long-term estimations and adjustment speeds.

The ARDL model is conducted in the following steps: (1) F-bound tests determine the cointegration between different variables and the long-run relationship between them; (2) Determine the lag of variables in the ARDL model using the Schwarz information criterion (SBC) or Akaike information criterion (AIC); (3) Estimate the ARDL model with defined lags to test the long-run relationship between the variables in the model.; (4) Calculate the short-term effects of variables by using the error correction model (ECM) based on the ARDL approach to cointegration.

The ARDL model estimates the short-term and long-term relationships between the variables and CO2 emissions in this study as follows:

$$\Delta lnCO2_t = \propto_0 + \begin{array}{l} \sum_{i=1}^{p} \propto_1 \Delta lnCO2_{t-i} + \sum_{i=1}^{p} \propto_2 \Delta lnBCP_{t-i} + \sum_{i=1}^{p} \propto_3 \Delta lnINP_{t-i} + \sum_{i=1}^{p} \propto_4 \Delta lnGDP_{t-i} + \\ \sum_{i=1}^{p} \propto_5 \Delta lnEC_{t-i} + \partial_1 lnCO2_{t-1} + \partial_2 lnBCP_{t-1} + \partial_3 lnINP_{t-1} + \partial_4 lnGDP_{t-1} + \\ \partial_5 lnEC_{t-1} + \varepsilon_t \end{array} \quad \textbf{(3)}$$

Note: Δ is the Forward Difference Operator, $\propto_0$ represents the constant coefficient of the model and εt is the statistical error.

are the coefficients showing the long-run relationship between variables;

represent the short-term relationship. After confirming the long-term association between the variables, we will now estimate the short-term association by building an ARDL-based error correction model (ECM).

4. RESULTS AND DISCUSSIONS

4.1. Descriptive statistics Descriptive statistics

The descriptive statistics results among variables in terms of standard deviation, mean, maximum, and minimum are presented in Table 1. The results from Table 1 show that the difference among these values is mostly not more significant than 10%; therefore, the variables in the model all follow the Gaussian distribution.

Table 1. Description of the model's variables.

Variables	Obs	Mean	Std. Dev.	Min	Max
lnCO2	36	4.3041	0.948	2.8563	5.8318
lnBCP	31	3.9879	0.7131	2.6142	4.8392
lnINP	34	2.3244	0.4343	1.3299	2.8003
lnGDP	37	6.6224	1.1368	4.5657	8.3341
lnEC	37	2.9532	1.1907	0.3249	4.9108

Source: Results are computed by authors

4.2. Unit root test results

In this study, the unit root test specifications ADF (Dickey-Fuller) and PP (Phillips-Perron) are used to test the stationarity of the regressors. The results of Table 2 show that most of the variables are stationary at the first level difference with a significance level of 1%, and only the lnGDP variable stops at the root level with a significance level of 10%. Such results confirm the suitability of the ARDL model to test the short-run and long-run relationships between variables.

Table 2. Outcomes of unit root analysis

Variables	I(0)		I(1)	
	ADF	PP	ADF	PP
lnCO2	-3.062	-11.140	-5.414***	-30.429***
lnBCP	-1.155	-3.520	-4.801***	-28.342***
lnINP	-1.713	-3.520	-7.050***	-44.433***
lnGDP	-3.327 *	-10.071	-4.665 ***	-28.754***
lnEC	-2.826	-8.275	-5.414***	-27.038***

*Note: *, **, *** represent 10%, 5%, and 1% significance level, respectively*

4.3. The optimal lags

Determining the optimal lags for chronological data when using the ARDL model helps ensure that the variables used in the model do not lead to heteroscedasticity and autocorrelation. Results in Table 3 show that the model has an optimal lag of 3 based on the minimum AIC information criterion (Perasan & Shin, 1997). Models with low statistical observations based on the SBIC information criterion will give better and more stable results (Liew et al., 2008). Therefore, to be suitable for this study, the SBIC information criterion will be used to determine the optimal lag of the variables in the model. The optimal lags of lnCO2, lnBCP, lnINP, lnGDP and lnEC variables are 1, 1, 2, 4, 2 respectively.

Table 3. Outcomes of the optimal lags

Lag	LL	LR	Df	p	FPE	AIC	HQIC	SBIC
0	31.1133			0.000	7.8e-08	-2.1761	-2.111	-1.9306
1	166.252	270.28	25	0.000	8.5e-12	-11.3543	-10.9637	-9.8817
2	194.183	55.863	25	0.000	9.1e-12	-11.5986	-10.8824	-8.8989
3	247.987	107.61*	25	0.000	2.3e-12	-13.9989*	-12.9571*	-10.0721*
4	.	.	25	.	2.7e-45*	.	.	.

Source: Results are computed by authors

4.4. Cointegration Test

After checking the stationarity of the data series to see if the variables in the model have a long-term relationship, research is done to test the cointegration between the variables. The results of this test are shown in Table 4.

Table 4. Outcomes of Cointegration Test

Variables: lnCO2, lnBCP, lnINP, lnGDP, lnEC	F - value= 3.651		t- value= -3.944	
	Critical value F-statistic		Critical value t-statistic	
Critical Values	Lower bounds I(0)	Upper bounds I(1)	Lower bounds I(0)	Upper bounds I(1)
1%	3.74	5.06	-3.43	-4.60
5%	2.86	4.01	-2.86	-3.99
10%	2.45	3.52	-2.57	-3.66

Source: Results are computed by authors

The results of the table above show that the F value is larger than the critical value of the upper limit I (1), with a significance level of 10%; besides, the t-test also shows that the t-test value is less than the critical value of the upper limit I (1), with all three levels of the significance level of 1%, 5%, and 10%. Thus, the cointegration test results show a cointegration relationship between the variables in the model. In economic terms, it means a long-run relationship exists between bank credit in the private sector, private sector investment, GDP growth, and energy consumption, which is in correlation with CO2 emissions in Vietnam.

4.5. Short-run and long-run estimates

The results of the ARDL model analysis on the short-term and long-term relationships between variables are presented in Table 5.

Table 5. Results of ARDL bound test model

Variables	Coefficient	Standard Error	p- value
Long-run estimates			
lnBCP	0.2847	0.1178	0.033
lnINP	0.5359	0.2818	0.082
lnGDP	0.1658	0.2344	0.493
lnEC	0.4248	0.2795	0.055
Short-run estimates			
lnBCP	-0.1917	0.1431	0.025

lnINP	-0.1153	0.1545	0.47
lnGDP	-0.2965	0.2534	0.265
lnEC	-0.5025	0.1013	0.000
R2	0.8278		
Adjusted value of R	0.6269		

Source: Results are computed by authors

The above table shows that in the short term, all factors reduce CO2 emissions in Vietnam, although the lnINP and lnGDP variables are not statistically significant. Under the condition that other factors remain constant, expanding credit activities in the private sector has been confirmed to reduce CO2 emissions (Islam et al., 2013; Shahbaz et al., 2013; B. et al., 2020; Emenekwe et al., 2022). These experimental studies all prove that increasing credit activity in the private sector can attract more foreign investment in energy-saving projects, reducing energy consumption and thereby reducing emissions. This result confirms the capitalization and technological effect of private investment activities on CO2 emissions in Vietnam, as Yuxiang and Chen (2011) concluded. At the same time, increasing energy consumption from renewable sources also positively affects environmental quality, supported by other macroeconomic variables.

However, in the long run, credit, investment in the private sector, and energy consumption increase the significance level of CO2 emissions by 5% and 10%, respectively. This result is consistent with previous studies by Jian et al. (2019) and Raheem et al. (2019). The leading cause of this phenomenon in Vietnam is as follows: the continuous flow of consumer credit given to the private sector over a long period has created more cash flow in the economic system, which stimulates the buying and using of high-energy consumer goods for example, motorcycles, cars, air conditioners, refrigerators, and building houses… This activity has increased energy consumption, but the electricity source generated from renewable energy is not enough, so alternative energy sources must be found, leading to an increase in emissions. For the business sector, the scale of private credit business is increasing, helping businesses access more abundant capital and increasing investment activities. The results from Table 5 also show that with the 10% significance level, if the business's investment in fixed assets increases by 1%, there will be an increase of 0.53% in emissions as long as other factors are consistent. This correlation is suitable with the previous assertion in the study of Hassan, S. (2018), Zhao et al. (2016), and Fu et al. (2014). Thus, financial support is increasingly favorable for developing private enterprises, helping them continue expanding production, thereby increasing energy consumption demand and increasing emissions, hence the increase in both the demand for energy consumption and emissions in Vietnam. As a developing country, increasing private investment (especially FDI) will positively affect the environment. However, in the long term, with more significant capital needed for economic growth, in the context that environmental regulations are still relatively lax in Vietnam, and businesses to maximize profits, this will have specific consequences concerning the environment. Although not statistically significant, in the long term, a 1% increase in GDP growth rate also increases CO2 emissions by 0.16% because for Vietnam - a developing country, the growth of its economy remains one of the top goals; therefore, the damage caused to the environment is inevitable.

Besides, the study uses CUSUM and CUSUMsq tests (Brown et al., 1975) to measure the effectiveness of the regression model. Figure 1 shows that the critical values are below the 5%

significance level, indicating that all estimated parameters are stable over the sample period (the kink does not lie outside the limits of the straight line). Therefore, this confirms that the ARDL model is appropriate and reliable.

Figure 1. Results of CUSUM and CUSUMsq test

5. CONCLUSIONS AND POLICY IMPLICATIONS

This study examines the role of bank credit in the private sector and private investment during Vietnam's transformation into a low-carbon economy under the control of two variables: GDP growth and energy consumption. For this purpose, data from 1986 to 2021 are in the suitable ARDL regression model. The experimental results of the study show that bank credit in the private sector and private sector investment reduce CO2 emissions in the short term but increase CO2 emissions in the long term, making Vietnam's goal of becoming a low-carbon economy more difficult. As a result, for the country to achieve net-zero emissions, it is necessary to pay attention to the following points:

Firstly, the current expansion of bank credit in the private sector in Vietnam is only effective in the short term. Consequently, in the long term, because the private sector will have an advantage in promoting capitalization, technology, and income effects, it is essential to consider reforming financial activities and prioritizing lending activities, especially environmentally friendly projects. In the current situation of scarce business capital, expanding credit activity will help businesses have the opportunity to access more abundant money to invest in new technology, which consumes less energy or green technology.

Secondly, private investment also negatively affects the environment ultimately. Consequently, continuing to create more abundant capital for the economy, such as opening activities for attracting foreign investment, should go hand in hand with more specific and complete constraints and regulations in terms of the environment. This creates a great set of rules for investment activities while "greening" the economy.

Thirdly, it is encouraged to consume goods that use energy sparingly and exploit and use solar and wind energy sources better. In addition, it is advisable to facilitate the production and exploitation of renewable resources to reduce pressure on the government and, simultaneously, open up new business opportunities contributing to the country's sustainable economic growth.

THE IMPACT OF FINANCIAL DECISIONS ON DEFAULT RISK A STUDY BASED ON VIETNAM LISTED CONSTRUCTION ENTERPRISES

Assoc. Prof. PhD. Pham Thi Thanh Hoa, Trinh Nhu Yen[1], PhD. Pham Thi Minh Hien[2]

Abstract: *This study aimed to examine the impact of financial decisions on default risk of Vietnam listed construction enterprises, including three decisions: financing, investing and distribution. The research analyzed a sample of 16 construction companies listed in the Hochiminh Stock Exchange of Vietnam, from 2012 to 2021 by using panel data regression models such as Pooled OLS, FEM, REM. The results indicate that financing and investing decisions are the most influential on default risk, in which current liabilities to total capital and current assets to total asset ratios are the most significant indicators.*

Keywords: Financial decisions, default risk, financing decision, investing decision, dividend decision, Vietnam listed construction enterprises

1. INTRODUCTION

The business is always tied to financial decisions and these financial decisions can lead to different financial risks, including the risk of default. The trade-off relationship between profit and risk has become a classic theory in corporate governance in general and financial management in particular. Research on financial risk has been studied for a long time and has many opinions. The issue of default risk and financial decisions is always a matter of concern in practice, in the business environment. The goal of corporate financial management is to maximize the value of the enterprise or to maximize the value of shareholders' ownership, which can be understood as maximizing the market value of the enterprise. Making financial decisions to maximize shareholder equity can lead to default risk, so it is necessary to study the effect of financial decisions on default risk.

Determining the effects of financial decisions on default risk will help investors have a clearer overview of the business they are investing in rather than following the crowd vaguely. Currently, Vietnam still does not have a systematic and open risk assessment organization for investors. Only the Credit Information Center of the State Bank is a public agency with the function of national credit registration; collecting, processing, storing and analyzing credit information; scoring, credit rating, but most investors, especially individual investors, cannot access that information. Therefore, understanding the impact of financial decisions on the risk of default will help corporate administrators and market regulators to take timely measures and solutions.

The stock market has also experienced many fluctuations, recently the world financial crisis in 2007 has affected the stock market in particular and the Vietnamese economy in general. In recent years, the business environment has become more and more difficult, complicated, and affected business activities of enterprises. Climate problems, natural disasters, especially Covid-19 have significantly affected the solvency and default risk of enterprises. In Vietnam, there have been many large and small businesses of different industries affected by Covid-19 and many businesses have fallen into bankruptcy since the pandemic occurred. Thus, the study aims to examine the impact of financial decisions on default risk of listed construction firms.

[2] General Department of Taxation

The rest of this paper is organized as follows: Section 2 reviews the prior literatures and develop the hypothesis. Section 3 presents the data and methodology, while Section 4 shows the empirical findings and discussion. Finally, conclusions are presented in Section 5.

2. LITERATURE REVIEW

In the world, Frank H. Knight said: "risk is the uncertainty that can be measured". Expressing more specifically, the authors C. Arthur William, Jr. Michael, L. Smith in the book "Risk management and insurance" - Risk management and insurance wrote: "Risk is the potential volatility of the results. Risks can appear in almost any human activity.

The goal of financial decisions is to maximize shareholder value and revolve around three main decisions: investment decisions, capital raising decisions, and income distribution decisions. Decisions made to invest or raise capital or decisions on income distribution that have the potential to increase the value of the enterprise are evaluated as good decisions (Damodaran, 2014). Financial decisions include investment decision, financing decision and dividend decision.

Default risk:

Measuring default risk has been studied for a long time and there are many approaches. Synthesis of popular measurement methods through Altman's Z score model. This is a well-tested and widely accepted method today. This index can help investors better assess risks, and even predict the bankruptcy risk of businesses in the near future. The bankruptcy risk coefficient, or Z score, was established by American economist Edward I. Altman, a lecturer at New York University. This coefficient only applies to businesses, not to financial institutions such as banks or financial investment companies. In the US, the Z-score has been relatively accurate in predicting bankruptcy of businesses in the near future. About 95% of business failures are predicted by Z score one year before the closing date, but this rate drops to just 74% for 2-year forecasts.

Binh and Duc (2017) in their study to find the right model to predict bankruptcy and financial distress for Vietnamese listed companies, proved that the Z-score is one of the two key models to give signals about the financial viability of the company. bankruptcy of enterprises. It can be said that Altman's Z''-score model has proven to be a good predictor model, which can be applied effectively and accurately in emerging markets, especially for countries that do not have such a system. unified credit rating assessment, including the Vietnam market.

The research model to evaluate the impact of financial decisions on the default risk of enterprises is written in the form of the following equation:

$$ZS = a.F_i + b.I_j + c.D_k + Size_s + \varepsilon_m \quad (1)$$

In which:

ZS: Default risk

F: Financing decision

I: Investment decision

D: Dividend decision

Hypothesis

The study on the default risk of Chinese enterprises by Law and Roache in the IMF report (2015) has tested the correlation between the independent variables representative for the profitability ratios: the ratio of EBIT to the total assets, the ratio of retained earnings to the total assets; liquidity measured by the ratio of working capital to total assets, leverage ratio, debt structure measured by short-term debts to long-term debts, size and age of companies to dependent variable (Z score) . The study uses the panel data regression method to analyze and give the results. The results of the study show that *in terms of profit distribution decisions, the larger the share of profits for shareholders, governments and creditors on total assets, the higher the Z-score – or the lower the probability of default*. And the greater the ratio of retained earnings to total assets, the lower the probability of default. *Regarding capital decisions, Chinese enterprises tend to increase their liabilities, increasing the possibility of default.* In particular, the higher the ratio of short-term debt to long-term debt, the higher the risk of default. *Regarding investment decisions, the ratio of working capital to total assets also positively and significantly affects the risk of default.* The greater the amount of working capital a company maintains, the lower the probability of default. *For the indicators of liquidity or size and age, there is no significant statistical significance*.

In another study of Khurshid, M.R (2013), also used the method of regression analysis of array data with nearly similar variables. The dependent variable is also the Z score calculated according to Altman's research and the independent variable includes liquidity, solvency, profitability and profit margin. *The results show that liquidity, profitability and solvency are negatively correlated with the dependent variable.* For example, an increase in the ratio of liabilities to total assets will decrease the Zscore thereby increasing the probability of default. In theory, when a business has a high net profit to sales ratio, it means that the business is operating very efficiently, but the results of the study show that *ROS has the opposite effect with Zscore*. That is, when ROS increases, Zscore decreases and default risk increases. This result is quite exceptional compared to the normal theory. And the EBIT-to-Total assets return is positively correlated with Zscore.

In the study on the determinants of China's default risk by Xuan Zhang et al. (2020) studied the polynomial logit method and concluded that the *default risk of enterprises is lower when interest rates are high.* Because when interest rates are high, the debt-to-total assets ratio will decrease and reduce the risk of default of enterprises. In addition, *businesses may face a high risk of default when they hold many highly liquid assets*.

Abor et al. (2009) in their research on risk pressures and corporate finance policy in emerging markets concluded that firms with more intangible fixed assets would rely more on external debt than enterprises with a proportion of tangible fixed assets. In addition, *enterprises with a high proportion of fixed assets in the asset structure will have less external debt, so default risk is also reduced*. Moreover, the dividend payout ratio shows the firm's more debt reliance, even at the 10% significance level. Businesses with a low dividend-to-capital ratio often have cash constraints and may have difficulty meeting their debt obligations when their debts come due. *Firms in emerging markets that can maintain high dividend payouts are more liquid and more likely to attract investors for loans.*

Hypothesis 1:

Ho: Financial decisions do not impact on default risk of Vietnam listed construction enterprises.

H1: Financial decisions have an impact on default risk of Vietnam listed construction enterprises.

Hypothesis 2:

Ho: Investment decisions do not impact on default risk of Vietnam listed construction enterprises.

H1: Investment decisions have an impact on default risk of Vietnam listed construction enterprises.

Hypothesis 3:

Ho: Dividend decisions do not impact on default risk of Vietnam listed construction enterprises.

H1: Dividend decisions have an impact on default risk of Vietnam listed construction enterprises.

Variables and metrics

The dependent variable of the model is ZS calculated from Altman's formula for predicting default probability Z" in emerging markets such as Vietnam.

Z"= 3.25 + 6.56 R1 + 3.26 R2 + 6.72 R3 + 1.05 R4

The independent variable includes a group of 3 financial decisions, namely investment decision, financing decision and profit distribution decision.

Table 3.1: Describe independent variables in the model

Signal	Name	References	Expected direction
F2	Current Liabilities/Total E+L	Nenu and partners (2018)	+/-
F3	Total Liabilities/Total E+L	Rommer (2005)	-
I1	Current Assets/ Total Assets	Ngo Thu Giang (2015)	+
I2	Fixed Assets/Total Assets	Ngo Thu Giang (2015)	+
D2	EPS	N/G	+
Size	Size	Ln (Total assets): Book value of total assets (Vo and Phan, 2013)	+

3. RESEARCH METHODOLOGY AND DATA

3.1. Research data

The topic is limited to companies in the sample of 16 construction companies listed on HOSE. The data of listed companies is the annual financial statements of companies. Financial reporting data of companies in the sample are collected from reliable aggregated sources.Financial report data is aggregated according to groups of criteria that suit the requirements of the topic.The result of this process is that the data is gathered in the form of a panel (panel data), the observations are made on many companies over a time series (from 2012 to 2021).

3.2. Research methodology

This study uses the method of regression analysis of panel data using Stata software.

First, the author runs the loop to test the reliability of the variables in the model because for each decision the author has included representative criterias. After selecting suitable variables, the author will conduct descriptive statistics, regression using panel data, FEM and REM models to give the better model and defects for the model.

4. RESULTS AND DISCUSSION

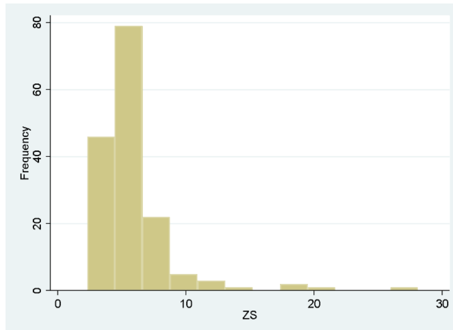

Figure 4.1: Zscore distribution histogram (Source: Stata 17 software)

Looking at the graph describing Zscore, almost 80% of the Z coefficients appear with a value greater than 5, more than 40% of the Z coefficient appear with a value less than 5. There are also few sales. Firms appear with Zscores greater than 10. This means that firms selected within 10 years all have Z-scores in the gray and safe zones.

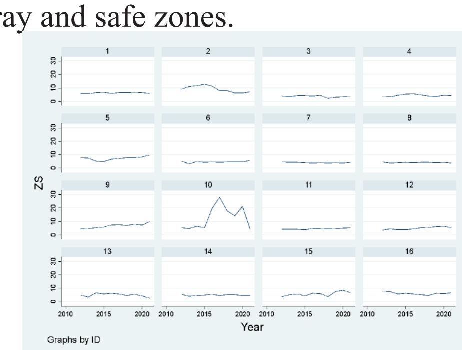

Figure 4.2: Zscore distribution histogram in accordance to stock code (Source: Stata 17 software)

Looking at the Zscore distribution chart by stock code, most of the enterprises in the sample have stable Zscore and are in the safe threshold. Although even during the Covid-19 period, businesses of different industries were significantly affected, the enterprises in the research sample all balanced the Z coefficient. However, stock code No. 10 (NHA) is the most volatile (14), there are years when the Z coefficient is close to 30 at an extremely safe threshold.

Descriptive statistic

Table 4.1: Descriptive statistics of variables

Variable	Obs	Mean	Std. dev.	Min	Max
ZS	160	5.915406	3.18939	2.282983	28.09145
F2	160	.4628014	.2144418	.0228328	.8400835
F3	160	.590317	.2060765	.0454678	.8632241
I1	160	.6354639	.2559101	.020389	.9669799
I2	160	.1916607	.2245826	.0041247	.915833
D2	160	1806.751	2217.708	-5652.699	7984.809
Size	160	28.0552	1.434109	25.49669	32.75029

It can be seen that the average Zscore of the sample is 5.91. This number is higher than 2.6, showing that the selected enterprises are in the safe zone similar to the statistical section of the default risk table.

Among the selected variables, only the D2 boundary (EPS) has the smallest value which is negative. This is also possible because while doing the research data, the author has also seen that there are years when the business has a loss leading to negative EPS.

Correlation matrix (alpha =5%)

Table 4.2: Correlation matrix (source: Stata 17 software)

	ZS	F2	F3	I1	I2	D2	Size
ZS	1.0000						
F2	-0.4038*	1.0000					
F3	-0.6729*	0.5991*	1.0000				
I1	0.0536	0.7888*	0.2581*	1.0000			
I2	0.0652	-0.6514*	-0.1519	-0.8394*	1.0000		
D2	0.2743*	-0.0466	-0.1196	-0.0008	0.0661	1.0000	
Size	-0.4460*	0.2741*	0.5327*	-0.0402	-0.1033	-0.0696	1.0000

In general, financing decisions are negatively related to ZS and investment decisions and profit distribution decisions are positively correlated with the dependent variable. To be specific, F2 and F3 have the most correlation with the dependent variable and inverse. I1, I2 are positively correlated. Moreover, the correlation coefficients between the explanatory variables still consider and take care of multicollinearity in the model.

Multicollinearity test VIF coefficient

Table 4.3: Multicollinearity test VIF coefficient

Variable	VIF	1/VIF
I1	7.05	0.141920
F2	4.96	0.201728
I2	4.15	0.240702
F3	2.43	0.410895
Size	1.80	0.555289
D2	1.04	0.962601
Mean VIF	3.57	

The VIF coefficient is used to test for multicollinearity. The coefficients have no multicollinearity when the mean is less than 10. Looking at the table, it can be seen that mean VIF = 3.57 shows that the variables do not have multicollinearity. This is also evident when the VIF coefficient of each variable is less than 10.

Table 4.4: Results

Variables	Dependent variable: ZS		
	FEM	REM	FEM robust
Constant	5.076601 (0.643)	9.930362 (0.125)	5.076601 (0.661)
F2	-12.5449 (0.000)	-10.20519 (0.000)	-12.5449 (0.028)
F3	-3.325117 (0.080)	-5.293529 (0.001)	-3.325117 (0.129)
I1	10.37218 (0.000)	7.797026 (0.000)	10.37218 (0.001)
I2	-2.592642 (0.182)	-0.2475053 (0.885)	-2.592642 (0.222)
D2	0.0002473 (0.021)	0.0002769 (0.003)	0.0002473 (0.000)
Size	0.0736563 (0.850)	-0.0561297 (0.801)	0.0736563 (0.870)
Hausman Test	Chi2(6)=14.80 Pro>chi2=0.0113		

Ho: There is no correlation between unobserved effects and explanatory variables (random effect exists, REM is the chosen model)

H1: There is a correlation between unobserved effects and explanatory variables (random effects do not exist, FEM is the chosen model)

Prob > chi2 = 0.0113. This figure is lower than 0.05, it means reject Ho, accept H1. Hence, it proves that the FEM model is more optimal than the REM model. So, the final model is the FEM model. The author tests the variable variance for the defective result and then apply FEM robust.

4.2 Regression results

FEM: (2)

Through the process of testing the correlation between financial decisions and default risk, it is also clear that there is a close relationship between how to raise capital, how to invest and how to distribute profits with bankruptcy of the enterprise. Sometimes we cannot avoid going into debt, but by coordinating financial decisions together, businesses will not fall into the gray area - high probability of bankruptcy. For example, businesses that do not invest in low-liquidity assets such as inventory, fixed assets, and already invested should choose high-quality assets, using maximum effort. At the same time, companies find ways to increase revenue and save all kinds of costs from production costs, selling expenses, and administrative expenses.

Financing decisions have a negative impact on default risk, in which, F2 (Current Liabilities/ Total Capital) has the most influence on default risk. Thus, the more debt a business uses in its total capital, the lower the Z' score, which means the risk of default is high. This is logical and consistent with the theory because it is clear that when a business has a lot of debt, the risk of bankruptcy will be higher than that of a business with little debt. This conclusion is similar to studies in China (Law and Roache, 2015) in Vietnam (Nguyen Thi Vu Khuyen, 2019).

Investment decisions have a positive effect on default risk, the ratio of current assets to total assets has the most influence on the risk of default in investment decisions. This is also evident because the proportion of current assets accounts for the majority of the assets structure of enterprises in the sample. This result shows that if the enterprise increases asset investment, the Z' coefficient is high, which means that the risk of default is low. This is consistent with theory and practice, when businesses invest in assets and manage assets effectively, they will develop firmly and avoid the risk of default.

It can be seen that the dividend decision has no significant effect on the default risk because the percentage is the lowest in the research model. It seems that the decision on how much to distribute profits does not seem to affect default risk too much. D2 (EPS) has a positive effect on the coefficient Z'. This means that the higher the EPS, the higher the Z' coefficient, the lower the risk of default. This positive relationship shows that if businesses try to increase revenue, save costs to increase profits, the risk of default is lower. Effective business is still a safe measure to help businesses survive.

Impact of size to default risk: Research results of 16 construction enterprises show that the variable size has no effect on default risk. It is also possible that because the enterprises selected in the sample are large, and listed companies, they are more resilient to events and have better financial capacity than smaller companies. However, some studies in France (Rommer, 2015), Jordan (Zeitun, 2006) show that the scale fluctuates in the same direction with ZS.

5. CONCLUSION

In correlation with default risk, enterprises all show that debt structure is a very important factor. In the construction industry, the results show that increasing current liabilities reduces the risk of default. In addition, the ratio invested in short-term assets reduces the risk of default. Regarding financial decisions, the maintenance of capital structure has a great influence on the default risk of enterprises. When the debt structure is too high, especially short-term debts, it means that businesses have to face many short-term debts to pay, if they do not have enough money to pay, businesses will easily fall into bankruptcy. In terms of investment decisions, how enterprises choose to structure their assets will also affect the default risk. When enterprises increase the proportion of current assets, it will reduce the default risk. This is also reasonable because after all, businesses always have to trade-off between risk and profit. When increasing the proportion of assets structure makes more production and profits increase, default risk will also decrease. Based on the profit distribution decision, the conclusion shows that EPS has a positive relationship with Z', the higher the EPS, the lower the default risk. Dividend distribution will also affect the financing and investment decisions of enterprises, so this is also a factor that should be considered by enterprises when making financial decisions. Construction enterprises need to develop appropriate business strategies to increase profitability, financial management capacity, and reduce financial risks.

The number of samples given in the model is still limited and quite small. The implementation cannot be without errors, so the level of interpretation and accuracy of the model is still limited because the truthfulness and transparency of the financial statements are still not really guaranteed. However, the results of the study can be the direction for many other future studies on this topic

PROMOTING VIETNAM - ISRAEL TRADE RELATIONSHIPS IN THE CONTEXT OF THE SIGNING OF VIFTA AGREEMENT

Assoc. Prof.Dr. Vu Duy Vinh, Dr. Do Dinh Thu, Tran Thi Thuy Hang, Nguyen Thi Thu Ha[1], Vu Dinh Dung [2]

Abstract: The Vietnam - Israel Free Trade Agreement (VIFTA) was officially signed on July 25, 2023. This is the first new-generation FTA that Vietnam has signed with a country in the Middle East. The signing of VIFTA has opened up great opportunities for economic cooperation between Vietnam and Israel, especially international trade. Through VIFTA, Vietnamese goods can not only enter the Israeli market, but from Israel, Vietnamese goods can also penetrate the prospective markets of many Middle Eastern countries such as the United Arab Emirates (UAE), Kuwait, Saudi Arabia, Turkey... On the other hand, Israeli goods can also easily enter the Vietnamese market and the ASEAN market through Vietnam. The article focuses on studying the current state of Vietnam-Israel trade relations since the two countries began negotiating VIFTA in 2016 until now. From there, it draws conclusions on the results achieved and limitations in trade relations between the two countries. On the basis of the current status of trade relations between Vietnam and Israel and commitments in VIFTA, the article proposes solutions to promote trade relations in the context of the two countries signing the VIFTA Agreement. .

Keywords: Vietnam - Israel Free Trade Agreement, VIFTA, Vietnam - Israel trade relations

1. INTRODUCTION

Although Vietnam and Israel are geographically distant, they have many favorable factors: the products of the two countries do not compete with each other but complement each other, Israel needs many Vietnamese products and vice versa. While the Israeli market is not large, it is the gateway for Vietnamese goods to enter the markets of prospective countries in the Middle East. Vietnam is also a gateway for Israeli goods to enter the ASEAN market. Realizing the great potential and opportunities of both parties, Vietnam and Israel have negotiated to sign the VIFTA Agreement with a very high level of commitment.

The problem for Vietnam is finding ways to take advantage of the VIFTA Agreement to promote economic cooperation between the two countries, especially international trade relations.

The article includes the following main sections:

- Introduction to research methods and overview
- Analysis of the current state of Vietnam - Israel trade relations in the 2016 – 2022 period
- Evaluation of Vietnam - Israel trade relations in the 2016 – 2022 period
- Propose some solutions to promote Vietnam - Israel trade relations in the context of the signing of the VIFTA Agreement

2. RESEARCH METHODS AND OVERVIEW

2.1. Research methods

The article uses several research methods commonly used in the field of social sciences such as qualitative analysis, comparison, synthesis, descriptive statistics, analytical statistics, case study

[1] Email: vuduyvinh@hvtc.edu.vn, Academy of Finance .

[2] Foreign Trade University

methods. The article uses the above research methods to analyze and forecast based on available survey data, data of scientific works, reports of domestic and foreign agencies and organizations, available official statistical data.

2.2. Research overview

As relations between Vietnam and Israel have not been close and the VIFTA Agreement has just been signed, there are not many research works on this topic. Here are some studies on Vietnam-Israel economic and trade relations as well as research on the VIFTA Agreement:

- Research by Hoang Kieu (2021) in the article: "The potential for Vietnam-Israel cooperation is huge, especially in the field of technology" published on the online newspaper vov.vn. The article points out Israel's strengths, especially in techniques and technologies such as agriculture, defense and information technology, etc. If Vietnam manages to take advantage of and exploit these technologies, it will bring great benefits for Vietnam.

- Research by Uyen Huong (2020) in the article: "Vietnam-Israel promotes the signing of a Free Trade Agreement" published on the online newspaper of the Vietnam News Agency. The article points out the great potential for trade cooperation between Vietnam and Israel as the two countries' products complement each other but do not compete with each other, helping Vietnam to have access to high-tech Israeli products, contributing to reducing production and business costs, thereby improving the competitiveness of Vietnamese goods.

- The article: "Tightening relations with Israel" published on the People's electronic newspaper on May 13, 2022 on the occasion of the working visit of the Communist Party of Vietnam delegation to Israel, pointed out that Vietnam is Israel's No. 1 trade partner in Southeast Asia, with the rapid growth of two-way trade reflecting the huge goods exchange needs of the two sides. Israel is committed to supporting policies and programs on technology transfer to Vietnam in areas of strength such as start-up nation, digital transformation, renewable energy, information technology, artificial intelligence; it actively promotes the early signing of a Free Trade Agreement (FTA) and a Labor Cooperation Agreement between the two countries.

The above studies are only general and suggestive. They have not yet deeply analyzed the theoretical and practical bases and do not provide systematic and long-term solutions.

3. RESEARCH RESULTS

3.1. Actual state of export activities from Vietnam to Israel in the 2016 – 2022 period

** In terms of scale, export growth rate*

In the first three years since the negotiation of the VIFTA Agreement (2016 to 2018), Vietnam's exports to Israel tended to increase, but not evenly. In 2020, when the Covid-19 pandemic broke out, Vietnam's exports to Israel decreased sharply, but increased sharply again from 2021, and will continue to increase in 2022 but slowly. This is a very positive sign.

Table 3.1: Vietnam's export turnover to Israel in the 2016 – 2022 period

Year	Export turnover ((Million USD)	Growth (%)
2016	554.15	4
2017	712.10	28.5
2018	779.84	9.2

2019	774.03	-0.7
2020	683.38	-11.3
2021	780.60	14.2
2022	785.67	0.6

Source: Compiled from data of the Ministry of Industry and Trade and General Department of Customs

** In terms of export items*

Vietnam's export products to the Israeli market are not abundant or diverse and only focus on a few items such as mobile phones & components; aquatic products, cashew nuts; coffee; textile; footwear… These are also Vietnam's strong products.

Table 3.2: Some of Vietnam's exports to Israel in the 2016-2022 period

Unit: Million USD

Year / Items	2016	2017	2018	2019	2020	2021	2022
Mobile phones & accessories	287.00	393.48	420.87	424.20	315.23	355.69	293.21
Seafood	48.29	74.24	95.68	65.44	54.13	76.10	80.36
Cashew	40.32	46.66	54.59	53.27	48.64	57.86	59.75
Coffee	21.83	21.40	22.82	18.00	19.12	20.26	24.31
Textile	15.26	17.78	21.61	22.47	22.37	25.20	32.77
Footwear	36.87	43.46	41.82	51.12	42.91	61.29	92.30
Other goods	113.55	115.10	122.45	139.50	180.93	184.23	202.97
Total	554.15	712.10	779.84	774.03	683.38	780.60	785.67

Source: Compiled from the data of General Department of Customs

In the structure of Vietnam's exports to Israel, mobile phones & components account for the highest proportion but have been in decline (in 2019 they were the highest, reaching 54.8%, but in 2022 only 37.4%).

Footwear and seafood have the second and third highest proportion respectively and textiles ranks third. These items all had increasing significance in the structure of Vietnam's exports to Israel from 2016 to 2022 (Ha Anh, 2023).

3.2. Actual state of import activities to Vietnam from Israel in the 2016 – 2022 period

** In terms of scale, import growth rate*

Table 3.3: Import turnover of Vietnam fromIsrael for the 2016 – 2022 period

Year	Import turnover ((Million USD)	Growth (%)
2016	683.75	-43
2017	345.30	-49.8
2018	420.50	21.7
2019	381.92	-9.1
2020	893.20	133.9
2021	1,109.70	24.3
2022	1.442.19	31.1

Source: Compiled from data of the Ministry of Industry and Trade and General Department of Customs

From 2016 to 2022, Vietnam's imports from Israel were relatively erratic, with sharp decreases in some years and strong increases in others. Imports have seen a particularly big increase from 2020, which may not be a positive trend.

** In terms of imported goods*

Vietnam imports a number of products from Israel such as vegetables and fruits; fertilizer; computers & electronic products, components; machinery, equipment and spare parts.

Table 3.4: Vietnam's imports from Israel in the 2016 - 2022 period

Unit: Million USD

Year / Items	2016	2017	2018	2019	2020	2021	2022
Vegetables	2.13	2.07	2.48	4.15	2.53	3.07	3.8
Fertilizer	46.10	38.21	58.39	52.1	55.29	96.5	92.8
Computers, electronic products, components	505,36	217.04	259.7	220.9	754.25	911.97	1,209.7
Other machinery, equipment and spare parts	81.40	42.35	63.85	66.18	40.7	49.62	59.3
Other goods	48.76	45.63	36.23	38.62	40.2	48.52	76.58
Total	683.75	345.3	420.5	381.92	893.2	1,109.7	1.442.19

Source: Compiled from data of the Ministry of Industry and Trade and General Department of Customs

Over the years, Vietnam has not imported many types of products from Israel. Among them, computers, electronic products, components and fertilizers have the highest quantities, with the most significant turnovers.

Other machinery, equipment and spare parts are also imported with relatively considerable turnover into Vietnam. The quantity of consumer goods imported into Vietnam from Israel are insignificant. Most of the goods imported from Israel are input production materials for economic sectors that contribute to promoting development of production; inputs with advanced technologies have particular significance. This is a favorable sign (Huyen My, Thy Thao, 2021).

3.3. The current situation of Vietnam - Israel trade balance in the 2016 - 2022 period

Table 3.5: Vietnam - Israel trade balance in the 2016 - 2022 period

Unit: Million USD

Year	Export turnover	Import turnover	Trade balance
2016	554.15	683.75	-129.6
2017	712.10	345.30	366.8
2018	779.84	420.50	359.34
2019	774.03	381.92	392.11
2020	683.38	893.20	-209.82
2021	780.60	1,109.70	-329.1
2022	785.67	1.442.19	-656.52

Source: Compiled from data of the Ministry of Industry and Trade and General Department of Customs

In 2016, when the Vietnam-Israel FTA negotiations began, the trade balance between Vietnam and Israel had a deficit of 129.6 million USD.

In 2017, 2018 and 2019 Vietnam's exports to Israel grew considerably while imports to Vietnam from Israel increased insignificantly. As a result, Vietnam's trade balance with Israel was in surplus for 3 consecutive years, with the surplus quantity increasing from $366.8 million in 2017 to $392.11 million in 2019.

In 2021 and 2022, Vietnam's exports to Israel increased slowly, while imports from Israel experienced a surge, making Vietnam's trade deficit with Israel increasingly severe (Le Thai Hoa, 2023).

Figure 3.1: Import and export turnover and Vietnam - Israel trade balance in the 2016 - 2022 period

4. EVALUATION OF VIETNAM-ISRAEL TRADE RELATIONS IN THE PERIOD OF 2016 - 2022

4.1. Achievements

4.1.1. Considerable two-way trade growth

Despite many obstacles due to Vietnam and Israel not yet signing an FTA, lack of incentives between the two countries and geographical distance, two-way trade between Vietnam and Israel are growing rapidly.

Table 4.1: Two-way trade between Vietnam and Israel in the period of 2016 -2022

Unit: Million USD

Year	Export turnover	Import turnover	Two-way trade	Growth (%)
2016	554.15	683.75	1.237.9	-28
2017	712.10	345.30	1,057.4	-14.5
2018	779.84	420.50	1,200,3	13.5
2019	774.03	381.92	1,155.9	-3.7
2020	683.38	893.20	1,576.9	36.4
2021	780.60	1,109.70	1,890.3	19.9
2022	785.67	1.442.19	2.227.9	17.9

Source:Compiled from data of the Ministry of Industry and Trade and General Department of Customs

Trade relations between the two countries have ups and downs. In general, trade relations between both parties have increasingly grown, especially from 2020 to 2022 despite the whole world being heavily affected by the Covid-19 pandemic. This proves that the two countries have seen each other's potential and want to strengthen their commercial ties (Ha Anh, 2023).

4.1.2. Many Vietnamese products are popular with Israeli consumers

Vietnamese products favored by Israeli consumers are agricultural products, especially spices, seafood, food, consumer goods...

For seafood products, Israel has been in the Top 22 leading markets out of over 100 seafood export markets of Vietnam every year. Notably, in 2022, tuna exports to Israel reached 36.63 million USD and Israel ranked fourth among the 10 largest tuna import markets of Vietnam (after the US, Canada and Japan)..

Canned tuna, frozen shrimp and squid, pangasius, coffee, pepper, cashew nuts, clothes, shoes... have a stable foothold in the market and are favored and appreciated by Israeli consumers. In addition, fragrant, long grain, 5% broken rice, packed in 5 kg bags; dried, processed foods, dried or canned processed fruits (mango, banana, passion fruit, dragon fruit, pineapple), dried fruits and vegetables, confectionery, soft drinks of all kinds... continue to penetrate in small quantities and values, but have begun to be distributed in the Israeli market.

Currently, Israeli businesses have increasing interest in the Vietnamese market and partners and considering Vietnam among the important stable goods suppliers in Asia. Vietnamese products are favored by Israeli consumers for their quality and unique flavor, which Vietnam needs to maintain.

4.1.3. Complementary items

Vietnam, on the basis of its conditions and advantages, has built a structure of import and export goods complementary with Israel's. The goods that Vietnam exports to Israel are those that Israel does not have advantage in, and conversely, the goods that Israel exports to Vietnam are the goods that Vietnam lacks and has no advantage.

Import and export goods of the two countries are not mutually exclusive, hardly compete but complement each other (Huyen My, Thy Thao, 2021).

4.1.4. Vietnam imports a number of important inputs for economic sectors

Vietnam's science and technology level remains low compared to worldwide standards. In the context of rapid developments in the 4.0 industrial revolution, Vietnam's technological limitation is a bottleneck, making it difficult to close the gap in development level with highly developed countries.

Israel is a country with a relatively high level of scientific and technological development, capable of providing inputs with high technological content. In recent years, although the VIFTA Agreement has just been signed and has not yet taken effect, two-way trade has grown quite well. Especially, Vietnam has imported machinery, equipment and spare parts with relatively high intellectual and technology content, contributing to Vietnam's rapid transition to a knowledge and digital economy.

4.2. Shortcomings and limitations

4.2.1. Vietnam's exports to Israel increased slowly and imports increased rapidly, making Vietnam's trade deficit larger

Vietnam - Israel trade relations are not commensurate; in the period of 2019 and earlier, Vietnam basically had trade surplus. However, from 2020 to now, Vietnam has an increasingly large trade deficit in trade relations with Israel.

Vietnam's overall trade balance has been in surplus for nearly 10 years. In particular, there are a number of markets where Vietnam has large trade surpluses such as US, EU and others with large trade deficits such as China, Korea, Japan, and Taiwan. Vietnam's trade deficit from Israel is not large compared to other countries. However, if the level of trade deficit from Israel and some other countries continues to increase, Vietnam may lose the overall trade surplus, which has taken decades to achieve.

4.2.2. The processing level of Vietnamese products exported to Israel is not high

Vietnam's biggest export items to Israel are mobile phones and accessories. These items have a high level of processing, intellectual and technology content. However, these items are mainly produced and exported by FDI enterprises.

Vietnam's real commodities exported to Israel are agricultural products, seafood, footwear and textiles. These items have a low level of processing, intellect and technology. Processed agricultural products are only dried, while seafood is also dried or slightly more processed, canned and seasoned. Footwear and textiles are mainly processed for foreign companies. As the processing level of Vietnamese products exported to Israel is not high while intellectual and technology content are only modest, added values, export prices and export turnovers are low.

4.2.3. Among Vietnam's trade relations with the world, the proportion of the Israeli market is still quite small

Countries in West Asia (Middle East) have very prospective markets. Some high-income countries have big demand for imports. Vietnamese goods can enter many Israeli markets, which could serve as a springboard to enter the markets of West Asian countries, especially prospective markets such as United Arab Emirates (UAE), Saudi Arabia, Kuwait...

In recent years, Vietnam's trade relations with the world have developed at a rapid pace. However, this development is uneven as relations with some areas have not grown as expected, including West Asia, which consists of Israel.

Israel is the gateway for Vietnamese goods to enter West Asia, but two-way trade relations between Vietnam and Israel has only made up 0.31% of Vietnam's worldwide relations recently. Meanwhile, the figures with countries similar to Israel in Asia, such as Singapore, are four times higher, reaching 1.26%; Taiwan is even greater, up to 3.79% (Asia-Africa Market Department, 2023)

4.2.4. Trade promotion activities in the two countries' markets are not as effective as in other markets

While in other markets such as China, Japan, Korea, EU, USA... Vietnam has been very focused on organizing trade promotion activities such as exhibitions, fairs, ... in a large-scale and organized manner with high budgets, in some markets with insignificant import and export turnover like Israel, little attention is paid to organizing these activities both in Vietnam and Israel. This is somewhat sensible because markets that bring in large import-export turnover require much attention to trade promotion. However, markets with insignificant current turnover but have potential like Israel also demand more effort. If only the domestic market of Israel is taken into account, the market is indeed small. However, it should be noted that Israel is a springboard and a gateway for Vietnamese goods to enter the vast and prospective West Asian market, with many rich countries with large import and export demand. On the other hand, Vietnam is also a gateway for Israeli goods to enter the Southeast Asian market. Therefore, both Vietnam and Israel need to make considerations for their future benefits.

5. SOME SOLUTIONS TO PROMOTE VIETNAM-ISRAEL TRADE RELATIONS IN THE CONTEXT OF THE SIGNING OF THE VIFTA AGREEMENT

5.1. Accelerating the process of bringing the VIFTA Agreement into effect

The VIFTA Agreement was signed on July 25, 2023, but the two sides still have plenty of work to do for the Agreement to come into effect. This requires great effort from both parties. In the following period, the State and National Assembly of the two countries will evaluate and approve the Agreement; after some time it will officially take effect. In order for this Agreement to take effect in 2024, the two Governments, Ministries of Foreign Affairs, Ministries of Industry and Trade, National Assemblies, etc. have plenty of active work to undertake.

Since the beginning of 2023, the Israeli Government has had to devote their time and resources to resolve security issues such as unrest due to protests against judicial reform plans and tense conflict between the Israeli army and Islamic armed force Hamas.

That leaves the Government and State agencies of Israel with little room for other matters. Therefore, Vietnamese officials need to actively urge Israeli agencies and leaders to accelerate the procedures and take the next steps.

5.2. Enhancing the roles and responsibilities of management agencies

To promote Vietnam-Israel relations, the two sides have established intergovernmental committees in different fields. Including the Vietnam - Israel Intergovernmental Committee on economic - trade and scientific and technical cooperation. This Committee plays the main and focal role in the promotion of bilateral economic - trade - scientific and technical relations. In particular, the decisive issue is to further enhance the responsibility and effectiveness of the Vietnam-Israel Intergovernmental Committee on economic, trade and scientific and technical cooperation as the agency in charge of implementing cooperative relations between the two countries. Special attention is paid to the role of the Trade and Investment Sub-Committee of the Intergovernmental Committee in monitoring the implementation of the action plan for the coming years (2023-2030), promoting two-way trade to achieve the goal of $3.5 billion by 2025 and $5 billion by 2030 that the leaders of the two countries have set. It is necessary to reform the structure and work methods of the sub-committees in the Vietnam-Israel Intergovernmental Committee to enhance the practical effectiveness of cooperation programs.

5.3. Overcoming trade barriers, complying with international trade principles

Some of the major barriers between the two countries are:

- Israel's standards are increasingly integrating with standards of the US, UK and similar countries and will get increasingly difficult for countries with low development levels like Vietnam to meet. To overcome this barrier, Vietnamese goods must constantly improve their quality mainly by applying new and advanced techniques and technologies and management processes that satisfy international standards.

- Kashrut or Kosher certification. They are not a legal requirement for importing food into Israel, with the exception of beef, poultry, and other meats and products. However, products without Kosher certification have much smaller market shares, as most supermarkets and hotels refuse to buy them. Therefore, in order to reduce difficulties when entering the Israeli market, Vietnamese exporters must thoroughly research the Kashrut or Kosher certification in order to comply.

- With Israel being the gateway and springboard for Vietnamese goods to extensively penetrate the predominantly Muslim Middle Eastern market, Vietnamese exporters must focus on HALAL certification for food products. It is forecasted that by 2025, food with HALAL certification marks will account for 20% of the total value of food consumed worldwide. HALAL certification for products is the key to opening the door to the Muslim market for businesses.

- The standards for assessing inspection results of imported and exported goods are not consistent between the two parties. The two countries have not yet signed an agreement to recognize inspection results of imported and exported goods. Therefore, goods that meet export standards from one country to the other must be re-examined for quality and technical compliance, causing excessive procedures and time wastage for importers and exporters.

In order to better support the business community with interests in each other's markets, the Governments of the two countries need to have policies to create a more favorable and open environment for exporters and investors of the two countries.

- The two governments should strengthen customs cooperation to support trade and investment development. In the immediate future, the customs of the two countries need to create favorable conditions for procedures, documents and processing time for enterprises of the two countries in importing and exporting goods.

- The involved ministries of the two countries should shortly announce the criteria, regulations and conditions on the quality of goods imported and exported to the two countries' markets.

- The business communities of the two countries should practice healthy competition, cooperate for mutual benefits, limit risks in the process of trade exchange, and choose the most trusted and high-quality goods and services to export, which would create favorable conditions for mutual development and enhance enterprises' brands and national prestige.

- Commercial banks of the two countries should provide import and export financing loans for businesses, giving priority to small and medium enterprises, with preferential policies on credit, interest rates, fees, payment. .

- Maintain comparative advantage in the structure of import and export goods between the two countries, harmonize and modernize procedures on origin, quality inspection, customs procedures, L/C payment, apply modern logistics systems to reduce transaction costs incurred in import and export contracts of the two countries' enterprises. Businesses should aim to perform transactions via the two countries' local currencies or other strong non-USD currencies to avoid dependence on changes in the USD exchange rate.

- The General Department of Standards, Metrology and Quality of Vietnam and the Israel Quality Management Agency should come to an agreement on the standards for evaluating inspection results of imported and exported goods. There is particular need for congruence between the two countries on veterinary inspection procedures and negotiations to soon reach an agreement on mutual recognition of import and export inspection results.

5.4. Strengthening cooperation in the field of finance and banking to create favorable conditions for businesses

One of the major obstacles in the development of trade and investment between the two countries is the limited payment mechanism and implementation of credit transactions through banks.

The authors propose the establishment of a Vietnam - Israel Joint Venture Bank similar to the Vietnam - Russia Joint Venture Bank (VRB) which has been operating since 2006. The Vietnam - Israel Joint Venture Bank would be established under a collaborative agreement between the two Governments of Vietnam and Israel. This would be a joint venture bank between a State-owned commercial bank, possibly Vietcombank, Vietinbank, BIDV... and a reputable Israeli bank. This bank would apply advanced automation and electronic technology, connecting payments directly between Vietnam and Israel through a number of currencies, mainly VND, ILS, AED, USD, EUR. Vietnam - Israel Joint Venture Bank would open branches in key economic regions of Vietnam such as: Hanoi, Ho Chi Minh City, Vung Tau, Khanh Hoa, Da Nang, Hai Phong and have branches in major Israeli cities.

In addition, the Governments of the two countries should promote activities in the financial and banking sectors in the direction of:

- Continuing to strengthen financial capacity, expand networks, develop and diversify products and services, especially payment services to satisfy demands from businesses and people of the two countries.

- Continuing to improve the payment mechanism to support Vietnamese and Israeli businesses in commercial cooperation, import and export of goods between the two countries by advanced payment methods complying with international practices, creating trust and equal business efficiency for enterprises of the two countries. Vietnamese commercial banks should negotiate with Israeli counterparts to discount export documents through financial companies or third-country banks. In cases of necessity, they should be allowed to grant credit lines to Israeli commercial banks, creating favorable conditions for Israeli businesses to be financed and guaranteed when importing Vietnamese goods.

- Diversifying resources and building investment funds to promote trade and investment activities between the two countries.

5.5. Expanding trade promotion, promoting Vietnamese and Israeli goods in the two countries' markets

a. Establishment of trade centers

In the coming time, the Government needs to support the establishment of Vietnamese trade centers in major Israeli cities including Jerusalem, Tel-Aviv, Haifa and Be'er Sheva… due to the current lack of these malls in major Israeli cities.

The government needs to aid Vietnamese businesses to expand on trade promotion activities due to high costs and complicated procedures. These activities include: Organizing periodic exhibitions of Vietnamese exports in Israel and Middle Eastern countries. Expanding on activities to promote Vietnamese exports in the Israeli market, including participation in exhibitions, fairs, presentation of samples, catalogs, films, video tapes, etc. Organizing and supporting Vietnamsese trade delegations to survey the market, exchange information and promote trade as well as seek new business and investment opportunities. Organizing information channels about the Israeli market for Vietnamese businesses.

However, such conferences or trade promotion activities have not been held on a regular basis. Vietnamese businesses need to pay active attention to and invest in exploiting the Israeli market; Specifically, they should proactively survey and research the market, attend fairs, exhibitions, trade promotion and connection events held in Israel, hold direct meetings with trade partners to recognize cooperation demand, thereby contributing to promoting exports to this market.

The fairs are mainly held in Israel, but rarely in Vietnam to attract Israeli businesses to explore business and cooperation opportunities. Concerned parties should take particular notice of this fact and organize more domestic promotional events. Israeli enterprises have demand to find suppliers and partners in Vietnam, help verify legal status, organize trade promotion and connection events, attend exhibitions presenting Vietnamese export products and businesses to support them in getting access to the market and establish cooperative relations with Israeli partners.

b. Developing export support services

The government also needs to showcase proactiveness in consulting, supporting, marketing and promoting information of Vietnamese businesses having interest in the Israeli market and presenting trade and investment opportunities in Vietnam to Israeli partners.

The Government should have policies to encourage the development of various types of export support services, including: research, market forecasting, information analysis and consulting for businesses; forwarding and customs clearance services; financial analysis services; legal services… Vietnam needs to have appropriate policies, including opening the market for foreign service providers, to quickly develop these types of services.

5.6. Enhancing the competitiveness of Vietnam's exports to Israel

The Israeli market is that of a well-developed country with high standards comparable to those of the EU and the United States. Therefore, if Vietnamese goods fail to improve their competitiveness, they will experience great difficulties in entering the Israeli market, let alone competing with other countries' goods there. After all, in order to flourish in the Israeli market as well as that of other developed countries, businesses need to strive to improve the competitiveness of Vietnamese exports in general and exports to Israel in particular. Other favorable factors are only beneficial in the beginning. It is competitiveness that is the decisive factor in the long run. To improve competitiveness of goods, first of all, the quality of products must be improved, where improvement and equipment of state-of-the-art technology plays a decisive role. Enterprises need to focus on adequate investment in technology. Enterprises need to grasp the worldwide technological situation and import technology when domestic equipment is inadequate, giving priority to importing from countries in the same association or international economic organizations to receive incentives. Companies should limit the import of cheap but obsolete and eco-unfriendly technology, but prioritise advanced and source technology within their financial capabilities.

For the Israeli market, businesses need to strictly implement the delivery regime with the right model and quality as agreed. Due to the considerable transport distance, transportation expenses account for a large proportion of the goods' overall costs, so efforts should be made to reduce production and intermediate costs, as well as handle transport parameters in prices to create more competitive power for Vietnamese goods in the Israeli market.

5.7. Focusing on exporting products with high added value

Israeli business practices and habits are a tendency to buy finished, processed products with high added value, pre-packed with complete packaging, especially for food products and consumer goods (seafood, cashew nuts, coffee, pepper, beverage, confectionery, cinnamon, textiles, footwear, etc.) and also electronics and household goods for consumers to use immediately after purchase from distribution channels or retail supermarket chains. These are favorable factors for Vietnamese manufacturing and exporting enterprises to seize opportunities in exporting high-value-added goods to the Israeli market.

Therefore, Vietnamese manufacturing and exporting enterprises need to focus on offering processed products with high added value, competitive prices and suitable quality, quickly respond to inquiries in transactions with Israeli buyers and comply with the requirements of new Israeli import regulations and standards.

In addition, businesses also need to regularly monitor political and security developments in Israel, because this is a sensitive area with conflicts and instability affecting the entire region, to have prompt countermeasures on transactions including purchase and sale contracts, transporting import and export goods and protect their business benefits.

5.8. Media promotion

As Vietnam historically has had little trade relations with the Middle East region in general and Israel in particular, businesses and the people have little interest in this market and information is limited. The VIFTA Agreement has been signed and will come into effect shortly. In order for the business community to have increased understanding of the Israeli market, recognize lucrative opportunities from the VIFTA Agreement such as tariff reductions, market opening and be prepared to seize them, the information work Propaganda is very important and necessary. First of all, the Ministry of Industry and Trade and media agencies need to promote communication on many information channels about the VIFTA Agreement and the Israeli market. In the context of the 4.0 industrial revolution and developments in information technology, there are a variety of effective means to perform this task such as the Internet, social networks, websites, etc that agencies, organizations and businesses need to ultilize to their advantage.

The Ministry of Industry and Trade, the Vietnamese embassy and trade agency in Israel should issue publications and manuals providing information on the Israeli market, regulations on standards of import and export goods, import and export policies, business guidance, export orientation, trade opportunities, direct introduction of business partners, listing of Israeli business companies wishing to find suppliers and partners in Vietnam and seeking help to verify legal status…

5.9. Improving the quality of human resource training

In order to improve the quality of human resources to promote Vietnam-Israel trade relations, it is necessary to focus on a number of solutions such as:

- Vietnam and Israel need to negotiate and sign an agreement on the equivalence of education and training degrees between the two countries

- Further implementing the project of selecting Vietnamese students to train in Israel with the proposal of training officials in Israel with the Vietnamese State's budget and funding from the Israeli Government and its organizations.

- Creating favorable conditions for eligible Israeli educational and training institutions to open representative offices, affiliates, and independent establishments to perform educational activities in Vietnam. The two countries could consider establishing a Vietnam-Israel University similar to the Vietnam-Germany University model being implemented in Vietnam as a cooperation between the Vietnamese Government and the German Federal Government.

- Strengthening cooperation in training at undergraduate and postgraduate levels between the two countries, enhancing exchange of lecturers, focusing on granting scholarships for Vietnamese students to study in Israel, especially in Israel's advantageous fields.

The state budget plays an important and leading role in human resource training. However, limited resources from the state budget brings a need for socialization, i.e. mobilizing social resources to invest in training. Harmonious collaboration between the state and the private sector is crucial, including contributions from students' families, business and professional associations. Corporations, State-owned enterprises and private economic groups with vast resources need to take the lead in cooperating to train personnel for their own projects and strategies to develop and strengthen their bilateral trade and investment. This would create a chain effect pushing small and medium companies to develop their own human resources.

CONCLUSION

The Israeli market is not large but has plenty of potential. Upon realizing the great opportunities between the two countries, the governments of Vietnam and Israel have negotiated and signed the VIFTA Agreement. The article proposed a number of solutions to promote Vietnam-Israel trade relations in the context of implementing the VIFTA Agreement, contributing to the penetration of Vietnamese goods into the Israeli market and the highly prospective Middle East region.

THE IMPACT OF AUDIT FIRM ROTATION ON AUDIT FEES: EMPIRICAL EVIDENCE IN VIETNAM

Ph.D Tran Thi Thu Phuong[1], MAc. Le Thi Minh Toan[2]

Abstract: This study aims to examine the relationship between audit firm rotation and audit fees. Ordinary Least Squares regression is used to test this relationship. Using data from 72 companies listed on the Vietnamese stock exchanges on HOSE and HNX, with a total of 286 observations from 2017 to 2020, this study manually collects audit firm rotation and audit fees. The results show that audit firm rotation is positively related to audit fees. The findings support audit firms in determining audit fees as well as support the authorities in building a fee framework for independent audit activities to improve audit quality. Audit firms need to pay more attention to audit firm rotation when making arrangements related to audit fees. When there is an audit firm rotation, audit firms are unfamiliar with the new client and the need for a broader review of the work process of the new client (to maintain the quality of the audit work), audit firms should spend more time and cost in the first years of the audit.

Keywords: Audit fees, Vietnam, audit firm rotation.

1. INTRODUCTION

In an environment with high competition among audit firms, determining a reasonable audit fee will help audit firms acquire new clients, retain old clients, and ensure and improve audit quality. The topic of factors affecting audit fees has been interesting to professionals, authorities and academia. In Vietnam, the Law on independent auditing provides a number of grounds for determining audit fees, including such as content, volume and nature of work; working time and conditions used by practising auditors to perform services; qualifications, experience and reputation of practising auditors, of audit firms, of branches of foreign audit firms; the degree of responsibility and duration required by the performance of the service (Congress of the Socialist Republic of Viet Nam, 2011). In addition to the provisions of the audit law, many previous studies around the world have investigated factors affecting audit fees (Ferguson et al., 2003; Khalil et al., 2008; Yan & Wheatley, 2010; Xu, 2011; Johl et al., 2012; El-Gammal, 2012; Hallak & Silva, 2012; Kikhia, 2015; Nor, 2015; Urhoghide & Izedonmi, 2015; Kimeli, 2016; Musah, 2017; AL-Mutairi et al., 2017; Khasharmeh, 2018; Samsuri & Arifin, 2018; Kanakriyah, 2020; Fisabilillah & Praptiningsih, 2020; Karaki & Thuneibat, 2022; Salehi et al., 2022). These studies discussed most of the factors that play an important role in determining audit fees, including audited firm size, complexity, auditee risk, profitability, audit firm size and audit report lag (Abuyahia & Al-Thuneibat, 2019; Bouqalieh & Nour, 2019). Many discussions are going on regarding audit firm rotation and audit fees. When there is an audit firm rotation, audit firms are unfamiliar with the new client, which creates additional challenges for auditors and the need for a broader review of the work process of the new client (to maintain the quality of the audit work) so audit firms should spend more time and cost in the first years of the audit and therefore their effect on audit fees must be considered (Salehi et al., 2022). Therefore, it is necessary to study the influence of audit firm rotation on audit fees of listed companies. The results of previous studies in the world on the influence of audit firm rotation on audit fees are different; some studies showed a positive influence of audit firm rotation on audit fees. (Kwon et al., 2014; Hassas et al., 2016). Some studies showed the opposite result (Corbella et al., 2015), but some studies did

[2] University of Finance and Accountancy

not find evidence of this relationship (Narayanaswamy & Raghunandan, 2019; Salehi et al., 2022). In Vietnam, a number of studies have investigated the factors affecting audit fees, among which the main factors are the audited firm size, complexity, reputation and size of an audit firm, audited client industry, and auditor's tenure (Phan, 2012; Le, 2017; Nguyen & Tran, 2017; Vo, 2021). So far, in Vietnam, there are very few studies on the influence of audit firm rotation on audit fees. Therefore, we conduct this study with the main objective of examining the influence of audit firm rotation on the audit fees of companies listed on Vietnamese stock exchanges. This study has both theoretical and practical contributions. Theoretically, the research results provide evidence of the influence of audit firm rotation on audit fees, which is rarely done in Vietnam. In addition, we have also reviewed previous research on the influence of audit firm rotation on audit fees. This result can be used as a reference for further studies on the influence of audit firm rotation on audit fees. In practical terms, the research results have proven that audit fees are higher if there is rotation of audit firms.

After the introduction, this study is structured into five main sections: Section 2 provides regulations on a rotation of audit firms in some countries around the world, section 3 provides a literature review and hypothesis development, section 4 explains the sample and research model, section 5 provides the findings and discussions, and section 6 concludes the study.

2. Regulations on a rotation of audit firms

The tenure of the audit firm is the period during which the audit firm performs the audit for the client (Salehi et al., 2022). Audit firm rotation is the conversion of an audit firm after a set period of having been appointed to audit a client. After the collapse of the world's leading companies, including the fault of the audit firm, the regulations on audit firm tenure limits or mandatory rotation of audit firms have been promulgated by most countries in the world. The rotation of audit firms or term limits enhances independence, reduces the risk of familiarity and thus improves audit quality, and this increases audit fees. Most countries around the world have a rotation policy, for example, in Thailand, which requires rotation of the audit firm for listed companies every five years. The requirements on rotation are also widely applied in other countries such as Bangladesh, China, Japan, etc. The regulations on audit firm tenure in Asian countries are shown in Table 1. In Vietnam, the professional ethical standards for accountants and auditors (effective January 1, 2016) also have regulations on the term of audit. There is a big difference between the regulations of Vietnam and some countries in the world on the term of the audit firm. The current regulations of Vietnam only refer to the term of the auditor in charge of the overall audit, not the audit firm, whereby a member in charge of the overall audit is not allowed to sign an audit report for more than three consecutive years for an audit client that is a public interest entity (Vietnamese Ministry of Finance, 2015).

Table 1: Term of an audit firm of some Asian countries

Country	Mandatory audit firm
Bangladesh	Yes - Every three years for listed companies
India	Yes - Every four years for banks, privatised insurance companies and Government companies
China, Pakistan, Singapore, Thailand	Yes - Every five years for listed companies
Indonesia	Yes - Every six years for all companies
Hong Kong, Japan, Malasia, Phillipines, Srilanka, Taiwan, Vietnam	No
Korea	Yes - Every six years for KSE-listed companies or KOSDAQ registered except foreign-invested companies and/or listed on foreign exchange.

3. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

Audit fees represent the cost paid by an auditee to cover charges required by an auditing firm in order to audit the financial statements (Asthana et al., 2019). Many previous studies in the world have shown a set of predictor variables affecting audit fees (Basioudis & Francis, 2007; Audousset-Coulier, 2009; Bedard & Johnstone, 2010; Xu, 2011; Johl et al., 2012; Vu, 2012; Picconi & Reynolds, 2013; Castro et al., 2015; Kikhia, 2015; Naser & Hassan, 2016; Musah, 2017; Gandía & Huguet, 2018; Musah et al., 2018; Narayanaswamy & Raghunandan, 2019; Kanakriyah, 2020; Khasharmeh, 2018; Fisabilillah & Praptiningsih, 2020; Salehi et al, 2022). Many researchers classified them on the basis of characteristics specific to auditee, including auditee size, auditee risk, complexity and profitability. In contrast, others based their classification on characteristics specific to audit firms, including audit size and audit tenure (Kikhia, 2015). After countries promulgated regulations on the limitation of audit firm tenure, many studies have been conducted on this topic. However, the research results are inconsistent. Some studies show a positive effect of audit firm rotation on audit fees; some other studies show the opposite results, and some studies do not find evidence of this relationship.

- Audit firm rotation is positively related to audit fees

The results of some previous studies show that audit firm rotation has a positive effect on audit fees. Kwon et al. (2014) examined the relationship between the rotation of audit firms and audit fees in Korea. This study showed that the mandatory rotation of audit firms has a positive effect on audit fees. In the Iranian market, Hassas et al. (2016) concluded that mandatory audit firm rotation has caused a significant increase in audit fees. In other words, when the rotation of audit firms is mandatory, auditors need to perform longer audit hours to assess existing risks better and gain sufficient knowledge of their new client's work environment, which in turn increases the fees charged by independent auditors.

- Audit firm rotation is negatively related to audit fees

In another study, Corbella et al. (2015) surveyed if higher audit fees are connected with audit firm rotation in Italy. Their findings suggested that following audit firm rotation, the total amount of fees paid to the auditor was lower for firms audited by big auditors and unchanged for firms audited by a less well-known auditor.

- Audit firm rotation is not related to audit fees

Contrary to the results of the above studies, many studies did not find evidence of the influence of audit firm rotation on audit fees. In the India setting, Narayanaswamy and Raghunandan (2019) concluded that mandatory audit firm rotation does not affect audit costs. In the Iranian market, Salehi et al. (2022) investigated the impact of mandatory audit firm rotation on audit fees at companies listed on the Tehran Stock Exchange (TSE). The research results show that the mandatory audit firm rotation does not have a significant effect on audit fees.

Although the research findings in the world on this topic are not consistent, the number of studies supporting the positive influence of audit firm rotation on audit fees accounts for a large proportion, and they are based on Vietnam's regulations on the basis for determining audit fees. Therefore, the hypothesis proposed in this study is:

H: Audit firm rotation is positively related to audit fees.

4. DATA AND RESEARCH MODEL

4.1. Data

In this paper, we use a sample of companies listed on Vietnamese stock exchanges for the period from 2017 to 2020. Our sample starts from 2017 because we wanted to study audit fees after Vietnam mandated important regulations on the accounting and auditing profession. Also, we end our sample in 2020 to avoid the possible impacts of the COVID-19 pandemic on audit fees.

We collect financial statement data from cafef.vn, mof.gov.vn. We start with companies listed in Ho Chi Minh City and Ha Noi Stock Exchanges and then exclude financial institution firms because these firms have different financial statement formats. We manually obtain audit firms' data from annual reports downloaded from cafef.vn. In some cases where not enough information can be collected on the above sources, we collect information from audit firms in conjunction with their clients. We also remove observations with missing data. Our final sample has 286 observations from 72 unique firms.

4.2. Research model

To test our hypothesis, we follow previous studies (Clatworthy et al., 2009; Kanakriyah, 2020; Salehi et al., 2022) with some suitable adjustments for Vietnam and run the following Ordinary Least Squares (OLS) regression by *STATA 13*:

$FEE_{it} = \alpha + \beta_1 ROTA_{it} + \beta_2 SUBS_{it} + \beta_3\ INVREC_{it} + \beta_4 AUDO_{it-1} + \beta_5 CONL_{it} + \beta_6 ROA_{it} + \beta_7 FINR_{it} + \beta_8 SIZE_{it} + \beta_9 INDS_{it} + \beta_{10} ACCO_{it} + \beta_{11} AUQU_{it}$ (1)

- Dependent variable:

FEE_{it} is audit fees, which is the natural log of audit fees in year t (Kanakriyah, 2020).

- Independent variable:

$ROTA_{it}$ is audit firm rotation, which is an indicator equal to 1 if there is an audit firm rotation in year t and zero otherwise (Narayanaswamy & Raghunandan, 2019).

- Control variables:

$SUBS_{it}$ is the number of subsidiaries, which is the natural log of the number of subsidiaries (Clatworthy et al., 2009). $INVREC_{it}$ is accounts receivable and inventory, which is equal to the accounts receivable and inventory of firm i in year t divided by lagged total assets (Johl et al., 2012). $AUDO_{it}$ is modified opinions, which is an indicator equal to 1 if the client had modified opinions in year t-1 and zero otherwise (Clatworthy et al., 2009). $CONL_{it}$ is contingent liabilities, which is an indicator equal to 1 if the client disclosed contingent liabilities in accounts and zero otherwise (Clatworthy et al., 2009). ROAit is the returns on assets, which is equal to the net income of firm i in year t divided by lagged total assets (Clatworthy et al., 2009). FINRit is financial risk, which is an indicator equal to 1 if the Z-score is below 2.073 and zero otherwise (Gul, 2006). $SIZE_{it}$ is client size, which is the natural log of the lagged total assets of the client in year t (Kanakriyah, 2020). $INDS_{it}$ is the client's industry type, which is an indicator equal to 1 if a client is a manufacturing company and zero otherwise (Kanakriyah, 2020). ACCOit is the audit committee, which is equal to the number of audit committee members with accounting and financial backgrounds of firm i in year t divided by the number of audit committee members (Johl et al., 2012). $AUQU_{it}$ is the audit firm's reputation, which is an indicator equal to 1 if firm i is audited by a Big Four auditor in year t, and zero otherwise (Kanakriyah, 2020).

5. FINDINGS AND DISCUSSIONS

5.1. Descriptive statistics and correlations

Table 2 reports the descriptive statistics of the variables in the research model. The findings show that:

- The mean of audit fees (FEE) is 18.111, showing that the average natural log of the audit fees is 18.111.

- The mean of audit firm rotation (ROTA) is 0.291, showing that the average audit firm rotation ratio is 29%.

- The mean of the number of subsidiaries (SUBS) is 0.673, showing that the average natural log of the number of subsidiaries is 0.673.

- The mean of accounts receivable and inventory (INVREC) is 0.453, showing that the average ratio of accounts receivable and inventory to total assets is 0.453.

- The mean of modified opinions (AUDO) is 0.062, showing that the average modified opinions ratio is 6.2%.

- The mean of contingent liabilities (CONL) is 0.052, showing that the average disclosed contingent liabilities ratio in accounts is 5.2%.

- The mean of returns on assets (ROA) is 0.057, showing that the average returns on assets ratio is 5.7%.

- The mean of financial distress (FINR) is 0.3, showing that the average ratio of Z-score < 2.073 is 30%.

- The mean of client size (SIZE) is 27.603, showing that the average natural log of the lagged total assets of the client is 27.603.

- The mean of the client's industry type (INDS) is 0.04, showing that the average manufacturing companies ratio is 4%.

- The mean of audit committee financial expertise (ACCO) is 0.386, showing that the average number of audit committee members with accounting and financial backgrounds ratio is 38.6%.

- The mean of the audit firm's reputation (AUQU) is 0.279, showing that the average Big Four auditor ratio is 27.9%.

Table 2: Descriptive statistics

Source: Results analyzed from data collected from 2017 to 2020 by the authors

Table 3 shows the Pearson correlation of selected variables. The evidence shows that ROTA is positively associated with FEE, providing preliminary evidence that there is a positive relationship between audit firm rotation and audit fees. The table also shows that SUBS, INVREC, AUDO, CONL, FINR, SIZE, INDS, ACCO, AUQU are positively correlated with FEE. In addition, most of the correlation coefficients among the independent variables are small, while the variance inflation factors (VIF) range between 1.29 and 6.97, indicating that multicollinearity is not a concern.

Table 3: Pearson Correlations

5.2. Baseline regression results

Table 4 reports the baseline regression results of Ordinary Least Squares regressions. The results show that the coefficient on ROTA is positive and statistically significant at 1% level (coef. = 0.142 and P>t= 0.002). In terms of economic significance, the coefficient on ROTA means that when there is an audit firm rotation, the natural log of the audit fees rises 14%. The findings support our hypothesis that there is a positive association between audit firm rotation and audit fees. Previous studies support the evidence that when there is an audit firm rotation, audit firms need to look at a broader review of the work process of the new client (to maintain the quality of the audit work), audit firms should spend more time, leading to higher audit fees (Kwon et al., 2014; Hassas et al., 2016).

Table 4: Baseline regression results

Variable	Coef.	P>t
ROTA	0.142	0.002
SUBS	0.055	0.011
INVREC	0.667	0.000
AUDO	0.105	0.141

Adj R-squared	0.8041	

Source: Results analyzed from data collected from 2017 to 2020 by the authors

Turning to control variables, I find that audit fees are positively related to number of subsidiaries (SUBS coef. = 0.055 and P>|t|= 0.011), accounts receivable and inventory (INVREC coef.= 0.667, P>|t|= 0.000), contingent liabilities (CONL coef.= 0.208, P>|t|= 0.001), financial risk (FINR coef.= 0.097, P>|t|= 0.001), client size (SIZE coef.= 0.086, P> |t|= 0.000), the audit firm's reputation (AUQU Coef.= 0.278, P>|t|= 0.000).

5.3. Cross-sectional tests

- Role of Big Four auditors

This section investigates whether Big Four auditors affect the relationship between audit firm rotation and audit fees. The available literature shows that big auditors are positively related to audit fees (Kikhia, 2015; Kanakriyah, 2020; Li & Wang, 2022). Therefore, we surmise that the relationship between audit firm rotation and audit fees is more evident for firms audited by Big Four auditors. To test this conjecture, we classify observations into two subsamples: Firms audited by Big Four auditors and firms audited by non-Big Four auditors. We then re-run the main regression using these subsamples. As reported in Table 5, we find that the coefficient on ROTA of the subsample of Big Four auditors [column (1)] is larger than that of the subsample of non-Big Four auditors [column (3)]. Importantly, we find that the coefficient on ROTA is positive and statistically significant in column [2], while it is not significant in column [4]. Overall, this finding supports our conjecture that the relationship between audit firm rotation and audit fees is more evident for firms audited by Big Four auditors.

Table 5: Cross-sectional tests - the Role of Big Four auditors

Variable	Big Four		Non-Big Four	
	[1] Coef.	[2] P>|t|	[3] Coef.	[4] P>|t|

- CEO-chairperson duality

Next, we examine whether CEO-chairperson duality (the CEO also serves as chairperson of the board of directors) affects the relationship between audit firm rotation and audit fees. When the CEO acts as the chairperson of the Board of Directors, he has much power to dominate other directors (Dunn, 2004). In these circumstances, powerful CEOs are more likely to negatively affect the board of directors' ability to protect the integrity of financial statements, including monitoring the independence and work of auditors. Therefore, we surmise that the relationship between audit firm rotation and audit fees is more evident for firms without CEO-chairperson duality. To test this conjecture, we create an indicator variable which takes the value of one if the CEO also serves as the chairperson and zero otherwise. We re-run the main regression using the subsamples of firms that have CEO-chairperson duality (CEO = 1) and firms that do not have CEO-chairperson duality (CEO = 0).

As reported in Table 6, we find that the coefficient on ROTA of the subsample without CEO-chairperson duality [column (3)] is larger than that of the subsample with CEO-chairperson duality [column (1)]. Importantly, we find that the coefficient on ROTA is positive and statistically significant in column [4], while it is not significant in column [2]. Overall, the finding supports our conjecture that the relationship between audit firm rotation and audit fees is more pronounced for firms that do not have CEO-chairperson duality.

Table 6: Cross-sectional tests - CEO-chairperson duality

6. CONCLUSIONS

This study investigates the relationship between audit firm rotation and audit fees. This study uses a sample of 286 observations from 2017 to 2020 of firms listed on Vietnamese stock exchanges. The study measures audit fees using the natural log of audit fees (Clatworthy et al., 2009; Kanakriyah, 2020; Salehi et al., 2022). The research results have shown that audit firm rotation is positively related to audit fees, and the relationship is statistically and economically significant. Cross-sectional analyses show that the relationship between audit firm rotation and audit fees is clearer for firms audited by Big Four auditors and for firms that do not have CEO-chairperson duality.

This study makes several contributions to the literature. Firstly, the research results provide further evidence consistent with the argument that when there is an audit firm rotation, audit firms need to look at a broader review of the work process of the new client (to maintain the quality of the audit work), audit firms should spend more time and cost in the first years of the audit (Kwon et al., 2014; Hassas et al., 2016). Second, this study is different from recent studies which explore Vietnamese data (Phan, 2012; Le, 2017; Nguyen & Tran, 2017; Vo, 2021). The study differs from Le (2017), who investigated the impact of auditor tenure on audit fees. In our study, we examine at the firm level. This study also differs from Nguyen and Tran (2017) and Vo (2021), who did not find the impact of audit firm rotation on audit fees.

Our article also has policy implications. With the evidence of the positive relationship between audit firm rotation and audit fees, we believe that when there is an audit firm rotation, audit firms are unfamiliar with the new client and the need for a broader review of the work process of the new client (to maintain the quality of the audit work), audit firms should spend more time and cost in the first years of the audit. Therefore, we recommend that, in order to improve audit quality, the Vietnamese government should not only pay more attention to the audit firm rotation when completing the fee framework for independent audit activities but also introduce regulations on the rotation of audit firms. The Vietnamese government has introduced regulations on mandatory audit firm rotation for listed companies after a set period of having been appointed to audit a client. The required period of rotation is determined based on the audit firm rotation regulations of other countries. In particular, it is necessary to carry out relevant research to determine a set period required for mandatory rotation.

This study has some limitations. Firstly, our study is based on a small sample size from 2017 to 2020. The sample is not really large because the number of listed companies with full-fee data in Vietnam has not been collected yet. Future studies could re-investigate the topic using a different sample. Secondly, our study results may be affected by other omitted variables related to regulatory change, such as the Fair Value Measurement. The information related to these factors has not been published, so the authors cannot collect it. Future studies could re-examine this topic once more information becomes available.

CARBON TAX TO SUSTAINABLY DEVELOP THE BUSINESS ECONOMY: INTERNATIONAL EXPERIENCE AND SUGGESTIONS FOR VIETNAM

Dr. Dinh Thi Hoa[1]

Abstract: *Sustainable development of business economics is these days a top concern for countries around the world, including Vietnam. However, currently, Vietnam is a country with high CO_2 emissions and is severely affected by climate change. This has had a negative impact on the regular operation and sustainable development of the enterprise. Based on the above practice, this author conducted a study on the experience of several countries around the world in term of using Carbon taxes to reduce CO_2 emissions and promote the sustainable development of enterprises. On this basis, this article proposes a number of suggestions for issuing Carbon tax, thus ensuring the sustainable development of Vietnamese enterprises.*

Keywords: *Carbon tax, climate change, CO_2 emissions, sustainable development.*

1. INTRODUCTION

The 2018 Global Climate Report shows that Vietnam ranks 5th in the Climate Risk Index [1]. According to experts, there are many reasons for climate change, among which the main reason is the rising of greenhouse gas emissions (mainly CO_2). Large quantity of CO_2 causes the sun's heat to be retained in the atmosphere, leading to global warming and triggering a series of extreme weather events. Climate change has a significant impact on the manufacturing and commercial activities of enterprises. According to reports from the Vietnam Chamber of Commerce and the Asia Foundation in Vietnam, there are 10400 enterprises in 63 Vietnamese provinces (including over 8700 domestic private enterprises and nearly 1700 foreign-invested enterprises), and 54% of them reported production and business interruptions due to natural disasters. Otherwise, 51% of enterprises have also suffered a productivity decline due to adverse weather conditions [19].

Based on the above facts, in this article, the author mentioned the experience of applying carbon taxes to reduce CO_2 emissions in some countries around the world, and thus proposed suggestions for Vietnam. The emergence of a carbon tax may affect businesses and consumers via conducting a rise in the prices of products and service fees. However, in the long run, a carbon tax will promote the use of environmentally-friendly energy, reduce CO_2 emissions, and enhance environment reservation. When climate change is under control, implementing green production by enterprises will help maintain business continuity and stability, and establish trust and foothold in the market. This is the foundation for sustainable development of enterprises.

2. RESEARCH METHODOLOGY

Statistical method: This method is used to present data on CO_2 emissions and carbon tax levels related to the research topic. The data is arranged in logical order to ensure coherence and cohesion.

---

[1] Trade Union University, Email: hoadt@dhcd.edu.vn.

Comparison method: This method is used to compare the carbon tax levels related to the economic development speed of some countries around the world, and thus proposing a suitable carbon tax rate on Vietnam in the near future.

Analysis method: Used throughout the entire content of the article, to clarify the role and impact mechanism of Carbon tax on the sustainable development of businesses.

Comprehensive method: The author will summarize the data and information collected based on each content and present it systematically for the research process.

3. THEORETICAL BASIS AND RESEARCH OVERVIEW

3.1. Theoretical basis

Carbon tax: Carbon tax is a tax levied based on the amount of carbon (or CO_2) generated by production and consumption activities. The basis for imposing a carbon tax is to set an additional cost for each ton of CO_2 emitted into the atmosphere. The calculation of carbon tax will offset the social costs of CO_2 emissions (such as the cost of solving environmental problems). Carbon taxes are implemented in many countries around the world, characterized by:

Taxable objects: Carbon taxable objects mainly include fossil fuels, such as gasoline, petroleum, methanol, naphtha, butane, and liquefied natural gas; Peat, coal... These are products that emit CO_2 into the environment during combustion.

Taxpayer: Carbon taxpayers are people who sell fossil fuels to the market for consumption. In other words, these are organizations or individuals that import or extract fossil fuels.

Tax rate: Carbon tax is calculated based on the damage caused by one unit of CO_2 emissions into the environment (usually calculated per 1 ton of CO_2). Therefore, carbon taxes are usually determined at the absolute amount of 01 tons of CO_2 per unit.

The purpose of a carbon tax is to offset the social costs caused by CO_2 emissions. Therefore, carbon taxes are usually used to protect the environment, mitigate climate change, and create a healthy environment for the sustainable development of enterprises.

Carbon tax and sustainable development of business economics: Due to the tax on fossil fuels aimed at reducing CO_2 emissions, carbon taxes play an important role in promoting sustainable development of enterprises. This is manifested from the following perspectives:

Firstly, carbon taxes can help alleviate climate change and create a healthy environment for sustainable development of enterprises.

The carbon tax regulates the behavior of CO_2 emissions into the environment. Therefore, enterprises that use fossil fuels (coal, oil, natural gas, etc.) are directly affected by carbon taxes. The determination of carbon tax is based on CO_2 emissions, which increases the production costs of enterprises. In order to reduce costs and improve business efficiency, companies are forced to find new ways to more effectively reduce the use or use of fossil fuels. This commercial behavior will help reduce CO_2 emissions in the atmosphere and reduce the risk of climate change. When climate change is controlled, extreme weather phenomena will be alleviated, which will help businesses sustain production and commercial activities, improve labor productivity, and increase income.

Secondly, carbon tax promotes the transition to use clean energy.

As mentioned above, carbon taxes increase the cost for businesses. This has led to competition between the carbon free industry and the traditional fossil fuel combustion industry. Therefore, in addition to effectively using fossil fuels, in the long run, companies must also seek and shift towards cleaner and more environmentally friendly energy sources (renewable energy). Clean energy is the foundation for ensuring sustainable development of enterprises. In addition, the carbon tax levied from CO_2 emitting actors will help the country provide more funding for the transition of enterprises from fossil fuels to renewable energy.

Thirdly, Carbon taxes help companies explore new markets.

Currently, countries around the world encourage the production and use of clean products. They proposed mechanisms to drive companies towards cleaner products, such as the EU carbon boundary mechanism. Therefore, when the government imposes a carbon tax on fossil fuels, fossil fuels will encourage enterprises to shift towards clean energy production of green products. Having products being labelled as "green product", companies can easily enter many global markets, thus contributing to the sustainable development for enterprises.

3.2. The Research Overview

- Reyer Gerlagh, Bob van der Zwaan (2006), *Options and Instruments for a Deep Cut in CO_2 Emissions: Carbon Dioxide Capture or Renewables, Taxes or Subsidies*? The Energy Journal [16]. The article studies the tax policy system aimed at reducing CO_2 emissions and protecting the environment, thus lay the foundation for the sustainable development of enterprises in some countries around the world. The core of this research is about Carbon Tax. This article points out that carbon tax is an effective tool for countries to control climate change and achieve sustainable development goals. This article also compares two carbon tax schemes: Levying a direct carbon tax on CO_2 emissions and impose a carbon tax on the use of fossil fuels (leading to CO_2 emissions). The article also points out that the choice of carbon tax scheme also depends on the socio-economic situation and specific goals of each country.

- Nguyen Thi Thu (2016), *Green Growth Tax Policies: Practical Applications in Various Countries including Vietnam,* Portal of the Ministry of Finance [12]. This article analyzes the content of several tax policies aimed at achieving green growth and sustainable economic development in various countries around the world, including carbon taxes. The article believes that imposing a carbon tax on fossil fuels can help countries effectively utilize natural resources and reduce environmental pollution, enhancing the ability to respond to climate change, thus creating a beneficial conditions and directions for the sustainable development of enterprises.

- OECD (2018), *Taxation of Energy Use in 2018*, February 2018 [14]. Research has shown that emissions from energy use cause damage to the environment and health, and have a significant impact on the sustainable development goals of countries. By calculating the cost of these losses, carbon taxes can reduce emissions while increasing tax revenue, providing funding for business operations. This study evaluated the extent and scope of carbon taxes imposed on energy by countries, major industries, and fuel groups in 2015. Research has shown that carbon taxes have had a significant impact on the CO_2 emissions activities and the achievement of sustainable development goals in 42 economies of the OECD and G20.

- Nguyen Thi Thu Hien (2022), *Carbon tax - an effective economic tool for promoting the reduction of greenhouse gas emissions*, Journal of Industry and Trade [13]. This article provides an overview of carbon taxes; Analyze and clarify the role of carbon taxes in reducing greenhouse gas emissions to achieve sustainable economic development goals. In addition, this article also analyzes Vietnam's current tax system and measures to protect the environment. Since then, this article has evaluated the feasibility of implementing a carbon tax in Vietnam and proposed some suggestions to promote the implementation of a carbon tax in Vietnam.

- Financial Journal (2023), *The Application of Carbon Tax Helps Sustainable Development*, March 2023 [5]. The article points out that the promulgation and implementation of a carbon tax will create revenue for the national budget and be used for investment research, developing renewable energy and low-carbon technologies can help ensure the sustainable development of countries. The article also points out that in order to achieve the sustainable development goals promised by COP26, Vietnam needs to mobilize all resources and flexibly apply various solutions, including carbon tax solutions. However, implementing a carbon tax in Vietnam remains difficult. Therefore, the Vietnamese government needs to study the experiences of various countries and the actual situation in Vietnam in order to formulate sensible policies.

4. RESEARCH RESULT

4.1. International experience

Currently, carbon taxes are being implemented in many countries around the world to promote sustainable business development and green economy. As of December 2021, 35 countries have imposed carbon taxes [4]. The first country to levy a carbon tax was Finland in 1990. After Finland, Sweden and Norway implemented a carbon tax in 1991. Since then, carbon taxes have been widely and widely applied around the world. Currently, Vietnam is researching and understanding carbon taxes. Vietnam's carbon tax in the near future needs to be based on practical conditions and learn from the experiences of various countries around the world.

4.1.1. Experience from Japan

In December 2009, Japan's green economy development strategy mentioned a low-carbon economy. In order to significantly reduce greenhouse gas emissions, Japan focuses on controlling medium to long-term CO_2 emissions. However, as of 2014, Japan remains the sixth largest emitter in the world [15]. Japan's CO_2 emissions and energy taxes are far lower than those of developed countries. This prompted the Japanese government to study and incorporate carbon taxes into the 2012 tax reform plan. In Japan's carbon tax law, the taxable objects are crude oil and petrochemical products, hydrocarbons, and coal. Since 2009, Japan's carbon tax rate has been continuously adjusted to ensure consistency between the Carbon Tax Law and economic conditions (Table 1).

Table 1: Carbon Tax rate in Japan

Tax rate (JPY/ CO_2)				
1. Global warming taxes		289		
2. Oil and coal taxes		Crude Oil and Petrochemical Products		779
		Liquefied hydrogen and carbon gas		400
		Stone		301
Execution phase				
Taxable object	Tax rate before 2012 (Japanese yen)	From 1-10-2012	From 1-4-2014	From 1-3-2016
Crude Oil and Petrochemical Products (/kl)	2.040	2.290	2.540	2.800
Hydrocarbons gas (/ton)	1.080	1.340	1.600	1.860

Coal (/ton)	700	920	1.140	1.370
Sale taxes	39.1 billion yen in the first year, 262.3 billion yen in the second year			

Source: MOE - Carbon Tax Details, page 2

The adjustment of carbon tax policy helped Japan achieve a record reduction in carbon emissions in 2020: Japan's carbon emissions in 2020 were 1.15 billion tons, a decrease of 5.1% from 2019, making it the lowest year since Japan began compiling emission data in 1993. The significant decrease in carbon emissions in Japan has created a favorable and sustainable environment for business operations. This result is mainly attributed to the impact of the carbon tax policy, which limits the use of fossil fuels and strengthens the development of clean and renewable energy in the country. The largest reduction in carbon emissions in Japan was in the industrial manufacturing and transportation industries, with declines of 8.1% and 10.2%, respectively [20]. Given the above achievements, the Japanese government is determined to reduce carbohydrate emissions by continuing to adjust carbon taxes to accommodate each stage.

4.1.2. Experience from Australia

A report released by the Australian Research Institute in August stated that Australia ranks fifth in the world in terms of fossil fuel carbon emissions (after China, the United States, Russia, and Saudi Arabia), with per capita annual emissions of approximately 57 tons of carbon dioxide, 10 times the average level [18]. This is because Australia is the world's third largest exporter of fossil fuels, second only to Russia and Saudi Arabia. Among them, coal is Australia's main export product. In this situation, the Australian government is researching and adding a carbon tax to the Australian tax system to limit greenhouse gas emissions, address climate change, and create a favorable business environment for sustainable development of enterprises.

According to the Australian carbon tax law, companies that emit over 25000 tons of carbon annually will be taxed. It is estimated that the 500 companies with the highest CO_2 emissions in Australia will pay AUD 23 per ton in the first three years. The tax rate that companies must pay in the coming years will increase from $25.94 per ton of CO_2 to $27.2 per ton [9]. These enterprises are mainly coal-fired power plants, mining companies, and metal workshops. In addition, to encourage businesses to invest in clean energy with the goal of reducing emissions by 80% by 2050, the Australian Government has issued a policy: businesses will be supported with 10 billion Australian dollars for 5 years when investing in wind energy, solar energy and other renewable energy sources. These days, Australia's carbon tax is the highest in the world, far higher than that of European countries. The Australian government has provided support to people affected by carbon taxes, especially low-income groups. About 97% of low and middle-income households receive government support, which comes from carbon taxes. If companies find it difficult to compete with competitors, the government will also allocate 40% of its revenue to clean energy [9].

Through the aforementioned carbon tax regulations, Australia has achieved significant achievements in reducing CO_2 emissions and achieving sustainable development goals.

In 2020, the waste generated by power generation in Australia significantly decreased.

In 2021, Australia's third largest source of pollution, transportation greenhouse gas emissions, decreased by 12% compared to 2020.

Thanks to the to increasing use of solar and wind energy, and reduced emissions from natural gas facilities. In 2021, Australia's CO_2 emissions decreased by 26.1 million tons (5%) compared to 2020, a decrease of 20.1% compared to 2005 [2].

Reducing fossil energy emissions, coupled with increasing the use of renewable energy, is the foundation for improving Australia's business environment, thus orienting the activities of the enterprise towards environmental protection, in order to achieve the goal of sustainable development in the future.

4.1.3. Experience from Singapore

Singapore was the first country in Southeast Asia to adopt a carbon pricing mechanism. Singapore will begin imposing a carbon tax on all facilities that emit 25000 tons or more of CO_2 annually in 2019, including refineries and power plants. Carbon tax will be collected from entities that emit greenhouse gases, but not all entities that emit greenhouse gases must pay carbon tax. The current carbon tax in Singapore is S $5 per ton of CO_2. In order to achieve the goal of reducing greenhouse gas emissions, the Singapore government has issued a roadmap for increasing carbon taxes: In 2024 and 2025, the carbon tax was S $25 per ton of CO_2. The CO_2 emissions in 2026 and 2027 were S $45 per ton, followed by S $50 to S $80 per ton over the next three years [10]. In order to help enterprises transition to a low-carbon sector, the Singapore government has allocated some of its carbon tax revenue to support enterprises. Because the main subjects paying the carbon tax are power generators, this will lead to an increase in electricity prices and directly impact consumers, so to mitigate this impact of the carbon tax, households with income low will receive support from the Government. In addition, according to the latest standards developed by the Intergovernmental Panel on Climate Change, according to the revised Carbon Tax Act of 2022, the Singapore government has reviewed and updated its greenhouse gas inventory. Subjects subject to Singapore's carbon tax currently include 6 types of gases: CO_2, CH4, N2O, HFCs, PFCs, SF. In order to implement government regulations, Singaporean companies must now assess their emissions based on the greenhouse gas inventory that the government imposes a carbon tax on.

The implementation of carbon tax has effectively promoted the development of the clean energy sector to achieve sustainable economic development. Singapore recently built the Keppel Energy Building. This is the first building in Singapore to be certified as a positive energy building. Currently, Keppel generates approximately 600000 kilowatts of electricity annually from solar panels, which is more than twice the annual consumption of the building. This means that the building is not only energy-efficient, but more than 100% of its energy comes from on-site renewable energy [21]. In addition to promoting energy transformation, carbon taxes have also greatly increased the revenue of Singapore's national budget. The Singapore government has invested carbon tax revenue in science and technology to achieve a low-carbon future. The transition to clean energy and investment in science and technology are important steps forward for old enterprises. The transition to clean energy and investment in science and technology are important steps for Singapore's businesses and economy to achieve sustainable development in the future.

4.2. Suggestions for Vietnam

Currently, Vietnam is one of the countries what are severely affected by climate change. The continuous increase in CO_2 emissions in Vietnam (Figure 1) has a negative impact on business activities and people's lives.

Unit: Million tons

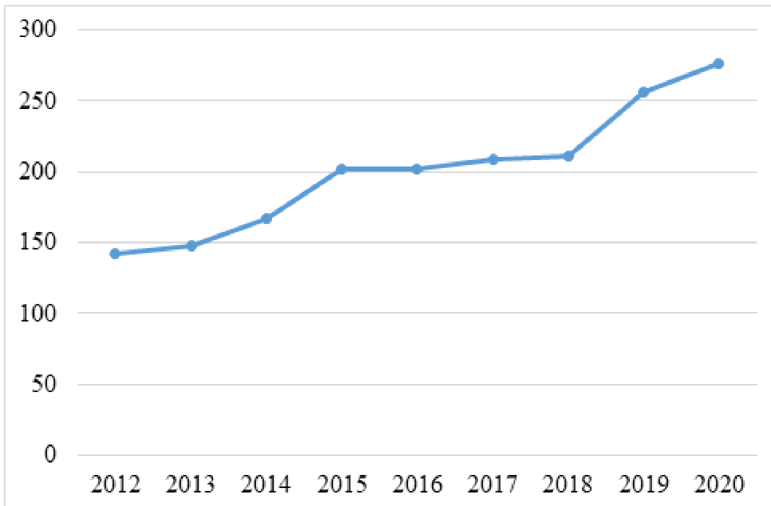

Figure 1: Vietnam's CO_2 emissions in the period 2012-2020

Nguồn: Worldbank and author's compilation

Through Figure 1, we see that Vietnam's CO_2 emissions are constantly increasing. If in 2012, Vietnam's CO_2 emissions were more than 140 million tons, then by 2020 it will be 276.3 million tons (increased 197,3% compared to 2012). During the period 2012-2020, 2019 Vietnam had the largest increase in CO_2 emissions (speed increased by 21,1%); Next, 2015 and 2014 had CO_2 emission growth rates of 20,8% and 13,4%. The large amount of CO_2 emissions has greatly affected the lives of Vietnamese people and businesses.

According to the Climate and Development Report, Vietnamese businesses and people are severely affected by excessive CO_2 emissions. Specifically, 300 coastal areas are facing flood risks, affecting production activities and reducing competitiveness; There are approximately 32000 businesses operating in the Mekong Delta, and due to rising sea levels, 50% of them are at risk of flooding, which has a negative impact on rice, fruit, and seafood production [22]. In the face of this situation, it is crucial for Vietnam to learn from the region and countries around the world to adjust tax systems to reduce CO_2 emissions and create a sustainable business environment for enterprises.

Currently, Vietnam's tax system includes nine different purposes of taxation. In particular, the promulgation of environmental protection taxes is aimed at regulating activities that may have a negative impact on the environment. However, the current environmental protection tax regulations have not clearly reflected the cost per unit of CO_2 emissions into the environment, so the impact of environmental protection taxes on reducing CO_2 emissions is negligible. In addition, Vietnam's environmental protection tax has not yet been separated from budget revenue at all levels to invest in the environmental sector. If Vietnam implements a carbon tax, these limitations of environmental protection tax will be overcome. This approach indicates that applying a carbon tax in Vietnam is feasible and necessary to reduce greenhouse gas emissions, help address climate change, and lay the foundation for sustainable economic development.

By studying the experiences of Japan, Australia, and Singapore, the author provides some suggestions for the application of carbon taxes in Vietnam:

Firstly, Vietnam needs to enact carbon tax laws as soon as possible to mitigate climate change and create a sustainable business environment for businesses. Vietnam's carbon tax law requires specific regulations for taxable objects, tax-free objects, and taxpayers, as follows:

Taxable objects: Materials and fossil fuels that are such as petroleum, methanol, butane, liquefied natural gas, peat, coal, etc.

Tax-free objects: Energy that does not generate CO_2 during combustion (such as wind, solar, hydropower, etc.).

Carbon Taxpayer: A facility that produces goods from energy that generates CO_2.

Secondly, Vietnam should establish carbon tax as an independent tax in its tax system. Currently, many other studies suggest that Vietnam should include carbon taxes in environmental protection taxes (adjusting environmental protection taxes to reflect carbon prices). However, according to Vietnam's national independent contribution report [6], the author suggests establishing a carbon tax as an independent tax coexisting with an environmental protection tax. At that time, Vietnam can expand the scope of taxation on existing environmental protection tax objects. In addition, when the carbon tax is determined in this way, the income from the carbon tax can be separated and directly used for environmental activities.

Thirdly, Vietnam needs to study a roadmap for imposing carbon taxes at appropriate tax rates. This means that Vietnam's carbon tax must be consistent with every stage of its economic development, as well as with the countries in the region and the economic organizations in which Vietnam participates. Due to the different CO_2 emissions of each material and fuel, Vietnam needs to study imposing a unified carbon tax on each metric ton of CO_2 emissions. This will make it easier for economies to calculate their carbon tax obligations- For countries like Vietnam that have received a carbon tax for the first time, this is a very necessary issue.

Based on the ratio between CO_2 emissions and the economic development or per capita income situation of Vietnam with Singapore and other countries, and analysis of international organizations and scientists, the author suggests implementing a carbon tax in Vietnam starting from 2025, with the following roadmap:

2025: Levy a carbon tax of $6 per ton of CO_2

From 2030: Carbon tax is $15 per ton of CO_2

Vietnamese government can use revenue from Carbon tax to support the development of low-carbon and clean technologies (such as investing in renewable energy research), and emission reduction operations, thus creating a healthy environment for the long-term and stable development of Vietnamese enterprises.

5. CONCLUSION

Carbon tax is seen as a measure to improve the business environment. It helps companies transition to new business types that are more environmentally friendly and sustainable. Nowadays, the role of carbon tax in sustainable development of enterprises is increasingly recognized and practiced by various countries.

Through studying the experiences of some countries, it shows that Carbon tax plays a huge role in minimizing the impact of climate change and improving the business environment for businesses. Therefore, in order to promote sustainable development of enterprises, Vietnam should research adding a Carbon tax to the tax system. However, imposing a carbon tax on poor and low-income households will be difficult for basic commodities. Therefore, in Vietnam's Carbon Tax Law, in addition to the specific implementation roadmap, it is also necessary to study the application of carbon tax incentives to enterprises and individuals. Therefore, in Vietnam's Carbon Tax Law, in addition to specifying the content and implementation roadmap, it is also necessary to study the application of carbon tax incentives to enterprises and individuals engaged in technological activities to create environmentally friendly products, thus creating a healthy business environment and promote sustainable business operations for enterprises. This is the foundation for Vietnam's economy to develop quickly and sustainably in the future./.

EXECUTIVE MANAGEMENT CAPACITY OF VIETNAM COMMERCIAL BANK IN DIGITAL TECHNOLOGY AGE

PhD. Truong Thi Duc Giang[1]

Abstract: *Currently, commercial banks (commercial banks) account for the majority of the Vietnamese banking system. In the period of 2018-2023, the commercial banking system has developed and been affected, with significant consequences from the Covid 19 pandemic. The bank's operation itself is a sensitive activity because it involves many stakeholders in the banking sector society. Any change by a bank can spread widely, affecting the bank's customers. Especially in the era of digital technology, the spread is very fast. Business growth and profit development are always the criteria for banks to implement and develop. Along with the development of science and technology, banking management and administration in the digital era is considered an important and urgent issue. Therefore, the issue of executive management capacity of commercial bank in the digital era is mentioned in the research. At the same time, the study also points out a number of results, experiences and new points in executive management capacity required at Vietnamese commercial banks in the digital era.*

Keywords: *Competence, management, administration, commercial banks, digital technology, executive management capacity of commercial banks in the digital technology era.*

1. INTRODUCTION

The operational efficiency of a commercial bank in the technology era depends largely on the executive management capacity of its leaders. With such characteristics, the bank's operations always require tough executive management capacity from the bank's leadership, ensuring that the bank's operations do not occur. To clarify the executive management capacity of commercial banks in the digital era, the article uses theoretical research methods combined with practice, within the scope of research at two typical banks, namely: Joint Stock Commercial Bank for Foreign Trade of Vietnam and Technological and Commercial Joint Stock Bank of Vietnam. Therefore, it is necessary to study the executive management capacity of Vietnamese commercial banks in the digital era.

2. THEORETICAL BASIS

2.1. Executive management at commercial banks

Setting the meaning of the word management in each context, each specific field, many economic experts have given the concept:

- According to Mary Parker Follett (born September 3, 1868) was an American social theorist best known for bringing the ideas of human psychology and human relations to industrial management in his work. The New State" in 1920 pointed out: Management is the art of achieving ends through others. Her concept, although it has the direction of a person specializing in psychology, contains many emotions from workers, but it is undeniable that her idea of "Management is an art" still valid until now.

---

[1] University of Finance and Business Administration, Email: longgiang0578@gmail.com.

- According to James Stoner and Stephen. Robbins also in his book Management Principles taught at Gujarat University of Technology emphasized: " Management is the process of planning, organizing, leading and controlling the activities of the members of an organization. Organization and use all other resources of the organization to achieve the set goals. management is the purposeful influence of the management subject towards the management object in order to achieve the highest results with the organization. original target".

To summarize the above concepts, a general concept of management can be given as follows:

Management is the use of a finite resource to achieve maximum goals. In other words, make the best use of resources, use resources most effectively to achieve the set goals.

According to the Business Dictict.com dictionary, executive management is: "The design, implementation, and control of activities aimed at converting resources into desired goods and services, and executing the business strategy of the company". From this definition, it can be seen that executive management activities include activities that turn resources into usable goods and services, create value for the organization, and governance also linked to business strategy.

Executive management is a part of general management. Therefore, executive management has all the characteristics of management activities in general. *Executive management is the planning, organization and implementation of plans for business activities in order to create the highest possible level of efficiency in an organization. The direction of management is to balance costs with revenue to achieve the highest possible net operating profit.*

For commercial banks, the difference in the business characteristics of the bank - a business providing financial services, has created a difference in executive management.

Executive management is becoming crucial in the success factors of the commercial banking system. The purpose of commercial banks is to profit and increase profits. Therefore, executive management in commercial banks focuses on dealing with specific challenges and new trends that managers must address, related to the balance between cost optimization and requirements, growing business demand.

So, executive management commercial bank is the planning, organization and implementation of a banking business plan towards balancing costs with revenue to achieve the highest possible net operating profit.

2.2. Executive management capacity at commercial banks

Executive management is becoming important in the success factors of financial service providers, especially banks. Executive management focuses on specific challenges and new trends that administrators must address, related to the balance between cost optimization and growing business requirements.

Banking operations have evolved from data entry and labor intensive processes to highly automated process controlled environments. This work includes a mixture of practical and academic elements; it is designed to contribute to better functioning parts by providing tools to implement theoretical concepts in real, proven situations in everyday practice.

The term "capacity" as interpreted on the website https://hvdic.thivien.net/ means qualifications, in accordance with the provisions of the law, which may include rights, performance of obligations or to perform a specific task is assigned. Accordingly, competence emphasizes that a subject has the legal status to carry out a specified job in order to achieve the highest goal in that job.

From the above points of view, it can be understood:

Executive management capacity at commercial banks is the ability to develop strategic plans, organize the implementation of banking business plans in order to achieve specific goals in the future, in which the most important goals are: especially to balance revenue and costs, towards the highest net profit.

The bank's executive management capacity in the digital age is the ability to develop a strategic plan to change the business model from the traditional to the modern method of digitization, by applying new technologies. such as big data, cloud computing, internet of things, etc. to be able to change the operating method, leadership, working process, culture of the bank, namely: Management model, mechanism credit risk management model to suit the development trend of the world.

3. THE CURRENT SITUATION OF EXECUTIVE MANAGEMENT CAPACITY OF VIETNAM COMMERCIAL BANK IN THE DIGITAL TECHNOLOGY ERA

3.1. Overview of executive management capacity at Joint Stock Commercial Bank of Vietnam in the digital era

The article mentions the governance capacity of two banks: Joint Stock Commercial Bank for Foreign Trade of Vietnam (Vietcombank) and Vietnam Technological and Commercial Joint Stock Bank (Techcombank), these are two large banks. The leading bank can represent Vietnam's commercial banks, because it ensures good standards and competitive conditions, develops in the commercial banking system, and the two banks absorb the shock of 2020. In the case of a positive economy as well as a decrease in pressure from the epidemic, both banks have a lot of room for extraordinary income, which proves the banks' management ability in the digital era is very good.

3.1. Executive management capacity at Joint Stock Commercial Bank for Foreign Trade of Vietnam

3.1.1. Overview of executive management capacity at Joint Stock Commercial Bank for Foreign Trade of Vietnam in the digital age

As one of the largest banks in Vietnam, Vietcombank has taken many measures to improve management efficiency in the digital age. In particular, in 2018, Vietcombank innovated the way of executive management, but the results were not good. Therefore, it is still necessary to research and come up with effective solutions that focus on executive management capacity to improve business efficiency of Vietcombank.

About the management model:

Vietcombank chooses the form of management as a centralized management model in the process of operating and managing the bank based on online information from the branch to the Head Office - the use of information technology is always considered, is the most important factor in the operation of the bank. The Bank has gradually implemented the application of a management model in accordance with international standards and good practices, including: reorganizing business types according to customer objects in order to unify the entire system and according to the basic characteristics of the bank's business in the financial market, it consists of blocks (Block model): Wholesale banking, retail banking and Capital management and trading; in parallel with the establishment and reorganization of support types, including: Risk Management Division, Finance/Accounting Management Division and logistics and operations; continue to closely apply management models according to international practices. The thorough application of models makes full use of information technology sources.

About the internal management mechanism

Vietcombank has built and issued many synchronous management documents. Regulations on staff management, regulations on handling labor discipline and material responsibility, regulations on appointment, re-appointment, dismissal and resignation associated with substantive rewards and application of KPIs... Especially, a big change in awareness when internal processes and regulations have directed all organizations and individuals into customer-oriented activities. The obvious change is from passivity, the traditional way of doing things, the old and traditional way of doing things has been replaced by the initiative in finding customers, diversifying products and services, ... based on a digital platform. Modernization, the internet…

About credit risk management

In this period, Vietcombank applied the method of calculating the minimum capital adequacy ratio (CAR) according to the Basel I calculation formula. The standards in Basel I and the implementation and implementation roadmap are mainly aimed at the target, ensure the highest safety in the operating system of the bank. The bank's capital includes: original capital (tier 1 capital) and supplementary capital (tier 2 capital). The criteria for classifying capital are specified in detail. In order to motivate banks to constantly develop the size of tier 1 capital, not being too dependent on tier 2 capital, Basel has set the minimum level for tier 1 capital and the maximum capital level for tier 2 capital.

Capital adequacy level. The bank's equity assessment index is one of the most important indicators to ensure the bank's capital adequacy, because it shows the bank's level of assurance against losses caused by the risks. Risks or imbalances in macroeconomics. The group of Financial Soundness Indicators (FSIs) assesses the level of capital adequacy, equity and risk-weighted assets calculated according to Decision No. 457/2005/QD - The State Bank, dated April 19, 2005 of the State Bank, stipulating prudential ratios in the operation of credit institutions and Circular No. 13/2018/TT-NHNN, May 18, 2018 of the State Bank of Vietnam. The State Bank shall prescribe the internal control system of commercial banks and foreign bank branches. However, the calculation of the risk-weighted adjusted asset ratio is quite complicated and requires detailed items in the balance sheet of the Bank, so the content of this analysis cannot be done. perform the calculation of capital adequacy ratio CAR, which will take data from the financial statements and annual reports of Vietcombank as a basis for analysis and evaluation. The results show that Vietcombank's CAR for the period 2015-2020 still meets Basel I capital standards.

3.1.2. Overview of executive management capacity at Vietnam Technological and Commercial Joint Stock Bank in the digital age

For the Management level, Techcombank is committed to building and expanding the development of an open, transparent and safe Executive - Management system for customers, employees and capital contributors, based on the foundation. modern information technology platform for long-term sustainable development of the organization.

About management model and mechanism

In the context of Vietnam's legal conditions constantly changing in the direction of using corporate management regulations according to world standards, Techcombank has actively applied the Executive Management model, ensuring the most compliance, comply with the provisions of Vietnamese laws and meet the growing international conditions. From the regulations on the Executive Management structure of the Bank drafted by the Board of Directors, the Executive level commits to perfecting and implementing the organization based on the regulations of Public Executive- Management, specific regulations on authority, responsibility and ensure the safety of all levels. Councils at the Executive level are completed and put into practice according to fully regulated functions, with specific regulations on responsibilities and powers between levels and ensuring accuracy with full regulations. enough of the law. In addition to the councils formed to improve the quality of executive management on issues such as risk management, capital management and liquidity, the Board of Management also proactively introduced councils in the Executive Management - Articles of Association structure. To better unify, examine and manage the Bank's key issues, bring great value to customers and build longevity for the Management structure during the strong growth period of the organization.

About internal management in the bank

Techcombank's main Executive - Management structure is perfected and developed on the principle of publicity and the most benefits, in which there is a clear division between the Management and Executive levels, ensuring maximum roles and responsibilities of each member level, especially the responsibility of the Management level in indicating the direction, regulation and management of the Bank. At the same time, the management mechanism for all basic areas of the bank is also taken care of to better match the growth position of the organization, so that partners can safely invest capital in business and appreciate the organization.

In 2019, the implementation and improvement of the Executive- Management Structure has been gradually implemented in accordance with the regulations set forth by the Board of Directors, serving as the basis for the process of changing the business model and operating activities each year. working towards meeting international regulations and standards such as OECD, IFC and COSO guidelines. The Bank has actively researched and applied the Code of Corporate Management in accordance with the best standards issued by the State Securities Commission in collaboration with IFC in recent years. In order to better enforce the standards for listed companies and according to the standards on management, the Bank has appointed the position of Person in charge of corporate management, thereby supporting the Board of Directors in the mechanism of corporate management. implement, make decisions, ensure compliance with regulations, legal documents and the Charter of the unit. At the same time, the person in charge of managing the unit will manage, consult and advise the Board of Directors on legal requirements and all risks in business and development.

Techcombank is committed to completing and implementing the Executive - Management structure in order to enforce the legitimate regulations of the involved parties. To shareholders and investors, the Chairman's Message on Corporate Management for the Board of Directors, the bank is committed to perfecting and developing a most public and beneficial Executive - Management structure, ensure the interests of related parties, thereby ensuring the survival and development of the organization. It is necessary to maintain a flexible system that is most beneficial to help businesses achieve great value within the allowable risk level, with an appropriate Executive - Management team and an information disclosure mechanism. For State management units, the bank always ensures the highest banking management system to ensure safety for all involved subjects. For customers, the bank actively establishes entities at all levels to control and direct the important activities of the bank in order to best serve the capital needs of customers and absolutely guarantee the rights and interests of customers. Benefits customers when using all services of Techcombank.

About credit risk management

Currently, the credit risk management model at Techcombank is built according to Basel II standards, including three lines of defense. Techcombank has built and developed Switzerland's T24 core banking system since 2000 and continues to improve. All activities in the customer data system as well as the bank's accounting system and database are confirmed to meet international standards.

Since 2009, Techcombank has hired the world's leading consultant McKinsey to re-finish the structure system, along with strategic partner HSBC has been actively supporting the development of the risk management system. With this support process, Techcombank has developed a risk management framework according to a new model including "3 lines of defense" and "enterprise-wide risk management" into application. First, is the line of defense for risk management at direct business units including branches, Business Units and other operating units. Second, is the line of defense including the Risk Management Division and the Compliance Division, operational and legal risk management. The third line of defense includes an independent audit department.

More specifically, the first line of defense is to protect the Bank; the second line of defense will create policies, risk appetite, processes, product approvals, controls and immediate construction of early warning systems, development of debt collection plans and operating procedures, ensure specific safety tasks of each individual participating in the entire credit process, etc…; The third line of defense is under the control of the Board of Directors, so it has high independence, helping the Supervisory Board and the Board of Directors on the effectiveness of the unit throughout the operations of business divisions, operations and risk management department. After a period of using and implementing the above three lines of defense model, the 7,000 employees in Techcombank are well aware of each individual's responsibility for the bank's risk management. This helps strengthen credit, compliance and risk culture across the organization.

3.2. Results on executive management capacity at Vietnamese commercial banks in the digital age

The level of IT application in Vietnam's banking system has been improved. According to the Vietnam ICT Index 2019 Report: "The implementation of information security and safety measures has been focused. The rate of installing firewall devices at the main data center is 100%, the rate of deploying IPS/IDS solutions at the main data center is 90%, the rate of deploying Internet access control is 100%. The percentage of banks that have implemented Core banking is 100%, as well as the percentage of banks that implement interbank electronic payments is 100%" (Vietnam ICT Index 2019 Report)

According to this report: *"The level of technology application is still not high. Outdated IT infrastructure, the ratio of ATMs/total payment cards is 0.33%; POS machine/total payment card ratio is 0.39%. The rate of installation of information security analysis and warning system (SOC) at the main data center is only about 50%. In addition, the ratio of Internet bandwidth providing Internet Banking services to the total number of Internet Banking customers is still low, only about 0.66%. The human resource base has not been focused, the ratio of IT professionals/total bank staff is 2.4%, the percentage of IT professionals with international certificates in IT/total bank staff is 10.3%"* (Vietnam ICT Index 2019 Report)

Table 3.1: Some indicators of IT application of the Vietnamese commercial banking system

Ordinal Number	Targets	2019	2018
1	Proportion of banks achieving certificates of information security	46,7%	59,4%
2	Proportion of banks that have implemented Core banking	100%	100%
3	The degree of automation when processing transactions of Core banking system	83,3%	90,6%
4	Implement the risk management system	53,3%	53,1%
5	Resource Management (ERP)	36,7%	53,1%

Source: Vietnam ICT Index 2019

The new context of commercial banks is the race for "data collection and processing" mainly through modern applications such as AI, big data... through non-traditional channel systems. Systems such as: data channels on social networks, data channels on behavioral psychology, data channels on telecommunications, and data channels on phone usage... and through a combination with financial technology leaders (Fintech) to use the data array of these organizations. A number of credit institutions have now paid much attention to the development of digital banks and systems for making business decisions based on automated database system analysis. Has a foundation to continue promoting technology applications for automatic calculation and executive management work, for example, VIB has used the risk management system platform, this type is Transferred from supplier Commonwealth Bank of Australia (CBA), OCB as a consultant of Development Banking Singapore (DBS) has completed the automatic capital calculation as required by Basel II.

However, the rate of technology application in risk management of credit institutions is not the same because the amount of expenditure for investments is very large, ranging from several tens of millions of dollars. Along with large investment costs, cleaning and diversifying data (accounting for about 50% - 80% of the total time to implement information technology projects) is also more difficult in the process of digitizing the process. Risk management activities at Vietnamese credit institutions. Highly inconsistent statistics from information sources are given in statistical reports, in analytical reports. This is because credit institutions are considering applying many systems at a time such as Oracle's Flexcube, Temenos' T24, etc., thus losing the accuracy of statistical data systems. In addition, leaders with in-depth professional experience and high ability to analyze data sources and build statistical probabilistic models are still few, which is also one of the problems faced by Vietnamese credit institutions. faced in the process of digital technology risk management.

3.2.1. Results of executive management capacity at Techcombank in the digital era

Digital transformation plays a vital role for every business in today's technology age. Techcombank is a pioneer bank in digital transformation and data transformation to the cloud (cloud).

The desire to pioneer transformation has been established right in Techcombank's strategic vision of "Transforming the financial industry, raising the value of life". This vision is realized by the Bank, through development strategies based on the three pillars of "Digitalization - Data - Talent", in which cloud integration plays a pivotal role. With the name of the bank with the word "Tech - Technology". Therefore, during 30 years of operation, the Bank has always established a leading position in the process of technology transformation, which also demonstrates the management capacity of the bank's leaders in the digital era. The bank expects the investment cost for technology in 2023 to exceed 100 million USD, and the bank's leadership has made decisions for more than 1,000 employees who are devoting full-time to the technology, digitization and data fields at Techcombank, it can be said that this is a huge resource that not all corporations, even in the technology industry, can mobilize. Digitization and cloud technology are not merely a tool to achieve business goals, but conversely, this is the core element expressing Techcombank's identity for its executive management capacity in the digital age.

With the transformation in Techcombank's executive management capacity, the bank has achieved the following results:

+ Thanks to the leadership's decisions that are strategic investment decisions for digitization - data, Techcombank has successfully converted 43 data systems to the cloud in the past year. Along with that, 10 new platforms from the world's leading companies have been integrated into Techcombank's cloud system, and many of them are the first platforms available on the cloud in the banking industry in Vietnam.

+ At Techcombank, "Cloud First" has been applied in leadership decisions on strategic and operational initiatives, shortening implementation time. From the "Data center" on the cloud, NH has built and continues to refine the "Data brain", so that the bank can actively improve its ability to approve unsecured loans, while still ensuring credit quality assurance, especially for high-end individual customers and small and medium enterprises. This is the key to helping Techcombank shift the way it operates, from just providing what customers ask for, to proactively anticipating needs and providing solutions even before customers think about it. Techcombank's executive management capacity through leadership's decision to carry out digital transformation and data transformation to the cloud has kept the bank highly secure - thanks to its highly secure cyber security process. based on the cloud security platform of the world's leading corporation Amazon, and tight internal management mechanisms.

+ In addition, Techcombank's executive management capacity through the leadership's decision is also reflected in the bank's leadership having decided to build a fully automatic credit card issuance process in the cloud, and reduce the time it takes to issue a credit card, approval time from a few days to just a few seconds as soon as the customer completes the registration. The preparation time to launch a new NH activity has been markedly reduced, making it possible for a campaign or initiative that used to take weeks to launch, now starting immediately in a few days. The IT department is operating at much improved productivity and our operating income per employee has increased by 40% since 2020.

3.2.2. Results of executive management capacity at Vietcombank in the digital era

Vietcombank acted with the principle of sticking to the guidelines and resolutions of the Central Committee and the leadership and direction of the Party Committee of the Central Business Sector and the State Bank of Vietnam, putting policies into concrete actions with high determination to achieve the goal. Have a clear goal. With efforts, solidarity, initiative, creativity, and strong transformation in strategic planning, the entire Vietcombank system has unanimously agreed to conquer the journey of "Reaching out to the greater business environment", accelerating business, anticipate new trends in technology and banking management, successfully implement the vision and strategic goals set out. It is becoming the number 1 bank in Vietnam, one of the 100 largest banks in Asia, one of the 300 largest banking and financial groups in the world, one of the 1,000 largest listed companies in the world, have made great contributions to the development of Vietnam.

In order to achieve strategic goals, Vietcombank has determined a specific guideline for success, in which a central and urgent task is to become a leading bank in digital banking transformation, application of digital banking system, and more, system of the most modern technology, to welcome the industrial revolution 4.0. Accordingly, Vietcombank's technology has made strong steps, demonstrated by building and modernizing its organizational model, business strategy and especially by improving its IT application infrastructure to focus on building a building an advanced modern technology architecture, starting from innovating the core application system, building a service-oriented architecture, developing distribution channels and improving risk management capabilities. At the same time, actively research, invest and apply outstanding and appropriate technologies, in order to seize opportunities and expand the supply of diversified and convenient banking products and services to customers.

The drastic direction of Vietcombank's Party Committee in response to the requirement of "change for success" is clearly shown in closely directing the implementation of a series of transformation projects, improving the bank's governance capacity. Recognizing the importance of technology projects with Vietcombank's long-term development strategy, Vietcombank's Party Committee and Board of Directors established a Directing Committee for technology projects, in which the Secretary of the Party Committee, Chairman of the Board of Directors direct direction; the members are all members of the Board of Directors and senior management of the bank. When implementing projects, at least 1 member of the Board of Directors/Board of Management directly participates in the role of Project Director, taking the highest responsibility for the implementation and progress of the project. The limitations and delays in the implementation process are analyzed, evaluated, directed and adjusted in a timely manner, and the management methods and new and advanced technological trends of each project are approved by the Board of Directors. leaders are ready to put it into practice very soon, achieving qualitative changes to bring Vietcombank to new heights. Under the drastic leadership and spirit of acceptance of change and willingness to innovate by the Party Committee of Vietcombank, in the year 2019-2021 Vietcombank has successfully implemented a series of projects to improve management capacity, typically the Project Core Banking Project and Basel II Program.

Core Banking Project (Project to transform core banking system) - The largest and most influential project of the bank. The project was directly managed by the General Director, Deputy Secretary of the Party Committee of Vietcombank in the role of Project Director and two Deputy General Directors in charge of technical and professional activities; mobilize and concentrate resources of the whole system, bring into full play the creativity and responsibility of collectives and individuals. Under the close attention and direction of the Party Committee and Board of Directors of Vietcombank, the project was successfully implemented in January 2020 with record numbers: The highest number of integrated applications (more than 100 applications)), the fastest conversion time, customers can continuously maintain 24/7 service during the transition period… The project has helped Vietcombank to have strong transformation steps, have a distinct competitive advantage, especially is a highly extensible platform, easy to upgrade and integrate with other systems, ready for the process of bank digitization to move towards an independent digital banking model in the future. The results of the implementation of the "New Core Banking" project are also practical actions in Vietcombank's operations to welcome the Party Congress at all levels to the Party Congress of Vietcombank for the 2020-2025 term.

Standing behind but playing a fundamental role in the success of transformation projects and digital banking transformation towards customer experience and satisfaction are projects to build and complete public infrastructure. information technology - processing, storage and service transmission platform. Under the close direction of the Party Committee and Executive Board of Vietcombank in the professional work of information technology, the investment in the right direction and efficiency in the application of artificial intelligence, building a centralized and complete database. Improving the technology system management process, applying international safety and security standards (PCIDSS, 3DS, ITSM, IAM...) is an important factor to ensure Vietcombank's technology system operates safely and stably, determined, effective and meet the requirements of application development for strategy implementation.

Implementing the Resolution of the Party and the direction of the Government, Vietcombank's Party Committee has thoroughly understood in terms of awareness, played an important role in terms of orientation, directing the whole system to actively and actively participate in the revolution. industrial network in general and technology development and digital transformation at Vietcombank in particular. All officers and employees of Vietcombank under the leadership of the Party Committee and Executive Board have made constant efforts to contribute to the national digital transformation.

Vietcombank's Party Committee and Executive Board have given the right orientation, directed to focus on researching and taking advantage of outstanding technological achievements in order to comprehensively upgrade the digital banking system, identifying this as a political task, top importance. In 2020, right after completing the Core Banking project, with only 5 months of efforts to deploy, Vietcombank has launched a completely new digital banking service called VCB-Digibank for individual customers on the basis of consolidation of Internet Banking and Mobile Banking services. For the first time in Vietnam, customers have the opportunity to experience a uniform digital payment service on all types of devices, quick access, modern and convenient design, ensuring safety and security for customers, client. The comprehensive upgrade of the digital banking system creates a premise to serve the society's electronic payment activities, promoting non-cash payment activities. With more than 15 million regular customers, Vietcombank plays a big role in the cashless payment system in Vietnam; This is a huge responsibility in the national digital transformation.

Affirming its development strategy as a leading bank in the 4.0 Revolution in Vietnam, Vietcombank's Party Committee and Board of Directors have also taken pioneering steps for the digital transformation. In August 2019, Vietcombank put the Digital Banking Center into operation, demonstrating the drastic direction and realization of Vietcombank's goals in comprehensively developing the digitalization of banking activities. The trends of technology revolution 4.0 artificial intelligence (AI), big data (Big Data) and connected things have all been put into research and development by the Board of Directors, concretized by innovative initiatives. In each phase. Completing the above important tasks shows the role, importance and correct vision of the Party Committee and the Board of Directors of Vietcombank. Focusing on a strategy of fast and strong transformation, improving work efficiency towards customers, etc. Has been promoting Vietcombank's resources in the process of technological transformation, performing well its tasks. entrusted by the Party and State. The entire Vietcombank system has been and will continue to strive to maintain the role of the leader, realizing the goal of "The leading bank in digital transformation" to contribute to the banking governance in the field of digital transformation. Change the country number. (Department of management of technology projects - Vietcombank Headquarters Party Committee).

3.3. Some limitations in executive management capacity at Vietnamese commercial banks in the digital era

- The bank's apparatus and operation mechanism is not suitable and up to date with the development of international practices
- The change in mindset is very important, the bank's staff is the factor that creates the transformation process of the bank. Therefore, continue to develop high-quality human resources.
- Comprehensive digital transformation has not been carried out at the same time.
- There have not been diversified and rich extension activities.

4. SOLUTIONS ON EXECUTIVE MANAGEMENT CAPACITY AT VIETNAMESE COMMERCIAL BANKS IN THE DIGITAL TECHNOLOGY ERA

Through the results of the governance capacity of two large joint stock commercial banks in Vietnam of Vietnamese credit institutions in the digital age, the article offers some solutions as follows:

Firstly, commercial banks quickly perfect their apparatus and operating mechanism and management model according to international standards. Focus on strategy formulation and monitoring of the Bank's strategic goals. Restructure the Board of Directors with a reasonable number of members. The Board of Directors issues a Resolution directing business activities and assigning specific tasks to each member; at the same time, supervise the Board of Management to implement and comply with the provisions of the Charter of the Bank, the Regulation on organization and operation of the Board of Directors, the internal management regulations and other regulations. of the bank.

In addition, the members of the Board of Directors and the Board of Management necessarily put the interests of shareholders, the State and the Bank as the top performance criteria, perform well in their management direction and management, fulfill assigned duties and responsibilities. Complete the Human Resources Committees, Strategy Committees, Executive Boards. At the same time, perfecting the mechanism and regulations of the bank's management.

Secondly, commercial banks continue to develop high-quality human resources. First of all, raise the leadership's awareness of bank governance. Members of the Board of Directors, Board of Directors, Supervisory Board, chief accountants, directors of branches should make efforts to increase understanding, raise awareness and improve operational efficiency. Next, improve the professionalism of the Board of Directors, continue to enhance the professionalism of the Board of Directors through transparency and clear responsibilities. The board should continue to develop a proper "business culture".

Annually open professional training courses for 100% of senior managers (bank managers) and middle level (branch managers). At the same time, open professional training courses for 35%-40% of officials of departments, including updating professional knowledge about digital technology and knowledge of law. Building a culture that values performance, quality of work, respects and is always willing to benefit partners and the national economy. Striving for 100% of employees to always develop well, update their professional knowledge, legal understanding and have a good grasp of the bank's operations. The Bank always prioritizes the budget for the development, training and fostering of the bank's human resources.

Thirdly, in order to conduct a comprehensive digital transformation, commercial banks need to conduct digital transformation and modernize management, administration, and implementation of the Digital Strategy. On the other hand, banks need to establish a Digital Banking Center with the criteria to strengthen the digitization capacity of the whole banking system and directly plan and deploy digital platforms applying modern technology. Banks need to complete digital management by 2023-2025, connecting data with the entire banking system and with the national data portal.

Fourthly, in order to have diversified and rich expansion activities, it is necessary for commercial banks to strengthen international cooperation relations, and to expand strategic partners to jointly implement their commitments in the development of international markets. Develop the banking business in general and learn, apply and develop effective banking executive management in accordance with international practices. On the basis of developing two market development strategies, expanding the market share to the cooperating countries.

Every year, banks need to organize in-depth exchange seminars and expand cooperation, actively participate in domestic and foreign forums, economic and business conferences in order to grasp the new opportunities. development trend, while looking for more partners, business opportunities and sharing experiences with partner businesses. Participating in conferences and forums is an opportunity to promote cooperation between Vietnam's banking industry and leading global and regional financial firms and corporations with financial and technological potential. Promote and introduce the image of banks to the region and the world through media and the internet.

5. RECOMMENDATIONS ON EXECUTIVE MANAGEMENT CAPACITY AT VIETNAMESE COMMERCIAL BANKS IN THE DIGITAL TECHNOLOGY ERA

In the new context to develop technology application in business activities as well as management capacity of commercial banks with digital technology application, the State Bank of Vietnam needs to create favorable conditions in the direction of building a The legal and mechanism framework for commercial banks is as follows:

First, the State Bank needs to cooperate with foreign consulting units to consider, evaluate and forecast the banking ecosystem to be rebuilt according to the development trend of technology, thereby establishing orientations. guidelines to preserve financial markets from recovering from future shocks.

Second, the legal framework needs to be adjusted and improved, guiding commercial banks to meet international standards, of which banks must improve the quality of their internal management models, identify redefining or expanding the bank's current risk management framework to synchronously respond to 4.0 technology.

Third, the State Bank should actively agree with the Ministry of Information and Communications to develop a legal theoretical framework for general data protection regulations, a security law mechanism for passwords based on the new technology platforms such as AI, RPA, cloud computing...

Fourth, the list of international standard conditions for suppliers and partners in technology development should be implemented in order to create optimal conditions for commercial banks in the process of censorship and partner selection. Limit the level of risk from 3rd parties.

Fifth, the State Bank should proactively deploy and coordinate with foreign organizations to develop programs to support training in human resources, improving the skills of employees according to the speed of technology development. numbers at commercial banks.

THE IMPACT OF GLOBAL MINIMUM TAX RATE IMPLEMENTATION ON FDI ATTRACTION IN VIETNAM

Dr. Nguyen Thi Bich Diep, Dr. Le Ngoc Thom[1]

Abstract: Implementing the global minimum tax rate will have an impact on the investment environment in general and attracting FDI in particular. The article aims to analyze the current status of FDI attraction in Vietnam in the past year and the basic content of the Global minimum tax rate. Then, analyzing the positive impacts as well as some limitations to attract FDI when implementing global minimum tax rate in Vietnam. From there, we provide some policy suggestions to improve the investment environment in the context of global minimum tax rate implementation.

Keywords: FDI, Global minimum tax rate, FDI attraction policies.

1. INTRODUCTION

To create a healthy and fair competitive environment between countries through the tax system and prevent tax loss, since 2013, the "Base Erosion and Profit Shifting (BEPS) Initiative" has been approved by the Organization for Economic Cooperation and Development (OECD) with two contents: (1) Division of taxing rights, assessment of profit distribution and profit distribution principles; (2) Ensure that all businesses operating internationally pay a minimum tax rate." At the 2021 BEPS Global Cooperation Forum (IF), a statement was issued on the "Two-pillar solution framework to address challenges arising from the digital economy", including: Pillar I includes: includes tax allocation content for digital activities and Pillar II regulations on global minimum tax rates. The content of Pillar II includes two main rules: combined internal law (GloBE) and source country's taxing rights (STTR). More specifically, GloBE rules include two rules: Minimum tax rate (IIR) and less than minimum taxable payment (UTPR). At present, more than 140 countries in the world have agreed and implemented the Two-Pillar Solution Framework, including Vietnam.

The global minimum tax rate is an international tax policy, so it will have certain impacts on investment incentive policies in particular and the investment environment in general in Vietnam - a country that attracts and receives foreign direct investment capital flows. In the theories of location advantage or the OLI model, investment incentive policies create a favorable environment for foreign investors and impact the profits of investors. Empirical studies by Kimono et al. (2007) or Ren (2012) have shown the positive impact of specific FDI preferential investment policies such as reducing costs, time, investment information, reducing risks when investment activities are carried out. It can be said that this is one of the conditions for foreign investors to easily access the market of the receiving country.

Therefore, the article aims to consider the implications of the global minimum tax rule affecting the investment environment to attract FDI through the investment incentive policy system in Vietnam and make some recommendations to improve the investment policies in the context of that scene.

2. POLICIES ATTRACTING FDI IN VIETNAM

2.1. Situation of FDI attraction

Vietnam currently attracts investment from many countries around the world, however major investors mainly come from East Asia such as Korea, Japan and Singapore... In 2020, although the global investment trend was decreased, Vietnam for the first time was among the top 20 countries attracting FDI in the world. By 2021, FDI capital into Vietnam would continue to maintain stability and exceed the 31 billion USD, an increase of 9.2% over the same period in 2020.

After the historic 1986 Party Congress, opening a challenging and hopeful development path created opportunities for the economy to transform, including foreign direct investment. As soon as the Law on Investment (1987) was enacted, it marked an important turning point in receiving foreign investment in Vietnam.

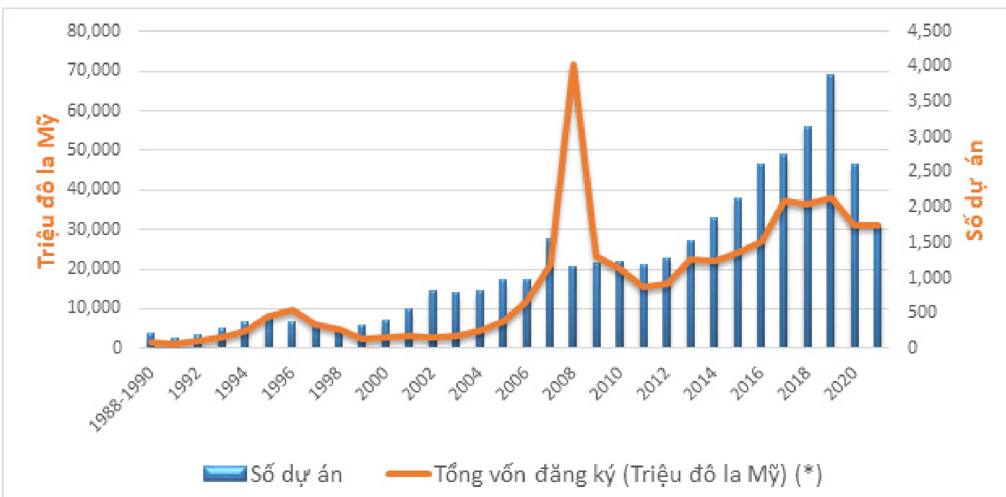

Figure1: Number of projects and FDI registered capital in Vietnam 1988 – 2021

Source: GSO

Vietnam gradually changes in accordance with the development situation of the region and the world as well as the current state of the global economy. The Government continuously supplemented and improved the Foreign Investment Law and in 2005 issued the Investment Law with many changes, including licensing and investment project management issues. In 2014, the new Investment Law was born and replaced the 2005 law to continue the open investment policy in accordance with the country's economic capacity and purpose of attracting FDI in each stage. Besides policy corridors, Vietnam also changes and prepares both hard and soft infrastructure to create pull points to attract FDI and promote the most effective sources of FDI capital such as infrastructure, management level, or quality human resources...

In the period from 2000 - 2015, the economy as well as the FDI attraction situation did not have any major changes due to the impact of the world financial and economic crisis of 2008-2009. Vietnam had timely policies in turn to support domestic and foreign businesses in many different forms, soon after that the number of projects and amount of registered capital improved. Since 2015, FDI capital has begun to show signs of increasing rapidly compared to previous years. Summarizing 30 years of attracting investment in 2018, FDI plays an important role in Vietnam's economy with a proportion of 55% of industrial production, 70% of export value, and 3.7 million jobs. Year 2019 was an important step when the highlight was a record high disbursed FDI capital of 20.38 billion USD.

In 2022, Vietnam had also attracted nearly 30 billion USD, showing positive signs for a return after the pandemic. However, if Vietnam applies the global minimum tax rate, it will directly affect FDI capital flows, so Vietnam will face many difficulties in attracting FDI through tax incentives.

2.2. Investment incentives policies attracting FDI

To promote economic development, stabilizing economic policies such as financial policy, monetary policy, etc. is always of concern to the government. For investors, especially foreign investors, investment incentive policies are one of the important contents when investing in Vietnam.

Foreign investment incentives mainly focus on: (i) Corporate income tax incentives, (ii) Import and export tax incentives and (iii) Land finance incentives. The current preferential policies to attract investment are implemented in accordance with the Investment Law 2014, the Law on Corporate Income Tax (2008 and revised 2013), the Law amending and supplementing a number of articles of the 2014 tax laws, Consolidation document 14/VBHN-VPQH merging the Law on Corporate Income Tax, the Law on Import and Export Tax 2016, Decree No. 118/2015/ND-CP detailing and guiding the implementation of a number of articles of the Investment Law, Decree No. Decree 123/2017/ND-CP amending a number of articles on land use levy collection, land rent collection, water surface rent, Decree 57/2018/ND-CP on business incentive mechanisms and policies investment in agriculture and rural areas, the Law on Non-Agricultural Land Use, etc.

Preferential tax policies in attracting investment in Vietnam (corporate income tax incentives; import tax exemption; exemption or reduction of land use fees, land rent, land use tax; accelerated depreciation, increased deductible expenses when calculating taxable income) is considered attractive compared to other countries in the region. With a competitive tax incentive policy, along with strengths such as: stable political and economic situation, large labor source..., foreign investment capital flow entering Vietnam has continuously increased over the years.

Currently, there are more than 300 projects with registered investment capital of over 100 million USD operating in the field of processing and manufacturing industries in economic zones and industrial parks and are enjoying incentives. Corporate income tax is lower than 15%, which is usually businesses in the high technology sector (such as Samsung, Intel, LG, Bosch, Sharp, Panasonic, Foxconn, Pegatron...). Accordingly, the total registered investment capital of these types of projects accounts for nearly 30% of total FDI capital in Vietnam (about 131.3 billion USD). These are projects that will likely be affected by the global minimum tax. If the global minimum tax is applied and Vietnam does not have timely response solutions, the benefits from preferential corporate income tax policies that projects enjoy in Vietnam will no longer exist and affect the attractiveness to loss of competitive advantage of the Vietnamese market in attracting foreign investment and affecting investment expansion plans of investors.

Regarding state budget revenue, in the period 2020 - 2022, the amount of corporate income tax revenue from the foreign-invested enterprise sector over the total corporate income tax revenue is as follows: Total income tax revenue Enterprise imports account for about 18 - 21% of total domestic budget revenue. Corporate income tax revenue from the foreign-invested enterprise sector is about 7.5 - 8.5% of total domestic budget revenue. Corporate income tax revenue from the foreign-invested enterprise sector accounts for about 39 - 41% of total corporate income tax revenue. If Vietnam does not apply the global minimum tax, state budget revenue from corporate income tax will not be affected. However, if Vietnam applies the standard domestic minimum tax regulations, Vietnam will have the right to impose additional taxes on FDI enterprises that are enjoying an effective tax rate in Vietnam lower than the minimum rate of 15%, thereby increasing state budget revenue. In case Vietnam does not collect additional corporate income tax, all preferential revenue for current businesses will be collected by developed countries with businesses investing in Vietnam into those countries' budgets. On the other hand, when Vietnam applies the global minimum tax (Regulations IIR and UTPR) to Vietnamese enterprises investing abroad that are subject to the global minimum tax and have subsidiaries in the country, If the actual corporate income tax is lower than the minimum level, additional corporate income tax will be collected from these enterprises, thereby increasing state budget revenue.

3. THE IMPACT OF GLOBAL MINIMUM TAX RATE TO ATTRACTING FDI

3.1. Global minimum tax rate

In the global economic with fierce competition between countries to attract investment; in June 2013, the Organization for Economic Co-operation and Development (OECD) initiated and was approved by countries in the group of leading developed and emerging economies in the world (G20) to prevent taxation basic erosion and profit shifting with the goal: "Dividing taxing rights, evaluating the profit allocation of businesses and building principles global profit allocation rules; ensure that all businesses engaged in international investment must pay a minimum tax rate."

Following that, the IF Joint Cooperation Forum adopted 15 actions to establish a modern and globally fair international tax system under the Tax Base Erosion and Profit Shifting Reform Program (BEPS). Widespread and consistent implementation is a key requirement for the effectiveness of the BEPS Program, especially the implementation of international tax rules. To implement, on July 9, 2021, Finance Ministers and Central Bank Governors of the G20 group agreed on the principle of a Two-Pillar Solution to address tax challenges arising in the economic digitalization process (referred to as the Global Minimum Tax Agreement), including: (i) The first pillar is tax allocation for digital-based business activities (reallocation of taxing rights to multinational companies between the place of headquarters and the place of business operations and income generation); (ii) The second pillar sets a global minimum corporate income tax rate of 15% for multinational companies to prevent these companies from shifting profits to low-tax countries to avoid income tax .

3.2. The impact of global minimum tax implementation on FDI attraction in Vietnam

According to data and preliminary statistical information from the global business database, there are currently about 1,017 foreign-invested enterprises in Vietnam whose parent companies are subject to the global minimum tax. Among them, there are at least over 100 large enterprises that are likely to be affected by the global minimum tax if applied from 2024. Thus, when it takes effect, the global minimum tax will have both positive and negative impacts for Vietnam's economy and investment, specifically:

- *Positive:*

First, participating in the implementation of the global minimum tax contributes to strengthening Vietnam's international integration in general and reforming the tax system in accordance with international practices and standards in particular. Actively participating and implementing OECD tools and legal frameworks will contribute to improving Vietnam's image in the eyes of foreign partners and investors. This will also contribute to improving Vietnam's tax legal framework and promoting amendments to Vietnam's FDI attraction policy in the direction of reducing tax incentives and enhancing competition by investment - business environment, infrastructure development, human resources...etc.

Second, developed countries may be larger beneficiaries of a global minimum tax. Establishing a global tax collection and control mechanism can be a point of success for developed countries when establishing a global tax mechanism, ending competition for tax incentives from developing countries development as well as increase tax revenue from multinational corporations and companies.

Third, the contents of the global minimum tax are agreed in principle, but some contents are still reserved and have not been regulated or guided in detail, which could affect the operations of corporations and businesses multinationals. According to the MLI Convention that Vietnam has signed, Vietnam has the right not to apply some content on applying the double tax elimination method, applying tax agreements to limit the taxing rights of resident organizations/individuals.

- *Limitation:*

First, the application of the global minimum corporate income tax will reduce competition in attracting investment in developing countries that mainly rely on tax incentives to attract FDI. The level of impact depends on the characteristics of the tax system, specifically the standard corporate income tax system of each country. Countries with low tax collection efficiency (with low tax rates and many preferential policies leading to low tax revenue) will be more affected due to potential knock-on effects on the CIT base and other tax calculation. In contrast, countries with average or above average tax rates with a large tax revenue source (low tax incentives) will be less affected by the application of global minimum tax.

Second, the application of global minimum tax may cause short-term disturbances in FDI capital flows. According to the OECD, a global minimum tax would increase global investment costs and could therefore reduce global GDP by 0.1 percentage point in the short term. It is expected that a part of FDI capital may return to developed countries when the incentive to avoid taxes is reduced and corporations will pay more attention to the investment - business environment and economic growth prospects when choosing to make decisions to invest while limiting investment capital in developing countries when tax incentives are no longer so attractive.

Third, the global production and supply chain may have certain changes. The global minimum tax will make multinational corporations consider more before deciding to move production and supply chains abroad or shift production between countries due to changes in tariffs, in when prioritizing ensuring stability of domestic production and supply chains.

Fourth, a global minimum tax may give multinational companies less incentive to shift profits to countries that are "tax havens" or countries with low corporate income tax rates. The application of preventing taxation global Base Erosion principles allows developed countries and countries with high corporate income tax rates where multinational corporations and companies are headquartered to increase additional tax revenue for with the profits that the above companies previously transferred to tax havens.

Fifth, the application of this global minimum tax may incur some costs for reforming the tax management system and administrative procedures in the investment sector, and implementation progress depends on management capacity of relevant ministries, branches and localities. The mechanism for sharing information, data and tax obligations of multinational corporations requires a capable tax administration system and coordinated efforts at the international level, which is also a big challenge for developing countries development with often inadequate tax management capacity like Vietnam. This requires stepping up tax reform, reform administrative procedures and innovate Vietnam's FDI attraction mechanisms and policies to be more consistent with GloBE rules in the near future.

4. RECOMMENDATIONS

Based on the analysis of the current situation and impact of the global minimum tax on attracting foreign direct investment in Vietnam, the authors propose a number of policy recommendations as follows:

Firstly, improve the institutional and policy environment to create favorable conditions for foreign direct investment activities in terms of both attraction and effective use: review the implementation of legal documents to avoid overlap between documents; Propose recommendations to develop and improve synchronous and unified investment policies and continue to improve administrative procedures in the direction of creating conditions for foreign investors, especially investors targeting priority areas.

Second, perfect policies other than taxes: According to research by the United Nations Industrial Development Organization (UNIDO, 2011), economic stability, political stability, raw material costs, domestic market, Labor costs and transparency of the legal framework in the host country are valued more highly by investors than tax incentives. Many other studies by international organizations (WB, IMF, ADB...) have also shown that tax incentives are only one of the factors that investors consider when deciding to invest. Therefore, along with considering amending the tax incentive policy to make it more reasonable, Vietnam also needs to research and create favorable conditions for investors on non-tax policies (such as exemption and reduction of land rent, improvement of land rent, administrative procedures to cut compliance costs for businesses, etc.)

Third, modernize socio-economic infrastructure: To meet the requirements of the country's new development period, the Government needs to pay attention to a number of solutions: (i) Complete the development of national sector plans and specialized technical plans to serve as a basis for supplementing, editing, improving quality and having a long-term vision for infrastructure plans, establishing specialized projects, and mobilizing investment capital, ensuring balanced and harmonious development between sectors, localities and territories. Develop planning and investment plans to build large logistics service centers with good connection to seaports, airports, and main transport routes. Review, supplement and adjust the planning for building infrastructure systems for digital economic development, ensuring integrated efficiency and systematicity, especially electricity networks, telecommunications infrastructure and information technology, data infrastructure, national broadband infrastructure, cloud computing infrastructure, national data management, trusted electronic authentication and identification service infrastructure. (ii) Improve mechanisms and policies, especially the Public-Private Partnership (PPP) method to attract more and more effective foreign investment capital including ODA, FDI and private investment capital of domestic private sector, effectively exploit resources from public assets to create investment capital for infrastructure development; Amend and supplement regulations on financial support policies, taxes, prices, fees, and concessions to increase the commerciality of projects and the responsibility of users to contribute, ensuring satisfactory benefits of Investors. (iii) Promote the application of high technology in the management and operation of energy infrastructure such as developing a smart power network with the ability to generate distributed power from many power generation points. Actively innovate and develop science and technology in the information technology - communications and energy industries to increase localization and master technology and equipment, helping to cut costs of importing and purchasing equipment from outside. Prioritize science and technology capital, capital from national programs to develop high technology, develop domestic products, services, and solutions to serve the construction and development of infrastructure systems for economic development.

Fourth, enhance the transparency of the economy. One of the factors of interest in a country's institutions is the corruption index to evaluate the transparency of a country.Therefore, governments at all levels need to continue to improve on this criterion. Investment management agencies need to publicize information about policies, laws, plans as well as the socio-political and economic situation and investment development orientations of the country, region, and each industry. for investors to understand. Along with that, it is necessary to reform administrative procedures, recruitment - training and the stage of receiving - processing information to access and increase reliability with investors. In the "Digital Government" reform, it is also necessary to use modern and unified means of providing information to help businesses access quickly and conveniently and limit corruption.

In summary, the solutions that need to be considered when implementing global minimum tax include: (1) Improving the institutional and policy environment; (2) Completing the non-tax policy system (3) Modernizing socio-economic infrastructure; (4)Increase the transparency of the economy.

FACTORS EFFECTING THE ADOPTION OF IFRS: THE CASE OF MANUFACTURING COMPANIES ON HO CHI MINH STOCK EXCHANGE

PhD. Ngo Nhu Vinh[1], B.A. Tran Ha Anh[2]

Abstract: *The main objective of this research paper was to analyse the factors influencing the implementation of IFRS in manufacturing Vietnamese enterprises. This was achieved through the utilization of descriptive statistical tools and logistic regression analysis based on a sample of 59 manufacturing enterprises in Vietnam from 2017 to 2021. The research methodology employed a mixed approach, combining both qualitative and quantitative methods. The findings indicate that higher levels of profitability, leverage ratios, firm size, and foreign capital increase the likelihood of implementing IFRS. Based on these results, appropriate recommendations have been provided to facilitate the effective implementation of IFRS in Vietnamese enterprises, aligning with the Ministry of Finance's IFRS application roadmap.*

Keywords: *IFRS, manufacturing companies, profitability, leverage, firm size, foreign capital, audit quality.*

1. INTRODUCTION

Globalization and internationalization of businesses as well as the associated need for comparable and reliable financial information has led to the harmonizing of financial accounting principles. This has resulted in many factors in the business and accounting community advocating for the standardization of accounting rules across the globe because standardized accounting principles can facilitate cross-border trading through increased comparability of financial information. As of April 2019, a total of 166 countries worldwide had adopted or planned to adopt IFRS for the comprehensive or substantial financial reporting obligations of their public entities, encompassing both listed corporations and financial institutions within their national jurisdictions (IFRS Foundation, 2019).

IFRS presents opportunities to enhance the quality of financial information for developing nations. For instance, Dante et al. (2018) collected data from 13 emerging countries and concluded that the adoption of IFRS led to an improvement in the quality of financial information on financial statements and helped mitigate earnings management. Vietnam's membership in the WTO since 1995 and the opening of its stock market in 2000 have marked significant milestones in the country's economic development. Additionally, the State Securities Commission (SSC) became an official member of the International IOSCO in June 2001. As a result of increased international economic integration, foreign trade, and exposure to foreign investment inflows, Vietnam has been motivated to establish a suitable accounting standard system.

There is a pathway of transition to IFRS in Vietnam. Decision 345/QD-BTC announces the phased implementation of IFRS in Vietnam. However, the application of IFRS in the Vietnamese market will have a significant impact on the financial reporting of listed companies. During this application process, the government will need to consider the market's sensitivity to continue making revisions and additions. Based on a review of previous studies, the research author has

[1] Academy of Finance, Email: ngonhuvinh@hvtc.edu.vn.

[2] Academy of Finance.

observed that in publications in Vietnam and studies conducted worldwide, there is a considerable focus on behavioural data analysis, while the application of IFRS based on secondary data or financial statements is less prominent. There are still gaps in the research that can be explored. Therefore, clarifying the issue that is currently highly emphasized in the accounting field in Vietnam can provide valuable insights for other emerging economies facing similar challenges.

2. LITERATURE REVIEW AND BACKGROUND THEORIES

2.1. Literature review

Worldwide, several studies have been conducted to identify the factors that influence the transition and adoption of IFRS. Bova and Pereira (2012) conducted a study in Kenya and indicated that higher levels of IFRS compliance are associated with the leverage ratio, corporate size, and profitability ratio. Research of Uyar et al. (2016) on elements affecting the preparation of IFRS in SMEs in Turkey indicates that several business features such as size, independent audit, and international integration do show influence on the preparation of SMEs. Lima et al. (2018) argue that large-scale enterprises, inter-national markets are important driving forces for compliance enterprises to apply IFRS, while profitability does not have a significant impact on IFRS compliance. Omri and Akrimi (2011) conducted a study using data from publicly traded companies in Tunisia and highlighted that international trade openness, and the type of audit are significantly related to the level of readiness to adopt IFRS by companies. The studied by Phang and Mahzan (2013) identified the significance of the national accounting regulatory body in influencing the level of readiness for IFRS convergence in Malaysia. Oyewo's study (2015) examined the factors influencing the application of IFRS by SMEs in Nigeria to adopt IFRS and indicated that control variables, including work experience and educational qualifications, had a positive impact on the level of application.

In Vietnam Le Tran Hanh Phuong (2019) on the macro and micro-level factors influencing the adoption of IFRS in Vietnam. The study used data from 500 large-scale companies in Vietnam and showed that the micro-level factors (including foreign participation, foreign investment, and audit quality) have an impact on the adoption of IFRS by large companies in Vietnam. Another similar study by Tran et al. (2019) illustrated that ROE has an impact on the adoption of IFRS by companies. Moreover, the study conducted by Nguyen Thi Kim Cuc and Nguyen Le Van Khanh (2018) collected 198 samples and identified factors such as capital structure, industry, and firm size that influence the voluntary adoption of IFRS in Vietnam. Tung (2022) using questionnaire survey of managers of 82 small and medium enterprises in Vietnam showed seven factors including pressure of international integration, legal system, size of enterprise, professional organizations at home and abroad, Qualifications of accountants, Benefits/Costs all have a positive influence on the application of international financial reporting standards.

Profitability (PRO)

Dumontier and Raffournier (1998) conducted a study on 28 publicly listed companies that adhere to Switzerland's accounting standards and 51 others that follow IFRS. They examined the relationship between the adoption of IFRS and various business characteristics such as internationality, ownership structure, size, capital, audit practitioners' reputation, and profitability. The findings revealed that there is no correlation between the adoption of IFRS and business outcomes. Conversely, Carmona and Trombetta (2008), as well as Ha and Kang (2019), concluded that highly profitable companies tend to adopt IFRS in order to ensure the reliability of their profit results. In this research, Return on Equity (ROE) is employed as an independent variable to reflect the operational status of companies. Lopes and Viana (2008) also analyzed financial information from 44 listed companies in Portugal that have adopted IFRS and observed a positive impact of net profit and equity on the accounting policies of these entities.

Leverage (LEV)

Meek et al. (1995) argued that voluntary information disclosure increases with financial leverage. Many companies that rely on debt financing aim to lower borrowing costs by providing more relevant information to creditors. These companies strive to build positive relationships with creditors by ensuring the quality of the information they publish. Mohamed and Fatma (2013) utilized the ratio of long-term debt to total assets as a measure of corporate debt level. This viewpoint is supported by the research conducted by Dinh and Pham (2020). Several studies have confirmed the impact of debt levels on the decision to adopt IFRS. For instance, Murphy (1999) and El-Gazzar et al. (1999) measured the level of debt using the total debt to shareholders' equity ratio. On the other hand, Affes and Callimaci (2007) employed the total debt to total assets ratio as a measure of leverage. Kolsi and Zehri (2013) utilized the long-term debt to total assets ratio as an approximation for the level of firm indebtedness. These various approaches highlight the importance of debt levels in understanding the adoption of IFRS in different studies.

Size of enterprise (SIZ)

Affes and Callimaci (2007) and Ha and Kang (2019) have highlighted the motivations behind early adoption of IAS/IFRS by German and Austrian listed companies. Through a logistic model and a sample of 106 German and Austrian companies, the findings indicate that larger companies are more likely to adopt IAS/IFRS at an early stage. This is because larger companies have a greater reliance on external funding and strive to differentiate themselves in the market by providing high-quality financial reporting. On the other hand, Marta et al. (2008) examined a sample of 56 companies listed on the Portugal Stock Exchange and found that smaller firms are less inclined to abandon their national accounting standards. In contrast, larger companies proactively implement higher-quality accounting policies even before the official adoption of IFRS.

Audit quality (AUQ)

Al-Basteki (1995) conducted a study on 26 companies listed in Bahrain that chose to disclose information according to IAS. The study examined various characteristics of these companies, including the reputation of the external auditor, industry sector, company size, level of foreign operations, and the degree of dependence on external financing. The findings indicate that the decision to adopt IFRS is strongly influenced by the type of external auditor, particularly those belonging to the Big 4 auditing firms. Similarly, Joshi and Ramadhan (2002) and Ha and Kang (2019) also investigated accounting practices and the extent of IFRS adoption in Bahrain. Their research sample consisted of 36 companies, and the results revealed that 86% of the companies applying IFRS were audited by a Big Four auditing firm.

Foreign capital (FRC)

Akinyemi (2012) highlights the increasing cross-border capital flows and foreign direct investment, facilitated by mergers and acquisitions in the era of globalization. This trend has necessitated the adoption of harmonized accounting standards worldwide, specifically through the application of IFRS. Francesco and Raynolde (2012) emphasize that foreign investors highly value enterprises that follow IFRS, as it helps to reduce information asymmetry compared to GAAP. Bae et al. (2008) also support this viewpoint, stating that foreign investors often request financial statements prepared in accordance with IFRS. Daske et al. (2008) argue that the implementation of IFRS is favoured by lenders, as globally consistent financial information enables them to proactively manage lending risks. However, enterprises seeking loans are often required to convert their financial statements from national accounting standards to IFRS. Consequently, this becomes a motivating factor for businesses to adopt IFRS swiftly (Le, 2019). It is important to note that the authors specifically mention borrowing from foreign countries through financial institutions and foreign banks as the context for their discussion.

2.2. Background theories

Agency theory

Managers' accounting choices and disclosure of financial information are analysed using agency theory, which suggests that these choices and disclosures are used to reduce agency costs. Compliance with IFRS may restrict accounting choices and require more disclosure, potentially reducing agency costs and explaining companies' attitudes towards IFRS compliance.

The theory also explains the impact of leverage and foreign capital on the adoption of IFRS. Excessive dividend policies pursued by shareholders can affect the equity guarantee for creditors. Adopting IFRS reinforces creditor confidence and facilitates external funding, especially from banks. When borrowing from foreign entities, financial institutions and foreign banks require clear, comparable, and transparent financial statements, making compliance with IFRS necessary.

In addition, agency theory explains how the type of auditor and firm size impact the approval of IFRS. Managers seek trustworthy auditors to ensure credibility of financial information, especially when applying complex international standards like IFRS. Reputable auditors, such as those from the Big4 firms, possess expertise and knowledge in these standards, facilitating compliance. Larger companies, with better access to external funding like foreign capital, must exhibit transparent financial reporting. Adopting IFRS enhances transparency and comparability, attracting foreign investors and lenders. Hence, larger firms are more motivated to adopt IFRS to improve their capital-raising and loan acquisition capabilities.

Foreign investors' participation and profitability factors are also explained by agency theory. Managers, who have more power in choosing accounting options, benefit from the approval of IFRS as it aligns their interests and provides compensation based on financial performance. By choosing IFRS, managers can enhance the book value, particularly equity and profits, which can positively impact their compensation, especially when stock options are involved.

Signalling theory

The theory of signalling demonstrates how the party possessing greater information can mitigate information asymmetry by effectively conveying that information to others. When applying signalling theory to financial disclosure, it implies that managers can utilize financial statements to signal their expectations and intentions. For instance, applying IFRS can serve as a signal to market participants that the company is willing to disclose a greater amount of information or adhere to more stringent accounting standards.

Signalling theory proposes various factors that can account for differences in the extent to which companies comply with IAS/IFRS standards. These factors include profitability, leverage, the auditor's type, and company size. It has been commonly suggested that these variables impact the voluntary adoption or adherence to IAS/IFRS by influencing the challenges associated with information imbalance in the market (Karim and Ahmed, 2005; Samaha and Stapleton, 2009; Al-Akra et al., 2010).

3. RESEARCH METHODOLOGY

3.1. Research Process

Building upon prior research related to the theoretical framework of IFRS adoption, the authors identify key factors that significantly impact the adoption of IFRS. These factors are assessed using appropriate accounting method, which involve the selection of suitable independent variables and a regression model. Subsequently, the authors gather relevant data to construct a suitable econometric model. The data for this research is primarily sourced from the audited financial statements of companies listed on the HOSE (Ho Chi Minh City Stock Exchange). The information is collected from two websites, namely finance.vietstock.vn and cafef.com.

after being collected, the primary data will be coded, and the secondary data will be systematized and calculated to transform them into indicators within the research model. For Statistical analysis and model validation, authors analyze the data with the assistance of SPSS 26 software and various analytical techniques, such as Descriptive statistics, Correlation analysis, Logistic regression analysis, Confusion matrix testing.

The dependent variable in this study pertains to IFRS adoption, characterized by two distinct values: “Yes” indicates the full, partial, or selective adoption of IFRS, whereas “No” indicates a lack of intent or unwillingness to adopt IFRS.

3.2. Sampling method

Since the research utilizes secondary data from manufacturing companies listed on HOSE, it is possible to determine the population size. Therefore, the research will employ the sampling formula proposed by Yamane (1967).

$$n= N/ (1+Ne^2)$$

In which:

n: the required sample size to be determined.

N: the population size. In addition, since the research collects data over a duration of 5 years with totaling 128 manufacturing company in the HOSE, the population size would be 640.

e: the allowable error, with ±0.05 being the most prevalent.

Therefore, Therefore, the minimum sample size should be 247 samples. In this research, there are 293 samples which indicates that the number of samples examined in the research project has satisfied the minimum sample size requirement.

3.3. Hypotheses

H1: Companies with higher profitability are more likely to adopt IFRS.

H2: Companies with higher Debt to Shareholders’ equity ratio are more likely to adopt IFRS.

H3: The larger the companies are, the easier to adopt IFRS.

H4: Enterprises that are audited by Big 4 are more likely to apply IFRS.

H5: The enterprises with foreign capital are more likely to apply IFRS.

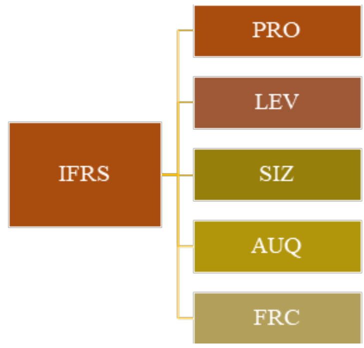

Figure 1: The proposed study

Table 1: Variables and Measurement

Variable	Measurement	Expected tendency direction
Dependent Variable (IFRS)	IFRS adoption: 1, if the firm has adopted IFRS 0, if the firm has adopted IFRS	
Independent variables		
PRO	Profitability – Net return on equity	(+)
LEV	Leverage – Total Debt / Total assets	(+)
SIZ	Size of enterprise – Logarithm of total assets	(+)
AUQ	Audit quality. 1, if Vietnam's enterprise audited by Big4. 0, if Vietnam's enterprise does not audit by the Big4	(+)
FRC	Foreign Capital 1, if the enterprise has had foreign funds. 0, if the enterprise has not had foreign funds.	(+)

From the above research model, the authors determine logit regression as follows:

LOGIT [IFRSi] = β0 + β1 * PROi + β2 * LEVi + β3 * SIZi + β4 * AUQ + β5 * FRCi + εi

Parameters: β0, β1, β0…., βn.

Error: ε

4. RESEARCH RESULTS

4.1. Descriptive statistics

Table 2: Descriptive Statistic

	N	Minimum	Maximum	Mean	Std. Deviation
Application of IFRS	293	0	1	0.37	0.483
ROE	293	-0.115	0.588	0.16570	0.118534
LEV	293	0.102	0.839	0.45973	0.173093
Firm_Size	293	0.83	1.00	0.8784	0.03810
Audit Quality	293	0	1	0.46	0.499
Foreign investors	293	0	1	0.86	0.344
Valid N (listwise)	293				

The descriptive statistics presented in the table depict the minimum, maximum, mean, and standard deviation of both the independent and dependent variables. The dummy variables in the hypothesis include A_IFRS, AUQ, and FRC. Therefore, these three variables take a minimum value of 0 and a maximum value of 1. Specifically, the mean of A_IFRS is 0.37, indicating that 37% of the collected research samples have adopted IFRS, which amounts to 21 businesses. Among the gathered data from manufacturing companies, 46% of them are audited by Big4 firms, and a significant 86% of companies have foreign capital.

Based on the assessment of mean and standard deviation, it can be observed that among the collected data from 59 companies, there is no significant variation in terms of firm size. However, there is relatively large variation in leverage and ROE among these businesses.

4.2. Nonparametric Correlations

Table 3: Correlations

			A_IFRS	PRO	LEV	SIZ	AUQ	FRC
Spearman's rho	A_IFRS	Correlation Coefficient	1.000	0.743**	0.520**	0.201**	0.094	0.118*
		Sig. (2-tailed)	.	0.000	0.001	0.001	0.109	0.043
		N	293	293	293	293	293	293
	PRO	Correlation Coefficient	0.743**	1.000	-0.050	0.080	-0.013	0.006
		Sig. (2-tailed)	0.000	.	0.397	0.171	.822	0.923
		N	293	293	293	293	293	293
	LEV	Correlation Coefficient	0.520**	-.050	1.000	0.150*	-.073	0.022
		Sig. (2-tailed)	0.001	0.397	.	0.010	0.213	0.705
		N	293	293	293	293	293	293
	SIZ	Correlation Coefficient	0.201**	0.080	0.150*	1.000	.045	-0.021
		Sig. (2-tailed)	0.001	0.171	0.010	.	.446	0.727
		N	293	293	293	293	293	293
	AUQ	Correlation Coefficient	0.094	-0.013	-0.073	0.045	1.000	0.185**
		Sig. (2-tailed)	0.109	0.822	0.213	0.446	.	0.001
		N	293	293	293	293	293	293
	FRC	Correlation Coefficient	0.118*	0.006	0.022	-0.021	0.185**	1.000
		Sig. (2-tailed)	0.043	0.923	0.705	0.727	0.001	.
		N	293	293	293	293	293	293
**. Correlation is significant at the 0.01 level (2-tailed).								
*. Correlation is significant at the 0.05 level (2-tailed).								

By examining the significance values (sig.), it can be observed that figures for sig. of PRO, LEV, SIZ, and FRC are all less than 0.05. This indicates that these variables influence on the dependent variable A_IFRS. Conversely, AUQ does not exhibit an impact on A_IFRS (sig. = 0.109, greater than 0.05). Therefore, the variable AUQ is excluded from the model. Secondly, correlation coefficients are used to assess the degree of influence of the independent variables on the dependent variable. The correlations of PRO, LEV, and SIZ are 0.743, 0.520, and 0.201 respectively. Based on the support of SPSS26, these variables have a significant correlation at the 0.01 level (2-tailed). Additionally, the correlation of FRC (0.118) is significant at the 0.05 level (2-tailed). Thus, the order of impact of the independent variables on A_IFRS is as follows: PRO, LEV, SIZ, and FRC.

4.3. Logistic Regression

Table 4: Omnibus Tests of Model Coefficients

		Chi-square	df	Sig.
Step 1	Step	69.500	5	.000
	Block	69.500	5	.000
	Model	69.500	5	.000

Since we are using the Enter method to simultaneously include all independent variables in the model, only Step 1 appears in the statistical results. In this table, the Sig value in the Model row is used to assess the goodness of fit of the model. Specifically, in this case, the sig value of the Chi-square test in the Model row is 0.000, which is less than 0.05. Therefore, the regression model is a good fit.

Table 5: Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	316.209[a]	.538	.680

a. Estimation terminated at iteration number 5 because parameter estimates changed by less than .001.

The table presents the Model Summary, which provides a summary of the model's performance. The Cox & Snell R Square and Nagelkerke R Square are pseudo-R-squared values. The Nagelkerke R Square value is commonly used as a measure of model fit, with a higher value indicating a better fit (approaching 1). In this case, the Nagelkerke R Square value of 0.680 indicates a relatively high level of model fit.

Table 6: Classification Table

Observed			Predicted		
			Application of IFRS		Percentage Correct
			0	1	
Step 1	Application of IFRS	0	161	24	87.0
		1	59	49	45.4
	Overall Percentage				71.7

a. The cut value is .500

The Classification Table displays the classification of objects into "Application of IFRS" and "No application of IFRS" based on two criteria: actual observations and predictions.

- Among the 185 observed cases of "No application of IFRS," there were 161 cases correctly predicted as "No application of IFRS," resulting in an accuracy rate of 161/185 = 87.0%.
- Among the 108 observed cases of "Application of IFRS," there were 49 cases correctly predicted as "Application of IFRS," resulting in an accuracy rate of 49/108 = 45.4%.

Therefore, the average prediction accuracy rate is (87.0% + 45.4%)/2 = 71.7%

Table 7: Variables in the Equation

		B	S.E.	Wald	df	Sig.	Exp(B)
Step 1[a]	PRO	7.340	1.287	32.534	1	.000	1540.604
	LEV	2.989	.832	12.898	1	.000	19.860
	SIZ	10.596	3.634	8.501	1	.004	39960.177
	AUQ	.484	.283	2.933	1	.087	1.623
	FRC	.976	.462	4.459	1	.035	2.653
	Constant	-13.628	3.321	16.836	1	.000	.000

a. Variable(s) entered on step 1: ROE, LEV, Firm_Size, Audit Quality, Foreign investors.

The Sig value of the Wald test for PRO, LEV, SIZ, and FRC is less than 0.05 (at a 95% confidence level), indicating that these four variables (PRO, LEV, SIZ, and FRC) have a significant impact on A_IFRS. On the other hand, the variable AUQ has a Sig value of the Wald test equal to 0.087, which is greater than 0.05. Therefore, AUQ does not have an impact on A_IFRS. This result is consistent with the findings obtained from the Spearman correlation analysis.

β represents the unstandardized regression coefficients of the independent variables. These coefficients can have positive or negative values, indicating the direction and magnitude of the relationship between each independent variable and the dependent variable. After excluding the variable AUQ from the model, based on the results above, we can enter the following variables into the logistic regression equation:

LOGIT [IFRS]= -13.628 + 7.340*PRO + 2.989*LEV + 10.596*SIZ + 0.976 * FRC

5. DISCUSSION

The profitability, leverage, size, and foreign capital impact the decision to apply IFRS in Vietnamese manufacturing enterprises, while Vietnamese enterprises in the survey do not apply IFRS based on auditing by Big 4.

Audit quality does not significantly influence IFRS adoption in Vietnamese manufacturing companies. The main concern is the perceived higher cost of Big 4 audits compared to local firms. Big 4 audits assure unbiased evaluation of financial statements, upholding accounting standards like IFRS. The focus is on financial data precision. While engaging Big 4 offers expertise, it does not directly affect IFRS adoption. Adopting IFRS demands careful planning; professionals may aid a seamless transition. The choice of audit firm, whether Big 4 or not, is separate from IFRS adoption and should not heavily impact it.

High profitability strongly influences IFRS adoption in Vietnamese enterprises, similarly with Bova and Pereira (2012) and Tran et al. (2019). Robust profitability signifies operational capacity and solvency, attracting investor interest in stable growth. Moreover, adopting IFRS by highly profitable firms aims to enhance transparency and attract foreign investment, as credible and comparable financial information positively impacts investor perception.

Financial leverage significantly influences the adoption of IFRS among Vietnamese manufacturing firms, corroborated by findings by Bova and Pereira (2012), Nguyen Thi Kim Cuc, and Nguyen Le Van Khanh (2018). This highlights leverage's pivotal role in IFRS adoption decisions. Firms with greater financial leverage recognize the need to meet creditor expectations, fostering transparency and accountability through IFRS implementation. Enhanced information provision to creditors builds trust, fostering strong relationships. Higher leverage firms thus lean towards IFRS adoption, ensuring comprehensive and dependable financial reporting to bolster confidence.

Enterprise size significantly influences IFRS adoption, notably among larger firms, consistent with Uyar et al. (2016), Lima et al. (2018), Nguyen Thi Anh Linh (2019), Nguyen Thi Kim Cuc and Nguyen Le Van Khanh (2018), and Tung (2022). These studies underscore the positive correlation between size and IFRS adoption likelihood. Larger enterprises, often corporations or joint-stock firms in Vietnam, are more prone to embrace IFRS. This preference stems from their exposure to globalization, with many transitioning from state-owned origins. To navigate global impacts, these enterprises prioritize international accounting standards, particularly IFRS. Their substantial presence in international markets and with investors necessitates reporting alignment for credibility and comparability. IFRS adoption signals their commitment to global best practices, ensuring financial reporting conformity.

IFRS adoption in Vietnamese manufacturing firms is positively impacted by foreign capital involvement, in line with Bova and Pereira (2012) and Gordon et al. (2012). Firstly, foreign investors demand reliable, comparable financial information – met by IFRS adoption. IFRS offers a consistent framework and international standards for uniform reporting. This builds trust and attracts foreign investments. Secondly, foreign borrowing often mandates compliance with global regulations. IFRS adoption ensures reliable reporting, aiding access to foreign capital. Enterprises with foreign borrowing adopt IFRS to meet partner requirements and enhance their ability to secure foreign loans.

6. RECOMMENDATION AND CONCLUSION

6.1. Recommendation

Profitability is crucial for assessing a company's financial health. Robust profitability can be further enhanced through IFRS implementation, offering improved risk management by disclosing risks faced. Adhering to IFRS enhances risk practices, including identifying, assessing, and mitigating risks. This shields profitability and minimizes disruptions. Moreover, a solid understanding of IFRS principles and regulations is vital, necessitating a grasp of its financial standards and guidance.

Besides, manufacturing firms with high leverage must assess the exact effects of transitioning to IFRS on their borrowing practices. This evaluation aids in selecting borrowing methods beneficial to the business without harming shareholders. Policymakers should formulate regulations and detailed guidelines on disclosing financial leverage matters under IFRS adoption. To enhance understanding, research and development investments can be promoted by policy agencies. Sharing knowledge and guidance materials can aid businesses in navigating financial leverage and IFRS application.

Depending on the scale, businesses may consider implementing the following measures to effectively apply IFRS. Firstly, for large enterprises, they should enhance internal controls, risk management, capability such as human resources, information technology and compliance with IFRS regulations. Companies can employ internal audit methods to ensure the accuracy and reliability of financial reporting. For SMEs, companies can plan for a long-term conversion to mitigate financial impacts. Instead of an immediate conversion, companies can plan for a phased conversion, starting with the most significant factors or from the upcoming financial years.

The use of loans and international investment capital has pressured businesses to adopt IFRS in their accounting systems. Developing a well-structured conversion plan with clear stages, objectives, and timelines ensures a smooth transition with minimal disruptions. Providing training and expert guidance equips employees with the necessary knowledge and skills to comply with IFRS and meet investor requirements. By undertaking these measures, businesses can effectively incorporate IFRS, enhance their financial reporting practices, attract foreign investments, and thrive in the global marketplace.

6.2. Conclusion

The results identified four direct factors influencing the application, namely profitability, leverage, firm size, and foreign capital. The research also discovered the impact level of these factors on readiness. The findings indicate that profitability has the highest impact weight (0.743), followed by leverage (0.520), firm size (0.201), and foreign capital (0.118).

The research has achieved certain results but still has some limitations. The paper suggests future research directions for related topics. Firstly, the paper does not representative of the entire population. Therefore, future studies could utilize probability sampling methods to improve sample quality and enhance generalizability. Moreover, Future research could consider exploring a wider range of industries to provide a more comprehensive understanding of the factors influencing the adoption of IFRS across various sectors. This would contribute to a more holistic assessment of the readiness and challenges faced by different types of businesses in Vietnam.

FACTORS AFFECTING THE INTENTIONS IN APPLYING MODERN MANAGEMENT ACCOUNTING OF MANUFACTURING ENTERPRISES IN THE CENTRAL PROVINCES OF VIETNAM

MA. Huynh Tran Bich Phuong[1], MA. Nguyen Thi Quynh Trang[2], MA. Vo Thi Bich Ha[3]

Abstract: *This study assesses factors affecting the intention to apply modern management accounting (MMA) in manufacturing enterprises in central Vietnam. SPSS and SmartPLS software are used to process data collected from 150 senior leaders and chief accountants in manufacturing enterprises. Research result shows that there are eight factors affecting the intention to apply MMA, including Perception of usefulness, perception of the application's ease, manager's attitude, subjective norms, factors belonging to the business, low-cost strategy, differentiation strategy, and business environment. The manager's attitude has both a direct impact on the intention to apply MMA and an indirect impact on the intention to apply MMA. From the research results, several recommendations are proposed to promote the intentions of applying MMA to manufacturing enterprises in central Vietnam in particular and for all manufacturing enterprises in general.*

Keywords: *Modern management accounting; Modern management accounting application; manufacturing enterprises.*

1. INTRODUCTION

The 4.0 industrial revolution, the development of information technology, and the challenges of the competitive environment have created many new management tools called modern management accounting (MMA). Traditional management accounting is gradually showing limitations, such as focusing on short-term goals and ignoring long-term goals that can help businesses create competitive advantages and sustainable development. In order to overcome those limitations, MMA was born to help businesses achieve sustainable competitive advantage. MMA techniques such as Just-In-Time (JIT), Activity-Based Costing (ABC), and Balanced Scorecard (BSC)… not only provide information collected from within but also from outside the enterprise, with the purpose of not only serving short-term, operational decision-making but also supporting planning, determine and build a long-term vision and strategy. MMA techniques not only evaluate financial indicators but also non-financial indicators: customer satisfaction, delivery time, storage time, etc.

Enterprises in central Vietnam play an important role in the country's economy and society because the central region is the gateway to the sea of the central Highlands region, a pedestal and bridge for the Central Highlands provinces, connecting the route. East West Economic Corridor. Therefore, the issue of economic development in the central region is always focused. According to Thai Anh Tuan (2018), the majority of manufacturing enterprises in Vietnam are aware of the importance of management accounting in planning and making the most accurate and optimal decisions in business management. The application of management accounting is mainly in large enterprises with modern management platforms, but the organisation of management accounting in manufacturing enterprises is still in its infancy or only limited to traditional management accounting. Business administrators still mainly focus on daily management and operations

[1] University of Finance and Accountancy, Email: huynhtranbichphuong@tckt.edu.vn.

[2,3] University of Finance and Accountancy

through financial accounting data and often attach more importance to financial accounting than management accounting.

There have been many studies in the world and Vietnam on MMA, such as research by Shadi Maher Al-Khasawneh, Wan Anisah Endut, and Nik Mohd Norfadzilah (2020) "Factors affecting usage of MMA techniques in industrial companies listed in Amman Stock Exchange", the results show that factors external to the enterprise have a positive and significant influence on MMA techniques. Additionally, the results show that advanced manufacturing technology, differentiation strategy, and low-cost strategy have a positive and significant impact on the adoption of MMA. Dr Nguyen Quoc Hung (2021), in his research about "*Factors affecting the intention to apply MMA in Vietnamese enterprises*", shows that there are three groups of factors that directly affect the intention to apply modern MA, including (1) Managers (the attitude; subjective norms and expectation); (2) Enterprises (internal factors and unique characteristics) and (3) Environment conditions (competitive pressures; market volatility; information and communication; science and technology; institutional pressures). In addition, research also affirmed two factors that directly impact the attitude of managers, including perceived usefulness and perceived ease of use. In summary, there are many studies on the application of management accounting in businesses in Vietnam, but research projects on the intention to apply MMA are not yet popular, especially when researching enterprises operating in the manufacturing sector in the Central provinces, has not found any research.

Thus, to aim for sustainable development, manufacturing enterprises in general, especially manufacturing enterprises in the central provinces, should consider applying MMA in management and administration. This study will identify specific factors affecting the intentions to apply MMA, thereby serving as a basis for managers in Central enterprises to have policies to apply MMA in their businesses.

2. LITERATURE REVIEW AND HYPOTHESES

2.1. Literature review

MMA is understood as providing financial and non-financial information to support and advise administrators in performing administrative functions such as strategic planning, organisational design, managing production and business activities, evaluating operational efficiency towards the future to create long-term value, increasing value for businesses and stakeholders, towards corporate sustainability (Nguyen et al., 2021). Thus, MMA always has characteristics that show differences compared to traditional management accounting, specifically:

- MMA has an outward and future-oriented focus;
- Information on MMA is both financial and non-financial information;
- Internal systems or set targets do not constrain MMA;
- Support orientation and implementation of long-term goals for businesses.

Thus, the role of management accounting is not limited to providing only internal past information. Still, management accounting needs to provide future-oriented and strategic information for development long-term development and increased value for businesses and stakeholders towards corporate sustainability. This is also the main goal of MMA. Besides traditional management accounting, it gradually shows limitations, such as focusing on short-term goals and ignoring long-term goals that can help businesses create competitive advantages and sustainable development.

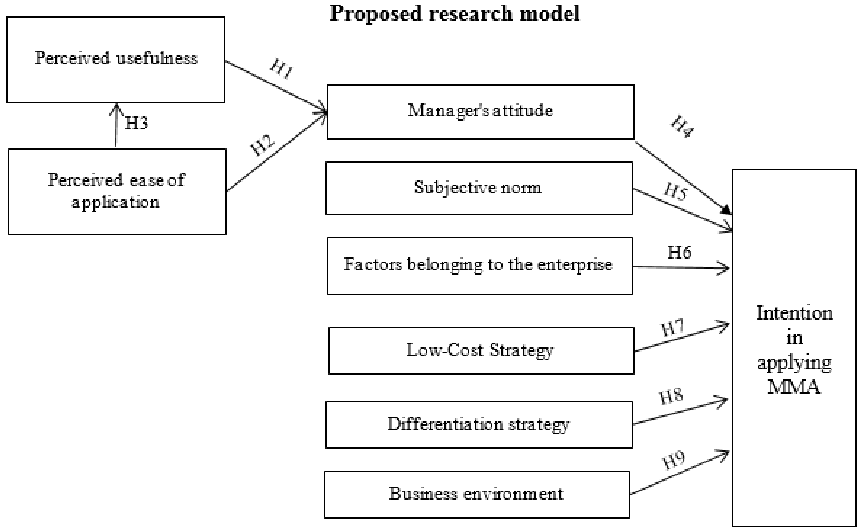
New management accounting techniques have appeared since the 1980s, supported by many authors such as Kaplan (1984), Sulaiman et al. (2015), and Ekbatani (2011). MMA techniques include Activity-Based Costing (ABC); Balanced Scorecard (BSC); Just-In-Time production (JIT); Total Quality Management (TQM); Target Cost; Kaizen costs; Life cycle Cost. These techniques represent basic functions of management, including Cost accounting and control methods; methods of planning, controlling, and measuring operational efficiency; and decision support. In the study, the authors mentioned the above management accounting methods in identifying factors affecting to the intentions in applying management accounting of manufacturing enterprises in the central provinces of Vietnam.

2.2. Research hypotheses and model

Through research, analysis, and comparison of theoretical models of previous scholars, the authors believe that the Theory of Reasoned Action (TRA) model of Fishbein and Ajzen (1975) and the Theory Of Planned Behavior (TPB) model of Ajzen (1991) has strengths in studying behavioural intentions. At the same time, the research team applied a combination of Diffusion of Innovations Theory (DOI), the intention to innovate the organization depends on factors belonging to the manager, enterprise, and organization; the Technology Acceptance Model (TAM) Theory of Davis et al. (1989) and the Technology Acceptance Resource Expansion Model (R-TAM) of Mathieson (2001), research to identify influencing factors to the intention to apply MMA includes Factors of perceived usefulness, perceived ease of application, manager's attitude, subjective norms, factors belonging to the business, low-cost strategy, differentiation strategy, and business environment.

Combining the application of the models of Ayadi and Affes (2014), Urquidi and Ripoll (2013), Sreekumar (2015), Haim Hilman (2014), and Shadi Maher Al-Khasawneh et al. (2020); We believe that business environment, differentiation strategy, and low-cost strategy also have an impact on MMA adoption intention. Therefore, the author added the element "Low-cost strategy" and the element "Differentiation strategy" to the research model.

Proposed research model



(Source: Suggested by author)

Based on research and background theory, we recommend the following hypotheses:

- Perceived usefulness: Perceived usefulness is defined as the degree to which an individual judges that adopting a new technology will lead to an increase in work efficiency (Davis et al., 1989). The factor "Perceived usefulness" that affects "Attitude" has been tested in the studies of Davis (1989) and Mathieson (2001) in the field of information technology application. Research by Subasinghe and Fonseka (2009) also suggests that perceived usefulness has an impact on managers' attitudes toward applying MMA. Therefore, the hypothesis is given as follows:

H1: *There is a positive relationship between the perceived usefulness of applying MMA and managers' attitudes.*

- Perceived ease of application: Perceived ease of application is defined as an individual's perception that using a new technology will not require much effort from that individual. Innovative technological systems that are perceived as easier to use and less complex are more likely to be accepted and used by potential users (Davis et al., 1989). Research by Mathieson (2001) suggests that "Perceived ease of application has an impact on managers' attitudes". Inheriting this research, perceived ease of application is considered one of the important factors affecting the application of MMA. Therefore, the authors hypothesise:

H2: *There is a positive relationship between the perceived ease of applying MMA and managers' attitudes.*

The studies of Davis (1989) and Mathieson (2001), both said that "Perceived ease of application" has an impact on "Perceived usefulness". Using this result, the authors propose the following hypothesis:

H3: *There is a positive relationship between the perceived ease of application and the perceived usefulness of MMA.*

- Manager's attitude: Attitude is defined as a mental readiness gained from experience, creating a direct influence on an individual's reaction to the objects or situations that he or she encounters-contact (Allport et al., 1935). Inheriting the research of Ajzen (1991), Davis (1989), and Mathieson (2001) said that the administrator's attitude will affect the intention to act, and the administrator's attitude will affect the intention to apply MMA. Therefore, the hypothesis is given as follows:

H4: *There is a positive relationship between the manager's attitude and the intention of applying MMA.*

- Subjective norms: Subjective norms are the perceptions of influencers who think that the individual should perform or not perform the behaviour. The ultimate determinant of behaviour is not attitude but behavioural intention (Ajzen, 1991). Inheriting the research of Ajzen (1991), Davis (1989), and Mathieson (2001) said that subjective norms will affect behavioural intentions. Therefore, the hypothesis is given as follows:

H5: *There is a positive relationship between the subjective norm and the intention in applying MMA.*

- Factors belonging to the enterprise: Factors belonging to the enterprise are a set of capabilities that the organization currently has. These factors are one of the conditions for administrators or leaders of organizations to intend to innovate that organization. Research by Pindaro (2007), Rogers (1995), and Venkatesh (2000) also confirm that factors belonging to the business affect innovation in organizations. Therefore, the hypothesis is given as follows:

H6: *There is a positive relationship between the factors belonging to the business and the intention of applying MMA.*

Competitive strategy is a company's long-term action plan to gain a competitive advantage over its competitors after assessing the strengths, weaknesses, opportunities, and threats in the industry and comparing them with themselves (Porter, 1985). The study by Sidra Shahzadi and colleagues (2018) also said that one of the factors within the organization that strongly affects the application of management accounting in management is the competitive strategy in business. Research work by Affes and Ayadi (2014), Urquidi and Ripoll (2013), Sreekumar (2015), Haim Hilman (2014), and Shadi Maher Al-Khasawneh, Wan Anisah Endut and Nik Mohd Norfadzilah (2020), the results for found that differentiation strategy and low-cost strategy have a positive and significant impact on the application of MMA. Therefore, the hypothesis is given as follows:

H7: *There is a positive relationship between the Low-Cost Strategy and the intention in applying MMA.*

H8: *There is a positive relationship between the differentiation strategy and the intention of applying MMA.*

- Factors in the business environment: Includes the impact of the social environment, partners, and legal regulations. In the research model, the authors inherit the research of Pindaro (2007), Rogers (1995), Venkatesh (2000), and Nguyen Quoc Hung (2021). Many businesses are qualified to apply MMA but do not apply it because they do not have external pressure. Therefore, the hypothesis is given as follows:

H9: *There is a positive relationship between the business environment and the intention of applying MMA.*

3. DATA AND METHODOLOGY

3.1. Data

In this study, the authors used the PLS-SEM tool to process data. With the PLS-SEM tool, use a minimum sample size of 10 times the largest formative observatory variable measured for a concept or 10 times the largest number of paths affecting a concept in the model (Barclay & al, 1995). In many cases, Hair and colleagues (2016) advise researchers to choose a standard sample size calculation formula according to Cohen (1992). Cohen in 1992 suggested that the minimum sample size needed to use in research depends on the number of arrows pointing to the structure in the PLS path model or independent variables used in the research model. Assuming the number of independent variables in the structural model is 05, 122 observations are needed to achieve statistical power (at a 5% significance level). This study has eight independent variables, so the sample number needed is at least 144.

In actually conducting the survey, the authors conducted over 150 research samples that met the requirements. The survey subjects of the project are senior leaders and chief accountants in manufacturing enterprises in the central provinces of Vietnam. Thus, with the expected sample size as above, it can be concluded that the sample size is large enough to run the model and is appropriate.

3.2. Methodology

The research was studied by combining the qualitative method and the quantitative method, done in two following steps: (1) *Qualitative research*: In this study, qualitative research was conducted through consulting with experts. After synthesising expert opinions, the authors grouped similar factors and evaluated their important roles, representing the characteristics of factors affecting the intention to apply MMA to manufacturing enterprises in the central of Vietnam. (2) *Quantitative research*: After being collected, the questionnaires were processed on SPSS 22.0 and SmartPLS 3.0 software to perform data analysis through the following steps: Descriptive statistics, scale reliability testing measure, evaluation measurement models, and evaluation structural models. The measurement scales and coding of variables are shown in Table 1.

Table 1: Summary of measurement scales and coding of observed variables

Variable	Name	Observed variable	Source
Perceived usefulness (HI)	HI1	MMA information helps administrators control production costs effectively.	Davis (1989), Mathieson (2001), Subasinghe và Fonsseka (2009)
	HI2	MMA information helps administrators plan better strategies.	
	HI3	MMA information helps administrators avoid risks when making decisions.	
	HI4	MMA will help administrators control business activities better.	
	HI5	MMA knowledge is useful for administrators.	
Perceived ease of adoption (AD)	AD1	MMA information is presented in an easy-to-understand manner and provides timely information to users.	Davis (1989), Mathieson (2001)
	AD2	Applying MMA methods is quite easy.	
	AD3	MMA reports can be presented simply without depending on any regulations.	
	AD4	Administrators without accounting expertise can also read and understand the Management Accounting Report.	
	AD5	Administrators with knowledge of economic management can read and understand the Management Accounting Report.	
Factors belonging to the enterprise (DN)	DN1	The enterprise size has an impact on the application of MMA.	Pindaro (2007), Rogers (1995), Venkatesh (2000)
	DN2	The specific characteristics of an enterprise's production and business organisation model have an impact on the application of MMA.	
	DN3	A professional management team trained in management accounting in business has an impact on the application of MMA.	
	DN4	The enterprisehas the infrastructure and management equipment has an impact on the application of MMA.	
	DN5	The enterprisehas a communication team that guides and reorganises the management process, which has an impact on the application of MMA.	
Low-Cost Strategy (CS)	CS1	The enterprise fully exploits resources to serve management work.	Ayadi and Affes (2014), Haim Hilman (2014), Sreekumar (2015), Urquidi và Ripoll (2013)
	CS2	The enterprise focuses on innovating processes in management accounting	
	CS3	The enterprise focuses on minimising costs in management.	
Differentiation strategy (DS)	DS1	The enterprise focuses on creating uniqueness in management.	Amara và Benelifa (2017), Ghasemi etal., (2015), McLellan và Moustafa (2011)
	DS2	The enterprise always creates motivation to promote innovation in management.	
	DS3	The enterprise always demonstrates outstanding value in management.	
Manager's attitude (TD)	TD1	Applying MMA is necessary to make accurate decisions.	Ajzen, I.(1991), Davis (1989), Mathieson (2001)
	TD2	Not applying MMA makes us often have difficulty deciding on the optimal solution.	
	TD3	Without applying MMA, we can easily make mistakes when making decisions if we rely on emotions and experience.	
	TD4	Not applying MMA means we do not have timely information to make decisions.	
	TD5	Not applying MMA makes us feel unsafe in management.	

Subjective norms (CM)	CM1	Administrators should be properly aware that competitive pressure is a factor motivating businesses to apply for MMA.	Ajzen, I.(1991), Davis (1989), Mathieson (2001)
	CM2	Administrators should be properly aware of the effects of MMA information.	
	CM3	Administrators need to appreciate the role of MMA in management work.	
	CM4	Administrators need to apply MMA in management is necessary.	
	CM5	Administrators need to use MMA information because of the importance of them to decision-making.	
Factors in the business environment (MT)	MT1	The uncertainty and ever-changing nature of the market cause businesses to apply MMA.	Pindaro (2007), Rogers (1995), Venkatesh (2000), Nguyen Quoc Hung (2021)
	MT2	Market information is increasingly abundant and diverse, making it difficult to choose the optimal solution, requiring the application of MMA.	
	MT3	The professionalism of competitors pushes businesses to change their management.	
	MT4	Media information such as the message "improving management capacity" of the Prime Minister at business forums, the 4.0 technology era... has motivated businesses to apply for MMA.	
	MT5	The development of information technology is putting pressure on businesses to change their management methods.	
	MT6	Institutional pressure (such as Circular 53 - Guidance on enterprises applying management accounting) has an impact on the intention to apply MMA in enterprises.	
Intention in applying MMA (YD)	YD1	We will learn about modern management economics.	Ajzen, I.(1991), Davis (1989), Mathieson (2001)
	YD2	We will participate in training courses on MMA to consider and apply it.	
	YD3	We are interested in applying scientific management measures.	
	YD4	We need time to prepare before applying for MMA.	
	YD5	We intend to apply MMA in the future.	

(Source: Suggested by author)

4. RESULTS AND DISCUSSION

To test the influence of factors on the intention to apply MMA, we use SPSS 22 and SmartPLS 3.0 software.

4.1. Descriptive Statistics

The research variables are summarized in the following table:

Table 2: Description of characteristics of manufacturing enterprises in the Central provinces of the research sample

Characteristic	Quantity	Ratio (%)
1. Type of company		
Private enterprise	6	4.0
Limited liability company	98	65.3
Joint Stock Company	44	29.3
Enterprises with foreign investment capital	1	0.7
Other	1	0.7
2. Total number of employees of the entire enterprise: (People)		
Under 50	34	22.7
From 50 - 100	51	34.0
From 100 - 500	43	28.7
Over 500	22	14.7
3. Total business capital: (Billion VND)		
Below 5	11	7.3

From 5 - 10	48	32.0
From 10 - 50	63	42.0
Over 50	28	18.7
4. Enterprise age: (Years)		
Below 5	24	16.0
From 5 - 10	38	25.3
Over 10	88	58.7
Total	150	100

(Source: Compiled from survey data by the author, 2022)

From the obtained results, 150 questionnaires were used as a research sample classified by business age, size, and type of business. Of the total 150 survey samples, the proportion of samples belonging to the Limited Liability Company type is the highest, accounting for 65.3%, more than half of the research sample. This result is consistent with current reality. Next, the survey sample of the Joint Stock Company type is second with a rate of 29.3%, and the remaining types are Private Enterprises and other types with a low rate. Total number of employees of the entire enterprise: 34% of the sample participating in the survey work in enterprises with 50 - 100 employees. This result is consistent with the general characteristics of manufacturing enterprises in the central provinces of Vietnam. Meanwhile, the number of survey samples working in large-scale enterprises (500 employees or more) accounts for the lowest proportion of 14.7% of the total 150 research samples. According to total business capital, The majority of research samples focus on capital of 5 to 10 billion, accounting for 42% of the total sample surveyed. The survey sample only had capital of less than 5 billion, accounting for the lowest percentage, only 7.3%. By enterprise age: Out of the total 150 survey samples, the proportion of enterprises with a business age of over 10 years is the highest, accounting for 58.8%, more than half of the research sample. Next, businesses with a business age of 5 to 10 years are ranked second with a rate of 25.3%; the remaining are businesses with a business age of less than five years, accounting for a low rate.

4.2. Results of testing the reliability of the scale

The data processing results in Table 3 and Table 4 show that the scales all have Cronbach's Alpha coefficients greater than 0.8, the combined reliability of the scales is greater than 0.7 and the external loading factor is greater than 0.8. (outer loading) of the observed variables are all greater than 0.4. Thus, the scales in the model are highly reliable.

Table 3: Measurement results of external factor loadings (OL)

YD2									0.902
YD3									0.847
YD4									0.924
YD5									0.866

(Source: Results of research data analysis by the author, 2022)

Table 4: Results of measuring reliability and convergent validity

Observed variables	Cronbach's Alpha Coefficient	Composite reliability (CR)	Variance Average extraction (AVE)
CM	0.932	0.949	0.787
CS	0.850	0.907	0.764
DA	0.871	0.908	0.666
DN	0.908	0.931	0.731
DS	0.901	0.938	0.835

HI	0.936	0.951	0.796
MT	0.933	0.947	0.751
TD	0.917	0.938	0.752
YD	0.930	0.947	0.781

(Source: Results of research data analysis by the author, 2022)

Based on the results in Table 3, Table 4 shows that the external loading coefficients of the observed variables are all greater than 0.7, and the AVE values in the model all reach values greater than 0.5. Therefore, the proposed scales all meet the requirements for convergent validity.

4.3. Evaluate the model

The research results in Table 5 show that the scale's discrimination is very good. All values of the Heterotrait-monotrait ratio (HTMT) are smaller than the threshold of 0.85. This proves that the proposed scales all meet the requirements of discriminant validity. Therefore, the variables proposed by the authors are retained for the next steps.

Table 5: Heterotrait-Monotrait Ratio (HTMT)

	CM	CS	DA	DN	DS	HI	MT	TD	YD
CM									
CS	0.444								
DA	0.612	0.301							
DN	0.423	0.328	0.516						
DS	0.666	0.387	0.533	0.564					
HI	0.421	0.126	0.849	0.369	0.372				
MT	0.356	0.323	0.355	0.181	0.334	0.289			
TD	0.579	0.291	0.772	0.510	0.603	0.709	0.335		
YD	0.714	0.501	0.566	0.438	0.843	0.405	0.435	0.650	

(Source: Results of research data analysis by the author, 2022)

The results of Table 6 show that the variance inflation factor (VIF) of all exogenous variables is less than 5, so the research model's multicollinearity phenomenon is still at an acceptable level.

Table 6: Results of evaluating the VIF coefficient

DA4	3,094	HI5	3,410	YD3	2,574
DA5	2,856	MT1	4,054	YD4	4,523
DN1	3,057	MT2	4,622	YD5	3,013

(Source: Results of research data analysis by the author, 2022)

R^2 in Table 7 shows that the model has good quality. The analysis results show that the variable "Perceived ease of application" explains 64.0% of the variation "Perceived usefulness"; the variable "Perceived ease of application" and the variable "Perceived usefulness" explained 51.2% of the variation "Manager's attitude"; the variable "Factors belonging to the business", the variable "Low-cost strategy", the variable "Differentiation strategy", the variable "Manager's attitude", the variable "Subjective Norms" and the variable "Business environment" explains 75.6% of the variable "Intention to apply MMA". Thereby, the R^2 value shows moderate and strong predictive ability.

Table 7: Testing using R^2 and adjusted R^2

	R^2-value	Corrected R^2 value
HI	0.643	0.640
TD	0.519	0.512
YD	0.766	0.756

(Source: Results of research data analysis by the author, 2022)

The data in Table 8 summarizes the results of the impact of f^2 when the authors split the structural model into small models with one dependent variable (HI, TD, YD) and several independent variables. Specifically, DA has a large impact on HI, DA has a large impact on TD, and DS has a large impact on YD; The remaining relationships have a small impact.

Table 8: Results of impact scale coefficient f^2

Relationship between variables	f^2	Influence level
CM->YD	0.059	Small impact
CS->YD	0.067	Small impact
DA->HI	1.800	Big impact
DA->TD	1.162	Big impact
DN->YD	0.027	Small impact
DS->YD	0.783	Big impact
HI->TD	0.062	Small impact
MT->YD	0.031	Small impact
TD->YD	0.063	Small impact

(Source: Results of research data analysis by the author, 2022)

The results summarized in Table 9 show that with the assumption of a 5% significance level, the relationships in the model are all statistically significant ($p < 0.05$) and have a positive relationship.

Table 9: Results of direct impact relationship

	Impact coefficient	t-Statistics	p-value
CM -> YD	0.061	1.602	0.010
CS -> YD	0.142	3.064	0.002
DA -> HI	0.802	13.373	0.000
DA -> TD	0.467	2.038	0.042
DN -> YD	0.097	1.969	0.049
DS -> YD	0.606	5.893	0.000
HI -> TD	0.089	1.155	0.048

(Source: Results of research data analysis by the author, 2022)

In addition, the results of testing the intermediate variable using the BC-bootstraps method shown in Table 10 show that the indirect effects of the factors in the model are shown as follows: the variable "Perceived usefulness" has a full intermediary role between the variable "Perceived ease of application" and the variable "Manager's attitude". "Manager's attitude" is a partial mediating variable between "Perceived usefulness" and "Intention to apply MMA". Thus, the manager's attitude has both a direct impact on the intention to apply MMA and an indirect impact on the intention to apply MMA.

Table 10: Results of testing the mediating role

Relationship	Estimate	p-value	Conclude
DA -> HI -> TD	0.235	0.000	Full intermediary role
HI -> TD -> YD	0.024	0.002	Full intermediary role
DA -> HI -> TD -> YD	0.078	0.000	Partial intermediary role
DA -> TD -> YD	0.078	0.002	Partial intermediary role

(Source: Results of research data analysis by the author, 2022)

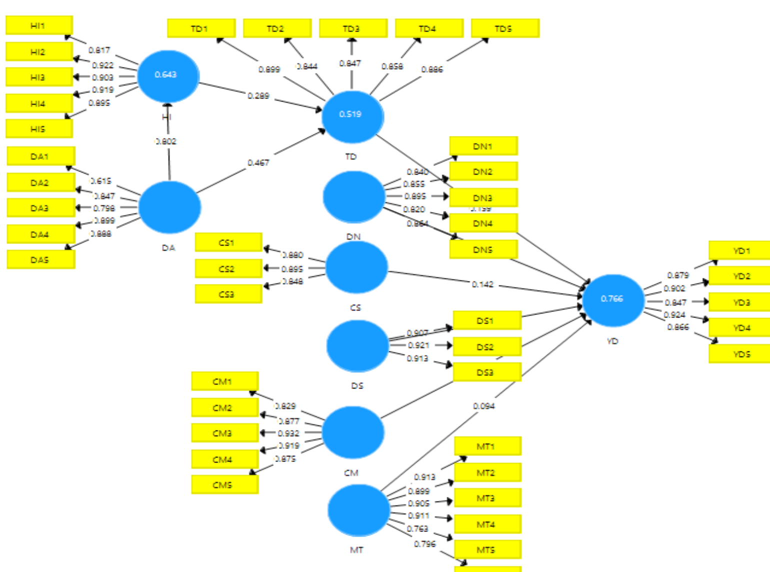

Figure 1: Model evaluation results

In this study, the authors discovered factors that influence the intentions in applying MMA to manufacturing enterprises in central provinces of Vietnam. From the research model proposed by the authors, the project tested nine hypotheses. According to the test results, nine hypotheses H1, H2, H3, H4, H5, H6, H7, H8, and H9, all have a positive impact on the intention to apply MMA.

5. CONCLUSION AND POLICY IMPLICATIONS

The study has identified factors affecting to the intentions in applying MMA of manufacturing enterprises in central provinces of Vietnam. According to quantitative analysis results, factors that positively impact the intention to apply MMA include Perceived usefulness, perceived ease of application, manager's attitude, subjective norms, factors belonging to the business, low-cost strategy, differentiation strategy, and business environment. The results of hypothesis testing accepted hypotheses H1, H2, H3, H4, H5, H6, H7, H8, H9. The research results also show that there are similarities and new findings compared to previous studies. DA has a large impact on HI, DA has a large impact on TD, and DS has a large impact on YD. This result is the basis for the authors to propose recommendations for business managers.

Research results have shown that two factors, "Perceived usefulness" and "Perceived ease of application", have a direct impact on a "Manager's attitude". Therefore, increasing managers' Perceived usefulness and perceived ease of application will make managers have a positive attitude about applying MMA. Regarding the "Perceived usefulness" factor, for managers to have a positive attitude about applying MMA, it is necessary to make them feel that applying management accounting is very useful. MMA information helps managers plan better strategies, control production costs, and operate business operations more effectively. Regarding the factor "Perceived ease of application", to move towards the intention of applying MMA, managers need to feel that these methods are easy to apply, appropriate, and applicable to their business. This requires managers to have knowledge and understanding of MMA. Managers must focus on improving management skills and knowledge of management accounting, especially MMA, through long-term or short-term training programs. The differentiation strategy factor is a strategy that focuses on providing a product or service with different attributes compared to competitors to reach a large market. Differentiation helps businesses become different and grow. Businesses must invest in market research and communication activities to find out the unique properties of their products compared to competitors. Differentiation strategy is considered the key for brands to unleash creativity and innovation and assert their position in the market. A differentiation strategy is truly an effective long-term solution for businesses in today's increasingly fierce market competition.

During the process of implementing the project, the authors could not avoid some limitations, such as research space and research subjects, so they could not accurately and fully evaluate the factors affecting and the affecting level of these factors to the intentions in applying MMA. These are also research directions that the authors can consider and will research in the future. The authors intend to expand the scale of research to neighbouring areas, especially delving into the research of new factors affecting the intentions in applying MMA in more enterprises.

ENHANCING FINANCIAL CAPABILITY THROUGH MERGERS AND ACQUISITIONS ACTIVITIES IN ENTERPRISES

Dr. Tran Van Hai[1], Assoc. Prof. Dr. Hoang Van Quynh

Abstract: The research aims to propose solutions for mergers between Vietnamese securities companies to improve the financial capacity of securities companies currently operating on the Vietnam Stock Exchange - VNX (HNX, HoSE and Upcom exchanges). Through research samples collected from 27 Vietnamese securities companies in the period from 2014 to 2021, secondary data are audited financial statements and financial safety reports. By using the quantitative research method of principal component analysis PCA (Principal Component Analysis) and K-means (cluster) analysis on SPSS 20 software. As a result, the authors have classified 4 clusters of Securities companies can merge with each other according to the criteria of financial capacity and business strategy to improve financial capacity in the future. Based on the research results, the author provides some discussions and assessments on the important role of improving the financial capacity of securities companies, and recommends financial solutions for strategic development goals. long-term, based on growth and limiting risk management for companies in volatile stock market conditions.

Keywords: Securities company financial capability, Mergers and acquisitions, Securities company financial safety, Securities company risk management, Securities company financial reporting, Securities company financial safety reporting.

1. INTRODUCTION

In the modern economy, the financial market plays a crucial role as a medium for short and long-term capital flow in the economy. To ensure the efficient functioning of the financial market, the role of market intermediaries, including securities companies, cannot be ignored.

In Vietnam, the establishment and development of securities companies are closely tied to the evolution of the financial market. Since the official launch of the market in July 2000, the number of securities companies has grown from 5 to nearly 80, including 27 small-scale securities companies (capital under 1,000 billion VND). There was a time when the number of securities companies reached 105 (as of December 2009). However, under the influence of market economic laws, many securities companies operated inefficiently, leading to mergers, acquisitions, cessation of operations, and dissolution, resulting in a decrease in the number of securities companies.

Vietnam is increasingly integrating into the global economy, and its financial market is expanding. Vietnamese securities companies are facing a mix of opportunities and challenges. To survive and develop, securities companies must first enhance their financial capability. This imperative emerges from the consensus among experts and managers that the fundamental issue lies in weak financial capability.

As Vietnam integrates deeply into the global economy, and its financial market expands, Vietnamese securities companies are facing intertwined opportunities and challenges. To survive and thrive, securities companies must primarily enhance their financial capability. This necessity arises from the consensus among experts and managers that the underlying cause of the issue is weak financial capability.

Amid the changing landscape, many securities companies have made efforts to improve their financial capability to meet the demands of the competitive environment, ensuring their stability and development. However, facing new development requirements, many companies have begun to reveal weaknesses in financial capability, resulting in consecutive years of losses.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

According to Tran Van Hai (2023), "Financial capability of a securities company is a term describing the financial capacity of the company. This capacity is reflected through the ability to have capital to support business activities, payment capability, and profit generation of a securities company." Financial capability not only reflects the current financial ability of the securities company but also its potential and prospects, even in the future. The financial capability of a securities company reflects its organizational ability to conduct business operations and achieve financial goals within a certain period (Tran Van Hai, 2023). To enhance the financial capability of securities companies, various studies have been conducted worldwide, including:

In the research conducted by IOSCO, the International Organization of Securities Commissions (1998), "Methodologies for Determining Minimum Capital Standards for Internationally Active Securities Firms Which Permit the Use of Models Under Prescribed Conditions" (IOSCO, 1998), methodologies were established to determine minimum capital standards for internationally active securities firms, allowing the use of models under standards 21 and 22. Additionally, IOSCO introduced objectives and principles of securities regulations in May 2003, increasing investor protection and financial system stability through thorough supervision of capital standards. Capital standards allow securities firms to withstand losses, especially in unfavorable market volatility, and achieve an environment where securities firms can cease operations for a short period without affecting customers and disrupting the orderly functioning of the financial market. According to IOSCO's perspective, securities firms with sufficient capital levels do not pose risks to customers, investors, or partners. This implies that a securities firm with adequate capital can achieve other management objectives. The principles for market intermediaries, mainly securities companies, consist of 4 principles:

Principle 21: Establish minimum input standards for market intermediaries.

Principle 22: Initial and ongoing capital requirements for market intermediaries to reflect the risks they undertake.

Principle 23: Market intermediaries must adhere to internal organization and conduct standards to protect client interests and manage risks.

Principle 24: Market intermediaries should have procedures to handle incidents to minimize damages, losses for investors, and limit systemic risks (IOSCO, 1998).

In this way, the IOSCO principles establish the first and most important standards, which are the capital adequacy standards, the sufficient capital level, and the result is ensuring the payment requirements of securities firms.

According to Healy and colleagues (1990), *Does corporate performance improve after mergers.* The study investigated the operational effectiveness of companies following mergers and acquisitions by employing a sample of 50 merger transactions among US industrial companies completed during the period from 1979 to 1983. The research results concluded that merged companies experienced significant improvements in profitability and cash flow after the mergers, leading to an increase in their assets. There exists a strong positive correlation between the post-merger increase in operational cash flow and stock profitability, with the expectation of economic enhancement serving as the basis for the reassessment of the ownership capital of companies after the mergers (Healy, 1992). Therefore, the merger and consolidation strategies among multiple companies will synergistically bolster the financial prowess of these strong companies through increased cash flow, profitability, and asset augmentation.

According to Herring and colleagues (2005), in their study "*Capital regulation for position risk in Banks, Securities firms, and Insurance companies*," the authors examined the reasons behind the differences in capital regulations, even though securities firms and insurance companies engage in similar financial business activities and share some common partners. The study also highlighted the contrasting capital regulatory approaches between US securities firms and those in Europe. European regulators often apply consolidated supervision and capital regulation to the securities activities of commercial banks within their jurisdiction, treating them similar to any other traditional banking activities (Herring, 2005). The capital adequacy regulations for securities firms in the US, differing from those in Europe, will provide certain advantages for US securities firms.

Harimaya et al. (2006), *The Changing Structure of Cost for Japanese Securities Firms*. Harimaya and their team conducted a study on Japanese securities firms from 1998 to 2002, examining the emergence of online securities firms and the differences compared to existing securities firms after the relaxation of regulations. For instance, banks participating in securities business through their subsidiaries. The research supports the existence of small online securities firms participating in a specific securities business sector (Harimaya, 2006). The study's findings suggested that the online securities firm model brings about business efficiency, as well as the issue of bank ownership yielding positive results.

Elyasiani et al. (2007). *Convergence and Risk-Return Linkages Across Financial Service Firms.* Elyasiani and colleagues (2007) conducted research on the interconnection of risk and return among commercial banks, securities firms, and life insurance companies in the United States from 1991 to 2001. The results revealed a significant and size-dependent interdependence between profitability and risk that varies with scale. Larger organizations exhibited stronger risk transmission (volatility), while smaller organizations displayed clearer profit interdependence with limited risk propagation. The differences in risk transmission models between larger and smaller organizations impact investment choices, trading, and mergers and acquisitions within the industry. In economies with developed financial sectors, there's a trend towards mergers and consolidations across sectors such as commercial banking, insurance, and securities to enhance competitiveness and efficiency. However, this is accompanied by an increase in risk with scale, underscoring the necessity for high financial capacity and securities liquidity requirements to be thoroughly considered.

Fang et al. (2009), *A Metafrontier Study of Securities Broker and Dealer Efficiency Under Zero-Sum Gains.* The study by Fang and colleagues (2009) focused on the efficiency of brokers and dealers within securities firms within a zero-sum gain framework. Current studies estimate firm-level efficiency using conventional data envelopment analysis (DEA) but neglect the constraint of 100% market share. Experimental findings demonstrated that the conventional DEA model underestimates the efficiency of less efficient securities firms in Taiwan. The technology gap ratio in the output orientation indicates that foreign ownership has a negative impact on securities firm efficiency. Specialized securities brokerage firms are significantly more efficient than integrated securities firms. Additionally, financial reforms initiated by the government cannot improve the efficiency of broker and dealer intermediaries in the securities industry.

Samuels (2018), *Early Warning System for Economic and Financial Risks in Jamaica*. Samuels (2018) presented the notion that "Indicators used to measure the stability of banks and securities dealers include: capital adequacy, asset quality, liquidity, profitability, and sensitivity to market risk." The study's shortcoming is that the author didn't consider capital capacity and the capital adequacy ratio of securities firms.

3. METHODOLOGY AND PROPOSED MODEL

The study predominantly employs a quantitative research methodology. The paper utilizes techniques such as Principal Component Analysis (PCA) and K-means clustering analysis within the SPSS 20 software.

The current market scenario reveals an excess of securities firms in comparison to the demand and market scale. Moreover, a significant proportion of securities firms face financial limitations. Consequently, the M&A strategy among securities firms emerges as a near "compulsory" option for smaller-scale securities firms aiming to augment their ownership capital.

From the perspective of securities firms, there is a need to reevaluate the objectives of establishment and operational activities in light of the firm's owners. Shareholders of securities firms, particularly those that have experienced prolonged periods of losses or inefficiencies, should actively seek partnerships for mergers or the sale of the firm. This approach aims to reduce risk and enhance financial capability.

Smaller-scale securities firms, unable to acquire additional capital from investors, encounter challenges in issuing shares to raise funds. Firms that have sustained losses for several consecutive years or exhibit modest profitability insufficient for establishing a robust market presence, or firms that possess core software technology but face high prospects of intense competition in the forthcoming years, should consider engaging in M&A. These firms must recognize that M&A represents a favorable opportunity for bolstering growth, cost savings, and achieving a critical and sustainable competitive advantage over rivals in the market. For instance, a firm with a low debt-to-equity ratio can potentially partner with a firm that employs high financial leverage. This synergistic approach aims to balance the financial structure of the company.

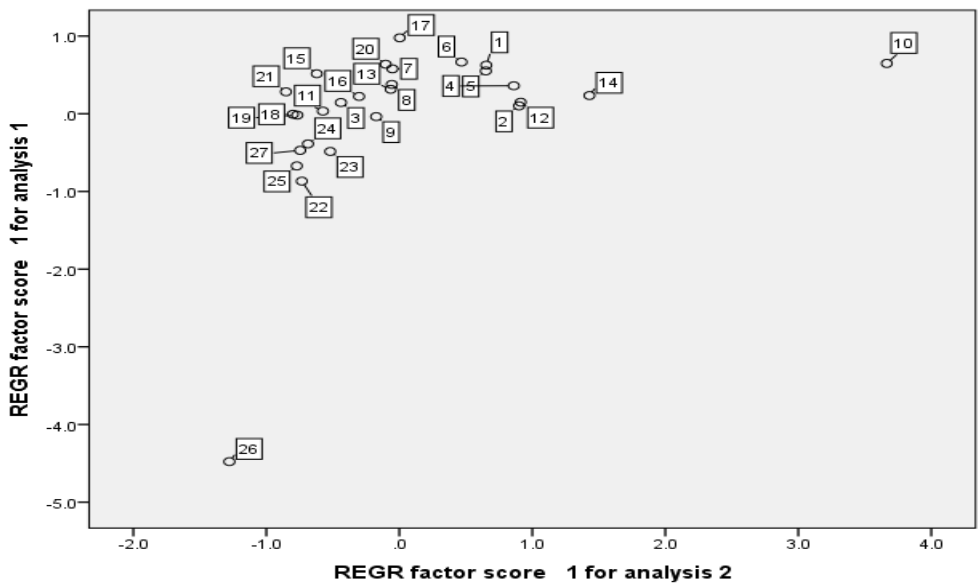
However, alongside the achieved benefits, M&A transactions entail numerous risks that can pose threats to existing shareholders. Therefore, a complete merger or consolidation is only pursued when no alternative solutions remain. Identifying potential partners assists companies in making swift decisions when opportunities arise. The aforementioned criteria can be adjusted for each M&A transaction, with fundamental criteria revolving around the financial capacity and performance of the candidate company.

Securities firms can engage in M&A through horizontal combinations between two or more securities firms. The outcomes of such combinations extend beyond increasing the scale of shareholders' equity. They offer opportunities to expand into new markets, combine brand identities, reduce fixed costs, and enhance the efficiency of service delivery systems. In this type of transaction, the management teams of both participating securities firms will possess a wealth of information regarding each other's business conditions.

The paper employs statistical techniques such as Principal Component Analysis (PCA) and K-means clustering analysis using SPSS software to examine the financial capability and business strategies of small-scale securities firms during the period from 2014 to 2021. Securities firms with similar characteristics are grouped together into clusters based on the results. Leveraging this outcome, the study proposes potential M&A opportunities among these securities firms. The following steps are undertaken:

Step 1: Conduct an analysis to generate two representative variables named FAC1_1 (REGR factor score 1 for analysis 1) and FAC1_2 (REGR factor score 1 for analysis 2), based on the financial capability and business strategy variables of the securities firms. Chart 1 illustrates the correlation between these newly established variables.

Chart 1. Characteristics of Small-scale Securities Firms in Financial Capability and Business Performance



Source: Statistical research conducted using SPSS software

Step 2: Based on the two newly created variables, the study employs the K-means clustering technique to cluster 27 securities firms (Table 1).

Table 1. History of Cluster Center Changes

Iteration History[a]									
Iteration	Change in Cluster Centers								
	1	2	3	4	5	6	7	8	9
1	.494	.000	.422	.000	.504	.260	.182	.000	.261
2	.121	.000	.000	.000	.339	.227	.546	.000	.008
3	.116	.000	.000	.000	.366	.000	.303	.000	.050
4	.040	.601	.000	.000	.374	.000	.095	.000	.026
5	.052	.000	.000	.000	.192	.000	.099	.000	.030
6	.073	.000	.000	.000	.192	.000	.016	.000	.009
7	.064	.459	.000	.000	.263	.000	.000	.000	.009

9	.053	.000	.000	.000	.033	.000	.000	.000	.029
10	.050	.000	.000	.000	.040	.000	.016	.000	.035

a. Iterations stopped because the maximum number of iterations was performed. Iterations failed to converge. The maximum absolute coordinate change for any center is .050. The current iteration is 10. The minimum distance between initial centers is 1.948.

Source: Statistical research conducted using SPSS software

To analyze the differences among the securities firms, the author utilizes the Two-sample T-test for two populations. In cases involving more than two groups, the author employs Analysis of Variance (ANOVA). While the T-test requires pairwise comparisons, the accumulation of errors for each comparison at a 5% significance level can lead to an overall error rate different from 5%. Therefore, in this situation, ANOVA is recommended as it simultaneously tests all sample groups with an overall error rate of 5%. The results are as follows:

Table 2. ANOVA Statistical Table

ANOVA						
	Cluster		Error		F	Sig.
	Mean Square	df	Mean Square	Df		
REGR factor score 1 for analysis 1	23.220	8	.116	201	200.810	.000
REGR factor score 1 for analysis 2	24.009	8	.084	201	285.082	.000

Source: Statistical research conducted using SPSS

The sig value of the ANOVA table is 0.000 < 0.05, indicating that the clustering results align well with the collected data.

4. RESEARCH RESULTS

Through Table 3, it is evident that the securities firms are classified into 4 clusters (clusters 1, 5, 7, and 9). Based on these results, the study proposes M&A activities between securities firms belonging to these 4 clusters to increase the scale of equity capital and financial capacity. Specifically:

Cluster 1: Securities firms including Beta Securities, DongA Securities, HAC Securities, IRS Securities, LVS Securities, NVS Securities, VISE Securities, and VSEC Securities.

Cluster 2: Securities firms including DVSC Securities, SBS Securities, and VUA Securities.

Cluster 3: Securities firms including APSC Securities, CVS Securities, HVS Securities, and VNSC Securities.

Cluster 4: Securities firms including ASCS Securities, CSI Securities, ECC Securities, HBS Securities, JSI Securities, ROSE Securities, SBBS Securities, SJCS Securities, VIG Securities, VISECO Securities, VTSC Securities, and VTSS Securities.

5. DISCUSSION AND CONCLUSION

According to the researcher, newly merged securities firms resulting from M&A within the same clusters should meet a minimum equity capital requirement of over 1,000 billion VND.

From the perspective of government agencies, clear signals are necessary regarding the reduction of the number of securities firms. The policy should continue to discourage the establishment of new securities firms and instead encourage the restructuring of existing ones through mergers and consolidations.

The gradual process of merging and consolidating securities firms serves to reduce the number of such firms in the market while minimizing negative fluctuations for the securities market system. This includes addressing issues related to customer transaction account handling and related financial obligations, consulting and underwriting contracts for securities issuance, handling technical infrastructure, and the workforce of operating personnel in merged or consolidated securities firms. This process also significantly curbs the erosion of investor and customer confidence in securities firms, compared to the process of dissolution or bankruptcy. Furthermore, post-merger or consolidation, securities firms can pool resources, including both human and financial resources, to execute securities business activities.

State agencies need to establish and implement specific regulations concerning the dissolution, consolidation, and merger of securities business entities, including securities firms. The procedure for implementing dissolution, consolidation, or merger of securities firms needs to be clarified, including situations where such actions are mandatory. Encouragement mechanisms should prioritize smaller securities firms merging with larger ones (with equity capital exceeding 1,000 billion VND) in the market or consolidating with other smaller securities firms to continue providing financial market services. Incentive mechanisms may involve exemptions, reductions, or deferrals of corporate income tax for 2-3 years, reductions in securities investment tax for investors opening accounts and conducting securities transactions at the merged or newly established firms within a specified period, possibly 6-12 months...

FISCAL POLICY FOR CIRCULAR BUSINESS MODEL: INTERNATIONAL EXPERIENCE AND LESSONS FOR VIETNAM

Msc. Le Vu Thanh Tam[1], MA. Nguyen Thi Ha Linh[2]

Abstract: *Fiscal policy is considered as an effective economic instrument for guiding and encouraging businesses to implement the circular economy model by affecting the costs and benefits of production and consumption behaviors of subjects. This article gives an overview of the circular economy model, world trends, the role of fiscal policy and international experience in using tax policy tools to encourage businesses to implement the circular economy model. This article also analyzes the current situation of fiscal policy on guiding and encouraging businesses to implement the circular economy model and makes recommendations for Vietnam.*

Keywords: *Circular business, fiscal policy, green growth, sustainable development.*

1. INTRODUCTION

Vietnam is one of the world's top five most vulnerable countries to climate change, with increasingly serious pollution levels and increasingly scarce resources. Therefore, the implementation of the theoretical economy in general and the digital economy in particular is considered as one of the main solutions, which is reflected in the recent guidelines, policies and laws of the Party and State such as the Document of the Party Congress, Socio-economic development strategy, legal regulations and operating documents. In order to successfully develop a circular economy, in which business organizations play a pivotal role, policies to encourage and support businesses to convert to a digital economy model play a very important role. important, where fiscal policy is seen as central, especially in the early stages of the transition.

Although it has been mentioned since the last years of the 1960s, in the work "Economy of a spaceship named Earth" (Boulding 1966), the theoretical economy and the new economic model are only real The interest has returned from the beginning of the 21st century, in which the new mathematical model has been mentioned in both theoretical and experimental studies since the middle of the 2nd decade of this century. The reason why this model has received great attention is because the condition to meet the requirements for the development of this model has really just appeared, that is, the development of science and technology has reached the level of helping people to develop a new model. handle the problems of this model, especially the fourth industrial revolution.

Along with science and technology, fiscal policy plays a decisive role in the successful development of the knowledge economy as well as circular business model. This article will refer to the experience of developing fiscal policy for circular business model of some countries, lessons and some policy suggestions for Vietnam.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

Circular Business Models (CBMs) can be considered as the interpretation of circular economy principles within the company's boundaries. Depending on the experts, CBMs can be classified under the wider umbrella of either Green Business Models (GBMs) and/or Sustainable Business Models (SBMs). About this topic, a systematic literature review has been carried out by Rosa et al. (2019). Results unveil that in terms of CBMs the most discussed research areas are (i) practical implementation of CBMs, (ii) challenges related with the adoption of CBMs and (iii) decision-support tools.

It is possible to distinguish three research streams on CBM classification: (i) papers referring to the ReSOLVE framework (The Ellen MacArthur Foundation, 2015), (ii) papers referring to the Business Model Canvas (BMC) methodology (Osterwalder, A., et.al, 2010) and (iii) papers proposing hybrid models mixing both the previous methods. The ReSOLVE framework (The Ellen MacArthur Foundation, 2015) aims at supporting companies and governments during the definition of circular economy policies. It identifies six different ways to be circular (e.g. Regenerate, Share, Optimize, Loop, Virtualize and Exchange). Each of them is subsequently detailed in specific actions. Even if the ReSOLVE framework cannot be considered a real classification method, many experts started from it to develop their own models.

Considering the BMC-based classification methods, papers pertaining to this category try to modify the original BMC in order to map circularities. Considering hybrid models, the experts try to mix the previous classification methods in order to reinforce them. Given the popularity of ReSOLVE and BMC methods, the FENIX project considered them as reference CBM classification methods. Specifically, the ReSOLVE framework has been exploited for the identification of CBM archetypes at macro level.

Subsequently, the BMC method has been considered for the detailed description of CBMs at micro level. In addition, a meso classification of CBMs archetypes was adapted from the last OECD's report on CBMs (consisting of fourteen classes considering the full amount of different business models related with circular economy existing in literature) (OECD—European cooperation and economic development organization, 2017).

Considering tables reported by Rosa et al. (Tolio, T., et.al, 2017), it is possible to see that some types of CBMs are more frequent than others. The most common CBMs described in literature are represented by recycling practices and use-oriented PSSs. They are followed by bio-based/secondary materials exploitation, reuse and refurbishing/remanufacturing practices, result-oriented and product-oriented PSSs and industrial symbiosis. Not so commonly described in literature are those CBMs related on renewable energies, co-ownership and co-access, repair practices, product dematerialization and new technologies. However, it is evident from the assessed literature the presence of a big research gap in terms of (i) how practically transform linear BMs in circular ones and (ii) how to involve common people in current industrial CBMs..

3. METHODOLOGY AND PROPOSED MODEL

Data collection method

This article collected data on the basis of studying existing documents and by manipulating logical thinking to draw necessary scientific conclusions related to the content of circular business model. By reviewing the scientific literature from various official sources around the world as well as practicing the method of systematizing theory and history, the article has reached important conclusions on the issues involved to the situation of fiscal policies for circular business model in several countries.

Data analysis method

Research conceptualize overview of circular business model; summarize the situation of circular agriculture development in the world, then discuss and draw lessons from fiscal policies for circular business model in Vietnam.

4. RESEARCH RESULTS

4.1. Overview of fiscal policy for circular business

4.1.1. Concepts of circular business

All but two[1] of the reviewed definitions focus on value creation and roughly follow either the value logic framework of Richardson (2008), which envisions the value proposition, value creation and delivery, and value capture (e.g. Linder and Williander, (2017), Nußholz, (2017), and Lahti et al., (2018)), or the business model definition of Osterwalder and Pigneur (2010), which is based on that logic: "A business model describes the rationale of how an organisation creates, delivers, and captures value" (p.14). This is then combined with circular economy principles (Manninen et al. 2018; Lüdeke-Freund et al. 2019; Zucchella and Previtali 2019) or translated into circular business model strategies by Bocken et al. (2016), Geissdoerfer et al. (2018), and Oghazi and Mostaghel (2018).

These comprise recycling measures (closing), efficiency improvements (narrowing), use phase extensions (extending), a more intense use phase (intensifying), and the substitution of product utility by service and software solutions (dematerialising) (Geissdoerfer et al., 2018). However, while all of these strategies seem compliant with the circular economy as conceptualised for example by Webster (2015), we could not find any source that would justify a business model to qualify as 'circular' (Urbinati et al. 2017) or compliant with the circular economy concept solely based on the idea of narrowing loops (i.e. efficiency gains alone). Thus, this strategy seems to constitute more of an 'add-on' than a circular business model strategy in its own right.

Some authors highlight the relationship between circular and sustainable business models. Geissdoerfer et al. (2018), Lahti et al. (2018), and Zucchella and Previtali (2019) assume sustainability aspects to be integral to the circular business model concept. This corresponds to a previous analysis carried by the authors that some but not all conceptualisations of circular business models focus on sustainability aspects (Pieroni et al. 2019).

Based on this analysis of the literature, circular business models can be defined as business models that are cycling, extending, intensifying, and/or dematerialising material and energy loops to reduce the resource inputs into and the waste and emission leakage out of an organisational system. This comprises recycling measures (cycling), use phase extensions (extending), a more intense use phase (intensifying), and the substitution of products by service and software solutions (dematerialising).

[1] Urbinati et al. (2017) refer to CE practices (e.g. recycling and reuse) and Manninen et al. (2018) refer to the related concept of Natural Capital instead

4.1.2. Fiscal policy for circular business model

According to Rizos et al. (2021), 39% of surveyed businesses (accounting for the highest percentage) believe that it is necessary to increase financial support for businesses implementing traditional business models or activities. Higher costs when implementing business according to circular principles are a barrier (26% in the electrical and electronics industry and 50% in the agricultural and food industry). Access to financial resources (23% in the electrical and electronics industry and 30% in the agricultural and food industry).

In Vietnam, according to the 2021 survey results of the Vietnam Business Council for Sustainable Development (VBCSD) and EPRO Consulting Joint Stock Company, 54% of businesses have difficulty converting their models. In a circular model, nearly 48% believe that financial difficulties are a barrier to this transformation, accounting for the highest proportion of difficulties (technology and engineering is 43% and policy is 34%).

Therefore, it is obvious that fiscal policy plays a very important role in converting the model from linear to circular economy. To implement fiscal policies for circular transition, government intervention mainly bases on the tax system and government spending along with the development of the credit system. used to support the development of this model. In addition, the public procurement process will attract a large amount of investment from businesses, thereby creating resources and a stepping stone to develop circular business model; At the same time, it helps strengthen private investors' confidence in the circular economy. The credit system plays another important role, which is to create stable loan channels for businesses to develop business models.

4.2. Experience of some countries on fiscal policies for circular business model

4.2.1. Tax policies

a. Tax policies on economic activities harm the environment

To limit plastic waste and promote the transition to circular economy for plastic, European countries have proposed different tax rates applied to plastic waste, such as 450 EUR/ton in Italy, 450 EUR/ton in the UK, and 450 EUR/ton in the UK. is 200 GBP/ton. Thanks to the application of taxes, plastic has been reused as a resource, thereby reducing the amount of plastic produced and released into the environment, as well as limiting the negative impact of plastic waste.

As for first-use royalties, European countries apply to raw materials such as sand, gravel and stone used in the construction industry. The policy of taxing first-use resources will stimulate resource use efficiency. France plans to reduce value added tax (VAT) to 5,5% instead of 20% on recycled materials, fine industries that do not comply with new standards, and continue to generate a lot of waste, damaging the environment.

Carbon tax is considered a market-based solution to reduce emissions. Adopting carbon tax will force business to analysis benefits and costs thereby adjusting excessive energy exploitation, use, and consumption. Subjects adopted to carbon tax are mainly fossil fuels such as gasoline, oil, methanol, naphtha, butane; liquefied petroleum gas; burning fuels such as peat, coal... The tax base is the amount of carbon emissions, calculated in tons of emissions. Tax rates can be tax rates based on percentage, absolute tax rate (absolute tax rate) or mixed tax rate (collected both by percentage and absolute tax rate). The carbon tax rate is about 1 - 130 USD/ton of CO2.

Finland, Sweden, Norway, Denmark were the leading countries to apply carbon taxes in the early 1990s. Currently, many countries around the world (UK, Netherlands, USA, Canada...) Apply a carbon tax to reduce emissions. According to the Organization for Economic Cooperation and Development - OECD (2015), carbon taxes have the effect of reducing greenhouse gas emissions, while also generating significant revenue for the national budget. Most East Asian countries could increase budget revenue by 0.5 - 2% of GDP in 2020 if they apply a tax of 20 USD/ton CO2. This budget revenue is especially higher in developing countries due to high emissions relative to GDP.

b. Tax incentives for environmentally friendly economic activities and products

Many countries have applied tax incentive policies to encourage and promote investment in clean technology and effective use of alternative energy sources. Policy tools to achieve diverse goals include tax holidays, tax exemptions, tax liability reduction mechanisms, and additional cost reduction mechanisms. The United States provides a tax credit for renewable electricity generation for each kWh of electricity generated by renewable energy sources, such as wind power. In 2019, the deduction rate is 2.4 cents/kWh and the deduction period lasts 10 years from the time the electricity production facility is put into use. Facilities (using wind energy) that begin construction in 2016 receive a 100% tax deduction, decreasing to 80% in 2017, 60% in 2018, 40% in 2019 and 0% thereafter. Malaysia implements an 100% deduction of the capital costs incurred for a green technology project from the year of assessment 2013 to 2020 and a 100% deduction of the costs. capital incurred for green technology assets from 2013 - 2020 (support can be offset against 70% of statutory income in the year of assessment).

The Chinese government provides tax incentives for industrial activities to promote the development of the circular economy, encouraging the import of energy-saving machinery and equipment and raw materials. Businesses that meet the conditions can be exempted or refunded input value-added tax at a certain rate. For corporate income tax, if a business purchases and uses special equipment in the prescribed list for the purpose of environmental protection, energy and water saving, and safe production, the cost of purchasing the equipment is can get a 10% income tax deduction. For businesses that use wastewater, exhaust gas and solid waste as main production materials, income tax can be reduced or exempted for a limited period, such as exemption for 3 years and 50% reduction for the next 3 years for with businesses treating wastewater and community waste, businesses innovating technology in energy conservation and emission reduction, seawater desalination and similar projects... Biodiesel production with animal waste and vegetable oil is exempted from consumption tax.

4.2.2. Green public spending policy

In Europe, in the 2020 Circular Economy action plan, green public procurement becomes a mandatory criterion for green public expenditures in European Union (EU) countries. The Chinese government implemented the project "Building an environmentally friendly society", issuing a series of policies to promote green purchasing. In 2005, the country also issued a number of instructions on "promoting the development of a reuse economy", which emphasized that China needs to increase the use of products labeled as water saving, saving and using energy effectively, environmental labels, green food labels and green organic foods, reducing the use of products that use a lot of packaging and products that are only used once. In addition, all government agencies are required to practice green procurement.

Although countries in the Association of Southeast Asian Nations (ASEAN) region have not yet issued their own laws on green procurement, many governments have policies to encourage the development of sustainable consumption. The initial step in developing green shopping is implementing 3R (reuse, reduce, recycle) and eco-labelling. Japan enacted the Green Procurement Promotion Act in 2000, which applies to the Government, agencies, local authorities, businesses and people. This law encourages a shift in demand towards environmentally friendly goods.

4.2.3. Policy for financial markets

For sustainable and efficient use of resources, Japan encourages the issuance of green bonds to promote the development of environmental projects. In 2014, the Development Bank of Japan issued green bonds for the first time, with the number issued gradually increasing over the years. In 2017, the Ministry of Environment announced green bond principles to ensure consistency with green bond principles issued by the ICMA audit organization. Green bonds are allowed to be traded on the stock exchange (Nguyen Thi Thu, 2020).

China uses the following policies: (i) support for conversion costs: Enterprises converting from the traditional economic model to the digital economy model are supported with 10% of the conversion costs; (ii) price policy: the State applies price policy to contribute to the conservation and orientation of organizations and individuals to save and use resources rationally. Accordingly, the authority applies restrictive pricing policies to restricted items in high resource consumption industries; (iii) establishment of a Science and Technology Fund, which has the task of promoting the development of the circular economy. In addition, the Green Development Investment Fund (mobilized partly from socialization and partly from the state budget) is encourage and propagate circular business.

In addition, every year, two businesses with good environmental products will won scientific and technical awards. As of 2019, there are about 109 Chinese enterprises receiving support for transformation in production model. This shows that China’s transition in policies have achieved significant success.

4.3. Lessons for Vietnam

4.3.1. Current status of fiscal policy for circular business model in Vietnam

In Vietnam, many elements of circular business model have been mentioned in the fields of clean technology with little waste, low consumption of raw materials and energy, encouragement of recycling, and use of recycled products. . However, Vietnam has very few models that carry the full connotations of digital marketing, although in terms of goals and content, there have been models or business methods that have had the manifestations of this model since early on.

Legal regulations on circular business model have just appeared, are not synchronized and mainly focus on a number of environmental and energy saving areas. Regulations related to the financial sector (taxation, public spending) specifically related to the tourism industry are almost non-existent. The Government prioritizes public procurement and spending towards activities related to environmental protection, response to climate change and green growth. However, due to the limited potential of the state fund for circular economy, the ability to support interest rates or finance programs and projects is limited and has not met realistic expectations... In addition, the regulations for receiving fund for applying circular business models are still difficult, thus limiting businesses’ access. Policies for financial market development for CBM face many barriers because this business direction is still considered a development option with many risks, making it difficult to attract investors.

The Government also issued incentives for environmental protection activities such as interest rate incentives; issue Vietnamese green bonds, government bonds, Government-guaranteed bonds and local government bonds that mobilize funds for irrigation, environmental protection, wind power, solar energy.

Although tax incentives and support policies have encouraged businesses, organizations and individuals to convert to the circular business model, in the short term, these policies are not enough to offset the costs of businesses when greening production. This is one of many difficulties for small and medium-sized enterprises that want to switch to eco-business, because green production orientation requires large investment capital. Industry needs to be optimized at the lowest level (Nguyen Hong Thang, 2021).

4.3.2. Some proposed solutions on financial and credit policies for circular business

Research on experience in some countries shows that to encourage and support the business sector to successfully transition to a circular economy model, the following contents are needed:

Firstly, supplement and complete appropriate tax policies to encourage subjects to participate and convert to operating according to the model and principles of digital marketing (technology transfer tax, import-export tax,...). Review, amend and supplement the current tax and fee policy system, determine appropriate tax rates for preferential taxable goods to ensure consistency and transparency (environmental protection tax, natural resources tax, special consumption tax, export tax, environmental protection fees...). Reduce value added tax rates for products from circular business models.

Secondly, issue specific regulations on green public procurement or public procurement of products and services produced and provided from business models according to circular principles. Implement green public procurement or green public spending and green public investment. Green public procurement, in addition to protecting the environment, also creates demand in the green procurement market and green value chain for environmentally efficient products and services.

Thirdly, develop both depth and breadth of the financial market, including encouraging and supporting the formation of financial products to serve the transition from the traditional business model to circular business model. The legal framework for the development of the financial market needs to continue to be improved in the direction of creating conditions for international investors to invest more strongly in the Vietnamese stock market.

5. DISCUSSION AND CONCLUSION

Currently, many countries such as Sweden, Finland, China, the Netherlands... have researched and developed fiscal policies for circular business model with many achievements. Recently, under pressure from corporate profits, resources have been overexploited, and environmental pollution has become increasingly serious. Therefore, the circular business model is an inevitable direction for Vietnamese businesses. In this way, production and business activities will ensure quality, efficiency, sustainability and environmental friendliness in the future.

UNIVERSITY SOCIAL RESPONSIBILITY AND STUDENT-BASED UNIVERSITY BRAND EQUITY: AN EVIDENCE FROM PRIVATE HIGHER EDUCATION INSTITUTIONS IN HO CHI MINH CITY

Ph.D Du Thi Chung[1]

Abstract: *The purpose of this study is to evaluate the effects of university social responsibility (USR) on brand equity in the context of private universities in Ho Chi Minh city, Vietnam. The quantitative data set was collected from 167 students in private higher education institutions located in Ho Chi Minh city. Partial least squares structural equation modeling (PLS-SEM) was used to analyse the measurement model and test proposed hypotheses in this study. The structural model analysis results indicated that USR has significantly positive effects on five components of university brand equity, from the highest effect to the smallest level, ranking as follows: (1) brand reputation, (2) brand trust, (3) brand loyalty, (4) perceived quality and lastly (5) brand awareness. Findings of this study suggest implications for private universities to enhance brand equity through USR pratices then increase their competitive advantages in educational market place.*

Key words: *private university, university social responsibility, university brand equity*

JEL code: L32, M14, I23

1. INTRODUCTION

Many organizations have recently acknowledged that it is important to establish a customer's brand by practicing social responsible and addressing a society's social requirements and higher education and universities are not exceptions (Mahmood and Bashir, 2020). Previous literature revealed that in the current competitive environment, CSR contributes to brand equity by filling a good image in consumers' minds (Aaker, 1991). One of the most popular definition of CSR (Carroll, 1979) claims that "The social responsibility of business encompasses the economic, legal, ethical, and discretionary (philanthropic) expectations that society has of organizations at a given point in time."(p.500). World Bank Group (2004) acknowledges that the modern corporate social responsibility (CSR) agenda is evidence that businesses are a part of society and contribute positively to societal goals and aspirations. Corporate social responsibility (CSR) must be mentioned as another concept that is influencing the development of brands nowadays, especially corporate brands as the public wants to know what, where, and how much brands are giving back to society. Both brand equity and CSR have become significantly important and the organizations have recognized how these strategies can add or detract from their value (Blumenthal and Bergstrom 2003). The CSR concept covers different plentiful fields, with interest of social responsibility in Higher Education Institutions (HEIs) increasing significantly (Carroll, 2015). Practicing social responsibility in universities is not only privileged to the obligation of education but also to satisfy the emerging needs of the society (Vázquez et al., 2014). A numberous researchs indicated that approaching CSR is critical to the survival of universities (Huempfner & Kopf, 2017).

Branding strategy in higher education instituations has increasingly become a strategic task for universities in order to develop significantly distinguished brands and communicate their strengths

[1] University of Finance – Marketing, Email: duchung@ufm.edu.vn.

in the context of increasingly fiece competition (Jevons, 2006). Pinar et al. (2011) suggested that brands can be designed to deliver greater customer value by building a brand ecosystem that focused on students' experience. USR activities could promote the university's brand image and reputation and develop strong brands (Tan et al., 2022). However, literature revealed research on the USR and university brand equity has been conducted in the developed countries whilst there is limitation of research in emerging economies. Few studies have attempted to understand USR in developing nations (e.g. Mehta, 2011; Gomez, 2014, Plungpongpan et al., 2016; Latif, 2017; Latif et al., 2022). Despite the relatively limited number of studies in university brand equity, it is important to understand in what ways the students' perceptions enrich the brand equity of a university (Pinar et al., 2020). However, up to date, literature review shows that only a few studies have examined effects of USR on student-related outcomes, like student satisfaction and loyalty (Sánchez-Hernández & Mainardes, 2016); brand image (Plungpongpan et al., 2016). Therefore, there is a crucial need for further research that examines the relationship between university social responsibility and student related outcomes to identify the constructs that are vital to students (Elliott and Shin, 2002). Besides, previous research on USR, student loyalty and satisfaction call for from different cultural backgrounds (Vazquez et al., 2014, Sanchez-Hernandez and Mainardes, 2016). Moreover, there are not much study that look into CSR and dimesions of university brand equity (Tan et al., 2022). Thus, the importance of university brand equity dimensions and USR practices from students' perspective were investigated in this study to fill this gap. As a results, this research on USR focused on its linkage with multi-dimesions of university brand equity based on students in the context of private university sector in an Asian emerging market. The private universities is an education sector operates mainly on a profitable business model that expanding their competition and the commercialization of education in Vietnam. In Vietnam, there were 242 universities in 2020 with 176 public universities and 66 private universities. Private universities have played an important role in training high-quality human resource, make significant contributions to the development of local education and training.

2. LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

2.1. S-O-R Model

Mehrabian and Russell (1974) developed the S-O-R theory (stimulus-organism-response theory) that stated that environmental factors (stimuli) can promote an individuals' self-assessment state (organism), and then influences behaviors of an individual (response). The organism is considered to be an internal process which plays an intervening role in the relationship between the stimulus and the response emitted by an individual (Mehrabian and Russell, 1974). The S-O-R model may provides an explanatory perspective on behavioral outcomes regarded to corporate social responsibility (Wu et al., 2022). The S-O-R model is useful for supporting an integrative model in this study. As a result, this research aims to examine the relationship among stimuli (S) (university social responsibility practices) lead toward the cognitive state of organism (O) (USR perception) and response (R) (student-based university brand equity).

2.2. University social responsibility

The term University social responsibility (USR) is derived from the concept of CSR. Carroll (1979) posits that CSR has four dimensions: economic, legal, ethical, and philanthropic responsibilities. According to Vasilescu et al. (2010), the concept of USR relates to ethics and the approach the university takes in its interactions with broader society. It implies a movement of the university towards consideration of social and environmental concerns and the promotion of a general civic mindedness and concern for environmental sustainability. The USR movement has led to the creation of social responsibility offices in universities that support the development of partnerships with government, civil society and the private sector. The social responsibility literature provides an analysis of the nature of current higher education institutions partnerships, however, and the capacity for social responsibility in an socio-political context, which favours a market-based orientation to curriculum and program development.

2.3. Brand equity and university brand equity

Brand equity is the positive differential effect that knowing the brand name has on consumer responses to the product or service (Keller, 1993). Aaker (1991) defines brand equity as, "a set of assets and liabilities linked to a brand, its name, and symbol, which add or subtract from the value provided by a product or service to a firm and/or that firm's customers" (p. 15). Prior studies have operationalized brand equity dimensions using multiple constructs. While various consumer-based brand equity (CBBE) dimensions have been identified in the literature, the four dimensions of CBBE proposed by Aaker (1991) were widely accepted, they are brand associations, brand awareness, perceived quality and brand loyalty that are important from the customer perspective. Recent studies investigated various issues related to university branding that have deepened the understanding of brand in the context of higher education (Pina et al., 2020). A strong university brand equity means that students and other stakeholders have high brand awareness, a favorable brand image, perceive that the brand is of high quality, and are loyal to the brand (Heer, 2020). Tran Viet Dung (2019) also proposed Aeker's four components (1991) including brand awareness, brand associations, perceived quality and brand loyalty in order to manage brand equity for higher institutions in Vietnam. Nguyen Van Thanh Truong (2021) identifies that perceived quality and reputation effect on university brand equity. Based on different contexts and approaches, it shows that research in university brand equity still lacks the consistency of dimensions; consumer-based brand equity has been measured with multiple constructs, therefore, this study measures the concept of university brand equity described by multiple constructs some of which include brand awareness, brand trust, brand associations, brand reputation, perceived quality, and brand loyalty.

2.4. Hypotheses Development

2.4.1. University social responsibility and university brand awareness

Brand awareness is considered as an important dimension of brand equity and defined as the ability of a potential buyer to recognize or recall that a brand forms part of a certain product category under different conditions (Aaker, 1991). As a result of S-O-R model, CSR has the potential to be beneficial for developing positive brand awareness as well as building strong image among consumers. Universities create brand awareness, especially recognition by increasing the familiarity of the brand through visible promotional tools used to ensure repeat exposure to students. Thus, the more potential students see, hear it, or think about the brand, the more likely the brand will be registered in the mind. Thus the study proposed the following hypothesis:

H1: University social responsilbility positively influences students' university brand awareness.

2.4.2. University social responsibility and university brand trust

Organizations that actively engage in CSR activities can develop trust towards the organization from stakeholders (Chang, 2015). According to Rojas-Méndez et al. (2009) students' trust can be understood as students' confidence in the integrity and reliability of the university. The trust can help in building long and enduring relationships (Abdelmaaboud et al., 2021). USR can be utilized to increase community perceptions of legitimacy, value, and trust, and universities must recognize that they have a responsibility to return to society (Latif, 2017). This leads to an improved level of trust in the HEI, as students carry a perception of fairness, accountability, and responsibility. Hence, this study proposes that:

H2: University social responsibility positively influences on university brand trust.

2.4.3. University social responsibility and brand reputation

CSR should be one of a university's main duties, contributing to community sustainability while improving the organization's image (Dima et al., 2013). Parsons (2014) claimed that USR is one of the strategies approved by the management to supervise the university and to improve its reputation. The strong implementation of CSR activities could positively contributes to the university brand reputation (Plungpongpan et al., 2016; El-Kassar et al., 2019). Khoi (2021) found that universities' reputation was influenced by their social contributions. Tan et al. (2022) showed that the influence of CSR on brand reputation is positive and extremely robust for both public and private colleges in Malaysia. Hence, it is proposed that:

H3: There is a significantly positive impact of USR on the university's brand reputation.

2.4.4. Corporate social responsibility and Perceived Quality

Previous studies found that CSR activities have significant and positive influences on customer perceived value in services sector (Latif et al., 2020). Results support Vázquez et al. (2014) notion that focusing on the USR can improve service quality and student satisfaction. Santos et al. (2020) found a significant impact of USR on service quality in universities USR has been identified as the 'university's commitment to recognizing the interests of society and performing in a way that improves the well-being of its members through the provision of educational quality (Latif, 2017; Latif et al., 2022).. Hence, it is proposed that:

H4: There is a significantly positive impact of USR on perceived quality.

2.4.5. University social responsibilities and brand loyalty

Aaker (1991) defines brand loyalty as the attachment that a customer has to a brand. CSR may be used as a method to boost consumer's brand loyalty (Pirsch et al., 2007). The findings of previous studies shows that CSR was found to be strongly significant effect on customer loyalty (Mandhachitara and Poolthong, 2011; Zhao et al., 2021). El-Kassar et al., 2019) show that USR has a significant impact on student-university student loyalty. Tan et al. (2022) confirmed that CSR has a positive and strong direct effect on brand loyalty in private universities. Therefore, the following hypothesis can be proposed:

H5: There is a significantly positive impact of USR on brand loyalty

3. METHODOLOGY

The quantitative methodology is adopted in this study. The final quantitative data was collected from 167 students studying in two private universities in Ho Chi Minh city using paper-based survey questionnaires. The convenient sampling method was employed, and respondents were voluntary for their participation. The sample size (n = 167) is considered small compared to the study population, therefore we used partial least squares-structural equation modeling (PLS SEM) to analyze the measurement and structural models. A number of previous studies support that PLS-SEM has advantages at small sample sizes (Chin 1998; Hair et al., 2017). The PLS-SEM offers the significant benefit of using small data to validate models when the sample size is smaller than the indicators used in the measurement model (Jhantasana, 2023).

All constructs and items were developed based on previous studies to design questionaire. Seven items of USR scale were extracted from Latif et al. (2022) and Tan et al. (2022). Items measuring Brand awareness were generated from the study of Pinar et al. (2020). Brand reputation scale was extracted from the study of Latif et al. (2022) with 4 items. Measurements of Perceived Quality (5 items) and Brand trust (5 items) were withdrawn from Latif et al. (2022); Brand loyalty (4 items) from Tan et al. (2022).

The questionnaire was design and divided into two sections: One section measured the demographic characteristics of the participants, and section two measured the respondents' perception of the constructs in the model. Respondents were asked to rate each item according to a 5-point Likert scale, with anchors ranging from 1 (strongly disagree) to 5 (strongly agree). Out of 167 respondents, 658.7% were female, 41.3% were male; 78.4% were from economics and business management majors; 21.6% were others.

Table 1: Constructs and items

Constructs	Code	Items	Resources
University Social Responsibility	USR1	My university treats employees very well.	Latif et al. (2022); Tan et al. (2022)
	USR2	My university helps civil society organizations in the community	
	USR3	My university is committed to ecological issues.	
	USR4	My university respects the legal regulations.	
	USR5	My university behaves honestly with their students.	
	USR6	My university has many supporting policies for students if they are in difficulty	
	USR7	My university encourages students to participates in voluntary charitable activities.	
Brand Awareness	BAW1	The university is well-known	Pinar et al. (2020)
	BAW2	The university's brand name is instantly recognizable	
	BAW3	The university is among the first to come to mind when one thinks of all universities in the country	
Brand Reputation	REPU1	My university has a good image	Latif et al. (2022)
	REPU2	My university has a professional image	
	REPU3	My university 's program run by the university is reputable	
	REPU4	My university graduates are employable	
Perceived Quality	QUAL1	I am satisfied with the quality of academic staff at my university	Latif et al. (2022)
	QUAL2	I have access to latest infrastructure at my university	
	QUAL3	I am satisfied with the teaching on offer at my university	
	QUAL4	Tương xứng với chi phí bỏ ra	
	QUAL5	The quality of examinations/tests conducted at the university	

Brand Trust	TRUST1	I am sure that the university staff were always acting in my best interest	Latif et al. (2022)
	TRUST2	Integrity is a word I'd use when describing the university staff	
	TRUST3	I have great confidence in the faculty members	
	TRUST4	University staff always kept their promises to me	
	TRUST5	I can trust my university	
Brand Loyalty	LOY1	I say positive things about my university to other people.	Tan et al. (2022)
	LOY2	I recommend my university to others.	
	LOY3	I encourage friends and relatives for education in my university	
	LOY4	I consider my university as my first choice for post-education programs	

4. RESULTS AND DISCUSSIONS

4.1. Measurement Model Analysis

Composite reliability: Cronbach's alpha and composite reliability scores were used to examine the internal consistency and reliability. The construct is considered reliable when the Cronbach's alpha score and composite reliability score are above the recommended cut-off of 0.7 (Hair et al., 2017). As shown in table 2, composite reliability scores and Cronbach's alpha values of all latent constructs were found to meet the threshold criterion. Hence, the reliability of the measurement model was satisfactory.

Convergent and discriminant validity: All constructs were also tested for convergent and discriminant validity. Convergent validity is supported if average variance extracted (AVE) estimates for each underlying construct exceed 0.50 (Hair et al., 2017). While discriminant validity is established when shared variance between any two constructs is less than the square root of the AVE by the items measuring the construct (Fornell and Larcker, 1981). As displayed in table 2, convergent validity was supported by the AVE scores of all the latent constructs, which were ranging from 0.662 to 0.775 and well above the required minimum level of 0.50. The outer loadings (table 3) were examined to evaluate the correlations between the latent variables and the reflective indicators in the outer model. As shown in Table 3, all the outer loading scores were above 0.6, demonstrating convergent validity of latent constructs was confirmed (Hair et al., 2017). The results indicate that the square roots of the AVE for each construct (table 4) was higher than the corresponding inter-construct correlations, this shows that all constructs in the outer model attained discriminant validity.

Table 2: Reliability and Convergent Validity Testing

Constructs	Cronbach's Alpha	rho_A	Composite Reliability	AVE
Brand Awareness	0.855	0.868	0.911	0.774
Brand Loyalty	0.879	0.884	0.916	0.733
Brand Reputation	0.921	0.926	0.944	0.809
Perceived Quality	0.882	0.930	0.917	0.734
Brand Trust	0.893	0.907	0.922	0.703
USR	0.927	0.928	0.941	0.696

Note: AVE: Average Variance Extracted

Brand Trust	0.351	0.654	0.409	0.430	0.838	
USR	0.296	0.624	0.647	0.404	0.551	0.835

Note: Square roots of AVEs are exhibited on the diagonal (bold). Construct correlations are shown below the diagonal.

4.2. Hypotheses Testing Analysis

Results of structural model analysis (table 6) in this study supported 5 proposed hypotheses. Hypothesis 1 indicates that among the endogenous variables, USR factor has the smallest impact on brand awareness (β = 0.296, p value = 0.000). This supports the S-O-R model. This result explains that when a university practices social responsibility activities, it will increase the level of brand awareness with stakeholders. However, because the data was surveyed on students from universities therefore most students already knew clearly about their university. As a result, the impact level of USR to brand awareness is not very significant.

The results also support hypothesis 2 that confims the positive relationship between USR and brand trust (β = 0.551, p value = 0.000). Thus, the results are consistent with previous findings (e.g Latif, 2017; Chang, 2015) that considers the students as the important stakeholders in university and socially responsible engagement help organizations gain their stakeholders' trust. This research confirms the impact of students' perceptions of university social responsibility activities on their trust toward their schools.

The analysis result also demonstrates H3 is supported (β = 0.647, p value = 0.000), this confirms USR strongly and positively influences university brand reputation. This provides evidence that increasing the intensity of social responsibily may improve university brand reputation. This result also supports the findings Plungpongpan et al., 2016; El-Kassar et al., 2019; Khoi, 2021; and Tan et al. (2022). This finding indicates that practicing USR in higher education can work as a tool to strengthen the university's reputation.

H4 and H5 are also supported, this result shows there are positive affects of USR on both perceived quality (β = 0.404, p value = 0.000) and brand loyalty (β = 0.624, p value = 0.000). H4 is acceptable, this finding is consistent with the results from Vázquez et al. (2014), Su và Swanson (2017) who confirmed that focusing on the USR can improve perceived service quality from stakeholder, enrich the findings of advantages of CSR activities in customer perceived value (e.g. Arslanagic-Kalajdzic and Zabkar, 2017; Green and Peloza, 2011; Su et al., 2017; Su & Swanson, 2017; Servera-Francés and Piqueras-Tomás, 2019). The result also supports that focusing on the USR can improve students' perceived quality according to Vázquez et al. (2014); Yuen et al. (2018); and Santos et al. (2020). Additionaly, H5 is accepted in this work, the study confirms the positive relationship between university social responsibilities and brand loyalty. This result supports the findings of previous studies (e.g. Fatma et al., 2016; He and Li, 2011; Lin and Chung, 2019; Nyadzayo and Khajehzadeh, 2016; El-Kassar et al., 2019; Chen et al., 2015; Gürlek et al., 2017; Mandhachitara and Poolthong, 2011; Tan, 2022). The result illustrates USR was found to be strongly effect on university loyalty.

Table 5. Testing hypotheses Results

Paths	Original Sample (O)	Sample Mean (M)	T Statistics (|O/STDEV|)	P Values	Conclusions
USR -> Brand Awareness	0.296	0.304	3.772	0.000	Supported
USR -> Brand Trust	0.551	0.547	8.876	0.000	Supported
USR -> Brand Reputation	0.647	0.648	13.890	0.000	Supported
USR -> Perceived Quality	0.404	0.409	5.775	0.000	Supported
USR -> Brand Loyalty	0.624	0.624	11.999	0.000	Supported

Effect Size and Predictive Power Evaluation: The R^2 values for constructs as follows: Brand Awareness (0.088); Brand Loyalty (0.390); Brand Reputation (0.419); Perceived Quality (0.164) and Brand Trust (0.303). Cohen (1988) and Chin (1998) suggest that R^2 values of 0.67, 0.33, and

0.19 are substantial, moderate, and weak respectively. These values of R^2 values are considered high and acceptable (Hair et al., 2017). Besides, the effect size is calculated to examine the explained variance (R^2) of the endogenous constructs. According to Cohen (1988), f^2 value of 0.35, 0.15, and 0.02 are considered large, medium, and small respectively. As shown in Table 5, the f^2 values show that of CSR significantly effects on Brand Loyalty, Brand Reputation and Brand Trust (0.435 – 0.720) whereas the effect of USRs on Perceived Quality and Brand Awareness are considered as medium (f^2 = 0.196) and small (f^2 = 0.096).

Table 6: R^2 and f^2 coefficients

Constructs	R Square	R Square Adjusted	f^2
Brand Awareness	0.088	0.082	0.096
Brand Loyalty	0.390	0.386	0.639
Brand Reputation	0.419	0.415	0.720
Perceived Quality	0.164	0.159	0.196
Brand Trust	0.303	0.299	0.435

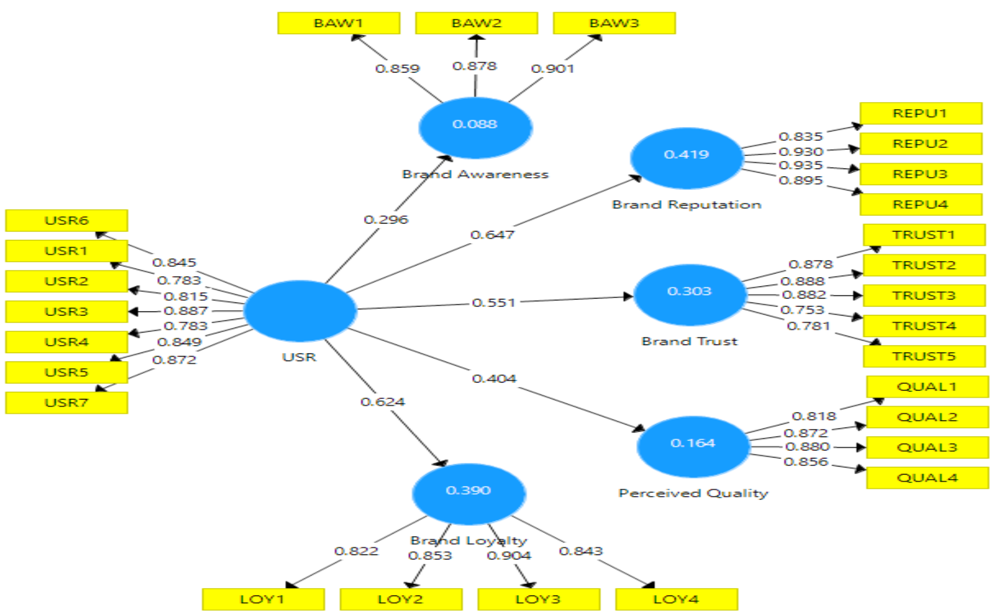

Figure 1: Path Model Result

5. CONCLUSION AND POLICY IMPLICATIONS

The purpose of this study was to investigate the impacts of USR on dimensions of brand equity includings brand awareness, brand reputation, brand trust, perceived quality, brand loyalty in the context of private higher education. The results could confirm that CSR initiatives in private universities help enhance brand equity with five components. The results highlight the importance of USR in improving brand equity private universities. This study make a contribution to the literature on effects of USR and student-based university brand equity, especially brand reputation, trust and loyalty. Therefore, for private universities, the implementation of USR is very critical, directly affecting brand loyalty that leads to an increasing number of students in the future.

The findings of this study proposed private university to develop successful branding strategies by focusing on the implemence and communication of their USR practices in brand management. Private universities should focus on the implementation of CSR as a key factor to improve university's loyalty, reputation and trust. Activities demonstrating the university's social responsibility should focus on aspects such as communication about good treatment of university staff, developing activities to support students both financial and non-financial policies. Private higher education institutions should also propagate volunteer activities for the local community and encourage students to participate in social activities. In particular, private universities also need to honestly disclose student-related issues. Moreover, private universities should consider USR as a quality standard and be presented in their mission statement and commitment.

6. LIMITATIONS AND FUTURE RESEARCH DIRECTION

This study has several limitations. First, data was only collected from student of private universities in Ho Chi Minh city. It is also proposed that more research shouls increase the sample size and the number of institutions in order to improve generalisability. Future studies may also compare the impact of USR on the brand equity between public and private universities in Vietnam. In addition, this study only considers the direct impact of university social responsibility on brand equity dimesions. Further works could examine the role of mediating variables in this relationship as well as examine the impact of social responsibility on other student-related outcome variables.

FACTORS AFFECTING DIGITAL TRANSFORMATION IN GARMENT ENTERPRISES: AN EMPIRICAL RESEARCH IN PHU THO PROVINCE

PhD. Vo Thy Trang[1], MA. Nguyen Thi Duyen[2],
MA. Nguyen Hong Nhung[2], MA. Tran Thi Nhu Quynh[2]

Abstract: *In the context of the 4.0 industrial revolution taking place globally, the digital transformation process is considered a revolution that changes operating and business models. In Vietnam, garment industry is one of the areas that needs to be prioritized in the Prime Minister's National Transformation. This study delves into the factors influencing digital transformation in garment enterprises situated in Phu Tho province. A quantitative research approach was employed, with an online survey encompassing 400 questionnaires distributed among garment businesses in the region. The study encompasses various analytical techniques, including descriptive statistics, Cronbach's Alpha, Exploratory Factor Analysis (EFA), multivariate regression models, and hypothesis testing through SPSS software. The findings reveal that six key factors, namely leadership, digital business strategy, employee capabilities, technology infrastructure, organizational culture, and external market pressures, exert significant influence on digital transformation in these enterprises. Consequently, the research offers pragmatic solutions aimed at catalyzing digital transformation endeavors within the garment sector of Phu Tho province, thereby aligning with the government's overarching digital transformation objectives.*

Keywords: *Digital transformation, garment enterprises, digital transformation service.*

1. INTRODUCTION

In the digital age, digital transformation is an imperative because it bestows a multitude of benefits upon individuals and has a profound impact on various facets of society, particularly in the realm of business development. As posited by Berman (2012), digital transformation paves the way for the emergence of innovative business models. Broadly defined, digital transformation, as articulated by Baker (2014), encompasses a sweeping spectrum of changes that revolve around the widespread adoption of digital technology across all aspects of human society. It represents a comprehensive process that transcends mere digitalization, operating at a higher echelon. Digital transformation describes enormous transformations at the scale of businesses or even markets and societies (Khan, 2017). According to Matzler et al (2016), digital transformation is the combined use of technologies such as cloud technology, sensors, big data, etc. to create new products, services and business models. (Matzler, 2016). According to Brennen and Kreiss (2016), digital transformation is the process of using digital technology to restructure the economy, institutions and society. The foundation of digital transformation is information technology, data digitization and digital transformation. Information technology constitutes the primary means, primarily involving computers, through which data is digitized and manipulated. Data digitization is the process of converting information from physical or analog forms into digital formats and serves as a stepping stone towards the digitization of processes. Process digitization involves utilizing data that has been converted into digital formats to enhance operational procedures. The data or information that undergoes digitization serves as the raw material for process digitization. For digital transformation to occur, process digitization is a prerequisite. From data digitization to process

1 Academy of Finance, Vothytrang@hvtc.edu.vn.
2 Academy of Finance.

digitization, and from process digitization to digital transformation, these are considered as the successive stages in the completion of a comprehensive digital journey. Without data digitization, there can be no process digitization, and without process digitization, digital transformation cannot take place. Process digitization is an essential constituent of the digital transformation process (Bremen, 2016). According to Matzler and colleagues (2016), organizations may need to undergo significant data and process digitization to achieve successful digital transformation (Matzler, 2016). Digital transformation occurs at both micro and macro levels. At the micro-level, it unfolds within each organization, even within its various departments. Digital transformation allows businesses to gain customers, employees, and investors. It also generates new opportunities and value for enterprises. At the macro level, digital transformation takes place across industries, multiple sectors, and even entire nations. Macro-level digital transformation involves the creation of smart cities and digital governments. Vietnam is embarking on the Industry 4.0 revolution with rapid developments in e-commerce and digital governance, etc. Over the past two decades, information technology and communication infrastructure have experienced rapid growth. The Vietnamese government has recognized the importance of establishing a digital government and digital businesses. Consequently, the government has implemented a digital transformation program until 2020, with a vision extending to 2030.

Phu Tho, a province situated in the Northern Midlands and Mountainous region of North Vietnam, is now considered a strategically significant area, particularly in terms of its economic and socio-cultural contributions, national defense, security, and foreign relations. Throughout this development journey, businesses in general, and the textile and garment industry in particular, have played a vital role, serving as the core driving force of the local economy.

In reality, many garment enterprises in Vietnam, both in general and in Phu Tho province in particular, have not fully grasped the concept of digital transformation. As a result, they tend to be relatively passive and carry out digital transformation reluctantly. Many enterprises, including garment businesses, even exhibit a tendency to avoid undergoing digital transformation altogether. The consequence of this is that numerous enterprises have experienced declining sales and are falling behind global trends.

2. LITERATURE REVIEW

Digital Transformation

Stolterman and Fors (2004) suggest that digital transformation revolves around leveraging technology to fundamentally enhance the efficiency and scope of operations within an enterprise (Stolterman, 2004). According to McDonald and Rowsell (2012), digital transformation goes beyond the mere digitization of resources; it also involves generating business value through digital assets (McDonald, 2012). In alignment with this viewpoint, Fitzgerald and his associates (2013) define digital transformation within businesses as the application of novel technological means, such as social media platforms, advanced analytics, or automated connectivity systems, to bring about significant changes in business operations. These changes encompass enhancing customer experiences, streamlining operations, and establishing new business models (Fitzgerald, 2013). Hess and colleagues (2016) propose that digital transformation pertains to the modifications that digital technology can introduce to a business model, leading to alterations in products, organizational structures, or the automation of business processes (Hess, 2016).

Swen & Reinhard (2020) contend that digital transformation entails the integration of digital technology into business operations to fundamentally alter how business models function and provide new value to customers. It encompasses changes in processes, procedures, digital-based management culture, and efficient business objectives. Digital transformation serves as a foundational solution that helps businesses enhance their competitive capabilities, increase labor productivity, foster sustainable growth, and integrate into the global economy. This can be understood as the utilization of digital technology to create or modify existing business processes, cultures, and customer experiences to meet the evolving demands of the market and the enterprise.

Factors Affecting Digital Transformation

Leadership: Leadership is a crucial factor in shaping the digital transformation process. The initial phase's outcome is whether the business is committed to a digital transformation plan or not. Swen and Reinhard acknowledge that leadership capabilities and organizational culture are essential in executing digital transformation. Managerial factors, such as age, management experience, and a realistic understanding of digital transformation, influence the increased adoption of digital transformation services. Bader and colleagues have demonstrated that a business's capabilities are most evaluated through the manager's strategy in controlling inventory, transporting raw materials and goods, managing the order placement process, and digital transformation. This transformation is considered a revolution that enables businesses to carry out these activities based on new technology platforms (Sia, 2016).

Digital Business Strategy: Bharadwaj (2000) posits that information technology plays a vital role in business operations. It not only supports management activities but also evolves into a crucial element in crafting an enterprise's strategy. The development and implementation of a business strategy aimed at achieving long-term objectives on a digital technology foundation are referred to as a digital business strategy (Bharadwaj, 2000).

Employee Capabilities: Digital transformation involves a shift in human perception within a digital environment. Reis et al have pointed out that factors such as organizational aspects, technology, IT skills, and gender significantly influence the digitization of backend operations and, consequently, have a substantial impact on digital transformation (Reis, J., 2018). Kane et al have demonstrated that when employees are confident and proactive, capable of making decisions and completing tasks independently, they tend to be more innovative in achieving service efficiency. The value of trust positively influences employee technology adoption behaviors. The appropriate skills and capabilities of employees are paramount in the transformation process. With the right expertise, employees can plan and execute processes smoothly and efficiently, leading to a readiness to change operational methods and adopt new technologies (Kane, G.C., 2018).

Corporate Culture: Digital transformation requires a corporate culture that values verification and data sharing (Dremel, 2017). This demands a high level of transparency in work and business processes, as well as a mindset of data sharing among employees. Additionally, digital transformation may create a clash of cultures between younger, tech-savvy employees and older, experienced employees in traditional business who may lag behind in technology (Kohli, 2011).

Technology Infrastructure: Osmundsen et al argue that information technology and communication infrastructure are crucial for backend operations in efficiently supporting information access and services. Logistics infrastructure includes physical infrastructure like transportation systems and organizational infrastructure such as human resources, policy frameworks, rules, and procedures. To achieve development, effective management, and efficient operation of infrastructure systems, businesses must implement software solutions on their information technology infrastructure. This enables them to streamline operations and optimize performance while ensuring effective management of their infrastructure (Osmundsen, K., 2019). Information technology infrastructure serves as the prerequisite and foundation for driving digital transformation and economic development. Additionally, compared to traditional transportation forms, digital transformation requires the application of multiple technologies, data storage, and analysis, leading to the need for ensuring security and data safety for the system. Currently, digital technology has become the foundation for recent innovations worldwide, with emerging technologies such as AI, cloud computing, IoT, big data, and robotics rapidly breaking down digital barriers, serving as pillars for driving digital transformation (AlNuaimi, B.K., 2022).

Business Pressure: Faced with the competitive pressures of better meeting customer demands, prolonged pandemic situations, new government regulations, businesses are increasingly recognizing the full spectrum of challenges they are confronting. This compels businesses to improve and optimize their management, implementation processes, and resource utilization (Putthiwat, S., 2021).

3. METHODOLOGY

This study was designed using quantitative analysis methods while also considering qualitative information as supportive and deemed appropriate for the research objectives. Firstly, data collection was conducted through questionnaires, and then the data were tabulated using descriptive and inferential statistical analysis techniques. The target population of this study comprises all textile and garment enterprises in Phu Tho province. The sampling method employed convenience sampling. The total sample size consisted of 400 employees from 15 textile and garment enterprises in Phu Tho province.

Data were collected through direct interviews with employees from 15 textile and garment enterprises in Phu Tho province, based on pre-prepared questionnaires. Responses to the questionnaires were prepared in the form of Likert scale ranging from 1 to 5. To analyze the data, achieve the research objectives, and test the proposed hypotheses, the collected data will be processed as required for the analysis.

The results of this study will discuss each latent variable before they are combined into a regression model among variables. The discussion begins with the conduct of a measurement model through the Exploratory Factor Analysis (EFA) of independent variables and continues with dependent variables. After analyzing that each index can be used to determine the appropriateness of the regression model, the regression model evaluation stage is carried out to determine the accuracy of the research model through R-Square (R2).

4. RESEARH RESULTS

A total of 400 questionnaires were distributed, and 389 questionnaires were returned (97.25%). Among the returned questionnaires, 356 were deemed eligible for analysis. The demographic profiles of the respondents are summarized in Table 1. The majority of the respondents were under the age of 35 (over 63%). Respondents had low educational qualifications, with nearly 2/3 having completed high school. More than three-quarters of those surveyed had at least 4 years of work experience.

Table 1. Research sample statistics

Demographic variable	Categorize	Quantitative	Percentage (%)
Sex	Male	103	28,93
	Female	253	71,07
Age	Under 25	33	9,27
	25 - 30	88	24,72
	30 - 35	105	29,49
	35 - 40	43	12,08
	Upper 40	87	24,44
Job Position	Managers	40	11,24
	Office staff	65	18,26
	Production staff	251	70,51
Education level	High school	230	64,61
	Intermediate level	30	8,43
	College, University	85	23,88
	Master	11	3,09
Experience	1 - 4 years	32	8,99
	4 - 10 years	137	38,48
	Above 10 years	187	52,53

Source: Summary of the author's survey results

Since the research used the Likert scale to assess employees' opinions on factors influencing digital transformation capability in garment enterprises in Phu Tho province, it is essential to test the reliability of the scale.

Table 2 demonstrates the reliability test of the variables using Cronbach's α coefficient, and it is observed that the values for all variables are higher than 0.7. Therefore, the responses from the participants are considered reliable. Due to the high reliability obtained, seven variables can be used for further statistical tests.

Table 2. Cronabch' Alpha

Biến	Cronbach's Alpha
Leadership	0.838
Digital Business Strategy	0.867
Employee Capabilities	0.856
Corporate Culture	0.873
Technology Infrastructure	0.850
Business Pressure	0.809
Digiatal transformation	0.805

Source: Analysis results from SPSS

Using Cronbach's α coefficient to test the reliability of the digital transformation variable in the research reveals that the value of this variable is also higher than 0.7. Therefore, respondents' answers are considered reliable. Hence, all variables were analyzed (Table 2).

Furthermore, Table 3 presented the results of the suitability test using the KMO and Bartlett's test. With a KMO coefficient of 0.836, which satisfies the condition of 0.5 < KMO < 1, factor analysis is appropriate for the actual survey data of the study. The significance value of Bartlett's test = 0.000 < 0.05 indicates that the observed variables have a linear correlation with the latent factors.

Table 3. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.836
Bartlett's Test of Sphericity	Approx. Chi-Square	6043.822
	Df	465
	Sig.	.000

Source: Analysis results from SPSS

The results from the Rotated Component Matrix reveal that there are 6 factors extracted from the model, and the variable NL2 has the lowest factor loading of 0.237 (Factor 2) < 0.5. However, this variable has a factor loading of 0.691 on Factor 3, which is greater than 0.5, so variable NL2 is not excluded from the model. Variable VH4 has the second lowest factor loading of 0.391 < 0.5, and therefore, this variable is removed from the model. Thus, through the Cronbach's Alpha test and EFA, 6 factors are extracted with 29 observed variables having factor loadings above 0.5, and the scale has discriminant validity. Additionally, there is no cross-loading between factors, meaning that questions related to one factor do not overlap with questions related to another factor. Therefore, after factor analysis, these independent factors are retained, unaffected by any other factors. Specifically, the factors are as follows:

- The "Leadership" factor (LD) consists of 5 items including LD1, LD2, LD4, LD5, and LD6.
- The "Digital Business Strategy" factor (CL) comprises 5 items ranging from CL1 to CL5.
- The "Corporate Culture" factor (VH) consists of 4 items: VH1, VH2, VH3, and VH5.
- The "Technology Infrastructure" factor (NT) includes 5 items from NT1 to NT5.
- The "Business Pressure" factor (AL) consists of 5 items from AL1 to AL5.
- The "Employee Capabilities" factor (NL) comprises 5 items, namely NL1, NL2, NL3, NL4, and NL5.

Before estimating the impact of the factors on the digital transformation of the garment enterprises in Phu Tho province, Vietnam, the study conducted multicollinearity tests among the independent variables through the Pearson correlation coefficient matrix. The results showed that all correlation coefficients were less than 0.7, indicating no evidence of strong correlations among the independent variables. These independent variables are exogenous and suitable for use in the subsequent regression analysis.

The model was then deployed to assess the effects of the factors on the digital transformation capability of the textile enterprises in Phu Tho province, Vietnam. The results revealed that the adjusted R-squared was 0.827, indicating that the independent variables explained 82.7% of the variation in digital transformation within these garment enterprises.

Table 4. ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	71,899	7	10,556	201,676	0,000[b]
	Residual	16,001	290	0,051		
	Total	87,930	298			
a. Dependent Variable: CD						
b. Predictors: (Constant), LD,CL,NL,VH,NT,AL						

The results in Table 4 showed that Sig.= 0.000 < 0.05, so using the regression function for analysis is appropriate.

The results of assessing the impact of factors on the digital transformation ability of garment enterprises in Phu Tho province are presented in Table 5.

Table 5. Regression Model

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.298	.127		.552	.581		
	LD	.177	.032	.230	5.533	.000	.766	1.306
	CL	.286	.043	.273	6.674	.000	.789	1.267
	NL	.272	.026	.253	6.548	.000	.883	1.133
	VH	.160	.039	.165	4.119	.001	.820	1.220
	NT	.225	.035	.247	6.429	.003	.897	1.115
	AL	.117	0,027	0,019	0,636	.002	.621	1.611

Source: Analysis results from SPSS

The aim of this article is to exam the level of influence of the factors on the digital transformation of garment enterprises in Phu Tho province. The sample used in this study was drawn from 356 employees across 15 garment enterprises in Phu Tho province. Based on the research findings, the article offers some observations on the impacts of the factors as follows:

The factor that has the strongest impact on digital transformation in textile enterprises in Phu Tho province is "Digital Business Strategy (CL)", with an estimated coefficient of 0.286, sig < 0.05. The estimated coefficient for this factor is positive, indicating a positive relationship between these two variables, which is consistent with previous research. Therefore, the estimation results imply that if textile enterprises in Phu Tho province pay more attention to their digital business strategy, their chances of successful digital transformation increase. The second most influential factor is "Employee Capability (NL)", with an estimated coefficient of 0.272, sig < 0.05. The third is the impact of "Technology Infrastructure (NT)", with an estimated coefficient of 0.225, p < 0.05. The fourth factor is "Leadership (LD)", with an estimated coefficient of 0.177, sig < 0.05. Leadership is an important factor shaping the digital transformation process. A positive coefficient for this factor indicates that businesses with a higher level of digital transformation awareness among their leadership tend to accelerate their digital transformation. Ranked fifth is the "Corporate Culture (VH)" factor, with an estimated coefficient of [insert value], sig < 0.05. The positive coefficient for this factor shows a positive relationship between these two variables, supporting the perspective of previous studies. Therefore, the positive correlation implies that companies with a modern corporate culture tend to undergo digital transformation more rapidly. Finally, the factor with the least impact, with an estimated coefficient of 0.117, sig < 0.05, is "Business Pressure (AL)". This factor has a positive relationship with digital transformation at garment enterprises in Phu Tho province. It shows that the greater the pressure for digital transformation, the more it motivates garment enterprises in Phu Tho province to quickly and successfully implement digital transformation.

5. CONCLUSION

Digital transformation is essential and a mandatory requirement for businesses in any sector to survive and thrive in today's context. For garment enterprises in Phu Tho province, there is no significant difference in their digital transformation capabilities regardless of their scale, business field, and ownership type. The experimental research results indicate that the factors influencing digital transformation in garment enterprises in Phu Tho province, in order of importance, are as follows:

Leadership: The findings emphasize the significance of an initial commitment from a business to establish a digital transformation plan. According to Swen and Reinhard (2020), effective leadership and a supportive organizational culture play a pivotal role in the successful implementation of digital transformation initiatives. The management factor, which encompasses elements such as age, managerial experience, and practical knowledge of digital transformation, has a direct influence on the increased utilization of digital transformation services, as noted by Swen (2020). Furthermore, Bader and their colleagues (2022) demonstrated that a business's capability can be primarily gauged by the strategies employed by its managers in the management of raw materials, production processes, and digital transformation. This revolution allows businesses to conduct their operations on novel technology platforms, as discussed by AlNuaimi (2022).

Digital Business Strategy significantly influences a company's digital transformation capability. This suggests that business leaders need to study and proactively learn to develop an appropriate digital transformation strategy for their businesses.

Employee capabilities also play a crucial role in successful digital transformation. Labor quality in textile enterprises in Phu Tho, both specifically and provincially, remains relatively low. The labor force has not undergone training, and more than 70% lack technical expertise. This is a significant obstacle to the digital transformation process for businesses in Phu Tho. During the digital transformation process, automation systems will gradually replace manual processes. Consequently, some labor will be reduced immediately, but at the same time, labor quality must be improved to meet the demands of more complex tasks. Workers need technical skills as well as a combination of digital literacy, social communication, and soft skills to enhance their adaptability and flexibility between jobs and tasks. Meanwhile, labor in Phu Tho's garment enterprises is undergoing significant changes and lacks cohesion, making training and developing the workforce to meet the demands of digital transformation challenging.

Corporate culture: The digital transformation capacity of textile enterprises in Phu Tho province is markedly influenced by their corporate culture. Culture encompasses a collection of values, beliefs, attitudes, and behaviors embraced and followed by the members of an organization. An accommodating and adaptable culture, one that welcomes change, plays a pivotal role in facilitating the effective digital transformation of a company. Consequently, it is imperative for textile businesses in Phu Tho province to foster a pliable culture that encourages seamless adaptation to emerging technologies and the capacity to swiftly pivot when the need arises.

Technological infrastructure: Technological infrastructure is one of the key drivers of digital transformation for textile businesses in Phu Tho. The process of transforming the technological infrastructure will not be successful without choosing the right technology. However, even with the right technology, the transformation cannot succeed if businesses do not embrace change. Therefore, selecting appropriate technology is crucial for the success of digital transformation, and businesses must be willing to adapt and change to stay competitive in the market.

Business Pressure: The prolonged impact of the pandemic has brought about significant changes in the operational landscape of businesses, including those in the textile industry in Phu Tho. The imperative of adhering to social distancing, enabling remote work, and implementing medical isolation protocols has compelled companies to intensify their integration of technology, digitalize their data, and enhance the digital competencies of their workforce. Consequently, businesses have made strides in narrowing the gap in their digital transformation capabilities. Hence, the pressure faced by businesses is identified as a key factor influencing the digital transformation capacity of textile enterprises in Phu Tho province. These findings are consistent with research conducted both domestically and internationally, exemplified by studies like Anh et al. (2022) and Ha (2023), etc.

GLOBALIZATION'S IMPACT ON BUSINESS, ENERGY, AND ECONOMY: A SUSTAINABILITY PERSPECTIVE

Assoc.Prof.PhD. Nguyen Thi Viet Nga, Le Nguyen Ha Phuong[1], Giang Ngoc Ha Linh[2], Nguyen Ngoc An[3]

Abstract: Globalization has played a significant role in shaping the world's economic landscape, driving waves of industrialization and transforming energy resources from traditional coal and wood to fossil fuels and eventually to sustainable energy sources. The integration of global markets has led to increased energy consumption, making energy-intensive practices fundamental in the global economy. This research aims to explore how Globalization has influenced business, energy, and economy and to examine its implications for sustainability and the economy of the future. Employing a methodology based on literature review, descriptive qualitative analysis, and data examination, this study applies Hart and Milstein's sustainable value framework to assess potential advancements in the field. The results indicate the urgency to reduce carbon footprint, especially in light of recent circumstances, and emphasize the critical need for more ambitious visions in sustainability. The advent of artificial intelligence has opened up new business opportunities, aligning with the fifth industrial revolution, which holds promising prospects for the economy of the future. In conclusion, Globalization has been a catalyst for innovation and transformative perspectives in business, energy, and economy. However, achieving sustainability on an international scale requires further efforts, particularly in emerging markets, developing countries, and low-income nations, which face challenges in balancing their economies amidst the ongoing impact of Globalization. Emphasizing sustainable strategies in businesses will contribute to the cultivation of enduring business values. Despite advancements in renewable energy, the transition from traditional oil and natural gas remains slow and necessitates continued efforts towards sustainable energy sources.

Keywords: Globalization, energy, economy, business, sustainability.

1. INTRODUCTION

Globalization, a gradual and enduring process, has been intricately intertwined with successive waves of industrialization, shaping the world's societal and economic fabric. This phenomenon has facilitated the transition of human civilization from basic energy resources, such as coal and wood, to fossil fuels, subsequently evolving towards sustainable energy alternatives and eco-conscious business practices. The global energy market's integration, driven by Globalization, has necessitated escalated energy consumption, leading to energy-intensive practices becoming integral to the economy. However, this interplay between Globalization and industrialization has introduced numerous challenges to the global economy, with supply and demand dynamics pivotal to business profitability. In response to mounting environmental concerns, many large corporations have initiated efforts to safeguard the global environment and their own sustainability. Despite such advances, the adverse impacts of industrial activities persist and, paradoxically, products with severe environmental consequences can prove economically more attractive than their greener counterparts. This underscores the urgent need for businesses to adopt sustainable

[1] Academy of Finance, Email: Ngahvtc1980@gmail.com.
[2] Hanoi Financial and Banking University.
[3] Military Commercial Joint Stock Bank

strategies to protect both their profits and the environment. Rising costs and prices, in addition to impacting customer purchasing power, bear environmental ramifications, yet companies may not always be compelled to address environmental waste or compensate for their environmental footprint. The complexities of quantifying such impacts have resulted in unaccounted costs and unmeasured environmental consequences. Consumer preferences for affordable products, coupled with businesses' pursuit of cost-efficient commodities, challenge the protection of profits and the corporate foundation. In light of these intricacies, business sustainability emerges as a compelling solution, addressing the economic, social, and cultural dimensions that Globalization has complicated. Saving money and safeguarding profits become crucial imperatives for clients and businesses to maintain the foundation of the economy. Notably, market forces and companies seeking enduring success, resources, and customer loyalty have shifted their focus towards business sustainability amid Globalization's ever-evolving landscape and challenges, aligning with sustainable objectives and developmental goals. As Globalization continues to exert its influence across social, economic, cultural, and virtual domains, the advent of artificial intelligence (AI) has ushered in both opportunities for enhanced efficiency and apprehensions regarding its impact on the labor market and workforce. The burgeoning AI revolution has demonstrated its capacity to revolutionize various sectors, introducing novel insights and possibilities on the international innovation stage.

In commencing this empirical investigation, we formulated the following research inquiries: "In what ways has Globalization influenced business, energy, and the economy?" and "How has Globalization impacted the world with regards to business sustainability and prospects for the future economy?" The research approach adopted for this study encompasses an extensive literature review, complemented by descriptive qualitative analysis and data examination.

The structure of the study is designed as follows. Section 2 is for the Literature Review. Sections 3 covers Analysis and results. Finally, Section 4 is devoted to the Conclusion.

2. LITERATURE REVIEW

2.1. Business sustainability plays a crucial role for companies and enterprises

The concept of 'business sustainability' has emerged from deliberations on effectively incorporating sustainability principles into enterprises. According to some scholars, business sustainability refers to an organization's approach to attain competitiveness in the market while employing sustainable strategies (Bari et al., 2022).

Business sustainability can be defined as the capacity of an organization to effectively oversee and harmonize economic, social, and environmental aspects, ensuring long-term growth and viability (Sivarajah et al., 2020). The pursuit of sustainability objectives entails aligning business goals with the ever-changing internal and external dynamics, seeking equilibrium through adaptation. Scholars have highlighted that corporate sustainability is intrinsically linked to value creation, prioritizing the exploration of promising opportunities while mitigating corporate risks. To attain corporate sustainability, business practitioners must prioritize accepted practices that are socially and environmentally responsible and acceptable (Vu et al., 2017).

In recent times, an increasing number of businesses have come to recognize the critical importance of achieving long-term business sustainability. This imperative extends not only to their internal operations but also throughout the entirety of their market and supply chain network.

Sustainable business practices, once perceived as expensive inconveniences, are now indispensable for maintaining competitiveness in the market. As the prevalence of businesses claiming to operate sustainably rises, the need arises to discern between those genuinely contributing to sustainable development and those merely making unsubstantiated claims.

The Erb Institute at the University of Michigan delves into two aspects of business sustainability for consideration. The first aspect, Enterprise Integration, centers on businesses responding to market shifts by incorporating sustainability into their existing business considerations, aiming to enhance their competitive positioning. Conversely, the second aspect, Market Transformation, involves businesses actively leading the change within their markets, proactively promoting sustainable practices rather than merely reacting to market incentives.

In conclusion, this paper underscores the significance of sustainability description, theoretical frameworks, and practical sustainability standards, performance, and reporting. It emphasizes the imperative for global companies and their management, policymakers, regulators, investors, educators, and research scholars to adopt sustainability principles as integral aspects of their day-to-day operations and to invest more in research and development to advance sustainable practices(Hoffman,2018).

2.2. Sustainable value framework helps organizations create value

Stuart et al. (2003) contend that sustainability can serve as a catalyst for organizations to drive value creation while simultaneously addressing critical challenges. By examining their concept of sustainable value and applying the sustainable value framework in a business context, we aim to foster sustainable business practices.

The graphical representation utilizes a matrix format, with the vertical axis depicting time, where the present is at the bottom and the future at the top. On the horizontal axis, internal perspectives of organizations are situated on the left, while external perspectives are located on the right.

Hart and Milstein posit that businesses generate and capture value in the four quadrants delineated in Figure 1. From a purely business standpoint, the lower left quadrant emphasizes internal and near-term objectives, such as cost management and risk reduction, leading to value creation. Simultaneously, in the lower right quadrant, external factors are considered, and the focus is on maintaining legitimacy and enhancing reputation with external stakeholders, contributing to value generation. Credibility with stakeholders allows a business to distinguish itself effectively.

	Future		
	Innovation and repositioning	Growth path and Trajectory	
Internal	Share holder Value		External
	Cost and Risk Reduction	Reputation and Legitimacy	
	Present		

Figure 1. Key Dimensions of Shareholder Value

Source: Stuart et al. (2003)

Transitioning to the upper left quadrant, value is created by embracing innovation and repositioning strategies to adapt to changing conditions, ensuring the development of future-oriented products and services. Lastly, the upper right quadrant addresses external dimensions and future performance, where the pursuit of a clear trajectory for growth generates value by introducing new services or tapping into untapped markets.

In essence, these four quadrants represent a comprehensive framework for understanding how a business generates value for its stakeholders.

2.3. From industry 4.0 towards the economy of the future and industry 5.0

Forbes attributes digitalization as the primary catalyst for Industry 4.0, which is marked by various trends such as interconnected customers, empowered employees, streamlined production, and transformed products. Additionally, the article highlights the contrast between digitalization and digitization. It suggests that to become customer-centric throughout the enterprise, digital transformation requires enhancing the organization's capacity to handle change comprehensively, making change a core competency while engaging in the process of digital transformation (Kraaijenbrink, 2022).

In September 2021, Industry 4.0 was a term used to describe the fourth industrial revolution, characterized by the integration of digital technologies, automation, data exchange, and smart manufacturing processes. It brought about significant advancements in various industries through the use of technologies like the Internet of Things (IoT), artificial intelligence (AI), big data, cloud computing, and more. The focus was on optimizing production processes, enhancing efficiency, and enabling a more connected and intelligent ecosystem.

Industry 4.0 was expected to drive economic growth and change the way businesses operate. It aimed to improve productivity, reduce operational costs, create new business models, and revolutionize the global economy. Some of the key features of Industry 4.0 included:

- Smart Factories: Manufacturing facilities equipped with interconnected machines and systems that can autonomously exchange information and make decisions to optimize production.
- IoT and Sensor Integration: The use of sensors and connected devices to gather real-time data from various processes and products, enabling better monitoring and decision-making.
- Big Data and Analytics: Utilizing large datasets to gain insights, predict outcomes, and optimize operations.
- Cyber-Physical Systems: The integration of physical machinery and digital technologies, allowing for real-time interaction and collaboration between the physical and virtual worlds.
- Additive Manufacturing (3D Printing): A technology that allows for the creation of complex objects through layer-by-layer printing, revolutionizing prototyping and manufacturing.
- Artificial Intelligence and Machine Learning: Implementing AI algorithms to enhance decision-making processes and enable autonomous systems.
- Cloud Computing: Providing access to computing resources and data storage over the internet, facilitating scalability and data accessibility.

Now, as for Industry 5.0, it is more of a speculative concept and not yet a widely adopted term. Some experts and futurists suggest that Industry 5.0 would be the next stage of industrial development after Industry 4.0, with a stronger focus on human-centered manufacturing. While Industry 4.0 emphasized automation and the integration of digital technologies, Industry 5.0 would seek to combine the advantages of technology with human creativity, emotional intelligence, and problem-solving capabilities.

In an Industry 5.0 scenario, the vision is to find a balance between automation and human labor, where humans and machines work collaboratively to achieve a sustainable and inclusive economy. The idea is to leverage technology to enhance human capabilities and well-being rather than replacing human workers with machines.

The transition from Industry 4.0 to Industry 5.0 is expected to bring about new challenges and opportunities. As automation and AI continue to advance, there are concerns about job displacement and the need for upskilling and reskilling the workforce to adapt to new roles. Additionally, ethical considerations and questions about the role of humans in an increasingly automated world are likely to arise.

2.4. Artificial Intelligence's incorporation in business and it road to industry 5.0

While the majority of businesses are currently in the process of digitalizing their operations by incorporating artificial intelligence (AI), the internet of things (IoT), cloud computing technology, and other cutting-edge technologies represent the next stage of the Industrial Revolution, already present and emerging. The rapid development of new technologies and their integration into human processes has effectively ingrained Industry 5.0 into everyday business practices. Industry 5.0 goes beyond merely digitalizing manufacturing processes; it also addresses challenges such as the demand for a larger workforce and the aging workforce issue (et al., 2019).

Artificial Intelligence (AI) has made significant strides in the business world, transforming various industries and enabling new possibilities. Its incorporation in business has brought about several benefits, including improved decision-making, enhanced customer experiences, increased operational efficiency, and the ability to process and analyze vast amounts of data. Here are some key aspects of AI's incorporation in business:

- Data Analytics and Insights: AI enables businesses to extract valuable insights from the massive amount of data they generate. By using advanced analytics and machine learning algorithms, companies can identify patterns, trends, and correlations in the data, leading to better-informed decisions and more targeted strategies.
- Personalization and Customer Experience: AI-powered recommendation systems and chatbots have revolutionized customer interactions. These technologies can personalize product recommendations, provide real-time customer support, and enhance overall user experiences, leading to increased customer satisfaction and loyalty.
- Automation and Efficiency: AI-driven automation streamlines repetitive and time-consuming tasks, freeing up human resources to focus on more complex and creative aspects of their work. Robotic Process Automation (RPA) and AI-powered systems help businesses optimize workflows and improve efficiency across various departments.
- Predictive Maintenance: In industries like manufacturing and logistics, AI can predict equipment failures and maintenance needs, minimizing downtime and reducing operational costs.
- Fraud Detection and Security: AI algorithms can detect unusual patterns in financial transactions, helping businesses prevent fraud and enhance security measures.
- Natural Language Processing (NLP): AI-powered NLP allows machines to understand and process human language, facilitating applications like sentiment analysis, language translation, and voice assistants.
- Supply Chain Optimization: AI can optimize supply chain operations by predicting demand, improving inventory management, and enhancing logistics and delivery processes.

As for the road to Industry 5.0, as mentioned earlier, Industry 5.0 is a speculative concept that is envisioned as a more human-centric approach to industrial development. The incorporation of

AI in Industry 5.0 would likely focus on finding ways to combine AI's capabilities with human ingenuity and creativity.

While Industry 4.0 emphasized automation and machine-to-machine communication, Industry 5.0 may aim to create a collaborative environment where humans and AI systems work together harmoniously. For example:

- Cognitive Assistance: AI systems could assist workers by providing real-time information, insights, and recommendations, allowing humans to make better decisions and solve complex problems.
- Human-AI Collaboration: Industry 5.0 might encourage the development of AI systems that are more intuitive and capable of understanding human context and emotions, fostering better collaboration between humans and machines.
- Ethical and Responsible AI: As AI becomes more integrated into the workplace, ensuring ethical and responsible AI practices will be crucial to address potential biases and avoid negative consequences.
- Upskilling and Reskilling: The transition to Industry 5.0 would require a focus on upskilling and reskilling the workforce to adapt to new roles that leverage AI's potential and complement human skills.

It's important to remember that the concept of Industry 5.0 is still evolving, and the path towards its realization may differ from these speculative ideas. As AI and technology continue to advance, businesses and industries will need to adapt to new paradigms to embrace the potential benefits of Industry 5.0 while addressing itschallengesresponsibly.

3. ANALYSIS AND RESULTS

Globalization encompasses a broad range of factors that extend beyond business sustainability, energy, and the economy of the future, even though these areas are crucial elements of globalization. It involves the integration of global economies, cultures, and societies, with implications for various aspects such as politics, human rights, the environment, and technology. One of its effects has been the widespread dissemination of technology and information, creating new opportunities for innovation and development, as evidenced by the 4th and 5th industrial revolutions. However, it has also raised concerns about privacy, security, job displacement, and inequality. While business sustainability, energy, and the economy play significant roles in globalization, a comprehensive understanding of this phenomenon requires considering a wide array of issues and factors.

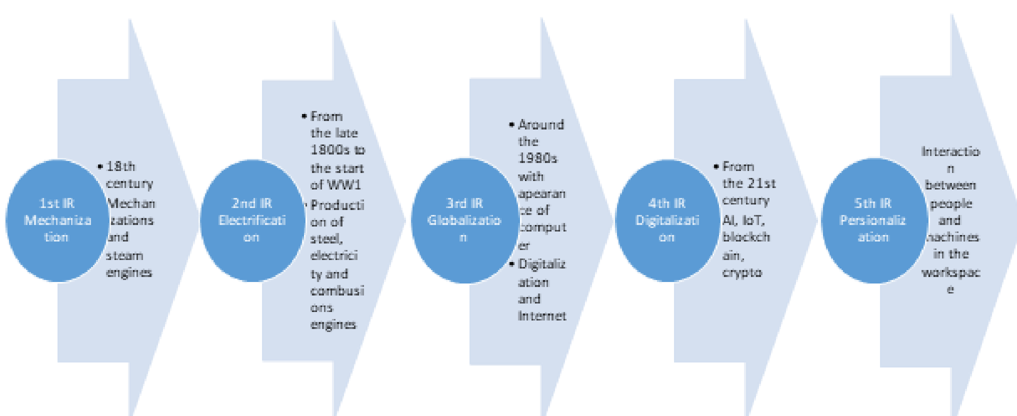

Figure 2. The evolution of industrial revolution (IR) before and after Globalization

Source: Summary of the author

3.1. Globalization and Energy

Energy plays a crucial role in economic stability and growth, and the relationship between the two is reciprocal. Energy serves as one of the fundamental pillars of the economy, and as globalization has progressed, the world's energy consumption and production have increased significantly to meet the demands of industries and populations. Throughout history, energy has been at the center of various industrial revolutions, starting from the mechanization and steam engine-driven first industrial revolution, continuing through the subsequent industrial revolutions and into the ongoing fourth and fifth industrial revolutions. The fifth industrial revolution emphasizes human-machine interaction, demanding substantial energy resources for the production of goods and services.

As globalization has intensified, the need for more energy to fuel increased production has become evident. However, the excessive consumption of energy has negatively impacted many economies, leading to the emergence of energy transition and sustainability initiatives aimed at efficiently using and storing energy for long-term benefit. The shift towards renewable energies has gained attention, despite their initial costliness and setup expenses.

Globalization has fostered a global economy heavily reliant on energy markets, commodity markets, innovations, international trade, and competitiveness, as illustrated in Figure 3.

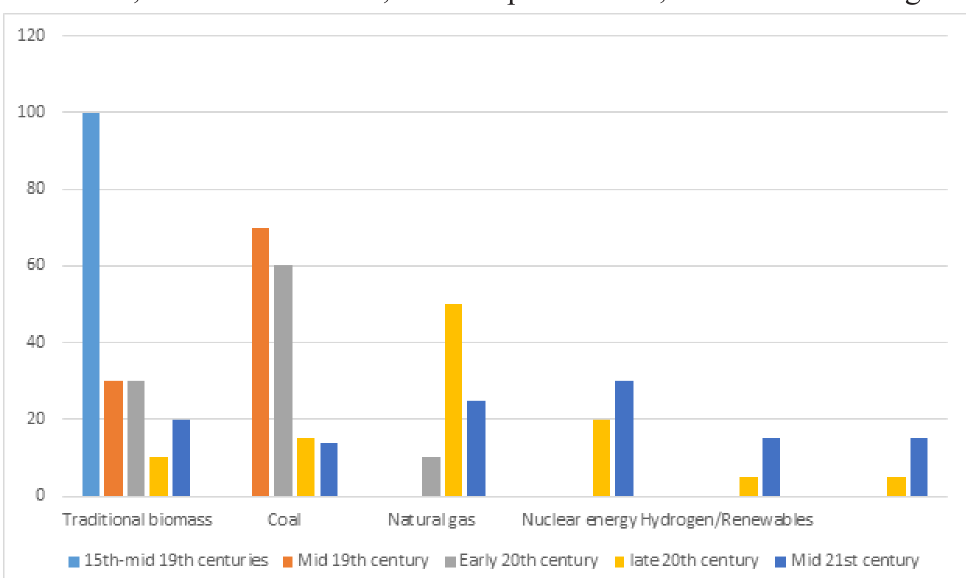

Figure 3. Energy sources' appearance and progress (%) before and after Globalization

Source: Summary of the author

3.2. Capturing sustainable business value by applying the sustainable value framework in business

To assist businesses in harnessing the benefits of sustainability, a comprehensive strategy can be applied. In the lower left quadrant, businesses can involve employees in finding ways to reduce waste and improve resource efficiency, leading to significant cost reductions, risk mitigation, and a more engaged workforce. In the lower right quadrant, engaging with the immediate and extended value chain can focus on developing product stewardship and extending the value of products and services, enhancing the business's reputation and legitimacy, thus creating more value for the company. In the upper left quadrant, adopting a sustainability approach can drive innovation and reshape the business by developing sustainable competencies and identifying the skills, products, and services required in a resource-constrained society.

Finally, in the upper right quadrant, businesses can chart a future trajectory and communicate a clear sustainability vision, stimulating competitive imagination and guiding organizational priorities. This can help identify unmet needs and new markets, including underserved or unserved sectors. To evaluate their sustainability efforts, businesses can use this framework to assess their activities in each quadrant and identify any imbalances in their portfolio of activities. By pinpointing the most opportune areas for action, they can develop initiatives to rebalance the portfolio and create new value while addressing sustainability challenges. (Refer to Figure 1 for illustration).

3.3. Energy sources before and after globalization

When considering the shift from traditional energy sources, it becomes evident how essential they have been. Historically, main energy sources included coal, oil, natural gas, nuclear, hydropower, biofuels, wind, and solar. In the early 1800s, traditional biomass, primarily wood, was the dominant energy source. With the industrial revolution, coal gained importance, and around half of the world's energy came from biomass. In the 1900s, the world adopted new energy sources like oil, natural gas, hydropower, and later nuclear energy in the 1960s. However, the transition to renewable energy, particularly solar and wind energies, has been slow, taking around 200 years to emerge in the 1980s. The cost and complexity of installations remain challenges in the shift towards renewable energy. Additionally, it is difficult for the world to entirely abandon the main energy sources like oil and natural gas, which are crucial commodities driving various industries and productions.

Artificial intelligence has played a significant role in the process of globalization and the global economy. The world now heavily relies on the energy of artificial intelligence for production, analysis, and security purposes. (Refer to Figures 3 and 4 for visuals).

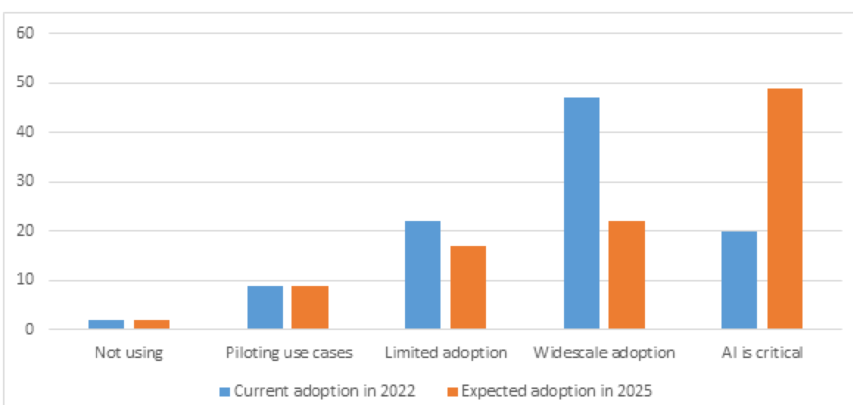

Figure 4. Current and expected adoption rate of artificial intelligence (%) in global IT business during 2022-2025

Source: Statista data, 2023

Incorporating sustainability into businesses and companies plays a vital role in safeguarding the planet by reducing and eventually eliminating carbon emissions in the production process. This significant step is both a challenge and an opportunity for companies as it leads them towards sustainable practices while retaining clients and customers. Initiatives such as regenerating energy resources, recycling energy and waste, and adopting new approaches in business awareness, marketing, and strategy contribute to advancing the global society's move towards sustainable globalization. Since sustainable business is a fundamental aspect of the economic sector, and the economy serves as a main pillar in both sustainability and globalization, the integration of sustainability practices contributes to the overall well-being of the planet and global society. (Refer to Figure 5 for visual representation).

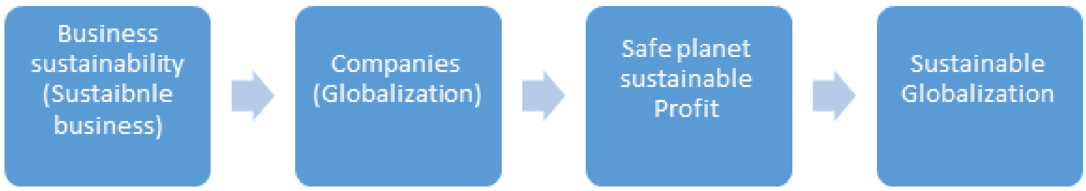

Figure 5. Incorporating sustainability in business for a sustainable profit and safe planet

Source: The author

4. CONCLUSIONS

Globalization has significantly shaped the world and global society, creating a global economy and a virtual world. It has played a pivotal role in driving industries 4.0 and 5.0, focusing on the potential of artificial intelligence to surpass human abilities. The future economy will rely on the synergy between machines and humans, necessitating sustainable practices for businesses and companies. However, the transition to renewable energy has been sluggish due to high costs and installation challenges. The world continues to heavily rely on main energy sources like oil and natural gas, which are essential commodities for industries and various productions. Despite globalization fostering innovation and new perspectives in business, energy, and the economy, the implementation of sustainability requires more efforts at the international level, especially for emerging markets, developing countries, and low-income nations, facing difficulties in balancing their economies amid the impact of globalization. Adopting sustainable strategies in businesses can lead to enduring business values, but it's evident that the shift towards renewables is still progressing at a slow pace.

COMPLETING THE LEGAL ACCOUNTING PROVISIONS FOR LIABILITIES IN VIETNAM

PhD. Do Minh Thoa[1]

Abstract: Provisioning is one of the very important accounting operations, affecting business results and the nature of continuous operation of a business in the accounting period. In Vietnam, the issue of contingency is referred to in Accounting Standard No. 18 " Provisions, Contingent Liabilities and Contingent Assets", the standard prescribes and guides the principles and methods of accounting for reserves; These regulations also gradually move towards general international regulations. However, this issue still has shortcomings and limitations as a legal basis for preparing and presenting on financial statements of Vietnamese enterprises. Therefore, it is necessary to clarify some basic contents related to the presentation of provision information, as well as to propose some specific solutions, which will be meaningful for the improvement of the current accounting legal framework system in Vietnam.

Keywords: accounting, provisions, liabilities, Vietnam

1. INTRODUCTION

Currently, the system of legal documents related to backup accounting in Vietnam, especially the Guiding Circulars is quite complete and detailed. However, the system of these documents has been issued sporadically, in the period from 2005 until now, there exist a number of inadequacies, limitations, need to overcome and improve.

Provision appropriations are essentially built on the basis of estimates, which is an important basis, but it does not lose the reliability of the data on financial statements if enterprises provide reliable bases for the work of estimating appropriations (debts). This is also a mandatory requirement for enterprises when presenting provisions on financial statements.

With the trend of international economic integration, the requirements of globalization and the information needs of accounting information users have set requirements for harmonization of accounting regulations and principles among countries around the world. International accounting standards (IAS/IFRS) are issued by IASC (International Accounting Standards Board) and IASB (International Accounting Standards Board). In the period from 1993 to 2001, the IASC restructured to form the IASB. The purpose of IASB is to develop the International Standards System of Financial Statements (IFRSs), forming a new era towards global accounting harmonization. Since then, the process of harmonizing international accounting has been increasingly interested by international accounting organizations as well as countries around the world.

Vietnam is a developing country the fledgling market economy cannot stand outside the flow of integration. In fact, the Department of Accounting and Auditing Regulations and agencies of the Ministry of Finance together with experts and scientists are implementing the roadmap to update and promulgate a new system of accounting standards in Vietnam in the direction of harmonization with IASs/IFRSs, including IAS Standard 37 - Provisions, Contingent Liabilities and Contigent Assets corresponding to Vietnam Accounting Standard VAS 18 - Provisions, Assets and Potential

1 Email: dominhthoa@hvtc.edu.vn, Academy of Finance.

Liabilities (Issued and announced under Decision No. 100/QD-BTC dated 28/12/2005 of the Minister of Finance).

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

2.1. Situation of study abroad:

IAS 37 defines and defines the method of accounting and explains the provisions payable (liabilities that are uncertain in terms of time or value), along with contingent liabilities (which may be current obligations and obligations that cannot be determined or cannot be measured) and contingent assets (which may be assets).

IAS 37 - Contingent Provisions, Assets and Liabilities, issued in 1998, significantly improved the financial statements at that time. Before it was enacted, there was considerable scope for profit manipulation, for example, units can make provisions for future expenses without current obligations. IAS 37 only allows contingencies that meet the definition of liability.

On 14 May 2020, IAS 37 was revised with guidance on Contracts with Great Risk – Cost of Contract Completion (IAS 37 Amendments) stipulates the costs that the company is taken into account when assessing whether the contract will suffer losses and is effective for the reporting year period commencing on or after January 1, 2022. In the amendment, the "cost of completion" of a contract includes "costs directly related to the contract." Costs directly related to a contract may be increased costs in the performance of that contract (e.g. materials, direct labor) or the allocation of other costs directly related to the performance of the contract (An example is the allocation of depreciation expense to an item of property, plant and equipment used to perform the contract).

IAS 37 - Contingent provisions, assets and liabilities issued by the IASB in September 1998 and effective for accounting periods beginning on or after July 1, 1999. - IFRS.VN.

2.2. Research situation in the country

In recent times, accounting for provisions has been hotly discussed by many interested researchers on forums about various aspects because accounting information about reserves is always considered important information in the management process of each enterprise and fully and honestly reflecting reserves is quite complicated.

Accounting for provisions in Vietnam has attracted the attention of researchers, however, the number of publications is limited and only focuses research on certain aspects of accounting for provisions. Some main contents of research on accounting for provisions in Vietnam can be listed as: *The first, Method of setting aside and handling provisions at enterprises* with research by Mr. Duong Thi Thanh Hien - Duy Tan University (2018) (http://tapchitaichinh.vn/). *The second, The need for provisions in enterprises* with the research of MSc Tran Thi Thanh Thuy (Faculty of Accounting – University of Economics and Technology) (2017) (http://tapchicongthuong.vn/). *The third, Legal basis related to provisions in enterprises today: Current situation and recommendations* with research by Phan Thanh Hai - Duy Tan University (2020) (https://hoiketoanhcm.org.vn/). *The fourth,* Pham Hoai Huong (2007) in his research clarified *the nature of the content reflected in reserve accounts according to the legal regulations of Vietnamese accountants; The fifth,* Mai Ngoc Anh (2012) provides general *research results on accounting estimates and methods for determining each estimate specified in International Auditing Standards (ISA), International*

Financial Statements Standards (IFRS) and US accounting principles (US GAAPs) thereby providing experiences suitable to the Vietnamese context. The topic also researches accounting standards and regimes on accounting estimates and methods of determining accounting estimates, assesses advantages and disadvantages from which to offer complete solutions;

The above studies have covered each content in the accounting of provisions, however, none of them have a comprehensive approach to the entire legal system of accounting for reserves in Vietnam today as well as complete solutions according to international practices.

3. METHODOLOGY AND PROPOSED MODEL

Research Methods: From the collected material, the author conducts qualitative research, through such methods: analyzing and synthesizing theory, experts, analyzing and summarizing experience, studying history … On dialectical materialistic perspective: use translation to speculate the corollary, use comparisons to make intermediate judgments, thereby using induction to make conclusions, summarize to propose recommendations and solutions.

Secondary data collection

Summary reports of the Ministry of Finance, Annual Report of the State Bank of Vietnam and Social Affairs, books and magazines such as: Financial and Accounting Research Journal, Accounting Journal, Accounting - Auditing Journal, scientific research journal of auditing, domestic and foreign studies related to the topic. Websites such as the website of the Ministry of Finance (www.mof.gov.vn), the International Accounting Standards Drafting Committee (www.iasplus.com) and some other websites.... Legal documents related to accounting provisions such as Enterprise Law, Accounting Law, International Accounting Standards, Vietnam Auditing Standards, Decrees, Decisions, Circulars... of the Government and agencies relevant function.

4. RESEARCH RESULTS

4.1. Assessing the limitations and contents of regulations on accounting for provisions for liabilities in Vietnam at present

4.1.1. Assessing the limitations of backup accounting for product issuance in Vietnam

In fact, when making provisions for warranty of products and goods, pursuant to Circular No. 48/2019/TT-BTC issued on August 8, 2019 on provisioning, there are specific provisions as follows:

“Article 7. Warranty provision for products, goods, services, construction works

1. Objects and conditions for making provisions: are products, goods, services and construction works performed by the enterprise that have been sold, supplied or handed over to the buyer still within the warranty period and the enterprise is still obliged to continue repairing and perfecting, contractual warranty or customer commitment.”

In fact, when applying enterprises, there are 2 interpretations as follows:

- *How to understand 1:* Appropriation of warranty at the end of the annual accounting period, based on the products and goods sold in the period and committed to warranty with customers by warranty cards, warranty stamps, sales contracts, quotations. According to accounting principles, this risk “provision” does not depend on whether the appropriated goods are still under warranty by the supplier. Because the time of appropriation is the end of the year, the warranty goods are based on the time when the customer brings the warranty for repair, therefore, it is impossible to determine whether the warranty liability belongs to the company or to the supplier at the end of the fiscal year.

- *How to understand 2:* Set up warranty at the end of the year based on the goods for which the supplier has exhausted its warranty liability.

Conditions for provisioning are specified in Article 7 of Circular No. 48/2019/TT-BTC Guide the establishment and handling of provisions for inventory discounts, losses of investments, bad receivables and warranty of products, goods, services and construction works at enterprises as " .... *still within the warranty period and the enterprise is still obliged to continue repairing, perfecting, warranty according to the contract or commitment to the customer"* is unreasonable, leading to the above interpretation of the enterprise. For example, the company sold the phone on 01/03/2021 with a warranty period of 2 years, So on December 31, 2022, the accountant of the enterprise has made a product warranty provision for the 2022 financial statements for the phone?. With current provisions in Circular No.48/2019/TT-BTC, enterprise will understand: "If the product is still within the warranty period, it will be made a backup", that would not be true of the nature of the provision for liabilities in terms of product issuance costs as stipulated by International Accounting Standard IAS 37 - Provisions, Contingent Liabilities and Contingent Assets.

The essence of the provision condition given in Circular No.48/2019/TT-BTC is the determination of "When to make provision for product issuance", here emphasis is placed on when contingency should be made. With regulations such as the current Circular No.48/2019/TT-BTC, it will be difficult to determine when enterprises should set up provisions: when exporting and selling products, or at the end of each fiscal year, as required by Circular No.48/2019/TT-BTC " .... *still within the warranty period and the enterprise is still obliged to continue repairing, perfecting, warranty according to the contract or commitment to the customer"*

4.1.2. Assessing legal content limitations on environmental restoration cost provision accounting in Vietnam

Environmental restoration costs can be understood as expenses to return to the current state of the environment before renovation activities for production and business purposes. In particular, typical of this cost is the cost of returning the premises to the initial state of the enterprise.

Accounting: The accounting of environmental restoration costs also has differences between Vietnamese accounting regimes and specific international accounting standards:

Content	Vietnam Accounting Regime	International Accounting Standards
Recognition methods	* In all cases, these expenses are provisioned to be recognized as expenses for the period a) Record the entire reserve value in expenses in the period, corresponding to the estimated value to be paid in the future b) Provisions are set aside periodically throughout the useful life of the asset: Accounting: Dr. Acc 627, 641, 642 Cr. Acc 352 - Provisions (According to Circular 200/2014/TT-BTC)	* The cost of site refund will be recognized in the cost of the asset when meeting the conditions for the time of recognition stipulated on time and reserve appropriation value. This value will then be gradually allocated to periodic expenses based on the depreciation method and useful life of the asset (Pursuant to IAS 16 - Property, Plant and Equipment)

Guidance on when to make provisions	* There are no specific provisions "5. About accounting for environmental restoration costs Circular 200 only provides for the advance deduction of environmental restoration costs and the use of Acc 3524 for accounting. The level of extraction, the beginning and end of the excerpt... must comply with mechanisms and policies applicable to each industry and each unit. For example, the advance deduction of mine cleanup costs of Vietnam National Oil and Gas Group or advance deduction of environmental restoration costs of Coal and Mineral Group must comply with specific provisions of law according to regulations of each industry" (quoting Official Dispatch No. 12568/BTC-CĐKT dated September 09, 2015; V/v: Explanation of contents of Circular No. 200/2014/TT-BTC)	* Provisions in IAS 37 - Provisions on the value of provisions Accordingly, the written value of the historical increase in the cost of the prescribed asset is the most reliable estimate of the cost value that the enterprise will have to spend to fulfill its obligations at the time of reporting. And this estimated value needs to show the time value of the money as well as the risks of that reserve
Change the appropriation value	Recognition in expenses for the period	Record changes in the cost of assets

From a corporate income tax perspective: There are no specific provisions for the declaration of advance deductions related to these environmental restoration costs, However, according to the general provisions on the determination of expenses deducted from previous deductions, the pre-deducted reconstituted expenses in the period shall be included in the deductible expenses when determining income subject to corporate income tax. And at the end of the contract, the unit must redetermine the exact amount of actual costs based on the actual invoices and legal documents incurred to adjust the declared costs. However, it is also possible to recognize the risks in ensuring regulatory requirements such as: the basis of prepayment cost deduction in the period because there is no guidance on provision for environmental restoration costs and determine the contract termination period to redetermine the actual costs incurred. Some tax authority guidelines do not accept deductible costs from this cost. Therefore, companies need to be careful in declaring deductions for this part of the cost.

Legal basis: Pursuant to Point 2.20, Clause 2, Article 4 of Circular 96/2015/TT-BTC,

"2. Expenses that are not deductible when determining taxable income include:

…

2.20. Pre-deducted expenses according to the term, according to the cycle that until the end of the term, the end of the cycle has not been spent or the expenditure is not exhausted.

Advance deductions include: advance deductions for major repairs of cyclical fixed assets, advance deductions for activities that have calculated revenue but continue to have to fulfill contractual obligations (Even in case the enterprise has asset leasing activities, service business activities for many years but collects money in advance from customers and has fully included in the revenue of the year of collection) and other prior deductions.

In case an enterprise has production and business activities that have recognized enterprise income tax calculation revenue but have not yet fully incurred expenses, the prescribed expenses shall be deducted in advance from the deductible expenses corresponding to the recognized revenue when determining income subject to enterprise income tax. At the end of the contract, the *enterprise must calculate and determine the exact amount of actual costs based on the actual legal invoices and documents incurred to adjust the increase in costs (in case the actual costs incurred are greater than the pre-deducted amount) or reduce costs (in case the actual costs incurred are less than the pre-deducted amount) in the tax period end of contract."*

In addition, these guidelines are providing guidance for pre-deducting periodic environmental restoration costs. In case an enterprise does not make an advance deduction but recognizes once in the last period, there is a risk of determining undeductible costs corresponding to past periods where this part of expenses has not been pre-deducted.

4.1.3. Assessment of legal content limitations on provision accounting for fixed asset repair costs in Vietnam

Fixed assets are used for a long time and are constituted by many different parts and details. When participating in the production and business process, the parts constituting fixed assets are worn out and damaged unevenly. Therefore, in order to restore the normal operation capacity of fixed assets and ensure safety in production and business labor, it is necessary to repair and replace worn and damaged parts and details of fixed assets. Depending on the form of repair, the impact of repair costs on production and business costs between periods, the method of accounting for repair costs is different. In principle, for periodic repair work, large repair costs, enterprises must plan in advance, from this plan, the accountant makes an estimate of repair costs and proceeds to deduct in advance to production costs regularly every month.

Specifically, according to Point c, Section 3, Article 62, Circular 200/2014/TT-BTC guiding the recognition of advance deductions for fixed asset repair costs according to technical requirements that must be periodically repaired (aircraft, ships...) as follows:

Every period, the accountant deducts in advance the cost of major repairs of fixed assets as planned, recording:

Dr. Acc 627/641/642

Cr. Acc 352 – Provisions

Actual major repair costs incurred, record:

Dr. Acc 2413 – Major repairs of fixed assets

Cr. Acc 111/152/153/214/334/338…

When major repairs to fixed assets are completed, the actual cost of major repairs incurred, record:

Dr. Acc 352 (3524) – Provisions

Cr. Acc 2413 – Major repairs of fixed assets

The accountant shall handle the difference in the actual amount of major repair costs incurred compared to the amount deducted in advance according to the plan (if any), recording:

+ If the actual arising number is greater than the previous extract, it will be supplemented and recorded:

Dr. Acc 627/641/642…

Cr. Acc 352 (3524) – Provisions

+ If the actual amount incurred is less than the previous deduction, write down expenses (According to the CIT Law) or write off other income increases (Based on VAS 15), record:

Dr. Acc 352 (3524) – Provisions

Cr. Acc 627/641… or Acc 711 – Other income

For example: On January 1, Pacific Airlines put into operation 1 Boeing 737-400 aircraft for international passenger transportation. According to technical requirements and based on the airline's operation plan, after 5 years Pacific Airlines needs to overhaul Boeing 737-400 aircraft on.

When starting operation, Boeing 737-400 has estimated the cost of overhauling the aircraft after 5 years, including: 1. Cost of buying new replacement equipment: VND 1,700 million. 2. Cost of reinstalling machinery: VND 600 million. 3. Cost of machinery repair staff: 700 million VND.

According to Circular 200/2014/TT-BTC, accountants will pre-deduct aircraft overhaul costs on year N financial statements as follows: (Each year provision for overhaul costs is 600 million)

Dr. Acc 627: VND 600 million

Cr. Acc 352: VND 600 million

Financial statements for the year N+1, N+2, N+3, N+4 will be made provision for overhaul costs according to the above entries

In December N+4, Pacific Airlines overhauled the Boeing 737-400 with a total actual cost of VND 3,200 million, the accountant recorded:

Dr. Acc 2413: VND 3,200 million

Cr. Acc 331, 112….: VND 3,200 million

On 31/12/N+4, the accountant transferred the actual overhaul costs incurred:

Dr. Acc 352: VND 3,200 million

Cr. Acc 2413: VND 3,200 million

The amount of overhaul costs deducted in advance from year N to the end of N+1 is: 600 million x 5 = 3,000 million

The actual overhaul cost incurred is: 3,200 million, so the accountant will make additional appropriations on 31/12/N+4:

Dr. Acc 627: VND 200 million

Cr. Acc 352: VND 200 million

Thus, Circular 200/2014/TT-BTC has acknowledged that the pre-deduction of periodic fixed asset repair costs is always a mandatory event for provisioning.

IAS 37 - Provisions, contingent liabilities and contingent assets do not allow Pacific Airlines to make provisions for the cost of overhauling Boeing 737- 400 aircraft, because at the end of the first year:

a. There is no obligation to spend VND 600 million at the end of the first year.

b. Just an intention of repair, not a current obligation (non-binding event)

c. Overhaul costs can be avoided by future airline action. (For example, sell the aircraft at any time)

However, according to experts, in practice, there are still many interpretations and improper implementation, because the event is mandatory:

i) A past event giving rise to a present obligation is called an event of a compulsory nature.

ii) A compulsory event is an event in which the entity has no choice but to perform obligations arising from this event.

This only happens when the payment of this obligation is mandatory by law or when there is a joint obligation of the event, resulting in a reliable estimate so that the 3rd party is sure that the business will pay the debt.

However, according to the principle of recognition of provisions of International Accounting Standard No. 37 (IAS 37), a reserve is recognized only when the following conditions are satisfied:

+ The entity has current obligations (legal or joint obligations) resulting from an event that has occurred. Legal obligation is an obligation arising from a contract, an existing legal document …. Solidarity obligation is an obligation arising from the activities of an enterprise when adopting issued policies or relevant current documents and documents to prove to other partners that the enterprise will accept and fulfill specific obligations.

+ The entity can be sure that resources associated with economic interests must be used to pay obligations. Thus, a debt that must be accompanied by a decrease in economic benefits is more likely than not to occur.

+ The value of the obligation can be reliably estimated.

The use of estimates is an important part of preparing financial statements and does not detract from the reliability of financial statements.

The provision for repairing fixed assets only represents the entity's intention to carry out repairs to this asset, not that the entity is obliged to do so because the entity may choose to sell such assets at any time. Thus, the above provision is not in accordance with the principle of provision recognition according to international accounting standards IAS 37 - Contingent provisions, assets and liabilities

4.2. Solutions to complete the legal system of accounting for provisions for liabilities in Vietnam according to international practices

4.2.1. Solutions to complete legal contents on provision accounting for product warranty in Vietnam according to international practices

Products with a long service life such as cars, motorcycles, computers, phones,... are usually sold with warranty conditions. During the warranty period of the product, if damage occurs, the seller will repair or renew the product for the buyer. Product warranty debts are not only a tool to insure and hedge risks, but they also convey signals about the future results of the company, and it is also a tool for managers to implement profitable management behaviors.

The determination of product warranty provision costs is based on the judgments and estimates of the business, combined with historical statistical data;

The value of warranty provision is based on the value of warranty costs that the enterprise expects to spend in reality, regardless of the value of revenue arising from the sale of products; The method of setting up warranty provisions based on revenue value is a commonly applied method in practice, but this is not the only method in determining the reserve value of product warranty.

The determination of product warranty contingency costs is based on the judgments and estimates of the business. Judgments and estimates of product warranty contingency costs are governed by the following factors:

(1) For new business products

Past statistical forecasts are a basis for businesses to determine the warranty reserve value for products.

However, for new business products, businesses do not have historical data related to this product. At this point, businesses need to estimate the warranty reserve value for the product based on the information that the business currently has. Some of the information that can be mentioned includes:

- Determine whether the manufacturing process is simple or complex: Products that require complex manufacturing processes are more likely to make mistakes than products with simple manufacturing processes;

- Product quality control process: Products with strict quality control procedures will have less defect and failure rates than products with less strict control processes;

- Do you have experience with products with similar technical standards?

In this case, enterprises still have to estimate with all their ability, based on existing information to determine the warranty reserve value to be set aside. Enterprises are not allowed to neglect the provision for product warranty (if these costs are material) on the basis that you cannot reliably estimate these costs

When manufacturing products, there will be a percentage of defective products and therefore, businesses will have to spend a lot of money to fix these defective products. Therefore, the provision for warranty should be made to reflect the above obligation.

(2) Quality of raw materials

The quality of raw materials used in the manufacture of products is also a factor affecting product warranty costs. In case the enterprise changes the supplier of raw materials, uses new materials to replace the materials in use, ... then the costs incurred for the product warranty will also be likely to change.

(3) Labor quality

The cost of product warranty also depends on the quality of labor. When enterprises replace skilled workers with new ones, it is likely to affect the quality of manufactured products and therefore, the rate of defective products increases, leading to an increase in product warranty costs.

(4) Warranty period

The warranty period is also a factor affecting the warranty reserve value of the business. The same product A, but if the warranty period is 24 months, the expected warranty cost will be less than when the warranty period is 36 months.

When the warranty period is longer, the percentage of defective products during the warranty period is also greater and therefore, the estimated cost value of the product warranty will be more.

Therefore, when setting up a product warranty provision, the reserve value will be different with the same product with a different warranty period.

For new business products, enterprises only have complete data on product warranty costs after the product warranty period expires. For example, product A has a warranty period of 36 months, only after 36 months from the time of putting the product on the market, the enterprise has in hand enough statistical data related to the warranty cost of product A

Example:

Product A has a defect rate for the first year of warranty service of 5%. However, by the second year, the defect rate is up to 7.5% of the products sold and the warranty defect rate in the third year is 10%.

Thus, if only the data obtained in the first year, the determination of the warranty cost of product A will not be accurate, when the actual cost that businesses have to spend on product warranty in the second and third years is much greater than the first year

(5) Variation in estimates in warranty costs

Estimates of warranty cost provisions need to be updated regularly to adjust the estimated value to be close to the actual cost value incurred.

For new business products, when there is actual data showing that the percentage of defective products is greater or smaller than the original estimated value, the product warranty reserve value needs to be adjusted to match the reality.

Similarly, the data on past warranty costs also needs to be adjusted to fit the current situation. For example, enterprises improve production processes, improve labor quality, apply stricter product quality control processes, ... are cases that show that the value of product warranty costs is expected to decrease compared to past statistical data.

Product warranty cost estimation process

The estimation of product warranty contingency costs can be done according to the steps below:

- Estimate the rate of product failure and the degree of failure of each product for each warranty year;

- Estimate the necessary costs spent on repairing the product;

- Calculate the reserve value of product warranty to be set aside based on the above information. This value is discounted to present value to reflect the time value of money if its effect on the financial statements is material.

From the above analysis, the author offers a solution to complete the legal content of provision accounting for product warranty costs in Vietnam according to current international practices as follows:

As analyzed in Chapter 2, Circular No. 48/2019/TT-BTC did not specify the time to make a product warranty provision

Answering the question "When to make a product warranty provision?", the answer here is "The sales performance period will be the period when product warranty provision should be made", the appropriate principle will govern the recognition of product warranty costs. At the time of determination of sales, i.e. the time of recognition in revenue, the accountant will estimate the cost of product warranty in the same period in which the accounting recognizes revenue. In essence, the warranty policy is for the purpose of promoting sales, warranty costs need to be recognized in accordance with the revenue recognition in the period, here it is necessary to comply with the appropriate principle of accounting

There are three methods for accounting for warranty costs of products and goods:

+ Accrual warranty cost method;

+ Method of selling separately warranty and:

+ Adjusted cash method;

(1) Accrual warranty cost method

According to the accrual method, the company recognizes warranty costs and estimated liabilities for future warranty performance in the sales period. This method is based on the assumption that the company offers a warranty policy to drive sales, and therefore estimated warranty costs need to be recognized to match these revenues.

Scenario 1: Mclaren started producing and bringing to market a new line of cars from January 2020 with a warranty policy that it will be repaired free of charge (both spare parts and advanced, except for parts that need to be replaced due to natural wear and tear) within 3 years or 100,000 km, whichever comes first. In 2020, the company has sold 1,000 vehicles with a selling price of 1,200,000,000 VND/vehicle, excise tax of 50%, VAT of 10%, cost price of 600,000,000 VND/vehicle. From its experience the company estimates that 2% of vehicles will be severely damaged with an estimated repair cost of VND 50,000,000 per vehicle, and 5% of vehicles will be slightly damaged with an estimated repair cost of VND 10,000,000 per vehicle. In 2020, the company incurred warranty costs of VND 400,000,000;

The estimated warranty costs for vehicles sold in 2020 are:

1.000 x 2% x 50.000.000 + 1.000 x 5% x 20.000.000 = 2.000.000.000 VND.

The entries that the company reflects on the sale of vehicles from 4/2020 to 12/2020 are as follows:

Reflecting car sales:

Dr. Acc 111, 112, 131	1.320.000.000.000	
Cr. Acc 5112		800.000.000.000
Cr. Acc 3332		400.000.000.000
Cr. Acc 33311		120.000.000.000

Reflect the cost of sale of the car:

Dr. Acc 632	600.000.000.000	
Cr. Acc 155		600.000.000.000

Pre-deduction of warranty costs:

Dr. Acc 641	2.000.000.000	
Cr. Acc 3521		2.000.000.000

Warranty costs incurred:

Dr. Acc 3521	400.000.000	
Cr. Acc 154, 152, 334, 331, 336		400.000.000

On the 2020 Business Results Report, the company reported the warranty cost for products sold in 2020 as 2,000,000,000.

On the 2020 Balance Sheet, the balance of credit 3521 for this model of VND 1,600,000,000 will be presented in the section Short-term or long-term liabilities? Suppose the company estimates that the warranty cost for the vehicles sold in 2020 will be incurred in 2021 is 500,000,000 VND, in 2022 it is 600,000,000 VND, in 2023 it is 500,000,000 VND. In this case, the company will present in the Short-term debt section as VND 500,000,000 corresponding to the security debt to be realized in 2021, VND 1,100,000,000 in the Long-term debt corresponding to the warranty debt to be realized in 2022 and 2023.

In 2021, when warranty costs related to 1,000 cars sold in 2020 were incurred, the Mclaren company noted:

Dr. Acc 3521	500.000.000	

Cr. Acc 154, 152, 334, 331, 336 500.000.000

Scenario 2:

Company A sells X phones. In June of year N, Company A sells 1,000 X phones to the market with the following information:

- Price: 25 million VND/phone
- Warranty period: 3 years

The determination of the warranty backup cost of phone X is carried out as follows:

- *Estimate product failure rate and degree of failure*

	Year 1	**Year 2**	**Year 3**
Minor damage	20%	15%	15%
Medium failure	15%	15%	10%
Severe damage	10%	10%	15%

- *Estimate the cost required for product repairs*

	Component replacement	**Repair workers**	**Total**
Minor damage	500.000	500.000	1.000.000
Medium failure	2.000.000	1.000.000	3.000.000
Severe damage	5.000.000	2.000.000	7.000.000

- *Calculation of warranty reserve value to be set aside*

	Year 1	**Year 2**	**Year 3**
Minor damage	= 1.000.000 * 20% = 200.000	= 1.000.000 * 15% = 150.000	= 1.000.000 * 15% = 150.000
Medium failure	= 3.000.000 * 15% = 450.000	= 3.000.000 * 15% = 450.000	= 3.000.000 * 10% = 300.000
Severe damage	= 7.000.000 * 10% = 700.000	= 7.000.000 * 10% = 700.000	= 7.000.000 * 15% = 1.050.000
Total (undiscounted value)	1.350.000	1.300.000	1.500.000
Discount value (*)	1.285.714	1.179.138	1.295.756

(*): assume warranty costs are paid at the end of each year and a cash flow discount rate of 5% per annum.

Thus, for each phone sold, Company A needs to set aside a warranty reserve in the amount of VND 3,760,608 (= 1.285.714 + 1.179.138 + 1.295.756).

The value of warranty provision in June of year N from the sale of phone X is VND 3,760,608,000, the revenue value recorded from the sale of the product is VND 25,000,000,000.

Scenario 3:

Company A is a telephone manufacturing company. In 20X8, Company A sold 100,000 X products with a selling unit price of 20 million VND/product, production cost of 15 million VND/product.

Based on historical data, Company A estimates that out of 100,000 X products sold, about 5,000 products are slightly damaged with repair costs of about 2 million VND/product and about 10,000 products are severely defective with repair costs of about 5 million VND/product. Thus, the estimated total warranty cost arising from the above number of products is:

5.000 * 2 million VND + 10.000 * 5 million VND = VND 60 billion.

Company A recorded revenue and cost of sales in 20X8:

+ Recognition of sales revenue:

Dr. Acc Cash: VND 2,000 billion

Cr. Acc Sales revenue: VND 2,000 billion

+ Record cost of goods sold:

Dr. Acc Cost of goods sold: VND 1,500 billion

Cr. Acc Inventory: VND 1,500 billion

At the same time, Company A recorded the provision payable for warranty costs at 31/12/20X8 as follows:

Dr. Acc Warranty cost: VND 60 billion

Cr. Acc Provision payable on goods warranty: VND 60 billion

An important issue in standard warranty cost accounting is the determination of whether the enterprise incurs obligations for warranty costs or not. In some cases, enterprises are only intermediaries working with customers instead of suppliers to facilitate the goods warranty process. The goods are then sent directly to the supplier for warranty, and if the supplier refuses the warranty, the business does not have any other obligations to the customer. In this case, the enterprise acts only as an intermediary, while the main warranty obligation belongs to the manufacturer, and therefore, the enterprise does not recognize the warranty obligation of the goods in this case.

In another case, the enterprise is obliged to warranty the goods to the customer, in which, part or all of the warranty cost will be refunded by the supplier. At this time, the enterprise recognizes all obligations related to the provision to pay warranty costs, and at the same time recognizes an asset related to the right to recover warranty costs from the supplier (reimbursement right).

(2) How to sell the warranty

Many companies sell warranty extensions outside the basic warranty period. For example, car companies or computer manufacturers may sell 1-year or 2-year warranty extensions for a certain amount, and usually, this warranty extension if the customer buys it immediately when buying the product, the price will be lower when buying the warranty extension later. In the case when selling products or goods that are accompanied by the sale of warranty extensions, the company applies the method of selling the warranty and separately recognizes the revenue of the products, goods and warranty extensions.

For example: Suppose the above Mclaren company has a warranty extension package of 2 years or 50,000 km whichever comes first for its new car when customers buy a car for VND 12,000,000 (excluding 10% VAT). If the customer purchases this extension, then after the expiration of the standard warranty period, the customer will be continued by the company free warranty for a period of 2 years (or 50,000 km whichever comes first).

Assuming that in January 2020, a customer buys a car and buys a warranty extension package, the accounting entries on revenue and cost price are as follows:

Reflecting car sales:

Dr. Acc 111, 112, 131 1.333.200.000

Cr. Acc 5112 800.000.000

Cr. Acc 3332 400.000.000

Cr. Acc 3387 12.000.000

Cr. Acc 33311 121.200.000

Reflection of cost prices:

Dr. Acc 632 600.000.000

Cr. Acc 155 600.000.000

The accounting entries for standard warranty costs remain the same as above.

At the end of 2020 when preparing the financial statements, the unrealized revenue on the extended warranty is presented in the Long-term debt section because the term of performance of this obligation is more than 12 months.

Since the extended warranty service is only available in 2023 and 2024, when preparing the 2022 Financial Statements, the accountant presents the unrealized revenue of the warranty extension in the section Short-term debt of VND 6,000,000 and Long-term debt of VND 6,000,000.

The unrealized revenue of this warranty extension will be allocated in a straight-line method unless another method is more reasonable. At the end of 2023, the company accounts for revenue:

Dr. Acc 3387 6.000.000

Cr. Acc 5113 6.000.000

The costs incurred for this customer's extended warranty package in 2023 are VND 4,000,000 accounted for in the cost price:

Dr. Acc 632 4.000.000

Cr. Acc 154, 331,.. 4.000.000

When preparing the 2023 Financial Statements, the unrealized revenue of this customer's remaining warranty period of VND 6,000,000 is presented in the section Short-term liabilities.

(3) Adjusted cash method

According to the adjusted cash method, the company recognizes warranty costs as costs in the period in which the warranty product repairs are incurred. In this way, the warranty cost is recognized in the cost of the repair period, not the sales period. Therefore, this method does not comply with the principle of appropriateness in accounting. If according to accounting principles, this method is not reasonable. In accounting practice, this method can be applied in the following cases:

From a benefit/cost point of view, when the warranty period is relatively short, it is not necessary to deduct the estimated warranty cost in advance. For example, store A that sells used smartphones applies a warranty period of 1 month for all products sold. Because the warranty period is relatively short, the warranty debt obligation at the time of making the report is not large, the company does not need to deduct warranty costs in advance when selling, but accounts for costs when incurred.

When warranty costs are incurred, the accountant writes: Dr. Acc 641/Cr. Acc 152, 334, 111

The Company cannot reliably estimate the value of warranty obligations at the time of sale. Assuming that company B has been in operation since January 1, 2015, the company produces a new type of product and sells them with a warranty period of 1 year. However, the company does not have reliable information to estimate the value of the warranty obligation incurred. In this case, the company does not deduct warranty costs in advance when selling, but accounts for costs when actually incurring warranty costs.

Accounting standards divide the warranty costs of products and goods into two categories: assurance-type warranties; and service-type warranties.

+ Assurance-type warranties can be understood as standard warranty method or statutory warranty (hereinafter referred to as standard warranty method). This warranty method ensures that products and goods sold to customers operate in accordance with the technical standards specified in the sales contract. For example, during the warranty period, if the customer discovers that the product has a defect from the manufacturer, the business will be obliged to repair or renew the product for the customer.

+ Service-type warranties can be understood as a service warranty method, ie customers pay a fee to the business in exchange for warranty services in addition to the standard warranty method (hereinafter referred to as the service warranty method). At this time, the enterprise will have additional obligations to customers in accordance with the contract, in addition to the obligation to ensure that the business does not sell customers defective products. Some examples of service warranty methods include: extended warranty period compared to the standard warranty method, product warranty even if the fault arises from the user, …

Accounting for service warranty method

The service warranty method is accounted for as a separate contractual obligation, regardless of whether the business sells these service orders independently or whether this service package is in a separate agreement with the customer

Example 1: Company A is a company specializing in the manufacture of suitcases. Products manufactured by Company A are warranted for 10 years, including defects arising from the user, and customers do not have to pay extra when purchasing Company A products to enjoy this warranty.

Although the warranty package is not sold separately by Company A to customers, the nature of the warranty package includes:

– The duration of the warranty package is extended; and

– Warranty for errors arising from the user

Company A is providing customers with services, in addition to ensuring that the goods produced by Company A are in accordance with technical standards and are not damaged when sold to customers. So, this is the service warranty method. Company A’s accountant needs to determine the independent selling price of this service and account for warranty obligations as a separate contractual performance obligation.

Example 2: Enterprises may incur simultaneous standard warranty and service costs

Company A is a Mobile Phone Manufacturing Company. Products sold by Company A are warranted for 12 months, excluding user defects. Customers can also choose to purchase an additional service warranty package that brings the total warranty period to 24 months or 36 months.

In 20X8, Company A received 100 machines sent by customers for warranty, of which:

– 25 machines break down within 12 months from the time of purchase and are eligible for warranty. The company determines these are standard warranty costs;

– 60 machines broke down after 12 months. These customers have purchased an extended warranty and are eligible for the warranty. Therefore, Company A determines that these are the service warranty costs;

– 15 machines broke down after 12 months, however these customers did not purchase an extended warranty and therefore, the Company charged for repair services for these customers.

Situations on service warranty accounting

Company A is a company specializing in distributing mobile phones, including product X. Know some information related to product X as follows:

– Customers who purchase product X are warranted for 12 months against manufacturer defects;

– Within 30 days from the date on the purchase invoice, customers can choose to buy a gold warranty package in the amount of VND 2 million. Customers who purchase a gold warranty package will be warranted for additional errors in power, screen, errors arising from breakage, water drop and other errors arising from the user; and

– At the time of purchase, if the customer buys both the machine and the gold warranty package at the same time, the amount to pay for the gold warranty package is 1 million VND.

On 08/08/20X9, customers simultaneously purchased product X and gold warranty package with an amount of VND 21 million, of which: the selling price of machine X is VND 20 million and the selling price of the warranty package is VND 1 million. The accounting is carried out as follows:

– Determination of contract performance obligations:

Company A has two contractual performance obligations:

+ Product X; and

+ Gold warranty package

– Determine the transaction price:

The total transaction price in this case is VND 21 million

– Allocate transaction prices for contract performance obligations:

+ Obligations related to product X:

Allocation price = 20/22 * 21 = 19.1 (VND million)

+ Obligations related to the warranty package:

Allocated price = 2/22 * 21 = 1.9 (million VND)

– Recognition of revenue from sales of goods and provision of services:

+ On 08/08/20X9, the Company transfers products to customers and at the same time recognizes sales revenue:

Dr. Acc Cash: 21 VND million

Có Sales revenue: 19,1 VND million

Có Liabilities arising from contracts: 1,9 VND million

+ Every month, the Company recognizes revenue from straight-line warranty services (distributed over 12 months), recording:

Nợ Liabilities arising from contracts: 158.000 VND

Có Warranty service revenue: 158.000 VND

Thus, according to the author's opinion, Article 7 of Circular No. 48/2019/TT-BTC issued on August 8, 2019 on provisioning provisions on subjects and conditions for provisioning should be amended as follows:

"Article 7. Warranty provision for products, goods, services, construction works

1. Objects and conditions for making provisions: are products, goods, services and construction works performed by enterprises that have been sold, supplied or handed over to buyers who have committed warranty to customers."

With such adjustments in the content specified in Circular No. 48/2019/TT-BTC, enterprises determine the time to make product warranty provisions depending on the accounting method of product warranty costs selected by the enterprise, specifically summarized as follows:

With three different methods to account for warranty costs of products and goods: (1) Accrual warranty cost method; (2) Adjusted cash method; and (3) Warranty Private Sale Method. The choice of which method is suitable depends on the nature of the warranty (standard warranty – original warranty or extended warranty) and the fact arising at the business.

+ The adjusted cash method is simple but is only suitable for products with a short warranty period or when it is not possible to reliably estimate the magnitude of the warranty obligation.

+ The accrual warranty cost method ensures the principle of conformity in accounting and, accordingly, warranty costs are recognized in the cost of the sales period through pre-deductions.

+ The method of selling a warranty is applied when the warranty is sold in addition to the standard warranty, and then the company will defer the revenue from the upsell warranty service to recognize the period in which this warranty service is performed.

4.2.2. Solutions to complete legal contents on provision accounting for refund costs in Vietnam according to international practices

Currently, according to the requirements of Vietnamese law, investors when implementing the project must have a Decommissioning Cost to return the site to the State or the land and water surface lessor after the expiry of the project term without continuing the project implementation. For example, mineral companies, after exploitation is completed, according to regulations, must complete the earth, restore the environment such as leveling to restore the current state of the terrain, planting trees to restore the environment. This cost is usually incurred at the time of mine closure and is of great value.

As required by regulations on Vietnamese accounting standards as well as World Financial Reporting Standards (IFRS), the determination of project reversal costs is one of the mandatory requirements in terms of data. So what is the purpose of determining the project revert cost, why is it necessary for the valuation company in determining this project revert cost (Decommissioning cost)?

Basically, determine the project revert cost (Decommissioning cost) to make provisions and allocate costs in the accounting period. Specifically, for the Vietnamese accounting regime, it will be specified in Circular 200/2014/TT-BTC guiding the corporate accounting regime. For International Financial Reporting Standards, clauses IAS16, IAS37, IFRIC1 and IAS02 are specified.

As prescribed in the current Vietnamese accounting regime - Circular No. 200/2014/TT - BTC - Guiding the corporate accounting regime, issued on December 22, 2014, stipulates:

"– When making provisions for environmental restoration expenses, expenses for site cleaning, restoration and return, provision for severance allowance in accordance with the Labor Law, etc., record:

Dr. Acc 627, 641, 642

Cr. Acc 352 – Provisions

Thus, according to the provisions of the current Vietnamese accounting regime, the cost of site return is set aside by writing an increase in costs, and at the same time writing an increase in a corresponding reserve. The circular contains no further guidance on determining the value of this reserve.

Theoretically, enterprises when setting up provisions for site return costs as prescribed in Circular No. 200/2014/TT - BTC - Guidance on the enterprise accounting regime issued on December 22, 2014 can approach in the following two ways:

a) Record the entire reserve value in expenses in the period, corresponding to the estimated value to be paid in the future.

b) Provisions are set aside periodically throughout the useful life of the asset.

Both of the above approaches, in the author's view, have specific inconsistencies:

– For option a, the value of liabilities is measured and presented appropriately, but the value of costs recognized in the period does not ensure the appropriate principle.

– For option b, although expenses are recognized appropriately between periods, the value of the reserve presented on the annual financial statements does not reflect the actual obligations of the enterprise.

From the above analysis, the author offers a solution to complete the legal content of provision accounting for refund costs in Vietnam according to current international practices as follows:

- For reconstitution costs, Circular No. 200/2014/TT - BTC - Guiding the corporate accounting regime, issued on December 22, 2014 stipulates that an increase in a reserve but according to international practices will not be recorded an increase in costs:

As Specified in International Accounting Standards

Accounting for decommissioning costs is specified in the Standards as follows:

- IAS 16: prescribing the method of initial recognition

– IAS 37: stipulating the timing and value of provisioning

– IFRIC 1: guide accounting methods in case of changes in the appropriation reserve value *(The International Financial Reporting Standards Interpretation Committee (IFRIC) is the guiding body of the International Financial Reporting Standards Board (IASB))*

– In addition, environmental restoration costs are accounted for in accordance with IAS 02 – Inventories

(a) IAS 16 prescribes the method of initial recognition

IAS 16 p16 regulations:

"The cost of an item of property, plant and equipment comprises:

(c) the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period."

Thus, according to the provisions of IAS 16, the cost of site return will be recognized in the cost of the asset when meeting the conditions for the time of recognition specified in IAS 37. This value will then be gradually allocated to periodic expenses based on the depreciation method and useful life of the asset.

Thus, according to IAS16 - PPE, at the time of initial recognition, the accountant recorded an estimate and recorded the cost of reversal for the asset put into use as follows:

Dr. Acc 211 (Cost of Property, Plant and Equipment)

Cr. Acc 352 (Provision for liabilities under IAS 37)

(b) IAS 37 stipulates the value of provisioning

IAS 37 p36 regulations *"The amount recognised as a provision shall be the best estimate of the expenditure required to settle the present obligation at the end of the reporting period"*.

Thus, the written value of the full price increase of assets as prescribed by IAS 16 is the most reliable estimate of the cost value that the enterprise will have to spend to fulfill its obligations at the time of reporting. IAS 37 also requires that this estimate should reflect the time value of the money as well as the risks associated with the provision, as set forth in p45-47:

"45 Where the effect of the time value of money is material, the amount of a provision shall be the present value of the expenditures expected to be required to settle the obligation.

46 Because of the time value of money, provisions relating to cash outflows that arise soon after the reporting period are more onerous than those where cash outflows of the same amount arise later. Provisions are therefore discounted, where the effect is material.

47 The discount rate (or rates) shall be a pre-tax rate (or rates) that reflect(s) current market assessments of the time value of money and the risks specific to the liability. The discount rate(s) shall not reflect risks for which future cash flow estimates have been adjusted."

Thus, when determining the value of provision for site return, enterprises need to pay attention to two factors:

– Time value of money; and

– Risks associated with the reserve.

(b1) Time value of money

IAS 37 states that, when the effect of the time value of money is material, the provision value is the present value of the estimates to be paid in the future to pay for the obligation to return the premises. As for the cost of returning the premises, usually the enterprise will be obliged to perform for about 5-10 years, even 30-50 years, so it is appropriate to discount future cash flows to the present value as stipulated in IAS 37. According to PwC, the interest rate representing the time value of money under normal conditions is the interest rate on government bonds in the same currency and the maturity period is similar to the expected time of repayment. The implementation of discounting future value to present value to represent the time value of money can be done in two ways:

– Discounting future prices (including the effects of inflation) using nominal interest rates; or

– Current price discounts (excluding the effects of inflation) using real interest rates.

There is the following illustrative scenario:

- At Emperor Company, on January 1, 2018, built a hotel on leased land in Tuan Chau Island. The lease period is 50 years and Emperor Company is obliged to demolish and return the land to its original state at the end of the lease term.

- The demolition cost at this time in the market is estimated at about 300 million VND. Assuming that the interest rate on government bonds denominated in VND with a term of 50 years is 5%, the expected inflation rate is 1.5% / year. Discounting future cash flows to present value to represent the time value of money can be done in one of two ways:

– Adjust the current price (VND 300 million) for the inflation rate (1.5%) to determine the future price in 50 years with a value of VND 631,572,726. Then the future price discount uses the nominal interest rate (5%) to discount to the present value, with a value of VND 55,075,496.

– The current price discount (VND 300 million) uses the real interest rate, where:

(1 + Real interest rate) = (1 + Nominal interest rate)/(1 + inflation rate)

From this we calculate the real interest rate of 3.45%

Discounting VND 300 million for an interest rate of 3.45%, we get a current value of VND 55,075,496.

Thus, the present value of cash flows in both cases is the same.

(b2) Risks associated with the reserve

IAS 37 does not contain specific guidelines for adjusting the risks associated with the provision. The standard only notes that accountants need to pay attention to ensure that risk adjustments are not duplicated, for example, if cash flows have already been adjusted for risk, the discount rate will no longer be adjusted:

"The discount rate(s) shall not reflect risks for which future cash flow estimates have been adjusted".

To adjust the present value of the reserve to reflect the risks attached to the reserve, can be done through two ways:

– Discounting adjusted cash flows for risk using an unadjusted interest rate for risk; or

– Discounting unadjusted cash flows for risk using the adjusted interest rate for risk.

In practice, determining the rate of interest adjusted for risk is not easy. Therefore, accountants often adjust cash flows for associated risks, then use the unadjusted interest rate for risk to discount to present value.

To better understand these two methods, consider the following example:

Based on the above example, the estimated value that Emperor Company must pay after 50 years to fulfill the obligation to return the premises is VND 631,572,726. However, the actual costs that may be incurred range from VND 600 million and VND 750 million. Emperor Company is risk-averse, and is willing to accept payment of costs with the value of VND 675 million, instead of taking the risk that the actual costs incurred may be up to VND 750 million.

Thus, to determine the present value of the reserve, the accountant will discount the adjusted cash flow value for risk (VND 675 million) to the unadjusted discount rate for risk (5%). Thus, the reserve value is VND 58,862,516.

To determine the adjusted discount rate for risk, the accountant may discount the value of unadjusted cash flows for risk (VND 631,572,726) to the appropriate interest rate to achieve the current value of VND 58,862,516, in this case 4.86% (lower than the discount rate not adjusted for risk).

Accounting:

Dr. Acc Asset Cost: 58.862.516 VND

Cr. Acc Provisions: 58.862.516 VND

Every period, the enterprise writes an increase in the reserve value payable, and at the same time writes an increase in financial costs in the period.

(c) IFRIC 1 guiding accounting methods in the event of a change in the reserve value of appropriations

According to IFRIC 1 guidelines, in case the reserve value changes due to a change in the timing or value of the estimated cash flow to fulfill the obligation, or a change in the interest rate:

– The changing value of the reserve will be added to or subtracted from the cost of the relevant asset; and

– The value minus from the historical cost of the asset does not exceed the carrying value of the asset. If the decrease in the payable value of the provision is greater than the remaining value of the asset, the excess value will be immediately recognized in the business results for the period.

– If the increase in the value of the provision leads to an increase in the cost of the asset, the enterprise may consider the loss of asset value as stipulated in IAS 36.

– When the asset has reached the end of its useful life, all changes related to the provision payable are immediately recognized in the business results for the period. The above rules are based on the assumption that the business uses the original pricing model.

4.2.3. Solutions to complete legal contents on provision accounting for fixed asset repair costs in Vietnam according to international practices

In terms of general accounting principles, both VAS and IFRS divide subsequent expenditures into 2 types:

+ *Costs for repair/maintenance of fixed assets and*

+ Cost of upgrading / renovating fixed assets: For the cost of upgrading and renovating fixed assets, the recognition between VAS and IFRS is the same: capitalized in the value of fixed assets.

The author discusses the basic differences in the cost accounting for repair/maintenance of fixed assets. Repair and maintenance of fixed assets are divided into 3 groups:

+ Regular maintenance of fixed assets

+ Major unusual repairs

+ Periodic maintenance of fixed assets according to technical requirements

The following will analyze and compare between VAS and IFRS on how the accountant records the cost of repair/maintenance of fixed assets in each case as follows:

(a) For regular maintenance costs of fixed assets

For this expense, VAS and IFRS both require recognition in expenses in the period. For example: If a motorcycle has to perform an oil change every month (or every 1,500 km), the cost of the periodic oil change is accounted for in the periodic cost.

(b) For abnormal repair costs/Major repair costs

When incurring costs other than periodic maintenance/maintenance costs, VAS requires to separate repair costs to maintain the operating condition of fixed assets and costs that help extend the life or increase the usability of assets. However, in practice it is difficult to distinguish whether an expenditure is to maintain operational status or to increase functionality or both, so international standards offer an open approach and are easier to apply in practice.

For example: A car in use is damaged, possibly due to a collision in traffic or other technical errors, the repair cost is 500 million VND.

– For VAS: Fully recognized in the cost in the period (if the value is small) or recorded in the prepaid cost and allocated for a period of up to 36 months if the repair value is large.

– For IFRS: It will be determined whether this repair will include the replacement of critical parts of the asset.

+ Repair costs mainly include the replacement of important parts of the asset: in this case, international standards require capitalization of the value of replacement parts to the value of fixed assets, while writing down the residual value of the replaced parts (including cases where previously replaced parts are not recognized, and depreciation separately). IAS 16 on PPE outlines several methods for determining the value of parts to be written down in this case, of which the replacement cost method is commonly used.

+ Repair costs if mainly include labor costs, replacement costs of non-essential parts, other costs will be fully recognized in expenses in the period.

In both cases, a large expense value will be recognized as an expense in the period to reflect the fact that the loss has taken place instead of deferring it as an asset item (upfront cost) as stipulated by Vietnamese accounting standards.

(c) For periodic fixed asset maintenance costs according to technical requirements (Overhaul)

(1) According to VAS: For fixed asset costs according to technical requirements that require periodic maintenance (for example every 5 years), VAS allows two directions of handling:

– Case 1: Deduct the cost of major repairs of fixed assets annually in advance, and at the same time record a reserve payable (previously according to QĐ15/2006/QD-BTC as payable expenses – 335)

According to Circular 200/2014/TT-BTC, for fixed assets where the repair is cyclical, enterprises are entitled to deduct the estimated repair costs in advance into annual costs. For this case, when property repairs arise, accounting is as follows:

If the enterprise has a repair plan at the beginning of the year, has made an estimate into the annual cost: When the enterprise has planned a major repair of fixed assets from the beginning of the year, the enterprise can deduct in advance the cost of major repairs of fixed assets according to a specific plan:

Every period, the accountant deducts in advance the cost of major repairs of fixed assets as planned, recording:

Dr. Acc 627/641/642

Cr. Acc 352 (3524) – Provisions

Actual major repair costs incurred, record:

Dr. Acc 2413 – Major repairs of fixed assets

Cr. Acc 111/152/153/214/334/338…

When major repairs to fixed assets are completed, the actual cost of major repairs incurred, record:

Dr. Acc 352 (3524) – Provisions

Cr. Acc 2413 – Major repairs of fixed assets

The accountant shall handle the difference in the actual amount of major repair costs incurred compared to the amount deducted in advance according to the plan (if any), recording:

+ If the actual arising number is greater than the previous extract, it will be supplemented and recorded:

Dr. Acc 627/641/642…

Cr. Acc 352 (3524) – Provisions

+ If the actual amount incurred is less than the previous deduction, write down expenses (According to the CIT Law) or write off other income increases (Based on VAS 15 – Accounting Standard No. 15), record:

Dr. Acc 352(3524) – Provisions

Cr. Acc 627/641… or Acc 711 – Other income

– Case 2: In case of failure to deduct the cost of major repairs of fixed assets, VAS requests to re-suspend the cost of major repairs of fixed assets on the prepaid cost account (if the value is large), then make allocation to expenses in the period for a period not exceeding 36 months.

Observe

+ In case No. 1, the recognition of a reserve payable is inconsistent with the definition of recognition of liabilities (according to which the enterprise must have current obligations - legal or constructive obligation).

+ In case No. 2, the provision on the allocation of repair costs for a period of 3 years is also not really appropriate because it violates the principle of suitability.

b) According to IFRS: IFRS guidance on cases when Major inspections/Overhauls

– For major inspections, international standards require that costs not be deducted in advance, because at the time of deduction there are no “current obligations arising from past transactions” and therefore not yet eligible to recognize a reserve in particular and a liabilities in general. For example, the business can stop using the asset and then will not have to pay any costs related to repairing/maintaining the asset. Note that the advance deduction of periodic asset maintenance costs according to this technical requirement is different from the case of recognizing the provision for decommissioning costs because in the case of Decommissioning costs, the enterprise already has a legal obligation.

– The treatment for major inspections is the same as for replacement parts, The enterprise writes down the entire replacement part (carrying amount) of the previous cost if it has not been fully allocated (regardless of whether the previous major inspection overhaul cost is recognized and depreciated separately), at the same time capitalize the cost this time into the asset value (recognition separately from other tangible parts and depreciation during periodic maintenance according to specifications, for example in this case 5 years).

In fact, the FASB Financial Accounting Standards Board (which sets accounting rules for public and private companies as well as non-profit organizations in the United States) has not accepted advance deductions for major repairs after 2005:

> An interesting question is whether a company can accrue planned maintenance overhaul costs *before* the actual costs are incurred. For example, assume that Southwest Airlines schedules major overhauls of its planes every three years. Should Southwest be permitted to accrue these costs and related liability over the three-year period? Some argue that this accrue-in-advance approach better matches expenses to revenues and reports Southwest's obligation for these costs. However, reporting a liability is inappropriate. To whom does Southwest owe? In other words, Southwest has no obligation to an outside party until it has to pay for the overhaul costs, and therefore it has no liability. As a result, companies are not permitted to accrue in advance for planned major overhaul costs either for interim or annual periods. [10]

From the above analysis, the author offers a solution to complete the legal content of preventive accounting for fixed asset repair costs in Vietnam according to current international practices as follows:

- For the cost of periodic maintenance of fixed assets according to technical requirements (Overhaul) for fixed assets where the repair is cyclical, Circular No. 200/2014/TT - BTC - Guiding the enterprise accounting regime, issued on December 22, 2014 is not stipulated to allow enterprises to deduct the estimated repair costs in advance into annual costs. As analyzed above, the provision of pre-deduction for the cost of repairing cyclical fixed assets as stipulated in the current Circular 200/2014/TT-BTC is wrong with the nature of a reserve under the provisions of IAS 37 - Provisions, Contingent Liabilities and Contingent Assets. Thus, Circular 200/2014/TT-BTC in stipulating the contents of Acc 3524 - Other payable provisions should be ignored *"... periodic repair and maintenance costs, fixed assets ...)*

The reflection of Acc 3524 in Circular 200/2014/TT-BTC should be amended to: "Account 3524 - Other payable provisions": This account reflects other provisions payable by law in addition to the provisions already reflected above, such as costs for environmental restoration, costs for cleaning, restoring and returning premises, provision for severance pay in accordance with the Labor Law…"

The instructions on accounting for pre-deduction of fixed asset repair costs according to technical requirements that must be periodically repaired (aircraft, ships...) in Point c, Section 3, Article 62 of Circular 200/2014/TT-BTC should also be eliminated

- Accounting for periodic fixed asset maintenance costs according to technical requirements (Overhaul) for fixed assets whose repairs are cyclical will apply the provisions of International Accounting Standard IAS 16 - Property, Plant and Equipment issued by the International Accounting Standards Board

Excerpts 43 and 44 are specified in IAS 16 - Property, Plant and Equipment as follows: (According to https://ifrs.vn/)

"43. Each part of a property, plant and equipment whose full cost accounts for a significant proportion of the total cost of that asset must be depreciated separately.

44. The unit allocates the amount in the initial recognition of a property, plant, and equipment to critical parts of that asset and depreciates each of these parts separately. For example, it is possible to depreciate the airframe and engine of the aircraft separately. Similarly, if the entity acquires real estate, plant and equipment under an operating lease agreement of which the unit is the lessor, the entity may separately depreciate the amounts reflected in the cost of the asset arising from favorable or adverse lease terms relative to market conditions. - IFRS.VN"

For factories, machinery and equipment that require cyclical major repairs, when put into use, the enterprise will “allocate the amount in the initial record of a property, workshop and equipment to important parts of that asset and depreciate each of these parts separately”. This means that, for each asset’s own depreciation department, the accountant determines the unique useful life of each part of that asset when the asset starts to be put into use.

5. DISCUSSION AND CONCLUSION

On May 23, 2022, Deputy Prime Minister Le Minh Concept signed Decision No. 633/QD-TTg on approving the Accounting and Auditing Strategy to 2030. Thereby improving the quality of the economic-financial-budget information system increasingly openly and transparently, honestly reflecting economic-financial information and data in the national economy, meet the requirements of management, administration and decision-making of State management agencies as well as other enterprises, units and organizations; strengthen international integration, cooperate with international organizations in accounting and auditing, create close links and mutual recognition between Vietnam and other countries in the region and the world.

For that reason, the author is aware that the improvement of the system of legal documents in general and documents related to accounting for provisions for liabilities is very important in Vietnam today. The study presented legal regulations on accounting for provisions according to current legal documents of Vietnam as well as principles according to international practices. On that basis, the author has proposed solutions to complete the legal content of accounting for provisions for liabilities in Vietnam.

SITUATION OF THE LEGAL FRAMEWORK ON GREEN BOND IN VIETNAM

PhD. Nguyen Tien Duc[1]

Abstract: Climate change and pollution are big problems all over the world, not just in one country. Because of this, countries are starting to focus more on protecting the environment and finding ways to grow their economies in a "green" and sustainable way. As one of these countries, Vietnam is using special bonds called green bonds to help fund projects that protect the environment. This is a critical effective tool for mobilizing capital to attract investment capital from domestic and foreign investors for sustainable environmental protection projects in Vietnam. However, there are still some things that need to be done to make sure the rules for issuing these bonds are clear and complete. This paper examines the present regulations for green bonds in Vietnam and suggests ways to improve them using qualitative approaches.

Keywords: green bonds, sustainable development, green finance, green financial tools

I. INTRODUCTION

The serious socio-economic effects of climate change have led countries to prioritize the environment and green growth for the economy. To implement green growth, countries need an enormous source of capital to implement green projects for the environment. According to the International Energy Organization (IEA), to halve global emissions by 2050, the world will need 46 trillion USD, equivalent to 1 trillion USD/year. Countries are beginning to employ specialized financial instruments called green bonds to raise this money. These bonds are a way for nations to get money for projects that help the environment and make sure that growth is sustainable. Green bonds have been around since 2008 and are becoming more and more crucial for countries to get the money they need for environmental projects.

Vietnam is one country that has already suffered and is expected to continue to suffer severe losses because of climate change. In response to these problems and to keep its commitments made at the COP-21 United Nations Climate Change Summit, the Vietnamese government has put in place a variety of forceful reactionary measures, such as issuing green bonds. It urged the economic sector to move toward turning green and towards sustainable economic growth through green bonds, which raised money for green investment firms. Despite tremendous development potential, Vietnam's issuance of green bonds has underperformed.

It is implementing green growth policies connected with creating green capital markets to finance environmental improvement projects that the Government has endorsed and given priority in the face of substantial environmental repercussions on socio-economic development. The development of a legal framework for green bonds is a crucial building block for encouraging the expansion of the market for these securities. This is a vital and effective tactic for attracting capital from both domestic and foreign investors to finance sustainable environmental preservation activities in Vietnam. In the current circumstance, it is vitally required to look for solutions to this issue based on the experiences of other countries.

II. LITERATURE REVIEW

Green bonds provide fixed income to holders and are defined as standard debt instruments. The intention behind selling these debt instruments is to generate revenue, which can be clearly stated as funding for "green" projects or projects related to environmental protection.

The Climate Bonds Initiative (CBI) defines "green bonds" as "bonds issued by governments, banks, localities or businesses that issue and label green bonds as debt securities including securitization, private placement, and guaranteed bonds aimed to mobilize capital for climate change solutions."

The group of organizations including 4 global banks (Bank of America Merrill Lynch, Citi Group, Crédit Agricole, and JPMorgan Chase Bank) worked together to draft a Code of Principles for the issuance and use of revenue from green bonds (Green Bond Principles - GBP). According to the GBP 2015 Code of Conduct, "green bonds" are any sort of bonds that use the revenues from the issuing of bonds for partial financing or refinancing, or for a completely new green project or green project that is running eligible for funding and abides by the GBP principle established.

The term "green bonds" is only used in a few legal papers in Vietnam now, and it is defined as follows:

+ Article 4 of Decree No. 163/2018/ND-CP, which regulates the issuance of corporate bonds, states that "Green enterprise bonds" are those that are issued for investing in environmental protection projects as per the Environmental Protection Law.

+ Decree No. 95/2018/ND-CP issued on June 30, 2018, providing for the issuance, registration, depository, List, and trade of government debt instruments on the stock market as stated in Article 21 as follows: "Green bonds are a type of Government bond issued to invest in projects related to environmental protection activities by the Bao Law environmental protection (green project) and is on the list of projects allocated public investment under the provisions of the Public Investment Law, the State Budget Law".

+ The Environmental Protection Law 2020, in Article 150, defines: "Green bonds are bonds issued by the Government, local governments, enterprises... The investment project benefits the environment and raises funds for protection".

By the aforementioned concepts, it is clear that green bonds are first and foremost a type of bond issued by the subject (Government, local government, business), where the proceeds from the issuance of green bonds are used in part or in full (typically as a whole) for green projects (projects towards environmental protection goals).

Sustainable development, with green growth as the cornerstone, has become an essential demand driven by the Party and the State to promote successful economic development, a fair society, and environmental protection. The objective of green growth, which takes the work of establishing green financial markets (including green bonds) as a cross-cutting vision, has been institutionalized through law texts from 2015 to the present. Green bonds have arisen as a financial tool in recent years, allowing issuers (governments, local governments, and enterprises) to raise funds to fund green initiatives and environmental friendliness. However, green bonds are still a new capital mobilization channel in Vietnam today, in the pilot phase of application in some localities, and lack specific regulations on issuance and selection standards to choose green projects and evaluate the environmental efficiency... that green projects bring.

III. METHODOLOGY

The author uses historical materialism and dialectical materialism as a framework for writing the paper. According to which the author employs particular social science research techniques, such as:

- Analytical techniques: The author uses this technique to evaluate the current state of the green bond legal framework as a foundation for concluding science. Throughout the whole writing process, this technique is utilized.

- General method: The author uses the general technique while reviewing to get to broad findings, viewpoints, ideas, and specific recommendations connected to the study topic of the paper.

- Statistical method: The statistics in the article were compiled using data from a variety of primary sources, including the General Statistics Office, the World Bank, the International Monetary Fund, UNCTAD… and the findings of earlier research.

In addition to the aforementioned conventional research techniques, the article also employs survey techniques, expert interviews, statistics based on data, annual summary reports of the Government, Ministry of Planning and Investment, Ministry of Finance, State Securities Commission, and localities to address the content required by the article.

IV. STATUS OF THE LEGAL FRAMEWORK FOR GREEN BONDS IN VIETNAM

Vietnam has viewed green growth as a key component of sustainable development in the face of climatic change and severe environmental degradation. In recent years, Vietnam has produced and published a significant number of normative legislative documents with the express purpose of establishing the legal foundation for implementing and expanding green development.

The Central Executive Committee of Course XI enacted Resolution No. 24-NQ/TW on June 3, 2013, during the Seventh Conference, on taking aggressive measures to combat climate change, enhancing resource management, and promoting environmental protection through green financing. The resolution identifies "promote the transformation of the growth model associated with restructuring the economy towards green growth and sustainable development" as its primary objective. It was releasing a set of metrics to measure the effects of sustainable development, including green growth into the national criteria, and launching a pilot project to build a green economy model, an industry, an urban green space, and a rural green space.

The national action plan for green growth for the years 2014 to 2020 was then authorized by the Prime Minister on March 20, 2014, under Decision No. 403/QD-TTg. The resolution listed 66 specific action tasks, including activity 2: "Complete the institutional framework to promote economic restructuring in line with the Green Growth Strategy," as well as 4 primary issues, 12 operational groups, and 12 operational groups.

Even though the government has policies and action plans for promoting green growth, developing a green financial system generally, and growing the green bond market specifically, there are still many issues and a lack of a legal framework for these operations.

On August 14, 2017, the government released Decision No. 1191/QD-TTG to approve the Bond Market Development Roadmap for 2017-2020, Vision to 2030, in which Section 3, Article 1 offers a remedy to complete the market policy framework with green bonds. It is specifically necessary to have issuance methods and market development policies for green bonds so that issuers may generate money by selling bonds to fund projects. According to Decision 1191/QD-

TTG, the Ministry of Finance is the primary organization responsible for setting policy processes for the green bond market border, together with the State Bank and the Ministry of Planning and Investment.

On June 30, 2018, the government released Decree 95/2018/ND-CP on the issuance, registration, depository, list, and trading of government debt instruments on the stock market, including green bonds. This kind of government bond was subsequently issued to finance projects related to environmental protection activities by the Environmental Protection Law (green projects) and leniency in the list of projects allocated for public investment by the Public Investment Law and State Budget Law. The decree promoted the issue, listing, and trading of this type of bond. The decree also requires the Ministry of Finance to collaborate with the Ministries of Planning and Investment, Natural Resources, and Environment to develop a green government bond issuance plan that considers the following aspects: the purpose of the issuance, the volume issued, the conditions and terms of the bonds, the recipients of the bonds, the process of registration, depository, listing, and trading, as well as a list of projects that will use the bonds.

Then, on December 4, 2018, Decree No. 163/2018/The ND-CP, which takes the place of Decree No. 90/2011/ND-CP (effective October 14, 2011), further completes the legislative framework for green bonds by regulating the issuing of corporate bonds issued by the government. Decree 163/2018/ND-CP regulates the issuance of individual bonds (including convertible bonds) of domestic enterprises, inside and outside the territory of Vietnam, but does not regulate the issuance of corporate bonds to the public. The phrase "green enterprise bonds" and several specific green bond regulations were first used by the government in Decree 163. Such as:

- For the principle of issuing and using green enterprise bond capital: The competent authority has authorized the disbursement for environmental protection projects by the given option, separate monitoring management, compliance with general requirements, as well as the accounting of capital from bond issuance.

- For revealing information before the enterprise's issuance of green bonds: In addition to the content of disclosure required under general rules, issuers must publish information regarding the regulatory procedure and capital disbursement from the issuing of green bonds as specified.

- As part of the content of periodic disclosure of green bonds, the issuer must prepare a capital usage report, payment schedule, project implementation status, and environmental effect assessment report; the capital use report must include the audit organization's opinion.

- For the corporate bond information page on the Stock Exchange: businesses that issue green bonds must provide information about the issuing enterprise's financial position, principal payment situation, bond interest; capital use situation, disbursement schedule, project implementation progress, and environmental impact assessment report, in addition to basic information and content about bonds.

The government is working hard to complete the legal framework for green bond development, developing corridors that attract investors, particularly groups of investors interested in green finance, environmental protection, and greening the economy as quickly as possible. Encourage businesses to issue green bonds to attract resources into green, clean sectors and ensure long-term growth. However, at this period, the creation of a legal framework was insufficient to remove the barriers to the issue of green bonds. For example, ICMA's green bond ideas such as monitoring the purpose of utilizing funds from issue, separate account accounting, and post-issuance reporting lack clear and meaningful law, requiring regulators to spend additional time drafting and providing guidance materials.

The Environmental Protection Law No. 72/2020/QH14 was adopted on November 17, 2020, and it went into force on January 1, 2022. This is Vietnam's highest legal document on green bonds. The Environmental Protection Law 2020 specifies several green bond issues in Article 150, including: (i) green bond definition; (ii) green bond issuers (governments, local governments, and businesses); (iii) how the proceeds from the issuance of green bonds are used; (iv) green bond issuers; and (v) incentives for green bonds.

On January 10, 2022, the Government issued Decree No. 08/2022/The ND-CP, which guides the Environmental Protection Law defining green bonds, for more specific advice on various problems relating to green bonds. Article 154, for example, describes a green-funded project as issuing green bonds as an investment project in environmental protection, investment projects that provide prescribed environmental benefits; or in Article 157, the proceeds from the issuance of green bonds must be used to carry out projects on the green classification list by the provisions of Clause 2, Article 150 of the Law on Environmental Protection (for example, renovating and upgrading environmental protection works; technological changes in the direction of applying the best existing techniques; ap using circulating economy, green economy, low carbon emissions; re-education, environmental restoration after environmental incidents...). Furthermore, the Decree specifies how to apply the Information Disclosure Mode, report the management position, distribute money collected through green bond issuance, preferential policies for green bond issuers and green bond investors, and so on.

The legislative framework for green bonds in Vietnam has been designed fully and exhaustively, providing a legal foundation for the growth of the Vietnamese green bond market. However, there is still some content to continue to be finalized, such as:

- Raising investor knowledge of green bonds: Investors should be given sufficient information on green bonds, such as green investment project assessment criteria, green investment project classification portfolio, and green bond incentives.

- Encourage green bond issuers: Companies should be encouraged to issue green bonds to raise funds for green investment initiatives.

- Completing the infrastructure system for the green bond market: A comprehensive and efficient green bond market infrastructure system, comprising a trading system, depository system, and credit rating system, is required.

Some suggestions for promoting green finance in Vietnam

Although the Vietnamese government has established and approved the legislative framework for green bonds, there are still certain limitations. This calls for a higher quality than the legal text system. Green bond principles must also be explicit and thorough for the green bond issuer to comply. Furthermore, transparency information on the issue and use of funds from green bonds should be tightly regulated as a basis for inspection and oversight of interested parties. Competent authorities should also conduct research and development of an indicator set to assess sustainable development enterprises to pique the attention of investors in green bonds.

First and foremost, the government must complete the policy framework for developing the green bond market. The growth and completeness of the legal system, the creation of a legal framework for socioeconomic interactions, and the ability of governments, corporate entities, associations, and training organizations under their authority to create an incentive environment or supply products and financial services need to improve liquidity for green bonds and support the shift from the "deep into the traditional" sector to the "green" economy. Furthermore, a policy system that promotes corporations and organizations to invest in green initiatives is required.

Second, there is a policy to encourage the issuing of international green bonds to attract substantial investment. Currently, Vietnam is collaborating with overseas organizations to provide advice, assistance, and assessment in the market for the issue and development of green bonds. The bank's strong credit rating and expert management make it a good choice for the government to increase its role in issuing and managing green bonds.

Third, design particular green project selection criteria. Green bonds are a relatively new stock on the Vietnamese market. This expansion and market development promise to be a significant step forward for the Vietnamese economy and aid in the resolution of the country's present critical environmental pollution crisis. To accomplish so, agencies, ministries, and companies must quickly create documentation to guide the execution of the evaluation process, as well as appraise the degree of "green" projects in the "Green project portfolio." Creating intermediate entities, such as credit rating agencies and independent review groups, to check the quality of green bond issuing projects.

Fourth, the support policy mechanism should be reviewed and supplemented, and enterprises and organizations should be encouraged to invest in green initiatives - reform legal processes in the posting of green bonds. Preferential tax and fee regulations should be examined and updated to encourage and assist issuers and investors to actively engage in the green bond market.

V. DISCUSSION AND CONCLUSION

Although the issuing of green bonds has been addressed in several legislative documents, decrees, and guiding circulars, there has yet to be a formal legal framework that offers explicit instructions and guidelines for the issuance and usage of green bonds. In particular, the Government of Vietnam must issue specific documents related to green bonds, which must stipulate Vietnam's standards in determining green bonds, green projects, and principles in issuing and managing capital formed from green bonds. These criteria must be designed in line with the GBP Green Bond Principle, but they must also reflect Vietnam's unique peculiarities in terms of economic development, politics, the environment, and society.

As a result, the Vietnamese government must study, investigate, and complete the overall bond market management mechanism, as well as green bonds. Based on the existing legal framework, specific papers should be published that establish the requirements for assessing green bonds, and green projects, as well as the rules of issuance and management, with capital formed from green bonds serving as a foundation for inspection and oversight by authorities.

THE RISE OF VIETNAM'S PRIVATE ECONOMY: A CATALYST FOR ECONOMIC ADVANCEMENT

Dr. Nguyen Huu Tan[1], Dr. Luong Quang Hien[2], Vu Mai Ngoc

Abstract: Throughout Vietnam's history, its economic system has undergone significant transformations. The initial economic system established in the 1946 Constitution lacked specific provisions dedicated to the economy. It neither introduced the concept of economy nor implemented a centrally planned approach. Instead, the 1946 Constitution aimed to safeguard private ownership and introduced the notion of a mixed economy, replacing the exploitative colonial system. The Vietnamese Constitution promoted the presence of both domestic and foreign private enterprises, along with an agricultural society primarily led by private farmers. Over the course of 37 years of implementing reforms, the role of the private sector in Vietnam's economy has experienced fundamental changes. The Party's perspective is to foster a diverse economy where the private sector plays a significant role in driving the nation's prosperity and holds a distinctive position compared to the public sector and sectors involving foreign investment. This article underscores the genuine value placed by the state on the private economy. In practice, the government has adapted to and capitalized on the advantages offered by its development.

Keywords: State economy, private economy, foreign-invested economy, Vietnam.

1. INTRODUCTION

Following the collapse of the centrally planned economic model in the late 1980s, Vietnam embarked on a reform process that began with granting land to individual farmers and recognizing private enterprises. In 1986, the Vietnamese Communist Party introduced the "Doi Moi" policy, which initiated economic renovation. Since then, Vietnam has embraced and encouraged a market economy, resulting in a shift from a rigid, agriculture-dominated planned economy to a more industrialized economy with a focus on market-oriented principles.

In 2001, Vietnam amended its constitution and introduced the concept of a "socialist-oriented market economy" for the first time. The subsequent decade of reforms primarily focused on the relationship between the state and the market, as well as the process of liberalization in the state's relationship with democracy. This article aims to reflect the perspective of the Vietnamese Communist Party and the government regarding the private sector, its contribution to the economy, and their encouragement of its role in driving the country's prosperity.

The private economy is defined as a component of the national economy that develops based on private ownership of the means of production. It has evolved through the opening of the market economy and successive party documents that permitted, supervised, and ultimately encouraged its growth.

The Doi Moi policy, initiated in 1986, aimed to develop a multi-component market economy with state management guided by socialist-oriented principles. The goal was to "create a strong force to unleash the productive forces and develop the market economy towards socialism" (Central Committee Meeting, 4th Congress). Subsequently, the 6th Central Committee Meeting,

---

[1] Email: nguyenhuutan@hvtc.edu.vn, Academy of Finance.

[2] Academy of Finance

6th Congress (3 - 1989), affirmed that "developing a multi-component market economy is a long-term strategic path towards advancing socialism."

At present (13th Congress - 2021), Vietnam maintains four economic components: the state economy, collective economy, private economy, and foreign-invested economy. These components consist of enterprises with varying legal forms and ownership rights. The establishment of the Private Economic Development Research Board aims to outline a development path for the private sector, which currently finds itself caught between a strong yet declining state economy and a gradually growing foreign-invested economy in Vietnam.

2. ACHIEVEMENTS AND THE CURRENT ROLE OF THE PRIVATE ECONOMY AFTER THE REFORMS

2.1. Achievements

The emergence of new private enterprises has witnessed remarkable growth, particularly in recent years. From 2011 to 2020, the number of newly registered businesses exceeded 1.035 million, almost double the figure recorded in the previous two decades (1991-2010). Despite the adverse effects of the Covid-19 pandemic, more than 400,000 new businesses were registered during the period of 2020-2021, with an average of over 133,000 new businesses per year. Furthermore, the average registered capital of these newly established enterprises experienced a significant increase, surging from 6.63 billion VND in 2011 to 16.57 billion VND in 2020.

Alongside the surge in new registrations, the number of active private enterprises has also witnessed robust growth, soaring from over 312,000 businesses in 2011 to surpass 660,000 businesses in 2020. Likewise, the count of non-agricultural business households has experienced a substantial rise, escalating from over 4.2 million households in 2011 to exceed 5.2 million households in 2020.

According to the 2022 Enterprise White Paper, published by the Ministry of Planning and Investment, the period from 2016 to 2020 demonstrated significant advancements in various indicators reflecting the scale of private enterprises when compared to the period from 2011 to 2015. Notably, the number of active businesses exhibited an impressive growth rate of 160.7%, accompanied by a 125.2% increase in the number of employees. Moreover, there was a substantial surge in capital by 235.5%, and fixed assets and long-term investments experienced remarkable growth of 254.0%, among other positive trends.

As of 2022, the private economy has established itself as a robust foundation within Vietnam's economic landscape, contributing approximately 42-43% to the country's GDP, accounting for 30% of state budget revenue, and employing approximately 85% of the workforce. Its significance lies in its ability to mobilize social resources for investment, drive business development, foster economic growth, facilitate economic restructuring, enhance budget revenue, improve living standards, and ensure social welfare.

After 36 years of implementing economic reforms, the private economy in Vietnam, according to 2022 statistics, constitutes approximately 75% of the country's GDP. However, this contribution primarily stems from the unofficial private sector, encompassing approximately 5.2 million production and business households, individual enterprises, economic entities, and nearly 30,000 cooperatives. In contrast, the official private sector, which comprises nearly 900,000 enterprises, contributes only around 25% to the GDP. Experts highlight the importance of shifting the focus from the unofficial sector to the official sector in terms of domestic product generation and employment in order to foster the private sector's competitiveness and its substantial contribution to sustainable economic development.

Vietnam's private enterprises have garnered international recognition, with notable companies such as Vingroup, T&T Group, Thaco, Vietjet, Sun Group, and Vinamilk exerting influence on the global supply chain. The country boasts approximately 29 private companies with a market capitalization exceeding $1 billion, and in 2021, six billionaires from Vietnam were members of the World Billionaires Club. Additionally, the number of enterprises employing over 1,000 individuals has consistently risen, increasing from 3.2 in 2010 to 8.7 in 2021, indicating an annual growth rate of 12.5% during this period.

Despite Vietnam witnessing around 120,000 - 130,000 new business registrations annually, the closure and dissolution rate remains high, reaching approximately 60% in comparison to the number of newly established enterprises. Consequently, to attain the target of 1.5 million businesses by 2025, an additional 400,000 newly registered businesses are required each year, nearly tripling the current business growth rate.

Regarding contributions to the state budget, the private economy's share has risen from 28.3% in 2010 to 30% in 2022, while the contributions from foreign-invested companies have experienced a substantial increase, surging from 26.3% to 42%. Conversely, the contribution from the state sector has declined from 45.4% to 28%.

However, the private economic sector, particularly individual businesses, faces challenges related to low labor productivity. Notably, the average income of workers in the individual business sector is comparatively lower than that of their counterparts in the state and foreign-invested sectors.

While the private economy in Vietnam has exhibited remarkable growth and made significant contributions to the country's economic development, there remain areas for improvement. Enhancing labor productivity, addressing the challenges faced by individual businesses in accessing resources, and promoting a more balanced contribution from the official private sector are key factors for ensuring the continued success and sustainability of Vietnam's private economy.

2.2. Roles of the private economy

The private economy has played a crucial role in driving economic growth, maintaining a substantial and stable share (around 38-40%) during the period from 2011 to the present. Moreover, it has significantly contributed to the overall social investment landscape. Between 2011 and 2020, private sector investments increased from over 545 trillion VND (accounting for 47.0%) to over 1,605 trillion VND (representing 57.3% of total investments). Prominent private enterprises have directly undertaken large-scale and complex infrastructure projects, including construction, real estate, bridges, ports, and airports. These endeavors have made remarkable contributions to the nation's development, transforming the social fabric and greatly enhancing infrastructure quality. Notable examples of such projects include Van Don Airport, Hai Van Tunnel, Deo Ca Tunnel, Hanoi - Hai Phong Expressway, Bach Dang Bridge, and more.

The private economy has also played a significant role in generating employment opportunities and improving livelihoods for workers. Approximately 60% of the workforce is employed in private enterprises across various sectors, with an average annual growth rate of nearly 4%. If we consider labor across all business households, private enterprises and business households together account for almost 74% of the workforce in various sectors.

Furthermore, the private economy has contributed significantly to promoting gender equality and empowering women through increased employment opportunities and income sources. Female workers constitute nearly 50% of the total female workforce across different types of enterprises. Additionally, women-owned businesses have not only created jobs and income but have also expanded their influence regionally and internationally. Many Vietnamese women entrepreneurs have been recognized and honored in prestigious rankings such as "TOP 50 Powerful Asian Businesswomen," "Outstanding ASEAN Businesswomen," "Powerful Women Entrepreneur Award," "50 Outstanding Business Leaders Changing Industries and Regions," and more.

The private economy also plays a crucial role in social welfare activities, particularly in expanding the coverage of social security and facilitating greater participation in social insurance programs. Private enterprises actively engage in social, community, and environmental initiatives, reflecting their social responsibility and commitment to societal well-being.

2.3. Issues

Despite achieving significant results, the development of the private economy still faces several persistent issues, particularly regarding its quality. These challenges can be observed as follows:

Firstly, the recent growth of the private economy has been characterized by a substantial increase in the number of small and micro-scale enterprises. According to the 2021 Statistical Yearbook, nearly 73% of private enterprises have a scale of less than 10 billion VND, and approximately 81% of private enterprises employ fewer than 10 individuals. The private sector lacks significant and robust enterprises. Its technological proficiency and capacity to participate in value chains, both domestically and globally, remain limited, particularly in low-value-added stages. As a result, the majority of export value is concentrated in foreign-invested enterprises, accounting for over 72% of the total export turnover.

Secondly, the contribution of the private economy does not proportionately reflect its quantity, scale, and potential. Its contribution to economic growth has remained relatively stagnant over an extended period, primarily driven by the informal sector (individual business households contributing up to 30% of GDP, while formal private enterprises contribute less than 10% of GDP). In contrast, during the same period from 2011 to 2020, the share of the FDI sector in GDP increased by nearly 5%, rising from 15.39% to 20% of GDP.

Despite private enterprises accounting for nearly 97% of the total number of businesses in the country, they contribute only 31.2% of pre-tax profits of all enterprises and less than 10% of GDP. The share of domestic revenue generated by private enterprises is relatively low, accounting for less than 20%. Conversely, the contribution of business households to state budgets is insignificant, amounting to less than 2%.

Thirdly, the operational efficiency of the private economy remains low, and its social labor productivity is relatively modest. On average, during the period from 2016 to 2020, active private enterprises accounted for 96.7% of the total number of enterprises, yet their labor productivity, measured at constant prices, was the lowest among economic sectors. It reached only 29.1% compared to the FDI sector and 24.6% compared to the state-owned economic sector.

Moreover, private enterprises exhibit lower profitability compared to the overall business sector, state-owned enterprises, and FDI enterprises. In the 2016-2020 period, the pre-tax profit-to-asset ratio for private enterprises averaged 1.4%, lower than the overall business sector's average of 2.4%. Similar trends can be observed in terms of the pre-tax profit-to-net revenue ratio (2.1% compared to 3.8%) and the pre-tax profit-to-owner's equity ratio (4.1% compared to 7.6%). The low profitability adversely affects the private sector's ability to accumulate capital and expand its scale.

Lastly, private economic entities face limitations in terms of resilience. A considerable number of businesses cease operations or dissolve each year. From 2011 to 2020, the average annual rate of business closures or dissolutions was approximately 73.5% of the number of newly registered businesses. The vulnerability of private enterprises has become more evident, particularly during the 2020-2022 period due to the adverse impacts of the Covid-19 pandemic.

3. SOLUTION TO PROMOTE THE DEVELOPMENT OF THE PRIVATE ECONOMY

3.1. Solutions from the State's perspective

To fulfill the Party's objectives of surpassing the middle-income trap, reducing reliance on foreign direct investment (FDI), and advancing the country's development, the State must augment institutional reforms, enhance the business environment, foster innovation, and elevate the level of national governance. The following key solutions should be prioritized:

First and foremost, it is crucial to consistently acknowledge the significant role of the private economy in our market-oriented socialist-oriented system. Private enterprises should be recognized as drivers of development and key contributors to bolstering the autonomy and self-reliance of the entire economy. This perspective should be evident in the construction, issuance, and implementation of mechanisms and policies pertaining to the private economy, as well as in the conduct of state management activities by officials and civil servants at all levels.

Secondly, effective implementation of the tasks and solutions outlined in Resolution No. 10-NQ/TW of the 5th Central Committee of the 12th Party Congress, which aims to develop the private economy into a vital driving force for the market-oriented socialist-oriented economy, should be continued. Regular inspections, monitoring, and evaluations of the implementation should be undertaken.

Thirdly, efforts should be focused on improving the transparency and stability of the legal system to foster confidence among private economic entities and promote their adherence to regulations. It is crucial to comprehensively address limitations, inconsistencies, and overlaps among legal documents, advance administrative reforms, reduce and transparently disclose administrative procedures, and eliminate unofficial costs imposed on businesses in their production and business activities. Mechanisms, policies, and laws that encourage the development of business households should be refined, actively promoting their formal registration and eliminating discrimination among different types of businesses.

Fourthly, it is necessary to create a favorable environment for private enterprises to exploit and utilize national resources by promoting equitization and divestment of state capital in enterprises where the State does not need to retain shares, and by minimizing the state's shareholding in businesses. The healthy development of factor markets should also be pursued.

Fifthly, enhancing the effectiveness and efficiency of state management, improving the quality of laws, and their enforcement is paramount. Constructing a responsive, efficient, and accountable government system, enhancing transparency, ensuring equal access for private economic entities to business opportunities, information, and resources, particularly financial resources and land, are important objectives. Priority should be given to removing barriers, direct administrative interventions, and addressing inequalities in accessing development resources. Transparency and public disclosure of land-use planning, land-use plans, and unused land resources are also essential.

Sixthly, the capacity of support institutions and organizations for enterprises, such as business development service providers, startup support centers, and legal consulting and support services for enterprises, should be strengthened.

Seventhly, supporting enterprises in enhancing labor productivity and focusing on the development and supply of high-quality human resources to the market are crucial. Issuing and implementing mechanisms and policies to encourage private investment in science and technology applications, research and development activities, and innovation are vital components of this endeavor.

3.2. Solutions from the perspective of the private economic sector

In order to foster development and success, the private economic sector must actively adapt to new trends and contexts, notably the Fourth Industrial Revolution, global uncertainties stemming from the Covid-19 pandemic, trade and military conflicts, and climate change, as well as deep international integration through new-generation free trade agreements. Private enterprises, in particular, should prioritize investment in innovation, bolstering technological capabilities, improving management proficiency, enhancing leadership capacity, and upgrading the quality of their human resources. These efforts will contribute to increased productivity, business efficiency, competitiveness, and successful integration into the production and value chains of larger corporations. Each individual enterprise should formulate clear plans and strategies to navigate both the short-term and long-term challenges. It is essential for enterprises to abide by laws and regulations, while placing significant emphasis on upholding the company's reputation and credibility with regards to the State, the community, customers, shareholders, and employees.

4. CONCLUSION

The development of Vietnam's private sector holds significant advantages in fostering an independent and self-reliant economy alongside the state-owned and collective sectors. The private economy has the capacity to attract a substantial portion of the population to participate in "ordinary" economic activities, contingent upon the government establishing genuine equality between foreign and state-owned enterprises, as well as between small and large businesses. Moreover, the implementation of supportive policies for small and medium-sized enterprises and the cultivation of a favorable business environment and startup ecosystem are vital. Nevertheless, obstacles persist in accessing land and bank loans for unrelated entities, hindering the realization of these advantages. Therefore, it is imperative to establish an effective system for safeguarding intellectual property rights to ensure the sustainable development of the private sector.

Vietnam must shift its focus towards the growth of existing businesses rather than solely pursuing an increase in the number of newly registered enterprises. Reforms in the Company Law, tax management regulations, taxation, and other relevant laws are necessary to establish an appropriate legal framework that facilitates the operation of sole proprietorships and individual businesses. This comprehensive approach serves as a fundamental strategy to encourage self-employed individuals and business owners to transition into formal enterprises, ultimately striving towards the target of 1.5 million efficiently operating businesses, and eventually reaching 2 million.

In the metaphorical context of Vietnam's economy as a ship, the private economy assumes the role of the driving force that determines the pace of its journey. However, it is important to note that the direction and destination of the ship entail separate considerations that extend beyond the influence of the private sector.

DIVIDEND POLICY OF STEEL JOINT STOCK COMPANIES LISTED ON VIETNAM STOCK MARKET

Assoc. Prof., PhD. Nguyen Thi Ha[1], MA.,Nguyễn Thanh Sơn[2]

Abstract: Dividends are a part of a company's after-tax profits paid to shareholders. Dividends are considered a tool that provides information to investors about the financial health status of a joint stock company. Dividend policy represents the decision between paying profits to shareholders versus retaining profits for reinvestment. The implementation of dividend policies of joint stock companies is not the same but depends on many factors such as the results of production and business activities, the company's cash flow situation, financial strategy, and development strategy of the company, legal regulations, personal income tax, investor psychology, transaction costs and costs of issuing new shares, investment opportunities and investment capital needs, need to repay loan repayment, life cycle of the company, control of the company, ability to penetrate the capital market,... Based on statistics of 23 steel joint stock companies listed on the Vietnam stock market during the period 2016 - 2022, the article will focus on analyzing the current situation of dividend policies of steel joint stock companies listed on the Vietnamese stock market, thereby providing assessments and proposing solutions to improve dividend policy of listed steel joint stock companies in the coming time.

Keywords: Dividend policy, steel company, listed

1. INTRODUCTION

Although dividend policy is now quite familiar to many people. However, it is not common to understand it thoroughly. The company's dividend policy is still considered an issue that needs to be summarized in the most general and complete way. Dividends depend on the company's operating results and how dividends are paid depends largely on specific conditions as well as the company's strategies.

Dividend policy is one of the three most important policies that impact the interests of shareholders in the company. A company's dividend policy represents the decision to distribute profits into two parts: consumption (paying dividends to shareholders) and accumulation (reserving for reinvestment). Dividend policy determines how the company's after-tax profits will be distributed, how much will be retained for reinvestment and how much will be paid to shareholders. Therefore, dividend policy will affect the amount of equity in the company's capital structure and the company's cost of capital. The main content of dividend policy is expressed through the legal bases for implementing dividend payment decisions, dividend payment ratio, and dividend payment process and form.

In Vietnam today, dividend payments are still spontaneous and not highly strategic. Steel joint stock companies are no exception to this practice. Many companies' business is still unstable, which has significantly affected the company's dividend payments. There are companies that are doing quite well but do not have a strong enough strategy to build a strategic dividend payment policy. comb. Companies also pursue satisfying the needs of short-term investors rather than the long-term development orientation of the company; Many companies also use dividend policy as a tool to polish their company image; Although some large companies have initially established

[1] Academy of Finance, Email: nguyenha@hvtc.edu.vn

[2] University Hospital of Medicine.

strategic policies according to a certain trend, the majority of remaining steel companies do not have a stable, long-term strategy and still depend heavily on environmental factors. and business results; There are also some companies whose dividend payout ratio is on the rise, affecting the process of accumulation and future development... All of these things greatly affect the company's stock price. company in the market. Faced with that situation, it is necessary to have complete research on dividend policies in joint stock companies in general and in individuals.

2. CURRENT STATUS OF DIVIDEND PAYMENTS OF LISTED STEEL JOINT STOCK COMPANIES IN THE PERIOD 2016 - 2022

2.1. Dividend payment situation of listed steel joint stock companies

Table 1: Statistics of listed steel joint stock companies paying dividends in the period 2016-2022

Unit: Company

Content	2016	2017	2018	2019	2020	2021	2022
Number of companies paying dividends	16	14	12	15	15	12	5
Number of companies not paying dividends	7	9	11	8	8	11	18
Total number of companies	23	23	23	23	23	23	23

Source: Compiled from annual reports of listed steel companies

Looking at table 1 shows that the number of listed steel companies paying dividends is decreasing while the number of companies not paying dividends is increasing. The dividend payment situation of listed steel companies can be divided into stages:

- Period 2016-2018: 2016 marked the return to growth of the steel industry after a slowdown in 2015 due to competition with cheap steel from China. Steel exports in 2016 reached 3.48 million tons, up 36% over the same period last year. In 2017, growth was stable and reached 3.75 million tons of steel exports. In 2018, this industry's profits dropped sharply. This decline comes from a number of reasons such as: (1) Excess capacity in segments such as galvanized steel, leading to fierce competition for businesses through price reductions; (2) Due to the US-China trade war, with the conclusion that there is tax evasion for some steel products from China through Vietnam for export to the US, the US Department of Commerce in May 2018 decided to decided to impose anti-dumping tax of 199.76% and anti-subsidy tax of 256.44% on cold rolled steel produced in Vietnam using substrate steel originating from China. In 2018, Vietnamese steel was involved in 16 trade defense cases. This has affected steel exports to markets such as the EU, US, and Malaysia - Vietnam's major steel export markets.

- Period 2019-2022: During this period, the profits of listed steel companies continuously decreased. In 2019, the steel industry faced many difficulties due to the spread of protectionist trends among countries to impose import restrictions, falling steel prices due to demand and globalization trends, making profits worse. The after-tax profit of the steel business group decreased by 23% compared to 2018 due to increased competition, fluctuations in global raw material prices, domestic electricity prices increased by 8.36% in March 2019 and trade protection. Trade in many countries, industry-wide consumption demand has also stagnated since mid-2019, causing some businesses to suffer losses such as Pomima Steel Joint Stock Company (POM), Hoa Phat Group Joint Stock Company (HPG), Hoa Phat Group Joint Stock Company Sen (HSG) accepts low consumption to keep other product prices stable.

In 2020, in the context of the Covid - 19 epidemic still affecting many areas of the world economy in general and Vietnam's economy in particular, Vietnam's steel industry still recorded positive numbers such as producing 17,219 million tons of crude steel, an increase of 14% over the same period in 2019, sales reached 16.98 million tons, an increase of 3.55 times over the same period in 2019. Although both steel output and steel sales increased, due to the cost of raw materials for steel production increased unusually in December 2020, affecting the profits of steel production companies. In addition, in 2020, the steel industry's exports will face more difficulties than in 2019 when five more countries are conducting anti-dumping investigations on Vietnamese galvanized steel and steel pipe products, including two countries in the main Southeast Asian market area are Malaysia and the Philippines. However, in 2020, there were still 15/23 companies paying dividends to shareholders. Among the 8 companies that do not pay dividends, there are 6 companies with low profits that do not pay shareholders and 1 company that achieves high profits, Vietnam Steel Corporation (TVN), has a profit after tax of 545,5 billion but spent all the remaining after-tax profits for reinvestment. A company suffered huge losses so it did not pay dividends to shareholders.

Although 2021 is considered a brilliant year for the construction steel industry, prices continuously set records, leading to the business results of many large companies breaking old records. However, due to the galloping increase in steel prices due to the sharp increase in input raw material costs, it is still affected by the Covid - 19 epidemic, leading to a sharp decrease in steel consumption demand in the last months of the year due to many provinces and cities. Prolonged social distancing has led to a decrease in domestic sales, which in turn has also affected the business results of many steel companies. Therefore, in 2021 there are only 12 companies paying dividends and 11 companies not paying dividends. And among the 11 companies that do not pay dividends, 2 companies have losses so they do not pay dividends, 5 companies have low profits so they do not pay dividends but keep them for reinvestment, and 4 companies have high profits. Tien Len Steel Group Joint Stock Company (TLH), Vietnam Steel Corporation (TVN), Thai Nguyen Iron and Steel Joint Stock Company (TIS) and Pomina Steel Corporation (POM) do not pay dividends but use them for reinvestment. .

In 2022, the global economy will continue to face difficulties as inflation increases and steel-using industries record slow growth. Meanwhile, the price of raw materials for steel production has increased, leading to increased production costs along with a decline in steel demand, causing the amount of raw steel production as well as the amount of finished steel products of all types to continuously decrease compared to the same period last year. Period of 2021, in addition, difficulties in the real estate market greatly affect the cash flow of steel enterprises. Accordingly, with record losses in 2022, many large steel industry enterprises such as Nam Kim Steel, SMC Trade Investment, Vietnam Steel Corporation... proposed not to pay dividends this year. As for Hoa Phat Group (HPG), even though its profit is up to 8,444 billion VND, it does not pay dividends because it wants to put all of it into business activities in 2023. In 2022, only 5/23 companies will pay dividends. In general, during this period, many companies suffered losses and profits were not high, which affected dividend payments to shareholders.

2.2. Dividend payment form of listed steel joint stock companies

The form of dividend payment represents part of the dividend policy of a joint stock company. According to statistics, 12/23 companies (accounting for 52.17%) apply cash dividends. This is considered an easy form to implement and is loved by most shareholders because shareholders want to ensure their income. There are 10/23 companies (accounting for 43.47%) applying the form of paying dividends in cash and in shares because this form ensures flexibility between shareholders who want to receive dividends in cash to ensure income. Just want to reinvest to increase profits. There are 1/23 companies (accounting for 4.35%) that apply stock dividends because the company's accumulated cash resources are not abundant and the company wants to use profits to reinvest to increase profits. more profits in the future.

In the period 2016 - 2022, the forms of dividend payment used by steel joint stock companies listed on the Vietnam stock market are shown specifically in table 2.

Table 2: Dividend payment methods of steel joint stock companies listed on the Vietnam stock market in the period 2016 - 2022

Unit: Company

Forms of dividend payment	2016	2017	2018	2019	2020	2021	2022
Pay dividends in cash	10	7	6	10	10	4	3
Pay dividends in shares	2	3	3	2	4	3	1
Pay dividends in cash and stocks	4	4	3	3	1	5	1
Total number of companies paying dividends	16	14	12	15	15	12	5

Source: Compiled from annual reports of listed steel companies

Table 2 shows that in the period 2016-2022, steel companies listed on the Vietnamese stock market mainly pay dividends in cash. Some companies that have always maintained the form of paying cash dividends regularly for many years can be listed as: Ho Chi Minh City Metal Joint Stock Company; Thanh Thai Group Joint Stock Company; Central Metal Joint Stock Company; Thu Duc-Vnsteel Steel Joint Stock Company; Nha Be Steel Joint Stock Company... The favorite form of dividend payment is Vingal-Vnsteel Industrial Galvanizing Joint Stock Company, which throughout the period 2016-2022 always paid cash dividends with rates ranging from 13% - 20%. Paying cash dividends is also a way for investors to see the company's strong financial situation. This is also one of the points to evaluate the attractiveness of these companies' stocks when investors make their investment decisions because many investors are often interested in cash and dividend payment policies, growth of companies over time. However, paying dividends in cash will cause companies to reduce a large amount of capital, which may partly affect the financial capacity of some companies.

Also during this period, there were listed steel companies that paid dividends entirely in shares such as: Pomina Steel Joint Stock Company paid dividends in shares in 2017 at the ratio of 100:30 and in 2019 at the ratio of 100: 15.

Some companies use a form of dividend payment that combines cash dividends with specific stock dividends such as: Hoa Phat Group Joint Stock Company in 2019 paid cash dividends at a rate of 5% and paid in shares. with a ratio of 100:20; In 2020, dividends will be paid in cash at a rate of 5% and paid in shares at a rate of 100:35; In 2021, dividends will be paid in cash at a rate of 5% and paid in shares at a ratio of 10:3. SMC Commercial Investment Joint Stock Company in 2017 will pay dividends in cash at a rate of 10% and paid in shares at a rate of 10:3, rule 100:30; In 2018, it paid dividends in cash at a rate of 10% and paid in shares at a ratio of 10:1. Son Ha Saigon Joint Stock Company in 2016 paid dividends in cash at a rate of 3% and paid in shares at a rate of 10:1. 100:12; In 2018, dividends were paid in cash at a rate of 5% and paid in shares at a rate of 100:10; In 2019, dividends will be paid in cash at a rate of 3% and in shares at a rate of 100:5.

Compared to paying cash dividends, paying dividends entirely in stocks or combining cash dividends and stock payments can help companies increase their financial resources for reinvestment. However, whether receiving stock dividends for shareholders is beneficial or not depends on the success of the company's new investment in the future.

In general, it can be seen that in the period 2016-2022, the main form of dividend payment used by listed steel joint stock companies is paying dividends in cash, followed by a combination of paying dividends in cash and paying in cash, stocks, a few companies choose to pay dividends in stocks.

2.3. Number of dividend payments

During the period 2016-2022, listed steel joint stock companies make dividend payments ranging from 1 to 3 times. Hoa Sen Group Joint Stock Company in the two years 2016-2017, each year the company paid dividends 3 times; From 2018-2022, dividends will be paid once a year. SMC Commercial Investment Joint Stock Company during the period 2016-2022, the company pays dividends twice a year. Ho Chi Minh City Metal Joint Stock Company in 2018 paid dividends twice, in the remaining years it paid dividends once, the remaining companies were mostly Hoa Phat Group Joint Stock Company, Central Metal Joint Stock Company, Thu Duc Steel Joint Stock Company – Vnsteel, Vingal Industrial Galvanizing Joint Stock Company – Vnsteel pays dividends one time. Some other companies, for certain objective and subjective reasons, do not pay dividends in the period 2016-2022.

It can be seen that the number of dividend payments or the frequency of dividend payments of listed steel joint stock companies depends greatly on the results of production and business activities in that year to decide, this shows that the companies does not have a clearly oriented dividend policy strategy.

2.4. Dividend payment rate

Table 3: Dividend payments of listed steel joint stock companies in the period 2016 - 2022

Unit: %

Dividend payment level (VND/share)	Proportion of listed steel joint stock companies (%) by dividend payment level						
	2016	2017	2018	2019	2020	2021	2022
0	39,1	52,2	60,7	43,5	52,2	56,3	82,6
300-900	13	8,7	8,7	30,4	8,7	17,5	13
1000-1500	43,5	21,7	13	21,7	26,1	8,7	0
1600-2000	0	8,7	4,4	4,4	13	8,7	4,4
2100-2500	0	0	4,4	0	0	0	0
2600-3000	0	8,7	4,4	0	0	4,4	0
Trên 3000	4,4	0	4,4	0	0	4,4	0
Tổng	100	100	100	100	100	100	100

Source: Compiled from annual reports of listed steel companies

Looking at table 3, it shows that the dividend payments of listed steel joint stock companies in the period 2016-2022 commonly range from 300 VND to 1,500 VND, specifically in 2016, up to 56.5% of companies paid. At this level, in 2019 it was 52.1%, in 2020 it was 34.8%.

2016 was the year when the proportion of companies paying dividends at 1,000 VND to 1,500 VND was quite high at 43.5%, while in other years this dividend payment level only ranged from 13% - 26.1%. Although exported steel products faced a lot of pressure in 2016 due to trade defense cases from other countries, Vietnam's steel industry has made many efforts in expanding the market to promote exports of all kinds of products, steel products. Accordingly, the export output of the steel industry in 2016 still increased by 18.1% compared to 2015, thanks to which the business activities of listed steel joint stock companies during this period were also better, earning more profits and therefore higher dividend payments.

Overall, in the period 2016-2022, the proportion of companies paying dividends above 2,100 VND is very low, ranging from 4.4% to 13.2%. The number of companies paying the highest dividend of over 3,000 VND includes Thanh Thai Group Joint Stock Company paying 5,000 VND/share in 2016, Ho Chi Minh City Metal Joint Stock Company paying 3,500 VND/share in 2018 and 4,500 VND/share in 2021.

Objectively, during this period, the majority of listed steel joint stock companies had to face many difficulties such as: facing protectionist trends between countries, cases related to anti-dumping policy; the US-China trade war and the Covid - 19 pandemic. In addition, domestic economic difficulties have affected the production and business of steel companies, such as the price of raw materials for steel production. Continuously increasing prices of electricity, gasoline, and bank interest rates remaining at high levels for a long time have significantly affected the efficiency of production and business activities of steel enterprises. In addition, due to competition with cheap Chinese steel, Vietnam's steel export turnover also faces many difficulties. Thus, the decline in production and business efficiency is the main cause leading to reduced dividend payments at listed steel joint stock companies.

Subjectively, during this period, listed steel companies have given more priority to the company's long-term growth through using retained profits to reinvest, thereby also making the trend of dividend payments is decreased.

2.5. Dividend payout ratio

Dividend payout ratio is an indicator that reflects the relationship between the dividend payment that common shareholders receive and the income of a common share. This indicator shows how much of each share income the company spends to pay dividends to shareholders. Through the dividend payout ratio, it is possible to evaluate and estimate the profit reinvestment rate, thereby estimating the future income growth rate.

Table 4: Dividend payout ratio of companies of listed steel companies in the period 2016-2022

Unit: Company

Dividend payout ratio	Number of companies							Average dividend payout ratio
	2016	2017	2018	2019	2020	2021	2022	
Hệ số 0	9	12	14	11	12	14	19	
Từ 0,1 – 0,3	6	6	0	3	3	4	1	
Từ 0,31 - 0,5	1	0	3	2	1	0	0	
Từ 0,51 – 0,7	3	2	1	2	5	1	0	
Trên 0,7	4	3	5	5	2	4	3	
Tổng số	23	23	23	23	23	23	23	0,292

Source: Compiled from annual reports of listed steel companies

Table 4 shows that the average dividend payout ratio for the entire period 2016-2022 of listed steel companies is 0.292. This is a fairly low dividend payout ratio. Thus, the majority of after-tax profits of listed steel companies are retained, with only a small portion of after-tax profits distributed to shareholders. The reason why the dividend payout ratio of these companies is low stems from the characteristics of the steel industry, which is the huge need for capital, so companies often retain most of their after-tax profits to increase their financial capacity for Business.

To see more clearly the dividend payout ratio of listed steel companies in the period 2016-2022, we can consider the dividend payout ratio according to the company's capital scale.

Table 5: Dividend payment coefficient of listed steel companies classified by capital size in the period 2016-2022

Group	2016	2017	2018	2019	2020	2021	2022
Capital size under 1000 billion	0,46	0,27	0,38	0,35	0,71	0,32	0,28
Capital size from 1000-5000 billion	0,18	0,24	0,21	0,18	0,23	0,24	0,85
Capital size over 5000 billion	0,11	0,12	0,12	0,39	0,05	0,03	-
Average dividend payout ratio	0,27	0,22	0,25	0,3	0,37	0,22	0,41

Source: Compiled from annual reports of listed steel companies

The table above shows that companies with a capital scale of less than 1,000 billion have the largest average dividend payout coefficient, followed by companies with a capital scale of 1,000 billion to 5,000 billion, and companies with a capital scale of 1,000 billion to 5,000 billion. Capital over 5,000 billion has the lowest dividend payout ratio, and in 2022, the group of companies with capital over 5,000 billion will not pay cash dividends, so the dividend payout ratio is 0. It can be seen Capital scale is one of the factors affecting the dividend payout ratio of listed steel companies.

2.6. Dividend policy model

Through reviewing the actual production and business activities of listed steel companies, it shows that most companies have paid more attention to building and implementing a certain dividend policy model. Each company is different in scale, development strategy and efficiency in production and business activities, so it has to choose and pursue different dividend policy models. Besides, even though the same model is chosen, the level of implementation of that model in each company is different depending on the qualifications, capacity of the leadership team and corporate governance and a number of customer reasons, other officials.

Some companies that choose a stable dividend policy model include: Central Metal Joint Stock Company (KMT) with a payout rate of 700 VND/share for many consecutive years with a dividend payout coefficient that fluctuates around the clock, around 0.7; Nha Be Steel Joint Stock Company (TNB) with a payout rate of 1,000 VND/share for many consecutive years with a dividend payout coefficient fluctuating around 0.7; Vingal – Vnsteel Industrial Galvanizing Joint Stock Company (VGL) with a payout rate ranging from 1300-2000 VND/share with an average dividend payout ratio of 0.9 during the whole period; SMC Commercial Investment Joint Stock Company (SMC) pays regular annual dividends at 1,000 VND/share, especially in 2022 at 500 VND/share.

Besides, some companies tend to pursue a residual dividend policy model. These companies do not strictly implement a surplus policy in the true sense, but here we want to emphasize the aspect that companies pay more attention to retaining profits to reinvest in their income distribution. Typical companies such as Hoa Phat Steel Group Joint Stock Company (HPG) in 2022 profited more than 8,000 billion but did not pay dividends but used it for reinvestment; Hoa Sen Group Corporation in 2021 profited more than 4,000 billion but did not pay dividends; Dai Thien Loc Joint Stock Company (DTL); Pomina Steel Joint Stock Company (POM); Vietnam Steel Corporation (TVN).

In addition, there are still some companies that have not yet shaped a clear dividend policy model such as Son Ha International Joint Stock Company (SHI), which in the entire period 2016-2019 paid dividends at 500 VND/share in There were 2 years of 2016-2017 paying two dividends with the first payment of 300 VND/share, the second additional payment of 200 VND/share, however in the period 2020-2022 even though the company had business activities good but does not pay cash dividends like the previous period or Tien Len Steel Joint Stock Company (TLH) does not pay dividends according to a certain model.

3. ASSESS THE CURRENT STATUS OF DIVIDEND POLICIES AT LISTED STEEL JOINT STOCK COMPANIES IN THE PERIOD 2016 - 2022

3.1. These achievements

Through analyzing the current status of dividend policies at listed steel joint stock companies in the period 2016-2022, it can be seen that these companies have achieved the following main results:

Firstly, the majority of listed steel joint stock companies have chosen and pursued a certain dividend policy model, this shows initial success and marks a mature step in management of listed steel companies.

Second, many listed steel joint stock companies have maintained annual dividend payments to create confidence for shareholders. Although in the period 2016-2022, the steel industry faces many difficulties such as the impact of trade protection measures, cases related to anti-dumping, and the impact of the US-trade war. China, the Covid -19 pandemic, raw material prices continuously increasing, difficulties in export markets.... These difficulties greatly affect the business results of steel companies, however many companies still persistently pursues its chosen dividend policy, maintaining continuous annual dividend payments.

Third, some joint stock companies have combined payment of cash dividends and stock dividends. This combination not only helps create trust with shareholders but also helps the company have more capital to invest compared to paying dividends in cash.

Fourth, some listed steel joint stock companies have initially resolved relatively harmoniously between the decision to pay dividends to shareholders and retain profits to reinvest to help the company grow in the future. Typically Tien Len Steel Joint Stock Company (TLH) and Central Metallurgy Joint Stock Company, although achieving high business efficiency, the dividend payment per share is only moderate and the company has spent most of its after-tax profit to invest for growth and reality shows that the company's investment is quite effective.

3.2. Limitations exist

Firstly, the majority of listed steel joint stock companies have not diversified their forms of dividend payment. In general, in the period 2016-2022, listed steel companies often choose to pay dividends in cash, however this method will reduce a large amount of the company's capital, thereby affecting its financial capacity. This is not really reasonable, especially in the context of many companies being in the growth phase.

Second, some companies have high dividend payout ratios, not balancing the retained profits for reinvestment. If the company has a good investment opportunity, because the remaining profit for reinvestment is low, the company will have to choose other sources of funding such as issuing more shares, borrowing capital from credit institutions, or other sources of funding. This has higher mobilization costs than retained profits, leading to increased financial risks, imbalance in funding sources, and reduced financial capacity of the company.

Third, some listed steel companies have not clearly shaped the dividend policy model that the company pursues. These companies do not have a long-term strategy for dividend payments and most dividend payments depend on the results of production and business activities each year, so dividend payments are erratic.

4. SOME DIRECTIONS TO IMPROVE DIVIDEND POLICIES AT LISTED STEEL JOINT STOCK COMPANIES

Firstly, it is necessary to complete the selection of an appropriate dividend policy model. Each dividend policy model has certain advantages and limitations, so choosing the appropriate model should be based on the advantages, limitations and specific characteristics of each company. The dividend stability policy model is more suitable for companies with relatively stable annual after-tax profits, abundant cash flow, and enough ability to pay dividends and pay off due debts. Before and after paying dividends to shareholders, companies that choose this model also need to keep a certain amount of accumulated undistributed after-tax profits to maintain continuous dividend payments to shareholders, winter in the following years. On the contrary, the dividend surplus policy model is more suitable for companies in the growth stage, with many investment opportunities that promise to bring high rates of return, meeting shareholders' expectations. With a low fixed dividend policy model and additional dividends at the end of the year, suitable for companies with good growth prospects, the company must regularly maintain dividend payments to shareholders at a minimum level, certain minimum.

Second, it is necessary to diversify forms of dividend payment to ensure that it is suitable for the characteristics and specific situation of the company in each certain period. The company can pay dividends in cash, in shares, or in combination with both cash and shares. Each form has different advantages and limitations, so companies need to choose the appropriate dividend payment form.

Third, it is necessary to determine the appropriate number of dividend payments per year. Deciding on the number of dividend payments per year should be based on the company's business characteristics and the wishes and psychology of shareholders.

Fourth, it is necessary to consider whether to use share repurchases instead of paying dividends because this is considered a way to pay indirect cash dividends to shareholders. Buying back shares has positive effects on the company such as reducing the number of outstanding shares and thereby increasing earnings per share (EPS). That could be attractive to investors and could therefore increase the company's stock price in the future.

5. CONCLUSION:

Research on dividend policy in joint stock companies is always a topical issue. The authors have applied the method of synthesizing theoretical and practical issues to provide specific directions and solutions to achieve the research objectives. The proposals of the project will contribute somewhat to the sustainable development of listed steel joint stock companies, especially in the socio-economic context that poses many opportunities as well as great challenges.

APPLICATION OF INFORMATION TECHNOLOGY FOR EFFICIENT DIGITAL TRANSFORMATION IN TAX MANAGEMENT IN VIETNAM

M.Fin Tran Thi Mo[1], M.A Nguyen Thi Boi Ngoc[2]

Abstract: Nowsaday, Digital Transformation in tax management is an urgent issue, contributing to modernizing tax management and reforming tax administrative procedures. The application of information technology win tax administrative reform has saved compliance costs for taxpayers and administrative costs for tax authorities, thereby minimizing interactions between tax authorities and taxpayers, contributing to reducing harassment and inconvenience to taxpayers. In recent years, Digital Transformation in tax management has always received investment attention in all aspects. However, certain limitations still exist in the implementation process. Therefore, a thorough analysis of the theoretical and practical underpinnings of this problem is required, and on the basis of that analysis, some fundamental remedies should be suggested to encourage the current digital transformation of tax administration in our nation. The article uses the method of collecting secondary documents combined with the use of synthesis, system, and analysis methods to clarify the theoretical basis of digital transformation in tax management. On that basis, evaluate the current situation of digital transformation, the situation of digital transformation in general in Vietnam and digital transformation in tax administration in our country today. In light of this, we offer a few proposals for advancing the current digital transformation of tax administration in Vietnam today.

Keyword: digital transformation, digital economy, IT in tax management

1. URGENCY OF THE RESEARCH PROBLEM

Information technology (IT) has been and will always be an effective and indispensable support tool for the tax sector to perform its functions: Organizing and managing the collection of taxes and fees into the state budget, implementing an important link of e-Government. Along with the reform and modernization of tax administration, the application of IT in tax administration must pay special attention to reforming tax administration procedures and processes in the direction of unity, transparency, simplicity, and science. study, in accordance with international practices; building a modern, effective and efficient tax industry. In the past time, the tax sector has increased the application of IT to support tax management (centralized tax management system TMS), electronic tax declaration, and electronic tax payment. However, the application of IT in tax administration has not really brought into full play the role of IT to improve tax administration efficiency, meeting the goals of the Government's resolutions assigned to the Ministry of Finance and the General Department of Taxation (reducing administrative procedures, contributing to improving the competitiveness of Vietnamese enterprises).

In the next stages, with the rapid development of science and technology, the strengthening and expansion of IT application in tax management to all organizations and individuals incurring tax obligations is increasing. becomes urgent when taxpayers change technology and management method on the basis of application of modern technology. The more the economy develops, the deeper and deeper international integration in the region and the world is. Commercial and service business activities are becoming increasingly diverse and complex: cross-border business, digital

[2] University of Finance – Marketing.

economy... requires IT application to be based on modern and effective solutions and technologies. linkage, integration, high automation; easy to expand and develop; inheriting the results of IT application from previous periods; overcome existing shortcomings and weaknesses.

Therefore, the organization of research and application of information technology in tax administration has scientific and practical significance, in order to build an information technology strategy of the tax sector in the future, which is the basis for tax administration. implementing IT application tasks in tax administration. The article clarifies the theoretical basis of digital transformation in tax management, evaluates the current situation of digital transformation, the situation of digital transformation in general in Vietnam and digital transformation in tax administration today. In light of this, we offer a few proposals for advancing the current digital transformation of tax administration in Vietnam today.

2. OBJECTIVES OF THE STUDY

The study aims to clarify theoretical and practical issues of IT application in tax administration, thereby drawing lessons from experience, and proposing solutions to apply IT in tax management in the next stage.

3. RESEARCH METHODS

The article collects secondary documents combined with the use of synthesis, system, and analysis methods to clarify the theoretical basis of digital transformation in tax management, especially the concept of digital transformation and tax administration, the organization and implementation of policies on digital transformation in tax management. On that basis, evaluate the current situation of digital transformation, the situation of digital transformation in general in Vietnam and digital transformation in tax administration in our country today. Thereby, we propose some solutions to promote the digital transformation process in tax administration in our country today. The data used in the discussion is collected from journals, topics, theses, presentations, reports, and statistical data published domestically and internationally.

4. RESEARCH RESULTS AND DISCUSSION

4.1. Concept of digital transformation and tax management

The idea of "digital transformation" emerged in association with the current scientific and technological revolution. Despite just recently emerging, it has already cemented its place among the most popular trends globally. There are many different approaches to digital transformation, but basically it can be understood that digital transformation is a process of comprehensive change for individuals and organizations in the way they live, work, and produce and operate, based on the foundation of the digital environment and digital technologies. Digital transformation is both a process of transformation at the system level to change behavior on a large scale, and the integration of digital solutions into all areas of the organization and unit, through developing new operational procedures, consumer experiences, and organizational cultures, aspires to fundamentally alter the way we conduct business. It not only reinvents traditional methods but also innovates new methods to meet changing market expectations. In other words, digital transformation is not only a change in technological solutions or operating processes of an organization, production and service unit, or a subject in the market, but also a change cultural change, requiring market actors to recreate business organization models. Simply expressed, this is a method for applying digital technology rationally and successfully to all facets of people and subjects, shifting human activities from the physical world to the virtual world in a network context.

Tax management is the State's establishment of mechanisms and measures to ensure the rights and obligations of tax payers, tax collection agencies and relevant organizations and individuals in the process of tax collection and payment.

4.2. Organization and implementation of digital transformation policies in tax administration.

*** Guidelines and policies on digital transformation in Vietnam.**

The Central Executive Committee issued Resolution No. 52-NQ/TW dated September 27, 2019 on a number of guidelines and policies to actively participate in the fourth industrial revolution. urgent to accelerate the digital transformation process.

The Prime Minister signed and promulgated Decision No. 749/QD-TTg dated June 3, 2020 approving the national digital transformation program to 2025, with orientation to 2030.

Decision 1911/QD-TTg dated November 15, 2021 of the Prime Minister on the connection and sharing between the National Database on Population and other national databases and specialized databases.

Notice 331/TB-VPCP of Prime Minister Pham Minh Chinh's conclusion at the first meeting of the National Committee on Digital Transformation on November 30, 2021.

According to the Ministry of Information and Communications, 2020 is determined to be the year to start the national digital transformation. The perception of the whole society about digital transformation has changed dramatically. The year 2021 and the whole period of 2021-2025 will be an acceleration period with specific implementation actions for each industry, each field, and each locality.

*** Digital transformation in tax management**

In recent years, the Ministry of Finance has proactively implemented tasks related to digital transformation in the financial sector.

- The Ministry of Finance issued Decision No. 446/QD-BTC dated March 30, 2018 of the Minister of Finance on the action plan of the Ministry of Finance to implement Resolution No. 02-NQ/BCSĐ dated March 9 /2018 on deploying technology applications of the 4.0 Industrial Revolution in the field of finance and budget.
- Decision No. 844/QD-BTC dated May 21, 2020 of the Minister of Finance on the action plan of the Ministry of Finance to implement a number of key tasks and solutions for e-Government development in the 2019 period -2020, orientation 2025 meets the specific requirements in Resolution No. 17/NQ-CP dated March 7, 2019.
- Regarding the Ministry of Finance's digital transformation roadmap, in Decision No. 2445/QD-BTC dated December 28, 2018 of the Ministry of Finance approving the e-Government architecture of the Finance sector, clearly stating the vision for the period 2021- 2025 is to continue perfecting information systems to serve the construction of paperless offices; building a digital finance platform based on data and open data; Establishing a Digital Finance industry ecosystem, in which the Government plays a role in creating and connecting with parties through open, data sharing and digital platforms to allow many parties to create services Smart finance.

Recognizing the importance and trend of developing the digital economy and the digital transformation process, the Tax industry has proactively prepared and participated in this field to ensure the effectiveness and efficiency of tax administration.

Recently, the Tax industry has accelerated the digital transformation process:

- *Implementing technical infrastructure solutions*: In recent years, tax authorities have deployed technical and technological infrastructure, gradually meeting the digital transformation requirements of the Tax industry. During the period 2016-2020, the Tax sector has upgraded the high-speed internal network system (optical cable) connecting the centers of the South and North, connecting from Tax Departments and Tax Sub-Departments to Regional and provincial centers according to the Finance sector communications infrastructure project, ensuring data transmission and reception and exchange requirements to deploy centralized processing applications at the General Department of Taxation such as: Tax management applications , email application, message exchange, online meetings throughout the Industry...

In addition, the General Department of Taxation has upgraded transmission lines connecting tax authorities with agencies and organizations outside the tax industry to support taxpayers and businesses in applying tax declaration, tax payment, and electronic tax refund...

In addition to upgrading transmission lines, the General Department of Taxation deploys decentralized systems, checks and monitors information exchanged between tax authorities and outside agencies to ensure standardization, safety and information security in data exchange.

Server infrastructure, network equipment, and security equipment of the Tax industry are continuously invested and supplemented to meet the deployment of new technologies such as cloud computing systems, virtualization of server infrastructure, and infrastructure. Big data for tax management and data warehouse (on Oracle's Datawarehouse technology platform) meets the requirements of the national tax database project of the Government and the Ministry of Finance.

Build a pilot database to store information received from third parties ((such as the General Department of Customs, Ministry of Planning and Investment, Ministry of Natural Resources and Environment, General Statistics Office, State Securities Commission, Vietnam Social Insurance...) helps manage budget revenue effectively, contributing to preventing state budget revenue loss.

- Develop applications to serve people and businesses: IT applications of the Tax industry not only provide good support for internal management, but also serve people and businesses well. In the last 5 years, the General Department of Taxation has built an electronic portal for tax declaration, tax payment, tax refund directly online, electronic invoices replacing paper invoices; publicize tax policies, regimes and administrative procedures on the website; providing free tax declaration support software for businesses and taxpayers.

The General Department of Taxation promotes the provision of online public services, creating favorable conditions and reducing costs for people and businesses to promote socio-economic development. To date, the number of administrative procedures provided online is 304, of which 182/304 administrative procedures have been upgraded to online public services levels 3 and 4.

The number of administrative procedures to meet level 3 online public services is 32 procedures, level 4 is 150 procedures. The Tax Department has integrated 150 online public services into the National Public Service Portal. Online public services of tax authorities are always highly appreciated by organizations and individuals when participating in transactions with tax authorities.

4.4. The current situation of digital transformation in Vietnam

4.4.2 The current situation of digital transformation in Vietnam

Through the study of the development of the digital economy in Vietnam in the 2016 - 2020 period, it can be seen that the digital economy in Vietnam is developing strongly and achieving certain achievements. Vietnam has been having guidelines, policies and passed legal documents to develop the digital economy in accordance with the general conditions of the country as well as international integration. The number of businesses operating in the IT field from 2016 to 2020 increased sharply due to effective policies and action programs from the State, making digital economy activities more vibrant, creating a potential market for growing businesses.

Infrastructure, services, ecosystems and digital resources are gradually being upgraded and improved to meet the needs of society. Faster, more stable internet speed. Science and technology are gradually rising to the forefront and international comparison, especially 5G technology. The increasing number of information sites, electronic devices and social networks makes the digital ecosystem more and more diverse. The level of participation in digital transformation of Vietnam ranks 70th, at a high level with 70.93% in 3 periods, respectively, 77.78%; 57.14%; 63.64%.

Vietnam has 68.72 million Internet users (November 2021), accounting for 70.3% of the population (according to data from the Vietnam Internet Center), especially in fixed broadband - mostly fiber optic. Internet speed in Vietnam is considered to be at a good level compared to the world, when the average download speed of fixed and mobile Internet in the world in November 2021 was 58 Mbps and 29.06 respectively. Mb/s. In these two types of connections, Vietnam is ranked 42nd and 48th respectively in the world, up from 50th and 53rd in January. In Southeast Asia alone, Vietnam's Internet is behind Singapore, Thailand, Malaysia and higher than the rest of the countries[1].

Businesses have been paying more attention to promoting their images on websites as well as forums and social networks. The percentage of businesses with a website in Vietnam as of 2018 was 44%. Along with that, businesses all use electronic tax declaration or do electronic customs procedures with a rate of over 90%, which will save a lot of time, effort and costs for businesses.

Table 2. Enterprises using online public services

Targets	2016	2017	2018	2019	2020
Percentage of businesses with a website	45	43	44	42	42
Percentage of businesses declaring tax electronically	99.64	99.94	99.83	99.90	99.8
Percentage of enterprises doing electronic customs procedures	95.31	99.96	99.96	99.54	99.7

Figure 2. Use of online public services in Vietnam

The use of online public services in Vietnam has increased significantly in recent years. In recent years, the government has been trying to develop and create a digital government, in order to reduce troublesome administrative procedures and save time for businesses. In 2020, some online public services that have a high number of uses in society are:

According to a UN report, Vietnam in 2020 has a high e-government development index (EGDI), belonging to group H3, ranking 86 out of 193 UN member states, up two places compared to 2018, with

[1] https://vnexpress.net/internet-viet-nam-dang-o-dau-so-voi-the-gioi-4405005.html

0.6667 points, online services index is 0.6529, telecommunications and infrastructure is 0.6694. Along with that, Ho Chi Minh City's local online services index ranks 42nd out of 100 cities[1].

Table 2. E-Government Development Index (EGDI) of Vietnam

Year	Vietnam's position in the EGDI ranking
2020	86
2018	88
2016	89
2014	99

The human resource index and information technology infrastructure of the provinces are quite high. Vietnam has improved the qualifications of the labor force in the IT industry to develop the digital economy; the workforce is qualified and ready to meet the domestic and foreign markets. The ability of students to self-study (the adjacent workforce) is also increasing due to the development from the platform of online learning services. As of 2020, the number of employees in the IT industry in Vietnam is 1,081268 people.

Table 3. Number of employees in the IT industry in Vietnam

Unit: People

Targets	2016	2017	2018	2019	2020
Number of employees in hardware and electronics industry	568,288	678,917	717,955	760,097	842,458

Vietnam has a full range of information technology education, training and research institutions that can meet the requirements of the market as well as develop the digital economy.

Regarding information technology infrastructure, in comparison with other countries in the world, the average download speed of Vietnam is 6.7Mbps, ranking 75 out of 200 countries.

4.5. The situation of information technology application in the tax industry.

Aware of the important role of information technology (IT) in the management and long-term development orientation of the tax industry, over the past time, the General Department of Taxation has promoted the application of IT in the management and support businesses (enterprises), people. According to the Information Technology Department, in 2022, the General Department of Taxation has built and upgraded 376 application versions to meet newly issued, supplemented and revised tax policies and operations. Including 95 upgraded versions of centralized tax management application, 158 upgraded versions of application to support taxpayers and 123 versions of application to support tax management and internal management.

Currently, the General Department of Taxation is deploying 20 services of providing and sharing data to serve the coordination of budget collection, of which 4 services of providing information on tax registration and tax obligations have been provided to the Department C06 - Ministry of Public Security: Service of looking up tax registration information according to people's identity cards; Service of looking up tax registration information by tax code; Service of looking up information on collection and payment by tax code; Registration fee tax number lookup service.

In tax management, the tax industry has deployed Edoc application nationwide with 2.6 million documents processed, upgraded tax management applications to meet Tax Administration Law No. 38, Decree 126. The tax authority has upgraded its website to expand the function of providing information for taxpayers, supporting information, and looking up electronic invoices.

Regarding technical infrastructure, the General Department of Taxation has increased bandwidth capacity, implemented a network monitoring management system; deploying and expanding the server system to ensure stable and smooth operation of the system.

For the database implementation, the tax IT system has monitored the operation and good management of the database system; receive and support 1,277 requests for data synchronization and reconciliation; 3,612 requests for administrative support related to system evaluation and tuning; convert and upgrade Etax system to Exadata x8m-2 and upgrade TMS database system to Exadata to improve system performance, meet data processing and reporting requirements.

In the implementation of information safety and security, the tax IT system has maintained 24/7 information security monitoring and supervision to promptly detect and handle risks; maintaining the administration and operation of the storage and backup system to ensure stable operation of the system; All computers are fully installed anti-malware software.

The strong and clear change in IT application of the whole tax industry can be seen through some outstanding results as follows:

Centralized Tax Management System (TMS)

Promoting the results achieved in the implementation of personal income tax (PIT) management applications and actively supporting the implementation of the Law on Personal Income Tax, the General Department of Taxation has decided to upgrade the application system architecture. current tax management to a centralized processing model at the General Department by upgrading and expanding the PIT management application system to manage other taxes. In 2015, the General Department of Taxation completed the implementation of the Centralized Tax Administration System (TMS) nationwide to support 63 tax departments and nearly 700 tax branches in tax administration.

This system has supported tax authorities at all levels to process data of the professional stages of tax registration, tax records management, declaration obligation management; Processing periodical declarations/tax finalization declarations; Processing tax receipts; Handling tax administrative decisions (tax refund, exemption, reduction, imposition...); Accounting and tracking of taxpayers' obligations (NNT); Synthesize reports according to the regime (accounting/statistics), evaluation reports, analysis to support tax management.

**** Electronic tax declaration, tax payment and refund application***

In the past time, the General Department of Taxation has actively implemented an electronic tax declaration system to support taxpayers to declare most tax declaration documents, including the first/additional declarations, and declarations for each time they arise, tax finalization declarations, financial statements, invoice reports, receipts for collection of fees and charges payable according to regulations. In addition, the General Department of Taxation has also implemented an information exchange system between tax authorities and land registration agencies - the Ministry of Natural Resources and Environment to support many tax departments in deploying and using the exchange system. communication between tax authorities and land registries.

According to information from the General Department of Taxation, the tax sector has actively implemented solutions to achieve the goals set out by the Government in Resolutions No. 19/NQ-CP (2017-2018), Resolution 02/ND -CP (year 2019-2021) and Resolution No. 36a/NQ-CP dated October 14, 2015 of the Government on e-Government.

Firstly, the electronic tax declaration system has been implemented in 63/63 provinces and cities and 100% of the Tax Departments are attached. Up to now, there have been 838,787 enterprises (enterprises) participating in using the electronic tax declaration service out of a total of 841,018 operating enterprises (reaching the rate of 99.7%). The number of electronic tax declaration dossiers received was 12,925,589 records.

Secondly, on electronic tax payment, the General Department of Taxation has coordinated with 55 commercial banks (completed the connection of electronic tax payment with the General Department of Taxation) and 63 Departments of Taxation to deploy the electronic tax payment service and declare tax declaration. communication and mobilizing enterprises to use the service. As of August 19, 2021, the number of businesses that have registered to use the service with the tax agency is 832,802 out of a total of 841,018 operating enterprises, reaching 99%.

The number of businesses that have completed service registration with the banking system is 831,154 out of a total of 841,018 operating enterprises (reaching 98.8%). From January 1, 2021 up to now, businesses have carried out 2,425,472 electronic tax payment transactions with the amount of over 486,844 billion VND and 29,350,060 USD.

Third, the tax sector has implemented electronic tax refund in 63 provinces and cities. From January 1, 2021 up to now, the total number of enterprises participating in electronic tax refund is 7,654 out of a total of 7,855 tax refund enterprises, reaching the rate of 97.44%.

The number of applications received was 17,177 out of a total of 17,440 applications, reaching a rate of 98.49%. The total number of system files has been resolved and refunded is 12,428 with the total amount of refund settlement is more than 79,772 billion VND.

Fourth, the General Department of Taxation continues to implement the electronic invoice pilot project. From January 1, 2021 to July 19, 2021, 172,800 invoices have been issued codes with a total revenue of more than 17,708 billion VND, the tax amount on the issued invoices is more than 1,552 billion VND. Following the success of implementing the first phase of electronic invoices in 6 provinces and cities in 2021, on April 21, 2022 the General Department of Taxation will implement phase 2 in the remaining 57 provinces and cities. With a spirit of high determination and with many synchronous and unified measures and solutions, the tax sector has successfully completed the task of implementing e-invoices more than 2 months ahead of schedule as prescribed in Decree No. 123/2020/ND - CP, contributing to accelerating the process of digital transformation and modernization of the tax industry in particular and the financial industry in general.

Up to now, nationwide, 100% of businesses operating and using invoices have switched to using e-invoices and 100% of business households and individuals doing business according to the registered declaration method have switched to using e-invoices. , with a total of over 2.1 billion e-invoices issued.

After more than 8 months of implementation (from March 21, 2022 to December 31, 2022), there were 42 public servants registering, declaring and paying taxes through the Portal, with a total tax paid of more than VND 3,444 billion. Of which, nearly 1,900 billion VND have been declared and paid directly by the public officials; the rest is deducted and paid by Vietnamese parties (Facebook is 1,748 billion VND; Google is 979 billion VND). Notably, there are 6 large foreign investors, Meta (Facebook), Google, Microsoft, TikTok, Netflix, Apple accounting for 90% of the market share in revenue of e-commerce business services on cross-border digital platforms in Vietnam that have registered for tax. , tax declaration and tax payment in Vietnam.

Also in 2022, the tax sector officially operates the e-commerce portal to receive general information of organizations and individuals doing business through the e-commerce floor in case the e-commerce floor has not yet made tax declaration on behalf of the company. individual. With outstanding features of data aggregation according to information of e-commerce floors and information of suppliers (organizations and individuals doing business on e-commerce floors) as well as functions of administration, decentralization, communication Receiving data to ensure information safety and security, E-commerce portal is a new beginning in e-commerce tax management, towards preventing revenue loss in this field.

According to statistics, from the end of 2021 until now, the number of administrative procedures has decreased from 304 to 234 procedures, of which 103/234 procedures reach the level of 3-4 and 97/103 procedures are integrated into the Public Service Portal. country, respectively, saving over 524 billion VND in compliance costs for people and businesses. This result exceeded the target set by the Government's Resolution 68/NQ-CP.

Fifth, the General Department of Taxation also expanded the service of electronic tax declaration and payment for individuals.

The General Department of Taxation has connected with 7 commercial banks to provide electronic tax payment services for individuals and electronic registration fees for cars and motorbikes on the National Public Service Portal or through other channels. payment Internet banking, Mobile banking. From January 1, 2021 up to now, there have been 125,981 car and motorbike registration fee payment transactions across the country in the form of Internet banking and Mobile banking, accounting for 5.42% of the total 2,324,067 fee transactions. registration fee for cars and motorbikes nationwide.

Following the direction of the Government, the General Department of Taxation has also completed the integration of information on financial obligations on land of households and individuals in 63 provinces and cities with the National Public Service Portal.

However, in order to deploy the service, there needs to be a connection and integration between the Public Service Portal of the provinces and cities with the National Public Service Portal so that the local land registration agency can receive information. tax notices as well as tax payment documents. Up to the time of the report, 50 provinces and cities have completed the technical connection to deploy the service. There have been nearly 38,000 successful payment transactions with the payment amount reaching nearly 180 billion dong.

Sixth, the tax sector also actively deploys the provision of online public services (DVCTT). The total number of administrative procedures in the tax field is 304 administrative procedures, of which 122 procedures are provided, level 2 is 32 procedures, level 3 is 32 procedures, and level 4 is 150 procedures. The total number of public services at levels 3 and 4 of the tax sector is 182 public services (reaching the rate of 59.9%).

Up to now, the General Department of Taxation has integrated 150 public services at levels 3 and 4 into the National Public Service Portal. It is expected that in 2021, the General Department of Taxation will complete the integration of 100% of level 3 and 4 public services into the National Public Service Portal…

In 2022, the whole industry has completed upgrading taxpayer support applications (NNTs) such as: HTKK, eTax, iCanhan. Specifically, by the end of 2022, there were 886,901 enterprises participating in using the electronic tax declaration service out of a total of 887,475 operating enterprises, reaching the rate of 99.94%. The number of electronic tax returns received in 2022 was 17,337,891 records.

To implement the requirements on e-government, the General Department of Taxation has built and officially deployed the eTax Mobile application from March 21, 2022. This application has contributed to building a more transparent, convenient digital society and reducing time, costs and risks for people and businesses. At the same time, the General Department of Taxation has also officially announced the application of the Portal for Foreign Suppliers (NCCNN). Accordingly, up to now, 42 foreign suppliers have successfully registered and declared tax.

Implement Decision No. 06/QD-TTg dated January 6, 2022 of the Prime Minister on the Project on developing the application of population data, identification and electronic authentication for national digital transformation in the period 2022 - 2025, with a vision to 2030, the Information Technology Department has reported to the General Department of Taxation and coordinated with the Ministry of Public Security and the Government Office to unify information exchange services; develop technical requirements to connect and share database data (database) about population with tax database; develop the service of tax registration for the first time, registration for changes in tax registration information for taxpayers who are households and individuals.

Especially, from July 1, 2022, the tax sector has "covered" electronic invoices (e-invoices) to 100% of businesses and business households to calculate tax according to the declaration method. Most recently, the General Department of Taxation has officially launched the e-commerce portal and the e-invoice program is created from the cash register. These are important applications that contribute to reducing the time and cost of implementing administrative procedures and promoting digital transformation at enterprises. Along with deploying applications to support businesses, the Information Technology Department has concentrated human resources, invested in equipment, and managed operations to ensure that the system of applications operates smoothly 24/7 to serve businesses and people.

For individuals and business households, the General Department of Taxation has upgraded the functions of supporting the establishment of a set of contracts (for nearly 1.8 million households) and supporting the establishment of a set of non-agricultural land for about 20 million taxpayers who use land. nonagricultural. Completing electronic tax declaration for property leasing activities (including house rental activities) at 63 tax departments and affiliated tax branches.

Application of IT in the work of inspection, examination and internal inspection.

To meet the requirements of management, synthesis, and executive direction in the inspection and examination of tax authorities at all levels, from the beginning of 2016, the General Department of Taxation has upgraded and supplemented quick report forms, in order to support tax authorities in making and synthesizing reports on the application, and at the same time issuing documents directing and guiding tax authorities at all levels to review and update data into the tracking application. inspection and test results.

The General Department of Taxation has upgraded the application of risk analysis (TPR) to modify the way to obtain data on the criteria specified in Decision No. 2176/QD-TCT dated November 10, 2015 of the General Department of Taxation on the application of risk management by tax authorities in the planning of tax inspection and examination at taxpayers' offices to meet the criteria of the set of financial statements as prescribed in Circular No. 200/TT- The BTC replaces the set of financial statements issued under Decision No. 15/QD-BTC on the corporate accounting regime effective from 2015.

In 2016, the General Department of Taxation completed the pilot implementation of the risk analysis application for VAT declarations at the Tax Department of Ho Chi Minh City. Hanoi and Quang Ninh Tax Department meet the professional inspection of tax records. In the internal inspection work, up to now, the General Department of Taxation has been and continues to upgrade the internal inspection application, meeting the professional contents specified in the process of receiving citizens, the process of complaints and denunciations, internal inspection process and user requirements after applying risk analysis according to sets of criteria on tax inspection, tax inspection, tax refund, tax debt management, planning audit annual internal audit of the tax sector.

Upgrade technical infrastructure.

After 2 years of researching a virtual computer platform solution (VDI) for users, in March 2016, the General Department of Taxation implemented phase 1 of a virtual computer system for users at the General Department of Taxation. City Tax Department. Hanoi, Tax Department of Bac Ninh province. In addition, upgrading the technical infrastructure of the systems in 2016 at the Tax Data Center, specifically:

- Implement upgrading virtualization system technical infrastructure to meet the requirements of electronic tax declaration, electronic tax payment and electronic tax refund applications.

- Deploying to upgrade the integrated axis system to improve the capacity of information exchange, integration and communication between applications inside and outside the tax industry, ensuring information security.

- Deploying a backup system for electronic transaction processing systems with high availability requirements such as electronic tax declaration and electronic tax payment systems, ensuring that the system is always stable, ready, and upgraded. high processing capacity, especially in the peak periods of tax finalization.

- Continue to deploy and upgrade the local equipment system for the whole industry to meet the requirements of modernizing the working environment, improving the capacity and working efficiency of tax officials.

4.6. Solutions to promote the application of information technology in the tax industry.

To overcome the above limitations and implement the national program on IT application in the activities of State agencies in the period of 2021-2030, the General Department of Taxation continues to promote IT application in the following directions:

- Building a national tax database to meet the requirements of e-Government implementation.

- Promote activities to support taxpayers through the extensive provision of tax electronic services; Encourage and support intermediary organizations to develop tax services to meet the requirements of socialization of some services.

- Modernize the industry's internal management to improve quality and operational efficiency, and create a professional and effective working environment.

- Develop IT technical infrastructure, advanced, modern and synchronous equipment.

- Ensure the IT system operates continuously, effectively, information safety and data security.

- Training and developing IT human resources in the tax sector in line with the orientation and development plan of the tax sector in the period of 2021-2030.

5. CONCLUSION

Deployment of tax IT technical infrastructure operating on cloud computing in the direction of providing platform-level services. Developing internet of things (IoT) infrastructure and new digital technologies in building applications and services for tax administration.

The Tax Department invests in equipment for tax officials to meet the requirements of modernizing the working environment; development of remote systems for working from home; equipped with systems to enhance the collaborative working environment for tax officials such as online conference system, data sharing system, email system, online training system, digital phone... With the motto of putting people and businesses as the center, the successful implementation of the above-oriented IT tasks is an important foundation for promoting tax administrative reform, has helped tax authorities, businesses and banks reduce the time to carry out procedures; reducing costs for businesses and society, especially, has contributed to publicity and transparency of information for taxpayers…, contributing to accelerating the digital transformation of the tax sector in the new period.

CARBON MARKET IN VIET NAM

Dr. Vu Ngoc Anh[1]

Abstract: Along with the continuous development of economics, society, science and technology, people are facing environmental problems such as climate change, greenhouse effect, global warming, and the rise of sea levels... Governments and countries are making efforts to overcome the consequences of climate change, especially reducing greenhouse emissions. The concept of "carbon market" was also born from there as one of the economic solutions to solve environmental problems. By studying the experiences of some countries in the Emissions Trading Mechanism, this article offers some suggestions for Vietnam to improve the legal framework as well as organize and operate the carbon market effectively.

Keywords: Carbon market, greenhouse emissions, carbon credits.

1. INTRODUCTION

The carbon market, also known as the market for exchanging credits for reducing greenhouse emissions (or carbon credits), is a type of market where the goods bought and sold in the market are the amount of greenhouse gases reduced by an emission/removal unit when operating between the Buyer and the Seller. This is a politically created market that places value on removing or avoiding carbon emissions and facilitating the trading of carbon (in tonnes of CO2 equivalent) in a market context. The carbon market has the effect of increasing the demand for emission reductions and climate action by businesses, encouraging private sector investment in large-scale emission reductions; At the same time, carbon markets can leverage the policy framework to accelerate low-cost decarbonization.

Depending on the nature of market activity, carbon markets can be classified into: compulsory markets and voluntary markets.

- For compulsory markets: emitters in this market are governed by emission compliance policies and must decarbonize or purchase credits in accordance with the law. Specifically, in Australia, there is a safeguard mechanism for high-emitting industries; in other regions of the world also formed compliance markets such as the European emission trading market (EU ETS), the Chinese emissions trading market, etc.

- For the voluntary market: market participants voluntarily buy and sell carbon credits to serve the common emission reduction goals or ensure the needs of enterprises on carbon credit exchange and greenhouse gas emission reduction. A number of frameworks and standards (sustainability, transparency ...) for the voluntary market have been established in the world, such as ClimateActive, VCMI, and IC-VCM…

There are many types of emission reduction projects that can generate carbon credits. These projects may include:

- Emission reduction activities that can generate carbon credits;

- The projects and carbon credits generated by this project are appraised according to various international standards.

---

[1] Email: vungocanh.htc@gmail.com, Academy of Finance.

- Projects can also deliver co-benefits on social, cultural, economic, and other environmental outcomes.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

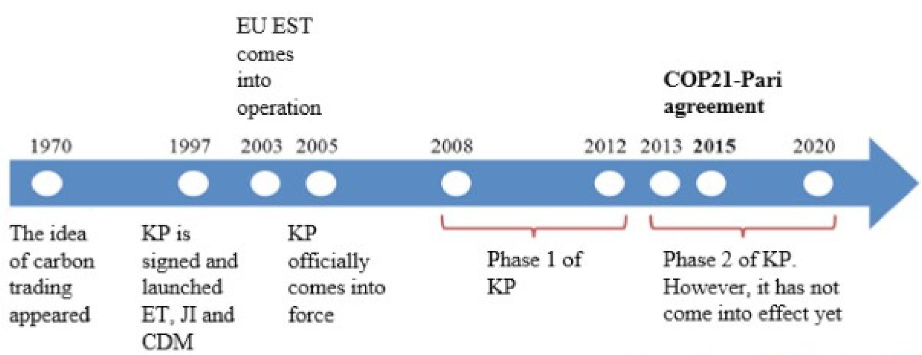
The concept of a carbon market is not a new concept, but it has only been emphasized in recent years. With the small number of studies on this issue, domestic and foreign legal documents and articles mainly provide general concepts and understandings as well as suggestions on how to build carbon markets in developed countries.

First of all, the 1997 Kyoto Protocol on climate change specifically stipulates types of greenhouse gases and classifies greenhouse gases by sectors/sources; At the same time, generalize the content of commitments to limit and reduce greenhouse emissions. According to Article 17 of the Kyoto Protocol, a carbon market allows countries with the right to excess emissions to sell or buy from countries that emit more or less than the committed target. As a result, a new commodity appeared globally, as a certificate to reduce/absorb two greenhouse gas emissions. Because Carbon Dioxide (CO_2) is a greenhouse gas equivalent to all greenhouse

gases, it is often referred to simply as carbon trading. Trading in carbon credits forms carbon markets.

Immediately after the Kyoto protocol came into effect in 2005, the trade in carbon credits developed quite strongly. Kyoto protocol has proposed three flexible mechanisms, including 1) Emissions Trading (ETS), 2) JI, and 3) Clean Development Mechanism (CDM). The carbon trading market development process, within the framework of Kyoto protocol, is presented in Figure 1.

Figure 1: The formation and development of the carbon trading mechanism process.



Source: Nguyen Thi Lieu et al. (2021)

The Kyoto protocol Phase I has set the stage for developing the international carbon market. However, while carbon markets continue to function, the future of the Kyoto protocol as a framework for GHG emission reductions is uncertain. At the 18th Conference of the Parties to the UNFCC (COP18), the Parties agreed that the second Kyoto commitment period would start from January 1, 2013, and end December 31, 2020. The goal for this period is to cut total GHG emissions below 1990 levels by at least 18 percent between 2013 and 2020. Nitrogen trifluoride (NF_3) is a controlled GHG starting from the Kyoto investor's second commitment period.

Secondly, The Paris Agreement on climate was adopted at COP21 in Paris, France, and came into force on November 4, 2016. This agreement developed a completely different framework from Kyoto protocol. Instead of setting emission limits, the Paris Agreement required the Parties to submit a Nationally Determined Contribution (NDC). The agreement has been signed by 193 countries and ratified by 189 Parties. About 100 countries that account for 58 percent of GHG emissions are considering or planning to use a carbon pricing instrument to achieve GHG emission reduction targets.

The Paris Agreement has fundamentally resolved the difference in levels of responsibility between developed and developing countries. It is built on a foundation of countries' shared commitment to best and continuous reinforcement in the coming years. The agreement reaffirms the goal to control the increase in average global temperature below 2°C and calls for the national effort to limit the increase of global average temperature to 1.5°C.

In their research, domestic authors also rely on the experiences of countries around the world and the characteristics of Vietnam to make recommendations to build an effective carbon market in Vietnam. Accordingly, there are 3 levels of carbon market development in Vietnam: (1) Government level: The State management structure for the construction and operation of the carbon market impacts the whole system to bring greenhouse gas emissions to a certain limit; (2) Ministries and sectoral level: An agency with a specialized function in carbon market management needs to be established to deploy, manage, and operate a carbon market. This agency has the role of managing, regulating, and supervising the credit granting, buying, and selling activities of market participants. It is also the agency that manages the credit registration and appraisal system and the market participation status of organizations and individuals; (3) Grassroots level: direct participation in the carbon market is the business establishments, individuals directly participating in the exchange of buying and selling credits. The participation of businesses and individuals in the carbon market must satisfy the criteria of the carbon market participants. *(9).*

3. INTERNATIONAL EXPERIENCE, CHALLENGES AND PROSPECTS FOR CAP-AND-TRADE SYSTEMS

a) General experience on quota systems and emission trading, challenges and prospects

Currently, there are 02 approaches to overcoming global warming and climate change: (i) Command and Control (i.e. applying fiscal and monetary policies); (ii) Market-based approach (i.e. application of offsetting mechanisms, setting of emission quotas and emission trading systems; and cap and trade systems). For a market-based approach to reducing greenhouse gas emissions, the government will set a cap/cap on total emissions, after which the emission quota is allocated free of charge or through auction to businesses.

In the above approaches, the cap-and-trade system is applied by many countries and brings certain successes. When this mechanism is applied, it will create an economically efficient way to reduce emissions; At the same time, it encourages technological innovation, mobilizes the participation and cooperation of the industry and is successfully implemented in many different regions.

Depending on the socio-economic, political and emission situation in each country, the implementation of cap-and-trade systems will vary, such as:

The European Union's emissions trading market (EU-ETS): is the largest multinational cap and trade system in the world, covering nearly half of the EU's CO2 emissions in 31 countries. The EU-ETS market came into operation in 2003, applying to more than 11,000 facilities, including power generation plants and large industrial facilities; implemented in phases: phase I (2005 – 2007), phase II (2008-2012), phase III (2013 – 2020) and subsequent phases until 2030.

In the early stages, the EU ETS allocates excessive emissions quotas resulting in low and unstable quota prices. This demonstrates that input "data" plays a very important role in calculations to make decisions about proper quota allocation and setting total quotas. Through each stage of development, the EU-ETS has so far transitioned from free quota allocation to auctions to solve distribution and competitiveness issues.

Allowing quota borrowing (banking) between compliance periods helps stabilize quota prices, avoiding devaluation. As can be seen, policies in the market can impact the price of quotas and affect the costs associated with reducing emissions.

- Along with the analysis of experiences on the EU ETS system, a number of other greenhouse gas programs and initiatives have also been developed such as:

(i) The Sulfur Dioxide (SO2) Emission Quota Trading Program aims to address concerns about acid rain by setting SO2 emission targets of coal power plants and consists of 02 phases: phase 1 (1995 – 1999) applied to 263 most polluting coal power plants; Phase 2 (2000 onwards) applies to 3200 power plants with a target reduction of 50% compared to 1980 levels. The program also enables quota trading and banking, along with ongoing emissions monitoring and penalties for non-compliance.

(ii) California Regional Clean Air Concessional Market (RECLAIM): implemented in 1993 to reduce NOx emissions and in 1994 to reduce SO2 emissions in Southern California. RECLAIM targets 350 sources of influence, including: power plants and industrial-related sources in the Los Angeles area. Implement a free allocation of RECLAIM (RTC) trading credits with an annual reduction ceiling of 8.3% for NOx and 6.9% for SO2. The program also includes a regional design that restricts transactions from downstream to upstream sources.

(iii) Regional Greenhouse Gas Initiative (RGGI): This is a US cap-and-trade system on CO2 emissions with the participation of 9 Northeastern states of the United States, which is a downstream program, focused on the power sector. The emissions limit decreased by 2.5% annually from 2015 to 2019 and there is a combination of price cap and price collar.

- On the basis of the cap-and-trade system, many new innovations and technologies such as: (1) carbon capture and storage (CCS) technologies by capturing CO2 emissions from large sources and storing them in deep geological formations or using them in other applications, allows for carbon removal and negative emissions. (2) Advanced pollution control technology for SO2 removal. Use SO2 reduction systems in furnace smoke (FGD), wet treatment technology (WFGD) to remove up to 95% of SO2, improve efficiency and cost-effectiveness in the gas reduce mercury emissions; (3) Renewable energy solutions. Sustainable technologies such as solar, wind, hydropower, bioenergy, geothermal, and marine energy; (4) Energy saving technology. Reduce energy waste and reduce emissions through solutions such as energy-efficient lighting, smart thermostats and advanced building insulation; (5) Improve emission monitoring by improving the accuracy and efficiency of measuring pollutants, using advanced sensors, real-time data analysis and remote monitoring systems.

Accordingly, the lessons learned from international experience from building a cap and trade system are:

- Consideration should be given to economic development trends and emissions, environmental targets; the granting and adjustment of quota allocations should be calculated based on performance and accurate data;

- Gradually reduce the limit/ceiling to avoid economic shocks; need to flexibly handle unforeseen events;

- It is necessary to balance between economic efficiency and competitiveness of the industry;

- It is necessary to gradually convert the free allocation of quotas to auctions;

- Avoid making unexpected profits or taking chances in the market.

b) Specific experience of some Emissions Trading Mechanisms (ETS) in the world

**** China ETS***

China's national emissions trading system is the world's largest in terms of the emissions it covers, estimated to exceed 4 billion tonnes of C02 and account for more than 40% of the country's carbon emissions. ETS China aims for fixed emissions by 2030 and neutrality by 2060. Since 2013, China has piloted ETS in Beijing, Shanghai, Tianjin, Chongqing and Shenzhen, and the provinces of Guangdong, Hubei and Fujian. The pilot systems are implemented in the following sectors: electricity, industry, buildings, transport and domestic aviation. The official national ETS system was launched on July 14, 2021 based on these pilot programs. The national carbon market includes more than 2,225 companies operating coal and gas plants designed to produce electricity and heat, most of which are state-owned enterprises. *(10)*

China's national carbon trading market is under the supervision and management of the Ministry of Ecology and Environment (MEE) while trading operations are run by the Shanghai Energy and Environment Exchange (SEEE) – which acts as a trading platform for the national ETS system. China Carbon Emission Registration and Offsetting Co., Ltd. is responsible for operating the registration and offsetting platform.

China's ETS system currently does not set a fixed emission cap/ceiling nor does it have a limit that decreases over time. Limits are flexible and based on the sum of "verified quotas". This is the limit based on intensity, which varies with the actual level of production. Therefore, the success of ETS depends on the effectiveness of emission reduction plans and technologies at regulated sites/facilities. China's carbon trading market provides financial incentives to companies and businesses to reduce emissions by allocating credits to emitters below the available quota, while requiring facilities that fall under emissions regulations greater than the allowed limit to purchase additional credits.

The allocation of carbon emission quotas is mainly free allocation and paid allocation (auction) will be launched at the appropriate time in the future. To date, the auction of quotas is conducted annually, whereby a fraction of the annual cap/ceiling can be put up for auction in order to provide facilities with additional resources to meet their compliance needs. The revenue from the auction is proposed to establish a national ETS fund and use this revenue to support the development of national carbon markets and key projects on reducing greenhouse gas emissions.

Emitting facilities can buy and sell licenses (quotas) in ETS as well as purchase China Emission Reduction Certificate (CCER) on the voluntary market to offset their emissions, the offset rate must not exceed 5% of the allocated emission quota. In the 2021-2022 allocation plan that allows borrowing, companies whose emissions exceed the allocation threshold by 10% or more can apply for loans from the pre-approved portion of the quota for 2023 with a maximum limit of 50% of the excess emissions. Penalties for failing to submit an emissions report or appraisal/verification report on time or providing fraudulent information range from 10,000 yuan ($1,483) to 50,000 yuan ($7,418). *(10)*

The market structure includes the primary and secondary markets, specifically:

+ Primary market: Greenhouse gas emission quotas are allocated to enterprises; Currently, there is only a free allocation form, no auction form.

+ Secondary market: Emission quotas can be traded back and forth by companies on a dedicated trading platform managed by the Shanghai Energy and Environment Exchange.

It should be further noted that, in China, emissions quotas are not currently considered financial instruments. Particularly for corporate accounting, China's Ministry of Finance has issued a temporary policy; Accordingly, the quotas acquired by the enterprise (excluding the amount of quota allocated for free) will be counted as assets in the financial statements of the enterprise.

As of July 16, 2022, the market value of China's national ETS has reached 8.5 billion yuan (~€1.2 billion), with nearly 194 million tonnes of CEA (China's emission quota) traded. The price of the national carbon emission quota (CEA) has increased from 48 yuan/mt (~€6) to a maximum of 61 yuan/mt (~€9), and prices have ranged from 58-60 yuan/mt (~€8-9), up 20% since trading began. A total of 179 million tonnes of China's emissions quota (CEA) was transferred in 114 trading days in 2021, with a high compliance rate of 99.5%. (compared to the EU ETS's compliance rate of less than 80% in 2005, the first year of trading). . *(10)*

**** Korea Emissions Trading Mechanism (K-ETS)***

Before being officially put into operation, the carbon market in Korea received mixed opinions from businesses. The K-ETS has been implemented since 2015, covering 684 large emitting facilities, accounting for 73.5% of national greenhouse gas emissions, including large emitting sectors such as power generation, energy, steel, chemicals. The K-ETS includes criteria for companies with average annual emissions above 125,000 tCO2e or average annual emissions of a site operating above 25,000 tCO2e. *(7)*

K-ETS is divided into 3 stages:

+ Phase 1 (2015-2017):: This is the period of accumulating experience and stabilizing the market and preparing the infrastructure for MRV deployment. Applies to 592 companies and makes free allocation of 100% of the total quota.

+ Phase 2 (2018-2020):: expand coverage and set stricter emission limits/ceilings. Raise MRV criteria. Make 97% of the total quota allocated free of charge and 3% allocated through auctions. The number of participating companies is 642.

+ Phase 3 (2021-2025): The number of participating companies is 684 companies. Freeallowance not exceeding 90% of the total quota, the remaining quota (minimum 10%) will be allocated through auction.

A special feature that can be learned from Korea's experience is the participation of 3rd parties, financial institutions, in the emissions trading market.

Financial institutions are allowed to participate in Korea's emissions trading system (K-ETS) as traders; Some banks and securities companies have become active participants in the market. The South Korean government actively encourages financial institutions to participate in ETS as a way to increase market liquidity and improve market efficiency. Financial institutions can participate in ETS as traders on behalf of clients and offer financial products (derivatives) that are related to ETS. Financial institutions must follow the same rules and regulations as other market participants and must comply with laws and regulations related to emissions trading and financial markets. The participation in the market by financial institutions will increase liquidity for the market thanks to the availability of buyers and sellers (through intermediaries who are financial institutions); The execution of trades will also be easier, making the overall trading operations and efficiency of the market.

However, the participation of financial institutions in the market brings certain concerns. Financial institutions may have competing interests as they act as both trading parties in the market and advisors to market participants. This can lead to a situation where financial institutions prioritize their profits over the interests of customers or the entire market, potentially leading to market manipulation or other forms of abuse. In addition, financial institutions may have access to sensitive information about market trends and other market participants; They may use the information to gain an unfair advantage. This can lead to a situation where some market participants may profit at the expense of others, leading to a decline in credibility, confidence and market stability.

Regulators in South Korea have taken various measures to ensure that financial institutions comply with the law and do not engage in market manipulation. For example, financial institutions must comply with strict disclosure and reporting requirements, and are subject to regular inspections and inspections by regulatory authorities. Overall, despite some challenges associated with financial institutions' participation in South Korea's emissions trading market, regulators are actively working to mitigate these risks and ensure market integrity and stability.

Thus, according to Korean experience, the participation of financial institutions in the market helps increase liquidity. However, it is necessary to have a strict management mechanism and regular inspection and inspection of state management agencies to avoid the situation of financial institutions manipulating prices and conducting illicit transactions to bring illegal benefits.

***Thailand's Voluntary Emission Trading System (Thai V-ETS)**

The Thailand Voluntary Emission Reduction Program was developed by the Public Organization for Greenhouse Gas Management of Thailand (TGO) to promote and support all sectors to voluntarily participate in reducing greenhouse gas emissions. Participating projects can be awarded "TVER" emission reduction credits (carbon credits) and can be sold on the Thai Voluntary Emission Trading System (Thai V-ETS) – also established by the NGO. The program currently covers areas such as: energy efficiency, renewable energy, waste management, transportation, tree planting/afforestation, forest restoration and conservation, agriculture.

TVER is appraised by an accredited third party and can be sold to an interested buyer. To be eligible for the Program and be granted TVER, projects must meet specific criteria and comply with internationally recognized standards such as the Validated Carbon Standard (VCS) or the Gold Standard (GS). TVERS can be used by companies and organizations to offset emissions voluntarily or to meet their sustainability goals.

In V-ETS, sellers set their own prices for TVER based on the cost of their emission reduction projects, as well as market demand for TVER; the buyer then negotiates with the seller to agree on a price for TVER. The TGO organization (which is the watchdog of the V-ETS) does not set a fixed price for TVER. In general, the carbon price in the V-ETS is determined through negotiation between buyers and sellers, whereas the TGO Foundation only provides guidance on prices and platforms for project registration, TVER issuance and management of the registration system.

Previously, T-VER project certification could be used to offset greenhouse gas emissions only in Thailand's jurisdiction. However, TGO has now linked the TVER Carbon Credit Standard to the Verra Foundation's Validated Carbon Standard (VCS). Therefore, the price of carbon credits received from T-VER projects tends to increase with global demand. Thus, it can be seen that the standardization and application of internationally recognized standards in the evaluation of carbon credits is very important; it helps projects approach international standards on emission reduction and also increases the value of carbon credits issued. *(11)*

c. Summary of some takeaways from practical experiences of other countries

By research on carbon markets in some regions and countries around the world, a number of lessons can be drawn for Vietnam about four main aspects of the carbon market as follows: (i) policy; (ii) scope and scale; (iii) market organization and operation; and (iv) measurement, reporting, verification (MRV) system.

(i) Policy

Vietnam has developed and completed many legal documents to implement policies on environmental protection, including climate change mitigation and adaptation activities. Regarding the construction and development of the domestic carbon market, Vietnam also has documents which stipulate the initial steps as a foundation for building the market such as: Vietnam Law on Environmental Protection 2020; Decree 06/2022/ND-CP on reducing greenhouse gas emissions and protecting the ozone layer; Decision 01/2022/QD-TTg... However, Vietnam is still in the stage of building and completing the legal framework to form and develop the domestic carbon market.

Based on the experience of other countries, in order to build and operate domestic carbon markets, these countries have issued adequate legal and regulatory documents and guidelines for market development. Thus, in order to establish and operate the domestic carbon market, Vietnam needs to review, at the Carbon Market Development Project, it is also necessary to provide a roadmap and orientation to complete the system of legal documents and responsibilities of agencies and ministries in building and operating the domestic carbon market.

In addition to perfecting the legal system, the policies set out must ensure the feasibility and liquidity of the market as well as ensure the participation of market participants. According to the experience of countries, besides policies that directly affect the market such as credit prices, market stabilization mechanisms, regulations on compliance and sanctions, regulations on total emission quotas, allocation and auction, there are other regulations on supporting emission reduction facilities or stipulating other mechanisms to increase calculation liquidity for national carbon credits.

(ii) Scope and scale

Carbon markets of large scale and scope and complexity will often bring more efficiencies but at the same time require more complex legal and technical preparation and basis. Vietnam needs to consider the level of scale at the initial stage when establishing the market, which can be piloted at the industry scale. The extent and scale of the market depends on the current status of policies, experiences and existing systems of greenhouse gas emission measurement, reporting and appraisal of Vietnam. With these factors at an early stage, Vietnam needs to have initial stages of understanding market needs. Accordingly, the market structure can go from a simple level to plans with a more complex structure as the parties' willingness to participate in the market increases.

Developing countries, including Vietnam, can implement simplified policies when the willingness to participate in transactions is low and gradually increase to more complex systems over time.

(iii) Market organization and operation

There are many lessons on state management to create a basis for readiness to trade in the carbon market, which can be learned from international experience when building a carbon market for Vietnam, such as the experience of South Korea, which has many similarities with Vietnam in the process of developing carbon markets. Currently, Korea is integrating the carbon market into the stock market and operating quite smoothly; Vietnam can refer to this Korean operating method.

Another advantage of Vietnam is that it has many years of experience and active activities in bilateral and multilateral credit creation mechanisms such as JCM and CDM. However, the state management of carbon credit trading activities as a special commodity product is quite new, with a wide scope, multi-sectors, many fields, carbon market management needs the participation from the central level to the ministerial level, branches, etc local. Therefore, it is necessary to unify the focal point management agency at the national level on carbon markets and carbon credit exchanges.

(iv) System for measuring, reporting and appraising greenhouse gas emission mitigation

Systems for measuring, reporting, and appraising greenhouse gas emission mitigation (MRV) should be developed and implemented in any carbon market. MRV systems are also widely used in mechanisms and schemes to reduce greenhouse gas emissions worldwide. To establish and operate the MRV system, it is necessary to develop specific, clear and appropriate regulations, measurement, reporting and appraisal procedures suitable to Vietnamese conditions for the national level and the following fields: energy, industrial processes, agriculture, forestry, land use and waste.

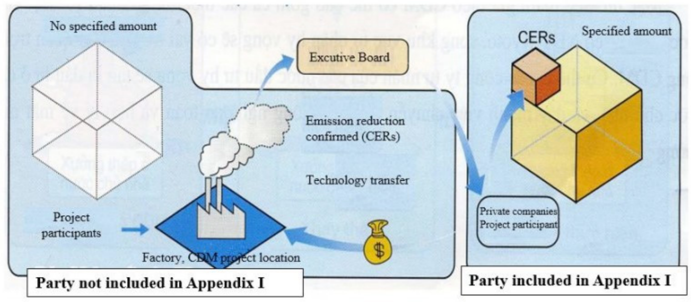
In summary, based on the experience of some countries in the world in organizing and developing carbon markets, Vietnam needs to research, develop and implement the following main contents:

- Clearly define the scope of the domestic carbon market.
- Clearly define the domestic carbon market management agency and the coordination responsibilities of relevant agencies
- Develop a system of legal documents to organize and operate the market.
- Building infrastructure for carbon market operation.
- Develop regulations on the implementation of domestic and international carbon credit exchange and offsetting mechanisms.
- Strengthening the capacity of carbon market participants

4. CURRENT STATUS OF CARBON TRADING IN VIETNAM

Under the KP, Clean Development Mechanism (CDM) projects aimed to help Non-Annex I Parties achieve sustainable development, contribute to the goal of the Convention, and help Annex I Parties achieve compliance with their country's GHG emission reduction targets. The CDM project implementation mechanism and CDM project operation are illustrated in Figure 2 below. Vietnam is one of the countries actively participating in the CDM Mechanism. To date, Vietnam has 254 CDM projects and is ranked fourth in the world for the number of registered CDM projects. The total amount of GHG reduction from the 254 CDM projects is about 140 million tons of CO2 equivalent. The percentage of projects that received CERs by type is shown in Figure 3.

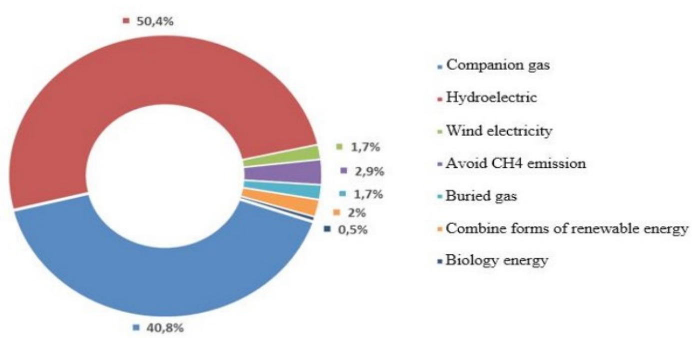
Figure 2: Mechanism for CDM adoption



Source: Mai Kim Lien et al. (2020)

Vietnam was one of the first countries to sign up for the Joint Credit Mechanism (JCM) with Japan, represented by the Memorandum of Understanding on Cooperation on Low Carbon Growth between Vietnam and Japan (signed first on July 2, 2013, and signed second on July 1, 2017). On April 6, 2015, the Minister of Natural Resources and Environment issued Circular No. 17/2015/TT–BTNMT stipulating the construction and implementation of the project under the Common Credit Mechanism within the framework of cooperation in the field of environmental protection—Low-carbon growth between Vietnam and Japan.

Figure 3: Percentage of cdm projects that have received cers by sector.



Source: Mai Kim Lien et al. (2020)

To direct, coordinate and manage activities to implement the JCM Mechanism, a Joint Committee with members from relevant ministries and sectors of the Vietnamese and Japanese governments participated, including 18 members, six from Japan and 12 from Vietnam from 2013 to now, the Joint Committees of the two countries Vietnam and Japan have held eight meetings (in 2015 there were two meetings in January and February). August). The relevant forms were first approved at the second meeting in 2014 in Tokyo and revised at the fifth meeting in 2016 in Hanoi.

Currently, seven entities are accredited and operate as Third-Party appraisals for projects under the JCM Mechanism in Vietnam. To become a Third Party in the JCM Mechanism, an organization or agency needs to meet the following conditions, including 1) Accredited according to ISO 14065 by an accreditation body that is a member of the International Accreditation Forum based on the international standard according to ISO 14.064–2 standard, or 2) is a Specialized Professional Body (DOE) or a professional body certified by the Clean Development Mechanism's Executive Board. Registrants becoming Third Parties are responsible for submitting their documents for review and recognition by the Joint Committee.

As of 2020, there have been 14 projects registered with the potential to reduce greenhouse gas emissions, reaching 15,996 tCO_2 equivalent/year. Vietnam has the second most registered projects after Indonesia, with 19 projects. Of the 14 registered projects, 11 projects received funding from the Japanese Ministry of Environment, and three projects received funding from the Ministry of Economy and Trade and Japanese Industry. The total funding received was nearly US$35 million, accounting for 38 percent of the total project implementation budget.

So far, six projects have been put into operation and have been monitored, verified, and issued carbon credits. The joint committee of the two countries granted 4,415 credits made of carbon, equivalent to 4,415 tons of carbon equivalent CO_2. The amount of carbon credits is allocated to the Government of Japan, the Government of Vietnam, and project participants.

In addition, the Ministry of Natural Resources and Environment developed a draft project "Developing the carbon market in Vietnam". Accordingly, by 2025, Vietnam will begin piloting and by 2028 will officially operate the carbon credit exchange.

According to the draft Project, by the end of 2027, our country will focus on developing regulations on carbon credit management, activities of exchanging greenhouse gas emission quotas and carbon credits; develop regulations for operating the carbon credit exchange; Pilot implementation of the carbon credit exchange and offset mechanism in potential areas and guide the implementation of the domestic and international carbon credit exchange and offset mechanism in accordance with the provisions of law and international regulations to which Vietnam is a member; Establish and organize pilot operation of a carbon credit exchange from 2025; Implement capacity building activities and raise awareness about carbon market development.

The project also sets the goal that by 2028, our country will operate an official carbon credit exchange; regulate activities connecting and exchanging domestic carbon credits with regional and world markets.

5. RECOMMENDATIONS

In order to develop a carbon market according to the contents of the author mentioned above, it is essential to learn from the experiences of countries to improve the knowledge and awareness of implementation officials. This is also an opportunity to exchange detailed information on research and organization building of the carbon market; regulations and methods for determining and allocating greenhouse gas emission quotas; the mechanism of operation of the carbon market; financial mechanisms and policies for market development ..., especially for countries with experience in building and operating carbon markets such as China, South Korea... These are the experiences that Vietnam wishes to learn to establish and operate the carbon market in accordance with the law in the coming time.

On that basis, the article proposed to continue strengthening coordination with ministries, agencies (embassies, bilateral and multilateral organizations), international cooperation between countries on carbon market development in particular as well as climate finance in general, as follows:

- Promote the strengthening of financial cooperation between the Ministry of Finance and the Government of Australia on climate finance through technical cooperation frameworks, policy consultations as well as training and capacity building.

- Strengthen training, especially intensive training for officials of the Department of Legal Affairs in particular and officials of the Ministry of Finance in accessing and learning about carbon markets and climate finance;

- Strengthen communication and dissemination to businesses and stakeholders about the carbon market and implementation of greenhouse gas emission reduction projects in Vietnam towards the goal of net-zero emissions by 2050 as well as targets under the Nationally Determined Contribution.

CONCLUSION

The formation of a domestic carbon market helps Vietnam seize opportunities in effectively reducing carbon emissions, as well as increase the competitiveness of Vietnamese products in the international market. Vietnam has a lot of potential because 3/4 of it is forest land, but in the past, there has been deforestation to grow industrial crops, so the proportion of primary forests is still small, only planted forests remain.

To be able to successfully build a carbon market, from the lessons learned from previous countries, Vietnam can apply it to its own practice to take the right steps. From establishing and perfecting the legal basis, to organizing, operating and improving the capacity to monitor, measure, report as well as improve IT application and common awareness of all industries and fields. and people in reducing greenhouse emissions... are all considered practical and necessary solutions to soon put the carbon market into operation in Vietnam.

DIGITAL TRANSFORMATION: OPPORTUNITIES AND CHALLENGES FOR ACCOUNTING AT SMALL AND MEDIUM ENTERPRISES IN VIETNAM

Master. Vu Thi Minh[1]

Abstract: Vietnam is in a period of drastic action to implement the goals set out in Decision No. 749/QD-TTg on the National Digital Transformation Program to 2025, oriented to 2030. With the goal set by 2025, Vietnam strives to develop the digital government, digital economy and digital society, contributing to the fundamental and comprehensive reform of management and administration activities of state management agencies, production and business activities of enterprises. In the field of accounting, digital transformation is one of the important goals set in the Accounting and Auditing Strategy to 2030 issued together with Decision No. 633/QD-TTg dated 23/5/2022 of the Prime Minister. In this article, the author will analyze the opportunities and challenges brought by digital transformation to management agencies, businesses and workers in the field of accounting in small and medium enterprises in Vietnam. At the same time, the author proposes some solutions to solve difficulties in the process of implementing digital transformation that stakeholders face in the coming time.

Keywords: Digital transformation, small and medium enterprises, accounting

1. INTRODUCTION

In Vietnam, the concept of "Digital transformation" is often understood in the sense of the process of changing from traditional business models to digital enterprises by applying new technologies such as Big Data, Internet of Things (IoT), cloud computing (Cloud) ... to change operating methods, leadership, working processes, company culture [4]. The purpose of digital transformation in businesses is to increase the efficiency of production and business activities, increase close relationships with customers, and improve the capacity of businesses in the market. This issue has also been emphasized and paid special attention by the Government of Vietnam recently through the national digital transformation under Decision No. 749/QD-TTg [6]. Digital transformation is the integration of digital technologies into all areas of a business, leveraging technologies to fundamentally change the way it operates, business models and provide new values to its customers as well as accelerate business operations [10].

In the field of accounting, digital transformation is one of the important goals set in the accounting and auditing Strategy to 2030 issued together with Decision No. 633/QD-TTg dated 23/5/2022 of the Prime Minister [7]. The development of digital technology makes simplify the process of collecting, processing and analyzing financial information for reporting in the enterprise [3]. Reports in enterprises can be known as: financial and accounting reports, management reports, published reports, internal circulation reports ... They are set up to serve stakeholders inside and outside the business. Due to the impact of the 4.0 technology revolution, there are five main trends pointed out in accounting activities in Vietnam in the coming time [1]. In particular, digital transformation in general and digital transformation in businesses in particular are forecasted to bring significant changes in the field of Accounting. Digital transformation in the field of Accounting is understood as the application of technology - digital technology to accounting

1 Thai Nguyen University of Economics & Business Administration, Email: Vuminh@tueba.edu.vn.

operations, helping accounting operations to be deployed synchronously, quickly and effectively, while saving manpower, time and costs for corporate accountants and state management agencies in accounting. Troshani (2018) demonstrate that established digital reporting to replace traditional reporting will minimize unnecessary administrative burdens but do not affect the effectiveness of accounting regulations [9]. Digital technology currently in Vietnam is being used in the field of accounting, such as: Electronic invoice software, electronic accounting software, electronic sales software, electronic office software, electronic tax declaration software...

Digital transformation in the field of accounting is considered an inevitable need of businesses and society in the current context. Obviously, the early implementation of digital transformation will bring more benefits to corporate accountants and management agencies such as tax authorities and statistics agencies. However, Digital transformation taking place in a developing market like Vietnam also poses many difficulties and challenges for parties involved in accounting activities, especially in small and medium enterprises which are weaker in terms of financial potential and personnel, technology than large enterprises. Therefore, in this article, the author analyzes the benefits and inadequacies brought by digital transformation to propose some solutions to overcome difficulties in the process of implementing digital transformation in the field of accounting for small and medium enterprises in Vietnam.

2. OPPORTUNITIES AND CHALLENGES FOR THE FIELD OF ACCOUNTING FOR SMALL AND MEDIUM ENTERPRISES IN THE PROCESS OF IMPLEMENTING DIGITAL TRANSFORMATION

2.1. Opportunities for accounting in small and medium enterprises

2.1.1. For small and sedium business accounting

When the accounting system is digitally transformed, accountants will have a modern digital working environment. Digital transformation helps improve the labor productivity of accountants. Thanks to digital technology products, accountants can work more independently, proactively solve work quickly and effectively, through application software, thereby creating higher value for businesses and accountants themselves.

(1) Use electronic office software for accounting department

Accountants in the enterprise can easily connect, shorten the distance with other parts of the business, easily exchange and handle work conveniently and efficiently between accounting departments when using electronic office software. All jobs arising in the enterprise can therefore be solved remotely via cloud computing technology. Especially through working time in the period of fighting the Covid-19 epidemic, the use of online office software has become more important and useful than ever.

(2) Use e-invoice software

E-invoices have many advantages over using traditional paper invoices such as: Save costs for printing, preserving, backing up, collecting information compared to paper invoices; Shorten the process of making and issuing invoices; Minimize risks occurring when using paper invoices (loss, tearing, loss); Easily store, check, manage invoices anytime, anywhere; Automatically email e-invoices to customers; Support payment reminder feature via E-banking, promoting the debt recovery process for businesses; Increase the convenience for accountants in accounting and reconciling accounting documents.

(3) Use accounting solution software

In Vietnam, there are many different accounting software used (MISA, Bravo, Fast, Weekend...) to support the entry of data from documents to produce financial statements quickly, accurately and efficiently based on pre-programmed procedures. Using Accounting software minimizes errors when doing manual accounting and produces financial statements quickly. Moreover, today's accounting software is specially designed for each separate accounting section, convenient for making department reports and reconciling accounting data in the company.

Applying digital transformation in enterprises will minimize work for the internal control department in small and medium enterprises for the following reasons: Information for control activities is always available and more transparent; The checking and reconciliation of accounting data with related parties is also conducted more conveniently, accurately and quickly on the digital platform; Business information is provided synchronously and transparently.

(4) Apply electronic payment

Enterprises use electronic payment methods such as e-wallets, credit cards, online transfers for customer convenience and to enhance transaction processes and accounting processes. Electronic payment is a convenient and fast financial solution for business activities and commercial transactions. With its speed and convenience, electronic payment helps transactions be carried out conveniently and meets customers' needs in the shortest time. For example, when purchasing online, customers can pay immediately through electronic payment methods such as credit cards, e-wallets or bank transfers. With modern technologies, accountants can easily track business transactions on electronic payment platforms such as e-wallets or online payment gateways. Payment invoices, detailed transaction information, and payment amounts will be provided in detail and transparently.

2.1.2. For small and medium enterprises

Digital transformation in the field of accounting also brings ultimate benefits to businesses themselves and business managers from two angles.

Firstly, digital transformation contributes to reducing operating costs for businesses. As analyzed, digital transformation greatly supports the work of accountants and operational accounting systems in enterprises. Through that, accounting activities under the digital technology platform help save operating costs more than traditional accounting work used to do before. Therefore, the labor efficiency of accounting personnel and the operational efficiency of enterprises are significantly improved.

Second, digital transformation contributes to increasing the ability to capture information and make decisions for business managers. With a digital-based accounting information system, the provision of information to decision-making managers is carried out quickly and accurately in all aspects: content, form, time, objects to be provided and information used. The information provided includes both financial information (assets, sources of capital, receivables – payable, inventory, revenue and expenses) and non-financial information (list of customers, suppliers, banks). Information is provided in a consistent, complete and continuous manner at the request of managers. Centralized data organization allows the provision of information at many different levels and levels. Accounting information systems are flexible and diverse in forms and subjects, and business managers can access them from many different places because of cloud computing technology.

2.1.3. For state management agencies in the field of accounting

For state management agencies in the field of accounting, digital transformation in Vietnam is carried out synchronously on both the business side and the State management agencies. Digital software has also been put into use at management agencies in the field of accounting to support activities between businesses and agencies management such as: software to support online tax declaration, electronic invoice management, State budget revenue and expenditure management, electronic customs management ... Using technology systems in State management agencies in the field of accounting also changes the profession, model and mode of operation of them. On the other hand, this change helps improve the efficiency of interaction between enterprises and State agencies by minimizing cumbersome, complicated and manual administrative procedures.

2.2. Challenges for the Accounting sector in the digital transformation process

First, the rapid development of digital technology is expected to quickly wipe out some of the traditional positions of accountants in the past. Applying digital technology to business accounting systems and the work of accountants requires accounting staff to reach a certain level of technology to access new technology, master technology, turn technology into an effective tool for accounting activities in particular and business accounting systems in general. On the other hand, accountants themselves need to understand the process of accounting operation procedures at their units to promptly detect which technology application processes are not suitable for elimination if that process is not really necessary.

Second, the investment cost for technical infrastructure systems for digital transformation is an issue that businesses also need to pay attention to. Digital transformation also means that businesses must actively invest in technology in their operations. In the Vietnamese market, small and medium enterprises account for more than 90% of the total number of enterprises. Most of these enterprises if forced to choose to spend some capital to invest in technology and train accounting teams compared to the capital spent to invest in technology with benefits are still quite lame. Because small and medium enterprises have not been able to fully exploit technology investment capacity. In addition, the confidentiality and safety of information is an important issue. While Vietnam's digital infrastructure is weak, regulations and measures to protect the software, hardware, and data of both businesses and partner customers are essential for businesses to avoid information theft. This is a major risk that accountants and businesses need to be aware of and prepare for possible problems when applying new technologies.

Third, digital transformation creates a fiercely competitive market for businesses specializing in providing accounting services. Large-scale accounting service providers have the advantage of applying digital technology and providing high-quality services to customers. As a result, these businesses are often able to acquire a large number of customers, increasing their market dominance and ability to connect with international customers. However, this ability is limited for small and medium accounting service providers.

Fourth, digital transformation also poses many difficulties and challenges to State management agencies in the field of accounting and Auditing (tax authorities, customs authorities, budget revenue and expenditure management agencies, ...). The shortage of skilled staff to use information technology to implement the digital transformation process. Meanwhile, building a workforce with professional expertise and understanding of technology is essential for any digital transformation strategy of any organization or agency. The investment process and deployment of digital infrastructure of the management agency is not suitable for the digital transformation process taking place rapidly in Vietnam today. The rules and regulations related to the state administrative management of Accounting are still quite rigid, inflexible, not really relevant. These problems have limited individuals and businesses from quickly accessing, deploying and timely applying new technology products to activities associated with the State management agency in Accounting and Auditing.

Fifth, there are obstacles in the application of international accounting and auditing standards in Vietnam. In the context of globalization and economic integration, financial information requires transparency, reliability and presentation in accordance with common international standards. Artificial intelligence (AI), intelligent robotics, blockchain technology, cloud computing, digital have had a certain impact on accounting and auditing cycles and methods, but it is necessary to direct them towards a common standard for output reports. Vietnamese accounting uses 26 standards (VAS), although they have been developed according to international accounting standards (IAS). They are suitable for the characteristics of the economy as well as the situation of businesses in Vietnam, but there are still some differences between VAS and IAS, significantly affecting the integration process of Vietnamese and international accounting and auditing The biggest difference between these 2 systems is manifested in many items on the financial statements prepared under IFRS and VAS. Financial statements prepared under IFRS are assessed at fair value or receivable value, but prepared according to VAS are recorded at historycal cost. This makes the value of assets, liabilities and capital sources of enterprises not reflect the actual market developments. The second issue, some International Accounting Standards (IAS) and International Financial Statement Presentation Standards (IFRS) have been introduced but nevertheless Vietnamese Accounting Standards have not been mentioned (IAS 19, IAS 20, IFRS 01,...) [2], [5]..

3. SOME SOLUTIONS FOR STAKEHOLDERS IN THE FIELD OF ACCOUNTING IN THE CONTEXT OF NATIONAL DIGITAL TRANSFORMATION

According to the national digital transformation strategy to 2020 and vision to 2030, the goal of developing the field of Accounting and Auditing in Vietnam will be oriented to: Continue to improve the corridor and legal framework on accounting - auditing on the basis of international practices in accordance with practical conditions in Vietnam; Human resource development in the field of accounting and auditing ensures both quantity and quality and is internationally recognized; Strengthen the capacity of state management agencies in accounting and auditing, develop human resources who have both professional management expertise and proficiency in using technology at work; Support businesses in the process of digital transformation in using accounting software; Invest in synchronous infrastructure development; Focus on high-quality accounting training according to international accounting standards at training institutions. In order to be able to effectively implement the above strategy in the coming time, it is necessary to pay attention to solving the following issues:

First, continue to improve the legal framework on accounting and auditing with innovative contents on principles and processes in accordance with digital technology application and international practices. Most importantly, the financial statements and the presentation of the financial statements must ensure standard, understandable information whether the report is published at home or abroad. The requirement is that financial statements need to be presented in accordance with principles and standards, ensuring general consistency, close to standards and rules for presenting international financial statements.

Second, improve the qualifications of the team of accountants, business managers, accounting and auditing experts in management agencies. The goal lies not only in improving the qualifications and skills of accounting and auditing, but also ensuring the capacity of information technology application. Obviously, businesses cannot easily change a new accounting team with technology knowledge instead of the existing one through a completely new recruitment process, so businesses need to improve their understanding of operating technology systems. In order to implement digital management issues between State agencies in the field of accounting and auditing, enterprises and individuals using services, management agencies need to organize training sessions to popularize issues related to the use of digital technology in their management activities, At the same time, there must be a team of highly qualified consultants to advise and solve difficulties encountered in the process of using public management services of agencies in the field of accounting – auditing.

Third, there are policies to support businesses in the process of digital transformation, especially small and medium enterprises. Specifically, the government should encourage and support enterprises in the use of technology software in accounting work, training and training accountants, qualified experts and skills in using information technology.

Fourth, Invest in the development of preliminary infrastructure and information technology in a synchronous and timely manner to enhance the development of technology applications to serve accounting and auditing activities; serving the inspection and supervision of legal compliance and accounting and auditing service activities. At the same time, focusing on the network security system, ensuring a high level of security of accounting data.

Fifth, accounting and auditing training institutions should focus on innovating training programs in the direction of approaching IAS and IFRS. Develop foreign language curriculum so that students can have international qualifications more easily, closer access to the orientation of the international accounting environment. At the same time, accounting training institutions also need to develop training content associated with digital transformation to help students after graduation adapt promptly to the digital age. .

4. CONCLUSIONS

Digital transformation is gradually deepening into all economic and social aspects in Vietnam. This rapid change is taking place in the field of accounting. Accordingly, the work of accountants as well as the way business accounting systems operate is also gradually transforming. Automating the process of data entry, data connection, processing, reporting, and analysis has changed the work of manual accountants as before and contributed to improving the efficiency of accounting activities in enterprises.

On the side of small and medium enterprises, digital transformation helps save operating costs for businesses, the digital accounting system ensures to provide faster and timely information to business administrators in the decision-making process. Digital transformation in State management agencies in the field of accounting helps reduce the burden and overload in handling administrative procedures between the State, enterprises and people in accordance with the roadmap for building an E-government in the construction roadmap.

Digital transformation poses difficulties for accountants, businesses and state management agencies in the field of accounting. It also creates fierce competition but also an opportunity for financial and accounting institutions to constantly develop financial services and accounting more professionally. Contributing to the transparency of information, improving service quality, meeting the increasing requirements of the people. Digital transformation is an inevitable process of society in general and the field of accounting in particular. It requires a radical and comprehensive change of stakeholders from accountants, enterprises, State management agencies in the field of accounting and the whole political system.

ASSESSING CAPITAL ADEQUACY RATIOS: A STUDY OF COMMERCIAL BANKS IN VIETNAM

Dr. Nguyen The Anh [1]

Abstract: This research delves into the assessment of Capital Adequacy Ratio (CAR) among Joint-Stock Commercial Banks (JSCBs) in Vietnam from 2015 to 2022. It investigates the variations in CAR over this period and explores its association with key financial metrics, including Return on Assets (ROA), Deposit Ratio (DEP), Liquidity (LIQ), Loan-to-Asset Ratio (LOA), Loan Loss Reserve (LLR), Non-Performing Loan Ratio (NPL), Leverage (LEV), bank size (SIZE), and the scale of board governance (BoardS). Moreover, the study examines the relationships between these financial metrics and CAR, shedding light on their impact on the capital safety of banks. This understanding can contribute to risk prediction and management within the banking system. As future research directions, further investigation into these relationships and exploration of additional influencing factors on CAR are recommended.

Keywords: Capital Adequacy Ratios, Car, Commercial Banks, Vietnam

1. INTRODUCTION

The Capital Adequacy Ratio (CAR) stands as a pivotal metric in the global banking sector, reflecting the financial robustness and ability of banks to cushion potential losses. For Commercial Banks in Vietnam, comprehending the determinants that shape CAR is of utmost significance. This study is dedicated to assessing these influential factors and elucidating the dynamics of CAR among Commercial Banks in Vietnam, spanning the years from 2015 to 2022.

To ensure the integrity and comprehensiveness of our dataset, rigorous data collection efforts were channeled towards securing secondary data from the independently audited financial reports of 26 Commercial Banks operating in Vietnam over the research period. The methodology adopted for this study primarily revolves around descriptive statistics, establishing a solid foundation for analysis and insights.

Furthermore, this study acknowledges that shifts in CAR can serve as reliable indicators of risk profiles and the resilience of these banks within a dynamically changing economic landscape. Beyond CAR, the research encompasses an extensive array of variables, including Return on Assets (ROA), Deposit Ratio (DEP), Liquidity (LIQ), Loan-to-Asset Ratio (LOA), Loan Loss Reserve (LLR), Non-Performing Loan Ratio (NPL), Leverage Ratio (LEV), Bank Size (SIZE), and Board Size (BoardS). These multifarious variables offer nuanced insights into the variation and resilience of Vietnamese Commercial Joint Stock Banks.

Significant findings indicate that variables like ROA, DEP, LIQ, LOA, LLR, NPL, LEV, SIZE, and BoardS exhibited stable trends across the study period, with minimal variations. Some variables, such as SIZE and BoardS, displayed an increasing average value over time, indicative of the expansion and growth of these banks. This stability across diverse facets of banking operations cultivates a predictable and secure environment for investors and regulatory authorities.

Furthermore, this study embarks on dissecting the interplay between these variables and CAR to fathom their impact on capital safety within the banking sector. The insights gleaned from

1 Email: nguyentheanh@hvtc.edu.vn, Academy of Finance.

this analysis can prove instrumental in the realm of risk prediction and management within the Vietnamese banking system.

As this study progresses, it is pertinent to acknowledge that future research avenues may delve even deeper into these relationships and explore additional factors that could exert influence on CAR. This research seeks to augment the understanding of the Vietnamese banking landscape and fortify the capacity to anticipate and adeptly manage risks.

2. LITERATURE REVIEW

Rubi Ahmad et al (2008) conducted a study with 42 financial institutions in Malaysia from 1995 to 2002. They used multivariate regression analysis for panel data. The study found that non-performing loans, equity-to-total-debt ratio, and liquid asset-to-total-deposits ratio had a positive relationship with capital adequacy ratios, while the individual bank risk index, net interest margin, and bank size had a negative relationship. These findings did not align with research in developed countries.

Ahmet and Hasan (2011) studied factors influencing the capital adequacy ratio of the Turkish banking sector from 2006 to 2010. They used data from financial reports of 24 sample banks. The study found that the loan-to-deposit ratio, return on equity, and leverage ratio had an inverse correlation with capital adequacy ratios, whereas the loan loss reserves ratio and return on assets moved in the same direction. Bank size, customer deposit ratio, liquidity ratio, and net interest margin did not significantly impact capital adequacy.

Ijaz Hussain Bokhari et al (2012) used Miller and Modigliani's capital structure theory (1958), along with asymmetric information theory and banking cost theory, to model factors influencing the CAR. They categorized CAR-influencing factors into three groups: internal bank policies, market dynamics, and banking operations regulations. Data from 12 Pakistani banks during 2005 - 2009 were utilized. Results showed that the deposit-to-assets ratio and risk asset portfolio had a negative impact on CAR, while other variables were not statistically significant. The study focused on bank-specific factors, without considering management or macroeconomic factors.

Mohammed T. Abusharba et al (2013) studied CAR determinants in 11 Islamic banks in Indonesia from 2009 to 2011. They employed multivariate regression and correlation matrix methods to model CAR influences. Independent variables included profitability measured by return on assets, credit quality reflected in the non-performing loan ratio, deposit-driven funding through the deposit-to-assets ratio, and liquidity represented by the loan-to-deposit ratio. Results showed that profitability and liquidity positively affected CAR, while non-performing loans had a negative impact. Other factors were not statistically significant. The study primarily assessed bank-specific factors influencing CAR, without considering macroeconomic factors.

Nadja Dreca (2013) investigated factors affecting the capital adequacy ratio of banks in Bosnia and Herzegovina using data from 10 banks over six years from 2005 to 2010. Explanatory variables represented capital structure, size, profitability indicators, deposit and loan components of total assets, and financial leverage. The study performed regressions with Ordinary Least Squares (OLS), Random Effect Model (REM), and Fixed Effect Model (FEM). Sustainability checks and model selection criteria favored OLS results. Specifically, bank size, deposit ratio, loan-to-asset ratio, return on assets (ROA), return on equity (ROE), and financial leverage had significant impacts on CAR. Non-performing loan reserves and net interest income-to-total assets did not influence CAR. These findings only considered bank-specific characteristics and did not delve into bank management or macroeconomic variables.

Leila Bateni et al (2014) conducted a study on CAR determinants using data from six Iranian banks between 2006 and 2012. They employed panel data regression with both FEM and REM. After testing, FEM results were deemed more appropriate. The study found that equity-to-assets ratio (EQR), ROA, ROE, and loan-to-asset ratio (LAR) positively influenced CAR, while bank size had a negative impact. Thus, larger banks in Iran had lower CAR due to riskier business activities. Adjusted asset risk ratio and deposit-to-assets ratio did not have statistical significance with CAR. This research examined bank-specific factors affecting CAR but did not consider management factors or macroeconomic variables.

Nuviyanti and Achmad Herlanto Anggono (2014) studied CAR determinants using data from 19 banks in Indonesia from 2008 to 2013. They considered factors reflecting bank operations such as operating expense-to-income ratio, net profit margin, non-performing loan ratio, loan-to-deposit ratio, and ROA and ROE as independent variables in the model. Results showed that operating expense-to-income ratio negatively influenced CAR. Quality-of-operation indicators, namely non-performing loans and loan-to-deposit ratio, impacted CAR, with non-performing loans having a positive correlation and loan-to-deposit ratio having a negative correlation. Bank profitability, represented by ROA and ROE, significantly influenced CAR. While ROA had a positive relationship with CAR, ROE had a negative correlation with capital adequacy. Other variables such as bank size, deposit-to-asset ratio, and net interest income-to-total assets did not significantly affect CAR. This research highlighted the importance of bank operations in maintaining a reasonable CAR by balancing income and expenses

Pham (2013) conducted a study on the factors influencing the CAR (Capital Adequacy Ratio) using data from 17 Vietnamese joint-stock commercial banks during 2006 - 2010. Based on the research model by Ahmad and Skully (2009), the author built a model with CAR as the dependent variable and eight independent variables, including bank size, deposit-to-assets ratio, loan-to-assets ratio, credit risk provisioning ratio, liquid asset ratio, net profit margin, net interest income ratio, and debt-to-equity ratio. Through regression analysis and p-value tests, all factors were found to have an impact on CAR. Specifically, bank size, loan-to-assets ratio, net profit margin, and net interest income ratio had a negative influence on CAR. The study focused on analyzing financial indicators related to banks' impact on CAR and did not consider management-related factors or macroeconomic variables.

Vo et al (2014) conducted research titled "Determinants of Capital Adequacy Ratio: Empirical Evidence from Vietnam's Commercial Banking System." The authors analyzed the factors affecting the capital adequacy ratio of 26 banks during the period 2007 - 2012 to quantify the influence of bank-specific factors on the minimum capital adequacy ratio in Vietnam. The results showed that an increase in the liquidity ratio (LIQ) and the credit risk provisioning ratio (LLR) had a positive impact on the capital adequacy ratio. On the other hand, bank size (SIZE), deposit ratio (DEP), return on equity (ROE), and return on assets (ROA) had negative effects on the capital adequacy ratio. The study did not find evidence of a relationship between leverage and lending activities' impact on the capital adequacy ratio. Additionally, the study did not address the potential influence of macroeconomic factors on the capital adequacy ratio.

Current research primarily focuses on factors that reflect a bank's operations when evaluating CAR, but the role of corporate management has not been thoroughly studied. Furthermore, macroeconomic factors such as economic growth, inflation, and legal changes impact banking *activities, but previous CAR studies in Vietnam have not examined these variables in conjunction with corporate management*

3. METHODOLOGY

The author analyzed and synthesized relevant documents regarding capital and capital adequacy, as well as the factors affecting capital adequacy. Based on each research issue, trends, and research perspectives of different authors on the topic were identified, forming the theoretical foundation for the paper's research topic. Additionally, the comparative method was used. The paper utilized secondary data to create tables and graphs for comparing, analyzing, and evaluating micro and macroeconomic factors influencing the capital adequacy ratio (CAR) of commercial banks. Drawing from both domestic and international theories and research, the author made adjustments and additions to establish 'variables influencing the minimum capital adequacy ratio (CAR).

Through the process of synthesizing reference materials and desk research, the study aimed to identify concepts related to the minimum capital adequacy ratio (CAR). It included variables measuring the minimum capital adequacy ratio (CAR) and factors influencing the minimum capital adequacy ratio (CAR) of commercial banks. The author examined and screened variables in the evaluation model for the minimum capital adequacy ratio (CAR). Qualitative research was conducted to assess the suitability of the theoretical model, as well as to explore, adjust, and supplement the factors used to measure research concepts, ensuring that the constructed model aligns with research theory.

This method was used for the purpose of adjusting factors. Qualitative research was employed during the data collection phase in a qualitative form through discussion and interpretation techniques

In this research study, the author employs both qualitative and quantitative research methods to establish criteria for evaluating factors influencing the CAR of commercial banks. The research results reveal that there are 9 factors affecting the CAR of commercial banks. The study collects, synthesizes, analyzes data, and evaluates the capital adequacy ratio (CAR) at Vietnamese joint-stock commercial banks using Excel software. The paper conducts descriptive statistical analysis through absolute comparison and relative comparison of variables within the research model to observe the changes in variables during the study period and to some extent, to identify the relationships between these factors and the CAR

4. RESULTS

4.1. Descriptive Statistics Results on Capital Adequacy Ratio (CAR)

Table 1: Descriptive Statistics Results on CAR

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	0.137	0.139	0.014	0.115	0.164
2016	0.141	0.141	0.014	0.118	0.172
2017	0.148	0.147	0.015	0.118	0.177
2018	0.141	0.139	0.016	0.113	0.171
2019	0.140	0.136	0.016	0.110	0.167

2020	0.141	0.139	0.015	0.108	0.178
2021	0.137	0.138	0.013	0.104	0.165
2022	0.134	0.133	0.013	0.102	0.163

(Source: Surveyed and processed by the author)

Table 1 presents the descriptive statistics results on CAR from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average capital adequacy ratio (CAR) was in 2017 at 14.8%, while the lowest was in 2022 at 12.5%. Furthermore, the standard deviation values of CAR show relatively little variation.

4.2. Descriptive Statistics Results on Return on Assets (ROA)

Table 2: Descriptive Statistics Results on ROA

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	0.009	0.006	0.012	0.002	0.065
2016	0.009	0.006	0.009	0.001	0.037
2017	0.007	0.006	0.007	0.001	0.032
2018	0.013	0.006	0.020	0.001	0.083
2019	0.012	0.007	0.016	0.001	0.084
2020	0.010	0.006	0.008	0.001	0.035
2021	0.012	0.008	0.009	0.001	0.030
2022	0.009	0.005	0.008	0.001	0.024

(Source: Surveyed and processed by the author)

Table 2 presents the descriptive statistics results on ROA from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Return on Assets (ROA) was in 2018 at 1.3%, while the lowest was in 2017 at 0.7%. Furthermore, the standard deviation values of ROA show relatively little variation.

4.3. Descriptive Statistics Results on Deposit Ratio (DEP)

Table 3: Descriptive Statistics Results on DEP

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	0.644	0.632	0.117	0.447	0.843
2016	0.676	0.667	0.110	0.420	0.861
2017	0.704	0.703	0.099	0.493	0.894
2018	0.706	0.717	0.097	0.521	0.886
2019	0.674	0.687	0.102	0.481	0.868
2020	0.674	0.695	0.099	0.461	0.860
2021	0.678	0.679	0.097	0.489	0.884
2022	0.674	0.674	0.097	0.484	0.881

(Source: Surveyed and processed by the author from Excel)

Table 3 presents the descriptive statistics results on DEP from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Deposit Ratio (DEP) was in 2018 at 70.6%, *while the lowest was in 2015 at 64.40%. Furthermore, the standard deviation values of DEP show relatively little variation.*

4.3. Descriptive Statistics Results on Liquidity (LIQ)

Table 4: Descriptive Statistics Results on LIQ

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	0.193	0.182	0.098	0.052	0.415
2016	0.184	0.161	0.103	0.048	0.415
2017	0.144	0.138	0.061	0.046	0.290
2018	0.134	0.127	0.059	0.052	0.325
2019	0.146	0.144	0.046	0.045	0.255
2020	0.143	0.153	0.048	0.051	0.244
2021	0.164	0.157	0.058	0.069	0.269
2022	0.158	0.139	0.057	0.062	0.265

(Source: Surveyed and processed by the author)

Table 4 presents the descriptive statistics results on LIQ from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Liquidity (LIQ) was in 2015 at 19,3%, while the lowest was in 2018 at 13,4%. Furthermore, the standard deviation values of LIQ show relatively significant variation.

4.4. Descriptive Statistics Results on Loan-to-Asset Ratio (LOA)

Table 5: Descriptive Statistics Results on LOA

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	0.498	0.488	0.120	0.249	0.720
2016	0.506	0.494	0.114	0.220	0.704
2017	0.556	0.560	0.102	0.264	0.695
2018	0.580	0.595	0.095	0.363	0.709
2019	0.596	0.598	0.092	0.319	0.723
2020	0.611	0.627	0.092	0.347	0.744
2021	0.623	0.639	0.091	0.399	0.743
2022	0.618	0.631	0.090	0.394	0.741

(Source: Surveyed and processed by the author)

Table 5 presents the descriptive statistics results on LOA from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Loan-to-Asset Ratio (LOA) was in 2021 at 62,3%, while the lowest was in 2015 at 49,8%. Furthermore, the standard deviation values of LOA show relatively significant variation.

4.5. Descriptive Statistics Results on Loan Loss Reserve Ratio (LLR)

Table 6: Descriptive Statistics Results on LLR

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	0.011	0.011	0.006	0.002	0.025

2016	0.012	0.009	0.009	0.001	0.032
2017	0.013	0.012	0.008	0.002	0.033
2018	0.013	0.011	0.010	0.001	0.050
2019	0.012	0.010	0.009	0.003	0.045
2020	0.011	0.007	0.010	0.001	0.052
2021	0.012	0.009	0.010	0.001	0.054
2022	0.010	0.008	0.010	0.001	0.053

(Source: Surveyed and processed by the author)

Table 6 presents the descriptive statistics results on LLR from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Loan Loss Reserve Ratio (LLR) was in 2017 and 2018 at 1.3%, while the lowest was in 2022 at 1%. Furthermore, the standard deviation values of LLR show relatively little variation.

4.6. Descriptive Statistics Results on Non-Performing Loan Ratio (NPL)

Table 7: Descriptive Statistics Results on NPL

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	0.023	0.019	0.022	0.005	0.126
2016	0.026	0.024	0.020	0.004	0.093
2017	0.030	0.025	0.020	0.007	0.090
2018	0.021	0.020	0.011	0.002	0.057
2019	0.025	0.022	0.017	0.005	0.093
2020	0.023	0.019	0.022	0.003	0.126
2021	0.024	0.019	0.019	0.007	0.090
2022	0.022	0.017	0.017	0.005	0.080

(Source: Surveyed and processed by the author)

Table 7 presents the descriptive statistics results on NPL from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Non-Performing Loan Ratio (NPL) was in 2017 at 3,0%, while the lowest was in 2018 at 2,1%. Furthermore, the standard deviation values of NPL show relatively little variation.

4.7. Descriptive Statistics Results on Leverage (LEV)

Table 8: Descriptive Statistics Results on LEV

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	9.475	9.325	3.140	3.195	15.982
2016	10.800	10.581	3.498	3.539	18.352
2017	11.263	10.685	3.789	4.234	19.160
2018	13.029	12.426	4.726	4.419	22.393
2019	13.932	13.207	5.167	5.239	27.591
2020	13.582	12.620	5.390	4.931	29.701
2021	13.304	12.809	5.385	5.181	33.113
2022	13.302	12.808	5.385	5.180	33.112

(Source: Surveyed and processed by the author)

Table 8 presents the descriptive statistics results on LEV from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Leverage (LEV) was in 2019 at 13.932, while the lowest was in 2015 at 9.475. Furthermore, the standard deviation values of LEV show relatively significant variation.

4.7. Descriptive Statistics Results on Bank Size (SIZE)

Table 9: Descriptive Statistics Results on SIZE

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	7.885	7.902	0.457	7.167	8.761
2016	7.953	7.953	0.451	7.199	8.827
2017	8.007	7.973	0.462	7.249	8.933
2018	8.088	8.022	0.472	7.264	9.015
2019	8.162	8.096	0.466	7.329	9.085
2020	8.218	8.166	0.469	7.309	9.118
2021	8.255	8.220	0.453	7.358	9.173
2022	8.251	8.217	0.453	7.351	9.171

(Source: Surveyed and processed by the author)

Table 9 presents the descriptive statistics results on SIZE from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Bank Size (SIZE) was in 2021 at 8.255, while the lowest was in 2015 at 7.885. Furthermore, the standard deviation values of SIZE show relatively significant variation.

4.8. Descriptive Statistics Results on Board Size (BoardS)

Table 10: Descriptive Statistics Results on BoardS

Year	Mean	Median	Standard Deviation	Minimum Value	Maximum Value
2015	8.071	7.000	2.478	5.000	14.000
2016	8.000	7.500	2.277	5.000	14.000
2017	8.393	8.000	2.986	5.000	17.000
2018	8.143	8.000	1.860	5.000	12.000
2019	8.107	8.000	1.771	5.000	12.000
2020	8.500	8.000	1.836	5.000	13.000
2021	10.357	10.000	1.747	8.000	14.000
2022	10.357	10.000	1.747	8.000	14.000

(Source: Surveyed and processed by the author)

Table 10 presents the descriptive statistics results on BoardS from 2015 to 2022 for 26 joint-stock commercial banks in Vietnam. The highest average Board Size (BoardS) was in 2020 and 2021 at 10.357, while the lowest was in 2016 at 8.0. Furthermore, the standard deviation values of BoardS show relatively significant variation.

5. DISCUSSION

The article is conducted with the purpose of evaluating the factors influencing the CAR (Capital Adequacy Ratio) of Commercial Banks in Vietnam *during the period from 2015 to 2022. To ensure a comprehensive dataset, the research collected secondary data from independently au-*

dited financial reports of 26 Commercial Banks *during the research period. The research method employed in the article is descriptive statistics. The research results reveal the following:*

- CAR (Capital Adequacy Ratio): The average CAR of banks during the research period fluctuates between 0.134 and 0.148, with no significant variation over the years. The highest CAR was recorded in 2017 (14.8%), while the lowest CAR was in 2022 (13.4%). The relatively low standard deviation of CAR indicates stability in its fluctuations over time. This stability in CAR over the years can instill confidence in the banking market. Changes in CAR can reflect the risk and resilience of banks in an evolving economic environment.

- Various Variables Studied: The research considered variables such as ROA (Return on Assets), DEP (Deposit Ratio), LIQ (Liquidity), LOA (Loan-to-Asset Ratio), LLR (Loan Loss Reserve), NPL (Non-Performing Loan Ratio), LEV (Leverage Ratio), SIZE (Bank Size), and BoardS (Board Size). These diverse variables provide crucial information about the variation and resilience of Vietnamese Commercial Joint Stock Banks from multiple perspectives.

- Key Findings on Specific Variables: ROA fluctuated between 0.007 and 0.013, indicating minimal variation over time. DEP, LIQ, LOA, LLR, NPL, LEV, SIZE, and BoardS also demonstrated similar stability with negligible variations. Some variables, such as SIZE and BoardS, showed an increasing average value over time, possibly representing the development and expansion of banks. The stability of these variables can create a predictable and stable environment for investors and regulatory authorities.

- Analyzing the Relationship Between Variables and CAR: The research also analyzed the relationship between the studied variables and CAR to understand their impact on the capital safety of banks. Understanding this relationship can assist in predicting and managing risks within the banking system.

- In the future, further research can expand to explore deeper into this relationship and investigate other factors that may influence CAR.

GREEN FINANCE: LEVERAGING PRIVATE INVESTMENT FOR SUSTAINABLE DEVELOPMENT

MPA. Nguyen Thi Phuong Thao[1]

Abstract: Green finance has gained significant momentum in the world. It is a worldwide trend that affects national governments, international financial institutions, and the financial systems of every nation and area. Innovative financial tools and private sector money may and should play a larger role in climate finance. Scaling up private climate finance in developing and emerging market countries necessitates a multifaceted strategy with advancements in a number of areas, support from multilateral development levels between public and private partnerships. This paper focuses on the private sector's role in fostering private climate finance, demonstrates how it mobilizes green investment, identifies challenges and opportunities, and then proposes some solutions for financial institutions aiming to strengthen their resilience and the resilience of the financial system as a whole, aligned with the Vietnamese government's goal of turning Vietnam into one of developed countries with high income by 2045.

Keywords: green finance, private sector, financial tools, sustainable development, green investment

1. INTRODUCTION

According to the Sustainable Development Goals and Paris Agreement, it was reproclaimed growth and development goals are inherently unlikely to persist without all nations addressing climate change and minimizing environmental impacts (Prasad et al., 2022). Since the global community is paying more attention to dealing with climate issues on a global scale, it is strongly highlighted that economy must create the groundwork for the creation and implementation of a funding strategy for global sustainability. However, driving the transformation towards to a low carbon economy will require substantial investments and innovation, thereby calling upon the terminology and engagement approaches of a variety of stakeholders including both government and private sectors. With limited government funding available, private sector plays a critical role in promoting green growth globally, as businesses and investors can advance green supply chains, give priority to green investments, and encourage the development of green technology. Therefore, in light of the world's environmental issues, green finance is key to managing business risks while guaranteeing long-term investment returns.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

In the wake of ratification of the Paris Agreement, green finance started to spark an explosion. Green finance is a notion that is quickly changing and whose idea has not yet been given a formal, universal definition. Green finance seeks to balance SDG achievement, environmental stability, economic growth, and ecological protection. It is the method of financing that calls upon the participation of a large number of financial organizations, both public and private, as well as a variety of asset classes, such as green bonds, green loans, green funds, and so forth, all of which are in charge of financing investments that are environmentally friendly. Recent studies show that until 2050, the supply-side of the global energy system will require financing ranging from USD 1.6

[1] Email: phuongthao.neu97@gmail.com, Academy of Finance.

to 3.8 trillion annually, and the financing gap for achieving the SDGs alone in developing countries is estimated to be USD 2.5 trillion annually. According to Taghizadeh-Hesary and Yoshino (2019), the amount of green finance demand and development is occasionally rising, and it is also thought that domestic bank credit is insufficient to close this funding gap.

Financing environmentally beneficial projects has become possible due to the introduction of new financial instruments like green bonds and climate bonds. However, as numerous academic writers have shown (Akomea-Frimpong et al., 2022), there is still a sizable financial gap when it comes to green investment. Climate change is one of the greatest challenges in the world. The issues posed by climate change may represent potential threats to the stability of the financial markets, the price system, and macroeconomics, all of which fall under the primary purview of central banks and financial regulators. Furthermore, as we move toward a low-carbon economy, changes in energy prices can have a direct impact on price stability, inflation, and economic growth across all sectors, including the banking sector.

According to financial experts, central banks and other financial authorities need to actively participate in the creation of a legal framework for green finance. To achieve this, progressive measures are required against financial and monetary regimes that support environmental solutions based on global solidarity and democratic economic governance for green funding. In order to raise money for long-term growth and incorporate green financing into their financial systems, emerging markets and developing nations in particular must put in place a plethora of regulations (Barbier, 2020). As a result, the financial sector has also contributed significantly to the growth of green financing. To bolster this, Mumtaz and Smith (2019) proposed that poor nations could imitate affluent nations in an effort to close the gap in green financing. The report goes on to say that green financing might forge connections between innovation, technical advancement, and economic greening to uncover untapped potential for economic growth. However, regulatory bodies like central banks must be used to address the financial system's operations.

According to the most recent IPCC special report, central banks or financial regulators may act as a last-resort facilitator for climate financing instruments that can assist reduce the systemic risk of stranded assets. The duty of central banks and financial regulators for broader societal objectives including the prevention of market failure and their part in formulating long-term national strategy are additional justifications for their increased roles. Additionally, in order to prevent a collapse of the credit market, central banks and regulators should restrict financial flows and bank lending to borrowers with high carbon footprints and damaging environmental practices. This is because it is one of their obligations to set specific restrictions on certain types of lending. Because monetary policies typically affect the economy with a lag, central banks and regulators must create and implement a forward-looking monetary policy approach.

According to the majority of empirical studies, regulatory and central bank actions significantly influence investment and financing decisions for green projects. More particular, Monnin and Barkawi (2015) suggested that central banks' role in supporting society in achieving its environmental goals has received less attention than monetary policy in worldwide discussions. On the other hand, according to Liu (2018), private investors play the biggest role in advancing green finance.

In contrast to other investment options, the private investment contribution is less than anticipated. Several studies explain why private investment is less significant than other types of investment, and one of the explanations given is the nature of green investments in terms of the trade-off between risk and return (Ruiz et al., 2016). Coordination between financial and environmental rules is advised, in accordance with (Akomea-Frimpong et al., 2022), in order to boost the amount of private green investment. This is the reason why the role of governmental authorities and monetary policies is remarkably significant to a country's economic development. Similarly, based on the available research articles on green finance, Rawat claimed that the reach of green finance in India has been constrained by stakeholders' lack of interest and ineffective government initiatives (International journal of recent technology and engineering, 2020). Despite many advantages of green finance and its significance to environmental challenges, some of its drawbacks include low yields, challenging methods, and a lack of expertise (International journal of recent technology and engineering, 2020). Hence, creative skills in finance and environmental economics are needed to build green finance. Therefore, the main obstacles to the growth of green finance in both developed and developing nations can be attributed to insufficient funding for small-scale investment needs, the short-term focus of investment products, a lack of knowledge of green financing and technical proficiency within businesses.

3. METHODOLOGY

The primary method adopted for this research is a qualitative approach, involving expansive literature reviews and collecting and analyzing non-numerical data to understand concepts, opinions or experiences. According to Tranfield, Denyer, and Smart (2003), a literature review is a more or less methodical method of compiling and summarizing prior research. A strong basis for knowledge expansion and the facilitation of theory formation is established by a successful and well-executed review as a research approach. A literature review has the ability to address research problems more effectively than any single study by incorporating the conclusions and points of view from numerous empirical findings.

The literature review draws on a variety of sources, encompassing books, research papers, academic and professional journal articles, and research publications, as well as adding instances or illustrations to the information. Boell and Cecez-Kecmanovic (2015) highlighted that the literature review is an important factor in all studies and assessments, typically including an outline, an explanation, and a critical evaluation of previous research as well as a recognition of current research challenges, new research issues, and questions for future research that are motivated by the data currently available. It is a collection of easily accessible (both published and unpublished) theme documents that include facts, concepts, data, and evidence published from a specific viewpoint to obtain or express those viewpoints on the nature of the subject and how it should be examined, and an effective review of the research papers involved.

This study's compilation, discussion, and analysis of the qualitative data help to answer the research question. This method is used throughout the research to achieve this goal. In addition, it broadens the scope of the research by utilizing multiple data sources and data collection techniques to confirm the validity of the research data (Saunders, Lewis and Thornhill, 2019).

4. DISCUSSION

The Role of Private Sector Investment in Sustainable Development

Private sector actors have yearned their desire for sustainable development to flourish in recent years. Krushelnytska (2019) stated that private investment money may be the primary source of the additional billions of dollars needed to bridge this gap and fund the preservation of the world's priceless ecosystems. Globalization and interdependence have prompted businesses and investors to acknowledge the overlap between public and private interests. They realize that the presence of a wealthy and sustainable society will contribute considerably to their success and well-being. In fact, private sector dominates the markets for food, energy and water. A government framework could foster public participation, but since this is a commercial initiative, it would be beneficial to collaborate more closely with the private sector.

A large number of businesses and other private sector players increasingly view themselves as contributors to promoting sustainable development efforts. They pursue towards this goal in a variety of ways including providing goods and services, generating tax revenues for funding essential social and economic infrastructure, as well as creating novel and creative solutions to help address development challenges. It is also strikingly becoming clear to companies and investors the importance of fighting against climate change. The private sector's contribution to development goes beyond the conventional strategy of fostering economic growth to the creation of deeper and more intricate public-private partnerships. As a result, the private sector is seeking out new opportunities to invest capital in ways that will both yield market-rate returns and minimize their negative environmental impacts, thus helping policymakers and the donor community in reshaping the business environment to facilitate green growth more effectively.

Green Finance: Mobilising green investment

Known as the new paradigm in the world of finance and business, green finance refers to the integration of business, finance and environmentally friendly behavior. According to Höhne et al. (2012), green finance is a broad term that covers investments in projects and initiatives aimed at sustainable development, environmental products, and policies aimed at promoting sustainable economic growth. It serves as a platform for a wide range of players, such as private individuals and companies, producers, investors, and financial lenders. Depending on the participant, green finance may be driven by monetary incentives, a desire to protect the environment, or a combination of both. In contrast to traditional financial activities, green finance places a greater emphasis on ecological benefits and gives the environmental protection sector more attention.

According to Maurice Strong, secretary-general of both the 1972 Stockholm Conference and the 1992 UN Conference on Environment and Development (Earth Summit), the corporate community was viewed as a growingly significant political force for sustainable development. To attract private capital and lessen the risk of private financing for renewable energy technology, they use loans and blended finance where political and commercial uncertainties diminish returns on investment. Zhang et al (2022) argued that green finance development will be more successful if all industries simultaneously embrace the same national policy. The same national policy should be followed by all economic sectors, including agriculture, industry, and services. Green financing must be added to ecological and environmentally sound initiatives as part of the development of rural regeneration. Furthermore, to promote other industries and support high environmental quality, governments should use a variety of financial instruments. Determining the characteristics of green finance development is therefore thought to be extremely important.

In the green finance market, there are mechanisms and financial products designed to reduce pollution emissions, preserve ecosystems, and protect businesses from unexpected changes in the environment. The former is exemplified by emissions trading, while the latter includes a variety of products such as environmental funds, weather derivatives, nature-linked securities, and ecological options, among others. For instance, the UK government has launched Green Finance Strategy entitled Mobilising Green

Investment with the aim of mobilising private finance for clean and resilient growth. The government has shown their commitment to pursuing its ambition to become the world's first Net Zero-aligned Financial Centre. It is estimated to cost 1% to 2% of GDP to achieve the UK's net zero goal (The UK Government, 2023). It is private investment that will be essential for delivering net zero, building climate resilience and supporting nature's recovery. Attracting private funding for decarbonization has been identified as the key challenge by the Environmental Audit Committee since businesses are regarded to be the primary source of the majority of the necessary investment. Hence, this investment presents a tremendous chance to level up the UK, particularly those regions with an industrial legacy, and will assist the sectors and technologies of the future while allowing traditional industries to adapt and thrive during the transition.

Another famous cases that environmental regulators use financial market mechanism to solve the problem of air pollution, water pollution and the problem of biodiversity is that the Swedish carbon tax is hailed as a success for being effective in reducing carbon emissions while decoupling continued economic growth from national emissions despite it levying the highest carbon tax rate in the world. In terms of definition, a carbon tax is a form of a government intervention used to address market failures. A carbon tax imposes a cost on polluters (emitters) for each ton of greenhouse gas emissions they release into the atmosphere (Meyer, Hvelplund and Nørgård, 2011).

The role of green finance in promoting significant sustainable development in Vietnam

The demand for Vietnam's investment in projects that minimize environmental consequences will increase with the commitment to attain net zero emissions by 2050 and reduce methane emissions by 2030. As a result, green finance is absolutely essential to Vietnam's aspirations for sustainable development. Climate change and environmental challenges are currently raising an alarming concern in Vietnam. The State has determined that developing green finance in Vietnam is the best course of action for raising capital for the green economy, with a strong commitment to the international community on the "zero" economy of greenhouse gas emissions by COP26.

In terms of regulating sustainable finance, the Vietnamese government has made some headway. The regulator established two goals for 2025 in 2018: establishing an environmental and social (E&S) management system in all financial institutions, as well as implementing banking procedures to incorporate environmental and social risk assessment into credit risk assessment. To raise private sector funding for projects with environmental and social benefits, the State Securities Commission and the International Finance Corporation published a handbook on "How to Issue Guide for Green Bonds, Social Bonds, and Sustainability Bonds" in April 2021. Furthermore, general action plans for expanding green credit and creating green banks in the nation have been laid out by the State Bank of Vietnam (SBV). By the end of 2022, credit balances for green projects would have reached around 500,000 billion VND, or about 4.2% of the total existing loans to the economy, according to the SB of Vietnam research. Credit institutions have provided financing for eco-friendly initiatives like sustainable agriculture, clean energy, and environmental sanitation. Therefore, Vietnam's finance sector will undoubtedly play a big role in delivering climate finance, and institutions must also embark on their own carbon transition journeys if the country is to achieve its ambitious decarbonization agenda.

Green Finance in Vietnam: Opportunities and barriers

After China and Mongolia, Vietnam is one of the most carbon-intensive economies in Asia, and to help combat climate change, it needs to make a swift shift away from high carbon activity.

The nation's finance sector will have to play a vital role as it follows this ambitious course, offering a wide spectrum of cutting-edge financial solutions. According to the research, five loans for sustainability and the environment were issued in Vietnam in 2022 by different issuers (Vietnam Investment Review, 2021). The greatest of these was a green loan of $500 million that VinFast, a Vingroup affiliate, granted. By the end of 2022, green loans were expected to equal roughly VND 500 trillion, or 4.2% of all outstanding loans, according to a report by the Training and Research Institute of the Bank for Investment and Development of Vietnam (BIDV). Green loans increased at a rate of about 22% each year from 2017 to 2022. Vinpearl, a fully-owned subsidiary Vingroup, recently issued an Exchangeable Sustainable Bond (ESB) worth $425 million with the assistance of HSBC, which is convertible into additional Vingroup shares. The first exchangeable sustainable bond ever issued is this one. HSBC assisted Vingroup in creating its initial Sustainable Finance Framework, which covers six green and two social project categories throughout Vingroup's business areas. Vingroup is the exclusive sustainability structuring bank. Clean transportation, eco-friendly structures, environmentally sound water and wastewater management, pollution prevention and abatement, energy efficiency, renewable energy, access to basic services like healthcare, and affordable housing are a few possible project areas. According to Sustainalytics, a top independent organization that rates the sustainability of publicly traded companies, the framework has a favorable effect on the environment and society.

Looking ahead in the bright future, Vietnam has an estimated $753 billion in climate-smart corporate investment opportunities between 2016 and 2030, with the majority ($571 billion) going toward the nation's transportation infrastructure requirements by that year. The total amount of potential investments in renewable energy is $59 billion, of which over half ($31 billion) will go toward solar photovoltaic projects and the remaining $19 billion will go toward small hydropower ones. Investment opportunities in new green buildings are roughly $80 billion (Vietnamnet Global, 2023). Due to the ongoing epidemic and increased focus on sustainable economic recovery, these figures demonstrate how Vietnam's sustainable finance sector will significantly change over the coming years. In the coming years, it is anticipated that new strategies, funds, and financing instruments that address environmental and social challenges will develop at an accelerated rate due to the Vietnamese government's commitment to expanding the sustainable financial sector.

However, Vietnam still lacks a legal framework, a thorough, consistent policy, environmental standards, and tools for commercial banks to use in risk management and promotion. The paper emphasizes that the lack of a legal framework for social, environmental, and green credit management makes it difficult for credit institutions to implement processes, norms, mechanisms, preferential policies, and products for firms in this field. In an August 2017 session on drawing resources for green and sustainable development co-hosted by the SBV, the CEO of HSBC Vietnam emphasized how difficult it is for many companies to establish the circular economy, a key component of sustainable development. He underlined that there are no specific rules or standards for limiting emissions or defining what "green" means in particular contexts.

Proposing financial strategies to stimulate green growth

Given the dynamic aspects of these challenges, there is no unified approach to address this issue. In fact, it is evident that each national setting can use a combination of tools that are suitable for their unique circumstances. Indeed, a significant lesson from some literature reviews clarifies that there is no silver bullet (Gramkow, 2020). In other words, no single policy tool (such as a carbon tax, an emissions trading system, etc.) will have the requisite traction to set in motion the uptake of investments that would both enhance economic recovery and move us all to a growth path that produces fewer GHG emissions. Instead, there exist a number of interventions and measures that may be appropriate to leverage green finance in private sector for promoting sustainable development as well as adaptation to climate change.

Firstly, establishing a legal framework to develop diversified and synchronous green finance solutions listed as regulations on the disclosure of information related to the environment of listed companies, especially in developing nations in general and Vietnam in particular, is a crucial first step towards facilitating green financing. By supporting the development of green technologies, the growth of related enterprises, etc., green finance can aid in the expansion of specific businesses or the economy. Therefore, a legal emission trading system and associated system with green funding need developing should be needed so as to serve a legislative purpose.

The second way for most cities addressing these issues is to create a pipeline of projects that can be financed via green instruments. Not every city has climate action plans, resilient strategies, or assessments of climate and vulnerability. Such strategies should be connected to specific investment plans when they are created or changed. In the real world, this might result in adopting city laws for green building and land use planning or looking into new models for operations and maintenance.

Thirdly, establishing a framework for carbon pricing is one of the most effective ways to ensure that the costs of mitigation and adaptation measures for climate change are taken into account when making major investments. The establishment of green infrastructure investment trusts (InvITs), which include bonds and other instruments, will then encourage the use of national investments. Lastly, the ultimate goal is to lower legislative hurdles, provide guidance for external borrowing, and minimize prevarication costs in order to lower barriers to green financing when interacting with global markets.

5. CONCLUSION

Green finance is a cutting-edge financial strategy with the goal of achieving resource sustainability and environmental preservation. Green finance can direct the flow of capital, achieve efficient risk management of the environment, and produce optimal distribution of social and environmental resources if its market mechanism is rational. The phenomena of knowledge asymmetry will be avoided and the moral hazard problem will be resolved with proper policy control as well.

THE IMPLEMENTATION OF GREEN ACCOUNTING: SUSTAINABLE DEVELOPMENT IN VIETNAMESE SMALL AND MEDIUM ENTERPRISES

PhD. Nguyen Thi Thuan[1], MA. Dang Thu Lan[2]

Abstract: *The study conducted an investigation and outlined several factors that impact the implementation of green accounting for small and medium-size enterprises in Vietnam. Subsequently, through a combined qualitative and quantitative research method, the paper introduces a model of variables influencing green accounting in Vietnam within the framework of globalization. Data used in the study were collected from the results of 207 survey questionnaires. Research results show that Professional associations and State management agencies affect the implementation of green accounting. However, two factors Manager's awareness and Economic characteristics have a negative with the implementation of green accounting in Vietnamese small and medium enterprises.*

Keywords: *Implementation, green accounting, small and medium, Vietnam.*

1. INTRODUCTION

Vietnam has experienced significant economic development over the past few decades with impressive economic growth rates. This growth has been driven by factors such as market-oriented reforms, foreign direct investment, and a young, dynamic workforce. However, the rapid pace of economic development has been accompanied by environmental challenges such as pollution, deforestation, and depletion of natural resources. Like many other countries, Vietnam has been influenced by the global discourse on sustainable development and environmental protection. These challenges demand a more systematic and comprehensive approach to accounting for the environment. The concept of green accounting emerged in Vietnam as a response to the complex interplay between economic development, environmental challenges and global sustainability trends. One of the earliest prominent mentions of green accounting can be traced back to the 1970s. In 1973, economist William Nordhaus introduced the concept of "adjusted net savings" as a way to account for the depletion of natural resources in his paper titled "The Allocation of Energy Resources." However, it was in the 1980s and 1990s that the term "green accounting" gained more widespread recognition. Various international organizations began advocating for the development and implementation of accounting systems that incorporate environmental factors. The United Nations first mentioned the definition of green accounting in the "System of Integrated Environmental and Economic Accounting" (SEEA). Green accounting, also referred to as environmental accounting, is defined as the "identification, measurement, and allocation of the economic benefits and costs of environmental resources." (UN, 1993).

In an era defined by increasing environmental awareness and growing concerns about the sustainability of the planet, traditional accounting practices have shown their limited scope in capturing the true costs and benefits of economic activities. Green accounting is a pioneering approach that seeks to bridge the gap between economic progress and environmental preservation.

1 Email: thuan.nguyenthi1@phenikaa-uni.edu.vn, Phenikaa University.

2 Phenikaa University.

Unlike conventional accounting which predominantly focuses on monetary transactions, green accounting incorporates ecological and social dimensions to provide a more complete picture of an entity's performance. This innovative framework revolutionizes the way we measure, report, and manage economic activities, placing emphasis on identifying and quantifying material environmental impacts. By prioritizing materiality, green accounting enables businesses to target their sustainability efforts where they can have the greatest effect (Moorthy and Yacob, 2013). A critical tool within green accounting is the Life Cycle Assessment that evaluates the environmental impacts of a product or process throughout its entire lifecycle, from resource extraction to production, distribution, use, and disposal. By considering the full spectrum of impacts, businesses can make informed decisions to minimize their environmental footprint. (De Beer and Friend, 2006).

In both developed and developing countries, the adoption of green accounting can have significant benefits. However, the specific challenges and opportunities will vary based on the level of economic development. Developing countries are heavily dependent on natural resources for their economic activities, which makes green accounting crucial for understanding the true economic value of these resources and for sustainable management. On the other hand, developing countries often face challenges in terms of data availability and quality, which requires a great deal of effort to implement comprehensive green accounting practices. In many developing countries, there may be a need to integrate green accounting principles into broader policy frameworks related to sustainable development and poverty reduction (Farouk et al., 2012).

Green accounting fosters transparency, enhancing stakeholder trust and credibility. Additionally, it can drive innovation by encouraging the development of sustainable technologies and practices. This can lead to cost savings in long-term through reduced energy consumption, waste reduction, and optimized resource utilization. Green accounting allows investors to evaluate a company's potential for cost savings through sustainability initiatives. Both globally and in Vietnam, there have been numerous studies and reports addressing green accounting and its effect in various business sectors, such as Rounaghi (2019), Huy (2014), Huong and Hang (2020). Nevertheless, there is remains a limited understanding of the factors influencing green accounting and how to effectively measure them. This study builds upon prior research findings and proposes a model that delineates the factors affecting the application of green accounting for small and medium enterprises in Vietnam.

2. LITERATURE REVIEW

With the trend of green growth, green economy globally, green accounting is more and more popular in many countries. Green accounting has also become the research topic of scholars around the world. The requirement of sustainable development, limitation and minimization of impacts on the environment makes green accounting a concern of policy makers, business administrators as well as researchers. According to Agarwal and Kalpaja (2018), standards and quantification are needed to control business activities that pollute the environment before allowing an organization to operate production or business activities or to force the organization to handle the pollution problems it has caused. When businesses take into account environmental aspects of economic activities such as service and product costs, businesses can consider reducing the amount of natural resources used in production and business activities to save money, thereby maximizing cost savings and ensuring compliance with environmental requirements. Research by Lako

(2018) confirms that the first way to strengthen Green Accounting practice is through employees' understanding and awareness of environmental and social issues. Van (2018) believes that green accounting is an important tool related to aspects of the influence of the natural environment on the economy. On the other hand, green accounting is the direction of transformation towards sustainable development that Vietnam is aiming for.

Hang (2019) believes that the application of green accounting contributes to providing accurate, transparent, complete and accountable information. This helps improve the image of the business to regulators, shareholders, investors and business partners. The author opines that businesses' awareness of social responsibility affects the application of green accounting. In addition, professional associations also need to participate in promoting the application of green accounting through proposing recommendations to the Ministry of Finance and related agencies based on experiences from other countries.

Research by Hung an Trung (2020) aims to analyze factors affecting the level of environmental accounting application at companies listed on the Vietnamese stock exchange. Data used in the study were collected from the results of 280 survey questionnaires and annual reports. Research results show that there are 5 factors affecting the level of environmental accounting application including: (1) Legal system; (2) Economy; (3) Competitiveness; (4) Accounting training system; (5) Manager. By inheriting relevant previous research and using a combination of qualitative and quantitative research methods, this study has built a model of factors affecting the level of environmental accounting adoption in market of listed enterprises. With a survey sample of 280 listed enterprises, the model testing results show that there are 5 factors affecting the level of environmental accounting application of listed enterprises in order of importance: System law; Manager; Economy; Accounting training system and competitiveness.

Khiem and Cong (2021) used quantitative research methods, using multivariable linear regression models to analyze data at manufacturing enterprises in Thai Nguyen province to indicate factors affecting the level of green accounting application. The results show that the factors: Potential for business expansion, People perception in the business and Incentives from stakeholders affect the level of green accounting adoption. However, the author's research is limited in terms of research scope and influencing factors, the level of data processing is quite simple.

Dinh et al. (2022) used qualitative research methods combined with quantitative methods to propose 6 factors affecting environmental accounting including: Firm size, The pressure of stakeholders, Perception of the benefits of implementation, Legal regulations , Financial resources, Staff qualifications, Applying environmental accounting in manufacturing enterprises. The results of multivariate regression analysis show that all 6 factors included in the study have a positive impact on the application of environmental accounting in manufacturing enterprises in Vietnam. However, the study still has limitations that future studies need to pay attention to. First, the data used in the study was collected through surveys in many types of enterprises (different sizes, industries, etc.), so it is not representative of each type of business. Secondly, many other factors can affect the application of EA, such as environmental strategy, business lines, audit, etc. but have not been considered in this study. Finally, the study used analytical and synthesis methods from published studies for a long time, and the sample size was small, so the generalizability was not high, affecting the quality of the study. Using qualitative research methods in Bali province by research of Adyatma et al. (2022) pointed out that small and medium enterprises in Bali have not yet understood and applied green accounting in their business activities. In general, small and medium-sized enterprises still manage and treat waste according to the traditional model, not as professionally managed as large enterprises. Awareness of the importance of protecting the environment can be started by implementing green accounting in the small and medium enterprises. With the application of green accounting in small and medium enterprises it is hoped that they will be able to create a positive impact on society, not only from an economic perspective, but also from a natural, social and cultural perspectives.

To evaluate the impact of factors on the application of green accounting in construction enterprises in Vietnam, Nguyen et al. (2023) collected 243 questionnaires from managers and accountants. Then, the authors used Cronbach's alpha test, exploratory factor analysis and multiple regression analysis to identify 5 factors affecting the application of green accounting in Vietnamese construction enterprises. These factors encompass: staff levels and resources, legal and regulatory systems, customer demands, legal and educational systems, stakeholders, managers' perceptions, internal resources. However, the study has certain limitations such as the modest sample size, restrited scope (stopping at the construction industry), and measurement questions posed that may affect respondents' answers.

From theoretical and practical research, the author proposes the following hypotheses for small and medium enterprise in Vietnam:

H1: Manager's awareness has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises.

H2: State management agency has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises.

H3: Professional associations has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises.

H4: Economic characteristics has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises.

3. RESEARCH METHODS

The authors used qualitative research methods combined with quantitative research methods. Research conducted interviews with experts in the field of financial and management accounting, experts in the field of accounting and auditing practice, managers of small and medium-sized enterprises, and university lecturers. From there, the authors calibrated the scales of the factors and set up a survey table for use in official research. The authors collected data, conducted preliminary analysis, and calibrated the scale and research model before official research. The author evaluated the reliability of Cronbach's alpha and analyzed the EFA exploratory factor. And then built a multivariate regression model to evaluate the impact, as well as the influence of factors on the implementation of green accounting of small and medium-sized companies in Vietnam.

3.1. Research data

According to the results of the survey on May 22, 2023 conducted by the General Statistics Office recently, it can be seen that Vietnamese enterprises are mainly small and medium-sized enterprises, accounting for over 97% of enterprises nationwide. (https://www.gso.gov.vn/tin-tuc-other/2023/05/doanh-nghiep-nho-va-vua-co-the-dong-gop-nhieu-cho-cong-nghiep-ho -ash/).

However, the author could not survey all Vietnamese small and medium enterprises due to limited resources and high costs. Therefore, the study used a non-probability convenience sampling method (Tho, 2013).

In the study, there are a total of 23 observed variables (including 7 dependent variable scales, 18 independent variable scales). The minimum sample size for this study is: 23 x 5 = 115 samples (Bollen, 1989). However, to ensure that the number of observations collected is sufficient for analysis and representative of the entire population, the authors sent 350 questionnaires to small and medium enterprises.

Research survey subjects: Business managers and chief accountants. Each business represents one survey respondent. The author sent questionnaires via email and Google Docs during the period from June 2023 to August 2023. To conduct the survey, all items in this study were designed on a 5-point Likert scale (1 = completely disagree and 5 = completely agree). After sending the letter, the author received a total of 225 responses, accounting for 64.29%. However, out of 225 responses, 18 responses were incomplete, leaving 207 responses worth analyzing.

3.2. Research model

The research model proposed by the authors is as follows (Fig. 1)

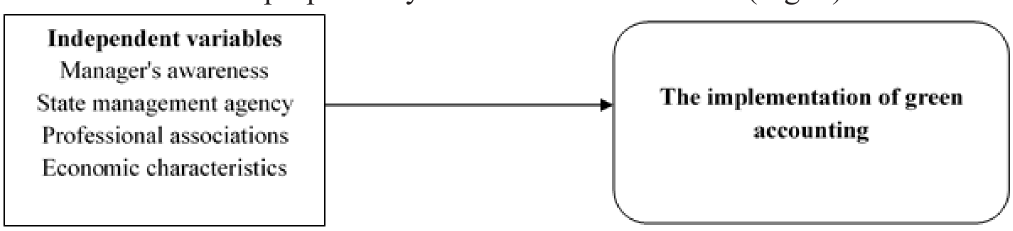

Fig. 1. Research model

4. RESEARCH RESULTS

According to Nguyen (2013), observed variables with item-total correlation less than 0.3 will be eliminated and the scale is selected when Cronbach's Alpha coefficient is 0.6 or higher. The results of Cronbach's Alpha analysis are presented in Table 1.

Table 1: Cronbach's Alpha coefficient of the factors

Factor	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
Measure The implementation of green accounting: Cronbach's Alpha = 0.887				
GA1	11.11	9.697	.627	.884
GA2	10.97	8.926	.737	.860
GA3	11.05	8.969	.686	.873
GA4	11.05	8.648	.795	.847
GA5	11.04	8.591	.792	.847
Measure Manager's awareness: Cronbach's Alpha = 0.78				
MA1	5.77	2.798	.668	.645
MA2	5.19	3.040	.614	.707
MA5	5.86	3.027	.572	.752
Measure State management agency: Cronbach's Alpha = 0.897				
SM1	6.75	5.847	.734	.884

SM2	6.89	6.173	.823	.851
SM3	6.85	5.966	.768	.869
SM4	6.88	6.152	.774	.867
Measure Professional associations: Cronbach's Alpha = 0.893				
PA1	14.24	9.893	.683	.883
PA2	14.18	9.384	.795	.857
PA3	14.09	9.763	.752	.867
PA4	13.98	9.985	.792	.860
PA5	14.35	9.723	.685	.883
Measure Economic characteristics: Cronbach's Alpha = 0.922				
EC1	5.83	2.766	.769	.916
EC2	5.79	2.728	.827	.897
EC3	5.79	2.593	.804	.905
EC4	5.79	2.495	.885	.876

Source: Authors' analysis

The results of Cronbach's Alpha analysis are presented in Table 1 showing that all scales have Cronbach's Alpha coefficients greater than 0.6 and the total variable correlation coefficients of the scales are greater than 0.3. Except for the case of variable MA3, variable MA4 of the scale was eliminated because it did not meet the requirements. Therefore, the scales meet the requirements and the observed variables continue to be used to EFA exploratory factor analysis.

Talbe 2: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.838
Bartlett's Test of Sphericity	Approx. Chi-Square	1997.045
	Df	120
	Sig.	0.000

Source: Authors' analysis

From the results of table 2, it can be seen that: The result of Bartlett's test of sphericity in the KMO and Bartlett's test table with sig = 0.000, means that the observed variables are still linearly correlated with the representative factor (specifically, the index 0.5 < KMO = 0.838 < 1 indicates that exploratory factor analysis is still appropriate for real data).

Table 3: Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	4.598	28.736	28.736	4.598	28.736	28.736	3.563	22.270	22.270
2	3.273	20.459	49.195	3.273	20.459	49.195	3.265	20.406	42.676
3	2.582	16.140	65.335	2.582	16.140	65.335	3.100	19.375	62.051
4	1.545	9.658	74.993	1.545	9.658	74.993	2.071	12.941	74.993

Source: Authors' analysis

According to table 3, there are 4 factors extracted based on the criterion of eigenvalue greater than 1, so these 4 factors best summarize the information of the 16 observed variables included in the EFA. The total variance extracted by these 4 factors is 74.99% > 50%, thus, the 4 extracted factors explain 74.99% of the data variation of the 16 observed variables participating in EFA.

Talbe 4: Rotated Component Matrix[a]

Factor	1	2	3	4
PA2	.869			
PA4	.864			
PA3	.837			
PA5	.787			
PA1	.783			
EC4		.937		
EC2		.900		
EC3		.888		
EC1		.863		
SM2			.893	
SM4			.872	
SM3			.868	
SM1			.837	
MA1				.825
MA5				.821
MA2				.775
Extraction Method: Principal Component Analysis. Rotation Method: Varimax with Kaiser Normalization.				
a. Rotation converged in 5 iterations.				

Source: Authors' analysis

According to table 4: Rotated matrix results show that the 16 observed variables are classified into 4 factors, all observed variables have Factor Loading coefficients greater than 0.5 and there are no longer bad variables.

The relationship between Manager's awareness, State management agency, Professional associations, Economic characteristics with the implementation of green accounting of small and medium enterprise in Vietnam is shown in the following models:

$$\mathbf{GA = \beta0 + \beta1MA + \beta2SM + \beta3PA + \beta4EC + \varepsilon}$$

Dependent variable: Implementation of green accounting

The independent variable consists of 4 variables:

Variables (Xit): Manager's awareness (MA), State management agency (SM), Professional associations (PA), Economic characteristics (EC)

ε is the error.

Table 5: Results of multiple regression analysis

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Correlations			Collinearity Statistics	
		B	Std. Error	Beta			Zero-order	Partial	Part	Tolerance	VIF
1	(Constant)	.674	.328		2.056	.041					
	MA	.121	.069	.114	1.744	.083	.244	.122	.107	.880	1.136
	SM	.217	.058	.237	3.755	.000	.326	.255	.230	.941	1.063
	PA	.319	.062	.333	5.149	.000	.413	.341	.315	.894	1.118
	EC	.055	.086	.040	.643	.521	.002	.045	.039	.970	1.031
a. Dependent Variable: GA											

Source: Authors' analysis

Table 5 results show the Sig value. of MA and EC are both greater than 0.05, so these two variables are not meaningful in the model. However, the value Sig. of SM and PA are both less than

0.05, which can confirms again that these variables are meaningful in the model. Table 5 shows that the adjusted R^2 is 0.243, meaning the model's level of explanation is 24.3%. Specifically, the four factors MA, SM, PA, EC explain 24.3% of the dependent variable. Furthermore, the results show that the VIF values of the independent variables are all less than 10, so it can be concluded that there is no multicollinearity phenomenon.

Table 6: Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics					Durbin-Watson
					R Square Change	F Change	df1	df2	Sig. F Change	
1	.493[a]	.243	.228	.6488	.243	16.189	4	202	.000	2.058
a. Predictors: (Constant), EC, SM, PA, MA										
b. Dependent Variable: GA										

Source: Authors' analysis

The results from table 6 show that the F statistic value is 16.189 with Sig value. very small (= 0.000 < 0.05). Thus, it can be concluded that the proposed model is suitable for real data, the independent variables have a linear relationship with the dependent variable. The Durbin – Watson coefficient is 2.058 (1 < 2.058 < 3), so it can be concluded that there is no first-order serial correlation in the model. Therefore, the model is not violated when using multiple linear regression method.

Table 7. ANOVA[a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	27.255	4	6.814	16.189	.000[b]
	Residual	85.020	202	.421		
	Total	112.275	206			
a. Dependent Variable: GA						
b. Predictors: (Constant), EC, SM, PA, MA						

Source: Authors' analysis

The regression results show that the order of influence of factors on the implementation of green accounting in order of importance are: PA, SM, respectively. However, two factors have opposite effects: MA and EC. This shows that PA and SM have an important influence on the implementation of green accounting.

Thus, the regression equation is expressed as follows:

$GA = 0.674 + 0.217\ SM + 0.319\ PA + \varepsilon$

Thus, the hypothesis H1: "Manager's awareness has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises" is rejected. It can be said that managers' awareness has an insignificant impact on the implementation of green accounting in Vietnamese small and medium enterprises. Or in other words, the impact of managers' awareness on businesses the higher the number of small and medium enterprises, the lower the adoption of green accounting. Hypothesis H2: "State management agency has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises" is accepted.

Thus, the more small and medium-sized enterprises are influenced by state management agencies, the higher their adoption of green accounting. Hypothesis H3 states that: "Professional associations has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises" is accepted. It can be said that professional associations are the important factors that have the most significant influence on the application of green accounting. Thus, when small and medium enterprises have the influence of professional associations, the application of green accounting is higher. Hypothesis H4: "Economic characteristics has a positive impact on the implementation of green accounting in Vietnamese small and medium enterprises" is rejected. Thus, when small and medium enterprises are affected by economic characteristics, the application of green accounting is lower.

5. CONCLUSIONS

The results of this study indicate that the role of State management agency and Professional associations have a significant impact on the implementation of green accounting. The other factors considered, Manager's awareness and Economic characteristics do not show a relationship with the implementation of green accounting.

Although the effectiveness and importance of green accounting have been acknowledged, in practice, the implementation of green accounting in small and medium-sized enterprises in Vietnam is still very limited. Research on the factors influencing green accounting currently yields inconsistent results. It is crucial and urgent to identify and suggest these factors. The authors' proposed research model presents potential for future studies to comprehensively promote the implementation of green accounting in the Vietnamese economy.

DEVELOPMENT OF ELECTRONIC BANKING SERVICES IN THE DIGITAL ECONOMY

MA. Nguyen The Hung[1]

Abstract: Developing E-Banking services is an inevitable and objective trend in the current digital economy. The benefits of e-banking are huge for customers, banks and the economy, thanks to its convenience, speed, accuracy and security. Digital technology is gradually changing fundamentally the form of providing financial and banking services. The development of e-banking services on the basis of digital technology can help banks comprehensively innovate from the process of providing products and services, innovating the distribution channel system, and expanding the product portfolio, providing services to a wider range of customers at a lower cost. From this situation, it is required to have practical summaries as well as solutions to promote the development of e-banking services in the current digital economy era.

Keywords: E- banking, Digital economy, Banking services

1. PROBLEM STATEMENT

In Vietnam, e-banking began to be known and had the first foundations in the mid-2000s. However, it was not until 2010, under the development and impact of the 4.0 revolution, that the e-banking trend really exploded. The popularity of the Internet and modern technology devices such as smartphones, tablets, laptops, etc. have created favorable conditions for e-banking to develop. The fact that Vietnam's population is young, sensitive to technology, and has a high rate of mobile phone and Internet usage (over 50% of the population) contributes to the demand for convenient services such as e-banking. The appearance of technology makes customers' habits and behaviors gradually change. They want to experience safe and convenient financial services, being able to transact anytime, anywhere right on a portable electronic device instead of spending time and effort commuting but poses the problem of service innovation for banks.

E-banking services bring new values to customers: save time and costs, conveniently perform anytime, anywhere, quickly and efficiently. Developing e-banking services is one of the top development strategies of commercial banks in the world. Determining that promoting e-banking services is one of the focus of operations, commercial banks have taken many concrete steps, from implementing, building and modernizing payment systems to creating advanced payment technology infrastructure systems.

However, the implementation of e-banking services in Vietnam in the current digital economy still has many limitations. For the purpose of further research on the development of e-banking services in the digital economy, research opportunities as well as challenges to develop e-banking services, thereby contributing solutions to deploying e-banking services. , to further successfully develop e-banking services in Vietnam, the author chooses the topic "Development of electronic banking services in the digital economy" as my research content.

2. CONTENT

2.1 Research Subject

The research topic: the theoretical basis and practice of developing e-banking services at commercial banks in the digital economy in order to propose solutions to develop banking services in today's digital economy.

---

1 Academy of Finance, Email: hungnt@hvtc.edu.vn.

2.2. Research Method

Research Objective: This article aims to clarify the current status of electronic banking service development in commercial banks, analyze the influencing factors on the development of electronic banking services, and provide solutions for the advancement of electronic banking services in the current digital economy.

Research Methods and Data: In addition to the synthesis method and statistical methods using secondary data, the authors utilize the exploratory factor analysis (EFA) method and multiple linear regression analysis method to identify the influencing factors and the extent of their impact on the development of electronic banking services in commercial banks.

The data used in the research are collected from a survey of 179 customers who are using electronic banking services in Hanoi, Ho Chi Minh City, and some other provinces and cities, from August 1 to August 10, 2023. In the survey questionnaire, the research proposes a measurement scale for six influencing factors on the decision to use Fintech services, consisting of 29 variables. These variables will be measured on a 5-point Likert scale with the following levels: (1) Strongly Disagree; (2) Disagree; (3) Neutral; (4) Agree; (5) Strongly Agree.

2.3 Electronic Banking Services

With a history spanning over 30 years, electronic banking services are understood in various ways depending on the researching entity, and to date, there has been no universally accepted definition for this type of service.

According to the FFIEC (Federal Financial Institutions Examination Council), electronic banking services are understood as a type of traditional banking service provided directly to customers automatically through interactive electronic communication channels. Thus, electronic banking encompasses the entire system that enables individuals or businesses to access their accounts, conduct transactions, or gather information about financial products and services through both public and private electronic networks, including the internet.

Electronic banking services include both traditional and modern banking services. Similar to traditional banking services, the utilities provided by electronic banking services are built on the core banking system of the bank and include information services, payment services, credit services, trade services, and finance services. Unlike traditional banking services, electronic banking services are provided through electronic channels.

* Fintech Services:

Fintech, short for Financial Technology, refers to the application of advanced technologies to enhance and improve the quality of traditional financial service methods. Based on functionality and target audience, Fintech products currently fall into two categories:

First category - Consumer-oriented: These solutions aim to enhance customer experiences in financial activities such as payment transactions, borrowing, crowdfunding, investing, etc.

Second category - Back-office: These are companies that provide technological solutions to issuing organizations or distribution agents, such as information security, user identification, risk management, etc.

To meet the convenience of the public's digital financial service usage, the Fintech ecosystem has introduced a series of specific flagship products, such as:

* E-Payment Services:

E-payment is an online payment method through electronic means. This allows users to easily and quickly conduct shopping transactions, money transfers, and bill payments. E-payment offers significant benefits, including convenience, speed, and integration. Online shopping and e-commerce payments: E-payment enables users to shop online and make payments on e-commerce websites. This saves time and enhances the user shopping experience. Bill payments and utility payments: E-payment provides a convenient payment method for monthly bills, including electricity, water, and bank loans. International money transfers and foreign currency transactions: E-payment facilitates easy international money transfers and swift foreign currency transactions, avoiding time constraints and high fees.

Payment for public services: E-payment offers a payment method for public services such as public transportation, social insurance, and taxes.

2.4.The current situation of developing e-banking services in Vietnam

Developing e-banking services is an inevitable trend in the context of international economic integration. Not only since the Covid-19 pandemic has digital payments developed, but for a long time, in many countries around the world, not using cash has become a strongly promoted payment trend.

In Vietnam, since 2006, the State Bank has submitted to the Prime Minister for approval the Scheme of non-cash payment. This scheme has been adapted to the development of the economy and the development of cashless payment technology. In the past, non-cash payment activities in our country have been expanded in both scale and quality; has made strong progress with many new, convenient and modern payment products and services based on information technology applications.

In 2015, the NAPAS card system handled more than 90% of automatic teller machine (ATM) switching transactions, the figure in 2019 was only about 40%. In the first months of 2020, when the Covid-19 epidemic occurred and especially during the period of social isolation, electronic payment activities took place smoothly and safely, payments via internet channels increased by nearly 50% in price. Transaction value while paying via mobile phone channel increased by more than 160% over the same period in 2019 (Source: State bank report 2019-2020).

In 2021, we will witness rapid progress from pre-tax revenue to Vietnam's financial-banking industry. Impressive numbers continuously appeared and crashed a series of peaks in the same period in previous years. With innovation, acceptance of application and integration of many advanced technology platforms, E-Banking Vietnam is going further and further. Typically, the outstanding growth from banks: Vietcombank, Techcombank, MB and VPBank is a clear example. One of the key deciding factors is mobile technology and quick processing of user data. According to Statista 2020, there are currently more than 120 million mobile subscribers in Vietnam, with more than 75% of them able to register to use financial-banking services and online payment transactions. This is as a springboard for the development of e-Banking technology and of course, the mobile platform is given top priority. According to statistics of the State Bank of Vietnam, non-cash payment has developed rapidly and strongly in the past, it has had great significance in terms of socio-economic development in the face of the impacts of the Industrial Revolution 4.0, helping to increase quick adaptation, quick recovery, to unpredictable social events. Especially in the context of the outbreak of the COVID-19 pandemic in the world as well as in Vietnam, non-cash payment has clearly demonstrated its advantages in safety, limiting the spread and contagion, which is also the convincing explanation for the current trend of strong shift from cash payment activities to non-cash payment activities. In fact, according to data from Vietnam National Payment Joint Stock Company (Napas), in 2021, the Napas electronic clearing and financial switching system has processed more than 800 million transactions, corresponding to more than 8 million billion dong, an increase of 113% in volume and 169% in transaction value over the same period in 2020. Total value of card payment transactions at points of sale (POS) and total value of card payments, e-wallets via Napas online payment gateway grew by 50% and 125% respectively over the same period in 2020.

COVID-19 epidemic has had major impacts in all aspects, which has promoted non-cash payments, is one of the important policies to promote the National Financial Inclusion Strategy to 2025, with orientation to 2030 by the Government. The banking industry has been offering many solutions to promote non-cash payments, especially in the context of the current complicated developments of the COVID-19 epidemic, making an important contribution to the process of realizing the goal of non-cash payments. objectives of the above Strategy and maintain smooth financial and banking activities, the lifeblood of the country's economy.

On the side of credit institutions: Up to now, most credit institutions have been actively applying the technologies of the industrial revolution 4.0 or cooperating with Fintech companies to optimize and simplify the process. business processes, improve operational efficiency and customer transaction experience. Many basic operations have been completely digitized (100%), many banks have recorded a rate of more than 90% of customer transactions done via digital channels. Banks have applied artificial intelligence (AI), machine learning (ML), big data (Big Data) technologies in customer assessment, classification and disbursement decisions, etc. to help simplify procedures and withdrawal time for disbursement and lending. In addition, credit institutions also focus on establishing partnerships, business cooperation, expanding the digital ecosystem of banking and non-banking products and services to attract and retain customers. deeply integrate banking services into the daily digital journey of customers. In addition, banks have researched and applied many new, modern, safe and convenient technologies (Tokenization application, mobile payment, QR Code use, eKYC...) in their operations. pay. By the end of June 2022, there are 5.6 million accounts and 8.9 million cards opened using this method. By July 2022, there were 82 credit institutions implementing payment via the Internet and 51 credit institutions implementing payment via Mobile, more than 100,000 points accepting QR Code payments.

The State Bank has licensed 48 payment intermediary service providers. Non-cash payment in the first 10 months of 2022 achieved a high growth compared to the same period in 2021. According to the Payment Department - State Bank, transactions through the interbank electronic payment system increased by over 4 6% in quantity and over 33.06% in value; through the financial switching and electronic clearing system, increased by 99.79% in quantity and 106.09% in value; non-cash payment transactions increased by 87% in quantity and 34% in value; via Internet channel increased 86.9% and 40.4% respectively; via mobile phone channels increased by 115.9% and 97.2% respectively; via QR Code method increased 169.4 and 204.7 % respectively *(Source: State bank report 2021-2022)*.

E-payment activities continue to grow rapidly in 2022 with the total number of transactions and transaction value increasing by 96.5% and 87.3% respectively compared to 2021. In which, the proportion of transactions Chip cards made through the NAPAS system continue to increase from 26% in 2021 to more than 60% in 2022. NAPAS 247 fast transfer service with VietQR code has also grown impressively after more than a year of launch and has become one of the fastest-growing service providers. popular form of payment. Particularly for the program of exemption and reduction of switching and clearing service fees, the total NAPAS fee has been reduced for member organizations in 2022 to reach VND 1,743 billion. *(Source: State bank report 2022).*

According to the latest statistics of the State Bank, the whole market has 120 million e-wallets. Of which 47 million wallets are active and 29 million wallets are active. Up to 3,300 billion VND is maintained by people in e-wallets for payment.

In addition, non-cash payment activities in the first 11 months of 2022 achieved high growth compared to the same period in 2021, up 85.6% in quantity and 31.39% in value. In which, transactions via Internet channel increased respectively 89.36% (in quantity) and 40.55% (in value); via mobile phone channel increased by 116.1% and 92.3% respectively. In addition, transactions via QR code increased by 182.5% and 210.6% respectively; transactions via POS increased by 53.57% and 48.78% respectively *(Source: State bank report 2022).*

2.5. Opportunities and challenges for developing e-banking services at commercial banks in present-day

2.5.1 Opportunities

Firstly, Vietnam is a country with a large population, currently ranked 15th in the world, with a young and educated population structure, and has an ability of accelerated access to technology. According to statistics, the current population of Vietnam is over 98.76 million people, the population structure is young and well-trained, so it has quick access to technology and the internet. By 2022, the number of smartphone subscribers reached 90.5 million (accounting for 73.4% of mobile phone subscribers) *(Source:Report to the Ministry of Information and Communications 2022).*

Secondly, the high determination of the Government and the State Bank of Vietnam. Seeing the importance of digital banking development, over the past time, the Government, as well as the State Bank of Vietnam, have given drastic directions and issued many legal documents to manage and promote the development of digital banking. development of cashless payment services, initially establishing a legal infrastructure for the implementation of digital banking, such as: Decree No. 101/2012/ND-CP on non-cash payments (amended and supplemented in Decree No. 80/2019/ND-CP); Decision No. 35/2007/QD-NHNN on principles of risk management in e-banking activities; Decree No. 35/2007/ND-CP on electronic transactions in banking activities; Decision No. 2545/QD-TTg approving the project of developing non-cash payment in Vietnam in the period of 2019-2020; Circular No. 16/2020/TT-NHNN allows opening personal payment accounts by electronic method (eKYC); Circular No. 09/2020/TT-NHNN stipulating information system safety in banking activities to update new regulations of the Law on Cyber Information Security...With the drastic direction and high determination of the Government, the State Bank of Vietnam, along with the issuance of legal documents that have been and are being completed, are one of the solid premise for the banks to develop digital banking more conveniently.

Thirdly, the awareness and determination of Commercial banks in Vietnam. In fact, compared to traditional banking activities, digital banks have many outstanding advantages based on the digitized operating model platform, digital banking will provide many new financial instruments such as mobile payment, trust loans on consumption based on advanced data analysis technology, digital insurance instruments, digital investments,... With outstanding advantages, digital banking helps commercial banks reduce operating expenses, increase profits, increase processing speed and ensure operational efficiency, helping customers reduce costs and be more convenient. Recently, commercial banks have been proactive and highly determined in developing digital banking to keep up with the trend of the times, as well as meet the requirements of competition and international integration.

2.5.2 Challenges

Firstly, the legal framework for digital banking has not kept pace with the speed of technology development. As we all know, the operations of banks must comply with the regulations of the law, so in order to develop digital banking, banks must be based on the regulations of the law. It can be seen that in the recent times, despite the intense and close attention and direction of the Government and the State Bank of Vietnam, with the rapid technological development, while the promulgation of regulations The law is not velocious but requires a certain period of time, so it has partly affected the development of digital banking. For example, the digital payment segment has developed for many years, but the legal writings for this activity were only issued by 2020 through Circular No. 16/2020/TT-NHNN; Circular No. 09/2020/TT-NHNN.

Secondly, the investment cost for digital technology is large with today's rapid technological development, the technology that was born in a very short time has been replaced by new and more modern technologies. Therefore, in order to adapt to the development of new technology, the banking system must regularly upgrade, improve, maintain, and innovate technology to meet competition, which puts great pressure on financial resources. For banks, especially small and medium sized banks, the financial pressure will not be small. This is also one of the challenges for commercial banks.

Thirdly, the limitation in human resources, especially human resources in the field of information technology. Digital banking operations need high-quality human resources, especially information technology staff. Meanwhile, according to the statistics of recruitment channels, the current recruitment demand of the information technology industry in Vietnam has increased 4 times, in which the software development industry has always achieved double growth, accounting for more than 50% of the recruitment demand of the entire information technology industry. This is also a group of industries with high-quality intellectual human resources, including a collection of engineers in multi-functional management software solutions, programming engineers, information security...

Fourthly, difficulties in customer information security. It can be affirmed that digital banking brings a lot of conveniences to customers and banks, but besides that, it also has to face the problem of personal information security, when customers and banks are always the target. of high-tech crime. In reality, there are many cases where customers use the service incorrectly and unmatched with the instructions, or fake information leads to being deceived and taken advantage of by crooks to appropriate money in their accounts.

Fifthly, the habit of using cash is still popular. Digital banking services are used quite a lot in urban areas. But the habit of using cash is still quite common, especially in rural areas. Therefore, changing people's consumption habits also poses many challenges to the digital transformation process of Vietnamese banks.

2.6. Factors Influencing the Development of Electronic Banking Services in Commercial Banks

2.6.1. Research Model and Hypotheses

The factors influencing the development of electronic banking services in commercial banks in this study are based on the following primary references:

Trust: Research by Nguyen Dinh Tho (2007), Nguyen Thi Hang Nga (2012), Parasuraman & colleagues (1988), Pikkarainen and colleagues (2004), Nguyen Thi Khanh (2020).

Employees: Research by Nguyen Thi Hang Nga (2012), Gronroos (1984), Ihab Ali El-Qirem (2013), Luis V. Casaló and colleagues (2008), Nguyen Thi Khanh (2020).

Information Security: Research by Sohail and Shanmugham (2003), Pikkarainen and colleagues (2004).

Service Products: Research by Nguyen Thi Hang Nga (2012), Gronroos (1984), Pikkarainen and colleagues (2004), Muhammad Rizwan and colleagues (2014), Nguyen Thi Khanh (2020).

Technology System: Research by Nguyen Thi Hang Nga (2012), Gronroos (1984), Pikkarainen and colleagues (2004), Ihab Ali El-Qirem (2013), Luis V. Casaló and colleagues (2008), Nguyen Thi Khanh (2020).

Marketing and Customer Care: Research by Nguyen Thi Hang Nga (2012), Gronroos (1984), Ihab Ali El-Qirem (2013), Muhammad Rizwan and colleagues (2014), Nguyen Thi Khanh (2020).

These six influencing factors are represented in the proposed research model as follows:

Figure 01: Proposed Research Model

Trust (TC)	H1
Employee Service Capability (NV)	H2
Information Security (BM)	H3
Electronic Banking Service Products (SPDV)	H4
Technology System (CN)	H5
Marketing and Customer Care (MC)	H6

Development of Electronic Banking Services (PTDV)

Source: Proposed by the author

Based on the proposed model, the research hypotheses are as follows: Hypotheses H1, H2, H3, H4, H5, H6 all have a positive relationship with the development of electronic banking services in commercial banks.

2.6.2. Research Methods and Data

The study employs research methods including Exploratory Factor Analysis (EFA) and Multiple Linear Regression Analysis to determine the factors influencing and their degree of impact on the development of electronic banking services in commercial banks.

The data used in the study were collected from a survey of 179 customers who are using electronic banking services provided by commercial banks in Hanoi, Ho Chi Minh City, and several provinces and cities. In the survey questionnaire, the research proposes a measurement scale for six factors influencing the development of electronic banking services, comprising 29 variables. These variables are measured on a 5-point Likert scale with the following levels: (1) Strongly Disagree; (2) Disagree; (3) Neutral; (4) Agree; (5) Strongly Agree.

2.6.3 Research Results and Discussion

Research Results Statistical results of the surveys reveal:

Table 1: Statistical Results of Customer Profiles

Indicator	Quantity (People)	Percentage (%)
Gender		
Male	83	46.37
Female	96	53.63
Total	179	100
Age Group		
Below 30 years old	57	31.84
30 to 50 years old	89	49.72
Above 50 years old	33	18.44
Total	179	100
Educational Background		
High School or Lower	62	34.64
College; University	117	65.36
Total	179	100
Occupation		
State Employees	44	24.58
Labor in Enterprises	35	19.55
Self-Employed	48	26.82
Other Occupations	52	29.05
Total	179	100

Source: Compiled from survey results

Continuing with the assessment of the reliability of the measurements based on the Cronbach's Alpha coefficient, the results indicate that the measurements of both the dependent and independent variables used in the model all meet the requirement with Cronbach's Alpha coefficients greater than 0.6. This demonstrates the consistency and reliability of the measurements.

The results of the exploratory factor analysis show that the Kaiser-Meyer-Olkin (KMO) value is 0.894, which is greater than 0.5, and the Bartlett's test has a Sig. value < 0.05. Seven factors were extracted, all with Eigenvalues greater than 1. The total variance explained by the six factors is 74.59%, exceeding 50%, and the factor loading values in the rotation matrix meet the condition of > 0.5. This indicates that the results of the exploratory factor analysis are appropriate, and the measurements or observed variables are convergent and discriminant, making them suitable for regression analysis.

Table 2: Regression Results

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
Constant	0.257	0.225		1.143	0.254		
TC	0.178	0.056	0.200	3.176	0.002	0.531	1.883

NV	0.143	0.060	0.152	2.383	0.018	0.522	1.915
BM	0.118	0.057	0.123	2.060	0.041	0.596	1.677
SPDV	0.149	0.054	0.171	2.771	0.006	0.552	1.811
CN	0.126	0.059	0.129	2.149	0.033	0.583	1.716
MC	0.235	0.053	0.243	4.411	.000	0.695	1.439
$R^2 = 0.592$							
Adjusted $R^2 = 0.579$							
Probability value of the F-statistic F = .0000							
Durbin-Watson statistic (d) = 1.823							

The source: Results of data processing using SPSS 26.0

Table 2 shows that the adjusted R-squared coefficient of the model has a value of 0.579, which means that the 6 independent variables in the model explain 57.90% of the variation in the dependent variable. The Sig. value of the F-test is < 0.05, indicating that the regression model is statistically significant and appropriate for the research data.

All six independent variables in the model have a linear relationship with the dependent variable, with Sig. values of the variables in the t-test all < 0.05, and the Beta coefficients of the variables are all positive. This indicates that all factors have a positive influence on the dependent variable. The results of the regression model show that all 5 research hypotheses are accepted.

Regression equation:

PTDV= 0.200*TC+ 0.152*NV+ 0.123*BM+ 0.171*SPDV+ 0.129*CN+ 0.243*MC

From the regression results presented in Table 1, the level of influence of the six factors on the decision to use electronic banking services is statistically significant in descending order as follows: Marketing and Customer Care (Standardized Beta = 0.243), Trust (Standardized Beta = 0.200), Electronic Banking Service Products (Standardized Beta = 0.171), Employee Service Capability (Standardized Beta = 0.152), Technology System (Standardized Beta = 0.129), and Information Security (Standardized Beta = 0.123).

* Discussion of Research Results

Based on the theoretical framework of electronic banking, electronic banking services, electronic banking development, and the research of Shorabi and colleagues (2013) and Grandon and Pearson (2004), six influencing factors and the observed variables for each factor were preliminarily constructed to measure the level of influence on the development of electronic banking services.

The results of the exploratory factor analysis extracted six factors with 28 observed variables, excluding the variable NV4 due to its factor loading coefficient being less than 0.5, along with three variables measuring the development of electronic banking services.

"Trust" has a beta coefficient of 0.200, indicating that a one-unit change in trust will result in a 0.200-unit increase in the development of electronic banking services, with other variables held constant. Customers believe that ensuring trust and the bank's credibility, as well as addressing customer inquiries and service requests, are crucial for the development of electronic banking services.

"Employee Service Capability" is a factor with a beta coefficient of 0.152, showing a significant impact on the development of electronic banking services in commercial banks. It indicates that a one-unit change in employee service capability will lead to a 0.152-unit increase in the development of electronic banking services when other variables remain constant. This factor includes variables related to employee attitudes, professional competence, appearance, etc. Human factors always require high standards. When employees display good attitudes, professionalism, and appropriate appearance, they are evaluated as having good service capabilities. In addition to professional knowledge, customers also demand employee qualities related to attitude and appearance.

"Information Security" is a factor with the lowest beta coefficient of 0.123 among the six factors analyzed. In the era of online banking, with the advancement of technology, information on the internet is vulnerable to theft, and personal account information is at risk of exposure. Therefore, customers have high expectations for information security, including account protection, security features, and prevention of account information theft, especially when using online electronic banking services.

"Service Products" is a factor with a beta coefficient of 0.171. When customers use electronic banking services, they expect a variety of service products and fee structures. The availability of diverse services and the fees associated with them influence customers' ease of use. In the current era, banks must compete by introducing new service products to the market with unique features and benefits to attract customer interest and usage.

"Technology System" is a factor with a beta coefficient of 0.129 after normalization. It is a factor that positively impacts the development of electronic banking services. This indicates that a one-unit change in the technology system will result in a 0.129-unit increase in the development of electronic banking services when other variables are held constant.

"Marketing and Customer Care" is a factor with the highest beta coefficient of 0.243 among the six factors, indicating the most significant impact on the development of electronic banking services. A one-unit change in marketing and customer care will lead to a 0.243-unit increase in the development of electronic banking services when other variables are held constant. This underscores the importance of marketing and customer care in driving the growth of electronic banking services.

2.7. Solutions recommended to develop e-banking services in the current digital economy

According to the current situation of e-banking service development in Vietnam, the author proposes some solutions to develop e-banking services in the digital economy, in specific:

Firstly, developing information technology, improving the level of modernization of banking technology constantly, applying new technologies to increase competitiveness, focusing on private and network security. Banks must concentrate on investing, researching and applying the most advanced security technologies in their e-banking services to create trust-worthiness for customers when using the services.

Secondly, the infrastructure and technical facilities need to be upgraded so that the implementation of e-banking services can become more feasible in non-urban regions, especially in remote areas, .., and even the international market.

Thirdly, if the e-banking services want to develop sustainably, three important factors should be combined: users (customers) - especially, customers' decisions to use e-banking services, service providers (e.g. banks) and environmental factors.

Fourthly, diversifying products, creating outstanding differences of products. When providing new services, the commercial banks must focus on customer participation, placing customers at the center of all services. At the same time, continuously innovate and diversify products and services of e-banking to attract customers, constantly improve the quality of products and services to satisfy customers' needs as well as ensure the implementation of commitments about the services provided.

Fifthly, paying special attention to customer care policy. Set up an online customer care department to advise and answer customers' questions 24 hours a day, and collect feedback from customers. Timely assessment of customer information and opinions contributing to improve the service quality and meet the increasing demands of customers.

Sixthly, banks need to actively invest in research and development, human resources, and develop specific and clear marketing strategies to promote the bank's images and enhance their brands.

Seventhly, simplification, that is, making everything easy to use is the most basic way for banks to win the hearts of online savings customers. The products themselves should be simple, the registration process for a product should be uncomplicated, but still ensure the necessary security and confidentiality.

3. CONCLUSION

Through analyzing the current situation, pointing out opportunities and challenges for the development of e-banking services in Vietnam, as well as through surveying customers using e-banking services, analyzing results from SPSS show factors affecting e-banking services. The author has proposed seven solutions to promote the development of e-banking services in Vietnam, including: Developing the information technology; attaching special importance to grow the infrastructure; combining the customers, suppliers and environmental factors; diversifying products; promoting the customer support and care policies; promote investment in human resource training and develop specific and clear marketing strategies; Simple process packaging to make it easy for customers to use and uncomplicated for consultants to advise. In order to implement these solutions, the close attention and direction from the Government, Ministries, Departments are necessary and most importantly, the focus on the banks themselves in the system are needed. Strong internal force will promote the strengths and limit the weaknesses. With this study, the author wishes to contribute to the development of e-banking services in the current digital economy era and to help e-banking services reach everywhere in all parts of the country.

IMPACT OF SUSTAINABLE BOND ISSUANCE IN LATIN AMERICAN AND CARIBBEAN COUNTRIES: LESSONS FOR VIETNAM

Ph.D Cao Minh Tien[1]

Abstract: *In this study, we delve into the correlation between the issuance of Green, Social, and Sustainability (GSS) bonds and the economic growth trajectories of countries within the Latin American and Caribbean (LAC) region. By analyzing variables such as the "Green Bond Issuance to Total Bond Issuance" ratio and the "Planned Sovereign Green Issuance", coupled with several pertinent economic and governance indicators, insights were derived using multiple linear regression techniques. Our findings elucidate that there is a positive correlation between certain variables, notably the planned sovereign green issuance and the private credit to GDP ratio, and economic growth. On the other hand, a more robust rule of law index displayed a negative correlation, suggesting an inherent trade-off between stringent legal adherence and economic efficiency. The primary datasets for this research were sourced from the Sustainable Banking Network (SBN) and the 2019 report from the International Finance Corporation (IFC). The period of 2016-2019 was earmarked for economic growth analysis, intentionally sidelining the anomalous economic patterns of 2020, attributed to the COVID-19 pandemic. Given the burgeoning importance of sustainable financing mechanisms in the global landscape and Vietnam's rapidly evolving economic ecosystem, the learnings from the LAC region present invaluable lessons. The key recommendations for Vietnam, based on our findings, are to foster the growth of GSS bonds, amplify private credit, and to cultivate a well-balanced legal framework, all essential for achieving sustainable economic growth..*

Keywords*: Sustainable Bond Issuance,Latin American and Caribbean (LAC),Green, Social, and Sustainability (GSS) bonds,Economic growth, Sustainable Banking Network (SBN), International Finance Corporation (IFC)*

1. INTRODUCTION

In recent years, the global financial ecosystem has witnessed a marked shift towards sustainable and responsible investments. At the heart of this transformation lies the concept of Green, Social, and Sustainability (GSS) bonds — financial instruments designed not only to raise capital but also to deliver positive environmental and social outcomes. With a worldwide emphasis on combating climate change, mitigating social disparities, and fostering sustainable growth, the adoption and issuance of GSS bonds have become a focal point for both developed and emerging economies.

The Latin American and Caribbean (LAC) region, characterized by its rich biodiversity, cultural heritage, and a blend of emerging economies, presents a unique canvas for studying the dynamics of sustainable bond issuance. While countries within the LAC domain are diverse in terms of their economic structures, political frameworks, and development trajectories, they share common challenges such as environmental degradation, social inequalities, and the need for sustainable economic growth. Therefore, understanding the implications of GSS bond issuances in this region provides not just regional but also global insights.

Vietnam, as an emerging economy in Southeast Asia, has been making significant strides in its economic development. However, like many developing nations, Vietnam grapples with challenges that intersect the domains of economic progress, environmental sustainability, and social equity. This makes the lessons from the LAC region particularly relevant. Drawing parallels

1 Mail: Caominhtien@hvtc.edu.vn, Academy of Finance.

between the LAC nations and Vietnam can offer a roadmap for integrating sustainable financial instruments into Vietnam's broader economic strategy.

In this study, we aim to dissect the relationship between GSS bond issuances and economic growth in the LAC countries. By doing so, we endeavor to provide a comprehensive understanding of the key drivers, challenges, and opportunities associated with sustainable bond issuances, with a special focus on deriving actionable insights for Vietnam. Drawing insights from the Latin American and Caribbean (LAC) region for Vietnam can be justified by several scientific considerations:

- Experience and Progression:

The LAC region has undergone economic and societal shifts that many developing countries, including Vietnam, might encounter. By learning from their experiences, Vietnam might sidestep potential pitfalls and capitalize on opportunities.

- Environmental Context and Economic Characteristics:

Both the LAC and Vietnam possess abundant natural resources and grapple with the challenges of advancing economically without detrimentally impacting the environment.

- Future Preparedness:

The LAC has made notable strides in sustainable bond issuances, garnering significant international investor attention. Vietnam can extrapolate from these experiences to prepare for a future where it might wish to issue sustainable bonds at scale.

- International Organizations and Support:

Numerous international entities have assisted the LAC in developing sustainable bonds. Drawing insights from the LAC could provide Vietnam with a better understanding of how to leverage such support.

- Diversification:

By referencing experiences from a region distinct from its own, Vietnam can acquire a more diversified perspective on the matter, thereby informing decisions based on a broader informational foundation.

In summary, turning to the LAC region as a reference for Vietnam can offer invaluable lessons regarding the approach and execution of sustainable bond strategies within its economic and environmental contexts.

2. LITERATURE REVIEW

The domain of sustainable finance, particularly the role and implications of Green, Social, and Sustainability (GSS) bonds, has garnered significant scholarly attention in the recent decade. This review aims to provide a succinct overview of the prevailing literature, charting the evolution of GSS bonds, their impact on economic growth, and their relevance in different regional contexts.

The burgeoning field of green finance has drawn the attention of both academia and industry, generating a plethora of research that delves into the intricacies of investments promoting environmental sustainability. This literature review aims to provide a panoramic view of the key insights and debates prevalent in the domain, with a particular emphasis on the evolution, impact, and challenges of Green, Social, and Sustainability (GSS) bonds.

2.1. Global Perspective on Green Finance

Yoshino et al. have painted a rather concerning picture of the global investment landscape when it comes to renewable energy and energy efficiency. Their study reveals a noticeable reduction in global investments geared towards these green avenues. One of the reasons postulated for this trend is the heightened attention financial institutions pay to fossil fuel projects, due to the perceived risks and lower returns associated with green technologies. This not only endangers energy security but also jeopardizes the broader objectives related to climate change mitigation and greenhouse gas emission reductions.

2.2. Birth and Evolution of GSS Bonds

Green bonds, which later diversified to encompass social and sustainability aspects (collectively denoted as GSS bonds), marked the inception of a significant paradigm shift in the financial world. These instruments originated from the aspirations of a group of Swedish pension funds aiming to invest in climate-conservative projects. Their collaboration with the World Bank in 2007 culminated in the issuance of the world's first green bond a year later . These bonds served as a conduit, bridging the gap between climate projects and investor financing.

The distinctive feature of these bonds is their dual appeal: they offer liquid fixed income assets and cater to investors with a heightened social consciousness who are keen on supporting green initiatives.

2.3. Classification and Growth of GSS Bonds

The Climate Bonds Initiative has been instrumental in tracking the global trajectory of these bonds. Their extensive reports have categorized these bonds into green, social, and sustainability sectors. The growth, however, has been uneven, with some regions showing more enthusiasm than others.

2.4. Focus on the Latin American and Caribbean (LAC) Region

The LAC countries present an interesting case study in the GSS bonds narrative. Fourteen nations from this region, as of 2020, have aligned themselves with the sustainability objectives endorsed by the UN, venturing into the capital market through the issuance of GSS bonds. This paper primarily revolves around analyzing the impact of these issuances on the economic growth of these countries, alongside addressing the limitations they face and distinguishing between sustainable and unsustainable bonds.

2.5. Research Linking GSS Bonds and Economic Growth

Despite the global interest in GSS bonds, there is a relative dearth of comprehensive studies that explore their direct relationship with economic growth. This paper seeks to fill this gap, especially focusing on the LAC countries, providing empirical evidence to shed light on this pivotal relationship.

- The concept of "green bonds" first emerged in the mid-2000s, with the European Investment Bank introducing the world's first labeled green bond in 2007 (Kidney, 2015). Zerbib (2019) outlined how these instruments rapidly gained traction, evolving from merely environmental concerns to encompass broader social and sustainability goals, thus giving birth to GSS bonds.

- Several studies have examined the economic benefits of sustainable bond issuances. For instance, Flammer (2018) observed that companies issuing green bonds witnessed a positive stock market reaction, indicative of the market's appreciation of sustainable initiatives. On a macro level, Ehlers and Packer (2017) highlighted how GSS bonds can play a pivotal role in financing infrastructure projects, subsequently stimulating economic growth.

- Focusing on the LAC region, Perez (2020) detailed how the region, with its unique set of environmental and socio-economic challenges, has turned to GSS bonds as a vehicle for sustainable development. Similarly, studies by Garcia and Torre (2018) emphasized the role of governance and institutional frameworks in the LAC region in influencing the uptake and impact of GSS bonds.

- A strand of literature has also explored the intricate relationship between governance structures and the efficacy of GSS bonds. A key finding from studies like Visser (2019) is that nations with robust governance mechanisms tend to derive greater benefits from GSS bond issuances, both in terms of economic growth and sustainable outcomes.

- Given the rising importance of developing economies in the global landscape, studies like Lee and Nguyen (2021) have pivoted towards analyzing the role of GSS bonds in these contexts. These studies underscore the dual benefits such bonds offer to developing nations: capital for growth and a framework for sustainable development.

- Considering the cross-regional relevance of sustainable finance, scholars like Rodriguez and Tellez (2022) have begun to draw lessons from one region (like LAC) and extrapolate them to others (like Southeast Asia). These comparative analyses serve as valuable blueprints for nations like Vietnam, looking to integrate GSS bonds into their financial landscape.

3. GREEN, SOCIAL, AND SUSTAINABILITY BONDS

3.1. Global GSS Bond Issuances

Global GSS Bond Issuances

The emergence and rapid growth of Green, Social, and Sustainability (GSS) bonds reflect the global financial market's heightened awareness and commitment towards a sustainable future. These bonds have not only provided a new dimension to financing but have also opened doors for diverse investors who prioritize social and environmental returns alongside financial gains.

1. Historical Overview

GSS bonds made their debut in 2007 when a coalition of Swedish pension funds collaborated with the World Bank to issue the very first green bond. This pioneering initiative marked the genesis of a financial instrument dedicated explicitly to addressing climate change and other sustainability challenges. Since then, the market for GSS bonds has exhibited exponential growth, transcending geographical boundaries and encompassing a vast array of sectors.

2. Classification and Market Expansion

The GSS bond market has evolved into a multifaceted entity over the years. The Climate Bonds Initiative has been instrumental in classifying these bonds into three distinct categories:

Green Bonds: Primarily aimed at environmental projects, these bonds finance endeavors that directly contribute to mitigating climate change, preserving biodiversity, and ensuring sustainable water and land use.

Social Bonds: These bonds fund projects that cater to specific social objectives, such as affordable housing, education, and healthcare, thereby addressing various social inequalities.

Sustainability Bonds: A hybrid of the above two, sustainability bonds finance projects that have both environmental and social benefits.

The global demand for GSS bonds has surged, with issuance reaching new records year after year. This trend signifies not just an appetite for sustainable investments but also a shift in the global consciousness towards a more responsible and resilient financial system.

3. Regional Dynamics

While GSS bond issuances have been a global phenomenon, certain regions have been more active than others. Europe has been at the forefront, followed closely by North America and Asia-Pacific. The Latin American and Caribbean (LAC) region, although a newer entrant, has shown promising growth potential, especially with the alignment of several countries to the sustainability objectives endorsed by the UN.

4. Sectoral Spread

The GSS bond market, initially dominated by multilateral development banks, has now expanded to include municipalities, corporations, and even sovereigns. Different sectors, ranging from renewable energy and transportation to agriculture and infrastructure, have tapped into this financing mechanism, underscoring its universal appeal and versatility.

5. Challenges and Opportunities

Despite the remarkable growth, the GSS bond market is not without its challenges. Issues related to transparency, standardization, and impact measurement have often been raised. However, with continual innovation, collaboration, and regulatory support, the GSS bond market holds immense potential to reshape global finance in line with the sustainability objectives of the 21st century.

The issuance of sustainable bonds was a response to the existence of polluting nations, thus giving rise for more than a decade to the commitment to ecological projects through the acquisition of sustainable bonds. Specifically, the global green bond market had its beginnings in 2007 when multilateral development banks raised funds for projects aimed to safeguard the climate. The first to enter this market, creating specific lists of green bonds, were the Scandinavian Stock Exchange and the London Stock Exchange, whilst the first green-type operation took place in Luxembourg with the European Investment Bank (EIB)

The World Bank set down the foundations of green bonds in a work coordinated by the International Association of Capital Markets (ICMA), also highlighting the social value of such bonds and their transparency. With all this, the World Bank issued the first green bond in 2008, linking the need for financing by investors with those projects seeking to protect the climate .

Since 2008, bond issuances have increased rapidly in size and coverage. The total amount of this market reached more than USD 550 billion in 2019. Figure 1 shows the cumulative amounts of issuances in Europe and the LAC region. According to the Climate Bonds Initiative , until 2020 the issue of GSS bonds is supposed to be USD 700,000 million, almost twice as much as in 2019 (USD 358,000 million). Likewise, ac- cording to the Climate Bonds Initiative, the sustainable bond market, at the end of 2020, reached USD 1.7 trillion, and almost 10,000 instruments were issued under the denomination GSS bonds since 2007. Figure 2shows the size of the market according to the type of bonds and Figure 3 shows the numbers of issuers and instruments during 2020.

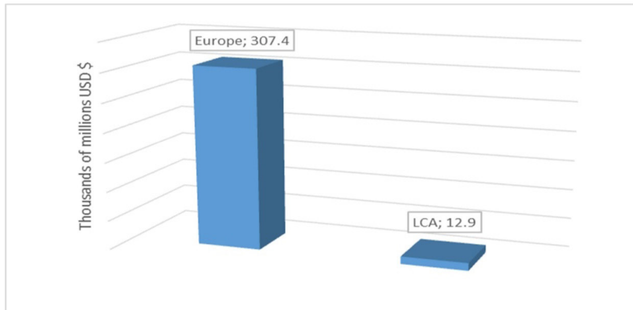

Figure 1. Cumulative issuance of sustainable bonds in Europe and the LCA region from 2019.

Source: Own elaboration based on

Figure 2. Cumulative size of GSS bond markets (December 2020). Source: Own elaboration based on

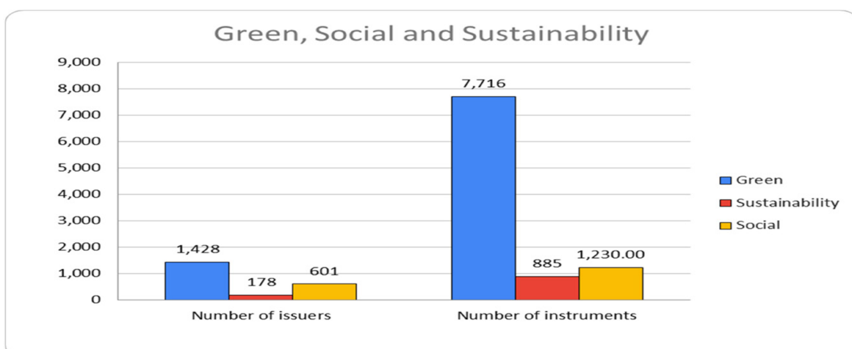

Figure 3. Cumulative number of GSS bond issuers and instruments (December 2020). Source: Own elaboration based on

3.2. GSS Bond Issuances in the LAC Region

In the LAC region, GSS bonds are a financial instrument with great potential given the increasing need for financing for the management of forests and hydrographic basins, and for infrastructures. This allows facing the damages caused by the climate change, by also increasing its transparency to attract investors.

In 2014, the first GSS bond issue was launched by Peru and, by 2020, there were twelve countries in this region issuing those bonds: Barbados, Mexico, Colombia, Ecuador, Peru, Chile, Argentina, Brazil, Panamá, Guatemala, Uruguay, and Costa Rica. Table 1 shows the cumulative amounts issued by these countries until December 2020.

Table 1. GSS bonds issued until December 2020 in the LAC region. Source: Own elaboration based on

Country	Number of Bonds	Number of Issuers	Amount Issued (in Millions of USD)
Argentina	4	3	610
Brazil	28	25	8260.30
Chile	10	3	9278.00
Colombia	3	3	332
Costa Rica	1	1	500
Ecuador	3	3	670
Guatemala	1	1	500
Mexico	12	9	4858.30
Panama	1	1	263
Paraguay	1	1	300
Peru	3	2	804
Supranational	9	4	2742.00
Total	76	56	29,117.60

Chile is the dominant country in the LAC region, representing 31.86% of total regional issuances, followed by Brazil with 28.37% and México with 16.69%. In the subsequent positions, we can find Peru, Argentina, Costa Rica, Colombia, and Uruguay, with partici- pation between 2.76% and 0.90%. The other three countries have a share of less than 1% (Figure 4). According to the number of issued bonds, the distribution is more fragmented; however, Brazil (37%), Chile (10%), and México (12%) keep the first places in the rank of the LAC countries.

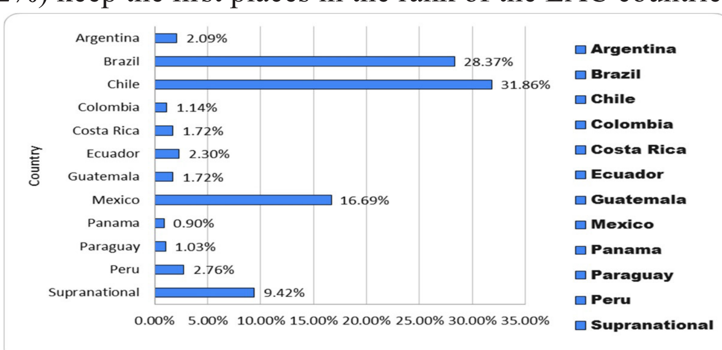

Figure 4. Share (%) of bond issuances in the LAC region. Source: Own elaboration based on

Figure 5 shows the use of the funds coming from GSS bonds, by type of project, high- lighting the relevance of renewable energies (44%), followed by those projects destined for the use of land and transportation. Renewable energies, as well as sustainable construction and transport projects, are the ones that make the most use of the resources obtained by the bonds at an international level.

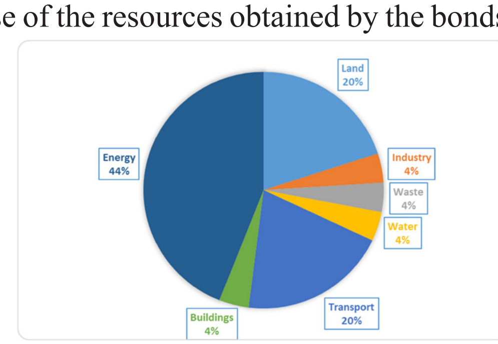

Figure 5. Use of GSS funds by type of project. Source: Own elaboration based on

Sustainable bonds in the LAC region have increased by 60% until June 2021. In spite of the impact of the COVID-19 pandemic, the LAC sustainable debt market continued to soar throughout 2020 and 2021. Thus, the total GSS issuance amounted to 16.3 bn in 2020. Table 2 shows the amount of GSS debt issued (in USD bn), number of issuers, and number of instruments.

Table 2. LAC sustainable debt market. Source: Own elaboration based on.

Country	Amount of GSS Debt Issued USD (bn)	% of LAC GSS Bond Market	Number of Issuers	Number of Instruments	% Benchmark insuance by Amount	Average Instrument Size USD (m)
Chile	17.800	36.60%	18	33	76%	540
Brazil	11.700	24.10%	53	90	30%	130
Mexico	7.800	16.00%	21	44	20%	181
Peru	1.200	2.40%	7	10	0%	118
Argentina	1.300	2.60%	11	13	0%	97
Guatemala	1.200	2.40%	1	2	58%	600
Bermuda	0.800	1.60%	2	2	88%	400
Colombia	1.300	2.70%	9	16	0%	80
Costa Rica	0.554	1.10%	3	3	0%	185
Uruguay	0.376	0.80%	2	3	0%	125
Panama	0.380	0.80%	4	13	0%	29
Ecuador	0.570	1.20%	3	3	0%	190
Barbados	0.090	0.02%	1	2	0%	4
Supranational	3.530	6.90%	3	12	47%	281
	48.60		138	246		

As formerly indicated, in the LAC area there are some countries that have made significant progress in relation to others such as Chile, Brazil, and Mexico, which have carried out projects aiming at sustainable development programs and its outlined objectives. However, there are other countries presenting certain drawbacks, called barriers. We can highlight (a) lack of knowledge and capacity development, (b) difficulties in identifying and creating green portfolios, and (c) lack of standardized monitoring mechanisms. Table 3 shows the barriers and progress made in the issuance of GSS bonds in the LAC countries.

As a solution to the expansion of the GSS bonds market in the LAC region, the management of development banks is required, through the structuring and evaluation of the projects to which the resources obtained by GSS bonds are going to be assigned, with the respective certifications, impact evaluations, and other types of internal and external reports [18–20]. Figure 6 shows the progress percentages of green financing with the management of development banks in the countries of the LAC region. It should be noted that, since 2016, the IDB group has given its support, strengthening the green capital market in the region and supporting more than 30% of issuances in terms of volume. Among some countries, we can cite Chile, México, and Ecuador.

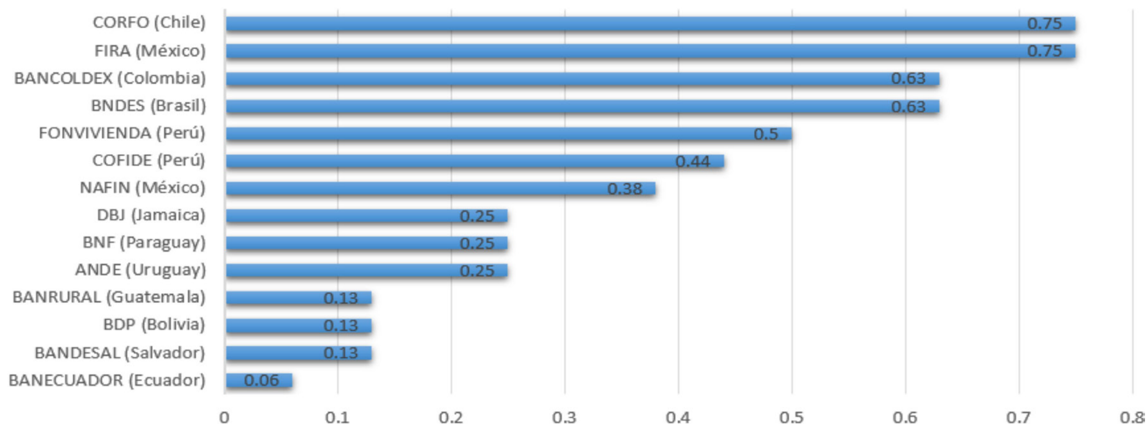

Figure 6. Development banks in the LAC region and progress in the green financing process. Source: Own elaboration based on].

Researching the impact of certain macroeconomic factors on the Financial Market in general and the Corporate Bond Market (CBM) in particular is not only necessary but also highly beneficial. It contributes to formulating solutions to address potential negative impacts stemming from macroeconomic factors on the CBM, and it aids in developing the CBM in alignment with the economic context. In recent years, this issue has garnered substantial attention from financial researchers. This study presents foundational theories that explore the relationships between macroeconomic factors and the financial market as a whole, with a specific focus on the Corporate Bond Market. The objective is to shed light on the intricate dynamics between these macroeconomic variables and the CBM, aiming to provide insights into potential avenues for mitigation and development.

6.3. Variables

In our analysis, we hypothesize that the economic growth of the countries in the LAC region is related to the volume of issuances of green bonds. To test this hypothesis, we are going to apply multiple linear regression. Therefore, we have to test the following contrast:

$$H_0: \gamma = \beta_0$$

$$H_1: \gamma = \sum_{k-1}^{n} \beta_k X_k + \varepsilon$$

where ε is the error term, by considering the following variables:

X1: "Green Bond Issuance/Total Bond Issuance", defined as the percentage of issuance of green bonds with respect to the total issuance during the period 2018–2019;

X2: "Sovereign Green Issuance: Total Planned";

X3: "Private Credit/GDP", defined as the ratio of financial resources provided to the private sector by financial institutions;

X4: "Market Capitalization" (in USD billion);

X5: "Political Risk Rating";

X6: "Regulatory Quality";

X7: "Rule of Law Index", which is a quantitative assessment of the extent to which countries are adhered to the rule of law and can be interpreted as the degree of compliance of a legal system;

Y: “Economic Growth”.

A summary of the just-defined variables, divided into explanatory and explained, can be seen in Table

Table 8. Defining the variables to be considered in the analysis.

	Explained Variable
Y	Economic growth
	Explanatory Variables
X_1	Green Bond Issuance/Total Bond Issuance
X_2	Sovereign Green Issuance: Total Planned
X_3	Private Credit/GDP
X_4	Market Capitalization
X_5	Political Risk Rating
X_6	Regulatory Quality
X_7	Rule of Law Index

	Explained Variable
Y	Economic growth
	Explanatory Variables
X_1	Green Bond Issuance/Total Bond Issuance
X_2	Sovereign Green Issuance: Total Planned
X_3	Private Credit/GDP
X_4	Market Capitalization
X_5	Political Risk Rating
X_6	Regulatory Quality
X_7	Rule of Law Index

The values of Y have been deduced from the figures of the GDP corresponding to the years 2018 and 2019 (see Table 9).

Table 9. Values of the explained variable used in the regression. Source: Own elaboration.

Country	GDP 2018	GDP 2019	GDP Variation (%)
Argentina	2.50	(1.80)	(1.72)
Barbados	0.80	0.10	(0.88)
Brazil	2.20	1.40	(0.36)
Chile	3.90	2.80	(0.28)
Colombia	2.60	3.30	0.27
Costa Rica	3.40	2.50	(0.26)
Ecuador	2.00	0.20	(0.90)
Honduras	4.10	3.50	(0.15)
Mexico	2.30	1.00	(0.57)
Panamá	5.60	4.90	(0.13)
Paraguay	3.40	1.60	(0.53)
Peru	4.00	3.20	(0.20)
Dominican Republic	5.00	5.50	0.10
Uruguay	1.62	0.30	(0.81)

The symmetric matrix in Table 10 shows the correlations between the explained and explaining variables used in our model.

Table 10. **Matrix of correlations of the independent variables.**

	Y	X_1	X_2	X_3	X_4	X_5	X_6	X_7
Y	1.0000	0.0998	0.3961	0.5492	0.1361	0.1590	-0.0888	-0.0121
X_1	0.0998	1.0000	0.5221	0.3714	0.5401	0.5988	0.4839	0.7298
X_2	0.3961	0.5221	1.0000	0.1451	0.3687	0.4572	0.4951	0.3622
X_3	0.5492	0.3714	0.1451	1.0000	0.3518	0.0750	0.0689	0.4920
X_4	0.1361	0.5401	0.3687	0.3518	1.0000	0.0142	0.1500	0.4526
X_5	0.1590	0.5988	0.4572	0.0750	0.0142	1.0000	0.4039	0.5260
X_6	-0.0888	0.4839	0.4951	0.0689	0.1500	0.4039	1.0000	0.7272
X_7	-0.0121	0.7298	0.3622	0.4920	0.4526	0.5260	0.7272	1.0000

The correlation matrix shows some multicollinearity problems (e.g., X1 and X6 are highly correlated with X7). So, after five iterations where non-significant coefficients have been removed, the results of the regression are shown in Table 11.

Table 11. **Regression results. Source: Own elaboration.**

Variable Coefficient Standard t-Stat	Coefficient	Standard Error	t-Stat	p-Value	VIF
Constant	−1.3615 (***,**,*)	0.3569	−3.8153	0.0034	
X2	0.1689 (**,*)	0.0727	2.3239	0.0425	1.1529
X3	0.3327 (***,**,*)	0.0996	3.3412	0.0075	1.3215
X7	−0.2090 (**,*)	0.0893	−2.3399	0.0413	1.4890
Significance level: *** = 1%, ** = 5%, and * = 10%.					

The coefficient of determination R2 equals 0.6148 which means that the predictors (Xk) explain 61.5% of the variance of Y. On the other hand, the adjusted R2 equals 0.4993. Finally, the coefficient of multiple correlation equals 0.7841. It means that there is a strong direct relationship between the predicted data (Yˆ) and the observed data (Y). With respect to the goodness of fit, F(3,10) = 5.3205 and p-value = 0.0189. Since p-value < 0.05, we reject

7. DISCUSSION AND CONCLUSIONS

a.. Discussion

The significant impact of Green, Social, and Sustainability (GSS) bonds on the economic growth of Latin American and Caribbean (LAC) countries offers valuable insights into the transformative potential of sustainable financing. The research has thrown light on three fundamental aspects:

Maturity of Economies: The positive correlation between Sovereign Green Issuance and economic growth underscores the fact that economies mature as they transition towards sustainable financing. Such issuances are reflective of a nation's commitment to longer-term, holistic growth strategies that resonate with global sustainability goals.

Private Credit Multiplier Effect: The observed relationship between the ratio of Private Credit/GDP and economic growth attests to the multiplier effect that private credits introduce. As financial systems deepen and expand, they amplify the economic outcomes of sustainable investment, fostering resilience and inclusiveness.

Rule of Law and Growth: The inverse correlation between the Rule of Law Index and economic growth poses intriguing questions. While robust legal systems ensure fairness and justice, they might sometimes add layers of bureaucracy that potentially slow down economic processes. This stresses the importance of a balanced approach where governance is both just and efficient.

b. Lessons for Vietnam

Drawing from the LAC experience, several lessons emerge for Vietnam:

Embrace GSS Bonds: As Vietnam aims to attain higher growth trajectories, embracing GSS bonds can be a pivotal strategy. Not only does it attract global investment, but it also aligns the country's growth with global sustainability benchmarks.

Strengthen Financial Systems: Ensuring that the financial system is receptive to sustainable financing is vital. This involves enhancing financial literacy, creating regulatory frameworks that incentivize green investments, and fostering a culture of innovation in the financial sector.

Governance Reforms: While ensuring rule of law is paramount, it is equally vital to ensure that governance mechanisms are efficient. Streamlined processes, transparency, and accountability can go a long way in ensuring that sustainable financing translates into tangible economic growth.

c. Conclusions

The emergence and growth of GSS bonds in the LAC region represents more than just a new financial instrument; it symbolizes the melding of progressive economic strategies with the pressing need for global sustainability. This trend is particularly salient for nations like Vietnam, which are poised at critical junctures in their developmental trajectories. The potential of GSS bonds goes beyond simply providing sustainable finance. Instead, they bridge the divide between economic progress and environmental stewardship.

Vietnam, like many other nations, is faced with a dilemma: how to achieve rapid economic growth without compromising the environment and the well-being of future generations. GSS bonds provide an innovative solution, offering a means of securing funds for projects that simultaneously propel growth and ensure ecological balance.

However, the introduction of GSS bonds is not without its challenges. To truly harness their transformative power, it is essential for countries to not merely emulate the models seen in the LAC region but to adapt them to fit their unique socio-economic, political, and cultural landscapes. This means a thorough understanding of domestic challenges, opportunities, and stakeholder aspirations, ensuring that the implementation of GSS bonds is not just effective but also inclusive.

In the intricate web of 21st-century challenges, where economic, social, and environmental threads are deeply interwoven, GSS bonds emerge as a promising tool. They represent the confluence of visionary financial strategy and a global commitment to sustainability. With the right approach, GSS bonds can indeed guide nations like Vietnam towards a future where prosperity does not come at the expense of the planet.

VIETNAM BANK FOR AGRICULTURE AND RURAL DEVELOPMENT PROMOTES ENTERPRISES TOWARDS GREEN PRODUCTION

Master, Phd Student Pham Thu Van[1]

Abstract: *The green economic trend is an essential aspect of sustainable development. Like many countries around the world, Vietnam has been implementing various solutions to promote a green economy, with green production being a crucial component of its sustainable growth strategy. The bank plays a significant role as a vital funding channel, actively supporting enterprises in expanding their production, especially in green production. Therefore, the implementation of solutions by the banking sector, through green credit lines, to promote green production in enterprises is highly necessary. Based on practical experiences, this article examines the current status of the Agricultural and Rural Development Bank of Vietnam (Agribank) in promoting green production within green credit and other related fields. It aims to evaluate and provide recommendations for promoting green production within the bank.*

Keywords: *Agricultural and Rural Development Bank of Vietnam, green production, enterprises, sustainable development.*

1. INTRODUCTION

In line with the global development trends, green production is becoming one of the models that many businesses are aiming for to meet new requirements and align with the overall development trends of the world. Simultaneously, it enhances the position and competitiveness of enterprises both in domestic and international markets. Green production is a manufacturing process where inputs and outputs are environmentally friendly and pose no harm to human health. The banking sector, as a crucial funding channel, actively supports reprocessing and expansion activities to promote economic growth. Therefore, implementing solutions from the banking sector will guide credit investments towards environmentally friendly and green production projects. This is also a top priority action in the context of global climate change. Green credit not only assists businesses and projects in adhering to environmental and social standards but also has the potential to drive the development of green economic sectors and promote efficient resource and energy utilization.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

2.1. Theoretical Background

Green production, also known as sustainable production, is a method of producing goods and services with the primary goal of optimizing business efficiency while minimizing negative impacts on the environment and society. The objective of green production is to balance the economic, environmental, and social aspects of producing goods and services. Green production has become a significant trend in business and manufacturing to address climate change risks and natural resource preservation. It helps businesses and organizations promote sustainability in their operations and meet the growing customer interest in environmental and social issues. The key principles of green production include: (i) Resource Efficiency: Promoting the efficient use of natural resources such as water, energy, and chemicals to reduce waste and greenhouse gas

[1] Email: Thuvanpham2002@gmail.com, Trade Union University.

emissions; (ii) Sustainable Products and Services: Creating sustainable products and services with high durability, easy reusability or recycling, and no harm to the environment or human health. (iii) Supply Chain Optimization: Optimizing the supply chain from suppliers to production and product transportation.

Promoting green production involves stimulating the transition towards green production, a concept in production and environmental management aimed at optimizing production processes and business activities to minimize negative impacts on the environment and society while enhancing business performance and efficiency. The primary goal of promoting green production is to strike a balance between producing essential products and services for humanity and protecting the natural environment.

Banks play a central role as significant financial intermediaries, often referred to as the lifeblood of an economy. Through their business activities, banks promote green production in businesses through various means:

Providing Funds for Green Production: Banks prioritize offering products such as loans, investments, or green credit to businesses with green objectives. This enables businesses to access capital at lower interest rates for investing in green projects and green production activities.

Favorable Interest Rate Policies: Banks can establish favorable interest rate policies for loans or credit that businesses use for green purposes, such as improving energy efficiency or reducing greenhouse gas emissions. Lower interest rates can make green production activities more attractive to businesses.

Green Advisory Support: Banks can offer advisory services on how to improve production operations to achieve green goals. This includes analyzing and assessing projects, processes, and environmental risk management.

Encouraging Energy and Resource Efficiency: Through credit activities, banks can encourage businesses to use funding or policies to invest in energy, water, material, and natural resource efficiency measures. This includes support for technology upgrades, resource management systems, and other resource-saving measures.

Building Partnerships with Green Organizations: Banks can collaborate with green organizations, researchers, and the government to create funding products and policies that support green production.

In summary, banks can influence green production activities in businesses by providing financing, favorable interest rates, advisory services, and assessments while promoting energy and resource efficiency. This helps drive the development and implementation of projects and production activities that have positive impacts on the environment and sustainability.

2.2. Related studies abroad

1. Chunji Zheng, Feng Deng, Chengfeng Zhuo (2022), *Green Credit Policy, Institution Supply and Enterprise Green Innovation*, Journal of Economic Analysis, Vol. 3 No. 3

Green credit policy (GCP) relies on financial means to promote environmental governance. Whether it can achieve the dual goals of economic development and environmental protection, especially in the context of different institution supply, remains to be scientifically tested. Further analysis finds that the supply of environmental protection system by local governments can strengthen the green innovation effect of GCP. However, the institution supply of innovation has not yet released a significant positive impact. In addition, the impact of GCP on green innovation of heavily polluting enterprises shows significant heterogeneity due to the differences in the types of green patents, the nature of enterprise property rights and the level of regional financial development. This paper analyzes the policy effect of green credit from the perspective of micro-enterprise green innovation, and brings the institution supply of local government into the analysis framework, so as to clarify the relationship between green credit and green innovation on the one hand. At the same time, it also provides inspiration for local governments to scientifically issue environmental protection policies.

2. Chengchao Lv [a], Jingfei Fan [a], Chien-Chiang Lee (2023), *Can green credit policies improve corporate green production efficiency?,* Journal of Cleaner Production Volume 397, 15 April 2023. This paper uses a double difference model to investigate the impact of green credit policies on green productivity of corporate from 2007 to 2020. It is found that the implementation of the Green Credit Guidelines can significantly improve the green production efficiency of heavy polluting enterprises. The implementation of the Green Credit Guidelines has a greater effect on the green production efficiency of enterprises among enterprises with smaller commercial credit financing scale and enterprises with lower capital use efficiency than other enterprises. The impact of the Green Credit Guidelines on state-owned enterprises, large-scale enterprises, and enterprises in the central and western regions is more obvious. And the implementation of the Green Credit Guidelines can affect the green production efficiency of enterprises through the financing scale effect and financing cost effect

2.3. Related studies in Vietnam

1. Nguyen Van Ha and Do Ngoc Ha (2019), *Green Banking and Green Tourism: Current Status and Recommendations,* Banking Science and Education Journal, Issue 211, December 2019. This study has highlighted the involvement of green banks in supporting green tourism in several ways:

Firstly, they have been developing environmentally-friendly products and services to promote green tourism, such as online services.

Secondly, they have been implementing internal green initiatives to improve the environment, thus supporting the growth of green tourism. Banks have started to build green headquarters to raise customer awareness of green banking activities.

Thirdly, they have been increasing the provision of green credit for the development of tourism. The Green Banks have "greened" their investment portfolios by increasing credit support for businesses in need of equipment and technology upgrades for energy efficiency, waste management, and other environmentally friendly activities.

2. Thu Trang (2022), *Promoting Green Credit, Green Banks Contributing to Green Growth and Sustainable Development*, Research and Exchange Forum, State Bank of Vietnam. Regarding the development of green credit in Vietnam. This is a top priority trend in the context of global climate change. Green credit refers to loans provided by the banking sector to support projects in production and business that do not pose risks to the environment or are intended to protect the environment and contribute to the overall ecological preservation.

3. According to Hoai Linh and colleagues (2022), *Decision-Making for Green Credit in Environmental Protection and Climate Change Adaptation:* Research on Factors and Recommendations.

Green credit is described as credit provided by financial institutions in the form of money with three distinct characteristics: Firstly, green credit is granted to projects in production and business that do not pose environmental risks. However, not all projects with "green" elements qualify for green credit, as banks have specific criteria. Secondly, green credit primarily utilizes funds mobilized from various societal sources, not solely from the bank's own funds. The capital used for green credit is referred to as green capital. Thirdly, the process of providing green credit involves the participation of multiple relevant agencies. Therefore, to encourage investors, the government supports through tax policies and commitments to stable outlets for businesses investing in environmentally prioritized projects. This includes offering long-term capital with favorable interest rates. [3]

3. RESEARCH METHODOLOGY

Statistical Method: This method is used to present data related to green credit balances, the structure of green credit in green production sectors, and green production projects funded by Agribank that are relevant to the research topic. The data is organized in a logical and scientific manner.

Comparison Method: This method is employed to compare green credit balances across different years, allowing for the proposal of solutions to increase green credit at the bank.

Analysis Method: The analysis method is used throughout the entire content of the article to clarify the role and mechanisms by which the bank's activities, particularly green credit activities, impact green production.

Synthesis Method: This method involves synthesizing data and information collected for each topic and presenting them systematically to serve the research process.

4. RESEARCH RESULTS

4.1. The Current State of Agribank promotes enterprises towards green production

In Vietnam, green production is an essential component of the country's move towards a green and sustainable economy. As part of the "Restructuring the Economy towards Sustainable Development" in the direction of green growth, the government has issued the National Strategy for Green Growth for the 2021-2030 period with a vision to 2050 (according to Decision No. 1658/QD-TTg, dated October 1, 2021, by the Prime Minister). In the government's strategy, credit institutions are considered important entities to channel investments into environmentally friendly and sustainable production activities, reducing risks for national sustainable development. With its primary function of providing capital to businesses, in recent years, banks have actively promoted green credit to encourage businesses to engage in green sectors.

The Vietnam Bank for Agriculture and Rural Development (Agribank) has gradually developed and emphasized various strategies to promote green production in Vietnamese businesses, with a particular focus on the expansion and enhancement of green credit. Recognizing the profound challenges facing Vietnam's agriculture sector due to climate change, Agribank is determined to take the lead in implementing the State Bank of Vietnam's direction to promote green credit for green production in Vietnamese enterprises. Specifically:

4.1.1. Providing Funding for Green Production:

Agribank, with 30 years of experience in providing credit capital in the rural financial market, deeply understands that sustainable development is the key to stable income for producers and reduces credit risks. Therefore, Agribank prioritizes credit for safe, efficient, sustainable agricultural development that protects the environment. Agribank has issued documents on promoting green credit growth, policies for environmental and social risk management in Environmental and Social Credit Governance (ECG) operations, and ESG policies in the bank's operations. The purpose is to guide the entire system, research and improve credit policy mechanisms related to environmental and social management, training, communication, and increasing awareness of green credit activities, as well as promoting efficient use of energy and resources. In the credit process, Agribank's credit notebooks always include project assessments and loan purposes related to environmental, social, and environmental impact assessments approved by competent authorities in accordance with the law. Agribank firmly rejects credit for projects that have significant and serious environmental and social impacts. Therefore, Agribank has provided a significant amount of green credit, contributing to the promotion of green production in Vietnam.

** Green credit balance at Agribank in the 2020-2021 period:*

Green credit can be understood as loans used to finance or refinance all or part of green projects. Green loans can have fixed-term or revolving credit. The green nature of a loan is determined by the purpose of its use, as reflected in financial statements or business documents. For the bank, green credit refers to loans provided for consumer needs, investment projects, production, and business activities that do not pose environmental risks and contribute to environmental protection and the protection of the overall ecosystem.

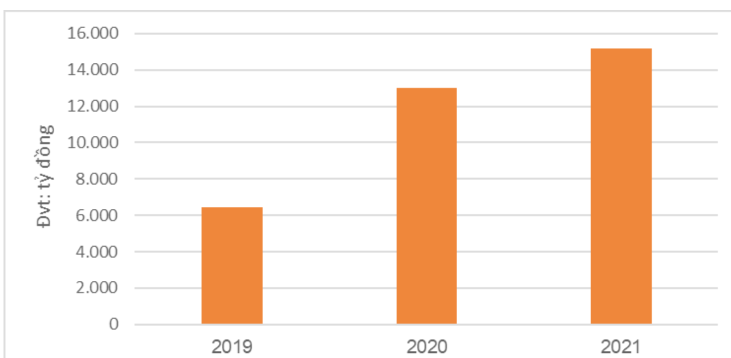

Chart 1: Credit Outstanding at Agribank during the period 2019 - 2021

(Source: Agribank Sustainable Development Report)

Looking at the chart, we can see that the green credit outstanding at Agribank during the period 2019 - 2021 has consistently shown an upward trend. In 2019, it reached over 6,000 billion Vietnamese Dong. By 2020, it doubled, with a growth rate exceeding 100% compared to 2019. In 2021, it increased by nearly 19% compared to 2020. This demonstrates that the bank is aligning with the directions set by the State Bank of Vietnam (SBV) in promoting a green economy and green production in businesses.

Structure of green credit outstanding:

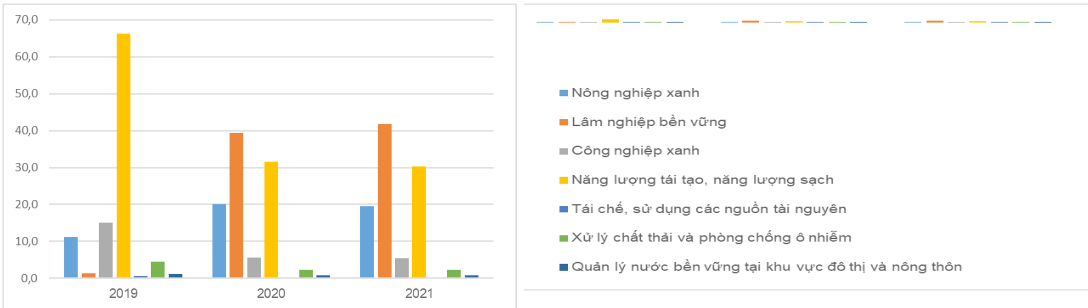

Chart 2: Structure of Green Credit Outstanding by Financing Sectors at Agribank during the period 2019 - 2021

(Source: Agribank Sustainable Development Report)

Examining the chart reveals that Agribank has actively contributed significantly to promoting green production in Vietnam, especially in sustainable forestry, which steadily increased and accounted for over 40% by 2021. Clean energy and renewable energy, however, showed a decreasing trend compared to 2019, making up more than 30% by 2021. Next were green agriculture at over 19%, followed by green industry and other green sectors.

Since 2016, Agribank has implemented a preferential credit program to serve "Clean Agriculture" with an initially unlimited capital scale, starting at 50,000 billion VND.

Green Agriculture Sector: Agribank has implemented a preferential credit program to support "Clean Agriculture" with an unlimited capital scale. Specific examples include flower cultivation (Lam Dong), large modelled fields (Can Tho), tra fish farm (An Giang), pig farm (Ha Nam), sugarcane (Khanh Hoa), corn (Son La), etc. Additionally, the bank collaborates with the World Bank and financial organizations to fund projects aimed at improving the quality and safety of agricultural products and developing biogas programs. These projects focus on low-carbon agriculture and risk management in the face of natural disasters.

Biogas and Waste Management: Agribank has implemented several projects utilizing biogas technology, providing renewable energy sources and organic fertilizer for agricultural cultivation. These projects also contribute to reducing environmental pollution and greenhouse gas emissions. For example, the bank collaborates with Lcasp to provide preferential loans for waste treatment in pig farming in the northern midland and mountainous provinces. This includes waste separation systems, biogas power generation systems, and wastewater treatment systems.

Sustainable Water Management: Agribank participates in the clean water supply and rural sanitation project in the Red River Delta region, funded by the World Bank.

Renewable Energy and Clean Energy: In terms of renewable energy development, Agribank invests in wind, solar, and hydropower projects that utilize unlimited resources. These projects provide stable energy costs, reduce mineral mining, and industrial waste discharge into the environment, contributing to long-term energy security for localities and the country as a whole. Specific projects include the TTC Phong Dien Solar Power Plant in Thua Thien Hue province and the Central Power Corporation's Solar Power Plant in Khanh Hoa province.

4.1.2. Preferential Interest Rate Policies

Agribank places a high priority on sustainable development. To stimulate credit demand in the green production sector, Agribank has implemented policies to reduce interest rates for customers engaged in green production. Interest rate reductions range from 0.5% to 1.5% per year compared to traditional interest rates, depending on specific cases. Agribank has initiated preferential credit programs with a minimum scale of 50,000 billion VND to serve "Clean Agriculture" for borrowers such as enterprises, cooperatives, cooperative unions, farm owners, etc, participating in various stages of the agricultural product production chain. These borrowers involve in safe, large-scale agricultural product production, with reduced interest rates ranging from 0.5% to 1.5% per annum compared to preferential interest rates for 662 agricultural and rural sectors. According to Agribank's statistics, the volume of credit benefiting from preferential interest rate policies during the period 2019-2021 is illustrated in the chart below:

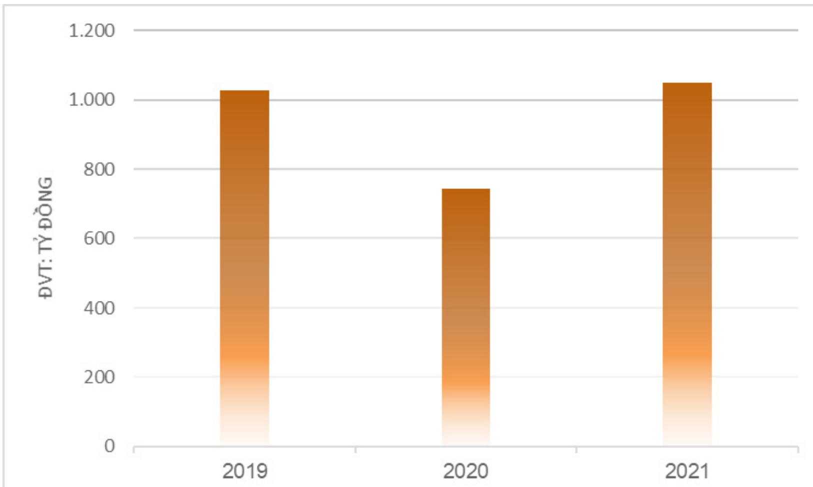

Chart 3: Volume of credit benefiting from preferential interest rate policies

(Source: Agribank Sustainable Development Report)

In 2019, Agribank provided over 1,000 billion VND in credit with preferential interest rates. In 2020, there was a decrease, but in 2021, it increased again, exceeding 1,000 billion VND. This demonstrates Agribank's continuous efforts to promote environmentally friendly production enterprises in the economy.

Additionally, customers borrowing capital under Agribank's programs for high-tech agriculture and clean agriculture will enjoy free money transfers within the Agribank system and a 50% reduction in fees for transfers outside the Agribank system...

4.1.3. Other Activities

Following the guidance of the government, Agribank not only encourages capital provision for green production but also "greenifies" all of its activities, playing the role of a company in Vietnam and providing various green services to enterprises. Agribank promotes the greening of its operations through various activities such as efficient use of resources within the bank and the application of technology to "greenify" banking activities. In reality, the activities of banks directly impact the environment. Recognizing this, Agribank, through the application of technology for paperless transactions, online banking, and more, contributes to promoting green credit. On a technological platform, Agribank has introduced a series of modern payment services such as cross-border payments with countries sharing borders, bilateral payments with commercial banks, with the State Treasury, ... facilitating green production enterprises in transaction and payment with partners.

4.2. Assessment of the Current State of the Agricultural and Rural Development Bank of Vietnam in Promoting Green Production in Enterprises

4.2.1. Achievements

Through the analysis above, Agribank has demonstrated its significant role in promoting green production enterprises in Vietnam. Specifically:

Firstly, green credit products have been diverse and not limited to just the green agriculture sector. Based on data on disbursements of green credit and the status of green credit outstanding at Agribank, it can be seen that the bank's green credit has significantly developed. In particular, green credits for green agriculture and sustainable forestry are the sectors to which the bank has lent the most. This shows the bank's shift towards focusing on sustainable business activities, setting the stage for the development of green production enterprises in Vietnam.

Secondly, Agribank has issued documents on promoting green credit growth and managing environmental and social risks in green credit activities.

Thirdly, Agribank has actively worked to promote its image as a green bank through its activities.

4.2.2. Limitations

Firstly, although green credit for green production enterprises has seen substantial and significant growth, it still represents a small portion of the total credit volume issued by the bank and has a relatively small share in the overall green credit in the economy.

Secondly, the structure of credit sectors for green production enterprises is not yet diverse and comprehensive, still primarily focusing on the bank's previous strengths.

Thirdly, the regulations defining what constitutes a green production enterprise, standards, and criteria are not specific and detailed, posing difficulties for the bank's credit officers in providing credit to green production enterprises.

4.2.3. Causes

Firstly, the regulations on environmental risk assessment by the bank are gradually being improved but have not been widely and thoroughly applied. The green credit granting process is still not fully developed and separate from the regular credit granting process.

Secondly, the professional staff for assessing environmental risks is limited and relies mainly on experience and assessments from external organizations.

Thirdly, the procedures for assessing green production enterprises are complex, making it difficult for businesses to meet the production requirements.

Fourthly, the credit approval process for green production enterprises often involves a lengthy period, large capital requirements, and long repayment terms. Therefore, the bank needs to calculate to ensure a minimum capital adequacy ratio for lending and comply with other regulations of the State Bank of Vietnam.

5. DISCUSSION AND CONCLUSION:

In conclusion, the Agricultural and Rural Development Bank of Vietnam has undertaken activities to promote green production enterprises in Vietnam, particularly through green credit.

Green credit is an inevitable and increasingly strong trend. Therefore, an economy with green production enterprises will be the direction for a green, sustainable, and circular economy.

To further promote the green production process in enterprises, Agribank should:

Firstly, Complete the credit granting process for green manufacturing enterprises specifically step by step according to IFC's instructions: The stage of receiving credit applications needs to screen for environmental risks (with a list of product fields). risky export); The stage of approving credit requests requires specific approval steps of environmental impact assessment for each industry and field surveys. When deciding to grant credit, banks must control environmental risks. After disbursement, environmental risks need to be monitored and reported. In the bank's organizational structure, there should be an independent department that evaluates the environmental and social impacts of projects based on the bank's risk management framework in accordance with the State Bank's roadmap and international practices. economics in granting green credit at banks. There is a team of specialized staff in identifying, evaluating and appraising green production projects.

Second, more preferential interest rates for green production projects, maintaining green production activities after disbursement. Interest rates can be reduced according to the enterprise's production roadmap, specifically: the longer the enterprise maintains green production activities, the interest rate will be reduced more than the initial interest rate reduction from 0.2 to 0.5% consistent with the bank's development goals, thereby encouraging green businesses.

Third, publicly report the environmental and social impacts of bank-funded projects, and publicly disclose the identities of businesses. This helps banks have more data about customers and help businesses be also more aware of their green production activities and creates an information system about green production businesses of the banking system in particular and the economy in general.

Recommendations for the Government and the State Bank of Vietnam (SBV):

Firstly, SBV should establish and implement a set of criteria for assessing and ranking credit institutions in terms of their commitment to social and environmental sustainability initiatives, particularly in actively promoting eco-friendly ecosystem balance, creating green ecosystems, adhering to green principles, and developing green products.

Secondly, the Government and SBV should facilitate and connect sources of green capital with international organizations to ensure that banks can continue to provide large amounts of funding to green production enterprises while maintaining risk safety in lending.

Thirdly, there should be a reduction in the safety risk ratio for lending to top credit institutions that excel in fulfilling their social and environmental commitments and providing green credit.

PRIVATE ECONOMIC DEVELOPMENT - AN IMPORTANT DYNAMICS OF THE SOCIALIST ORIENTED MARKET ECONOMY

Ph.D Le Thi Hong Nhung[1], M.A Bui Xuan Hoa, BSc Vu Hai Duy[2]

Abstract: The private economy increasingly occupies a large proportion and plays an important role in the country's economic development. The socialist-oriented market economy model initiated and led by the Party has been increasingly completed, under which the private economy has grown stronger in quantity, quality and scale. During the recent congresses of the Party, the private economy was identified as an important driving force of the economy and the State made many appropriate decisions to encourage the private economy to continue to develop. However, the practice of private economic development still has many obstacles and limitations. The article outlines the process of awareness and development of the private economy, clarifies the current situation and causes of limitations, thereby, proposes some solutions to further affirm the important role of the private economy in accordance with the law spirit of the 13th Party Congress.

Key words: Private economy, market economy, improvement of economic institutions

1. INTRODUCTION

As a part of the socialist-oriented market economy, the private economy in our country is increasingly contributing to the cause of national construction and development. Implementing the Party's orientation, in order for the private economy to truly be an important driving force of the economy, it is necessary to continue to innovate cognitive thinking and create a favorable environment for the private economy to develop strongly next time.

Over the past years, the private economy in our country has continuously developed, contributing more and more to the cause of innovation and socio-economic development of the country, especially since the implementation of the Central Resolution. Chapter 5, Session IX "On continuing to innovate mechanisms and policies, encourage and create conditions for private economic development". To affirm the important position and role of the private economy; The Party and State's attention to the development of the private economy in the country's revolutionary cause, the 5th Conference, the 12th Party Central Committee issued Resolution No. 10-NQ/Central, June 3, 2017 on private economic development to become an important driving force of the socialist-oriented market economy (hereinafter referred to as Resolution No. 10-NQ/TW).

The 13th Party Congress affirmed that strongly developing the private economic sector in terms of quantity, quality and efficiency "truly becomes an important driving force in economic development". This is the Party's major and consistent policy of promoting the private economy to continue to develop; while promoting the role of this economic sector in socio-economic development and strengthening national security and defense in the new situation.

2. INNOVATION IN THEORETICAL THINKING AND INSTITUTIONS, MECHANISMS AND POLICIES FOR PRIVATE ECONOMIC DEVELOPMENT FROM THE 6TH PARTY CONGRESS TO PRESENT

Summarizing more than 35 years of innovation, General Secretary Nguyen Phu Trong in the work "Some theoretical and practical issues on socialism and the path to socialism in Vietnam"

---

[1] Academy of Finance, Email: hongnhungllct@hvtc.edu.vn.

[2] Academy of Finance.

emphasized: “In The socialist-oriented market economy has many forms of ownership and many economic sectors. Economic sectors operating according to the law are all important components of the economy, with equality before the law and long-term development, cooperation and healthy competition. In which, the state economy plays the leading role; The collective economy and cooperative economy are constantly being consolidated and developed; The private economy is an important driving force of the economy; Foreign-invested economies are encouraged to develop in accordance with socio-economic development strategies and planning.

The innovation of economic thinking at the 6th Party Congress comes from the country’s reality, based on applying the views of V.I. Lenin, “considering a multi-sectoral economy a characteristic of the transition period”, officially recognized the private economy as an important component in investment and socio-economic development. Association in Vietnam, creating a political basis for the Party’s next breakthroughs in awareness of the position and role of the private economy.

Summarizing the development and contribution of the private economy to the country’s socio-economic development over more than 15 years of reform, the 5th China Conference of the IXth session issued Resolution No. 14-NQ/TW, dated November 18. March 2002, “On continuing to innovate mechanisms and policies, encourage and create conditions for private economic development” with many important solutions to encourage private economic development and private investment.

The 10th Party Congress officially affirmed that the private economy is one of the driving forces of the economy. The Party Central Committee (term X) issued Regulation No. 15-QD/TW, dated August 28, 2006, “On members working in the private economy”. The Politburo issued Resolution No. 09-NQ/TW, dated December 9, 2011, “On building and promoting the role of the Vietnamese royal family in the period of strong industrialization, modernization and international integration”.

The 11th Congress of the Home Page perfects mechanisms and policies to change growth models, economic infrastructure, improve the investment and business environment, and apply a variety of investment attraction formulas. . Attractive mobilization and effective use of all economic members’ resources, creating conditions for the formation of private economic corporations, encouraging private capital to contribute capital to state-owned economic corporations. At the 12th Congress, our Party affirmed that the market plays a key role in mobilizing, analyzing and effectively supplementing development resources, and is the main driving force to liberate production capacity, thereby setting the task continue to develop synchronously, operate across all types of markets, and at the same time evaluate the private economy as an important driving force of the economy. The 5th Plenum of the 12th Central Committee issued Resolution No. 10-NQ/TW dated June 3, 2017 on “On developing the private economy to become an important driving force of the socialist-oriented market economy” with specific goals and content for a group of solutions to encourage and support private economic development.

At the 13th Congress, our Party continued to affirm: “The private economy is encouraged to develop in all industries and fields where the law does not violate, and is supported to develop corporations into companies and business groups. The private economy is strong and has high competitive strength. Encourage private enterprises to cooperate and associate with state-owned enterprises, cooperatives, and household economies; develop joint stock companies with widespread participation of social actors, especially workers". Improving institutions, promoting public cooperation - consulting to mobilize social resources to develop infrastructure and provide work services. "Strive by 2030, to have at least 2 million businesses with the private economic sector's contribution to GDP reaching 60 - 65%"; Average total social investment reaches 33 - 35% of GDP.

From 2010 to 2022, the development of the Party's theoretical thinking has created the basis for building and perfecting institutions, mechanisms, and policies for private economic development in Vietnam. According to Article 51 of the 2013 Constitution, Vietnam's socialist-oriented market economy has many forms of ownership and many economic sectors; State economy plays a key role; All economic sectors are important components of the national economy, equal, cooperative and competitive according to the law. The State encourages and creates conditions for entrepreneurs, businesses and other individuals and organizations to invest, produce and do business; Legal assets of individuals and organizations investing, producing and doing business are protected by law and are not nationalized.

Mechanisms and policies for private economic development are constantly improved through the promulgation of the legal system, thereby: Fourth, Forming a common, unified legal framework on the establishment, organization and operation of private economic entities. The form of business organization applies to all business organizations regardless of the form of ownership and is increasingly consolidated with international regulations and rules; Second, property rights and business autonomy rights of individuals and organizations are institutionalized to protect consultants; Third, basically the private economy can compete on its own and be treated equally under the law compared to the state economy and the economy with foreign direct investment. What is special is that the process of accessing resources and the State's support for the private economy is gradually being ignored; Fourth, create favorable conditions for private investment to develop through improving tax policies, technology, and public administrative procedures.

3. CURRENT STATUS OF PRIVATE ECONOMIC DEVELOPMENT IN VIETNAM

The private economy has developed strongly. On average, in the period 2010 - 2021, on average, over 100 thousand businesses are established each year. In particular, in the period 2018 - 2022, each year more than 130 thousand new businesses will be established. Correspondingly, the annual registered capital reaches over 500 trillion VND. In the period 2018 - 2022, each year the newly registered capital reaches over 150 trillion VND.

Currently, the private economic sector has formed and developed a number of large-scale private sector enterprises, which are gradually doing multi-industry business and becoming large and important enterprises in the economy. In addition, some private sector enterprises have invested abroad and have had successes and built brands. The team of entrepreneurs is growing stronger, the entrepreneurial spirit, the spirit of innovation and the desire for improvement of the private economic sector are increasingly strong, social responsibility, ethics and culture are increasingly pervasive wide...

In fact, the private economy has many contributions to economic development:

First, in the period 2010 - 2021, the contribution of the non-state economic sector (including the private economy and collective economy) always accounts for over 50% of the country's GDP (50.55% in 2019; 50% in 2019; 56% in 2020; 50.04% in 2021, including the cooperative economic sector) and is the area with the highest proportion among the three sectors (state, private and FDI).

Second, the non-state economic sector (public, commercial, and service sectors outside national enterprises, excluding personal income tax) has an increasing contribution rate to the state budget in recent years period 2010 - 2021, from 11.7% in 2011 to 18.48% in 2021. In particular, since 2017, the private economic sector's contribution to the state budget has surpassed that of the state-owned enterprise sector and the FDI enterprise sector.

Third, the private economy gradually participates in links, production networks, and regional and global value chains through vertical links with the FDI sector. By 2021, the private economy will account for a very large proportion in the production of a number of products: 91.27% of sea salt output; 88.45% diameter output; 48.69% NPK fertilizer; 44.64% cement; 39.21% iron and steel in ingots or other raw forms; 49.91% rolled steel.

Fourth, investment by the private economy is constantly increasing, the proportion of the private economy in total social investment capital always exceeds that of the domestic economy and the FDI economy. In the period 2010 - 2021, the private sector's investment rate has increased from 44.6% in 2010 to 59.5% in 2021. In particular, although public investment is adjusted to decrease, total investment Infrastructure is still increasing. In particular, in the period 2010 - 2022, a series of large infrastructure projects undertaken by the private economic sector have been started, completed and put into use.

Fifth, private sector enterprises have a relatively stable capital turnover index, fluctuating between 0.7 and 0.78 times in the period 2010 - 2017, lower than the FDI enterprise sector (0. .84 to 1.08 times), but much higher than the state-owned enterprise sector (0.36 to 0.59 times).

Sixth, the private economy plays an important role in replacing investment capital in the context of reduced investment capital. In the period 2010 - 2021, the ratio of public investment in total investment in the highest year is 36.1% (2012), the lowest year is 24.1% (2019). However, the strengthening of private ownership and increased foreign investment contribute to economic stability.

Seventh, the private sector makes a very important contribution not only economically, but also socially - that is, solving labor and employment. In the period 2010 - 2021, although the proportion of workers aged 15 and over in the private sector has gradually decreased from 86.3% in 2010 to 82.6% in 2021, this sector has not yet resolved the problem. employment for more than 80% of the economy's workers. The average growth rate of the number of employees in the private economic sector in the period 2011 - 2018 reached over 3.6%, with the private enterprise sector alone reaching nearly 5.4%.

Besides, private economic development still has some of the following limitations:

Firstly, private economic development still has many barriers: 1- Although the political system's awareness of the private economy has changed, there is still stigma and discrimination, especially is a large part of officials, civil servants, and even people in the private economic sector. Lack of unity and still incorrect awareness of the role of the private economy in a socialist-oriented market economy; 2- The legal framework, mechanisms, and policies still have many inadequacies, overlaps, and lack of uniformity, not really facilitating business activities of economic entities, especially regional entities. private. Competition policy is not effective, there is also inequality in access to resources between economic sectors, and differences in the policy implementation process. Policies to protect domestic production, combat smuggling and trade fraud are not appropriate and have many limitations. 3- State management still has many shortcomings, especially in developing effective regulations and policies, the efficiency is not high, there are not many mechanisms and policies to encourage private enterprises to innovate, create products that are competitive in the international market. Improving administrative methods has not achieved the 3 reduction goals (reducing time, reducing costs, reducing paperwork). The implementation process is quick, duplicates, and overlaps at many stages. Operational support is still experienced and duplicated when the purpose, target audience and effectiveness below are not accurate. Vietnam's "compliance" costs and business costs at most stages are still in the group of countries with high business costs.

Second, private economic development still faces many challenges: 1- The number of economic establishments in the private sector is increasing rapidly, especially the number of newly established enterprises, but the proportion of enterprises is increasing rapidly. The rate of business shutdown, dissolution, and bankruptcy is still very high. The quality and operational efficiency of businesses in this field are slowly improving, most still operate in the commercial and service sectors. 2- Business entities in this area are mostly small and medium-sized groups, of which the proportion belonging to the micro group is quite high. If divided by the size of the number of employees, in 2017 there was up to 74% (this rate in 2010 was 63%). Only less than 1% of private sector enterprises have a scale of 200 employees or more, while the proportion of enterprises with a scale of less than 10 employees in the FDI enterprise sector is about 30% and State-owned enterprises are only about 7.7 - 13.4%; 3- The private enterprise sector has a high rate of loss-making enterprises, equivalent to the rate of the FDI enterprise sector in the period 2010 - 2017 (except for 2 years 2010 and 2012). The rate of loss-making enterprises in the private sector increased in the period 2013 - 2017 at 48 - 49% in 2016 and 2017 and is the area with the highest rate; 4- Social labor productivity of the private economic sector is lower than the average level of the economy.

Third, the private economy's contribution to economic growth is not commensurate with its potential. The proportion in the GDP base does not change in the period 2010 - 2021. The average size of domestic private economic units is small with the main component being individual economies contributing up to 30% of GDP, enterprises The private sector only contributes about 9% of GDP; The ability to participate in network production, regional and global value chains of large private enterprises but with regimes. Domestic private sector enterprises participate very little in the global value chain, only about 21% of enterprises. The domestic economy (including both domestic private and state-owned enterprises) only contributes 30% of exports, equivalent to 70% of regional FDI.

Fourth, the average income of workers in the private enterprise sector, although it tends to increase continuously over the years, is still at the lowest level among the three regions, from 3.4 to 7.5 million VND/person. /month in the period 2010 - 2021, equal to about 49 - 82.15% compared to workers in the state-owned enterprise sector and 73 - 90.1% compared to workers in enterprises in the FDI sector.

Fifth, the capacity of the private economy is still limited: 1- Private economic entities lack the capacity for innovation, technology development, and new production processes. According to the World Bank's assessment, Vietnamese enterprises' research and development costs have not improved much. If in 2008, the number of this index was 3.6/10 (ranked 42/134), increasing to 3.8/10 in 2010 (ranked 27/133), then by 2017 the index was at level 3, 5/10 (ranked 49/138); 2- The production capacity and ability to compete in both quality and price of the private sector, even businesses - the most capable actors of the private economy - are still very limited. The labor productivity growth rate of the private economic sector is still low, only equal to 34% of the labor productivity of the state-owned enterprise sector and about 69% of the labor productivity of FDI enterprises. Scientific and technological capacity is still limited, business investment in technological innovation only accounts for about 0.3% of revenue, much lower than in countries such as India (5%), and South Korea (10%)... Vietnamese businesses have not focused on improving connectivity and competitiveness to participate in regional and global value chains. Only about 21% of small and medium-sized enterprises can participate in part of the global value chain, and 14% succeed in connecting with foreign partners.

Sixth, private investment still has many surprises, there are signs that foreign investment and public investment overwhelm domestic private investment. In many fields, such as electronics, automobiles, motorbikes, etc., the widespread participation of FDI enterprises is not a factor in supporting and promoting the development of domestic private sector enterprises. , on the contrary, FDI enterprises compete and overwhelm domestic private sector enterprises. In addition, due to the development time of domestic private sector enterprises, FDI enterprises and state-owned enterprises have a shorter history, experience and operations, so they are still affected by external impacts. (strong, speculative) as well as the process effects of the market economy (speculation, chasing profits, group interests...)

4. SOME LESSONS ON PRIVATE ECONOMIC DEVELOPMENT IN THE NEW CONTEXT

Domestic and international circumstances pose many advantages and difficulties for private economic development

Firstly, the world is facing a recession, deflation and increased exchange rates of most currencies compared to the USD. The findings of some major economies are on the rise, causing negative impacts on world economic issues. Tightening monetary policy will put global economic growth at risk of decline. The world is facing a new recession.

Second, the world is intertwined and fragmented: on the one hand, new generation free trade associations (FTAs) and regional connectivity are promoted; On the other hand, divisive trends are also appearing, most notably the UK leaving the European Union (Brexit) and the Russia-Ukraine conflict. Russia is embargoed and the world is divided, European countries have difficulty with energy and many other related systems.

Third, capital flows are being transferred from some national media systems and operations to some emerging countries. Adjustments to national strategic goals to respond to key address risks. This is, on the one hand, economic development cooperation of transition capital trading countries; on the other hand, creating a competition to attract capital flows. As a result, countries must adjust their economic development.

Fourth, the world is in the fourth industrial revolution with many opportunities and methods. The fourth industrial revolution creates many opportunities, such as new economic space, new technology, new products; The world will be more open with stronger connections. However, the Fourth Industrial Revolution also creates disadvantages, such as the potential risk of capital movement and competition between the real world and the virtual world. In particular, along with adjusting business goals and strategies, a series of technology businesses are laying off thousands of workers.

Fifth, non-traditional security risks and strong climate change appear. Non-traditional security threats such as the Covid-19 pandemic have not yet seriously affected production and supply chains. Along the coast, climate change is happening faster and stronger, so it is expected to cause significant impacts on sea level rise, saltwater intrusion, drought, floods, tsunamis... on countries.

The reality of private economic development in recent times can draw some lessons

Firstly, renewing awareness about the role and position of the private economy... Unifying awareness and ideology about the role of the private economy in the economy needs to aim at being an important driving force to the national economy. It is necessary to have unified awareness in the socio-political system about the driving role of the private economy, thereby creating all conditions for private economic development, promoting the strengths and potential of the private economy.

Second, supplement and complete the legal framework, mechanisms and policies for private economic development to create a favorable and equitable business environment among economic sectors. Continue to improve the legal framework related to private economic development; Synchronously and effectively deploy the set tasks and solutions for private economic development. Building a streamlined, efficient and effective state apparatus; develop a team of officials and civil servants with integrity, strong political ideology, and high professional qualifications. Strengthen discipline, discipline, and drastically prevent and combat corruption, waste, and negativity.

Third, it is necessary to reform administrative procedures to achieve the 3 reduction goals (reduce time, reduce costs, reduce paperwork). Support economic development and advise employees by developing decisive and effective solutions to reduce costs for production and business activities; Have mechanisms and policies to create conditions for the private economy to actively participate in the process of international economic integration. Ensuring mechanisms and policies to encourage and support private economic development in accordance with market mechanisms; does not violate international connections, does not violate market principles; perfecting the autonomy and competition of the private economy. Supplement, complete and develop effective regulations and key lists related to private economic support, especially regulations on support for small and medium-sized enterprises.

Fourth, promote the role of private sector enterprises, honor private sector enterprises with innovative, creative models, and competitive products in domestic and international markets. . The private economic development account holder associated with the economic transformation process has created room, space and business opportunities for the private economic sector to invest in capacity building. Vietnam's economy is known to the world with a number of private corporations.

Fifth, Promote local private economic development. Private economic units must really make efforts to mobilize, update and firmly grasp the current regulations of the State to nurture and operate legally in the production and business process; Tool to find partners and links to improve competitiveness in the process of international economic integration. Enhance the responsibility of establishments and sectors in organizing and implementing and concretizing key accounts and policies on private economic development; Strengthen the State's discipline and discipline in developing and implementing the guidelines, laws, and policies for the private economy. Strengthen Party building activities in the private economic sector, preferably businesses. It is necessary to be proactive and responsive in honoring and rewarding iconic private economic enterprises and units with highly effective production and business activities, good compliance with legal regulations and many contributions. for the truth of socio-economic development...

Sixth, when dealing with investment in general and private investment in particular, it is important to resolve the main external resources, domestic resources must be decided. Really consider resources from the private sector as a driving force for development; At the same time, it is necessary to clearly identify the work of improving administrative practices and improving the business environment as an important foundation to encourage the development and investment of the private economic sector. Attracting FDI needs to be associated with attracting leading manufacturing and distribution enterprises to attract and absorb the domestic private sector. Promoting the guiding role of state investment to attract investment capital from society, including domestic private individuals. Consider state investment as a "bait" capital source to attract social resources and private sector investment in upgrading economic infrastructure, especially the transportation system.

5. CONCLUSION

In summary, it is necessary to note the following issues when developing the private economy: Creative capacity for the spirit of the private economy is an important driving force in account owners, policies, institutions, mechanisms, policies and implementation direction of the Party and State at all levels, sectors and localities. Create a favorable environment for the private economic sector in general and private sector enterprises in particular to develop at the same time as quickly removing barriers to the operation of private sector enterprises according to the law. direction to minimize shutdowns and bankruptcies. Encourage businesses in the private consulting sector to develop guidance on creating jobs and income for workers, especially the new workforce participating in guiding inclusive growth. Create funding sources to support newly established businesses and create an established environment for startups. In particular, attention should be paid to improving national competitiveness, enterprise competitiveness and industry competitiveness. Create an institutional environment, science - technology, finance, credit, land access, and enhance a fair competitive environment for all economic sectors to compete as a foundation for improving economic efficiency. . Important note for investment and private investment. Attracting resources from domestic businesses and people in infrastructure development in the direction of the state-led economy and avoiding public traps and foreign debt. Proactively have mechanisms and policies to attract resources to apply the achievements of the Fourth Industrial Revolution, with the focus on successfully digitally transforming the economy in the digital technology society./.

DEVELOPMENT OF VIETNAM'S DERIVATIVES MARKET VIEWED FROM INTERNATIONAL EXPERIENCE

MSc. Nguyen Thuy Linh[1], MSc. Duong Duc Thang[2]

Abstract:: This study aims to generalize basic issues about the derivatives market and derivatives transactions in the market and evaluate the current situation of the derivatives market in Vietnam from 2017 to present. Along with that, research experience in some markets around the world, in order to come up with solutions to develop this market in Vietnam.

Keywords: Stock market; derivatives and trading securities market

1. INTRODUCTION

After 23 years of operation, Vietnam's stock market has made significant developments. Total stock market capitalization today (August 2023) is about 8.2 million billion VND; equal to about 92.58% of the economy's GDP. From the first two listed and traded stock codes, REE and SAM, by the end of August 31, 2023, there were 1,585 stock codes listed and traded on all 3 exchanges. Although there have been strong developments, new trading products including stocks, fund certificates and bonds do not have risk prevention properties, while these are profit generating tools. Therefore, the introduction of derivatives and the formation of the derivatives market (TTCKPS) on August 10, 2017 in Vietnam is extremely necessary. It can be affirmed that the birth and operation of the Stock Market is an important milestone of Vietnam's stock market, making an important contribution to improving market structure as well as promoting liquidity in the basic market. However, in the process of operating the stock market, some limitations have been revealed. This article aims to evaluate activities, study the experiences of some countries, and propose some solutions to develop Vietnam's stock market in the coming time.

2. LITERATURE REVIEW

There have been many studies that were conducted to evaluate the importance of the development of the derivatives market for the stock market in particular and the economy in general, as well as studies on how to develop this market. .

Haiss and Sammer (2010) evaluated the role of derivatives in the relationship with growth through transmission channels: volume, efficiency and risk when researching in the markets of some developed countries. On that basis, the authors point out some experiences in developing and managing this market. Said point is that it is necessary to increase capital accumulation to promote positive effects of the derivatives market on the financial market; thereby helping to allocate resources more effectively; And at the same time, it is necessary to strengthen supervision of the use of derivative tools under the conditions that these tools are used to prevent risks.

1 Hanoi Open University, Email: nguyenthuylinh@hou.edu.vn.

2 Academy of Finance

Sendeniz-Yuncu (2018) points out that effectively operating derivatives markets help businesses share risks, thereby promoting the implementation of projects with higher risks but with a potential of a higher profit yield. At the same time, investors and manufacturers themselves can rely on the derivatives market as an information channel to reflect upon the market supply and demand, thereby making the right decisions in resource and forces distribution. The author assesses that this requires derivatives market development policy to aim for a balance between speculation and risk prevention to ensure effective resource distribution, thereby bringing an efficient economy.

In addition, the research of IGC (2012) can be mentioned. Research points out to derivatives in developing financial markets; which covers the use of derivatives, how to operate the tools as well as some recommendations on market development.

3. RESEARCH METHODS

The study uses secondary data collected from announcements of the State Securities Commission; stock exchanges combined with some Fiinpro data. Regarding research methods, use the following methods to present results to the subject of analysis:

- Economic statistical method: statistics on transaction volume and value
- Comparison method: compare the results of derivatives transactions over periods

3.1. RESEARCH RESULTS AND DISCUSSION

3.1.1. Overview of derivative products traded in Vietnam

3.1.1.1. Future contract

a) VN30 index futures contract

VN30 index futures contract is a futures contract based on the underlying asset VN30INDEX index - this is an index representing 30 potential stocks, leading the market with large capitalization value and liquidity. high, listed on HoSE. VN30 index futures are standardized, listed and traded at the Hanoi Stock Exchange. The characteristics of this futures contract are as follows:

- Underlying asset: VN30 Index
- Multiplier: 100,000 VND, for example, 1,000 points is 100,000,000 VND
- Margin ratio: According to current regulations of VSD (Vietnam Securities Depository); The initial margin rate is about 10% - 15% of the contract value
- Minimum price fluctuation: 0.1 index point
- Trading method: trading VN-30 index futures is similar to stocks; In which the stock market opens 15 minutes earlier than the stock market and ends at the same time.
- The last trading day of a futures contract is set to be the 3rd Thursday of the maturity month.
- Maturity month: latest month, next month, last month of the latest quarter, last month of the next quarter

b) Government bond future contracts

Government bond futures contracts are listed derivative securities, with the underlying asset being a government bond. Government bond futures contracts are instruments traded on the Hanoi Stock Exchange with standardized terms. The standardized factors are regulated by the Hanoi

Stock Exchange. Basically, Vietnam Stock Market has deployed 2 government bond futures products: 5-year and 10-year government bond futures contracts. The government bond futures contract form approved by the State Securities Commission is as follows:

- Term: 5 years and 10 years
- Underlying asset: 1) 5-year Government bond futures contract: Government bond with par value of 100,000 VND, term of 5 years, nominal interest rate of 5%/year, periodic interest payment every 12 months, principal payment once upon maturity; 2) 10-year Government bond futures contract: Government bond has a term of 10 years, face value 100,000 VND, nominal interest rate 5%/year, periodic interest payment at the end of the term every 12 months, principal payment once when expire.
- Contract size: 1 billion VND, transaction unit or transaction volume: minimum 1 contract
- Maturity month: Government bond futures contracts have 3 months of maturity approximately according to the nearest quarterly cycle
- Margin ratio: decided by the Securities Depository Center on the basis of calculating the risk level and approved by the management agency, the State Securities Commission.

3.1.1.2. Warrants are covered

Currently, covered warrants are deployed and traded in Vietnam as follows:

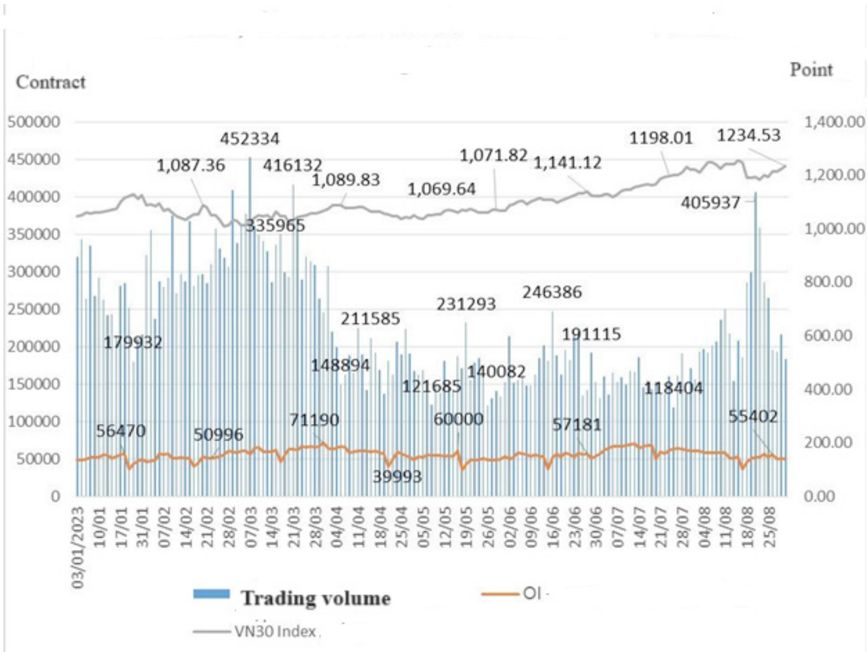
- Issuing organization: securities companies. However, to protect investors, the State Securities Commission requires securities companies to have sufficient conditions in terms of financial capacity, trading system, professional safety and personnel, as well as such as the ability to create a market... are allowed to become an issuing organization.
- Underlying asset: Currently, the underlying asset type in covered warrants in Vietnam is stocks. However, these stocks must meet the criteria of capitalization, liquidity and business operations. To ensure this condition, stocks will be screened in the VN30 group and periodically announced by HOSE on the Department's website.
- Type of warrants: Theoretically, there are two types of warrants: Call warrants and Put warrants. However, in the first phase of operating covered warrants in Vietnam, the purchased warrant type was chosen to be deployed at the HOSE
- Covered warrant trading: Investors open secured warrant trading accounts at securities companies similar to stock trading, and comply with the principle that when buying, they must have enough money and when The seller must have enough warrants. In addition, the exercise of warrants will be applied in European style, meaning investors can only exercise warrants at the expiration date. Another note for investors is that they are only required to exercise their rights to the warrants in a profitable state at the maturity date.
- Payment method: Pay the difference in money. Accordingly, the warrant owner will receive the difference when the payment price of the underlying security is higher than the exercise price.

3.1.2. The development of Vietnam's derivatives market

3.1.2.1. Future contract

Currently, futures contract is a stock index that is very popular with investors in the market. Along with the excitement in the underlying market, transactions on the stock market also have positive fluctuations.

Figure 1: Trading volume, futures OI of VN30 index and VN30 Index January - August 2023



Source: State Securities Commission

In August 2023, the VN30 index futures contract product had an increase in trading volume of 49.51%, an average of 228,360 contracts/session, an average transaction value (in contract terms) of 27,815 billion VND. VND/session, up 57.23% over the previous month. In particular, the largest trading volume of the month was at the trading session on August 22 with 405,937 contracts, this is also the session with the largest trading volume from the beginning of the year until now.

At the last trading session of the month, open interest (OI) volume reached 49,759 contracts, down 19.84% compared to the previous month. In particular, the trading session on August 1 recorded the highest open OI volume of the month with 60,926 contracts.

Regarding investor structure, the trading proportion of foreign investors in August 2023 accounted for 2.49% of the total market trading volume. The proportion of proprietary trading transactions of securities companies is 1.26% of the total market transaction value.

Table 1: Summary of futures contract transactions for the VN30 Index in August 2023

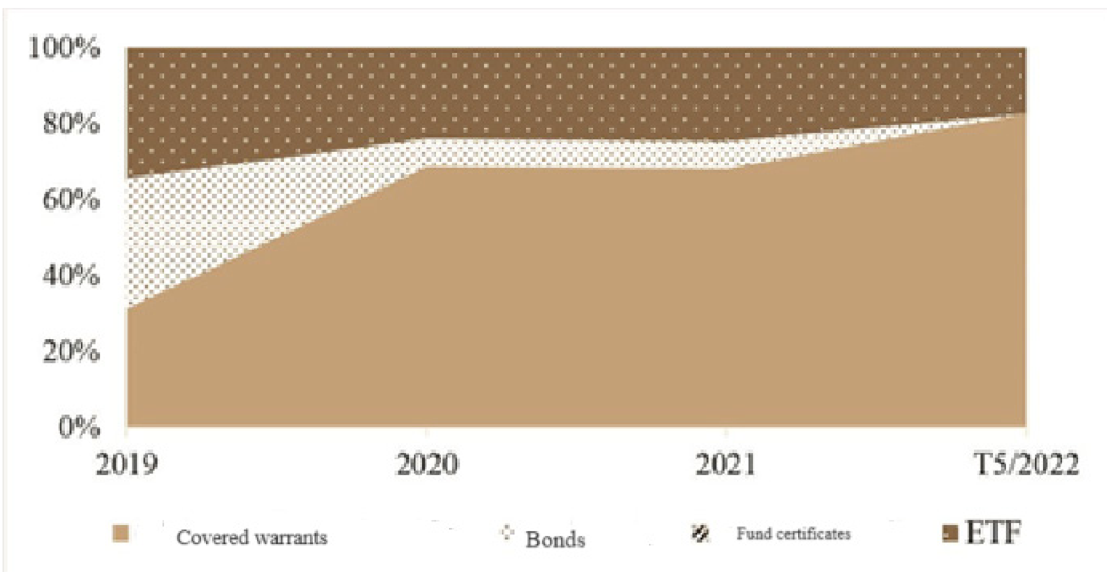
TT	Targets	Unit	July 2023	August 2023	Rise/fall (%)
1	Average trading volume per session	contract	152.739	228.360	49,51%
2	Average transaction value (in normal terms) per session	Billions dong	17.691	27.815	57,23%
3	OI volume (end of period)	contract	62.077	49.759	- 19,84%
4	Trading proportion of foreign investors	%	3,47	2,49	- 28,24%
5	Proportion of proprietary trading transactions	%	1,66	1,26	- 24,09%

Source: State Securities Commission

3.1.2.2. Warrants are covered

Covered warrants have been traded on HOSE since 2019 but have affirmed their solid position as the trading volume of this type of derivative securities is increasing. When compared with traditional financial products that have been around for a long time such as bonds, fund certificates, ETFs... on the HOSE trading floor, covered warrants account for an increasingly higher proportion than other instruments. (Figure 4). Furthermore, the transaction value of covered warrants also increased sharply during the 2 years of operation (Figure 5). Specifically, in 2021, the value of covered warrant transactions reached 17,694 billion VND, more than 3 times higher than in 2020 and 18 times higher than in 2019. The trading volume of this derivative product in 2021 reached 5,000,000 VND. 3 billion warrants, an increase of 1.83 times compared to 2020 and 14 times higher than 2019. In 2022, although the impact of the COVID-19 epidemic has cooled down, with the impact of the situation Political instability between Russia and Ukraine and changes in monetary policy of developed countries like the US have strongly affected the stock market. However, in terms of proportion, the trading volume and value of covered warrant transactions still grew quite well in the first 5 months of 2022 compared to other types of securities on the market.

Figure 2: Structure of trading volume of some securities on HOSE in the period 2017 - May 2022



In short, although two types of securities have just been put into operation, namely futures contracts and covered warrants, the securities market in Vietnam has developed rapidly, it can be said to have exceeded the expectations set by managers. This shows that this market has strong development potential, evidenced by its good growth rate with a rapid increase in both transaction volume and value.

4.2.3. Some challenges during the development of derivatives market in Vietnam

- First, although the legal basis for the operation of the derivatives market has basically been built based on the conditions of Vietnam's financial market. However, securities companies' ability to fully comply with legal regulations is still limited. Specifically, according to the 158/2020/ND-CP Decree on derivatives trading, securities companies must meet certain financial conditions such as self-trading of derivatives and must have charter capital and equity. Owning 600 billion VND or more, or operating derivative securities brokerage activities, it requires charter capital and equity of 800 billion VND or more... With such conditions, by the end of September 2023; there are only 24 securities companies that are members of derivatives trading. In addition to minimum capital regulations, securities companies must also meet other conditions on financial safety indicators, business profits, etc. With the general scale of current securities companies, further expansion of the securities market is difficult for authorities and lawmakers.

- Second, currently mainly trading VN30 products, other derivative products have not yet received a worthy position.

- Third, derivative products are different from the underlying market in that the underlying assets are mainly traded in the market on which they are listed, while derivatives can be issued by many different exchanges regardless of whether the underlying asset is traded on that same market. Specifically, currently on the Singapore stock market (SGX), there is a derivative product about the VN30 index futures contract with the code name FTSE Vietnam 30 Index that has been released by this exchange since 2019 and is still traded on the market. This is truly a challenging problem for the future development of Vietnam's derivatives market when having to compete for the same product with markets that are more developed in scale and depth.

4.3.Experience in developing derivatives markets around the world

4.3.1. Singapore

The Singapore derivatives market was formed in 1984 with the establishment of the Singapore international currency exchange market (SIMEX), the main products being futures contracts of the Nikkei 225 index. By December 1999, in order to create Favorable conditions for management while saving resources to build infrastructure and concentrate high-quality human resources, 3 commodity derivatives markets (SICOM), securities derivatives (SIMEX) and currency derivatives (SES) have merged to form a common stock exchange, Singapore Exchange (SE). SE is an independent organization, and it is also supervised by the Singapore Monetary Authority. Right from its inception, market managers made a reasonable decision to allow the Singapore derivatives market to connect with the Chicago market (the derivatives market has the longest history and most development in the world). world), thanks to which, investors are allowed to trade between the two markets without cost.

In addition, the conditions for participating in the market are also specifically regulated by SE for each group of subjects: (i) For individual trading members: must be a professional derivatives trader, fully qualified knowledge and understanding of derivative securities, no minimum capital required; (ii) For paying members: must have a minimum capital of 5 million Singapore dollars, have a license to provide capital market services and meet the highest financial standards. This regulation has attracted many investors to participate in the market in the early stages of establishment, creating a foundation to help the derivatives market develop quickly and sustainably. Since 2004, Singapore began adding stock options to trading and continued to reap many successes thanks to many policy mechanisms to facilitate investors such as: Replacing the on-premises order matching system with the online electronic transactions; Exemption from prospectus requirements; Relax options listing standards.

4.3.1. Korea

The year 1993 marked an important event when the Korean derivatives market was officially born. In May 1996, for the first time, derivatives and index futures contracts (KOSPI 200) were introduced based on the calculation of stock price index on the Korea Stock Exchange. After just one month of operation, the KOSPI 200 options market has clearly shown its operating efficiency and the need for an official derivatives market. Thanks to the success of putting this market into operation, Korean securities industry regulators decided to put the KOSPI 200 options market into operation in July 1997. Then, in April 1999, the Korea Futures Exchange (KOFEX) was established. In addition to derivatives being traded on KSE, options products and financial futures contracts are traded on KOFEX. Commodities listed on this Exchange are: Options and futures contracts Korean Treasury bonds, Interest rate futures contracts Currency stabilization bonds and KOSDAQ 50 futures index, options and futures contracts issued with denominations in USD...

Experience shows that to achieve the above success: (i) Korea has built a strict legal mechanism and has certain initial incentives for members participating in the stock market, specifically incentives tax incentives; (ii) Create a modern infrastructure, meeting the requirements of quick order matching transactions. Accept online transactions as soon as the derivatives market is put into operation; (iii) Applying a strict margin method when conducting derivatives transactions to prevent liquidity risks, the margin is made based on two regulations: the initial margin and the maintenance margin. maintain.

4.3.2. Japan

The Japanese derivatives market has a number of characteristics such as complex products, professional participants, highly speculative and risky transactions. Therefore, the derivatives market must be monitored and adjusted promptly and in accordance with the goal of stabilizing the market and protecting investors. The Tokyo Stock Exchange stipulates a number of principles of conduct for the market in a timely manner. Some specific cases include: (i) When the market price of futures contracts and options contracts exceeds the price of the underlying stock index, trading will be temporarily stopped for 15 minutes. (ii) When the TOPIX index fluctuates outside the allowed range, limit TOPIX trading to accounts jointly owned by securities trading organizations. (iii) When participating in a TOPIX trading transaction, the trading subjects must have a daily report on the change of position when participating in the transaction.

4.4. Solutions for developing Vietnam stock market

Nearly 6 years of establishment and operation have shown the strong development of the stock market in Vietnam. This market has made an impression on investors both domestically and internationally, reflected in its trading volume, attractiveness to investors as well as providing profit protection tools. This strong development lays a solid foundation for the future development prospects of the stock market, however, accompanying challenges are inevitable. Therefore, there need to be some appropriate solutions to develop Vietnam's stock market in the coming time:

Promote attracting investors by focusing on strongly attracting institutional investors on the basis of the issued legal framework. For individual investors, it is necessary to strengthen the implementation of training programs for them when participating in the stock market to increase professionalism.

- Continue to diversify goods for the stock market, first it is necessary to immediately deploy government bond futures contract products. This will be a trading product almost exclusively for institutional investors, so the proportion of institutional investors participating in the stock market will gradually increase. In addition, it is necessary to deploy covered warrant products and develop additional underlying indices to serve as base assets for derivatives.

- Strengthen supervision, handle violations, ensure market integrity and discipline, especially detect and strictly handle market manipulation acts.

- It is necessary to introduce a reasonable incentive mechanism for fees and taxes to increase the attractiveness of participating in the stock market to attract more investors and develop the market in the future.
- Narrow the number of intermediary financial institutions, especially securities companies with weak and ineffective operations; perfecting the operating model of securities trading organizations according to international practices; Improve the quality of risk management at these organizations based on equity and financial safety ratios.

CONCLUSION

Developing the stock market continues to be a very important content in the Vietnam Stock Market Development Strategy project for the period 2021 - 2030 that the Ministry of Finance is developing and submitting to the Government for approval. Regarding specific goals, the stock market size reaches a minimum of 100% of GDP by 2025 and a minimum of 120% of GDP by 2030. The bond market size reaches a minimum of 47% of GDP (corporate bonds reach 20% of GDP) by 2025 and reach a minimum of 58% of GDP (corporate bonds reach 25% of GDP) by 2030. The derivatives market grows on average 20-30% per year in the period 2021-2030. Therefore, the study hopes that its proposed solutions will be useful suggestions to help relevant agencies perfect the legal framework and implement solutions to promote the development of the stock market. Vietnam in general, TTCKPS in particular.

FACTORS IMPACTING LIQUIDITY RISK MANAGEMENT FOR BANKS IN VIETNAM POST COVID-19 PANDEMIC

MSc. La Viet Anh[1]

Abstract: Post-Covid-19 period has brought unparalleled challenges to global economies, particularly the banking sector, emphasizing the criticality of risk management, notably liquidity risk management, for regulators and banking executives in light of the series of bank collapses at the outset of 2023. This paper investigates the challenges facing liquidity risk management in the banking sector of Vietnam following the global economic repercussions of the Covid-19 pandemic. The study analyzes key exogenous factors, including the divergence in monetary policies between the State Bank of Vietnam and foreign central banks, as well as the collapse of foreign and domestic banks. It also examines critical endogenous factors, such as the impact of short-term excess cash reserves and the implications of rapid digital transformation on liquidity risk management. Based on the analysis, the paper proposes three key recommendations covering risk regulatory, contingency funding plan and risk training enhancement for banks as well as the State Bank of Vietnam to strengthen their liquidity risk management practices, thereby promoting a more resilient and stable banking sector domestically.

Keywords: Bank liquidity, liquidity risk, liquidity risk management, post Covid-19.

1. INTRODUCTION

Post Covid-19 period presented significant challenges for the global economies and financial system. As social distancing restrictions and vaccination becomes less popular topics in 2022, the world shifted its focus on the aftermath and possible side-effect of the pandemic. Global economic condition become tightened as the central bank authorities started hiking interest rates, the Russia – Ukraine war occurred while China kept its country in lockdown. These events and many others contributed to the instability of the global financial system, particularly for banks. The series collapse of large US banks along with Credit Suisse – a GSIFIs[2] bank in the first half of 2023 has sent shockwaves throughout the financial system and raising critical questions for liquidity risk management of the global banking industry.

The business model of bank which takes deposits and grants loans makes it inherently susceptible to liquidity risks. Unlike credit risks or operational risks, liquidity risk has significant consequence once occurred due of its potential to trigger bank run, a phenomenon that leads to not only the collapse of any bank but also threaten the stability of the global financial system. Understanding sources of liquidity risk and factors that impact liquidity risk management, particularly during unfavorable market and economic conditions, have become paramount in preventing bank collapses and ensuring the robustness of the financial system.

Effectively managing liquidity risk is a multifaceted undertaking that demands comprehensive strategy. Risk managers at banks are tasked with the challenge of striking a delicate equilibrium between maintaining ample liquid assets to cover unforeseen cash demands while ensuring opportunities for higher returns for banks through longer-term loans and/or less liquid investments. This equilibrium becomes even more intricate due to market volatility, changes in regulations, and

---

2 Global Systemically Important Financial Institutions.

the evolving landscape of business models. Additionally, the interconnected nature of the financial system amplifies the complexity, as liquidity issues in one institution can rapidly propagate to others, ultimately culminating in systemic risk. Consequently, managing liquidity risk extends beyond the purview of individual banks and necessitates a collective, system-wide approach, calling for collaboration among banks, regulatory bodies, and other stakeholders.

The unfavorable macroeconomic conditions after Covid-19 exposed weaknesses of global banking system in managing liquidity risk effectively. Until 2023, large US commercial banks such as Silvergate Bank, Silicon Valley Bank, Signature Bank, First Republic Bank, and even a G-SIFIs bank like Credit Suisse have complied Basel III standard[1] among other international risk management requirements. Nevertheless, the collapse of these banks in the second quarter of 2023 has reminded national supervisors and the financial system of the importance of sound liquidity risk management. Factors causing the liquidity collapse of these banks varies. For example, in the case of Silicon Valley Bank, external causes can be deduced to the Federal Reserve's interest rate hike, gaps in liquidity risk management from the authority, or the widespread panic on social media causing depositors to withdraw fund from the bank. Meanwhile, internal factors such as weakness of the banks in risk management oversight as well as inappropriate liquidity risk management strategy to ensure sufficient liquid assets have contributed to the downfall of these banks. For banks in Vietnam, the end of 2022 also witnessed a liquidity crisis of Saigon Commercial Bank (SCB) which required intervention from the State Bank of Vietnam (SBV).

The call for strengthen liquidity risk management practice becomes more vital for banks in Vietnam especially after the pandemic. By identifying factors that can impact the liquidity risk management, banks will be able to develop more effective practices and tools to enhance risk management capability and contributes to the stability of the banking system in Vietnam.

2. LITERATURE REVIEW AND PREVIOUS RESEARCH STUDIES

2.1. Liquidity and liquidity risk management in bank

Banks are inherently susceptible to liquidity risk due to their fundamental function as medium in the economy by borrowing short-term from depositors and lending long-term loans. The concept of liquidity and liquidity risk particularly in the banking industry therefore has been well-studied. Knies (1876, cited in Duttweiler 2009) emphasized "liquidity" as the need for a cash buffer to compensate for negative gaps between flows of incoming and outgoing payments in cases where their respective maturity periods could not be perfectly controlled. Recent studies have referred to liquidity as the capacity to obtain cash when it is needed, not as possession of cash or assets that can be readily converted into cash (Matz and Neu, 2006). Duttweiler (2009) defines liquidity not as a ratio nor an amount, but rather a representation of the degree to which a bank is capable of fulfilling its respective obligations. This definition aligns with the Basel III guideline (2008) where the term liquidity refers to the ability to fund the increases in assets and meet obligations as they come due. Further studies of liquidity explore subsets of liquidity such as natural liquidity which refers to contractual maturity of an asset/liability of banks when it comes due, or artificial liquidity which is created through transforming an asset into cash before its maturity date (Duttweiler,

1 Basel III is a set of international banking regulations developed by the Basel Committee on Banking Supervision (BCBS) that focuses on risk management framework of banks

2009). Other subsets of liquidity include short-term liquidity - the capability of a bank to fulfill payment obligations as and when they occur, and structural liquidity - the capacity to borrow sufficient long-term funds at appropriate spreads to support asset growth (Schmitt, 2018).

While liquidity is ability to access cash when needed, liquidity risk for a bank specifically refers to the risk that bank does not possess sufficient cash to meet their financial obligation, at one or more future periods in time (Matz and Neu, 2006). Alternatively, Heffernan (2005) defined liquidity risk as insufficient liquidity for normal operating requirements, that is, the ability of the bank to meet its liabilities when they fall due. In Basel III guideline (2008), liquidity risk (particularly funding liquidity risk[1] related to banks) is comprehensively defines as a bank's incapacity to fulfill both anticipated and unanticipated present and future cash flow and financial obligation without negatively affecting daily operation or financial condition of the bank. Liquidity risk possesses several notable characteristics that differentiates itself from credit risk, market risk or operational risk. Firstly, liquidity risk is a consequential risk that stems from other risks (Duttweiler, 2009), that is, any issues arise that impact the bank, if not managed appropriately, can trigger liquidity risk. Secondly, liquidity risk contagious and systematic which means a bank's liquidity crisis can spread to other banks in the system as evidently seen in the global financial crisis of 2007 – 2008 or the recent bank collapse of 2023. Thirdly, although liquidity is often overlooked in day-to-day operation, liquidity risk of banks needs to be monitored and managed all the time, not on average or most of the time, to ensure bank have sufficient fund for its due obligation (Duttweiler, 2009).

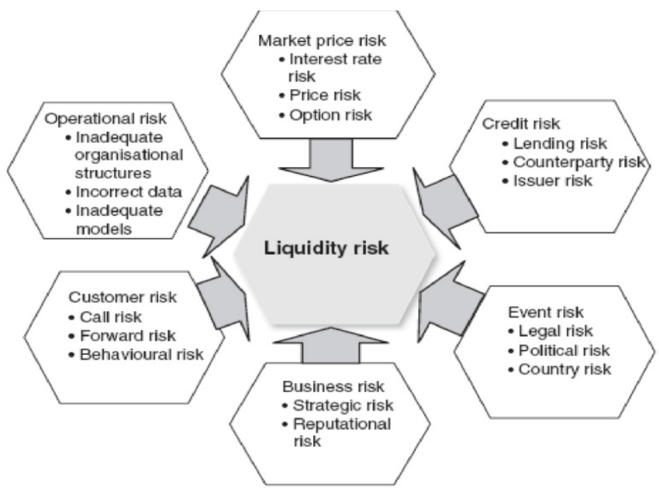

Figure 1: Liquidity risk relationship to other bank risks

(Source: Duttweiler, 2009)

The characteristics of liquidity risk makes liquidity risk management a complex process for any bank manager. Therefore, Basel III guideline (2008) was issued as an international standard to ensure that global banks have sufficient ability to fund increase in its asset and meet financial obligations as they come due at reasonable cost. The chance of liquidity risk occurs is often low, however, the consequence is severed to a bank once the risk happens. Therefore, the Basel guideline for liquidity risk management requires banks to manage intraday liquidity position on an ongoing basis as well as under various scenarios, including adverse market conditions.

[1] This paper focus on funding liquidity risk of bank which differentiates from market liquidity risk – risk that an organization cannot access liquidity in the market because of inadequate market depth or disruption.

2.2. Liquidity risk management practices

Best practices for liquidity risk management are widely studied among scholars. Some notable publications include Matz and Neu (2011), which provides a comprehensive overview of liquidity risk, its measurement, and management as well as the implications of Basel III; Venkat and Baird (2016), which cover liquidity tools such as liquidity metrics, regulatory reporting, operational processes, and stress testing; and La Ganga (2010), which discusses the lessons from the recent financial crisis and effective liquidity risk management and supervision, among others.

National supervisors also understand the importance of banking liquidity crises to the global financial system, hence the implementation of global liquidity risk management standards such as Basel III, Internal liquidity adequacy assessment process (ILAAP). Following these global standards, in Vietnam, SBV has issued regulatory requirements on liquidity risk management such as Circular 13 (2018)[1] or Circular 22 (2019)[2] and related circulars for banks in Vietnam to comply. These circulars mandate Vietnamese banks to implement a liquidity risk management framework that includes establishing risk strategy, setting risk appetite and limits on liquidity risk ratios, early warning system, stress testing, contingency funding plan and risk disclosure to stakeholders. These regulatory requirements from SBV align with the core of the Basel II guidelines to ensure the stability of banks in Vietnam and the global financial system.

2.3. Factors impacting liquidity risk management for banks

As mentioned, liquidity risk is a consequential risk, hence liquidity risk management at banks is influenced by a multitude of factors that can significantly impact the institution's solvency.

Previous studies and research consider numerous exogenous and endogenous issues that cause liquidity risk to global banks including banks in Vietnam. Matz and Neu (2006) described credit risk deterioration and operations risk as common internal factors while market disruptions, payment system issue or country risk are listed among common external problems leading to liquidity risk. Macroeconomic factors such as inflation control, interest rate fluctuations, credit market, regulatory requirements or monetary policy have certain influence on liquidity risk management of a bank. Various studies have been conducted to examine the relationship between macroeconomic factors and liquidity risk management of banks. Zhang and Zhao (2021)'s research on banks in China found that economic stability reduces the likelihood of liquidity risk; particularly, inflation control is an important factor in managing liquidity risk while stable monetary policies also help financial institutions reduce funding pressures and market volatility. Alternatively, Truong Quang Thong (2013) pointed out that a higher economic growth rate (GDP) in the current year has the effect of reducing the liquidity risk of banks in that year but will increase the liquidity risk in the following year. Furthermore, changes in inflation in the current year do not affect liquidity risk in that year, but they do have an impact in reducing liquidity risk in the subsequent year. Mazur & Szajt (2015) research indicated that macroeconomic determinants affect liquidity risk, particularly interbank interest rate for banks in EU countries.

Many studies and research have also been conducted to examine endogenous factors that impact liquidity risk of a bank. Delechat (2012) demonstrated that in Central American banks from 2006 to

[1] Circular 13/2018/TT-NHNN dated 18/05/2018 on internal control systems of commercial banks and foreign banks' branches

[2] Circular 22/2019/TT-NHNN dated 15/11/2019 limits and prudential ratios of banks and foreign bank branches

2010, factors such as the credit reserve ratio, net interest margin, market capitalization ratio, bank size, and the credit-to-GDP ratio had negative correlation with liquidity risk. Alternatively, factors such as the liquidity asset ratio and total assets exhibited a positive relationship with liquidity risk. Nguyen Thi Bich Thuan and Pham Anh Tuyet (2021) conducted a study on 25 commercial banks in Vietnam during the period 2013-2019, revealing that banks relying on market funding sources would increase liquidity risk. In contrast, increasing the scale, the ratio of equity to total capital, and the loan-to-deposit ratio, along with maintaining liquidity reserve ratios, reduces the likelihood of liquidity risk in banks. Ahamed (2021) research also pointed out that highly capitalized banks exhibit strong liquidity in the long run, whereas better asset quality can provide liquidity relaxation in the short run. Nga Phan Thi Hang, Hung Hoang Thai & Nguyen Thi Thuy Giang (2021) study of 27 Vietnamese commercial banks from 2010 to 2018 showed that technology investment will reduce the liquidity risk of commercial banks. In addition, the bank size, the ratio of Provision for Credit Losses (PCL) to the total credit outstanding, the ratio of equity to total assets, the bank's net interest margin, the ratio of loans to total assets, the ratio of cost to income and economic growth have affected to the liquidity risk of commercial banks in Vietnam.

In general, factors impacting liquidity risk management of banks are popular area for research. Whether global or regional, banking system in each country must consider similar external and internal factors to not only prevent but to manage liquidity risk effectively during adverse market conditions.

3. METHODOLOGY

In the article, the author applied the theory and methodology of dialectical materialism, historical materialism, systemization, interpretation, inductive, comparative method, etc. The article uses secondary data sources, mainly from reports and information originating from official sources of the State management agencies, scientific research works, books, textbooks, journals, e- information pages, etc.

3.1.Factors impacting liquidity risk management for banks in Vietnam in post covid-19 pandemic

On May 5th, 2023, the Head of the WHO[1] has declared an end to Covid-19 as a public health emergency. WHO stated that the pandemic has been on a downward trend since May 2022 which led to its conclusion on the end of Covid-19. Since May 2022, the global economic and banking system has encountered unprecedent challenges in the post pandemic period. Central banks and governments around the world struggles to maintain economic stability; meanwhile, the global banking system witnessed the series collapse of commercial banks in the United States along with Credit Suisse, the most prestigious bank in Switzerland in a few weeks of 2023. The current volatile environment calls for strengthening resiliency in bank's risk management framework, particularly liquidity risk management practice to prevent the spread of a global financial crisis. In the author's opinion, the events below are notable factors, both exogenous and endogenous, which are worthy of discussion in the context of strengthen the liquidity risk management for banks in Vietnam.

Exogenous factors - The gloomy macroeconomic outlook of the post pandemic period continues to be a major determinant in the turbulence of the global banking system. In overview, the post Covid-19 global economy faced complex challenges in 2022 with high inflation, tightening

[1] UN World Health Organization

monetary policies, Russia's military intervention in Ukraine, and the lasting impact of the Covid-19 pandemic. Policymakers revert to tight monetary and fiscal policies after providing unprecedented support during the pandemic to curb inflation and stabilizing the economy while looking forward to China's lifting Covid-19 restriction. Going into 2023, IMF reports indicated that challenges from 2022 still hindered recovery although the global economy became more resilient. Non-services sectors, including manufacturing struggles which lead to slowdown in economic activity coupled with weak productivity growth and reduced investment in productive capacity by firms. International trade and manufacturing indicate weaknesses while excess savings accumulated during the pandemic are decreasing. China's recovery, after an initial boost from pandemic opening, lost its momentum and is now facing issues of deflation, real estate firm collapse and other social structural issues. In Vietnam, however, the economic condition struggles in 2022 and continued to its slow growth into 2023. World Bank's report in June 2023 of Vietnam's economy indicated several notable trends including decline in real GDP to 3,72%; inflation declines quickly but still at high level of 4,3%; export and import both contracted due to lower external demand from trade partners; weaker private investment is reflected in low credit demand; both retail sales and private sector investment has fall sharply below pre-COVID period. However, FDI disbursement remains steady while public investment slowly improved compared to first half of 2022.

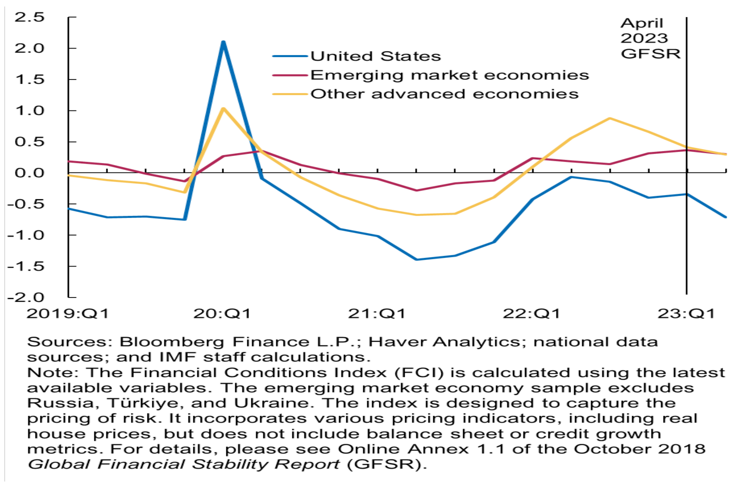

Figure 2: IMF report on global financial stability as of July 2023

The uncertain economic outlook both globally and domestically creates unprecedent difficulties for banks in Vietnam in terms of risk management capability. Among the macroeconomic trends, two notable macroeconomic trends that might impact domestic banks' risk management, particularly liquidity risk management includes:

First - The divergence between monetary policies of SBV in Vietnam and foreign central banks in post pandemic period. Central banks such as the FED[1] and ECB[2] monetary policies of post pandemic period focused on containing high inflation. This trajectory of hiking interest rate remains steady from 2022 until now. The FED has been increasing its federal funds rate from 0,25% in March 2022 to 5,5% as of September 2023; meanwhile ECB increased its rate from -0,5% in July 2022 to 4,25% in September 2023.

1 The Federal Reserve

2 European Central Bank

Figure 3: Federal Reserve fund rate hike between January 2022 – September 2023

(Source: Federal Reserve Bank of New York)

The constant tightening monetary policies aims to reduce inflation but comes with the consequence of collapse in the banking system during the first half of 2023. Starting in March 2022, several large commercial banks in the US such as Silvergate, Silicon Valley Bank, First Republic Bank and a G-SIFIs bank, Credit Suisse, suffered liquidity crisis as customers withdrew massive fund fearing loss of deposits. In the case of Silicon Valley Bank, the sharp increase of federal funds rate in 2023 created significant loss of value in the bank's bond portfolio which triggered panic among its investors and customers once the loss was disclosed. Meanwhile, banks in Vietnam must cope with sharp adjustment in monetary policies from SBV between 2022 and 2023. Under the pressure from foreign central banks to stabilize exchange rate, SBV had to increase interest rates twice between September and October 2022 by total of 2% along with open market operation (OMO) tool to lower supply of VND in the system. As consequence, interbank overnight rate increased sharply to almost 8% in beginning of October 2022 which indicated liquidity shortage in the system. In 2023, SBV has reverted its monetary policy by lowering interest rates to boost economic growth. However, the residual effect of high interest rate from 2022 remains as deposit influx increases significantly. Per SBV's statistics, retail deposit balance in the system as of June 2023 reached record of 6.3 trillion VND and wholesale deposit was 5.9 trillion VND. If banks struggle with funding in the end of 2022, they are now retaining significant excess funding amount. In 2022, liquidity risk managers struggle to maintain sufficient liquidity level while in 2023, they must cope with new issues of significant amount of short-term funding or increase foreign currencies outflow due to widen interest rate gap between VND and other foreign currencies like USD. Approaching the 4th quarter of 2023, while foreign central banks are likely to extend the rate hike trajectory, SBV on the other hand has not signal any reversal of its easing monetary policy to support GDP target in 2023. This divergence between domestic and foreign monetary policies will test liquidity risk managers of domestic banks to maintain (i) the balance of VND/foreign currencies liquidity reserve as well as (ii) to forecast the potential scenarios of current abundant deposit base being withdrawn in short-term.

Second – The collapse of foreign banks and SCB. The end of 2022 witnessed the unprecedent crisis of domestic corporate bond market and the bank run on Saigon Commercial Bank (SCB).

Although the government and SBV had intervene to prevent a contagious crisis in the banking system, these events startled the market and created further uncertainty in the banking system which led to further difficulty in interbank funding for banks. In the first half of 2023, the most significant liquidity crisis for banks since the GFC in 2008 occurred. In the period of two months, Credit Suisse, a G-SIFIs bank, collapsed while the failures of Silvergate Capital Bank, Silicon Valley Bank, Signature Bank, and First Republic Bank wiped out more than $500 billion of assets in the US banking system – more than the total assets of all failed banks in 2008 combined. The liquidity management failure of these banks shook the stability of many other banks around the world including banks in Vietnam. Although the liquidity crisis was largely contained due to government intervention, banks in Vietnam was reminded of the devastated consequence of liquidity risk. The rapid collapse of both foreign banks above as well as the case of SCB asked bank executives to review their liquidity risk management framework including contingency funding plan (CFP) in case of a liquidity crisis. CFP is a requirement by Basel II standard for bank to establish a compilation of policies, procedures and action plans for responding to severe disruptions to a bank's funding ability. Bank's CFP should detail the role, responsibility of each employee and clear communication within the organization as well as to external stakeholders of the bank. In the case of Silicon Valley Bank, the lack of a concrete CFP led to unclear communication to depositor who panicked and eventually withdrew their funds all at once. For Saigon Commercial Bank, SBV had to intervene and provide statement to assure the public before placing the bank under special monitor. The rapid responses from central banks indicated the contagious characteristic of liquidity risk in the financial system. Toward the end of 2023, although the global banking system has been largely stabilized, the liquidity crisis of both foreign and domestic banks provided valuable lesson for bank managers to further strengthen their oversight on liquidity risk management capacity, especially in unfavorable macroeconomic conditions.

Endogenous factors – Amidst the uncertainty of macroeconomic conditions, domestic banks also face internal challenges that might impact their liquidity risk management capability in post Covid-19 period.

First - The short-term excess cash reserve and cash equivalent in the banking system. Toward the end of 2022, interest rate increased as SBV tighten its monetary policies. In addition, rapid credit expansion of after Covid-19 while deposit level remained low created wide gap between deposit and lending thus put more pressure on liquidity of banks. Per SBV's statistic, credit growth of 2022 was 14,2% while funding only increased 6% compared to end of 2021. To compensate, banks in Vietnam offered competitive interest rate to attract funding from depositors. Moving into 2023, as funding became less of an issue, domestic banks have now encountered new problem of excess liquidity reserve. In the first half of 2023, as macroeconomic condition struggles, credit expansion only increased 4,5% while retail deposit balance in the system as of June 2023 reached record of 6.3 trillion VND and wholesale deposit was 5.9 trillion VND. In terms of liquidity management, the excess liquidity means lower net interest margin or profitability of the bank but also provide extra cushion against liquidity risk. However, further examination of the term of these excess cash indicates liquidity issue for banks if not managed properly. According to SBV analysis, 88% of deposit are short-term which matures within 12 months. Meanwhile 52% of loans from commercial banks are medium to long term. Banks' balance sheets are consisting of shorter-term funding and longer-term asset which put more pressure on liquidity structure of commercial banks as the deposit matures. Current economy outlook remains difficult but as market condition recovers, government spending and import/export improves then banks should expect higher level of cash outflow for lending purposes. As such, the current liquidity structure of short-term funding indicates potential source of liquidity risk. To support foreseeable credit growth, domestic banks must roll-overed the current short-term deposit continuously or attract more funding through competitive rate which appears against the current monetary policies of lowering interest rate from SBV. This scenario has not occurred, yet liquidity risk managers at banks must work closely with Asset-Liability management division to monitor the cashflow trend for different liquidity scenarios.

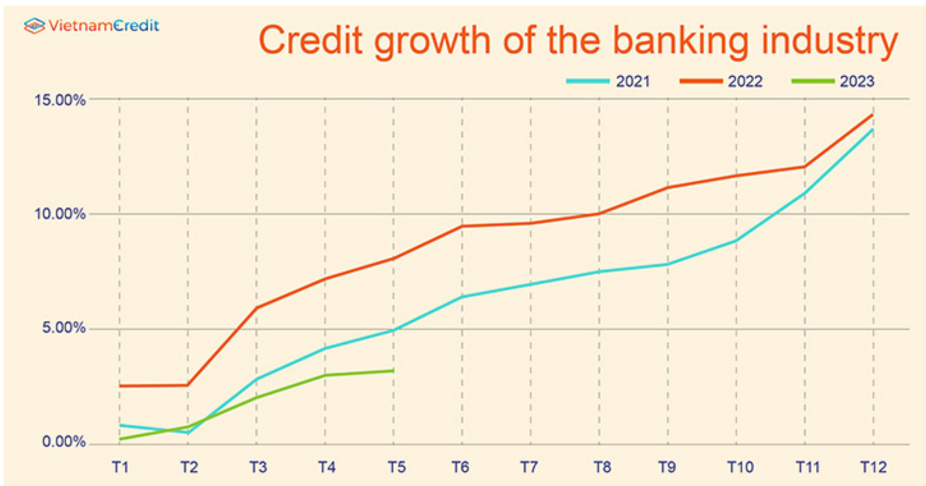

Figure 4: Credit growth comparison of Vietnam between 2021 – 2023

(Source: Vietnamcredit)

Second – Rapid development of digital transformation proposes challenge for liquidity risk management capability for banks. Digital transformation is significantly reshaping the landscape of risk management in banking. Banks are increasingly leveraging advanced technologies and data analytics to enhance their risk assessment and mitigation strategies through adoption of machine learning algorithms and artificial intelligence to analyze vast volumes of data in real-time, enabling more accurate identification of potential risks and fraud detection. Additionally, digital tools have streamlined the loan approval process, allowing banks to make quicker and more informed lending decisions. Following the development, SBV has issued a program in 2022 to promote digital transformation in banking system which aligns with the government's national strategy to develop digital economy by 2025 and orientation toward 2030[1]. In terms of liquidity risk management, the transformation enables banks to enhance risk forecast capability and manage liquidity risk exposure properly. This certainly is beneficial for banks but also proposes challenges to adapt and leverage technological advantages in risk management. First, digital transformation requires more advanced technological skills from human resources. Risk management staff must possess knowledge of data analytic with reporting, forecasting tools to apply to current liquidity risk management task. Second, digital transformation in risk management now requires further

[1] Decision 411/QD-TTg dated 31/2/2022 of Vietnam's Prime Minister on Approval for the national strategy for development of digital economy and digital society by 2025, orientation towards 2030

collaboration between IT, liquidity management division and risk management department to fully utilize the capability of system in managing intraday liquidity as well as dynamically forecasting risk scenarios as supposed to silo-working method among internal units as before. The factor of digital transformation not only ask risk manager to upgrade their technological understanding but also requires banks to streamline the risk management process between divisions to properly manage liquidity and forecasting liquidity risk when needed. Digital transformation will revolutionize risk management for domestic banks by empowering financial institutions with advanced tools to proactively identify, assess, and mitigate risks, ultimately contributing to a more resilient and efficient banking sector in the country. However, banks must be ready to support the transformation with capable human resource and appropriate risk management process in the short future.

The above exogenous and endogenous factors above, in the author's opinion, are notable trends that potentially impact the liquidity risk management landscape of banks in Vietnam in the period of post Covid-19. The struggling macroeconomic outlook, series of global bank collapse along with surprising liquidity surplus condition and rapid development of digital transformation are putting pressure on banks to further review risk management process while adapting to new issues that could impact the liquidity structure of the banks. However, this is also the opportunity for domestic banks to further enhancing their liquidity risk management and forecasting capability to become more resilient in case of severe disruption occur.

4. RECOMMENDATIONS FOR BANKS IN VIETNAM

Post Covid-19 pandemic presents difficulties for banks in Vietnam with unfavorable external conditions along with internal challenges. In terms of liquidity risk management, here are three recommendations for both banks as well as SBV with the objective of strengthening bank resiliency and promote system stability.

Firstly, SBV should issue regulation in line with Basel III standard for banks to comply. Basel III guidelines provide a globally recognized framework that promotes the resilience of banks by ensuring they maintain certain liquidity risk management level such as liquidity ratios. Basel III regulation by SBV will provide banks with specific guideline to appropriately measure liquidity risk ratios, thus establishing proper management control and reducing cost of retaining excess liquidity buffer. Furthermore, issuing Basel III guidelines demonstrates SBV's commitment to aligning the banking sector with international best practices, promoting transparency and consistency in regulatory standards and encouraging banks to adopt more prudent liquidity risk management practices.

Secondly, banks need to enhance contingency funding plan (CFP) and stress test practicality through routine exercises. Circular 13 (2018) issued by SBV requires banks in Vietnam to establish CFP along with regular stress test exercise for distress scenarios. As banks establish their CFPs, risk managers should review and implement trial exercises of the CFP regularly. The exercises ensure that bank employees understand the actions needed in distress situations. Actions need to be clear, concise, practical to implement, from executives to branch representatives. The CFP should include steps to integrate support from SBV if needed. In terms of stress test measurement, the objective is to ensure banks can properly implement liquidity risk measurements in distress scenarios. Therefore, banks should regularly review assumptions that are being used to establish stress test scenarios. The practicality of CFP and stress test implementation are crucial component of Basel standard but more importantly, they are lifelines for banks once liquidity crisis like bank run occurs.

Thirdly, banks should constantly provide risk management training for employees to (i) establish a resilient risk culture within the organization and (ii) enhance employees' technical and technological capability. Banks should review and upgrade their training programs not only for risk officers but also for executives and business employees to ensure that risk appetite and risk management processes are understood throughout the organization. Every employee, particularly business representatives, in the organization should be aware of the CFP and the risk level that the banks are exposed to before any business decision is made. On the other hand, digital transformation development requires risk employee in banks to possess knowledgeable skill in data and technological system. The quality of employees is crucial for risk management process in understanding real-time liquidity risk exposure and utilize advance tools to dynamically forecast potential risk sources for banks.

5. CONCLUSION

Post Covid-19 era has posed unprecedented challenges to global economies and the financial sector, with a particular spotlight on the banking industry. The emergence of liquidity risk as a critical concern for regulators and bank executives, evident in the series of bank collapses in early 2023, underscores the urgency of effective risk management practices. As the world grapples with economic and financial uncertainties in the aftermath of the pandemic, the banking sector in Vietnam must proactively assess and revamp their liquidity risk management strategies to ensure resilience and prevent systemic failures. This entails a comprehensive examination of both external and internal factors that influence liquidity risk management within the Vietnamese banking landscape.

Understanding the intricate implications of these factors is paramount for risk managers, as it enables them to identify vulnerabilities within existing processes. This, in turn, facilitates the development of a robust risk management framework that can adapt to the ever-evolving liquidity risk environment. To navigate the challenges posed by the post-pandemic landscape and uphold the stability of the banking system in Vietnam, a proactive and forward-thinking approach to liquidity risk management by leveraging the capability of high-quality human resource in combine with advance technological tools is imperative.

BUILDING A FUNCTION TO ASSESSMENT OF CORPORATE LIQUIDITY VIA DISCRIMINANT ANALYSIS: A CASE STUDY OF LISTED CONSTRUCTION COMPANIES ON VIETNAM STOCK EXCHANGE

Ph.D Nguyen Phuong Ha[1]

Abstract: This paper uses the discriminant analysis method to build a discriminant function with measurments of liquidity on different aspects including traditional liquidity ratios, cash conversion cycle and operating cash flow ratios to measure and assess a company's corporate liquidity. At the same time, through the discriminant function to determining the value of liquidity score (LS) to classifying companies with good liquidity and companies with poor liquidity. With a research sample of 90 listed construction companies on the Vietnam Stock Exchange in the period from 2013-2022, the results of the discriminant analysis show that construction companies with LS value < -0.128 have good liquidity; construction companies with LS value > 1.087 are companies with poor liquidity; construction companies are on liquidity warning when -0.128 ≤ LS ≤ 1.087.

Keywords: Liquidity, corporate liquidity, construction companies, discriminant analysis

1. INTRODUCTION

Corporate liquidity is one of the most important indicators in assessing a company's financial situation. It represents the ability of a company to convert its current assets into cash so that it can settle its current liabilities at corresponding costs but not reduce its value. Deriving from ineffective use of assets, liquidity risks may arise and this is also the most challenging risk of the financial risks that firms face. Liquidity risk becomes more complex due to increasingly strong developments in financial markets. Therefore, accurately assessing corporate liquidity is always an issue that receives a lot of attention from business managers as well as financial analysts and researchers at any economic period.

There are many different measurement methods to assess corporate liquidity. The first approach is also the most traditional one which is based on analyzing the ratio of current assets to current liabilities, including current ratio, quick ratio and cash ratio. The second approach introduced later is the analysis of the cash conversion cycle, which is considered to be a more dynamic measure than the traditional ratios above. Another approach used in recent studies is analysing the cash flow from the operating activities of companies. Each method has its own advantages and disadvantages, so using a certain method to measurement the corporate liquidity of a company will not be able to fully assess its true corporate liquidity. Therefore, the aim of this study is to use the discriminant analysis method introduced by Altman (1968) to build an indicator that allows to measure the corporate liquidity of the listed construction companies on Vietnam Stock Exchange in the most complete aspects, at the same time, classified construction companies with good corporate liquidity and construction companies with poor coporate liquidity.

2. LITERATURE REVIEW

2.1. Theoretical overview of corporate liquidity measurement methods

Over the decades, business managers, financial analysts as well as researchers have used a variety of techniques to measure liquidity to classify businesses with good liquidity and businesses with poor liquidity. Measurements are built on different perspectives when assessing corporate liquidity, including: (i) The method of measuring corporate liquidity is based on the relationship between current assets and current liabilities, known as traditional ratios; (ii) The method of measuring corporate liquidity is based on working capital management with cash conversion cycle; (iii) The method of measuring corporate liquidity is based on operating cash flow ratios.

2.1.1. Traditional ratios

The traditional ratios show whether a company's current assets are sufficient to cover the payment of its current liabilities at a given time. The traditional ratios include current ratio, quick ratio and cash ratio. They are widely used in financial analysis reports, especially corporate liquidity analysis of companies, so it can be said that this is the most popular corporate liquidity measure.

Subramanyam and Will (2009) argue that reasons for the traditional ratios's widespread use as a measure of liquidity include its ability to measure: (i) Current liability coverage, the higher the amount (multiple) of current assets to current liabilities, the greater assurance we have that current liabilities will be paid; (ii) Buffer against losses, the traditional ratios show the margin of safety available to cover shrinkage in noncash current asset values when ultimately disposing of or liquidating them. However, all three ratios are characterized by their static liquidity, as they only consider the firm's liquid resources reserves through balance sheet data at a certain time. Furthermore, the traditional ratios emphasize current assets liquidation rather than liquidity analysis.

2.1.2. Cash conversion cycle

According to Richards and Laughin (1980), meeting debt obligations through asset liquidation should only be considered a second line of defense. They find that securing operating cash flow instead of asset liquidation value is an important factor in corporate liquidity analysis. Therefore, to overcome the static feature of traditional ratios, Richards and Laughin (1980) introduced a more dynamic method of measuring corporate liquidity based on company's working capital management is cash conversion cycle. This indicator measures the time it takes for a firm to convert resources into cash flows, in other words, it reflects the length of time that the firm sells inventory and recovers inventory, recover receivable and pay bills. Since the introduction of Richards and Laughin (1980), the cash conversion cycle has been used by many scholars around the world in studies of corporate liquidity and it has been proposed as a measure of liquidity that is more consistent than traditional ratios such as Nordgren (1981); Kamath (1989); Katerina and Dan (1993); Gallinger (1997); Katerina and John (2000); Uyar (2009); Bhutto et al. (2011); AL-Shubiri (2015); Lin et al. (2014); Garanina and Petrova (2015); Bolek and Grosicki (2015). The results of these studies all show that the cash conversion cycle offers a more dynamic view, reflecting more truthfully about the true liquidity of a firm.

2.1.3. Cash flow ratios

Other than that it favors the cash conversion cycle, some other researchers argue that although cash conversion cycle is a more flexible indicator than traditional ratios, both measurement methods are affected by accrual accounting. According to Subramanyam and Will (2009), due to an accrual basis, financial transactions in the form of credit or cash are recorded when they arise instead of focusing on collection and payment in cash. Furthermore, accrual accounting determines net income based on estimates, deferred payments, amortization, and pricing, which are sometimes more subjective than cash flow factors. In addition, opposing views also indicate that the Balance Sheet's data is static and is only measured at a single point in time, while the Income statement has non-cash amortization items (such as depreciation expenses). The Cash Flow Statement, by contrast, records changes in other reports and off the books, focusing on issues that shareholders care about is the amount of cash available for business's operations and investment (Jagels and Coltman, 2001). Mills and Yamamura (1998) also state that the Cash Flow Statement shows more reliable information for liquidity analysis than the Balance Sheet and Income Statement. Due to these limitations, in recent years, cash flow ratios determined based on data on the Cash Flow Statements have gradually been of interest to financial analysts, managers and investors.

In the word, there are many authors used cash flow ratios in empirical research on corporate liquidity such as Ryu and Jang (2004); Kirkham (2012); Atieh (2014); Billah et al. (2015); Barua and Saha (2015); Pham Quang Tin et al. (2017). These studies focus on comparing the corporate liquidity as measured by traditional ratios (including current ratio and quick ratio) and cash flow ratios (including operating cash flow ratio and critical needs cash coverage ratio), and they also test which measure of corporate liquidity is more effective. The authors all find the conclusion that cash flow ratios reflect a better picture of a company's financial position, especially its liquidity, than traditional ratios.

It can be seen that over the decades with the development of the financial world, more and more indicators have been used to measure corporate liquidity based on various perspectives and needs from managers, investors as well as financial analysts. Although there have been many studies that give different measures to evaluate liquidity, the authors conclude that each measure has certain advantages and disadvantages, which are chosen to use based on different evaluation objectives and each has an important role in evaluating the corporate liquidity. That is the reason why this study decided to use a combination of the different measurement methods used in previous studies, to be able to assess the corporate liquidity situation of companies more generally and completely. To accomplish this, this study applies discriminant analysis in measuring and assessing corporate liquidity.

2.2. Discriminant analysis

Discriminant analysis is a multivariate classification technique that separates objects into two or more mutually exclusive groups based on measurable features of those objects (Altman, 1968). The measurable features are sometimes called predictors or independent variables, while the classification group is the response or what is being predicted. The discriminant analysis requires prediction of the number of groups and subjects in each group before performing the analysis, so the first step is to explicitly establish the groups, the initial number of groups from two or more. After the groups were established, data are collected for each group, using discriminant analysis to find a linear combination of characteristics for the clearest distinction between established groups through the following steps: Structure of the discriminant function to distinguish the expression of the dependent variables from the independent variables; next, texting if there is a difference between the groups when judged on the independent variables; Finally, it was concluded that the independent variables were the main cause of the differences between the groups or not.

The discriminant function introduced by Altman (1968) converts the individual variable values into a single distinction (Z-score) is presented as the following equation:

$$Z = a + V_1X_1 + V_2X_2 + \dots + V_nX_n$$

In there:

Z : The distinct value of the discriminant function

a : The constant

V_i: The discriminant coefficient

X_i: The independent variables

In the discriminant function, the discriminant coefficient V will be calculated such that the groups with different distinct values are as much as possible. Then, individual object score in one group will be calculated averagely to get the group means called "centroid", in the words, the group's centroid value shows the important location for a group. Differences between centroids indicate the degree of distinction between those groups could be observed. In the discriminant analysis of the two groups, the observations were assigned to the group with the closest centroid. The decision principle is usually to calculate a discriminant score or cutting point, if the discriminant is high than this value, it will be classified in the group with a large centroid, otherwise, if the discriminant of observations is low than this value will be classified as a group with a small centroid. Specifically:

If the two groups are of equal size, the discriminant score is the simple average of their two centroids:

$$Z_{CS} = \frac{Z_A + Z_B}{2}$$

If the two groups are of different sizes, the discriminant score is the weighted average of their two centroids:

$$Z_{CS} = \frac{N_A Z_A + N_B Z_B}{N_A + N_B}$$

In there:

Z_{CS}: Discriminant score (cutting point)

N_A : Number of observations in group A

N_B : Number of observations in group B

Z_A : Centroid of group A

Z_B : Centroid of group B

In the discriminant analysis, Wilk's Lambda value and Chi-square value are also examined to determine discriminating power. The Wilk's Lambda is used to measure the differences between groups and the homogeneity within groups. A low Wilk's Lambda and a large Chi-Square and with a significant p-value will indicate good discriminating power of the discriminant function (Ben et al., 2010).

2.3. Previous studies

The discriminant analysis method is proposed by Altman (1968) to correct subjective analysis ratios related to firm performance. Since the first study of Altman (1968), the discriminant analysis method has been used by many researchers in many different fields, especially those on financial distress prediction or operational efficiency of the business, and has shown its usefulness. The problem of liquidity is related to bankruptcy. A general view about financial distress is that results from a mismatch between the available current assets and its financial obligations. Therefore, in recent years, some researchers around the world also use discriminant analysis method related to forecasting and evaluating corporate liquidity.

Bhunia (2008) examined predictive ability in respect of the corporate liquidity position of a company through discriminant analysis. With twenty private-sector pharmaceutical enterprises in India divided into two groups of ten profit-making and ten loss-making, the author uses discriminant analysis is to identify liquidity position from two liquidity ratios (i.e., current ratio and cash position) as inputs which are relevant in distinguishing between profit-making and loss-making companies. The result of discriminant analysis shows that any company having a D-score higher than the cut-off score (1.905) is identified as a profit-making company with sufficient liquidity, at the same time a company with a D-score less than the cut-off score will be classified as a loss-making company with poor liquidity.

Bolek and Grosicki (2015) assessed the corporate liquidity of non-financial companies listed on the Warsaw Stock Exchange in the period 2004-2012. The authors built a discriminant function with independent variables including quick ratio, cash ratio, asset structure ratio, working capital to total assets ratio, short-term liabilities deferral period and cash conversion cycle. By discriminant analysis, the authors determine the difference and call the LS (L-score) to distinguish the liquidity of three groups: group "0" consists of companies generating a negative ROA-WACC and at the same time assigned as companies with a low level of liquidity, group "1" consists of companies with positive value of ROA-WACC, while assigned as companies with good liquidity, group "2" consists of companies with negative value of ROA - WACC, while assigned as companies with a high level of liquidity. The result of discriminant analysis shows if LS value in the range > -1.28 and < 0.74, it will indicate a good liquidity; if the LS value is higher than 0.74 than the liquidity is considered to be too low, and if it is lower than -1.28 than it is too high resulting in the profitability not covering the cost of capital.

The above studies have added to the theory of measures of corporate liquidity, but the limitation of these studies is that they only use ratios calculated based on the Balance Sheet and Income Statement without considering the Cash Flow Statement, so it is not possible to give a more general and complete assessment of the corporate liquidity. On the other hand, the number of empirical studies in the world using discriminant analysis methods to rank the corporate liquidity of compnaies is quite limited. The recent research in Vietnam by Nguyen Phuong Ha (2023) used the discriminant analysis method to assess the corporate liquidity of listed companies on HOSE in the period 2010-2019. The author uses the current ratio, cash conversion cycle and operating cash flow ratio to build a discriminant function to classify company liquidity. The results of the discriminant analysis show that companies with LS value < -0.349 have good liquidity; companies with LS value > 0.299 are companies with poor liquidity; companies are on liquidity warning when -0.349

$\leq$ LS $\leq$ 0.299. The research of Nguyen Phuong Ha (2023) has added more empirical evidence on the use of the discriminant analysis method to assess the corporate liquidity in Vietnam, however, this research builds a common discriminant function for all industries, while each industry has its own unique characteristics. Therefore, to supplement the empirical evidence in the economy of Vietnam in general and listed construction companies in Vietnam in particular, and at the same time, to help managers, investors and financial analysts can make better decisions, in this study, the author tries to find out the effectiveness of the discriminant analysis model in assessing the corporate liquidity of listed construction companies in Vietnam.

3. RESEARCH DESIGN

3.1. Research sample and data

The research sample includes 90 listed construction companies on Vietnam Stock Exchanges, including HNX and HOSE. Research data includes accounting data on financial statements of listed construction companies for the 10-year period from 2013 to 2022. The data is provided by Vietstock, a company specializing in collecting and analyzing financial data in Vietnam.

3.2. Corporate liquidity measurement

Based on the measurement methods used in previous studies on corporate liquidity, the indicators used to measure corporate liquidity in this study also include: traditional liquidity ratios, cash conversion cycle and operating cash flow ratios.

The selected variables are calculated and encoded as follows:

Table 1. Corporate liquidity measurement

Encoded Variables	Ratios	Formula	Referenced researches
X1	Current ratio (CR)	Current assets/ Current liabilities	Bhunia (2008)
X2	Quick ratio (QR)	(Current assets – Inventories)/ Current liabilities	Bolek and Wolski (2012)
X3	Cash ratio (CaR)	Cash and cash equivalents/ Current liabilities	Bolek and Wolski (2012)
X4	Cash conversion cycle (CCC)	ICP + RCP – PDP	Richards and Laughin (1980)
X5	Operating Cash flow ratio (CFO)	Cash flow from operating/ Current liabilities	Atieh (2014), Pham Quang Tin et al. (2017)
X6	Critical needs cash coverage (CNCC)	(Cash flow from operating + Interest paid)/ (Current liabilities + Interest)	Atieh (2014), Pham Quang Tin et al. (2017)

Notes: ICP: Inventories conversion period, RCP: Receivables conversion period, PDP: Payment deferral period.

3.3. Establish the discriminant function

To build a discriminant function that classifies good corporate liquidity or poor corporate liquidity, the research sample is divided into two groups. Usually a company's business is evaluated based on its profit achieved during the period. However, profit after income tax cannot be a suitable criterion for classification, because there are companies with positive profit after tax but it is not significant. On the other hand, the company's business performance should be considered based on how the company's profits are generated from the its resources. Kim et al. (1998) modeled the investment decisions in short-term assets of company. They claim that optimal corporate liquidity is determined by a trade-off between low return on assets and the benefit of minimizing costly external financing. They propose a model that predicts that the optimal investment in corporate liquidity increases with the cost of external funding. Research on capital markets in Poland by Bolek and Wolski (2012) also shows that investors prefer profitability over corporate liquidity and therefore managers should pay attention to this information when making liquidity decisions. However, managers also need to be concerned that the return on assets created is guaranteed to cover the costs of capital related to those assets or not. If the profitability of business operations is not enough to cover the cost of attracting capital, this will lead to overspending and bankruptcy (Dolbnya et al., 2020). Therefore, to evaluate whether a company is creating value when it invests in projects, return on assets (ROA) is compared with the weighted average cost of capital (WACC). If ROA is greater than WACC, the value of the company increases and vice versa. With the above problems, the study of Bolek and Grosicki (2015) proposes grouping in a discriminant analysis model to classify good or poor corporate liquidity based on the difference between ROA and WACC. If a company generates ROA higher than WACC, it means that liquidity management based on the selected ratios is good because the company can cover the cost of capital. On the contrary, if ROA is lower than WACC, it means that the company cannot cover the cost of capital, which means that the corporate liquidity is falling into a bad situation. Therefore, in this study, the sample is divided into two groups according to Bolek and Wolski (2012) as follows: The first group is the group of construction companies listed in the period 2013-2022 with a positive difference between ROA and WACC (coded as 1) including 699 observations; The second group is the group of listed construction companies in the period of 2013-2022 with the difference between negative ROA and WACC (coded as 0) including 82 observations.

The average cost of capital is determined as follows:

WACC = Re x E/(E+D) + Rd x (1 - corporate income tax rate) x D/(E+D)

In there:

WACC: Weighted Average cost of capital

E: Total Equity

D: Total Debt

Re: Cost of equity

Rd: Cost of debt

By limiting the scope of the variables to 0-1, and bearing in mind the multidimensional nature of the links between measures of corporate liquidity, after the group is identified and the data of the groups is collected, the discriminant analysis model is used to find the linear combination of these characteristics to best differentiate these two groups. Simultaneous analysis of all measures of corporate liquidity allows weighting for each individual indicator to be estimated. The discriminant function model built including the selected corporate liquidity ratios used in this study has discriminant weights, and thus becomes a new measure of corporate liquidity that considers all aspects of a company's liquidity. The aim here is to construct a distinguishing point for the level of corporate liquidity that is rated as "good" or "poor". For "good" corporate liquidity will correspond to a positive ROA-WACC, whereas a "poor" corporate liquidity will correspond to a negative ROA-WACC.

Inheriting and developing from the previous researches of Bhunia (2008) and Bolek and Grosicki (2015), a linear combination of the variables used to form the discriminant function in this study is as follows:

$LS = \alpha + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6$

In there:

LS: Discriminant Score of corporate liquidity

a: The constant

β: The discriminant coefficient of X

X_1: Current ratio - CR

X_2: Quick ratio - QR

X_3: Cash ratio - CaR

X_4: Cash conversion cycle - CCC

X_5: Operating Cash flow ratio - CFO

X_6: Critical needs cash coverage - CNCC

4. RESULTS

The results of discriminant analysis are as follows:

Table 2. Tests of Equality of Group Means

	Wilks' Lambda	F	df1	df2	Sig.
CR	0.919	68.032	1	779	0.000
QR	0.922	66.257	1	779	0.000
CaR	0.922	66.237	1	779	0.000
CCC	0.993	5.287	1	779	0.022
CF	0.998	1.303	1	779	0.025
CNCC	0.986	11.073	1	779	0.001

Source: Results were analyzed by the author from SPSS 23

Table 2 shows that all variables are statistically significant at the 5% level, that is, all of these variables are capable of significantly discriminating the difference between the group of positive ROA-WACC companies and the group of negative ROA-WACC companies.

Table 3. Wilks' Lambda

Test of Function(s)	Wilks' Lambda	Chi-square	df	Sig.
1	0.708	100.982	6	0.000

Source: Results were analyzed by the author from SPSS 23

Table 3 shows the results of Wilk's Lambda's analysis. In this study there are only 2 groups, so only one discriminant function is estimated. Wilk's Lambda has values from 0 to 1, a value of 0 means a big difference and a value of 1 means there is no difference. The results from Table 3 show that Wilk's Lambda value is 0.708, while Chi-square 100.982 with degree of freedom (df) is 6, p-value 0.000 < 0.05, so we can confirm there is a difference between two groups analyzed by independent variables. In other words, the estimation function is statistically significant.

Table 4. Canonical Discriminant Function Coefficients

	Function
	1
CR	1.403

QR	0.151
CaR	-0.117
CCC	-0.001
CF	-0.148
CNCC	1.082
(Constant)	-1.094

Source: Results were analyzed by the author from SPSS 23

Table 4 shows the discriminant function coefficient of each variable in the discriminant function. Because the sample is divided into two groups, only one discriminant function exists. With the results in Table 4, the discriminant function model to classify corporate liquidity according to ROA-WACC criteria of listed construction companies on the Vietnam Stock Exchange in the research period is built as follows:

LS = -1.094 + 1.403CR + 0.151QR - 0.117CaR - 0.001CCC – 0.148CF + 1.082CNCC

Table 5 presents the descriptive statistics results of the value of the LS function of two groups "0" and group "1" in the period 2013-2022. The results show that the average value of the LS function between the two groups is significantly different. The group of companies with negative ROA-WACC (LS0) has an average LS function value of 1.0379 and the group of companies with positive ROA-WACC (LS1) has an average LS function value of -0.2251. This result also shows that classifying observations according to the values of the LS function built as above shows that the lower the overall value of this function, the higher the ROA-WACC value for a given observation is.

Table 5. Descriptive Statistics of LS values of two classified groups

	N	Minimum	Maximum	Mean	Std. Deviation
LS1	699	-5.1512	9.5058	-0.2251	0.8302
LS0	82	-1.9533	11.7852	1.0379	2.1824
Valid N (listwise)	0				

Source: Results were analyzed by the author from SPSS 23

Table 6 shows the "centroid" values of the two groups. The centroid value of the "0" group is 1.087 and the centroid value of the "1" group is -0.128.

Table 6. Functions at Group Centroids

ROA-WACC	Function
	1
0	1.087
1	-0.128

Source: Results were analyzed by the author from SPSS 23

From the centroid values of the two groups, the distinction between the group of companies with good liquidity and the group of companies with poor liquidity, also known as the Liquidity Cut Score (LCS) of listed construction companies on Vietnam Stock Exchange during the research period is determined as follows:

$$L_{CS} = \frac{N_0 Z_0 + N_1 Z_1}{N_0 + N_1} = \frac{82 \text{ x } 1.087 + 699 \text{ x } (-0.128)}{82 + 699} = -0.00043$$

In there:

N_0: Size of the negative ROA-WACC companies group;

N_1: Size of the positive ROA-WACC companies group;

Z_0: Centroid of the negative ROA-WACC companies group;

Z_1: Centroid of the positive ROA-WACC companies group.

Thus, the discriminant analysis model results show that the discriminant between good corporate liquidity and poor corporate liquidity is $L_{CS} = -0.00043$ with Centroid low (good corporate liquidity) of -0.128 and Centroid high (poor corporate liquidity) is 1.087. A company with an LS value < -0.128 is a company has good corporate liquidity with profit to cover cost of capital during the period. A company with an LS value > 1.087 is one that cannot guarantee to cover the cost of capital with the profit generated during the period and corresponds to poor corporate liquidity. A company is in a liquidity warning zone when its LS value is in the range -0.128 ≤ LS ≤ 1.087.

Table 7. Classification Results[a]

		ROA-WACC	Predicted Group Membership		Total
			0	1	
Original	Count	0	11	71	82
		1	6	693	699
	%	0	13.4	86.6	100
		1	0.9	99.1	100

a. 90.1% of original grouped cases correctly classified.

Source: Results were analyzed by the author from SPSS 23

Table 7 presents the results of the group classification accuracy. The data in the table shows that the classification is quite consistent with the accuracy level of 90.1%.

5. CONCLUSIONS AND RECOMMENDATION

There are many approaches with different indicators to measure a company's corporate liquidity, each indicator has a certain important role in assessing corporate liquidity. Therefore, it is difficult to put draw conclusions about a company's true corporate liquidity situation if the assessment is only based on a specific indicator. The biggest contribution of this study is to find a connection among different corporate liquidity indicators by building a discriminant function to help financial analysts as well as business managers consider overall and synchronously the indicators to assess corporate liquidity. This helps to limit the disadvantages of indicators when considering the corporate liquidity position of companies through each individual indicator. Through discriminant function with independent variables including traditional liquidity ratios, cash conversion cycle, operating cash flow ratio, critical needs cash coverage, the results of discriminant analysis identified the cut-off point to classify the group of listed construction companies with good corporate liquidity and those with poor corporate liquidity.

The corporate liquidity approach in this study can help managers evaluate and make decisions related to liquidity management. They can evaluate the corporate liquidity of the companies in general and construction companies in particular by analyzing the different ratios or can use the model proposed in this study to have a more general and complete view.

The study has made certain contributions to the theory of measuring and assessing corporate liquidity. However, in order to assess the corporate liquidity of a company, it is necessary to consider it in the context of other compnaies in the same industry because each industry has its characteristics. Therefore, the discriminant function built in this study may not be suitable to measure and evaluate the corporate liquidity of companies in other industries. However, the dicriminant analysis method and the grouping of companies proposed in this study can be used to measure and classify the corporate liquidity position for companies in other industries.

STUDY ON ACCOUNTING STANDARDS FOR INVENTORY ASSETS AND PROPOSAL TO AMEND PUBLIC ACCOUNTING

Associate Professor, Dr. Ngo Thanh Hoang[1]

After a period of implementation, with the efforts of domestic and foreign scientists and the close and drastic direction of the political system, Vietnam has a roadmap to research and promulgate a system of accounting standards. Vietnam public sector by Decision 1299/QD-BTC dated July 31, 2019 approving the Project to announce the Vietnamese public accounting standards system (VPAS). To date, Vietnam has announced twice with a total of 11 VPASs [1]; In which the overall standards including Reporting standards and there 03 standards directly regulating tangible and intangible assets, including VPSAS 12 on Inventory, VPSAS 17 on factories, equipment, VPSAS 31 on intangible assets. This article delves into inventory standards (Vpsas 12), including the following contents: Which accounting items are recorded as inventory; when inventory is recorded; method of determining inventory book value; Present information about inventory on financial statements. Research regulations in the current accounting system on inventory, especially in Public accounting according to Circular 107/2017/TT-BTC and then propose amendments to administrative accounting. career in Vietnam in the coming time.

Key word: VPSAS 12; Public Accounting

1. EXPLAIN PUBLIC ACCOUNTING STANDARDS ON INVENTORIES (VPSAS 12).

VPSAS 12 is regulated to include 46 paragraphs, the main content of the Standard includes the purpose, scope of the standard, method of determining inventory value, recording costs and presentation of inventories on financial statements and the historical cost method are the dominant methods of inventory.

International accounting standards as well as Vietnamese accounting standards are presented and numbered in paragraphs. Researching each paragraph is necessary, but difficult to cover, so for me personally, I research one standard. need to be researched according to five questions: (1) Which accounting object is recognized by the standard (What)?; (2) When is that accounting object recorded?; (3) By what method is the recorded value of that accounting object determined?; (4) By what method are unusual situations recorded and evaluated?; (5) How to present information on the financial statements of the accounting entity that that standard regulates?.

With this research method, VPSAS 12 is understood as follows: [4]

1.1. Conditions for the recognition of accounting items as inventory and when inventory items are recorded.

This content in Vietnamese public accounting standards on inventories is specified in paragraphs 2, 3, 4, 5, 6, 8, 9, 10 and paragraph 11 of VPSAS 12.

Inventories are assets:

(a) Take the form of raw materials or tools and consumables during the production process;

(b) Take the form of raw materials or tools or consumables or distributed during the service provision process;

(c) Held for sale or distribution in the normal operating cycle; or

(d) In the process of production for sale or distribution.

---

1 Academy of Finance.

Inventories include: Inventories include goods purchased and held for resale, for example goods acquired and held for resale by an entity, real estate held for resale. Inventories also include finished products or unfinished products that the unit is producing. Inventory also includes raw materials and tools and equipment prepared for use in the production process; goods purchased or produced by an entity for distribution free of charge or at a nominal price to other entities. In some public sector entities, inventories are more relevant to the provision of services than are goods purchased and held for resale or goods produced for sale. In the case of an entity providing inventory services including the cost of performing the service, the entity has not recorded revenue related to the provision of this service.

Paragraph 9 of VPSAS details the forms of inventory, paragraph 10 regulates specific inventories in the public sector, the term commonly used in Vietnam is "print". Paragraph 11 requires that government-public sector strategic stocks be recorded as and treated as inventories.

1.2. Inventory valuation

Determining the value of inventory for book recording at the stages of inventory starting to be recorded (warehousing), inventory value (end-of-period inventory), inventory value and other recording situations Receiving the value of inventory is specified in paragraphs 12 to 25, which contain basic contents including: determining the value of inventory, method of recording inventory at cost and specific situations. For example, in the case of purchasing and processing yourself, there are costs other than purchasing and processing; Cost of inventory as a service, Cost of agricultural products harvested from biological assets...

Normally, inventory is determined at the lower price between cost and net realizable value, however in situations such as inventory acquired through non-exchange transactions (giveaways, gifts, etc.) sponsored, aided, transferred to, etc.), inventory must be determined at fair value at the time of receipt or inventory must be determined at the lower price between original cost and replacement cost. current position when inventory is held for: (a) Distribution free of charge or at nominal price; or (b) Consumed in the production of goods distributed free of charge or at a nominal price.

1.3. Methods and techniques for inventory valuation

Regulated from paragraphs 26 to 39. This content stipulates those techniques such as: standard cost method or retail method can be used for convenience if the result is approximately the original price. The standard cost method takes into account the normal consumption level of raw materials, tools, labor, efficiency and capacity of machinery and equipment.

The methods specified in this standard include: Name method, first in first out method or weighted average method;

Net realizable value: this is a new content in public accounting in Vietnam, writing down the original price of inventory to net realizable value is consistent with the principle of unrecognized assets. at a level that is greater than the future economic benefits or service potential that the entity expects to obtain from the sale, exchange, distribution or use of the asset.

With the regulation of net realizable value, public accounting in Vietnam will need to make adjustments in specific accounting policies in the coming time, thereby creating a provision for devaluation of inventory.

1.4. Exceptional situations in inventory accounting

Distributing goods free of charge or at a nominal rate, paragraph 39 provides: A public sector entity may hold inventories whose future economic benefits or potential services are not directly related to its ability to generate net cash inflows. These types of inventories may arise when the Government decides to distribute certain goods for free or at nominal prices. In these cases, the future economic benefit or service potential of the inventory for financial reporting purposes is reflected in the amount that the entity must expend to obtain the economic benefit or service. potentially necessary for achieving the unit's objectives. When the potential economic benefit or service cannot be purchased in the market, the entity should make an estimate of its replacement cost.

The regulation of future economic benefits or potential services of inventory is a new content that needs to be researched and applied to public accounting in the coming time.

The write-down of inventory and any loss to inventory is recognized as an expense in the period in which the write-down or loss occurs. The reversal of the decrease in inventory value will be recorded as an expense deduction in the period in which the reversal occurs. This is a new regulation and needs careful study to be applied in future public accounting policies.

1.5. Presentation of inventories on financial statements.

Regulated in paragraphs 43 to 46 of VPSAS 12,

2. CURRENT STATUS OF INVENTORY ACCOUNTING IN THE CURRENT ADMINISTRATIVE AND NON-BUSINESS ACCOUNTING POLICIES. [2],[3],[5]

According to the current HCSN accounting regime, inventory includes raw materials, materials, tools, instruments, and spare parts used for the unit's operations and types of products, goods, and expenses. Expenses for production, business and services in progress at units with production, business and service activities. The current HCSN accounting regime also regulates specific situations involving inventory, but does not regulate inventory for strategic reserves and inventory that is real estate held for sale.

Principles of inventory accounting:

- Detailed inventory accounting must be done simultaneously both in the warehouse and in the accounting department.

- Inventory purchased from any source must be reflected in that source even though it can be used for different purposes.

- Accounts reflecting inventory include: Account 152, Account 153, Account 155, Account 156, these accounts are used to reflect the value of raw materials, tools, products, and actual goods. import and export through warehouse. Raw materials, tools, instruments, products, and goods that are not warehoused (purchased for immediate use, produced for immediate sale) are not accounted for through this account.

- The accountant must open a detailed inventory tracking book in terms of quantity and value.

- Accounting for import, export, and inventory of inventory at actual prices. The actual value of inventory is determined on a case-by-case basis.

a) Actual warehouse price:

b) Actual ex-warehouse price

The unit may apply one of the following determination methods: Average Cost Method; Specific Identification Method (import price matched export price); First in - First out Method.

Inventory regulations for tax certificates.

Accounting principles for printing, distribution, management and use of printed matter, including:

- To reflect the import and export of printed materials, accountants use Account 152 “Raw materials”. Account 152 “Raw materials” must track in detail 2 types of issuance and sales orders:

Inventory accounting uses documents such as:

- Purchase invoice
- Purchase list
- Warehouse receipt (Form C30- HD)
- Warehouse release note (Form C31- HD)
- Minutes of inventory of raw materials, supplies, products and goods (Form C32- HD)
- Minutes of testing of raw materials, supplies, products and goods (Form C33- HD)
- Notice of broken items, lost tools, instruments, etc.

Record accounts:

Inventory accounting uses accounts 152 - Raw materials; Account 153 - Tools and supplies; account 155 - Products; Account 156 - Goods and related accounts.

Content and structure of inventory account:	
Debit side: - Actual value of imported inventory - Actual value of inventory detected in excess	Credit Party: - Actual value of warehoused inventory - The actual value of inventory is found to be lacking
Debit balance: Actual value of inventory currently in the unit’s warehouse.	

Accounting books used:

- General accounting books: Journal - Ledger or General journal and materials and tools account ledger or Recording vouchers, bookkeeping voucher register and materials and tools account ledger.

- Detailed accounting books: Warehouse books (S21 - H); Detailed book of raw materials, materials, tools, instruments, products and goods (form No. S22-H); Detailed summary table of raw materials, materials, tools, instruments, products, and goods (form No. S23-H); Book to monitor fixed assets and tools and equipment at the place of use (S26 - H).

3. THE DIFFERENCE BETWEEN VPSAS 12 AND INVENTORY ACCOUNTING IN THE CURRENT PUBLIC ACCOUNTING POLICIES

Through research and analysis in sections 1 and 2 above and through other studies, the author believes that the main differences need to be analyzed to find solutions to correct public accounting policies in general and administrative accounting. Future careers include:

Firstly, the object of inventory accounting recording:

Clearly specifying that inventory is a strategic reserve of the state, inventory is real estate held for sale, this is a new content that administrative and public accounting has not mentioned;

Inventories are services, this is an in-depth study, especially public units in Vietnam mostly provide public services, and currently the provision of public services must be settled on December 31. 12 and there is no clear plan for inventory accounting.

Second, VPSAS 12 stipulates recording inventory at "original cost", in administrative accounting, recording inventory at "actual price".

Third, a new concept added: Net realizable value is a concept that has no regulations in current public accounting policies as well as public administrative accounting.

Fourth, the recording of losses and provisions for devaluation of inventory has been clearly regulated in VPSAS 12, but in Circular 107/2019/TT-BTC there is no regulation.

Fifth, the situations recorded according to fair value of VPSAS 12 have not been specifically and clearly specified in current administrative accounting.

Sixth, the concept of future economic benefits or potential services that an entity is expected to obtain when selling, exchanging, distributing or using assets in VPSAS 12 is a subject that needs to be studied. Carefully study to amend Circular 107/2019/TT-BTC.

Seventh, inventory impairments have not been clearly defined in public accounting in general and current administrative accounting in particular.

4. SOLUTIONS TO AMEND THE PUBLIC ACCOUNTING POLICIES IN THE COMING TIME

4.1. Consolidate state budget funds accounting policies

The consolidation of state budget funds accounting policies such as public administrative accounting, social insurance accounting, national reserve accounting, and accounting in specific agencies such as the Party and Union, armed forces units, etc. It will be allowed to fully regulate accounting objects that are inventories such as strategic state reserves, and specific regulations will be researched in a separate content which is more specialized.

For public services, as one of the key contents, when administrative accounting is reformed towards full accrual, public services will have inventory when the service provision is completed or ended. end of the annual accounting period. Most public services do not end and are transferred on December 31, such as educational services that end and are transferred at the end of the school year, health services, etc. That is why the study includes Inventory for Public service services in accounting of administrative and public service units in the coming time are extremely urgent. To do so, we need to research to create a new account for accounting inventory as a public service. There are two items that need to be accounted for as public service inventory, including: (1) Time to transfer or provide public services, but the cost of providing unfinished public services and some public service items not really completed yet. (2) At the end of December 31, when determining operating results for the year, service costs have been incurred but the service has not been transferred yet. With these two contents, I propose to open an additional account to convert unfinished costs for services into inventory costs.

4.2. Determination of inventory value and method of determination

Synchronize and edit terminology from "actual" price to original price and stipulate cases based on original price and cases based on fair value.

Regulations and definition of net realizable value. This content requires quotes on the market, but getting quotes takes time and cost, so it is reasonable to allow price consultation on the free market, especially published on cyberspace. and the media. In other words, net realizable value depends more on accounting estimates, so if the content of net realizable value is specified, it is necessary to specifically stipulate the responsibilities and parties involved. participate in the estimate.

Consider implementing the concept of future economic benefits or potential services, because these are values that have not been determined with certainty, but can be estimated, so if this content is included in the public administrative accounting, risks arise for the chief accountant and account holder as well as parties with interests attached to the accounting unit. At this time, it is necessary to specifically stipulate the method for determining potential value, or it is necessary to allow for errors in the estimate, which are allowed to be adjusted when the final value is taken.

In determining and determining inventory losses, in my opinion, it is necessary to open an inventory reserve account, and thus when estimating the loss, it will allow the accountant to record an increase in costs and an increase in the reserve for a decrease. inventory price. When there is no actual loss, the accountant must reverse the provision, by reducing costs or reducing the difference between revenue and expenditure of the current period.

In summary, this research article aims to clearly point out the incompatibility between VPSAS 12 and the current administrative accounting regime, thereby using expert methods and direct inference methods. The author has proposed two groups of solutions to modify the administrative and public accounting regime in the near future. We look forward to receiving comments and comments from interested scientists.

THE IMPACT OF DIGITAL TRANSFORMATION AND DIGITAL MARKETING ON THE BRAND POSITIONING AND CONSUMER BEHAVIOR

Ph.D Student Nguyen Thi Hong Nhung[1], Ph.D Nguyen Thi Le Huyen[2], MBA. Nguyen Thi Phung[2]

Abstract: *This research aimed to consider the importance of digital transformation and digital marketing on consumer behavior, along with studying the indirect impact of this relationship through brand positioning. The authors conducted a survey of 300 leaders of small and medium-sized enterprises (SMEs) on "The impact of digital transformation and digital marketing on the brand positioning and consumer behavior" through online and direct forms using pre-designed questionnaires. Data analysis results showed tahat SMEs effectively use digital marketing tools to identify brand images in customers' minds and promote consumer purchasing behavior. At the same time, businesses with timely digital transformation contribute to increasing sales and increasing competitive advantage in the market. In addition, brand positioning plays an important role in the relationship between digital transformation and consumer behavior. The research results will be useful information for SMEs to fully exploit digital marketing means and transform strongly in the context of digital transformation to create a reputable and good image in the eyes of customers, and at the same time contribute to promoting consumer buying behavior in the coming time.*

Keywords: *digital transformation, digital marketing, brand positioning, consumer behavior, SMEs*

1. INTRODUCTION

Nowadays, when the world and the market are having a strong transformation under the impact of the Fourth Industrial Revolution, digital transformation is an inevitable trend, a vital issue for organizations and businesses all over the world. It is a process of changing thinking, applying digital technology to improve the efficiency of production and business activities, increase market speed, increase competitive position, promote revenue growth, increase labor productivity, expand the ability to attract and retain customers through responding to changing consumer behavior; digital transformation activities include the use of software, applications, information systems, artificial intelligence (AI), Internet of Things (IoT), cloud computing,... to collect and analyze data, automate business and management processes (Syaglova, 2019). In the age of digitalization, the best strategy for businesses is to connect with their customers through the internet environment - where they spend the most time during the day. Digital marketing is an indispensable optimal method for businesses at that time. This is a unique way to connect with customers through interaction, more effective than traditional marketing (Hawks, 2015; Edelman & Heller, 2015). Marketers are using digital marketing to dominate the market, because this tool has the ability to attract and influence consumers in an attractive but subtle way to increase customer satisfaction (Heller, 2015).

With positive changes from the application of digital transformation and digital marketing in business activities, businesses in the world in general and Vietnam in particular are gradually innovating to keep up with the development of technology and market. According to survey data from the Vietnam Association of Small and Medium Enterprises in 2022, more than 80% of business leaders want to digitally transform, 65% are willing to invest in digital transformation, especially

[1] University of Finance and Accountancy, Email: nguyenthihongnhung@tckt.edu.vn.

[2] University of Finance and Accountancy.

after the incidents of the Covid-19 pandemic in recent years. At the same time, the Ministry of Planning and Investment coordinated with the USAID LinkSME Project to implement the program "Supporting businesses in digital transformation for the period 2021-2025" with a survey of over 1,300 businesses in 2022 with the following results: 57% of businesses are looking for online marketing solutions; electronic transaction solutions (43%), network and data infrastructure (39.6%), businesses with needs for data analysis and smart reporting (63.5%), customer system management and sales channel management (60.7%), solutions for enterprise resource planning system (57.8%), and data security (50.2%). According to the report of Vietnam Digital Marketing Trends 2021 by ANTS Digital, Accesstrade, Younet Group, Novaon (2021), digital marketing has become an important strategic part for all business activities in Vietnam when increasing from 18% in 2020 to 39% in 2021 of businesses using digital marketing tools, and businesses have spent nearly 20% of revenue investing in digital marketing activities. Therefore, it is important for SMEs to promote extensive research to fully exploit the benefits of the digital transformation process and digital marketing tools to increase business efficiency through understanding consumer behavior in the coming time.

In addition, there are many domestic and international studies on the issue of digital transformation affecting consumer behavior, specifically, digital transformation brings many opportunities for businesses but many challenges when consumers change the way they search, choose, and buy products or services (Kruizinga & Lesscher, 2022; Koo et al., 2022). At the same time, digital transformation also contributes to changing the brand's position in the market (Istrefi-Jahja & Zeqiri, 2021). Digital marketing tools have a strong impact on changing consumer purchasing behavior (Nizar et al., 2018; Sanzeeda, 2019; Phung & Nhung, 2021) and also plays an important role in consumer brand awareness (Alamsyah, 2021; Istrefi-Jahja & Zeqiri, 2021; Sanzeeda, 2019). Besides, brand positioning contributes to promoting consumer awareness and attracting them to permanently buy a brand as well as show loyalty to that brand (Azmat & Lakhani, 2015).

However, these studies only show the impact of digital transformation and digital marketing on consumer behavior; or brand positioning, but there is no research showing the mediating impact of brand positioning in the relationship between digital transformation and digital marketing on consumer behavior. Therefore, this reseach is carried out to fill in this gap.

2. THEORETICAL BASIS AND RESEARCH HYPOTHESES

2.1. Consumer behavior

Consumer behavior is the study of consumers and the processes they use to choose, use (consume), and dispose of products and services, including consumers' emotional, mental, and behavioral responses (Kotler, 2001). It starts when the consumer becomes aware of a need or desire for a product, then concludes with the purchase transaction (Howard, 1977). Fishbein and Ajzen (1977) in Theory of Reasoned Action (TRA) argued that consumer behavior is based on the intention to perform a behavior that depends on two factors including attitudes toward behavior and social influences related to that behavior. The TRA model is very useful in predicting behaviors that are under the control of the human will. Next, The Theory of Planned Behavior (TPB) proposes additional factors to control cognitive behavior to predict consumers' actual intentions and behaviors.

Consumer behavior involves studies, which look into how people decide to buy things, what they choose to buy, where they prefer to buy it, why, and when they buy it. It is a mix of psychology, sociology, anthropology, and economic elements (Muniady et al., 2014). It thrives to understand the buyer's decision-making process, both individually and in groups. Significant progress has been achieved in identifying the behavioral elements of buying, and a number of theories of buying have been postulated (Muniady et al., 2014). According to these studies, consumer behavior will be implemented under cognitive behavior control and in the case of food purchase behavior, the cognitive behavior control factor becomes relevant to product prices. Therefore, it is important to examine the relationships between external as well as internal factors and consumer behavioral responses to understand consumer needs and trends which create competitive advantage for businesses (White et al., 2019).

Consumer behavior is strongly influenced by the digital transformation process through the ways of communicating, gathering, and exchanging information about products and/or services, and obtaining and consuming them, drastically changed (e.g., Hennig-Thurau et al., 2010). Of course, one can think of buying online, easily searching online and comparing product offerings from different suppliers, writing, and reading online reviews to be informed, or engaging in showrooming, which is gathering information offline about certain productsand finally buying online (Gensler et al., 2017). An era of marketing digitalisation, customers are gaining enormous empowerment by development of new technologies; they are becoming more demanding, and their expectations are increasing (Syaglova & Mojsovska Salamovska, 2019). Moreover, digital marketing has also significantly changed consumer behavior (Loanals et al., 2014). Digital marketing provides a multi-stream platform for customers to control the purchase process through product testing and reviewing (Swieczak & Łukowski, 2016). Digital marketing also effectively strengthens the brand value by eliminating brand misunderstandings as a consumer exchange of ideas, opinions, and experience that lead to greater purchase intention (Tham et al., 2019). Besides, brand positioning of businesses through building brand image, value, and reputation makes a difference, increases competitiveness, and creates trust with consumers, thereby significantly changing consumer behavior in choosing to consume products or services of that brand (Cristancho et al., 2017).

2.2. Factors affecting consumer behavior

Brand position

Brand positioning elaborates everything that differentiate one brand from the other (Nunnally & Bernstein, 1994). A brand's positioning is designed to develop a sustainable competitive advantage on product attribute(s) in the consumer's mind (Gwin et al. 2015).

A strong position for a brand or product in the consumer mindset would be a big achievement for the firm. In contrast, lack of a strong position equally or even more profoundly results in all marketing efforts to be wasted, the firm and its products be overlooked by customers and market share be lost leaving the competition scene for competitors and ultimately, the firm recession and closed up would be happened (Najafizadeh et al. 2012). Brand positioning is important not only to the success of the company but also to the trust and the quality of the product that these businesses are giving to their consumers. Once one gets the trust and provides the quality purchasers are looking for in a product, then an entrepreneur can undeniably achieve success in their business. (Mina, 2020).

A strong brand position is a powerful asset for any business organization. Hence, building strong brand perceptions is a top priority for many firms today (Morris, 1996). Brand positioning is the act of designing the company's offering and image to occupy a distinctive place in the mind of the potential or target market. (Mina, 2020). The end result is the successful creation of a customer-focused value proposition, a convincing reason why the target market should buy the product (Kotler, 2003). Through positioning, these brands try to build a sustainable competitive advantage via product attributes in the mind of the consumer (Gwin & Gwin, 2003). The importance of brand positioning has its role in consumer's perception and to attract them to buy certain brand and to buy it again and again (Muhammad & Lakhani, 2015). In their study, Khan & Razzaque (2015) pointed out that brand positioning variables (brand credibility, brand prestige and brand image) strongly influenced consumer behavior through purchase intention thereby suggesting that people are more inclined towards purchase of a product if the brand or product has high image in their minds, considered it as a status symbol for them and/or consider it to be credible. Thus, suggesting that if people have high brand prestige, brand image and brand credibility in their mind, they will perceive the value and quality of the product to be high, they will also expect that little risk will have to be borne by them and lesser information will be required in making purchase decision which in turn will convince them to buy that brand or product gain and again. Building a strong brand with positive equity positively influences firms' performance through its effect on consumers' responses towards brands. Brand equity and positioning generate four consumer responses, i.e. Willingness to pay a price premium, attitude towards extensions, brand preference and purchase intention. The willingness to pay a price premium reflects the amount a consumer is willing to pay for a brand in comparison with other brands offering similar benefits (Stephen, 2010). Therefore, we propose the following hypotheses:

H_1: Brand position has a positive impact on Consumer behavior

Digital marketing

Digital marketing is the use of technologies to help marketing activities in order to improve customer knowledge by matching their needs (Chaffey, 2013). Digital marketing is the marketing of products or services using digital technologies, mainly on the Internet, but also including Search Engine Optimization (SEO), Search Engine Marketing (SEM), Content Marketing, influencer marketing, content automation, campaign marketing, data-driven marketing, e-commerce marketing, social media marketing, social media optimization, e-mail direct marketing, display advertising, e–books, and optical disks and games are becoming more common in advancing technology (Desai & Vidyapeeth, 2019). These techniques are used to support the objectives of acquiring new customers and providing services to existing customers that help develop the customer relationship through customer relationship management (CRM) (Kannan, 2017).

Today, companies have realized the importance of digital Marketing. Online web searches have played crucial roles in influencing consumers' purchasing decisions. Digital marketers are in charge of driving brand awareness and lead generation through all the digital channels – both free and paid at company's disposal, these channels include social media, the company's own website, search engine rankings, email, display advertising, and the company's blog (Desai & Vidyapeeth, 2019). The digital marketer focuses on different key performance indicator (KPI) for each channel so they can properly measure the company's performance across each one. In research by Phung & Nhung (2021) also shows that there are 6 digital marketing factors that impact apartment buying behavior, which are Social Media Marketing; Content marketing; Search Engine Marketing; Online public relations; Affiliate marketing; E-Mail Marketing, in which the Social Media Marketing element has the strongest impact on customers' buying behavior.

Digital marketing aims to achieve various goals such as the following: Increase market share, increase the number of comments on a blog or website, upgrade sales revenue, reducing costs (e.g., distribution or promotion costs), achieve brand goals (such as increasing brand awareness), increase database size, reach Customer Relationship Management (CRM) objectives (such as increasing customer satisfaction, frequency of purchase, or reference level customer), improve management of the supply chain (such as by increasing coordinating members, adding partners, or optimize inventory levels) (Djakasaputra et al., 2021). Järvinen (2016) stated that digital marketing does have a positive impact on brand positioning and investing in digital marketing transforms to brand positioning. Krishnaprabha et al. (2020) showed that digital marketing activities have a high influence in building brand awareness as well as digital marketing activities allow on perceived quality, brand awareness, and brand loyalty. Thus, we come with the following hypotheses:

H_{2a}: Digital marketing has a positive impact on brand position

H_{2b}: Digital marketing has a positive impact on Consumer behavior

Digital transformation

Digital transformation can be understood as the changes that digital technology causes or influences in all aspects of human life (Stolterman & Croon Forst, 2006). The Capgemini research of Westerman et al. (2011) specifies digital transformation as: "the use of technology to radically improve performance or reach of enterprises". At this level digital technologies enable innovation and creativity, and stimulate significant changes in professional and knowledge domains (Tolboom, 2016). Digital Transformation is the adoption of digital technology to transform services or businesses, through replacing non-digital or manual processes with digital processes or replacing older digital technology with newer digital technology, digital solutions may enable – in addition to efficiency via automation – new types of innovation and creativity, rather than simply enhancing and supporting traditional methods (Li, 2021).

Many researchers and practitioners see positive efects of the digitalization. They sense the manifold benefts that foster an increase in sales and productivity triggered by innovative forms of value creation and new ways of interaction with customers and suppliers (Downes & Nunes, 2013; Matt et al., 2015; Parviainen et al., 2017). In addition to that, consumers are provided with wide-ranging options to provide information to others and make it quite easy and convenient to talk to each other online (Hennig-Thurau et al., 2010).

A key to business success in a digitally transformed marketing environment are strategies that enable maximum customer engagement (Syaglova & Salamovska, 2019). As new technologies for marketing communications emerge, customer behavior continuously evolves, and the customers' expectations are being further shaped and fine tuned by their experiences in the overall internet landscape. Having in consideration that the superior understanding of customers is the only sustainable source of competitive advantage, it is clear that in digital era, the quality of customer experience is highly valuable source of differentiation (Syaglova & Salamovska, 2019). The changes in customer behavior regarding the expected level and form of digital engagement, directly imply the need for adjustment of companies' communication strategies, but also, to the overall marketing strategies in general, in order to develop and design new digital services that would enable them to acquire, but moreover, to retain their customers, in the study, the author also pointed out that digital transformation helps businesses improve their brand's competitive position in the market (Syaglova & Salamovska, 2019).

The digitalization affects consumers since the ways of communicating, gathering, and exchanginginformation about products and/or services, and obtaining and consuming them, drastically changed (Hennig-Thurau et al., 2010). Of course, one can think of buying online, easily searching online and comparing product offerings from different suppliers, writing, and reading online reviews to be informed, or engaging in showrooming, which is gathering information offline about certain productsand finally buying online (Gensler et al., 2017). After the introduction of digital technologies, a plethora of new media have made their entrance, which gives consumers many opportunities to become more active, connected, empowered, and informed, contribute to increasing the strength of your brand (Lamberton & Stephen, 2016; Verhoef et al., 2017). In their study, Istrefi-Jahja & Zeqiri (2021) also stated that digital transformation has a positive impact on brand positioning of businesses and it is digital transformation that brings better competitive advantage compared to other competitors (Malik et al., 2014). Therefore, we propose the following hypotheses:

H_{3a}: Digital transformation has a positive impact on brand position

H_{3b}: Digital transformation has a positive impact on Consumer behavior

3. Methodology and sampling

3.1. Methodology

The observed variables in the survey questionnaire are built based on qualitative research results, customer satisfaction scale is used from 5-level Likert scale: Level 1- Totally disagree; Level 2- Disagree; Level 3 - No opinion; Level 4- Agree; Level 5- Totally agree

According to Henseler & Chin (2010), the research model is evaluated through two steps: the evaluation of the measurement model and the structural model. First, the measurement model is evaluated through evaluating the reliability, convergence value and discriminant validity of the measurement concepts in the model.

- The reliability of the observed variables must have an outer loading coefficient greater than or equal to 0,5 to meet the requirements of reliability and composite reliability coefficient must be greater than or equal to 0,7 to achieve composite reliability (Hulland, 1999).

- Convergent validity is used to evaluate the stability of the scale. According to Fornell & Larcker (1981), the coefficient of AVE (average variance extracted) must be greater than or equal to 0,5 (average variance extracted) to confirm the convergence value. Load factor of each observed variable on the factor is greater than or equal to 0,7 and is significant as evidence of the reliability of the scales.

- Discriminant validity measures the discriminant validity to help ensure differentiation, there is no correlation between the factors used to measure the factors. To measure the discriminant value, the square root AVE of each measurement factor is larger than the latent variable correlations between that factor and other factors, showing the discriminant and reliability of the factors (Fornell & Larcker, 1981).

Next, the research model is evaluated through structural model testing.

Composite Reliability (CR) is best when the value is greater than 0,7 (Hair et al., 2010). However, in exploratory research, the composite reliability can range from 0,6 to 0,7 (Moslehpour et al., 2018).

The outer loading coefficient must be greater than 0,5 (Hair et al., 2014), then the scale is significant in terms of reliability. If a scale does not reach the threshold of reliability, it is necessary to remove each observed variable with the lowest external loading coefficient in order to improve.

According to Henseler & Chin (2010), the research model is evaluated through two steps: evaluating measurement models and structural models. First, the measurement model is evaluated through evaluating the reliability, convergence value and discriminant validity of the measurement concepts in the model. If the outer loading coefficient of observed variable is greater than or equal to 0,5, the sample is reliable (Hulland, 1999)

Convergent validity is used to assess the stability of the scale. According to Fornell and Larcker (1981), the average variance extracted (AVE) coefficient must be greater than or equal to 0,5 to confirm the convergence value. The loading coefficient of each observed variable on the factor is greater than or equal to 0,7 and is significant proving the reliability of the scale.

Discriminant validity ensures the difference, there is no correlation between the factors used to measure the factors. To measure discriminant value, the square root AVE of each measurement factor is larger than the latent variable correlations between that factor and other factors, showing the discriminant and reliability of the factors (Fornell & Larcker, 1981)

Next, the research model is evaluated through structural model testing.

- The structural model was estimated by assessing collinearity issues, the path coefficient significance level, the level of determination coefficient R^2, the effect size f^2, and the predictive relevance Q^2.

- If two or more constructs (as independent variables) of the structural model are highly related, there is a multicollinearity issue, and it is observed when the variance inflation factor (VIF) coefficient is higher than 5. The goodness of the path coefficients was tested by the bootstrapping technique and t-statistics.

- The R^2 reflects the level of the construct's explained variance and can take values between 0 and 1. For social science research, the following thresholds are applied: weak (0,25), moderate (0,50), and substantial (0,75).

- The effect size f^2 shows the change in R^2 when a certain (exogenous) construct is omitted from the model. According to Cohen, the effect sizes of 0,02, 0,15, and 0,35 are small, medium, and large, respectively.

- The Q^2 value assesses the predictive accuracy of the structural model. Stone and Geisser suggest using the Stone–Geisser test. The predictive relevance should be positive and with values higher than zero.

- Bootstrapping test

Since the data analyzed in PLS is assumed to be non-normally distributed, the significance of coefficients such as path coefficients cannot be tested by using the parametric significance test in the regression analysis. Instead, PLS relies on non-parametric bootstrap analysis to check for coefficient significance (Hair et al., 2014). To check if the path coefficient is significantly different from zero, the t-value is calculated via bootstrapping. In this study, the non-parametric bootstrapping technique was tested for 128 observations, with 500 repetitions to ensure the requirement of testing the linear structural model.

3.2 Sampling

To analyze the relationships among digital marketing, digital transformation, brand position, consumer behaviour, linear structural analysis method (SEM) is applied. This method requires a large sample size because it is based on sample distribution theory (Raykov & Widaman 1995). However, according to Hair et al. (1998) if the Maxium Likelihood method is estimated, the minimum sample size will be from 100 to 150. In addition, the sample size for the estimation method used in the linear structural model (SEM) has three types: small sample ≤ 100, average sample 100-200 and large sample ≥ 200. The sample size of this study is 300, thus basically meeting the requirements of the analytical method. The authors conducted a survey of 300 leaders of small and medium-sized enterprises (SMEs) on "The impact of digital transformation and digital marketing on the brand positioning and consumer behavior" through online and direct forms using pre-designed questionnaires.

4. RESEARCH RESULTS AND DISCUSSION

4.1. Research results

Convergent and discriminant testing of variables (Figure 1)

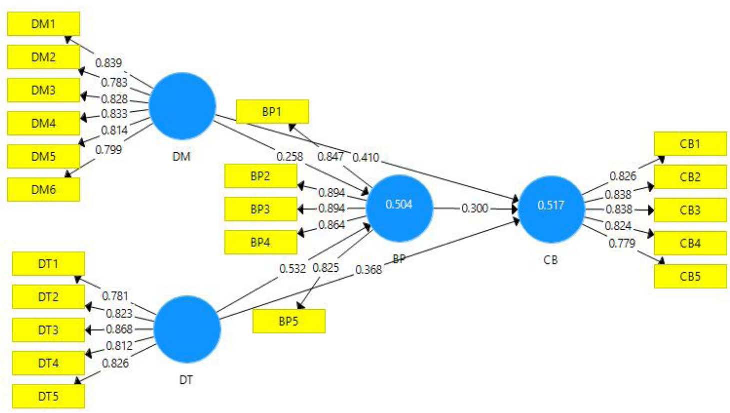

Figure 1: SMART PLS-SEM estimation model

Estimates show that the load coefficients of the observed variables are all over 0,7 with the official results as in Table 1.

Table 1. Results of analysis of external factor loading coefficients and convergent values of the variables

	BP	CB	DM	DT
BP1	0,847			
BP2	0,894			
BP3	0,894			
BP4	0,864			
BP5	0,825			
CB1		0,826		
CB2		0,838		
CB3		0,838		
CB4		0,824		
CB5		0,779		
DM1			0,839	
DM2			0,783	

DM3			0,828	
DM4			0,833	
DM5			0,814	
DM6			0,799	
DT1				0,781
DT2				0,823
DT3				0,868
DT4				0,812
DT5				0,826

(Source: Model estimation via SmartPLS)

Consistency test of factors (Table 2)

Table 2. Internal consistency test results (CA, CR, AVE)

Factor	Cronbach's Alpha	Composite Reliability (CR)	Average variance extracted (AVE)
BP	0,916	0,937	0,748
CB	0,879	0,912	0,675
DM	0,900	0,923	0,666
DT	0,880	0,912	0,676

(Source: Running the model via SmartPLS)

The analysis results show that all factors are reliable with Cronbach's coefficient Alpha greater than 0,7, specifically ranging from 0,879 to 0,916. Composite Reliability (CR) of all factors is satisfactory with coefficients greater than 0,7 and ranges from 0,912 to 0,937. Finally, the coefficient of the average variance extracted (AVE) of all factors are greater than 0,5 (ranging from 0,666 to 0,748) meeting the test requirements (Hair et al., 2014).

Structural model testing

The non-parametric bootstrap procedure was applied (Hair et al., 2014) to test the significance level. In this study, the initial sample contained 300 observations, each bootstrap sample also contained 300 observations. The number of bootstrap samples must be high but must be at least equal to the number of valid observations in the data set. In this study, the authors carried out the Bootstrapping technique 500 times to ensure the requirements of testing the linear structural model.

Test of multicollinearity violation assumption. (Multicollinearity)

The problem of collinearity of the structural model needs to be examined for the relationship between the factors. Variance inflation factor (VIF) is tested for multicollinearity. The results show that the VIF results show that the association between predictors does not violate the assumption of multicollinearity, because all coefficients are in the acceptable range (VIF = 1,767 – 3,171 < 5), (Hair et al., 2014).

Model fit test (Table 3)

Table 3. Tested by R Square and R Square Adjusted

	R Square	R Square Adjusted
BP	0,507	0,504
CB	0,522	0,517

(Source: Model estimation via Smart PLS)

The fit of the model was tested by using the R^2 value.

The analysis results show that the adjusted R^2 value of Brand position model is 0,504 and the adjusted R^2 value of Consumer behaviour model is 0,517, which meets the statistical standard of the model's suitability.

Table 4. Results of f^2 value and degree of influence

The relationship between variables	f^2 value	Influence level
DM->BP	0,090	Small impact
DT->BP	0,383	Great impact
BP->CB	0,093	Small impact
DM->CB	0,142	Average impact
DT->CB	0,044	Small impact

(Source: Running the model via SmartPLS)

The effect of predictors is tested by the effect of (f^2) (Cohen, 1988). The results show that all factors have impact levels ranging from 0,090 to 0,383.

Linear structure results

The results of testing the relationship between variables are shown in Table 5.

Table 5. Results of direct effects of relationships

The relationship between variables	Original Sample (0)	T Statistics	P Values
BP -> CB	0,300	3,284	0,001
DM -> BP	0,258	3,568	0,000
DM -> CB	0,333	5,056	0,000
DT -> BP	0,532	8,196	0,000
DT -> CB	0,208	2,650	0,008

(Source: Running the model via SmartPLS)

From the statistical analysis table of the regression coefficients in Table 5, it shows that the model has all relationships with statistical significance <0,05.

The above results show that all P Values of the effects are equal to 0,000 < 0,05, Therefore, these effects are all statistically significant.

+ There are 3 variables that affect CB: BP, DM, and DT. The standardized impact coefficients of these three variables are 0,300, 0,333, and 0,208, respectively. Thus, the level of impact of these 3 variables on CB in order from strong to weak is DM, BP, DT.

+ There are 2 variables affecting BP: DM, DT. The standardized impact coefficients of these two variables are 0,258, and 0,532, respectively. Thus, the level of impact of these 2 variables on BP in order from strong to weak is DT, DM.

4.2. Discussion

In this study, the authors discovered the impact of digital transformation and digital marketing on consumer behavior, and pointed out the role of brand positioning in that impact. The results of testing the hypotheses are consistent with the results of previous studies and have new research results compared to previous studies. The results of hypothesis testing will be discussed in detail as follows:

Digital marketing helps provide a multi-channel platform for customers to easily find information related to their needs, evaluate the value of products/services and be convenient during the purchasing process, this proves that digital marketing has an positively effect on consumer behavior; This result shows that hypothesis H_{1b} is accepted with positive impact coefficient β = 0,333 and p value less than 0,05. This result is quite consistent with Gartner's research (2021) stating that more than 91% of customers will search for information and knowledge on the Internet; and up to 67% of customers prefer to search for information or respond to reviews on media channels rather than having a direct conversation with a representative; the development of e-commerce platforms and retail websites tends to increase proportionally with increased online consumer demand, reaching 1,83 billion websites worldwide in 2021. According to NielsenIQ Vietnam, up to 64% of Vietnamese people said they will continue to shop online even when the Covid-19 epidemic is over. Forecasts from now to 2040, about 95% of shopping transactions are expected to be through e-commerce. This finding is also consistent with some previous studies such as the study of Ioanăs & Stoica (2014), Swieczak & Łukowski (2016), Nizar et al. (2018), Sanzeeda (2019), Phung & Nhung (2021). In addition, hypothesis H_{2a} is also accepted and shown in the context of digital transformation, small and medium-sized enterprises always focus on using digital marketing tools to strengthen their brand position in the market, this result is consistent with the research of Järvinen (2016); Krishnaprabha et al. (2020).

Hypothesis H_{3b}: digital transformation has a positive impact on consumer behavior, which is accepted because the impact coefficient is 0.208 and the p-value is less than 0,05. Some previous studies have presented similar results when digital transformation has drastically changed the way consumers collect information, interact with purchases (Gensler et al., 2017), or digital transformation has changed consumer behavior in shopping choices from sensing needs to searching for information and evaluating post-purchase feelings (Syaglova & Salamovska, 2019; Kruizinga & Lesscher, 2022; Koo et al., 2022).

At the same time, the research results also show that digital transformation contributes to changing the brand's position in the market and plays an important role in consumer brand awareness. This result is consistent with the research of Istrefi-Jahja & Zeqiri (2021) Alamsyah (2021), Sanzeeda (2019). This is also proposed by hypothesis H_{3a}. A reputable brand with a position in the market will easily convince consumers in their behavior, they are willing to pay higher prices, buy more, have a more open attitude, and buy again and again for the same products or services of these brands. This is the result collected by the authors on the impact of brand positioning on consumer behavior through hypothesis H_1 (positive impact coefficient β = 0,300 and p-value less than 0,05). This result is consistent with the research of Khan & Razzaque (2015), Azmat & Lakhani (2015).

5. RECOMMENDATIONS AND CONCLUSION

From the assessment and discussion of the above research results, the authors propose some managerial implications to help businesses find solutions for digital marketing and digital transformation to increase consumer behavior through brand positioning as follows:

Firstly, it is likely to build an overall digital marketing and digital transformation strategy for marketing activities in the overall picture of the business's common technology application and platform system. An effective digital marketing campaign needs to follow these basic steps: defining target customers; analyzing their internet usage behavior; rating competitors; defining campaign goals and budget; forming the strategy of the campaign; dividing time of stages; setting the main message; deciding on the preferred access channel; stting performance evaluation criteria; running campaigns and optimize.

Secondly, it is likely to fine-tune technical channels, evaluate, review current marketing tools and channels such as website, SEO, social media, customer database, … integrate multi-channel marketing platform to unify content and enhance brand awareness at touch points.

Thirdly, building and completing a customer management platform, understanding customer data and the information around it which is the core and central value for the future development of the business.

Fourthly, enhance customer experience with AR, VR, artificial intelligence, chatbots,… to make the shopping experience of dry aluminum products more enjoyable. It is likely to use big data and AI solutions to create personalized experiences, at the same time, bring many new marketing ideas

Fifthly, it is likely to develop specific customer communities on a digital platform, improve online ordering and payment methods, allow debt limits and more effective utilities with customers.

Sixthly, it is likely to implement data-driven marketing campaigns, personalized with intelligent creative content, capable of attracting leads and optimizing conversion rate (CRO).

Seventhly, digital marketing is an effective arm for businesses to increase brand recognition for customers and users. Digital marketing has gradually touched the lives of customers to help increase brand awareness of businesses, make a strong impression in the customers' mind. Promotion and communication activities on TV, phone, and Internet contribute to spreading the corporate brand, offering free public relations, creating crowd effect, increasing brand sympathy

In summary, increasing digital marketing and digital transformation measures and brand positioning is important and urgent, in line with an increasingly fiercely competitive market. At the same time, businesses with timely digital transformation contribute to increasing sales and increasing competitive advantage in the market. In addition, SMEs to fully exploit digital marketing means and transform strongly in the context of digital transformation to create a reputable and good image in the eyes of customers, and at the same time contribute to promoting consumer buying behavior in the coming time.

AUDITING CONSOLIDATED FINANCIAL STATEMENTS: AUDIT RISKS ARISING FROM VIETNAM LISTED STEEL COMPANIES

MSc. Nguyen Thu Hao[1]

Abstract: This study aims to identify and explain the risk factors which arise from audit of consolidated financial statements for Vietnam listed steel companies. The qualitative research methodology was used including questionnaires and interviews with professional auditors of independent audit firms in Vietnam, who have experience in conducting group audits for listed steel companies. The results showed that the high decentralization of managerial decision making due to private ownership, high number of components in group, the diversify of locations, high decentralization of accounting system, special reporting requirement for listed entity, steel production related risks are factors that could lead to high audit risk in audit of consolidated financial statements for listed steel company. The main contribution of this study is to explain the risks factors and suggest recommendations on auditor responses to help the audit firms in managing audit risk to be at acceptable level and perform a quality audit.

Keywords: audit risk, audit response, group audit, consolidated financial statements, steel companies.

1. INTRODUCTION

In audit of consolidated financial statements, audit risk is the risk that group auditor expresses inappropriate audit opinion when consolidated financial statements contain material misstatements. Audit risk in group audit is "higher risk" than stand-alone financial statement audit because of the complexity of audited entity and audit subject matter. Consolidated financial statements comprise the financial position and financial performance of parents and subsidiaries, in which the locations of subsidiaries will be diverse in different geographic areas, not limited to one country but can in all over the world. The financial reporting framework is also complicated with challenging judgements. Therefore, the auditors need to make audit risk assessments in a thorough consideration. The significant audit risks factors should be identified, and the appropriate audit response should be proposed to reduce the audit risk to an acceptable level.

ISA600 [1]including when component auditors are involved. The standard includes new and revised requirements and application material that better aligns the standard with recently revised standards, such as International Standard on Quality Management 1 and International Standards on Auditing 220 (Revised highlights the need for group auditor to take a "top-down" approach to the assessment of risk of material misstatement, and ISA315 [2] require the group auditor needs to obtain understanding of the group and its subsidiaries to appropriately conduct the risk assessment. The knowledge of the auditor regarding characteristics of audited entities and the environment surrounding the entities (i.e., specific industry or regulations) is very important to help the auditor in recognizing the risks factors associated with the auditee and financial statements.

In this study, we examines the risks factors arising from audit of consolidated financial statements of listed steel companies in Vietnam, because the following reasons: (i) consolidated financial statement of listed companies has numerous users of interest; (iii) steel enterprises

---

1 Academy of Finance, Email: nguyenthuhao@hvtc.edu.vn.

listed on the stock exchange are mainly privately owned, but currently occupy a major part in the supply chain of steel industry; (ii) the largest steel manufacturing companies are operating under group structure (i.e. parent – subsidiary model); and (iv) this group structure will expand in future due to the trend of vertical integrated model to achieve the advantages of raw materials input to production (upstream) as well as the distribution and outputs further down the supply chain (downstream). Those characteristics give rise to big concern of how those operations model and accounting system of those listed steel companies could be significant matters that lead to risks of material misstatement in consolidated financial statements.

2. LITERATURE REVIEW AND RESEARCH QUESTION

Research on audit risks of group audit:

The concerns on identifying and assessing the risks of material misstatement in performing group audit started since the scandal of McKesson and Robbins Group in 1938 [3] in which overstatement of inventory existed in consolidated financial statements but the auditor failed to detect due to underwork performed at subsidiaries. Then in 1992, fraudulent consolidated financial statement of Phar-Mor Group has overstated inventory and then overstated profit in three consecutive years, but the auditor did not notice that fraud. The audit failure was on audit procedures of attending stock count. Phar-Mor group has more than 300 stores in different locations, and the group auditor selected samples of stores to attend stock counts, and the fraud existed in not-selected samples [4]. These audit failures did give the focus on the importance of identifying and assessing the risks of material misstatement of the consolidated financial statements which comprise of financial information from multiple components and multiple locations in different geographic areas.

Research of Allen (1998) [5] gave a framework for risk factors specific to multi-location audit. The framework was developed by (i) identifying risk factors which are important in audit planning, (ii) evaluating the risk factors through interviews with auditors, (iii) examining the policy and procedure manuals of public accounting firms. The following are risk factors summarized by Allen in his research:

- Inherent risks: diversity of location, global operations, number of locations, proximity of locations, dollar value distribution
- Control risks: centralization of accounting system, effectiveness of controls, effectiveness of internal audit
- Audit risk: special reporting requirement

This framework was considered as a starting point for future research related to audit risks in group audit.

Then, Hegazy (2012) [6] performed an empirical study to assess the Allen's audit risks factors applied in the Egyptian audit firms, using descriptive data analysis and Spearman correlations. The results of study showed that: (1a) There is a high multilocation audit risk when the client is using decentralized the accounting information system (AIS); (1b) The decentralization of the managerial decision making result in the higher multilocation audit risk; (2) the higher consistency of the application of the internal control system's elements result the lower multilocation audit risk; (3) There is a negative relationship between the effectiveness of the internal audit and the multilocation audit risk; (4) There is a positive relationship between the client's operation of multiple business locations and the multilocation audit risk; (5) There is a positive relationship between the close proximity of locations in addition to transferability of the client's assets and the multilocation audit risk; (6) There is a negative relationship between the distribution of the dollar values in locations and the multilocation audit risk. From this, the study recommends the framework of audit considerations in planning audit and substantive testing so that the group auditor can make proper assessment on level of audit risks and have appropriate response to ensure the quality of the audit.

In perspective of audit regulation, auditing standards reflect the consistency of risk-based approach in group audit. ISA 600 (2009) requires auditor should identify and assess the risks of material misstatement through obtaining an understanding of the entity and its environment. The group engagement team shall (a) Enhance its understanding of the group, its components, and their environments, including group-wide controls, obtained during the acceptance or continuance stage; and (b) Obtain an understanding of the consolidation process, including the instructions issued by group management to components. And then the ISA600 give some examples of conditions that may indicate risk of material misstatements in the Group financial statements, including: A complex group structure; Poor corporate governance structures; Non-existent or ineffective group-wide controls; Components operating in foreign jurisdictions, Business activities of components that involve high risk; The existence of complex transactions, different accounting policies between component and group, different financial year-ends between component and group, etc.

ISA 315 revised in 2012 [2] give the guidance for auditor when obtaining understanding of an entity that auditor should consider the matter "Whether the entity has a complex structure, for example, with subsidiaries or other components in multiple locations. Complex structures often introduce issues that may give rise to risks of material misstatement. Such issues may include whether goodwill, joint ventures, investments, or special-purpose entities are accounted for appropriately".

Auditing Standard AS 107 issue by AICPA (2006) [7] "audit risk and materiality in conducting an audit" have guidance regarding extent of audit procedures should be performed at selected locations or components in case of multi-location audit or multi-components audit. The factors an auditor should consider regarding the selection of a particular location or component include (a) the nature and amount of assets and transactions executed at the location or component; (b) the degree of centralization of records or information processing; (c) the effectiveness of the control environment, particularly with respect to management's direct control over the exercise of authority delegated to others and its ability to effectively supervise activities at the location or component; (d) the frequency, timing, and scope of monitoring activities by the entity or others at the location or component; (e) judgments about materiality of the location or component; and (f) risks associated with the location, such as political or economic instability.

In addition, in the comments of the American Auditing Standards Board [8] responding to the IAASB's invitation on issues related to group audits, experts stated that risks factors identified in current ISA600 is appropriate, however, the regulators should consider additional risks factors in study of Allen (1998) and Hegazy (2012) when performing a group audit, in which the focus should be: group control environment, special financial reporting of components, proximity between components in group.

As a results, new ISA600 (2022) [9] to be effective for audit of group financial statement from 15 December 2023 further support the development of the risk-based approach, in particular, to drive greater focus by the group engagement team on their responsibility to identify and assess the risks of material misstatement of the group financial statements and to design and perform further audit procedures that are responsive to those risks, in order to obtain sufficient appropriate audit evidence in respect of the group as a whole.

However, the auditing standards are still limited to the audit procedures for risks assessments and cannot give specific examples on audit risks. The audit risks will depend much on the characteristics of the consolidated entity (the group) and the consolidated financial statements.

Therefore, the topic "*auditing consolidated financial statements: audit risks arising from Vietnam listed steel companies*" will give a practical view on audit risks in a group audit.

Research question:

In our study, we investigate the following research questions (RQ):

RQ1: what are audit risk factors arising from audit of consolidation financial statements of listed steel companies in Vietnam?

RQ2: How should audit firms do to identify and response to those risks?

3. RESEARCH METHOD

This paper used qualitative method to solve the research objectives. To identify the audit risk factors in audit of consolidated financial statements of listed steel companies in Vietnam, and analyze the response of independent audit firms to those risks, the researcher used the following techniques:

- Obtain the legal documents, technical articles, professional reports, and other information sources related to group audit, consolidated financial statements, listed steel companies in Vietnam. Conduct the analysis of the current situation to answer the RS1.

- Sending the survey questionnaire and performing in-depth interviews to auditors of audit firms that have experiences in group audit: to obtain the auditor's view regarding RS1 and the current practice audit regarding RS2.

4. RESULTS AND DISCUSSION

The following are risks factors arising from listed steel companies that auditor should consider in audit of consolidated financial statements:

Firstly, listed steel companies are privately owned but hold the largest market share of the steel industry

Steel companies joined stock exchanges 10 years ago. Currently, there are 20 listed steel companies in HOSE and HNX, and other 17 companies are trading in UPCOM [10]. Almost all the listed steel companies are privately owned, but they are the largest manufacturers in the steel industry, i.e., Hoa Phat Group, Hoa Sen Group, Pomina Steel company, Nam Kim group, Viet Duc Steel company, SMC Steel company. In which, Hoa Phat Group holds the largest market share in Vietnam for construction steel and steel pipes; and Hoa Sen Group is the leader of corrugated iron market share [Table 1]. This fact shows the Government's facilitation for private enterprises in the steel production sector.

Table 1: Market share of largest steel manufactures in Vietnam

Source: Vietnam steel industry 2021-2022 report – Vietnam Steel Association [10]

Audit risk consideration: private ownership creates centralization in managerial decision making then will impact the audit risk.

Because most of the leading listed steel companies are private-owned, therefore, there is high centralization in managerial decision-making and control over assets. Group management can have significant influence on components and therefore has the ultimate authority to decide the controls of assets or authorization of transactions. The degree of centralization of management decision making influences audit risk. If decision making and controls are centralized, then the auditor may easily obtain audit evidence related to consolidation process and group wide controls then reducing the audit risk. However, the high centralized management could lead to the risk of fraud due to management over-ride control. In another extreme, in case that the managerial decision making is decentralized between components in the group, no test of control can be performed for group wide controls at group level, this will increase the audit work at component level and increase the audit risk.

Secondly, listed steel companies have increasing number of components and diversity in business lines due to vertical consolidation

Among listed steel companies, there are eleven (11) companies operating in parent – subsidiaries model (which are referred as "group" or "corporation") and are required to prepare consolidated financial statements. The number of components in steel groups varies depending on the scale of each. In which, Hoa Phat Group, Hoa Sen Group and Son Ha Group are the three-leading groups in number of components and the complexity of group structure also.

Table 2: Listed steel companies operating in parent – subsidiary model

Name of listed company	Number of subsidiaries	Number of Associates and Joint ventures
Hoa Phat Group	5 subsidiaries level 1 24 subsidiaries level 2, 38 subsidiaries level 3, 4 subsidiaries level 4, 1 subsidiaries level 5	3
Hoa Sen Group	9	1
Nam Kim Group	4	-
Pomina Steel Corporation	1	-
SMC steel company	12	3
Dai Thien Loc steel company	2	-
Son Ha Sai Gon company	1	-
Son Ha Corporation	18	5
Tien Len Steel company	5	-
Thien Nam Group	1	-
Viet Duc Steel company	1	-

Source: author summarized from consolidated financial statements of listed steel corporation

Business consolidation is the development trend of steel manufacturing companies to create competitive advantage of reducing input cost of production (i.e., iron and coals as raw materials cost) and reducing the distribution and logistics costs through expanding the distribution network within the group and enhancing the power. This trend is known as vertical business integration, that is the merger of two enterprises that are at different stage of production - for example, steel production and iron ore mining, to form a closed chain of input to output consumption, to remove the middle cost and added cost from the process of making steel and achieve long-term benefits.

Hoa Phat is the leading of this vertical integration [10]. The most important cost streams for steel manufacturing companies are iron ore and coke, in which iron ore account for 30 – 40% of the input cost of steel production process using blast furnace and oxygen blast furnace technology. Since Hoa Phat Dung Quat Iron and Steel Production Complex was completed and comes into operation, Hoa Phat now owns a closed process, from iron ore to hot rolled steel, that lead to an increase four times in profit compared with previous years. To be self-sufficient in iron ore sources, in 2020 and 2021, Hoa Phat Group will not only maintain and develop domestic ore mines (in Ha Giang, Lao Cai, Yen Bai, Phu Tho), but also expand its ownership of an ore mine in Australia, that remark Vietnam steel production to the world. Hoa Phat continues to look to buy several new iron mines in Australia to respond at least 50% of its long-term iron ore demand. Otherwise, Hoa Phat bought a fleet of ships to transport mined ore to Vietnam. This business development creates the multiple and diverse components in Hoa Phat Group [Table 2] [11].

In addition, steel manufacturing enterprises can also acquire distribution channels when they want to capture the output market more deeply, to reduce labor costs as well as gain distribution centers in the future. For example, besides steel production, Hoa Phat Group and Hoa Sen Group expand their business in the other business lines, i.e., real estate, construction materials, furniture, and home appliances. These industries are considered to consume output products for the steel manufacturing industry. Specifically, in 2021, Hoa Phat established Hoa Phat Electrical Appliances Corporation, officially participating in large and methodical investments in the household electrical appliance industry. This step is part of the strategy to close the steel value chain of Southeast Asia's largest steel manufacturer from downstream to upstream, from ore mining, steel billet production, finished construction steel products and hot rolled steel coils; then this steel products are input for industries that bring high profits such as mechanical processing, automobiles, household products such as refrigerators, air conditioners, ovens, dishwashers.

The above trend of business consolidation is consistent with the steel industry in the world. This will create increasing numbers of components (including subsidiaries, associates and joint ventures) and diversity of business lines in steel groups in Vietnam in the future.

Audit risk consideration:

The number of components in the listed steel group are quite different. Therefore, for those groups which have a small number of components, each component might be significant to the group and the determination of audit scoping is quite simple. But for those that have a high number of components and even multiple levels, this complex group structure could impact the auditor's consideration in audit scoping. Auditors may find challenging in the selection of representative components to perform full scope audit or specific procedures to ensure sufficient and appropriate audit evidence as a basis for audit opinion. Otherwise, in the development trend, when the steel companies become more diversified in business activities, the audit risk will increase and create challenges to audit.

Thirdly, multiple location between components in listed steel corporation

Since the steel production needs the large factory scale and the location of manufacturing plants to be located near the geographic area of input materials to minimize the transportation cost, the component in group has multiple area located, for example, components in Hoa Phat Group spread across the country, some components are in another country (Australia, Singapore). Normally, steel production should be close to iron ore mines or coal mines or seaports.

Audit risk consideration:

If the location of components is close, there is a risk that assets can be transferred between components, for example, in between inventory observations. This fraud led to overstatement of inventory in consolidated financial statements.

If the location of components in group is fragmented and diverse, this will increase the audit work and difficulty in audit. The audit risk will increase due to the pressure of workload, audit time and cost. In addition, the internal controls will be different between components, so it is difficult for auditor to attend inventory count at 100% warehouse while this is the rebuttable procedures in audit. Auditors need to design an audit program to ensure that the sampling is representative for the whole population. Especially, if the component is in foreign country, then the decision to physical site also challenges the auditor.

Fourthly, centralization of accounting system for consolidation purpose

Entities may operate the accounting system for the purpose of preparing consolidated financial statements in two ways: (i) centralization and (ii) de-centralization. This degree of centralization will impact the audit risk and audit approach.

Among listed steel companies, only Hoa Phat group has organized the centralization for the purpose of consolidation reporting. In which, there is a consolidation team in the group responsible for recording accounting information of the whole group that is necessary for preparing consolidated financial statements. All information that is used for consolidated financial statements will be recorded at both group level and component level. The Group currently use the accounting software to support this work. The Group then uses the direct method for consolidating multiple levels of subsidiaries, in which the information of subsidiaries level 1 to level 5 is directly reported and summarized at group level. This accounting system will ensure higher accuracy and minimize the risks of errors. This centralization also helps the group in reducing the consolidation timing and the dependency on components in the process of preparing consolidated financial statements.

At the other extreme, the other steel companies still maintain the decentralized accounting system for consolidation purposes. In case the group has multiple levels of subsidiary, indirect method will be used for consolidation purposes. Each component will be responsible for recording and preparing its own financial statements. Then at the end of the accounting period, components will send the single financial statements to the group. The consolidated financial statements will be prepared based on those single component financial statements. The benefit of this accounting system is to reduce the pressure for consolidation team at group level, the consolidation process is also more convenient due to the component accountants have good understanding on their own transactions rather than group team. However, the group will have certain difficulties in managing and collecting information from remote geographical locations.

Audit risk consideration:

Auditors should base the degree of centralization in accounting system to consider the proper audit approach for group audit. When the accounting system is centralized, the auditor can decide to perform audit procedures for certain account balances or transactions at group level. In decentralized systems, the group auditor should determine the scope of work for each component. Auditors should also consider increasing the scope of work and the diversity of audit procedures for each component. Therefore, if the accounting system is moving toward decentralization, the higher of audit risk it would be, whereas the higher centralization of accounting system, the lower of audit risk in group audit.

Filthy, special reporting requirement for listed entity

As the listed entity, there is some special reporting requirement that differ with other entities as follows: (i) Listed entities are required statutory audit by independent audit firms approved by State Exchange Committee; (ii) The listed entity need to public the consolidated financial statements for unaudited figure and audited figure; and explain for any difference arising from those figures; (iii) Half-year consolidated financial statements are also reviewed by approved audit firms; (iv) The audit opinion for consolidated financial statement should be unmodified opinion. In case of qualified opinion, the listed entity should have the proper explanation and confirmed by audit firms for this impact of audit opinion; (v) Listed entities will be removed from stock exchange market if continuing loss in 3 years.

Audit risk consideration:

When the audited entity is listed, the audit risk will be higher. Because the listed entities must disclose a large amount of information and must also comply with a wide range of relevant standards, regimes, and regulations. In addition, listed companies must also be subject to review and supervision by state agencies, to ensure the reliability of financial statements to serve as a basis for economic decisions of users and stakeholders.

Finally, steel production related risks

Steel production activities can lead to some certain specific risk of material misstatement in consolidated financial statements of listed steel group as follows: (i) Inventory have large size, diverse in types and located in large store, and the counting inventory (such as iron ore, coal) need involvement of experts because of its special counting techniques; (ii) Complexity in manufacturing process of steel create the challenging in determination of production cost per unit, which involves lots of production phases and related cost; (iii) High level of slow moving inventory due to the current low demand of construction and real estate market; (iv) High value of depreciation and capitalization of fixed assets because steel manufacturing require the significant capital investment, mainly in plants and machinery, and production technology as well; (v) high volume of foreign transactions to import raw materials from foreign suppliers; (vi) environmental obligations due to steel production activities, including waste water treatments, carbon dioxide emissions or environmental recovery for iron ore mines, etc. (vii) the potential obligations related to the risk of trade defense barriers from many countries which could lead to litigation and claims.

Audit risk consideration:

The group auditor should consider whether the above matters could lead to significant risks of material misstatement in consolidated financial statements. The impact could be considered on financial statements level and assertion level. Identification of the risk of material misstatement in a specialized industry (i.e., steel industry) should be approached in the same way as in any other audit – by obtaining an appropriate understanding of the business and its environment. This requires the auditors to have competence regarding the specialized industry. The audit firm is likely to have additional resources available, for example technical guidance for industry risks, to support auditors.

Large audit firms (such as Big Four firms) have the competitive advantage in competence for specialized industry because they already possess the know-how technique and information through having existing clients in the industry or have the resources transferred from global networks. Smaller audit firms may have to carefully consider their competence when taking audit engagement in a specialized industry if they have not previously worked with an audit client in the same industry. Therefore, when accepting an audit engagement for listed steel companies, audit firms should consider of whether the audit firm has enough resources to do the group audit, enough knowledge of relevant industries and has experience with relevant regulatory or reporting requirements, or the ability to gain the necessary skills and knowledge effectively.

5. RECOMMENDATION ON AUDIT'S RESPONSE

The group audit represents a complex practical issue that challenges the auditor during performing an audit. Understanding the nature of audit risk factors should allow auditors to focus on specific problems and consider the appropriate audit responses. Based on the above risk factors arising from characteristic of the listed steel group and their consolidated financial statements, the following recommendations are suggested for group auditor to further consider in responding the risks to achieve the audit risk at acceptable level.

Firstly, in case of group has multiple components and the business line between component are diverse, this will be an indicator that aggregation risk exists, then auditors should notice that this factor will impact on the audit scope and procedures. Because the auditor cannot audit 100% of components in the group, therefore, the auditor should consider the sampling to ensure the aggregated risks to be at the acceptable level.

- The higher number of components and business lines, the higher aggregation risks, therefore, the auditor should lower the component materiality in relation to group materiality. This will increase the audit workload, together with consideration of staffing and the need to use experts.

- The auditor also considers this factor when determining significant components and then determines the audit scoping. If the component is financially significant, then the scope of work will be full scope audit. If the component is significant due to its nature (relating to risk of material misstatement in consolidated financial statements), the auditor should consider performing (i) full scope audit; or (ii) audit of specific account balances or (iii) specific audit procedures related to risk of material misstatement.

- For the component which has no financial significance and no "risk" significance, in case there is great number of relatively equal size components, the auditor should consider the additional information to support determination of audit sampling, for example: the centralization of accounting information system and internal controls; the rotation policy on choosing representative samples to test; other audit techniques focusing on the components which used to have material misstatement from previous audit; randomly select component for site visit, etc.

Secondly, when listed steel group have components in multiple locations:

- If the locations are geographically dispersed, auditors need to consider an appropriate percentage of components that they have perform testing (for example, attending inventory count). For example, the suggested percentage could be at least 60% of inventory balance in consolidated financial statements are audited by group auditor or component auditor who are in the same network with group auditor, remaining can be audited by component auditor from other audit firms. Moreover, auditors should consider performing testing on the small components or even far distance so that it is unpredictable to the audited entity. Because normally it is predictable that auditor will test the significant components or the components in the convenient logistic.

- If the location of components in group are proximity (close) to each other, to mitigate the risk that assets can be transferred between components, the auditor should gather information and evaluate the value of assets and the location of those assets, whether assets are stored in separate warehouses. The following information are risk indicators that could lead to fraud such as: no supporting documents for assets, group management and component management ignore the deficiencies of internal controls related to assets. Auditors should interview the client regarding assets procurement including related internal controls; attending the physical count of assets and observe the counting process; perform analytical procedures to identify any unusual transactions.

Thirdly, if there is a centralized accounting system at group level for consolidated financial reporting purposes, group auditors can consider performing audit procedures at group level using the group materiality and then not necessarily perform at component level**.** Because all the components use the same system and each line item (balance) in the group financial statement is audited as one aggregated amount, which indicates there is no aggregation risk and, therefore, no need to allocate materiality to components. For example, when accounts receivable uses the same system at all components and the risks of material misstatement relating to account receivable balances are similar among components, the group engagement team may be able to audit the account receivables balance of all components as one aggregated amount.

In contrast, if account receivables use different systems at different components, it is more likely that aggregation risk exists, and materiality would likely need to be allocated to significant components. Then group auditors should allocate audit resources for components with financial significance and risk significance; and consider the sampling of remaining components to test. If the remaining components have similarity in business activities and operation, internal control, etc., auditor can perform sampling and then systematize to the whole population to achieve the efficient audit.

This determination becomes more difficult when there is a case that certain financial statement line items are audited at the group level and others are audited at the component level. For example, when accounts receivable uses the same system at all components relating to accounts receivable, the group engagement team may be able to audit the accounts receivable of all components as one population. However, there are some procedures which are required to perform at component level even in the case that a centralized accounting system exists, for example verification of existence of inventory and fixed assets.

Because, for those assets as inventory and fixed assets, it is quite difficult to establish centralized financial reporting and internal control at group level because this requires specialization. Therefore, inventory management normally is decentralized and uses different systems at different components, then aggregation risk exists, and the group engagement team may not be able to audit inventory of all components as one aggregated amount.

In conclusion, the suggested approach is to consider audit procedures by audit area. Even though materiality has been allocated to components, the group engagement team may decide to test certain areas (e.g., accounts receivable) at the group level using group materiality if there is no aggregation risk as it relates to that financial statement line item, while testing other audit areas (e.g., inventory) at the component level using each component's materiality. In other words, the auditor can use different approaches in the same group audit for different line items.

Fourthly, if internal controls are effective, the number of components to visit will be reduced due to the lower assessed audit risk. When performing test of effectiveness of internal controls, auditor should focus on: (i) internal controls that could prevent, detect material misstatement in consolidated financial statements; (ii) if components has high similarity in internal control's structure and operation, the auditor can use the standardized procedures to test the operating effectiveness of internal control; (iii) auditor usually perform test of control to significant components and not applicable to non-significant component. However, to reduce the aggregated risk of non-significant component, the auditor should test of group wide control to determine whether additional work should be performed; (iv) There is different between internal control in component to component because internal control should be specified to fit the business activities and operations of each component.

Fifthly, for those specific significant risks identified that could lead to material misstatement in consolidated financial statements, the appropriate audit procedures should be specific to respond to the risks. For those steel industry-specific risks which are complicated (for example, the complex inventory valuation, environmental obligations or litigation and claims), for which the auditor may not have the necessary specific expertise in some areas, the auditor can consider using experts to obtain audit evidence. When reliance on experts, the auditor should evaluate evaluates the relevance and adequacy of the expert's findings or conclusions. It is important that using the work of experts does not mean that auditor can pass all responsibility over to an expert. The auditor should consider whether the findings of experts are consistent with the auditor's understanding of the client and conclusions of other audit procedures, any inconsistencies must be investigated.

6. CONCLUSION

This paper aims to explore and explain audit risks factors that could arising from audit of consolidated financial statements of listed steel companies. The risk factors are identified through examination of documents and interview with experienced auditors. The recommendations are proposed based on the risks factors and can be informative to practitioners and regulators as they continue to search for ways to improve the risk-based audit. Future research can focus on how group-wide controls at group level can be considered in risk assessment procedures and how those controls can affect the audit scoping.

EVALUATING THE LEVEL OF FINANCIAL REPORTING TRANSPARENCY OF SMES IN VIETNAM

MSc. Nguyen Huong Giang[1]

Abstract:The business sector, especially small and medium enterprises (SMEs), plays an important role in socio-economic development. Over the past years, Vietnam has witnessed impressive development of small and medium-sized enterprises. However, the small and medium-sized enterprise sector still faces many difficulties in maintaining and developing. Investigation reports on business activities show that this area is facing many barriers compared to large-scale businesses. According to data from the General Statistics Office, in recent years, the capital access rate of small and medium-sized enterprises in our country is very low, about 30%. A main reason is the widespread lack of transparency in business financial reports, making it difficult for banks to accept loan requests. Therefore, understanding clearly what financial reporting transparency is will help find measures to increase the transparency of financial statements. The study sets out criteria to evaluate the level of financial reporting transparency, thereby evaluating the level of financial reporting transparency of SMEs and proposing solutions to enhance the financial reporting transparency of SMEs in Vietnam

Keywords: SMEs, financial reporting transparency, access to capital

1. INTRODUCTION

Over the past three decades, the small and medium enterprise (SME) sector in Vietnam has grown exponentially. The number of registered enterprises has increased significantly, reflecting the formalization of household businesses as well as the establishment of new enterprises. The increase in the number of SMEs has led to strong growth in capital by private sector enterprises. SMEs have made major contributions to Vietnam's economic growth in recent years by creating jobs, contributing to poverty reduction, improving living conditions as well as inclusive and sustainable growth in Vietnam. Despite impressive growth in quantity, the scale of SMEs in Vietnam is still small. Vietnamese enterprises, especially micro and small enterprises, are growing slowly in scale. Upgrading is an important issue in the Vietnamese SME sector due to limitations in the business environment, access to capital and finance, human resources, management skills, access to the markets and technology, and innovation capacity, etc.

Thus, limited access to capital is a major obstacle to the growth and development of SMEs. The reason is that when accessing credit, the parties do not trust each other and do not cooperate with each other simply because of the "lack of transparency", especially the transparency of enterprises' financial reports. The accounting and financial reporting work of a part of businesses is still weak in terms of qualifications and poor awareness of complying with legal regulations, therefore, they are not capable of supporting commercial banks in accurately assessing the production and business efficiency of enterprises. Business financial disclosure still lacks transparency, most SMEs do not have a standard accounting system. Enterprise reports are not audited annually, so the level of reliability is low. These are the reasons why it is difficult for SMEs to receive credit guarantees even though this form of support has been available for many years. That pushes SMEs to implement information transparency, including financial reporting transparency. However, what is financial reporting transparency? What is the method of measuring the level of financial reporting transparency? Especially for SMEs in Vietnam? Many researchers are looking for answers to these questions.

2. LITERATURE REVIEW

Studies on financial reporting transparency have been conducted by domestic and foreign researchers. Specifically, research projects around the world have analyzed different aspects of corporate information transparency such as the level of information disclosure and the level of information asymmetry of businesses. Measures with different approaches have also been used and validated in many markets. A typical study by Yu-Chih Lin and colleagues (2007) was based on the Information Transparency and Disclosure Rating System index - Information Transparency and Disclosure Rating System (ITDRS).) to evaluate the level of information transparency of listed companies. This is an evaluation index ranking the transparency and disclosure of information of listed companies built in Taiwan. This index includes 88 disclosure items divided into 5 contents: (1) Compliance with regulations on disclosure; (2) Timeliness of reports; (3) Issues in publishing forecasts financial statements; (4) Publish annual reports; (5) Publish information on the company's website.

Jouini Fathi's (2013) study on factors affecting the quality of disclosed financial information of listed companies in France, examines the relationship between the quality of publicly disclosed financial information and the mechanism. management for 4 groups of influencing factors including: (i) Enterprise characteristics (Leverage, profit, listing status and industry); (ii) Characteristics of the board of directors (iii) Audit quality; (iv) Ownership structure for listed French enterprises for a period of 5 years from 2004 to 2008. The results show that the positive effects of a number of variables on the quality of financial market are announced. However, the holding ratio of institutional shareholders has an opposite effect.

In 2015, Zinatul Iffah Binti Abdullah and his colleagues researched and found the relationship between accounting standards, corporate governance, external control, internal control and ethical standards with financial statements based on the perspective of Auditors and management perspectives in Malaysia. Research results show that the above factors all affect information on financial statements. In particular, the factors of accounting standards, internal control, and ethical standards have a higher level of influence on financial statements than the remaining criteria.

In Vietnam, there are also a number of research projects on information transparency in financial statements such as the thesis of Nguyen Phuc Sinh (2008) researching the role and usefulness of financial reports in the operations of Vietnamese enterprises. . The author has used both international and domestic accounting theory and practice to analyze and evaluate the provision of useful information of financial statements in Vietnam and provide solutions to improve the usefulness of financial statements as well as standardize them.

Nguyen Thi Minh Tam (2009) discussed transparency in the operations of businesses and banks and the role of accounting and auditing. The author commented that transparency is an important basis for sustainable development, increasing the value of businesses in general, so businesses and banks need to promote transparency, in which the accounting – auditing system is an indispensable tool to implement transparency in company management. The reasons why financial information in our country is not truly transparent are that financial reporting transparency is not given due importance, and general provisions of international accounting standards on financial reporting have not been fully implemented. Preparation and presentation of financial reports, disclosure and transparency of published financial information have not been processed properly by law.

Research by Nguyen Thuy Anh (2012) also mentioned the issue of information transparency in the stock market. The study also used Standard and Poors (S&P) criteria to rank the level of information transparency of 89 companies listed on the HSX. This study mainly uses qualitative methods to explain and clarify the conclusions, and only uses a few typical cases to analyze the weakness in the level of information transparency.

In addition, there are a number of studies measuring the level of information disclosure based on a common rating system of the entire market or applying a rating system from a world organization to evaluate Vietnamese businesses (Le Xuan Thai and Truong Dong Loc (2019); Tran Thi Thanh Tu and colleagues (2014)).

In general, the mentioned study have just analyzed information transparency on financial statements of enterprises in general, or listed enterprises. There is no topic that systematically evaluates the financial reporting transparency of SMEs, especially the SMEs in Vietnam.

2. INFORMATION TRANSPARENCY AND THE ROLE OF FINANCIAL REPORTING TRANSPARENCY

2.1. Information transparency

There are a number concepts of information transparency. Winkler (2000) stated that information transparency is the amount of information on which economists base their decisions or expectations. DiPiazza and Eccles (2002) defined information transparency as the mandatory availability of information necessary for shareholders to make decisions.

Dau Anh Tuan (2006) believed that transparency includes opportunities, equality in access to information, reliability, consistency of information, predictability and openness of information providers. Information transparency in financial reports is very important to ensure the reputation and trust of business stakeholders, including shareholders, investors, business partners, banks and state agencies.

According to Vaccaro and Madsen (2009), information transparency is the completeness of information provided by each company to the market, related to their business activities. According to Bushman et al (2004), information transparency in the financial sector is the availability of company-specific information to outside investors and shareholders. OECD (2004) regarding the issue of information disclosure and transparency stated: “The corporate governance framework must ensure the timely and accurate disclosure of information on all important matters relating to the company. company, including its financial position, operations, ownership and corporate governance. According to Tran Minh Da Hanh (2014), financial reporting information transparency is demonstrated through the complete provision and honest presentation of useful information for users to make decisions, along with the degree of disclosure of information to the outside and the degree of ease of accessing information. Le Thi My Hanh (2015) pointed out that information transparency is the provision of reliable, timely, accurate, complete and consistent financial information in a way that the public can conveniently access.

Information transparency not only requires the quality of disclosed information, the content of the information as well as the relationship with the public and the method of disclosing information, but also requires necessary conditions in terms of legal framework, State macro management, operating functions of auditing companies, credit ratings, and information disclosure by issuing enterprises.

2.2. Financial reporting transparency

Although widely used to describe desirable attributes of financial reporting, the term "financial reporting transparency" lacks an agreed upon definition. For example, it does not appear as a qualitative characteristic in the IASB or FASB conceptual frameworks. We believe that the idea of transparency has been introduced into discussions of financial reporting from a variety of contexts, each of which describes a distinct meaning for the term and consideration of these contexts. This difference can be helpful in understanding the meaning of financial reporting transparency.

The important meaning associated with transparency, at least in some contexts, is accountability - the basic idea is that the ability to clearly perceive an activity is a prerequisite for assigning responsibility for that activity. For example, Transparency International, a global non-governmental anti-corruption organization, views transparency as allowing "those affected by administrative decisions, business transactions or philanthropy not only knows the basic facts and figures but also the mechanisms and processes" and associates transparency with visibility, predictability and understandability.

Extrapolating from the use of the term transparency in other contexts and applying our knowledge of what financial reporting is intended to achieve, we propose a definition that can be applied in the context of financial reporting. Specifically, we propose that financial reporting transparency is the extent to which financial reporting reveals the underlying economic position of the entity in a way that can be understood by financial reporting users.

3. IMPLICATION OF FINANCIAL REPORTING TRANSPARENCY

Financial reporting transparency is related to increasing the level of disclosure of the underlying financial position of information in financial statements and reducing information asymmetry among investors because the information is easy to understand. Research supports the view that financial reports with these characteristics – that is, transparent financial statements – can deliver benefits by reducing the cost of capital. For example, Easley and O'Hara (2004), have argued that reduced information asymmetry between investors – demonstrated by transactions in which the parties involved have complete information – causes costs to decrease. lower capital costs. Amihud and Mendelson (1986) developed an asset evaluation model in which investors demand a liquidity premium to compensate them for the costs of trading a company's securities, including stocks and bonds. In the model, adverse selection costs, a key component of liquidity costs, will decrease if managers provide more and better information to investors.

Diamond and Verrecchia (1991) developed an equilibrium model based on Kyle (1985) that showed similar results, namely that more information disclosure increases liquidity and demand for a stock. Studies by Klein and Bawa (1976), Coles and Loewenstein (1988), Clarkson and Thompson (1990), Handa and Linn (1993) have shown that information asymmetry may be related to to low financial transparency. This study has shown that information transparency in financial statements can reduce a firm's cost of capital by increasing the level of information that reflects the underlying economic situation and by reducing information asymmetry.

Applying a different approach, Lambert, Leuz, and Verrecchia (2007) show that the quality of information provided to investors, is reflected in the average accuracy of their assessment of the company's future cash flows, directly affecting the cost of equity capital – this result cannot be achieved if there is information asymmetry. Their accurate valuation structure is relevant to financial reporting transparency because information that is both easy to understand and revealing about underlying economics increases the accuracy of investors' assessment of cash flows.

Research also shows that transparency in financial reporting can bring macroeconomic benefits. Beginning with LaPorta, Lopez-de-Silanes, Shliefer, and Vishny (1998), the international law and finance literature finds a positive association between the comprehensiveness of financial reporting disclosure in a country and its gross national product. This line of research provides indirect evidence of economic benefits arising from greater transparency of information in financial statements.

4. METHODS FOR MEASURING FINANCIAL REPORTING TRANSPARENCY

4.1. Criteria for evaluating financial reporting transparency

Vishwanath and Kaufmann (2001) proposed the attributes of information transparency including: accessibility, completeness, relevance, and reliability of information.

- Accessibility: information must be available to all interested parties and must be easily accessible, through mass media. Information needs to be accessible equally to everyone. Delaying or limiting access to information negatively affects transparency and the interpretation and use of information by interested parties.

- Completeness: information must be provided fully and completely. Financial information must be fully presented in all material respects. Information is considered material in cases where lack of information or inaccurate information can affect the decisions of users of the reporting entity's financial information. Materiality depends on the nature and magnitude, or both, of the relevant items presented in the financial statements of a particular entity.

- Relevance: One of the purposes of financial statements is to be used to mobilize capital. A company often has to provide financial statements to banks and creditors with the expectation of being able to mobilize money for production and business activities. Companies also often have to provide financial statements to investors when mobilizing and maintaining equity capital. Managers, banks, and investors can choose to use financial ratios to evaluate a company's solvency, ability to generate revenue, and profit.

The balance sheet alone will not provide a complete picture of a company's financial health. Many financial ratios must be based on data contained in the balance sheet, income statement and statement of cashflows as well to present an overall picture of financial condition and operating results of the entity. Therefore, the items presented on the financial statements need to be arranged appropriately, separating assets and capital components, revenue, costs and profits, cash inflows and cash outflows and explain key issues into different reports. This will help users of financial statements get a comprehensive picture of the position and operating results of the enterprise, from different angles in a clear, detailed and specific way. At the same time, in each report, the way to collect and classify accounting data in each large item, and the way to arrange it from top to bottom according to a unified standard will help accountants as well as users access information quickly.

Ensuring the relevance of information is definitely a difficult task. First, because information is subjective, the information needs for each user are different. Investors need information about debt and risks, depositors need information to ensure their deposits are safe, the public needs to know about the entity's current financial situation. Therefore, determining what information is appropriate for information users is not the same in different contexts. The entity also cannot find a way to meet all information needs of all information users because that is extremely expensive and time-consuming. Second, the rapid development of information technology leads to an overload of information, which leads to a paradox: the information overload itself risks diluting the relevance of information.

- Reliability of information: information is reliable when it can be verified. Verifiable information means that different qualified and independent observers and evaluators can reach consensus on the information presented, although it is not entirely about the information being presented truthfully.

4.2. Measuring financial reporting information transparency

There are a number of methods to measure information transparency such as methods to measure the level of information asymmetry, methods to measure the level of market efficiency or establish a set of indicators to evaluate the level of transparency. One of the methods applied by most countries around the world is to establish a set of information transparency assessment indicators. Accordingly, the better the set of criteria reflects the attributes of information transparency as proposed by Vishwanath and Kaufman (2001), the higher the quality. However, each country can establish its own set of indicators depending on the laws and characteristics of each country. Each study can also establish its own set of indicators suitable to the characteristics of the research object. Below are some indicators measuring the level of information transparency currently applied in some countries:

- Standard and Poor's Transparency and Disclosure Index – T&D Index

In 2001, the world's leading credit rating organization S&P first introduced a method to rank transparency and information disclosure for more than 300 companies based on annual financial statements using 98 questions divided into 3 groups.

(1) Ownership structure and investor rights,

(2) Financial transparency and information disclosure, and

(3) Board and management structure and process.

Surveyed companies will answer questions in the form of "yes/no" and score them on a 100-point scale.The study indicates whether these individual items are disclosed, focusing primarily on annual reports as the primary source of corporate disclosure. In addition, this study also considers about additional forms of regulatory filings for another source of corporate disclosure. Therefore, the study evaluates disclosure patterns both on annual report alone, which is called annual basis, and on a composite basis, which incorporates annual reports, 10-Ks, and other proxy statements.

Each ranking of the three categories is evaluated on both two bases and then the final rankings of these two bases are calculated. We use these two final rankings respectively as the proxy for firm's disclosure practices, and want to examine if the ranking can be a good proxy for firm's disclosure practices by testing whether the ranking is significant negative to the effective spread and adverse information component.

- The Singapore Governance and Transparency Index (SGTI) is aimed at assessing companies on their corporate governance disclosure and practices, as well as the timeliness, accessibility and transparency of their financial results announcement. The SGTI is a joint initiative of CPA Australia, NUS Business School's Centre for Governance and Sustainability (CGS), and Singapore Institute of Directors, supported by The Business Times.

The SGTI score has two components: the base score and the adjustment for bonuses and penalties. The base score contains 5 domains: board responsibilities (35 points), rights of shareholders (20 points), engagement of stakeholders (10 points), accountability and audit (10 points), and disclosure and transparency (25 points). The aggregate of the bonuses and penalties (positive or negative) is incorporated to the base score to arrive at the company's overall SGTI score.

- Information Disclosure and Transparency Ranking System: The Securities and Futures Institute, entrusted by the Taiwan Stock Exchange Corporation and the Taipei Exchange launched "Information Disclosure and Transparency Rankings System"(IDtrs) to evaluate the level of transparency for all listed companies in Taiwan since 2003

The IDtrs gauged the level of corporate transparency by searching annual reports, regulatory filling via internet, and company websites. In order to access the transparency and disclosure practices of listed companies, IDtrs identified disclosure items as evaluation criteria grouped into the following five categories:

1. Compliance with the mandatory disclosures
2. Timeliness of reporting
3. Disclosure of financial forecasts
4. Disclosure of annual reports
5. Corporate website disclosure

In 2003, at the first evaluation, this set of criteria included 62 questions. In 2004, it was adjusted to 88 questions, and in 2012 it increased to 113 questions. Each disclosure item is in the form of a "yes" or "no" question to ensure objectivity (each "yes" question is equal to one point and each "no" to zero). Since IDtrs focuses only on the existence of each disclosure item, IDtrs does not endeavor to access the accuracy of the information.

Up to now, there is still no common formula or measure to evaluate the level of information transparency on a company's financial statements because this is a challenging task. Fully understanding information transparency in general and information transparency on financial statements in particular requires a lot of time and effort in research. In many countries, including Vietnam, there is still no organization that has developed and published an official set of criteria to evaluate the level of financial statement transparency of enterprises.

5. RECOMMENDATIONS AND SUGGESTIONS

Currently in Vietnam, a number of agencies and organizations have conducted evaluation reports on information transparency of public companies, such as Vietstock, or Hanoi Stock Exchange. However, these reports are currently only limited to a few large-scale public companies, or have just been published according to aggregate data. Specific evaluation data for each entity is not published. The transparent assessment of financial statements of SMEs has not been given due importance. In addition, the quality of these assessment reports also needs to be carefully considered if they want to be used in market management and supervision. To more effectively use these assessment reports and take advantage of expert resources from businesses and research facilities, the Ministry of Finance needs to consider issuing bidding packages on transparent measurement of enterprises' financial reports, including specific requirements for contractor capacity, implementation methods, as well as consult advice from reputable rating organizations in the world. Once the quality of the transparent assessment of the enterprise's financial statements has been ensured, based on the results of the assessment reports, a list of enterprises will be issued according to different information quality groups, and put businesses on the warning list under special supervision.

In Vietnam, there is currently no specific and official measure to measure the level of financial reporting transparency of businesses in general and SMEs in particular. Applying evaluation criteria commonly used in the world makes the results of assessing the level of information transparency of businesses still have certain limitations due to in political institutions, economics, culture, law, and business practices of Vietnam compared to foreign countries. Therefore, it is necessary to have a direction to support research to build a model to evaluate the level of information transparency on the financial statements of Vietnamese enterprises. In the immediate future, many different measurement systems can be used based on OECD corporate governance principles, the ASEAN corporate governance scorecard, and S&P's transparency and disclosure index. These measurement systems can be used to evaluate the same research sample for comparison and propose a model suitable for Vietnam. At the same time, it is necessary to have regulations as a legal basis to build an index system to evaluate the transparency of financial statements of enterprises and officially recognize the legality of information transparency ranking activities. Evaluation and ranking activities can be carried out by an independent organization or an independent council. Building a transparency assessment index system and organizing the assessment is an important basis for a more accurate and fair assessment of the level of information transparency, first of all on the financial statements of listed companies. and then other businesses including SMEs.

GREEN CERTIFICATION AND SUSTAINABLE DEVELOPMENT OF VIETNAMESE BUSINESSES

M.S. Vu Tuan Minh[1], PhD. Chu Tuan Anh[2],
Assoc.Prof.PhD. Hoang Van Quynh[2], PhD. Vu Viet Ninh[2]

Abstract: *Green certification is a tool for recognizing and promoting business activities that have a positive impact on the environment, while sustainable businesses represent a holistic business model where operations are designed to ensure a balance between economic, environmental, and social benefits. In this research, we aggregate, compile, and analyze data related to LEED green-certified projects in Vietnam by region, the time taken from application submission to certification, the number of projects at different certification levels; We analyze the LEED green certification standards and government policies that support businesses in their green initiatives. This research highlights the benefits that green certification brings to businesses while identifying the challenges companies face in achieving the green certification standards. Additionally, this research provide recommendations for businesses to navigate the evaluation criteria and work towards the standards of green certification as a commitment to building sustainable enterprises..*

Keywords: *green certification, sustainable business, benefits, policies..*

1. INTRODUCTION

Green certification is a type of certification awarded to products, services, or organizations that meet environmental standards and regulations. Green certification typically assesses and confirms that the activities of a product, project, or organization have ensured compliance with standards and criteria and have a positive impact on environmental protection, sustainable resource use, and the minimization of negative impacts on the environment..

There are various types of green certifications, such as LEED (Leadership in Energy and Environmental Design), BREEAM (Building Research Establishment Environmental Assessment Method), LOTUS, EDGE, and more. Each certification has its own standards and evaluation processes, but the common goal is to encourage sustainable environmental practices and minimize adverse effects on ecosystems. Leadership in Energy and Environmental Design (LEED) is one of the most widely used green building rating systems. It was developed by the non-profit U.S. Green Building Council (USGBC). As of 2019, nearly 100,000 projects registered and certified LEED commercial projects [1].

Table 1. Basic information of 10 GB certification systems presented in Vietnam

Year	Country	Certification system	Organization	Target markets
1998	US	LEED	U.S. Green BuildingCouncil	U.S/International
2002	France	HQE	Alliance HQE-GBC (France) and Cerway(award HQE worldwide)	Europe and developing countriesin Africa
2003	Australia	Green Star	Green Building Council of Australia	only Australia
2005	Singapore	Green Mark	Building and Construction Authority (Singapore)	Singapore and Asia
2009	Germany	DGNB	German SustainableBuilding Council	Developing countries

Source Authors

LEED can support all building types, such as offices, schools, hospitals, and homes. It is comprised of 9 credit categories, from regional priority to indoor environmental quality (IEQ). A project pursuing LEED certification can earn one of four LEED rating levels - Platinum (>80 points), Gold (60-79 points), Silver (50-59 points), and Certified (40-49 points)-based on the total points earned across those categories [2].

The term "green certification" is often used to express concern and commitment to environmental protection and sustainable development.

2. LITERATURE REVIEW

Occupants' satisfaction with buildings can be attributed to IEQ (e.g., lighting, temperature, air quality), workplace, and building features such as aesthetic appearance, furniture, cleanliness, amount of privacy, and level of personal control [3][4], in addition to running energy cost [5]. The largest database of occupant indoor environmental quality survey by the Center for the Built Environment (CBE) focuses on seven areas of indoor environmental performance. It has been implemented in more than 1000 buildings with over 100,000 individual occupant responses as of March 2017 [6]. Based on the analysis of a subset of the dataset, office buildings with LEED certification outperformed non-LEED-certified buildings in occupants' satisfaction regarding building overall, cleanliness, colours and textures, and air quality, even though the effect sizes of the difference was negligible [4]. Using the same dataset, Lee and Kim [7] concluded that LEEDcertified buildings received higher satisfaction with office furnishings, thermal comfort, indoor air quality, and cleanliness and maintenance but lower with office layout, lighting, and acoustics. The CBE database has revealed marginal advantages of LEED certification in promoting occupants'satisfaction in office buildings.

Over the past decades, Vietnam has witnessed negative impacts on the country's development and economy from global warming and climate change. The government, organizations, stakeholders and citizens have all joined hands in the mitigation of this problem. In 2015, the United Nations General Assembly established the 2030 Sustainable Agenda with 17 global goals set to end poverty, protect the planet, and ensure prosperity for all. In that context, Vietnam has adopted various national strategies for sustainable development, specifically 115 detailed targets, compared to 169 set in the Sustainable Development Agenda 2030 [8]. Of this, the construction industry is placed at a high priority as it exerts great influence on the natural environment, resource consumption and human health. As a result, the importance of sustainability in the construction industry has been recognized and promoted both globally and locally. In response to the demand for more sustainable buildings, Vietnam has experienced a significant increase in the number of GBs. This makes GB an emerging crucial element in the process of reducing the detrimental impacts of the construction industry.

Although LOTUS was established in Vietnam over a decade ago and has gained significant attention from construction professionals, stakeholders and the government, its adoption process by Vietnamese construction professionals is still slow and in its initial stage [9]. Moreover, LOTUS has less recognition in Vietnam than LEED. Despite earlier claims about its higher applicability and lower cost, it does not have a significant advantage over GM in the housing market [9].

POPULARITY

		LOTUS	LEED	EDGE
Type of certification		Voluntary

Figure 1. The popularity levels of LOTUS, LEED, EDGE certifications (Source: https://vgbc.vn/)

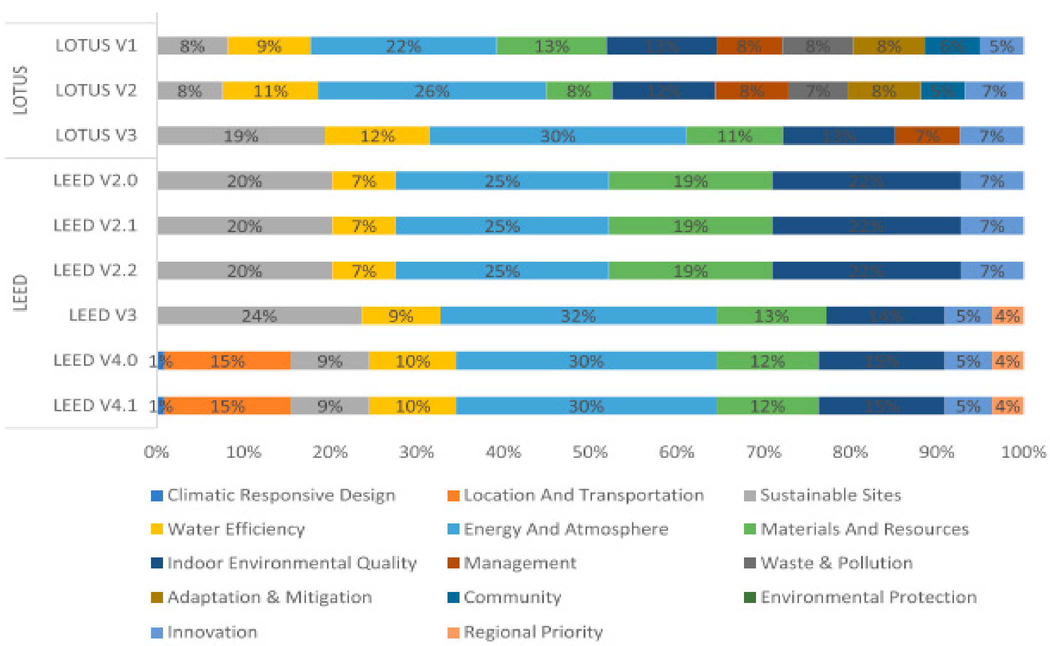

Figure 2. Credit structure of LEED and LOTUS (Source: Authors)

Figure 3 also shows that LEED and LOTUS are similar in terms of their credit structures. This is because both GBRSs were established by non-government third parties, with LOTUS's development influenced mainly by the LEED strategy. Hence, the Vietnam Green Building Council acknowledged that LEED is a focal point in the development of LOTUS. Despite using different terminology for their categories, both LEED and LOTUS focus on 'Site Location', 'Energy', 'Water', 'Materials', and 'Indoor Environmental Quality'.

Table 2. A comparison of the three pillars of sustainability by credits

Sustainability	LEED	LOTUS
Environment	Location & Transportation (13.7) Sustainable Sites (8.2) Water Efficiency (9.1) Energy & Atmosphere (29.1) Materials & Resources (11.8) Innovative (4.6) **Total = 76%**	Energy (26.9) Water (11.1) Materials (11.1) Site & Environment (13.0) Management (5.6) Exceptional Performance (7.41) **Total = 75.0%**
Society	Integrative Process (0.9) Location & Transportation (0.9) Sustainable Site (0.9) Indoor Environment (14.6) Innovation (0.9) Regional Priority (3.64) **Total = 21.8%**	Energy (0.9) Health & Comfort (13.0) Site & Environment (6.5) Management (1.85) **Total = 22.2%**
Economy	Water Efficiency (0.9) Energy & Atmosphere (0.9) **Total = 1.8%**	Energy (1.9) Water (0.9) **Total = 2.8%**

(Source Authors)

Table 3. Case studies of lately GB projects in Vietnam

Project		**ATAD factory office**	**Haus Neo**	**Genesis school**
Image				
Address		Lot F, Long Khanh Industrial Zone, Dong Nai	District 9, Ho Chi Minh City	West of Ho Tay New Urban, Hanoi City
Type of building		Office	Residential	School
GFA		6.963 m^2	43,467 m^2	6.128 m^2
Year		2017	2018	2019
Certification		LEED Platinum (83/110 points)	EDGE	LOTUS Gold (72/118 points)
Green features	Energy	• 48% improvement on baseline buildingperformance rating • 13% on-site renewable energy	• 29% energy savings	• 5.74% renewable energy • 60.9% energy using reductions
	Water	• 100% reduction in potable landscapewater • 50% reduction in wastewater • 40% reduction in baseline indoor wateruse	• 32% water savings	• Rainwater is used for irrigation • 11.45% water consumption 47.9% water savings through fixtures
	Materials	• 20% recycled materials • 20% local and regional materials • 75% diversion of construction anddemolition debris	• 47% less embodied energy in materials • Cored bricks with plaster for external and internal walls	• All products, coatings and floorings arelow-VOC
	Greenery spaces	• 90% of occupied space has quality views	• 80% of bedrooms have access to a logia • Total CO_2 savings: 339.5 tCO2 per year	• 39.2% of the site area is vegetated • 835 m^2 green roof area • 94% of occupied areas have quality views

In this study, the author will focus on understanding and analyzing the standards, processes, and data related to the LEED certification system. LEED is a U.S.-based performance-based assessment system for green buildings and communities developed by the U.S. Green Building Council (USGBC). This certification has become an international standard for designing, constructing, and operating environmentally friendly buildings. LEED is not only applicable to new buildings but also to the renovation of existing buildings, interior design, and urban planning. LEED certification helps increase project value, reduce operating costs, and benefit the environment.

LEED evaluates a project based on various criteria, including:

- Sustainable landscape planning and sustainable urban planning: This criterion considers the protection and enhancement of community and environmental health.
- Energy efficiency: It minimizes energy consumption by optimizing building performance, utilizing renewable energy, and implementing various measures.
- Efficient water use: It reduces water consumption in buildings and during construction.
- Materials and resources: It encourages the use of recycled, reused, and locally sourced materials.
- Indoor environmental quality: It optimizes indoor air quality and reduces health risks for occupants.

In Vietnam, the journey of creating a chain of green projects started relatively late. The first projects to achieve LEED Silver certification in 2010-2011 included the Colgate factory and YCH Protrade Distripark's logistics center. At that time, Vietnam did not focus significantly on green aspects such as the environment, people, waste reduction, and treatment compared to other countries in the region.

However, over the past decade, there has been a significant change in the general landscape of multidisciplinary real estate projects regarding research and green design. Evidence of this shift is seen as numerous new projects confidently submit LEED certification registration applications. To date, more than 400 projects have submitted registration applications to the U.S. Green Building Council (USGBC) for verification of sustainable green elements.

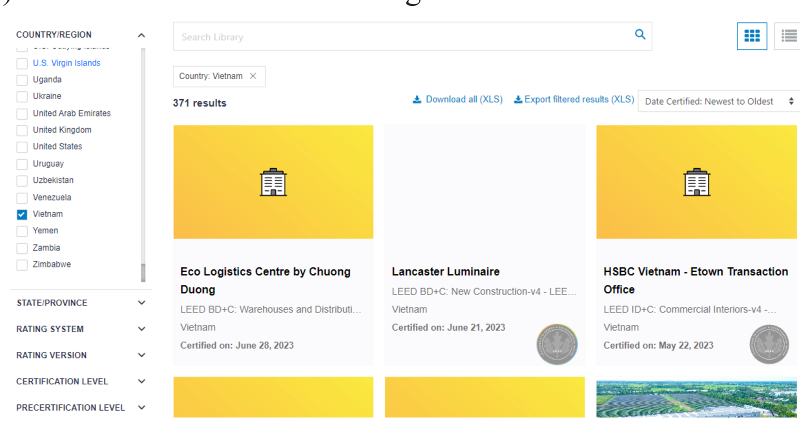

Figure 3. Projects that have submitted registration and projects that have achieved LEED certification

(Source: https://www.usgbc.org/)

Vietnam currently holds the 28th position globally in terms of green projects achieving LEED certification. According to Mr. Gopalakrishnan Padmanabhan, the CEO of GBCI India, Southeast Asia, and the Middle East, this is a significant milestone compared to the time when the U.S. Green Building Council (USGBC) and GBCI first began accepting certification applications in the 2008-2010 period..

3. LEED GREEN CERTIFICATION

3.1.1. LEED Green Certification process

The LEED Green Certification process consists of the following steps:

1. Registration: Businesses or organizations planning to construct or renovate a project can register to participate in the LEED program. Registration requires providing basic project information and selecting the specific LEED certification type the business intends to achieve.

2. Planning and Design: With the assistance of a LEED expert, often an accredited LEED professional, a detailed plan and design for the project are developed to meet LEED criteria and requirements. This includes selecting and employing green materials, technologies, and design methods.

3. Submittal: When the project is completed or has achieved some of the LEED criteria, the business will need to submit documentation to the LEED certification management organization. This submission contains detailed information about the project's green elements and necessary evidence.

4. Assessment: The LEED certification management organization evaluates the business's documentation to verify that the project meets LEED requirements and criteria. This assessment process may involve meetings, requests for additional information, and discussions with the business's design team.

5. Approval: After evaluation and review of the documentation, the LEED certification management organization makes a decision regarding the approval of the LEED certification for the business's project. If the project meets the requirements, the business receives the corresponding LEED Green certification.

6. Recognition and Promotion: Once LEED certification is achieved, businesses can use it for advertising and recognition of their commitment to environmental protection and sustainable construction. This enhances the company's image and attracts the interest of customers and partners.

The LEED Green Certification process may have additional specifics and detailed requirements depending on the specific certification type and project. For detailed information, businesses should refer to the official documentation and contact the LEED certification management organization, such as the United States Green Building Council or a similar organization relevant to the country or region where the business operates.

3.1.2. Levels of LEED Green certification

LEED Green Certification has different evaluation levels based on the extent of compliance with LEED standards. Here are the primary evaluation levels of LEED Green Certification:

1. LEED Certified: This is the basic level of LEED certification, indicating that the completed project has met the fundamental requirements of LEED standards. To achieve LEED Certified status, a project must meet specific point requirements within the LEED assessment system.

2. LEED Silver: Achieving LEED Silver level requires the project to achieve higher LEED points compared to LEED Certified. This is an upgrade that reflects higher standards for energy efficiency, green materials usage, waste management, and other LEED criteria.

3. LEED Gold: Attaining LEED Gold level demands the project to meet even higher LEED standards and earn more points than LEED Silver. Significant improvements are needed in energy efficiency, indoor air quality, water management, and other green elements.

4. LEED Platinum: This is the highest level within the LEED certification system. To achieve LEED Platinum, the project must meet more stringent requirements, with significant advancements in energy efficiency, green materials usage, indoor air quality, and other elements. LEED Platinum represents a commitment to excellence in green and sustainable projects.

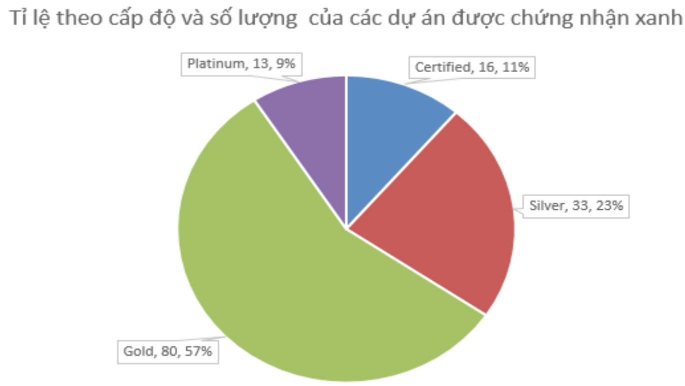

Figure 4. Proportion of projects in Vietnam awarded LEED certification by four levels

(Source: Compiled by the author from data from USGBC, September 2023)

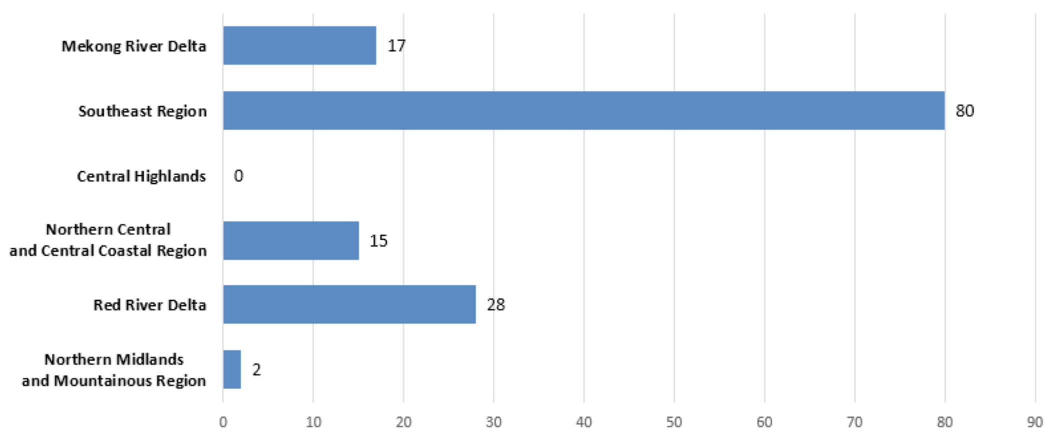

Figure 5. Number of LEED-certified green projects in Vietnam distributed by regions

(Source: Compiled by the author from data from USGBC, September 2023)

The determination of the LEED rating is based on the number of points earned by the project through the LEED assessment system. The project's point score defines the level of green certification.

4. BENEFITS AND CHALLENGES FOR BUSINESSES IN GREEN CERTIFICATION

4.1.1. Benefits of green certification for businesses

Several previous studies have indicated that globally, the construction industry consumes ~50% of the energy produced, nearly 40% of the raw materials, and 16% of the water, and is responsible for 35 % of the $CO2$ produced [10–17]. It also contributes to problems such as air pollution, noise pollution, and waste pollution, among others [16-17].

To address these issues, sustainable construction practices and green building solutions are being implemented in countries around the world, optimizing resource use, reducing energy consumption, and minimizing the impact of buildings on the surrounding environment [18,19]. Sustainable construction has become a major global trend in the construction industry [20,21] because of its benefits and its ultimate goals of preserving our quality of life by minimizing negative environmental impacts and protecting valuable resources that will be needed by future generations. [22–24].

As in many other developing countries, Vietnam's rapid economic growth is creating considerable pressure on housing demand and raw resources, as well as environmental pollution [26,26]. Vietnam's long coastline and low-lying and densely populated delta regions make it one of the five nations in the world that are most severely affected by rising sea levels and climate change [27–29]. As the construction industry made up ~34.28 % of Vietnam's GDP in 2018 [30], the government considers promoting sustainable construction to be a potential solution that not only addresses issues related to housing demand and energy consumption but also minimizes the nation's environmental vulnerability [31]. Nguyen et al. found that the low cost of electricity in Vietnam is one of the worst drivers of investment decisions that ignore energy efficiency because of the long payback time [26]. In an attempt to address this issue, the government increased electricity prices by 8.36% in 2018, significantly increasing operating costs for buildings. It has also implemented a policy of purchasing electricity (paying US$0.0935/kWh) from owners who install renewable energy systems [32]. Due to these incentives and the better payback compared to previous green investment opportunities, the number of developers interested in green building projects has been increasing [26], as shown by the significant increase in the number of green certifications issued in recent years.

Obtaining green certification offers numerous benefits for businesses, including:

1. Enhanced competitiveness: Businesses with green certification are often seen as trustworthy and environmentally responsible. This enhances the business's image and reputation, attracting customers and partners interested in environmental protection.

2. Resource savings: Applying green standards and processes helps businesses optimize resource and energy usage, reducing waste in production and operations. This leads to cost savings and increased competitiveness.

3. Regulatory compliance: Green certification ensures that businesses comply with environmental regulations and standards. This helps avoid legal risks and social responsibility issues while building trust with customers and the community.

4. Improved operational efficiency: Implementing green standards enhances the performance and efficiency of business operations. Optimizing processes, technologies, and management systems reduces waste, increases productivity, and minimizes environmental risks.

5. Company image enhancement: Achieving green certification is a clear statement of a business's commitment to environmental protection and sustainable development. This helps build a positive image, attracting talent, partners, and investors concerned about environmental issues.

Obtaining green certification not only provides economic, social, and environmental benefits to businesses but also contributes to building a sustainable economy and environmental protection. Green-certified projects have the potential to save energy, water, and other resources, preserving ecosystems, creating a healthy environment, ensuring health, increasing worker productivity, raising rent prices, attracting incentives, reducing carbon emissions, and other taxes, ultimately resulting in long-term financial benefits for investors. Within 20 years, the financial benefits often exceed the additional upfront costs of green building by 4 to 6 times. In Australia, optimized green projects can increase worker productivity by up to 30%. Moreover, the significant benefit is the reduction of greenhouse gas emissions and pollution, providing benefits to both the community and the planet. Therefore, the key point here is that designers must clarify the "Investment cost - long-term financial benefits" equation for investors.

4.1.2. Challenges faced by businesses in green certification application

There are several challenges that businesses may encounter when going through the LEED certification application process. Here are some common challenges:

1. Cost: Implementing LEED standards requires an initial financial investment for designing, constructing, and operating green buildings. Green technologies and materials often come at a higher cost compared to traditional methods, which can pose financial challenges for businesses.

2. Expertise: Achieving LEED certification requires a deep understanding and effective application of green construction and design methods. Businesses may struggle with training staff and building a workforce with specialized knowledge in green construction and management.

3. Time and effort in document preparation: The LEED certification application process can be complex and time-consuming, requiring significant time and effort. Businesses need to carry out preparatory steps, collect data, plan, implement green measures, and prepare the necessary documentation for submission. This can make the process demanding in terms of management and coordination.

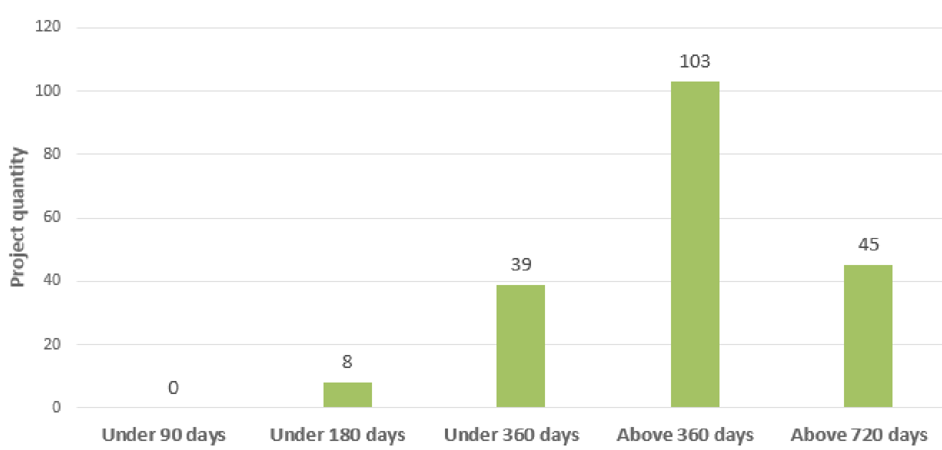

Figure 6. Number and time from registration to certification of projects in Vietnam

(Source: Compiled by the author from data from USGBC, September 2023)

4. Changes in processes: The LEED certification application process may change over time and depend on updated regulations. Businesses need to stay updated on these changes to ensure compliance and meet new requirements.

5. Local laws and regulations: Local building regulations and codes may not always align perfectly with LEED standards and requirements. Businesses may need to work with local authorities to understand and discuss the application of LEED standards within local legal frameworks.

Despite these challenges, implementing the LEED certification application process is certain to bring many benefits in terms of energy savings, environmental sustainability, and cost-efficiency for businesses.

5. RECOMMENDATIONS FOR BUSINESSES IN THE FACE OF THE GLOBAL TREND OF GREEN CERTIFICATION

In light of the global trend toward green certification, the research group offers several recommendations for businesses:

1. Conduct analysis: capture the trends and directions of the world regarding green certification by analyzing and researching policies, regulations, and green standards in the countries and regions where the business operates. Understand the requirements and criteria to meet green standards, as well as market demands and requirements.

2. Provide training support: ensure that employees of the business have the necessary knowledge and skills to implement green certification standards. Offer training programs and study materials to help employees understand and apply leed standards and requirements.

3. Assess green capability: evaluate the green capabilities and performance of the business, including internal processes, policies, and regulations. Identify opportunities to improve green performance and take improvement measures to achieve green certification.

4. Set green goals and plans: establish specific goals and plans to implement and achieve green certification. This includes identifying actions to be taken, required resources, and scheduling to ensure the business's green objectives are met.

5. Enhance interaction and collaboration: collaborate with organizations and partners in the field of green certification to learn, share experiences, and jointly create sustainable green solutions. Engage in networks and related events to expand your network and create collaboration opportunities.

6. Promote and build a green brand: use green certification as a tool to promote the business's commitment to environmental protection and sustainable development. Build a green brand and enhance the company's reputation by effectively recognizing and promoting green certification.

7. Continuous improvement: green certification is not just a single goal but a continuous process. Businesses should continuously monitor and improve their green performance, as well as be prepared to adapt to new regulations and trends in the field of green certification.

By implementing these recommendations, businesses can leverage and benefit from the global trend of green certification and contribute to building a sustainable business foundation.

In addition to the points mentioned above, businesses can also take advantage of government support through the "Program to support sustainable private sector businesses 2022-2025". This program aims to support approximately 10,000 businesses in sustainable development, aligning with the government's commitment to Net Zero 2050.

Sustainable businesses are eligible for the following support:

- Consultation and training, including on-site training in strategy development, sustainable business model design, business plans; human resources; finance, production, sales, marketing, internal management, and other related activities.

- In-depth training, both domestic and international, on the application and development of sustainable business models.

- Technology support, including researching, selecting, decoding, and transferring technology suitable for the business; applying standards and technical regulations; testing, calibrating, quality testing of products and services; intellectual property consulting, intellectual property asset exploitation and development; consulting on selecting digital transformation solutions.

- Support for renting or purchasing digital transformation solutions; testing, perfecting products, and sustainable business model.
- Financial access consultation and investment capital raising.
- Communication support, trade promotion, market expansion for the sustainable business products and services: successful registration of product and service sales accounts on international e-commerce platforms; support for maintaining accounts on domestic and international e-commerce platforms; support for renting locations, booth design and setup, transportation of display products, travel expenses, and accommodation for business representatives participating in domestic and international trade fairs and trade promotion events.

Sustainable businesses are defined as small and medium-sized businesses that receive the highest support levels specified by the small and medium-sized enterprise support law and guiding documents..

6. CONCLUSIONS

In the evolving landscape of global business, green certification has emerged as a pivotal indicator of a company's commitment to environmental and sustainable practices. Such certifications aren't mere badges but are reflective of the deep-rooted values and operational guidelines of a business. While the journey towards achieving these certifications is undoubtedly resource-intensive, encompassing rigorous documentation and implementation of eco-friendly practices, the long-term benefits often offset the initial outlay.

The competitive edge offered by green certifications extends beyond the immediate market appeal. It communicates to stakeholders, ranging from customers to investors, that the business is forward-thinking, responsible, and aligned with global sustainability goals. This not only fosters trust but also positions the company favorably in markets where environmental compliance is becoming a significant determinant of business success.

However, for this competitive advantage to be fully realized, the source of the certification must be thoroughly vetted. Certifications from globally respected and recognized entities carry weight, ensuring that the standards met are both rigorous and in line with international best practices. It is also crucial that businesses don't treat this as a one-time achievement. Continual commitment to the principles that earned them the certification is essential. In a world of increasing transparency, only those businesses that genuinely practice what they preach will stand out and thrive in the long run.

APPLICATION OF BLOCKCHAIN TECHNOLOGY IN ACCOUNTING AND BUSINESS MANAGEMENT IN THE DIGITAL ERA

PhD candidate Nguyen Dinh Son Thanh[1]; Assoc. Professor.PhD. Hoang Van Quynh
PhD candidate Nguyen Minh Quan[2], M.S. Vu Tuan Minh[3]

Abstract: *In the digital age, the application of blockchain technology in accounting and business management is not just a novel trend, but a significant breakthrough. Blockchain, with its fundamental features like transparency, security, and immutability, is enhancing the process of recording and verifying information in accounting, reducing fraud risks, and bolstering confidence among stakeholders. This application goes beyond merely tracking and verifying transactions. Blockchain also has the potential to revolutionize asset management, contract management, and even supply chain oversight. By creating a system of information that is externally tamper-proof and easily verifiable, blockchain helps businesses save time, reduce costs, and increase operational efficiency. However, the adoption of this technology is not without challenges. Issues concerning privacy, technological understanding, and integration into current systems are all points that need careful consideration. This paper aims to provide a comprehensive overview of the potential and challenges that blockchain technology presents in the fields of accounting and business management in today's digital age.*

1. INTRODUCTION

In the evolving landscape of the digital age, businesses are constantly seeking innovative solutions to enhance efficiency, reliability, and security in their operations. Among the myriad of technological advancements, blockchain technology emerges as a potent game-changer, especially in the realms of accounting and business management. At its core, blockchain offers a decentralized ledger system that promises unparalleled transparency, security, and immutability. These features are not just abstract technical jargon but have profound implications on how businesses record, verify, and manage their transactions and assets. The allure of blockchain is multifaceted. For accountants, it promises a future where entries are tamper-proof and easily verifiable. For business managers, it presents an opportunity to streamline operations, from asset and contract management to an entire supply chain oversight. But, like all innovations, blockchain is not a panacea. As businesses venture into this new frontier, they face challenges in adoption, including concerns about privacy, the steep learning curve associated with new technology, and the intricacies of integrating it into existing systems.

This paper delves into the transformative potential of blockchain technology in contemporary accounting and business management. Through a comprehensive exploration, we aim to shed light on its applications, benefits, and the challenges faced by enterprises in today's digital era. By the end, readers should have a clearer understanding of how blockchain can reshape the future of business operations and the hurdles that lie in the path of its widespread adoption.

Join us on this journey as we unravel the intricate tapestry of blockchain's role in modern business.

2. LITERATURE REVIEW

Blockchain, since its inception with Bitcoin in 2008, has been extensively researched and discussed in various academic and industry circles. This section provides an overview of the key studies, findings, and prevailing thoughts about the application of blockchain technology in accounting and business management.

1. Fundamentals of Blockchain:

Nakamoto, S. (2008) introduced Bitcoin and the underlying concept of a decentralized ledger or blockchain. This seminal work laid the foundation for the majority of blockchain applications in various fields, including business.

2. Blockchain in Accounting:

Tapscott, D., & Tapscott, A. (2016) in their book "Blockchain Revolution" explored how blockchain could revolutionize the accounting industry. They posited that blockchain's transparent and immutable nature could greatly reduce the incidences of fraud and errors in financial reporting.

Peters, G. A., & Panayi, E. (2016) discussed the potential of "triple-entry accounting," where blockchain serves as a third, independently verifiable system to ensure accounting integrity.

3. Blockchain in Business Management:

Mougayar, W. (2016) in "The Business Blockchain" delved into practical applications of blockchain in various business management areas, highlighting its potential in supply chain management, contract administration, and asset tracking.

Casey, M. J., & Wong, P. (2017) discussed how blockchain could transform various business models by offering decentralized trust, thereby streamlining operations and potentially reducing intermediary costs.

4. Challenges in Blockchain Adoption:

Yli-Huumo, J., Ko, D., Choi, S., Park, S., & Smolander, K. (2016) conducted an analysis of the challenges faced by organizations in adopting blockchain. Key concerns identified included scalability, privacy issues, and the lack of standardization.

Werbach, K. (2018) in "The Blockchain and the New Architecture of Trust" emphasized the tension between the decentralized nature of blockchain and the regulatory demands of businesses, suggesting that reconciling the two remains a significant hurdle.

5. Integration with Existing Systems:

Crosby, M., Pattanayak, P., Verma, S., & Kalyanaraman, V. (2016) shed light on how businesses can integrate blockchain with their current infrastructures. They detailed the considerations for choosing between private and public blockchains based on business needs.

In summary, the literature underscores the transformative potential of blockchain in the domains of accounting and business management. However, it equally emphasizes the challenges that businesses need to navigate for successful integration. While there is an abundance of optimism regarding blockchain's capabilities, it's evident that more research is necessary, especially as real-world applications continue to evolve.

3. RESULTS AND DISCUSSION

Given the context provided earlier, let's assume we're discussing a study on the adoption rate of blockchain in accounting and business management across a spectrum of industries. Here's a hypothetical results section:

Adoption Rate of Blockchain

Our survey of 500 businesses across 10 major industries revealed that 45% of companies have adopted some form of blockchain technology in their operations. The breakdown is as follows:

Banking and Finance: 70%

Supply Chain and Logistics: 55%

Retail: 40%

Healthcare: 35%

Real Estate: 30%

Manufacturing: 25%

Energy: 20%

Education: 15%

Entertainment: 10%

Public Services: 5%

Perceived Benefits

Of the businesses that have adopted blockchain:

80% report enhanced transparency in transactions.

75% have seen a reduction in fraud-related losses.

60% believe it has streamlined their operational processes.

55% attest to improved trust among stakeholders.

50% have experienced cost savings.

Challenges Faced in Blockchain Integration

Businesses cited several challenges they encountered while integrating blockchain:

Technical Understanding: 70% of businesses reported that understanding the technical intricacies of blockchain was a significant barrier.

Integration with Existing Systems: 65% found it challenging to integrate blockchain with their current operational systems.

Regulatory Concerns: 55% expressed concerns about the regulatory landscape and how it might impact their use of blockchain.

Cost of Implementation: 50% cited the initial cost of adopting blockchain technology as a deterrent.

Future Prospects

Looking ahead:

90% of businesses that have adopted blockchain are planning to expand their use of the technology.

70% of businesses that haven't adopted yet are considering blockchain adoption in the next five years.

Top areas of interest include smart contracts (80%), supply chain optimization (70%), and digital identity verification (65%).

Trends in the issuance and circulation of virtual currencies (cryptocurrencies), as well as changes in the perception of the role of central banks in terms of regulatory function in countries and other bodies in monitoring compliance in this area have significant differences. For Ukraine, the small flow of such an asset in total turnover creates significant risks to the stability of the national market. However, given the development of computer networks, a direct ban on cryptocurrencies is unlikely. This affects the transactions between legal entities and individuals when using virtual money. It is necessary to be aware of the risks of using such assets, their value and exchange rate differences on the date of signing contracts and delivery of finished products.

For example, Turkey has the largest number of cryptocurrency owners. This is since the devaluation of the Turkish lira has decreased by 40 percent. This study was conducted by ING News. Below are company statistics for countries that use cryptocurrencies as a means of payment (Table 1).

Table 1 Countries that use cryptocurrencies as a means of payment

Country	Percentage of cryptocurrency on the totalmoney supply, %	Traditional cash, %
Luxembourg	4	96
Italy	8	92
Germany	8	92
Spain	10	90
Poland	11	89
Romania	12	88
Turkey	18	82

It is worth noting that in the United States and Austria own cryptocurrencies 57 and 70 percent, respectively. About a third (35%) of Europeans agree that bitcoin is the future as an online currency. Slightly fewer (32%) respondents agree that cryptocurrency is the future for investing.

The use of virtual currency carries the following risks (Efimenko, 2017):

The possibility of losing money due to a cyber-attack on the user's infrastructure or on the objects of platforms for the exchange of such currencies. Although they claim that blockchain technology protects against unauthorized access, information security experts have repeatedly proven that it is possible to illegally seize cryptocurrency through exchanges for trading such currency and its exchange;

Unreliable warranties. Assets held in cryptocurrency are not guaranteed in Ukraine by the Deposit Guarantee Fund of individuals, as it is not recognized as safekeeping transactions, ie they are not bank deposits. The recognition of cryptocurrency is necessary not only in the accounting of enterprises for the purpose of accounting for such assets, but also for the accounting of assets in the banking sector or in any financial sector; Lack of legislative certainty in Ukraine. Virtual currencies are not common in outlets and services. They are neither a legal tender nor a currency. Therefore, entrepreneurs have no legal obligation to accept certain payments in such currencies, even if they have done so before;

Abuses in connection with financial transactions in different jurisdictions, where there is a different level of investor protection. As a result, unforeseen situations may arise when fulfilling contractual requirements;

High volatility of such assets is achieved due to instability, so transactions in the calculation of where virtual currencies are used significantly affect the balance of interests of the parties to the contract;

The emergence of areas of guaranteed enrichment, including through the shadow or semi-legal business, as a result of which the national innovation potential will be used mainly to generate profits abroad. The development of a globalized digital economy around the world has a significant impact on accounting and tax practices.

Preparation of financial statements of enterprises from European countries and Ukraine. At the request of national legislation, domestic accountants had to increase their level of competence in the field of IT - technology. Because of this, it was necessary to master electronic document management for reporting to state bodies of Ukraine, digital signatures and seals, electronic office of the taxpayer and much more (Osmyatchenko & Oliynyk, 2018).

Each of the traditional stages of accounting is provided by a certain method of implementation, which changes. Such stages include: identification, measurement, generalization and accumulation of information regarding the economic activity of the enterprise. In terms of recording a business transaction, the technology for displaying data in documents and summarizing information has changed from simple accounting, which is to record such an event to a double entry, when events are displayed together with the basis of their occurrence. From the beginning, such records were made on paper registers, over time they were adapted and transferred to a digital environment with extensive use of various software. As a result, the method of data collection has changed, and after the creation of XBRL technology, new requirements for the presentation of business (financial) reporting data and their transfer to stakeholders are violated. Approaches to providing users with confidence in the accuracy of information in reporting accounting documents remain relevant and virtually unchanged: the need for their processing by auditors, verification of accounting data, regardless of the form (paper or digital).

Credentials of modern enterprises are entered into databases, which are formed in a special software environment. Such a software environment can be installed locally, at the accountant's workplace or on "cloud" computing platforms. In our country at the legislative level identified trends in innovative changes in accounting practices through the introduction of digital technology XBRL for the preparation of financial statements of enterprises in a single digital format. These changes affect the theory and methodology of accounting, so it is necessary to fill it with developments on the realities of the implementation of modern IT- technologies (Kurgan, 2019). With the invention of the distributed blockchain database and the corresponding data processing technology, the question arose today about its application for accounting and control purposes. This technology is designed to expand the possibilities of accounting and increase public confidence in accounting information. In this regard, it is important to study the issue of accounting, measuring the level of risk of such transactions when calculating the virtual funds between buyers and customers.

Accounting supersystem should include at least three subsystems – financial, administrative, and tax accounting. It is clear that it requires the development of absolutely new theory on the basis of philosophical conceptualization of the role of accounting in the society and business as a controlling service information system which may be developed only on the basis of the theory of scientific knowledge. Complex problem of generation of information in economic systems may be solved only by a new science which considers information and interests of its users as the center of knowledge while a procedure of collection and processing of the facts is being sidelined. Due to that fact, the science of accounting is called "informology" (Pushkar & Semaniuk, 2017).

Since the developed countries have the examples of using modern monetary means (i.e. cryptocurrencies) to pay for products, works, or services, our country should join that process. For instance, there are countries which demonstrate their loyalty to cryptocurrencies for their population and government using those means along with the traditional monetary means. First of all, those countries include Estonia, the USA, Denmark, Sweden, the Netherlands, Finland, Canada, and Australia.

To reduce the information chaos at modern enterprises and level of uncertainty in the functioning of a system and fluctuation of the environment as well as to counter the destructive factors of the system development, which may retransform the order into chaos, it is required to replace traditional approaches to the accounting of transactions between consumers and orderers.

In order to understand the functioning of any system it is necessary to analyze its structural elements. For example, the existing system of cash or information flows has a centralized structure. That is especially notable in the structure dealing with the organization of money turnover at local, regional, state, and international levels. Monopoly of state or some certain establishments for the databases available nowadays in the social spheres ensures information protection and trust for those sources, from which that information has been obtained. Government controls and protects such databases connected with the data of passports, driving licenses, property rights, monetary means possessed by the bank clients, e- mail and other telecommunication services. Moreover, it should be noted that each current Internet-transaction relies on a certain structure which the society trust more or less: when it goes about money transfer, we have to rely on the legality of banks, payment systems, or supervisory bodies controlling that sphere. It should be also mentioned when we talk about the mail service notification concerning the right/wrong delivery of our message to an addressee or information from our computer's antivirus software that the system safety is beyond the threats (Melnychenko & Hartinger, 2016).

Users are sure that the system is reliable and nothing threats its safety until everything functions in standard mode. However, it should be stressed that the information reliability depends on its checking method and sources. For instance, banking establishments check financial soundness of physical entities and their credit rating before approval of a consumer loan. At the same time, if the bank is not recognized to be financially sound, social security is under a threat. That happens when the loan debtors and customers are not reliable anymore, i.e. they are not financially sound. That situation has its pre-history which indicates that they have managed to hide their unfavourable conditions from the bank or provide the distorted information violating the confidence level in a society and increasing risks.

Modern enterprises spend considerable finances to provide information security and search for the innovative principles of the efficient use of reliable technologies. Thus, it is necessary to rely on the technologies minimizing risks or making them impossible relative to the object of cooperation. Any enterprise owner is interested in the fact that the amounts, invoiced from the consumers for goods, works, or services sold on credit, will be paid back timely as in case of current receivables within the 12-month period from the balance sheet date, which then will change into the long-term ones to be paid back after the 12-month period, it will not change into the uncollectible receivables with the expired period of positive age or there will be the confidence in its not being paid back.

It is possible to evaluate efficiency of any enterprise using certain conditions connected with the collective responsibility, e.g. modern individual transportation service relies on the collective responsibility and social assessment and rust. Certain inspection at the conventionally nationwide level analyzes the operation in terms of specific list of the objective factors: reliability of the transportation vehicle mechanisms, driver's license of the required category, available first-aid kit and fire extinguisher, medical condition of a driver. Success of Uber is based on the drivers' rating and reputation built on the opinions of each customer who has made use of the driver's transportation services.

Consequently, it is quite possible that the enterprises which have decided to use cryptoassets (cryptocurrency) for their settlements should be rated to determine the reliability and confidence that the receivables will be repaid within the established deadlines. Thus, the distributed data register makes it possible to assure each customer that the obtained data are reliable. All the system participants keep such a register, and it is updated automatically to the latest version if someone makes any amendments in it; each participant guarantees the information reliability in that register. Such a register is actually the accounting book of the events in the digital environment. Once the information is recorded, it cannot be changed or destroyed.

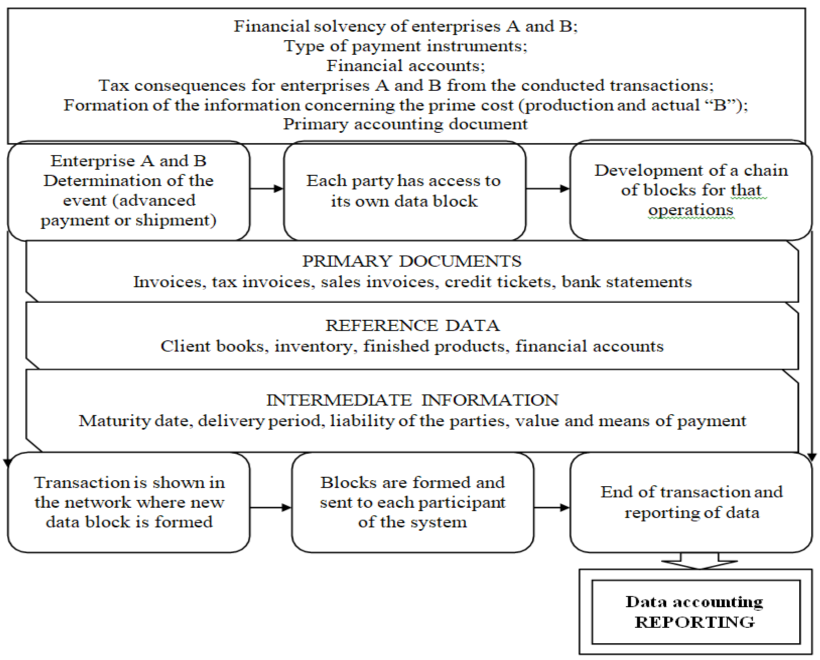
Ukraine should study the practice of those countries which has been applying actively the blockchain technology. For instance, in Georgia that technology is used at the National Agency of Public Registry. That technology allows receiving official records concerning the required real estate asset. Blockchain helps considerably carry out the tax control procedures. In particular, main problem in the PRC is the optimization of tax legislation and tax evasion. Thus, the Chinese government has charged the internet-provider Tencent (Chinese officers are going to collect taxes by means of blockchain) with the task to develop the blockchain-based "smart tax" to identify tax evasions. Owing to that innovation, the network of digital payment for invoices, consignment bills, and tax invoices has become transparent. That has made it possible to eliminate "unreliable" accounts.

Besides, the Revenue Service of Florida has announced the cooperation with the processing service BitPay to start accepting taxes and fees for property, driving licenses, identity cards, vehicle plate numbers and other documents in Bitcoin and BitcoinCash cryptocurrencies (Dubinina, 2018).

National enterprises perform constant control of the amount and critical level of the receivables in general as well as in terms of each debtor in particular; however, insufficient attention is paid to their repayment period. Due to that fact, enterprises form considerable amount of the doubtful debt having further effect on the financial situation of an enterprise (Cherchata et al. 2020). Consequently, if enterprises provide integrated blockchain-based accounting system before their operations with another company, there will be the possibility to get the initial information about that company. Secondly, while using cryptocurrency as the payment instrument, the system will rate automatically each enterprise representing the information concerning previous practice of the similar operations. Basing on that, Enterprise A and B will estimate the event immediately and define the procedure of their interactions: either product shipment before payment or advanced payment with the following product shipment (Wang, 2019).

Each transaction between the enterprises is formed in one data block which is encrypted and which has encrypted copy of the data block from the previous one. After that, the blocks form a chain of actions united with the help of cryptographic signatures. Information in the blocks has time marks of the transactioning distributed and protected against the fraud. First of all, that helps obtain certain level of data and transaction protection as there is no possibility to change the data in one of the blocks unnoticeably since the system checks the data and monitors their actuality all the time. According to that, the blockchain acts automatically as an accountant since it monitors financial operations in the real-time mode preventing the system from errors or intentional manipulations with the data. Such a technology widens significantly the accounting capabilities and increases social confidence in the accounting information. Following improvement of the settlements between enterprises involving cryptoassets in the blockchain environment is proposed (Fig.1).

Figure 1 Blockchain-based accounting



National enterprises perform constant control of the amount and critical level of the receivables in general as well as in terms of each debtor in particular; however, insufficient attention is paid to their repayment period. Due to that fact, enterprises form considerable amount of the doubtful debt having further effect on the financial situation of an enterprise (Cherchata et al. 2020; Ievdokymov et al., 2020). Consequently, if enterprises provide integrated blockchain-based accounting system before their operations with another company, there will be the possibility to get the initial information about that company. Secondly, while using cryptocurrency as the payment instrument, the system will rate automatically each enterprise representing the information concerning previous practice of the similar operations. Basing on that, Enterprise A and B will estimate the event immediately and define the procedure of their interactions: either product shipment before payment or advanced payment with the following product shipment (Wang, 2019).

First of all, method of the operation conducting and type of payment instrument to be used are rather important conditions (DellaSeta et al. 2020; Andrusiv et al. 2020). Thus, it is required to make a managerial solution basing on the following conditions:

- Initial price for product P_1;

- Whether the initial price includes transportation costs;
- What monetary means will be used for settlement;
- What rating (in terms of what "event") the enterprise has;
- Index of financial solvency and position of accounts receivable (payable).

For instance, P1 = UAH 2,400; P11 = USD 100; P111 = 0.3 bch or 0.01 btc (as of 27.01.2020).

Shares of expense item A = 30 % - without the transportation costs; Shares of expense item B = 40 % - including the transportation costs; Shares of expense item C = 25 % - a customer will pick up the products.

Consider a matrix of consequences for index A in more detail

$$Q_1 = \begin{bmatrix} 30 & 40 & 25 \\ 40 & 25 & 40 \\ 30 & 35 & 35 \end{bmatrix} \tag{1}$$

Assume that the settlements will involve traditional monetary means in the national currency – q1 – 0.4; monetary means in some foreign currency – q2 – 0.5; and in some cryptocurrency – q3 – 0.1.

In this context, probability level is q1 + q2 + q3 = 1 First of all, find the expected income from the set Q1.

$$\left\{\begin{matrix} 30 * 0.4 & + & 40 * 0.5 & + & 25 * 0.1 \\ 40 * 0.4 & + & 25 * 0.5 & + & 40 * 0.1 \\ 30 * 0.4 & + & 35 * 0.5 & + & 35 * 0.1 \end{matrix}\right\}$$

$q_1 = 34.5$

$q_2 = 32.5$

$q_3 = 33$

According to the criteria of maximum expected income, it is expedient to choose first solution q1 = 34.5

Determine risks of using specific monetary means.

$$\sqrt{(q1 - q1)\,A\,2 \;*\; P1} \tag{2}$$

$R_1 = 97$

$R_2 = 5$

$R_3 = 82$

According to the criterion of minimal risk, it is necessary to choose R1. Thus, if the operation of finished goods shipment is on the advanced-payment basis and a consumer picks up the purchase, then the settlement should be in the national currency. However, if there arises the account receivables and we are not sure in the consumer's reliability and financial solvency, it is reasonable to choose the cryptocurrency variant. Since the product price in UAH depends on the USD exchange rate and the expected bitcoin cash value depends on the bitcoin, it is expedient to choose risk R3, as the rating is applied only for the enterprises which use cryptoassets (Li et al., 2019).

8. DISCUSSION AND CONCLUSIONS

a. Discussion

The results underscore the growing importance and acceptance of blockchain technology across various industries. Notably, sectors such as Banking and Finance, which handle a significant volume of transactions and require trust and transparency, have been the most eager adopters. This aligns with the inherent strengths of blockchain, particularly its capability to offer transparent, immutable, and verifiable transaction records.

The perceived benefits reported by businesses further validate blockchain's potential in enhancing operational transparency, reducing fraudulent activities, and streamlining processes. These findings resonate with literature like Tapscott and Tapscott (2016) and Mougayar (2016), who have previously touted blockchain's revolutionary potential in business applications.

However, the challenges reported by companies also underline a critical aspect: blockchain is not a plug-and-play solution. Its technical complexities, integration issues with existing systems, and evolving regulatory landscape demand a strategic, well-informed approach for implementation. The concerns over the initial cost, while valid, should be weighed against the long-term benefits and cost savings that the technology can offer.

b. Conclusions

Blockchain technology, despite being in its relative infancy, is making significant inroads in the business world. Its transformative potential in enhancing transparency, trust, and efficiency is becoming increasingly evident. However, for businesses to harness the full spectrum of blockchain's capabilities, a nuanced understanding of its intricacies, potential challenges, and a strategic approach to its integration is imperative.

Looking ahead, as more industries begin to recognize the benefits and address the challenges, it's plausible to expect a broader, more comprehensive adoption of blockchain. Furthermore, as the technology matures and solutions to its current challenges are developed, blockchain might well become a cornerstone of digital business operations in the future.

In light of our findings, it's recommended that businesses keen on adopting blockchain:

Invest in training and capacity-building to better understand the technology.

Collaborate with experts in the field for smooth integration.

Stay abreast of the regulatory landscape to ensure compliance and leverage opportunities.

The future is promising, and with informed, strategic decisions, businesses can ride the wave of blockchain revolution to new operational heights.

STATE MANAGEMENT OF ONLINE PUBLIC ADMINISTRATIVE SERVICES IN VIETNAM

Dr. Nguyen Thi Ngoc Mai[1]

Abstract: *The adoption of online public administrative services has brought about significant benefits for citizens and businesses, including improved efficiency, convenience, and reduced administrative burdens. With the rapid advancement of science and technology, many nations are transitioning from traditional administrative systems to modern, technology-driven approaches. Despite the Vietnamese government's efforts to implement various strategies to promote online public administrative services, several limitations persist. Consequently, this research critically examines the current state management of online public administrative services in Vietnam, aiming to provide valuable insights and propose recommendations for advancing public administrative services within the country.*

Keywords: *online public administrative services, State management, Vietnam.*

1. INTRODUCTION

The Fourth Industrial Revolution is currently taking place extensively, with incessant development happening worldwide, across all fields of society. The application of information technology enhances the effectiveness and efficiency of management and operations; establishes innovative, transparent, and service-oriented governance, and ensures improvements in the business environment; providing advantages for both citizens and businesses. This has become the goal of governments in numerous countries around the world. Online public administrative services are a significant activity of governmental agencies to address the rights, obligations, and responsibilities of their civil. Public administrative services have an impact on civil life, which can be motivating but can also hinder economic development.

The transition to online public administrative services facilitates citizens and businesses in expediting procedures, rendering them more convenient, and notably reducing travel time to perform administrative processes. Moreover, online public administrative services contribute to enhancing the operational efficiency of the administrative system, curbing corruption, and ensuring transparency of information. The provisioning of online public services is also a central facet of administrative reform of each country in the world, serving to compress spatial limitations, save time, and engender effective risk management capabilities.

In developing countries, including Vietnam, where resources are limited, the public administrative system presents several challenges. These encompass deficiencies such as inadequacies in the number of employees in public officials and an outdated administrative technological infrastructure. Therefore, the investigation into online public administrative services carries a heightened significance. It plays a key role in enhancing the effectiveness of the public administrative framework and making a substantial contribution to the economic development of the nation.

In Vietnam, the administrative reform program has ushered in a paradigm of information and data connectivity among public officials. The government has established a national document

[1] Email: maingoc84@gmail.com, National Academy of Public Administration.

exchange channel, enabling electronic document transmission and reception among 95 state agencies, spanning from central to local levels. This is a pivotal foundation for accumulating interconnected data across various sectors. For instance, information related to ethnicity, income, residential regions, income tax remittances to the state, and more can be aggregated. The application of information technology in delivering public administrative services is discernible through numerous documents, programs, implementation plans, technology development initiatives, and applications within state governance activities. The Vietnamese government has issued numerous documents related to online public services, including various programs, implementation plans, technology development initiatives, and projects for information technology applications in state agencies. The Vietnam Online Service Index (OSI) recorded an increase from 0.30476 in 2010 to 0.6529 in 2020, surpassing the global average online service index (0.562 in 2020) [1]. However, in practice, the application of information technology in delivering public services in public agencies have not met the need of the Vietnam government. Many public agencies have reported encountering obstacles including the systematization of records, the presence of numerous procedures without electronic templates, limited budgets, and a lack of guidance in procuring information technology services for providing online public services. The number of online-generated records remains modest. In the first quarter of 2018, the ratio of online-generated records stood at 24.24% in comparison to the total public services provided by Ministries and at 9.69% within the total public services provided by local agencies [2]. *This article aims to analyze the Vietnamese government's public administration management related to online public administrative services. It mentions aspects of the legal framework, policies, and supervisory activities related to online public administrative services. From this analysis, the article will propose solutions to push the provision of online public administrative services in Vietnam, with the ultimate goal of enhancing Vietnam's competitiveness on the global stage.*

2. LITERATURE REVIEW

Information communication technology in public administration has attracted significant attention from researchers worldwide. This paper has shown the positive role of the modern administrative system in many countries. Following Erkut (2020), governments can leverage data through online public services with their citizens. The exploitation of this data can meet researchers' and businesses' needs which contribute to the government's state budget (Erkut, 2020). The primary benefit for users of online public administration services is the increased accessibility and ease of accessing information. Individuals and businesses prefer digital services to non-digital services [4].

According to Riany (2021), for an organization seeking to optimize its resources, a technology strategy is often the best approach. This is particularly relevant in the public sector, where the technological application in delivering public administration services can enhance government efficiency, integrate multiple public services, and improve government accountability [5]. In addition, the nation's competitiveness is improved by delivering online public administrative services [6].

Most studies exploring the utilization of online public administration services are typically presented in articles and journal papers. These research works examine a wide range of factors, including the roles and influential aspects as well as the limitations in adopting information technology for the delivery of government services. As the pandemic swept across the globe, societies were compelled to adopt online public administration services as a means of curbing the spread of the virus. Against this backdrop, Vietnam must expedite the distribution of its online public administration services more than ever before. The objective of this research topic is to present a comprehensive analysis of the online public administration services offered in Vietnam amidst the ongoing global digitization trend. The study aims to put forward effective solutions that can improve the delivery and accessibility of online government services in Vietnam.

3. STATE MANAGEMENT OF ONLINE PUBLIC ADMINISTRATIVE SERVICES IN VIETNAM

** The strategy, legal framework, and policies for providing online public administrative services*

The strategy for providing online public administrative services typically involves a comprehensive plan and framework for the digitization and delivery of government services to citizens and businesses through online platforms. The issuance of a comprehensive legal framework serves as an essential prerequisite for the advancement of online public administrative services. Over recent years, Vietnam has enacted various strategies and has established a relatively comprehensive legal system to facilitate the enhancement of online public administrative service delivery.

From 2010 to 2020, as part of the comprehensive program, the Government progressively refined the institutional and policy framework for the development of information technology applications in state activities. These institutional policies spanned various areas, ranging from national programs to directions, and included the provision of information and public services. In 2011, Resolution 30c/NQ-CP on administrative reform marked the state's policy shift from traditional administration to e-government. It set the goal of modernizing administration by 2020, aiming for 90% of official documents and papers exchanged among state agencies to be in electronic form. Most transactions of state agencies were to be conducted in an electronic environment, anytime, anywhere, using various multimedia communication applications. The resolution also called for the disclosure of a list of public administrative services on the government's e-administration information system over the Internet. It emphasized the unified use of electronic forms in transactions between state agencies, organizations, and individuals to simplify and streamline administrative procedures. A significant milestone in the implementation of e-government services was the issuance of Government Decree No. 43/2011/ND-CP on June 13, 2011, regulating the provision of online public services on electronic information portals or electronic gateways of state agencies.

On July 1, 2014, the Politburo of the Communist Party of Vietnam issued Resolution No. 36-NQ/TW, emphasizing the acceleration of information technology application and development to meet the requirements of sustainable development and international integration. Resolution No. 36-NQ/TW provided consistent guidance for the IT application strategy to meet international integration demands. Building on this foundation, many legal documents were issued to put the Party's directives into practice: Government Decree No. 36a/NQ-CP dated October 14, 2015, on e-government. Decision No. 1819/QD-TTg dated October 26, 2015, by the Prime Minister, approving the national program for the application of IT in state agency activities for the 2016-2020 period; Decision No. 846/QD-TTg dated June 9, 2017, by the Prime Minister, promulgating the list of level 3 and 4 online public services to be implemented in ministries, sectors, and localities in 2017; Resolution No. 17/NQ-CP dated March 7, 2019, by the Government, on some key tasks and solutions for e-government development for the 2019-2020 period, with an orientation toward 2025; Decision No. 749/QD-TTg dated June 3, 2020, by the Prime Minister, approving the "National

Digital Transformation Program until 2025, with a vision to 2030”; The regulations on digital signatures and digital signature authentication services in Decree No. 130/2018/ND-CP marked a turning point in the legal system for the development of online public services. Additionally, Government Decree No. 45/2020/ND-CP dated April 8, 2020, outlined the implementation of administrative procedures in the electronic environment. Government Decree No. 47/2020/ND-CP dated April 9, 2020, covered data sharing and connection among state agencies.

The National Public Service Portal, as outlined in Decision No. 274/QD-TTg dated March 12, 2019, emphasizes the transparency and openness of administrative procedure-related information. It aims to provide and support the execution of public services based on users’ demands. This approach ensures the ability of individuals, organizations, and state agencies to monitor, inspect, and assess the performance of public services. The National Public Service Portal features a user authentication function that allows individuals and organizations to log in and declare their information only once on the portal. This enables them to access various online public services provided by different ministries, sectors, and localities, by the authentication requirements of each public service: Implementation of a high-security authentication system through mobile identity solutions utilizing SIM cards integrated with digital signatures and other digital certificate devices; Research and deployment of advanced authentication solutions, such as authentication through digital signatures integrated into mobile applications and the use of biometric authentication methods; Integration with the National Single Window Portal, the National Public Service Portal, the electronic one-stop information system of ministries, sectors, and localities, as well as the public service delivery systems of various service providers (e.g., healthcare, education, electricity, water). This integration aims to organize the provision of online public services at levels 3 and 4 without being restricted by time or administrative boundaries.

- From 2020 to the Present

Resolution No. 76/NQ-CP, issued on July 15, 2021, replacing Resolution 30c/NQ-CP on the comprehensive administrative reform program for the period 2021-2030, emphasizes the application of information technology to reduce travel time, societal costs, and create convenience for citizens and businesses. According to this resolution: At least 80% of administrative procedure resolution documents are circulated electronically within relevant competent authorities or related agencies; At least 80% of administrative procedures that involve financial obligations should be implemented through online payment methods. Among these, the proportion of online payment transactions should reach a minimum of 30%. In 2021, the digitization of administrative procedure resolution results still in effect at the central, provincial, district, and commune levels should achieve a minimum respective percentage of 40%, 30%, 20%, and 15%. This will continue in the period from 2022 to 2025, with a yearly minimum increase of 20% for each administrative level until reaching a 100% rate. This is to ensure data connectivity and sharing in the resolution of administrative procedures in the electronic environment.

At least 80% of administrative procedures should be provided online at levels 3 and 4. Among these, at least 80% of administrative procedures should be integrated and provided through the National Public Service Portal. The ratio of online resolution of administrative procedures at levels 3 and 4 to the total number of cases should reach a minimum of 50%. The satisfaction level of citizens regarding the resolution of administrative procedures should be at least 90%. Within this, the satisfaction level for resolving issues related to land, construction, and investment should reach a minimum of 85%. 90% of internal administrative procedures among state administrative agencies should be promptly announced, publicized, and updated. Eighty percent of citizens and businesses, when performing administrative procedures, should not be required to provide the same information, documents, or papers that were accepted during the successful completion of previous administrative procedures. Instead, competent state agencies should manage or share this information, documents, or papers electronically.

This strategy also sets the following targets for 2030: One hundred percent of administrative procedures, that involve financial obligations, should be implemented through online payment methods, with the proportion of online payment transactions reaching at least 50%. At least 90% of administrative procedures of ministries, sectors, and localities that meet the conditions should provide online services at levels 3 and 4, and these should be integrated and provided through the National Public Service Portal. The ratio of online resolution of administrative procedures at levels 3 and 4 to the total number of cases should reach a minimum of 80%. 90% of citizens and businesses participating in the e-government system should have a unified and seamless electronic identity verification across all information systems of all government levels, from central to local.

Decision No. 942/QD-TTg dated June 15 towards the Digital Government for the period 2021-2025, with a vision to 2030. The key points of this strategy include 100% Level 4 Online Public Services: All administrative procedures should be provided as online public services at Level 4; User-Centric Redesign: All online public services should be designed or redesigned to optimize user experience, allowing users to pre-fill data that they have previously provided under the agreement, and should comply with service quality standards; Unified Identification and Authentication: All citizens and businesses using online public services should have unified and seamless identification and authentication across all government systems, from central to local levels; End-to-End Online Processing: At least 80% of administrative procedure dossiers should be fully processed online, with citizens only needing to enter data once; Convenient Online Interaction: All provincial-level and ministerial-level public service portals should support convenient and online interaction between citizens, businesses, and government agencies in state management activities and service provision based on digital platforms; 24/7 Service Availability: All government agencies should provide 24/7 online services, ready to serve citizens and businesses whenever they need assistance. All civil servants should be identified with unique numbers in their job performance; Electronic Document Exchange: 100% of document exchanges between government agencies should be conducted electronically and digitally signed with specialized digital signatures, except for classified documents as regulated by law; Percentage of Digital Processing: 90% of job-related records at the provincial and ministerial levels, 80% at the district level, and 60% at the commune level should be processed online; Reporting on National Information System: All reporting activities should be carried out on the national information reporting system; Electronic Data Management: 100% of records should be created, stored, and data shared electronically by regulations. Following this decision, the Prime Minister issued Directive No. 02/CT-TTg on the development of the e-government, aiming to promote the digital transformation of the national government.

Decree No. 42/2022/ND-CP, dated June 24, 2022, replaces Decree No. 43/2011/ND-CP regarding the provision of online public services by state agencies. In this new Decree, there are several important provisions: Compliance with Legal Regulations: Administrative procedures, online public services, and the workflow of state agencies must adhere to legal regulations, ensuring uniformity and integration with the National Public Service Portal and provincial-level public service portals; Financial Reporting Online: The Decree introduces provisions regarding the online publication of annual financial reports by state agencies on the Internet; Accessibility Across Multiple Platforms: The Decree specifies that the information provided must be easily accessible through various devices, including mobile devices. It ensures that organizations and individuals can evaluate their satisfaction with the provided information online; Data Privacy: State agencies are required to ensure the confidentiality and privacy of organizations and individuals providing online evaluations; Domain Names at the Commune and Ward Levels: The Decree includes provisions for domain names at the commune and ward levels; Common Tools for Development: It establishes a common set of tools that state agencies must use for the development of their electronic information portals; Two Levels of Online Public Service Provision: The Decree clearly defines two levels of online public service provision by state agencies: “Full-process online public services” and “Partial online public services. These provisions in Decree No. 42/2022/ND-CP are aimed at enhancing the accessibility, quality, and integration of online public services provided by state agencies in Vietnam, aligning them with legal requirements and modernizing the government’s online presence.

Thus, Vietnam’s legal and policy framework for the provision of e-administration services is fairly comprehensive, yet it lacks synchronization. Resolution No. 76/NQ-CP, issued on July 15, 2021, replacing Resolution No. 30c/NQ-CP regarding the comprehensive administrative reform program for the 2021-2030 period, provides a clear direction for the development of online public administrative services in the foreseeable future. Decree No. 42/2022/ND-CP, with its simplified classification of e-administrative services, aligns well with global trends in e-administration service classification. Furthermore, the unification of service delivery channels is designed to assist citizens in easily locating the relevant platform for their specific e-administrative needs. Decree No. 45/2020/ND-CP introduced a unified set of regulations for conducting administrative procedures in the online environment. This measure has made it easier for both government agencies and citizens to understand how administrative procedures are carried out online. However, a current drawback is the lack of uniformity in legal documents across different online administrative services, as exemplified in the specific case mentioned below.

Case Study: Integrated 3-in-1 Administrative Procedures

The “Integrated 3-in-1 Administrative Procedures” is an online public administrative service with the expectation of reducing the time required for citizens to complete birth registration, permanent residency registration, and health insurance card issuance for children under 6 years old. However, the practical implementation has revealed certain shortcomings, particularly in the issuance of birth certificates for children under 6 years old, stemming from the process of obtaining personal identification numbers for these children.

In this process, the Justice-Residency officials are responsible for receiving citizens’ applications and retrieving personal identification numbers from the personal identification database through software provided by either the Ministry of Justice or the Ministry of Public Security. Nevertheless, due to unstable technical infrastructure, accessing and retrieving personal identification numbers from these two sources is sometimes hampered, leading to system crashes, slow processing speeds, or even complete unavailability. This forces citizens to endure lengthy waiting periods. When the Justice-Residency officials are unable to obtain personal identification numbers from these databases due to technical errors or access restrictions, they must invest additional time and effort. This involves physically transporting all relevant documents to meet directly with local police authorities at the commune level to request personal identification numbers for the child. Only after this step can they proceed with the remaining procedures for birth certificate issuance. This process not only places added difficulty and pressure on the officials but also incurs additional travel costs. Unfortunately, these costs are not reimbursed or supported by the government, adding further challenges for the Justice-Residency officials.

Another issue in this administrative procedure is the redundant entry of the same information in the Declaration Form by the one-stop-shop officials. Whether citizens manually write the required information on the Declaration Form themselves or have the officials assist in filling it out, these officials are still required to re-enter this data into the local residency database on the Electronic Information Portal of the commune/ward, integrated with the Provincial Public Service Portal. This additional data entry task is necessary to generate the Receipt for Document Submission and appointment notices. However, the information on the Declaration Form and the fields on the Portal are not significantly different, making this re-entry process seem unnecessary. If citizens choose to complete the procedure online, officials are relieved from performing these repetitive tasks, and there's no need for the issuance of appointment notices. The workload of the one-stop-shop officials in charge of handling this procedure has significantly increased. This doesn't take into account the additional tasks these officials are responsible for, resulting in the wastage of office supplies. In reality, this could be avoided as electronic files or screenshots could serve as electronic verification if the process is completed online.

According to regulations, the birth information of a child must be recorded in the Birth Registration Book and bear the signature of the responsible official along with the signature of the applicant. This requirement poses significant challenges when implementing online public administrative services for this procedure. Information in the Declaration Form for birth registration, the Birth Registration Book, the Participation Form, and the social insurance and health insurance adjustment form share many identical fields. However, officials must manually enter this data multiple times due to the lack of integration and data sharing across the common database system. This leads to an excessive workload for officials.

Case Study: Driver's License Renewal

The renewal of a driver's license is conducted through the National Public Service Portal at level 4. Citizens can apply for this service from the comfort of their homes, submitting their documents online to the relevant administrative agency and receiving results through the postal service. Nevertheless, many citizens remain dissatisfied with this service due to various drawbacks: Electronic Health Check Requirement: The regulations mandate an electronic health check certificate. To obtain this certificate, citizens must undergo electronic authentication for their health check certificate at the commune/ward People's Committee, which requires additional time and expenses for electronic authentication. Meanwhile, the healthcare sector has not expanded the number of facilities providing electronic health check certificates on the National Public Service Portal, making it difficult for citizens to fulfill this requirement; Payment and Refund Process: Citizens are required to make payments to the treasury. In cases where their application is unsuccessful due to incomplete documents, the refund process consumes a significant amount of time; Incomplete Driver's License Data: Driver's license data is not fully accessible by the Traffic Police Department. It lacks integration, requiring traffic police officers to consult multiple software applications when verifying driver's license records. This has resulted in a low number of online driver's license renewal applications, as the existing regulations and database systems have not incentivized citizens to opt for online driver's license renewal.

These challenges highlight the need for improvements in the efficiency and user-friendliness of online administrative procedures in Vietnam.

** Building the infrastructure for the provision of online public administrative services in Vietnam*

Infrastructure plays a critical role in enhancing the quality of online public administrative services, particularly in developing countries where financial resources for infrastructure investment can be limited. In recent years, Vietnam has issued various state management documents to develop infrastructure for the delivery of online public administrative services. Decision 1605/QD-TTg dated August 27, 2010, to apply information technology in the activities of state agencies during the 2011-2015 period. Decision 1605/QD-TTg emphasized the development of dedicated data transmission networks for State agencies, maximizing the use of existing telecommunications infrastructure provided by telecommunications companies, connecting to units under ministries, cross-agency offices, and other state agencies within the political system, down to commune and ward levels nationwide. This was intended to ensure information security, develop the Government's electronic data center, and enhance electronic data management. In the period from 2011 to 2016, to ensure that the implementation of infrastructure and information technology applications is synchronized and that there is connectivity and interoperability between systems, the Ministry of Information and Communications issued Circular No. 01/2011/TT-BTTTT on January 4, 2011. This circular defined the technical standards that applied as a basis for surveying, designing, and implementing investments in IT application projects using state budget funds.

In 2012, the Central Party Executive Committee issued Resolution No. 13-NQ/TW on building a synchronized infrastructure system to fundamentally transform Vietnam into a modern and industrialized country by 2020. The resolution identified the promotion of the development and application of information technology as a top priority task in the industrialization and modernization process in each sector and field. This includes enhancing the ability to master technology and efficiently manage information infrastructure systems, providing information content for the leadership and management of the Party and State, meeting the requirements for information exchange in society, promoting socio-economic development, ensuring national defense and security, and safeguarding national sovereignty in cyberspace.

Subsequently, Decision No. 1293/QD-BTTTT emphasized the need to focus on providing high-level online public services widely to citizens and businesses to make the operations of state agencies more transparent and better serve citizens and businesses. It also highlighted the need to effectively implement information technology applications at one-stop departments and departments with inter-agency links. There was a continuous effort to enhance the effectiveness of the online public opinion reception channel for citizens and businesses in the online environment to increase their participation in the activities of state agencies.

In 2015, the Ministry of Information and Communications issued Document No. 1178/BTTTT-THH, which introduced the Vietnam Government Electronic Architecture Framework Version 1.0. This framework aimed to define and unify the overall structure of the National Government Electronic Architecture Framework. By 2019, the Vietnam Government Electronic Architecture

Framework was upgraded to Version 2.0 in Document No. 11757/VPCP-KSTT dated December 26, 2019. This provided a basis for state agencies at all levels to determine their responsibilities and positions in the synchronized development of the National Government Electronic Architecture Framework. It also served as a basis for ministries, sectors, and localities to develop their detailed Government Electronic Architecture Frameworks, saving time and resources while ensuring consistency and synchronization among ministries, sectors, and localities.

The integration and data-sharing platform play a crucial role in connecting and disseminating information among state agencies, facilitating the acceleration of administrative procedures. By the end of 2020, a nationwide system of integrated data-sharing platforms had been established according to the Vietnam Government Electronic Architecture Framework. As of December 2020, all 22 ministries and cross-agency offices and all 63 provinces and centrally governed cities had their integrated data sharing platforms (LGSP) in place and were connected to the national integrated data sharing platform (NDXP), achieving a 100% implementation rate.

November 24, 2020, the total number of transactions carried out through NDXP in November 2021 was 33,538,067, a 1.5-fold increase compared to October 2021. The total number of transactions carried out through DNXP in 2021 was 102,298,870. On average, approximately 270,000 transactions were conducted daily through NDXP (Ministry of Information and Communications, 2021). The computer adoption rate among officials and civil servants in Vietnamese ministries and cross-agency offices is relatively high, with the majority of them having access to computers. Nearly all civil servants were provided with email accounts (99.7% in 2020). However, there are still some civil servants who do not use email for work purposes, with an adoption rate of 94.2% in 2020 Ministry of Information and Communications, 2021).

According to the report by the Ministry of Information and Communications (2022), Provision of Online Public Services: A total of 3,812 online public services at levels 3 and 4 have been provided. User Registrations: There are over 2.8 million registered user accounts, marking a significant increase of more than 2.8 times compared to the same period in 2021. Access to Information and Services: The online platforms have witnessed over 736 million access instances for information lookup and service inquiries, showing a substantial increase of more than 2.69 times compared to the same period in 2021. Online Transactions: More than 4.93 million online records have been processed through the online portal, reflecting an increase of over 2.59 times compared to the same period in 2021. Additionally, there have been more than 2.72 million online payment transactions, totaling over VND 2,828 billion, which is more than 9.6 times higher than the same period in 2021. Hotline Calls: There have been over 192 thousand calls received by the advisory hotline. Regarding the technical infrastructure, there has been some improvement, but it is not yet significantly pronounced. The statistics related to mobile subscriptions, internet usage, and broadband connections are as follows: The mobile subscription rate per 100 inhabitants increased from 113.4 subscriptions in 2016 to 114.6 subscriptions in 2017, rising further to 117.8 subscriptions in 2019. By 2020, the number of mobile subscriptions reached 120 per 100 inhabitants. The rate of internet users per 100 inhabitants has also seen improvement. In 2016, it was 40 users per 100 inhabitants, increasing to 48.8 users in 2017, and further rising to 62.8 users in 2019. By 2020, the rate reached 72 users per 100 inhabitants. The percentage of households with broadband internet connections doubled from 30.1% in 2016 to 64.8% in 2020. However, the rate of businesses with internet connections did not achieve a high result. It decreased from 91.4% in 2016 to 84.2% in 2020.

** The oversight and monitoring of online public administrative services in Vietnam*

During the implementation of online public administration services, the Ministry of Information and Communications frequently engages in monitoring and inspecting the situation regarding the provision of these services by various government bodies, including ministries, their subordinate agencies, and provinces and cities directly under central government administration. Annually, these entities are obliged to submit reports detailing the status of their deployment of online public administration services. This proactive approach allows for the identification and timely resolution of difficulties and challenges encountered during the implementation of online public services. It also serves to address cases of inadequate application of information technology in administrative reform, administrative procedure handling, and any disruptive activities that may hinder citizens and businesses in their administrative procedures.

Citizen supervision also plays a pivotal role in the delivery of online public administration services by government agencies. Systems for receiving and processing feedback and recommendations from citizens, businesses, and various governmental departments have been relatively well-established by administrative regulations. Furthermore, the system for receiving and responding to recommendations from businesses and citizens through the Government Electronic Information Portal at the following addresses: http://doanhnghiep.chinhphu.vn and http://nguoidan.chinhphu.vn; http://pakn.dichvucong.gov.vn on the National Public Service Portal, has been operational. This system enables the government, under the guidance of the Prime Minister, to promptly address and resolve issues arising from citizens and the business community, thereby expeditiously addressing difficulties and challenges and enhancing discipline and administrative rigor. Alongside this, considerable emphasis has been placed on organizing inspections, evaluations, monitoring, and ensuring cybersecurity for information systems. This is essential to support the delivery of online public services within government agencies.

As reported by the Ministry of Information and Communications in 2022, in September 2022, the National Cyberspace Security Monitoring Center under the Ministry of Information and Communications recorded, alerted, and provided guidance on the handling of 988 cyberattacks that caused incidents in information systems in Vietnam. This marked an 8.9% increase compared to August 2022 and a 19.9% increase compared to September 2021. During the third quarter of 2022, 2,878 cyberattacks causing incidents in information systems in Vietnam were recorded, alerted, and guided for resolution. This marked a 15.5% increase compared to the third quarter of 2021.

4. POLICY IMPLICATIONS FOR PROMOTING E-GOVERNMENT SERVICES IN VIETNAM

The Government of Vietnam has issued numerous policies, programs, and plans related to online public services, yet it has not achieved significant outcomes. Legal documents and policy mechanisms related to online public services still exhibit certain limitations, which have not effectively encouraged citizens and businesses to utilize online public services. One of the reasons that businesses are less inclined to communicate with government agencies via the Internet is the absence of government policies promoting its usage. Besides, The usage of digital signatures in document issuance within government agencies is still limited. This is due to the cost of obtaining digital signatures and concerns about its security. Some services encounter difficulties in verifying information. For instance, the public service related to population data faces issues where entered information cannot be saved due to a message indicating a mismatch with the database. When contacting local authorities, it is revealed that the database matches the provided personal information, leaving users uncertain about the specific error location. Additionally, certain uploaded files are flagged as corrupted, but the exact nature of the issue is not specified. Moreover, some procedures that require adjustments or deletions cannot be processed. Therefore, in the coming period, the government of Vietnam needs to implement several following measures:

There is a need to establish mechanisms to encourage citizens and businesses to use online public administrative services through policies such as reducing or exempting fees for service implementation or providing digital signatures and certificates for free. Furthermore, there should be mechanisms in place to incentivize Vietnamese technology conglomerates, business communities, and data research experts to develop data models tailored to specific issues and sectors in Vietnam. These products will be applied to various systems contributing to improving the quality and efficiency of public services.

Regarding the improvement of administrative procedures, it is essential to continue simplifying procedures. This can be achieved by utilizing electronic identity accounts to verify information in the digital environment. Optimizing the operation of the e-government service portal for receiving applications and procedures, is crucial for ensuring convenience. Focus on streamlining and enhancing the quality of administrative procedures across all areas of state management, particularly those related to citizens and businesses. Implement administrative procedure reforms continuously to improve the business environment, mobilize all social resources, and enhance national competitiveness. Simplify administrative procedures between state administrative agencies, sectors, and levels, as well as within each state administrative agency. Significantly reduce existing administrative procedures, publicly disclose standards and administrative regulations, and allow individuals and organizations to supervise their implementation. Receive and handle feedback and suggestions from individuals and organizations regarding administrative regulations to support the improvement of the quality of administrative regulations and monitor the implementation of administrative procedures by state administrative agencies at all levels.

These measures will contribute to the continued improvement of the business environment, fostering rapid and sustainable economic development and ensuring favorable conditions for the country's economic growth.

DETERMINATION OF MATERIALITY IN GROUP AUDIT CONDUCTED BY AUDIT FIRMS IN VIETNAM

MSc. Nguyen Thu Hao[1]

Abstract: *Materiality is an important issue because it directly affects how much of audit evidence is enough as a basis to form audit opinion. In group audit, auditing standards require group auditor to determine appropriate component materiality, but those standards do not mention the way to do this, and practice of auditor varies widely. Prior academic regarding materiality problem in group audit is also quite limited in providing broad evidence on the factors that influence the determination of materiality. This paper examines the current practice of Vietnamese audit firms in determining materiality in group audit. The results showed that Vietnamese audit firms quite closely followed the current auditing standards on materiality. There is a consistency in using benchmark for overall group materiality and percentage of determining group performance materiality, clearly trivial thresholds at group level. We also find that that the percentage of 60% to 90% of overall materiality is normal range applied to determine component materiality and agreed across the firms. However, there are some misunderstandings from certain auditors when using the benchmark of parent company instead of consolidated figures to determine the overall group materiality. In addition, there is a difference in the method for determination of component materiality among audit firms. The explanation, and documentation to support the auditor judgements are also limited. The results of this study showed a practical aspect of implementing auditing standards on materiality and provide direction for further research.*

Keywords: *materiality, group audit, auditing firms, VSA600, ISA600.*

1. INTRODUCTION

The final objective of an audit is to obtain reasonable assurance as to whether the financial statement contains material misstatement or not. This require the auditor to plan the audit and perform the audit procedures to detect errors, individually or in aggregated, which could result in material misstatement in the financial statement [1]. Therefore, the determination of materiality is important because it will affect the audit scope and the auditor's decision on which misstatement is material and therefore should be adjusted. The determination of materiality will be considered in both quantitative aspects and qualitative aspects.

Materiality is not a new term in audit. The related auditing standards has provided guidance for auditor on how to apply materiality in planning audit, gathering audit evidence and completion of the audit, including: (i) establish overall materiality for financial as a whole (is also known as planning materiality); (ii) determine the performance materiality which is lower than overall materiality, this materiality level is used to design audit procedures for account balance and disclosure to ensure that the total uncorrected misstatement and undetected misstatement will not exceed the overall materiality (aggregated risk at the acceptable level); (iii) use this materiality level to evaluate the audit findings [2].

In a group audit, materiality affects auditor's conclusion on whether the consolidated financial statement contain material misstatement or not. The application of materiality in three processes of an audit is an important matter. Materiality is significant basis in group audit, because it is the key factor to (i) determine the scope of the audit work (for example, which account balances or

1 Email: nguyenthuhao@hvtc.edu.vn, Academy of Finance.

assertion need to be audited in aspect of consolidated financial statement), and (ii) determine the types of work performed at different components of group [3].

ISA 600 [4]including when component auditors are involved. The standard includes new and revised requirements and application material that better aligns the standard with recently revised standards, such as International Standard on Quality Management 1 and International Standards on Auditing 220 (Revised requires a group auditor to determine overall materiality for consolidated financial statement as a whole (refer as group materiality) and component materiality which is applicable for component that auditor will perform full scope audit for group audit purpose. The standard also mentions that component materiality should be lower than group materiality to reduce the risk that total uncorrected misstatement and undetected misstatement exceeds overall group materiality. However, the ISA gives no detailed guidance on how to determine the materiality level. Due to the lack of academic research and auditing standards, auditors need to use a lot of judgment in determining component materiality. Review report of IAASB (2015) stated that, there is evidence of "big gap in practice of determining component materiality" [5]. The professionals of US standards regulators also agreed that there is a need for guidance on component materiality and other aspects of materiality in group audit [6].

In Vietnam, group audit follow VSA 600 [7] which inherits from ISA 600. There has been no detailed guidance other than VSA 600 and require auditors to use professional judgments in making decision relating materiality. This gives rise to some difference approach in application of materiality in group audit conducted by Vietnamese auditing firms. Some audit firms use guidance of global network, some refer to guidance from current academic research, and some have no detailed approach for component materiality. This practice showed that there is a need for further guidance on materiality for group audit.

Therefore, the topic "*Determination of materiality in group audit conducted by audit firms in Vietnam*" will focus on the current practice of audit firms in Vietnam regarding using materiality in performing group audit.

2. BACKGROUND AND RESEARCH QUESTION

2.1. Overview on materiality in group audit

In general, based on the current regulation, when performing an group audit (or audit of consolidated financial statement), auditors need to determine and apply the following materiality thresholds [4], [7]including when component auditors are involved. The standard includes new and revised requirements and application material that better aligns the standard with recently revised standards, such as International Standard on Quality Management 1 and International Standards on Auditing 220 (Revised:

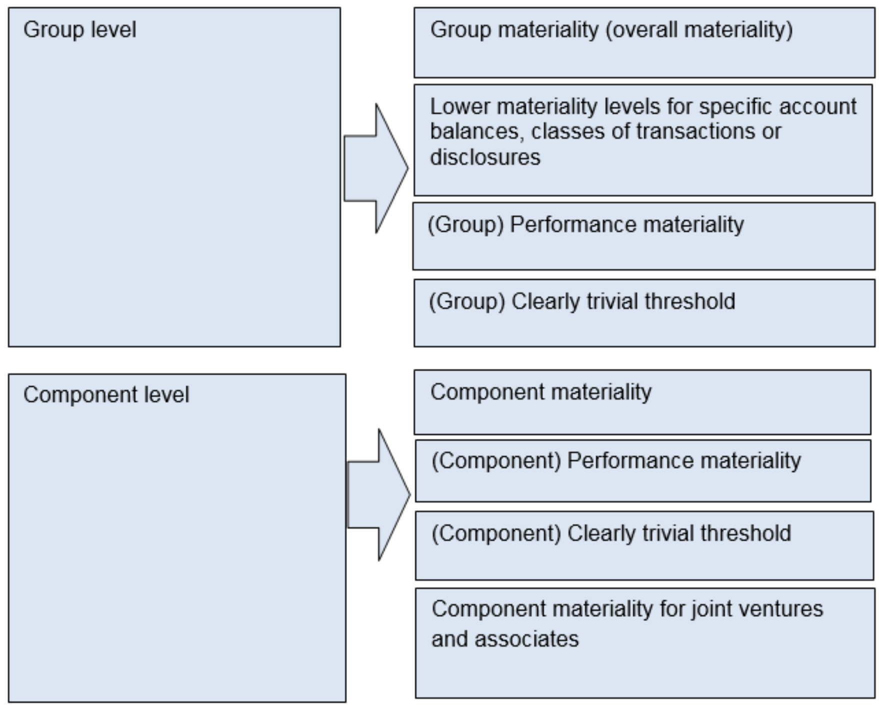

Table 1: Materiality in group audit

The determination of materiality at group level is the same as a statutory financial statement audit, when the group is considered as a single (stand-alone) audited entity. The main difference in determining materiality in group audit is at component level, *including component materiality, component performance materiality, and component materiality for joint ventures and associates*.

Component materiality

In a group audit, how much of the audit work performed at component is enough? This is a big question for all group auditors and component auditors. There is a need for materiality level which gives basis to determine the audit work performed at component, this level is called component materiality. Component materiality is used by the component auditor to perform the full scope audit at component level. The too high component materiality will lead to the under-performed audit work to achieve audit objective and then will give risk to financial statement users; in contrary, the too low component materiality will lead to overwork done and unnecessarily increase audit cost and the audit is not efficient. Therefore, the important issue for group audit is how to determine the optimal component materiality.

ISA 600 also suggests that the component materiality should be lower than group materiality to reduce the aggregated risk to an acceptable level. Aggregated risk is the risk that undetected and uncorrected misstatement, when aggregated, could lead to material misstatement. This risk will increase in the case of a group with a rising number of components. Because the auditor cannot perform full scope audit for all components of the group. Therefore, the determination of component materiality involves a lot of professional judgement, including the quantitative and qualitative aspects (such as number of components, nature of components, and characteristic of component). Generally, the different component materiality will be established for different components of the group.

In the current situation, there is no guidance from regulators on how to determine component materiality. The following is some suggestion from academic research:

- Kinney (1993) suggests component materiality is equal to 50% group materiality. And this level is consistently applied for all components of the group. This method is known as "HALF" method [8] .
- Zuber et al. (1983) and Kinney (1993) recommend the method in which component materiality equal group materiality multiplied by the square root of the proportions by size among components. This method is known as "SQRT probability method" [9].
- Then, in 2008, Glover et al. presented research on a more complex probabilistic method for determining the component materiality. This method defines a "aggregated" component materiality (this is the maximum value that total individual component materiality could exceeds the group materiality, which is called as "Maximum aggregate component materiality", MACM) by using the benchmark multiples (BM). BM has the value ranges from 1.5 to 9.0 depending on the number of components. Auditor will multiply the group materiality with this BM to determine the MACM. Then, the auditor allocates the MACM to component based on the proportion of the square root of revenue (or an equivalent measure of the component size). This method is known as "MACM" method [8].
- Inherits from research findings, in the audit guidance, AICPA also rely on MACM method of Glover (2008) to suggest auditor about how to determine component materiality. In addition, guidance of AICPA is more flexible at step allocating MACM to components, the allocation rate can be proportion of the square root of the revenue (similar to Glover 2008) or just solely the proportion of revenue (or asset, or equivalent value to measure the size of the component) of component in total group revenue (which means that the square root is not taken) [11].
- Stewart and Kinney (2013) study have built a model to determine component materiality using input data collected from auditing standards, audit risk models, factors from previous academic research, and Bayesian probability theory. This model is known as the General unified assurance and materiality (GUAM), in the study of Stewart and Kinney (2013) [12]which ultimately affect group audit scope, reliability, and value. However, standards are silent about how these amounts should be determined and methods being used in practice vary widely, lack theoretical support, and may either fail to meet the audit objective or do so at excessive cost. We develop a Bayesian group audit model that generalizes and extends the singlecomponent audit risk model to aggregate assurance across multiple components. The model formally incorporates group auditor knowledge of group-level structure, controls, and context as well as component-level constraints imposed by statutory audit or other requirements. Application of the model yields component materiality amounts that achieve the group auditor's overall assurance objective by finding the optimal solution on an efficient materiality frontier. Numerical results suggest group-level controls and structured subgroups of components are central to efficient group audits.","container-title": (Crossref. This model also integrates the following factors: number of components, probability distribution of potential errors, and internal controls throughout the group. Stewart and Kinney advise that this approach is innovative and has integrated elements from component-level assurance to group-level assurance into a unified Bayesian model, aimed at using in the decision-making process at the audit planning stage as well as supporting decisions during performing group au-

dit. However, GUAM is relatively complex and cannot be applied in practice without supporting software. Developing suitable software is considered an important step in the project of applying GUAM in audit firms.

In general, guidance from auditing standards and prior academic research on determining component materiality is quite limited and not detailed, which can give rise to distance in practice when mostly involved by auditor's judgements.

Component performance materiality

Component performance materiality is established when scope of work is audit of component financial statements. This is necessary to reduce to an acceptable level the risk that undetected and uncorrected material misstatements can exceed component materiality. The method to determine component performance materiality is the same as component materiality at group level. This work can be performed by a component auditor then reviewed by a group auditor.

Clearly trivial threshold

The clearly trivial threshold or tolerable error threshold is a threshold that is used by the component auditor to report the errors to the group auditor. During the audit process, if the component auditor discovers errors greater than this threshold, they will notify the group auditor. The clearly trivial threshold can be determined for each component which is usually based on a percentage (for example 5%) of the component materiality. However, the auditor can also define a single threshold that applies to all components to require that component auditors will use this threshold to report uncorrected misstatements.

2.2. Research question

Given the limitation on current professional guidance on determination of materiality in group audit. It is quite a big concern that how audit firms understood and implemented auditing standards on materiality in practice. Therefore, in our study, we investigate the following research questions (RQ):

RQ1: What benchmarks and percentages do audit firms use for determining overall materiality in a group audit?

RQ2: How is component materiality determined in group audits?

RQ3: Do audit firms need to determine component performance materiality in group audit?

RQ4: What amounts are used to determine clearly trivial threshold applied at component level?

RQ5: How do audit firms determine component materiality for associates and joint ventures?

3. RESEARCH METHOD

The paper focus on different aspects of materiality in group audit. To obtain practical information to describe the current practice of group audit conducted by audit firms in Vietnam, the researcher used the following techniques:

- Sending the survey questionnaire and collecting survey results (Appendix A): The researcher sent the survey questionnaire to auditors of audit firms that have experiences in group audit. Sending survey questionnaires and collecting survey results are carried out by meeting in person or sending via email. The survey ensures respondents' anonymity and asks respondents to be as specific as possible without including information that could identify auditing companies, audit client or individuals.

- In-depth interviews (Appendix B): The researcher conducted in-depth interviews with experience auditors by: meeting in person, conversing by phone and exchanging by email about issues that need to be learned about the current situation. See Appendix B for the author's interview questions, note that these are basic initial questions, subsequent questions are spontaneous and therefore may not be consistent between respondents. The researcher has approached auditors of five audit firms, comprised of two Big Four firms and three Non-Big Four firms.

The survey/interview questionnaires clearly state the motivation of the research paper, research questions and research products. The author states that the author will keep it confidential, and related discussions will not reveal information on auditing firm or individual auditor.

4. RESULTS AND DISCUSSION

4.1. Results

RQ1: What benchmarks and percentages do audit firms use for determining overall materiality in a group audit?

Overall (group) materiality (consolidated financial statements level)

The survey results show that there is consistency in using benchmark and percentage to determine overall materiality in group audit. Through interviews (Appendix B), audit firms all have priority for using consolidated profit before tax criteria to determine the overall materiality. According to the interview results, the auditor responded that "For most of enterprises, especially the listed companies or those operate in the high regulation environment, users of financial statement focus the most on the performance of the group, which reflect in the consolidated profit before tax.". The percentage is determined consistently at 5% of profit before tax. The results of in-depth interviews also show that a threshold at 5% of profit before tax is considered as material. In the case of a group that has a small profit, or gets loss, or unstable in business results, other benchmarks can be use, i.e., 0.5% of revenue or 1% of total assets.

Regarding the source of benchmark used, the survey (Appendix A) results show that 33% of auditors believe that their firm use the parent company's profit before tax data in calculating the overall materiality, 22% use profit before tax of this year's group financial statements (unaudited), 45% use profit before tax of the previous year's group financial statements (audited figure, with adjustments for changes to this year).
